CISCO-CCM-MIB

Note

This is a reformatted version of CISCO-CCM-MIB. Download and compile all of the MIBs in this section from <http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2>.

This MIB manages the Cisco Unified Communications Manager (Cisco Unified CM) application running with a Cisco Communication Network (CCN) system. Cisco Unified CM is an IP-PBX that controls the call processing of a VoIP network.

A CCN system comprises multiple regions, with each region consisting of several Cisco Unified CM groups with multiple Cisco Unified CM servers. The MIB can be used by the Cisco Unified CM application, Cisco Unified CM Administration, to present provision and statistics information.

The following terminology applies to this MIB:

- SCCP—Skinny Client Control Protocol
- SIP—Session Initiation Protocol
- TLS—Transport Layer Security
- MGCP—Media Gateway Control Protocol

Before you can compile CISCO-CCM-MIB, you need to download and compile the MIBs listed below in the order listed.

- 1 SNMPv2-SMI
- 2 SNMPv2-TC
- 3 SNMPv2-CONF
- 4 CISCO-SMI
- 5 INET-ADDRESS-MIB
- 6 SNMP-FRAMEWORK-MIB
- 7 RFC1155-SMI
- 8 RFC1212
- 9 SNMPv2-TC-v1
- 10 CISCO-CCM-MIB

CISCO-CCM-MIB Textual Conventions

CcmIndex ::= TEXTUAL-CONVENTION

DISPLAY-HINT d

STATUS current

DESCRIPTION

This syntax is used as the Index into a table. A positive value is used to identify a unique entry in the table.

SYNTAX Unsigned32(1..4294967295)

CcmIndexOrZero ::= TEXTUAL-CONVENTION

DISPLAY-HINT d

STATUS current

DESCRIPTION

This textual convention is an extension of the CcmIndex convention. The latter defines a greater than zero to identify an entry of the CCM MIB table in the managed system. This extension permits the additional value of zero. The value zero is object-specific and must be defined as part of the description of any object that uses this syntax.

SYNTAX Unsigned32 (0..4294967295)

CcmDevRegFailCauseCode ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

This syntax is used as means of identifying the reasons for a device registration failure. The scope of this enumeration can expand to comply with RFC 2578.

noError: No Error

unknown: Unknown error cause

noEntryInDatabase: Device not configured properly in the Cisco Unified CM database

databaseConfigurationError: Device configuration error in the Cisco Unified CM database

deviceNameUnresolveable: The Cisco Unified CM is unable to resolve the device name to an IP Address internally

maxDevRegExceeded: Maximum number of device registrations have been reached

connectivityError: Cisco Unified CM is unable to establish communication with the device during registration

initializationError: Indicates an error occurred when the Cisco Unified CM tries to initialize the device

deviceInitiatedReset: Indicates that the error was due to device initiated reset

callManagerReset: Indicates that the error was due to Cisco Unified CM reset

authenticationError: Indicates mismatch between configured authentication mode and the authentication mode that the device is using to connect to the Cisco Unified CM

invalidX509NameInCertificate: Indicates mismatch between the peer X.509 certificate subject name and what is configured for the device

invalidTLSCipher: Indicates Cipher mismatch during TLS handshake process

directoryNumberMismatch: Indicates mismatch between the directory number that the SIP device is trying to register with and the directory number configured in the Cisco Unified CM for the SIP device

malformedRegisterMsg: Indicates that SIP device attempted to register with Cisco Unified CM, but the REGISTER message contained formatting errors

protocolMismatch: The protocol of the device (SIP or SCCP) does not match the configured protocol in Cisco Unified CM

deviceNotActive: The device has not been activated

authenticatedDeviceAlreadyExists: A device with the same name is already registered with Cisco Unified CM

obsoleteProtocolVersion: The SCCP device registered with an obsolete protocol version

databaseTimeout: Cisco Unified CM requested device configuration data from the database but did not receive a response within 10 minutes

registrationSequenceError: (SCCP only) A device requested configuration information from the Cisco Unified CM at an unexpected time. The Cisco Unified CM had not yet obtained the requested information. The device will automatically attempt to register again. If this alarm occurs again, manually reset the device. If this alarm continues to occur after the manual reset, there may be an internal firmware error

invalidCapabilities: (SCCP only) The Cisco Unified CM detected an error in the media capabilities reported in the StationCapabilitiesRes message by the device during registration. The device will automatically attempt to register again. If this alarm occurs again, manually reset the device. If this

alarm continues to occur after the manual reset, there may be a protocol error

capabilityResponseTimeout: (SCCP only) The Cisco Unified CM timed out while waiting for the device to respond to a request to report its media capabilities. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops, and packet corruption. It is also possible to get this error if the Cisco Unified CM node is experiencing high CPU usage. Verify that the device is powered up and operating. Verify that network connectivity exists between the device and Cisco Unified CM, and verify that the CPU utilization is in the safe range

securityMismatch: The Cisco Unified CM detected a mismatch in the security settings of the device and/or the Cisco Unified CM. The mismatches that can be detected are:

- The device established a secure connection, yet reported that it does not have the ability to do authenticated signaling.
- The device did not establish a secure connection, but the security mode configured for the device indicates that it should have done so.
- The device established a secure connection, but the security mode configured for the device indicates that it should not have done so.

autoRegisterDBError—Auto-registration of a device failed for one of the following reasons:

- Auto-registration is not allowed for the device type.
- An error occurred while adding the auto-registering device to the database (stored procedure).

dbAccessError: Device registration failed because of an error that occurred while building the station registration profile. This usually indicates a synchronization problem with the database

autoRegisterDBConfigTimeout: (SCCP only) The Cisco Unified CM timed out during auto-registration of a device. The registration profile of the device did not get inserted into the database in time. The device will automatically attempt to register again

deviceTypeMismatch: The device type reported by the device does not match the device type configured on the Cisco Unified CM

addressingModeMismatch: (SCCP only) The Cisco Unified CM detected an error related to the addressing mode configured for the device. One of the following errors were detected:

- The device is configured to use only IPv4 addressing, but did not specify an IPv4 address.
- The device is configured to use only IPv6 addressing, but did not specify an IPv6 address.

CcmDevUnregCauseCode ::= TEXTUAL-CONVENTION

STATUS current

DESCRIPTION

This syntax is used as means of identifying the reasons for a device getting unregistered. The scope of this enumeration can expand to comply with RFC 2578.

noError: No Error

unknown: Unknown error cause

noEntryInDatabase: Device not configured properly in the Cisco Unified CM database

databaseConfigurationError: Device configuration error in the Cisco Unified CM database

deviceNameUnresolveable: The Cisco Unified CM is unable to resolve the device name to an IP Address internally

maxDevRegExceeded: Maximum number of device registrations have been reached

connectivityError: Cisco Unified CM is unable to establish communication with the device during registration

initializationError: Indicates that an error occurred when the Cisco Unified CM tries to initialize the device

deviceInitiatedReset: Indicates that the error was due to device initiated reset

callManagerReset: Indicates that the error was due to Cisco Unified CM reset.

deviceUnregistered: DeviceUnregistered.

malformedRegisterMsg: Indicates that SIP device attempted to register with Cisco Unified CM, but the REGISTER message contained formatting errors.

sccpDeviceThrottling: The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device.

keepAliveTimeout: A KeepAlive message was not received. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops, packet corruption and Cisco Unified CM node experiencing high CPU usage.

configurationMismatch: The configuration on the SIP device does not match the configuration in Cisco Unified CM.

callManagerRestart: A device restart was initiated from Cisco Unified CM Administration, either due to an explicit command from an administrator or due to a configuration change such as adding, deleting or changing a directory number associated with the device.

duplicateRegistration: Cisco Unified CM detected that the device attempted to register to two nodes at the same time. Cisco Unified CM initiated a restart to the phone to force it to re-home to a single node.

callManagerApplyConfig: Cisco Unified CM configuration is changed.

deviceNoResponse: Device is not responding Service Control Notify from Cisco Unified CM.

emLoginLogout: The device has been unregistered due to an Extension Mobility login or logout.

emccLoginLogout: The device has been unregistered due to an Extension Mobility Cross Cluster login or logout.

powerSavePlus: The device powered off as a result of the Power Save Plus feature that is enabled for this device. When the device powers off, it remains unregistered from Cisco Unified CM until the Phone On Time defined in the Product Specific Configuration for this device.

callManagerForcedRestart: (SIP Only) The device did not respond to an Apply Config request and as a result, Cisco Unified CM had sent a restart request to the device. The device may be offline due to a power outage or network problem. Confirm that the device is powered-up and that network connectivity exists between the device and Cisco Unified CM.

sourceIPAddrChanged: (SIP Only) The device has been unregistered because the IP address in the Contact header of the REGISTER message has changed. The device will be automatically reregistered. No action is necessary.

sourcePortChanged: (SIP Only) The device has been unregistered because the port number in the Contact header of the REGISTER message has changed. The device will be automatically reregistered. No action is necessary.

registrationSequenceError: (SCCP only) A device requested configuration information from the Cisco Unified CM at an unexpected time. The Cisco Unified CM no longer had the requested information in memory.

invalidCapabilities: (SCCP only) The Cisco Unified CM detected an error in the updated media capabilities reported by the device. The device reported the capabilities in one of the StationUpdateCapabilities message variants.

fallbackInitiated: The device has initiated a fallback and will automatically reregister to a higher-priority Cisco Unified CM. No action is necessary.

deviceSwitch: A second instance of an endpoint with the same device name has registered and assumed control. No action is necessary.

The following table lists the objects that are populated only if the Cisco Unified Communications Manager service is up and running or the local Cisco Unified Communications Manager service in the case of a Cisco Unified Communications Manager cluster configuration.

Table 3: CISCO-CCM-MIB Dynamic Tables

Object	Content
ccmTable	This table stores the version and installation ID for the local Cisco Unified CM. The table also stores information about all the Cisco Unified CMs in a cluster that the local Cisco Unified CM knows about but shows “unknown” for the version detail. If the local Cisco Unified CM is down, the table remains empty, except for the version and installation ID values.
ccmPhoneFailed, ccmPhoneStatusUpdate, ccmPhoneExtn, ccmPhone, ccmPhoneExtension	For the Cisco Unified IP Phone, the number of registered phones in ccmPhoneTable should match Cisco Unified Communications Manager/RegisteredHardware Phones perfmon counter. The ccmPhoneTable includes one entry for each registered, unregistered, or rejected Cisco Unified IP Phone. The ccmPhoneExtnTable uses a combined index, ccmPhoneIndex and ccmPhoneExtnIndex, for relating the entries in the ccmPhoneTable and ccmPhoneExtnTable.
ccmCTIDevice, ccmCTIDeviceDirNum	The ccmCTIDeviceTable stores each CTI device as one device. Based on the registration status of the CTI Route Point or CTI Port, the ccmRegisteredCTIDevices, ccmUnregisteredCTIDevices, and ccmRejectedCTIDevices counters in the Cisco Unified Communications Manager MIB get updated.
ccmSIPDevice	The CCMSIPDeviceTable stores each SIP trunk as one device.
ccmH323Device	The ccmH323DeviceTable contains the list of H323 devices for which Cisco Unified Communications Manager contains information (or the local Cisco Unified Communications Manager in the case of a cluster configuration). For H.323 phones or H.323 gateways, the ccmH.323DeviceTable contains one entry for each H.323 device. (The H.323 phone and gateway do not register with Cisco Unified Communications Manager. Cisco Unified Communications Manager generates the H.323Started alarm when it is ready to handle calls for the indicated H.323 phone and gateway.) The system provides the gatekeeper information as part of the H323 trunk information.
ccmVoiceMailDevice, ccmVoiceMailDirNum	For Cisco uOne, ActiveVoice, the ccmVoiceMailDeviceTable includes one entry for each voice-messaging device. Based on the registration status, the ccmRegisteredVoiceMailDevices, ccmUnregisteredVoiceMailDevices, and ccmRejectedVoiceMailDevices counters in the Cisco Unified Communications Manager MIB get updated.

Object	Content
ccmGateway	<p>The ccmRegisteredGateways, ccmUnregistered gateways, and ccmRejectedGateways keep track of the number of registered gateway devices or ports, number of unregistered gateway devices or ports, and number of rejected gateway devices or ports, respectively.</p> <p>Cisco Unified Communications Manager generates alarms at the device or port level. The ccmGatewayTable, based on Cisco Unified CM alarms, contains device- or port-level information. Each registered, unregistered, or rejected device or port has one entry in ccmGatewayTable. The VG200 with two FXS ports and one T1 port has three entries in ccmGatewayTable. The ccmActiveGateway and ccmInactiveGateway counters track number of active (registered) and lost contact with (unregistered or rejected) gateway devices or ports.</p> <p>Based on the registration status, ccmRegisteredGateways, ccmUnregisteredGateways, and ccmRejectedGateways counters get updated.</p>
ccmMediaDeviceInfo	The table contains a list of all media devices that have tried to register with the local Cisco Unified CM at least once.
ccmGroup	This tables contains the Cisco Unified CM groups in a Cisco Unified Communications Manager cluster.
ccmGroupMapping	This table maps all Cisco Unified CMs in a cluster to a Cisco Unified CM group. The table remains empty when the local Cisco Unified CM node is down

Static Table Objects

The following table lists the objects that get populated when the Cisco Unified Communications Manager SNMP Service is running.

Table 4: CISCO-CCM-MIB Static Tables

Object	Content
ccmProductType	The table contains the list of product types that are supported with Cisco Unified Communications Manager (or cluster, in the case of a Cisco Unified Communications Manager cluster configuration), including phone types, gateway types, media device types, H323 device types, CTI device types, voice-messaging device types, and SIP device types.
ccmRegion, ccmRegionPair	ccmRegionTable contains the list of all geographically separated regions in a Cisco Communications Network (CCN) system. The ccmRegionPairTable contains the list of geographical region pairs for a Cisco Unified Communications Manager cluster. Geographical region pairs are defined by Source region and Destination region.

Object	Content
ccmTimeZone	The table contains the list of all time zone groups in a Cisco Unified Communications Manager cluster.
ccmDevicePool	The tables contains the list of all device pools in a Cisco Unified Communications Manager cluster. Device pools are defined by Region, Date/Time Group, and Cisco Unified CM Group.

Troubleshoot SNMP

General Tips

The following are general troubleshooting tips:

- Check the community string or snmp user is properly configured on the system using the SNMP configuration web pages
- Check if Cisco Unified CM SNMP Service is activated and running by checking the ccmservice window and clicking **Tools > Service Activation/ ControlCenter - Feature Services**.
- Check if SNMP Master Agent is running by checking the ccmservice window and clicking **Tools > Service Activation/ ControlCenter - Network Services**
- Check if Cisco Unified CM is running.
- If Cisco Unified CM is not running, only the following MIB tables respond:
 - ccmGroupTable
 - ccmRegionTable
 - ccmRegionPairTable
 - ccmDevicePoolTable
 - ccmProductTypeTable
 - ccmQualityReportAlarmConfigInfo
 - ccmGlobalInfo
- For the rest of the tables to respond Cisco Unified CM needs to be running.
- Set the debug trace level to detailed for Cisco CallManager SNMP Service. Go to the Serviceability web window and click **Trace > Configuration > *<select serverCisco>* Performance and Monitoring Services > CallManager SNMP Service**.
- Execute the CLI command: **utils snmp walk 2c <community> <ipaddress> 1.3.6.1.4.1.9.9.156** or execute the walk from any other management application on this OID.
- Get the Cisco Unified Communication Manager release details, Cisco SNMP CallManager Service trace, and SNMP Master agent traces after the testing above for troubleshooting reference.

Review this section for Cisco CallManager SNMP Service Troubleshooting tips:

- Be sure to set the trace setting to detailed for Cisco CallManager SNMP Service (see the “SNMP Trace Configuration” chapter of the Cisco Unified Serviceability Administration Guide).
- Execute the command: **snmp walk -c<community> -v2c<ipaddress> 1.3.6.1.4.1.9.9.156.1.1.2**
- Get the Cisco Unified Communications Manager version details
- Collect the following logs and information:
 - SNMP Master Agent (path: platform/snmp/snmpdm/*) and Cisco CallManager SNMP Service (path: cm/trace/ccmmib/sdi/*) by using TLC in RTMT or this CLI command: `file get activelog`
 - SNMP package version by using this CLI command: **show packages active snmp**
 - MMF Spy output for phone by using this CLI command: **show risdb query phone**
- Send the trace logs and MMFSpy data for further analysis

The following table provides procedures for verifying that CISCO-CCM-MIB SNMP traps get sent.

Table 5: How to Check CISCO-CCM-MIB SNMP Traps

Trap	Verification procedure
ccmPhoneStatusUpdate	<ol style="list-style-type: none"> 1 Set MaxSeverity=Info in CiscoSyslog->dogBasic MIB table. 2 Set PhoneStatusUpdateAlarmInterv=30 or higher in ccmAlarmConfigInfo MIB table. 3 Disconnect a Cisco Unified CM server that your phones point to. 4 Phones will unregister. 5 Connect the Cisco Unified CM server again. 6 Phones will re-register. 7 Check that the ccmPhoneStatusUpdate trap is generated.
ccmPhoneFailed	<ol style="list-style-type: none"> 1 Set MaxSeverity=Info in CiscoSyslog->clogBasic MIB table. 2 Set PhoneFailedAlarmInterv=30 or higher in ccmAlarmConfigInfo MIB table. 3 Make a phone fail. Delete a phone Cisco Unified CM Administration and register the phone again. 4 Check that the ccmPhoneFailed trap is generated.

Trap	Verification procedure
MediaResourceListExhausted	<ol style="list-style-type: none"> 1 Create a Media Resource Group (MRG) that contains one of the standard Conference Bridge resources (CFB-2). 2 Create a Media Resource Group List (MRGL) that contains the MRG just created. 3 In the Phone Configuration window (for actual phones), set MRGL as the phone Media Resource Group List. 4 Stop the IPVMS, which makes the Conference Bridge resource(CFB-2) stop working. 5 If you make conference calls with phones that use the media list, you will see "No Conference Bridge available" in the phone screen. 6 Check that a MediaListExhausted Alarm/Alert/Trap is generated
RouteListExhausted	<ol style="list-style-type: none"> 1 Create a Route Group (RG) that contains one gateway. 2 Create a Route Group List (RGL) that contains the RG that was just created. 3 Create a Route Pattern (9.XXXX) that routes a 9XXXX call through the RGL. 4 Unregister the gateway. 5 Dial 9XXXX on one of the phones. 6 Check that a RouteListExhausted Alarm/Alert/Trap is generated.
MaliciousCallFailed	<ol style="list-style-type: none"> 1 Similar to QRT, create a softkey template. In the template, add all available "MaliciousCall" softkey to the phone different status. 2 Assign the new softkey template to actual phones; reset the phones. 3 Make some calls and select the "MaliciousCall" softkey in the phone screen during or after the call. 4 Check that a "MaliciousCallFailed" Alarm/Alert/Trap is generated.

Logs and Analytical Information for Linux and Cisco Unified CM Releases 5.x 6.x 7.x

Collect the following logs and information for analysis:

- SNMP Master Agent (Path : /platform/snmp/snmpdm/*)
- Cisco CallManager SNMP Service (Path : /cm/trace/ccmmib/sdi/*)

- The files can be collected using TLC (Real Time Monitoring Tool (RTMT)) or CLI by using the following command: **file get activelog** <path mentioned above>.
- All the files in /usr/local/Snmpri/conf folder. (This is possible only if ROOT/REMOTE login is available)
- The 'ls -l' listing of the above folder. (This is possible only if ROOT/REMOTE login is available)
- Collect Perfmon logs. Execute the following CLI command: **file get activelog /cm/log/ris/csv/**.
- Details of the set of actions performed that resulted in the issue.
- Cmservice logs. Execute the following CLI command: **file get activelog /tomcat/logs/ccmservice/log4j/**.
- Collect the SNMP package version. Use the **show packages activesnmp** CLI command.
- Get the MMF Spy output for Phone. Use the **show risdb query phone** CLI command.

Logs and Analytical Information for Windows and Cisco Unified CM Version 4.x

Collect the following logs for analysis:

- Set the Alarm level from the ccmservice Alarm Configuration window for Cisco Unified CM to Detailed.
- Set the RIS Trace configuration from the ccmservice window to Detailed.
- Do a snmpwalk on the ccm MIB from the network management application or execute command from any linux box by using the **snmpwalk -c <community>-v2c <ipaddress> 1.3.6.1.4.1.9.9.156**.
- Capture the output of the snmpwalk.
- Collect the logs under C:\Program Files\Cisco\Trace\RIS\CCMSNMP_*.log.
- Collect the logs under C:\Program Files\Cisco\Trace\DBL\ DBL_SNMP*.txt.
- Event logs (both application and system).
- mmfSpy output for 'misc', 'CMnode' tables.
- MMFSpy tool to dump registration status (C:\Program Files\Cisco\Bin\MMFSpy.exe, gives different options). Usage: "mmfSpy -j > OutputFileName".

CISCO-CCM-MIB only supports a limited amount of configuration information about a device. For more complete configuration information, the AXL interface accessing the data in DB serves the purpose.

The list of MMFs that are created by the Cisco Unified CM Agent are as follows:

- cmnode
- cmgroup
- cmgroupmember
- region
- regionmatrix
- timezone

- devicepool
- phonefailed
- phonestatsupd
- cmproduct
- cmmodel

Limitations

If multiple OIDs are specified in the SNMP request and if the variables are pointing to empty tables in CISCO-CCM-MIB, then the request will take longer. In case the getbulk/getnext/getmany request has multiple OIDs in its request PDU with the subsequent tables being empty in the CISCO-CCM-MIB, the responses may be NO_SUCH_NAME for SNMP v1 version or GENERIC_ERROR for SNMP v2c or v3 version.

- Reason—This timeout occurs due to the code added to enhance the performance of the CCMAgent and throttle when it gets a large number of queries thus protecting the priority of Cisco Unified CM callprocessing engine.
- Workaround:
 - Use the available scalar variables (1.3.6.1.4.1.9.9.156.1.5) to determine the table size before accessing the table. Or do the get operation on the desired table first and then query the non empty tables.
 - Reduce the number of variables queried in a single request. For example, for empty tables. if Management application has timeout set at 3 sec, then recommendations is to specify no more than 1 OID. For non-empty tables it takes 1 second to retrieve 1 row of data.
 - Increase the response timeout.
 - Reduce the number of retries.
 - Avoid using getbulk SNMP API. Getbulk API gets number of records specified by MaxRepetitions. This means even if the next object goes outside the table or MIB, it gets those objects. So if the CISCO-CCM -MIB has empty tables then it goes to next MIB and so will more time to respond. Use getbulk API when it is known that the table is not empty, and also know the number of records. Under this condition limit the max repetition counts to 5 to get response within 5 sec.
 - Structured SNMP queries to adapt to current limits.
 - Avoid doing a number of getbulks on the PhoneTable in case there are a number of phones registered to the Cisco Unified CM, walking it periodically may not be optimal. In such a scenario whenever there is an update, ccmPhoneStatusUpdateTable will be updated, use this information to decide whether to walk the PhoneTable.

Frequently Asked Questions

Q. Not getting any SNMP traps from the Cisco Unified Communication Manager node for the CISCO-CCM-MIB.

- A. For receiving SNMP traps in CISCO-CCM-MIB, you need to ensure that the value of the following MIB OIDs are set to appropriate values: `ccmPhoneFailedAlarmInterval` (1.3.6.1.4.1.9.9.156.1.9.2) and `ccmPhoneStatusUpdateAlarmInterv` (1.3.6.1.4.1.9.9.156.1.9.4) are set between 30 and 3600. The default is set to 0.

Execute the following commands from any Linux machine:

- `snmpset -c <Community String> -v 2c <transmitter ip address> 1.3.6.1.4.1.9.9.156.1.9.2.0 i <value>`
- `snmpset -c <Community String> -v 2c <transmitter ip address> 1.3.6.1.4.1.9.9.156.1.9.4.0 i <value>`

These are related to registration/deregistration/failure of phones.

You need to ensure that notification destinations are configured. This can be done from the Serviceability Web window. There is a menu for **SNMP > Notification destination**.

Before you configure notification destination, verify that the required SNMP services are activated and running (SNMP Master Agent and Cisco CallManager SNMP Services). Also, make sure that you configured the privileges for the community string/user correctly which should contain Notify permissions as well.

If still Traps are not generated check if corresponding alarms are generated. Since these traps are generated based on the alarm events, ensure that SNMP agents are getting these alarm events. Enable 'Local Syslog', setup the Cisco Unified CM Alarm configuration to 'Informational' level for 'Local Syslog' destination from the Alarm configuration available on **Cisco Unified CM Serviceability web page->Alarm->Configuration**. Then repro the traps and see if corresponding alarms are logged in CiscoSyslog file.

Receiving syslog messages as traps—To receive syslog messages above a particular severity as traps, set the following 2 MIB objects in the `clogBasic` table:

- `clogNotificationsEnabled` (1.3.6.1.4.1.9.9.41.1.1.2)—Set this to true(1) to enable syslog trap notification. Default value is false (2). For example, `snmpset -c <Community String> -v 2c <transmitter ip address> 1.3.6.1.4.1.9.9.41.1.1.2.0 i <value>`.
- `clogMaxSeverity` (1.3.6.1.4.1.9.9.41.1.1.3)—Set the severity level above which traps are desired. Default value is warning (5). All syslog messages with alarm severity lesser than or equal to configured severity level will be sent as traps if notification is enabled. For example, `snmpset -c <Community String> -v 2c <transmitter ip address> 1.3.6.1.4.1.9.9.41.1.1.3.0 i <value>`.

Q. What are the different traps defined for Cisco Unified Communication Manager?

A. The CISCO-CCM-MIB contains the traps related information. Following are the list of defined traps defined:

- `ccmCallManagerFailed`—Indication that the CallManager process detects a failure in one of its critical subsystems. It can also be detected from a heartbeat/event monitoring process.
- `ccmPhoneFailed`—Notification that the intervals specified in `ccmPhoneFailedAlarmInterval` indicate at least one entry in the `ccmPhoneFailedTable`.
- `ccmPhoneStatusUpdate`—Notification that is generated in the intervals specified in `ccmPhoneStatusUpdateInterv` if there is at least one entry in the `ccmPhoneStatusUpdateTable`.
- `ccmGatewayFailed`—Indication that at least one gateway has attempted to register or communicate with the CallManager and failed.

Note `ccmGatewayFailed` is deprecated and replaced by `ccmGatewayFailedReason`.

- `ccmMediaResourceListExhausted`—Indication that the CallManager has run out a certain specified type of resource
- `ccmRouteListExhausted`—Indication that the CallManager could not find an available route in the indicated route list.
- `ccmGatewayLayer2Change`—Sent when the D-Channel/Layer 2 of an interface in a skinny gateway that has registered with the CallManager changes state.
- `ccmMaliciousCall`—Sent when a user registers a call as malicious with the local Cisco Unified CM
- `ccmQualityReport`—Sent when a user reports a quality problem using the Quality Report Tool
- `ccmTLSConnectionFailure`—Sent when CallManager fails to open TLS connection for the indicated device

The mapping of the traps to alarms is as follows:

- `ccmCallManagerFailed`—`CallManagerFailure`
- `ccmPhoneFailed`—`DeviceTransientConnection`
- `ccmPhoneStatusUpdate`
- `ccmGatewayFailed`—`DeviceTransientConnection`
- `ccmMaliciousCall`—`MaliciousCall`
- `ccmMediaResourceListExhausted`—`MediaResourceListExhausted`
- `ccmQualityReportRequest`—`QRTRRequest`
- `ccmRouteListExhausted`—`RouteListExhausted`
- `ccmGatewayLayer2Change`—`DChannelOOS`, `DChannelISV`

Q. How can different SNMP traps from Cisco Unified Communication Manager be checked?

A. Following is the procedure for triggering few traps:

- `ccmPhoneStatusUpdate` trap
 - Set `ccmPhoneStatusUpdateAlarmInterv` (1.3.6.1.4.1.9.9.156.1.9.4) to 30 or higher in `ccmAlarmConfigInfo` MIB table.
 - Disconnect a ccm server that your phones are pointing to.
 - Phones will unregister.
 - Connect the ccm server again.
 - Phones will re-register.
 - Will get the `ccmPhoneStatusUpdate` trap.

- ccmPhoneFailed trap
 - Set ccmPhoneFailedAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.2) to 30 or higher in ccmAlarmConfigInfo MIB table.
 - Make a phone fail. Delete a phone from CM and register the phone again.
 - For phone failed traps two different scenarios can be tried:
Set the phone to point to tftp/ccm server A. plugin the phone to ccm server B on different switch. The phone status is unknown. Will see following: 2007-10-31:2007-10-31 14:53:40 Local7.Debug 172.19.240.221 community=public, enterprise=1.3.6.1.4.1.9.9.156.2.0.2, enterprise_mib_name=ccmPhoneFailed, uptime=7988879, agent_ip=128.107.143.68, version=Ver2, ccmAlarmSeverity=error, ccmPhoneFailures=1.
Register a 7960 phone as 7940 phone in the Cisco Unified CM and thus cause the db issue that makes the phone fail trap.
- MediaResourceListExhausted trap
 - Create a Media Resource Group (MRG), have it contains one of the standard ConferenceBridge resource (CFB-2).
 - Create a Media Resource Group List (MRGL), have it contains the MRG just created.
 - In the Phone Configuration page for real phones, set MRGL as the phone Media Resource Group List.
 - Stop the IPVMS which make the ConferenceBridge resource (CFB-2) stop working.
 - Make conference calls with phones that using the media list, you will see “No Conference Bridge available” in the phone screen.
 - Then check if a “MediaListExhausted” Alarm/Alert/Trap is generated.
- RouteListExhausted trap
 - Create a Route Group (RG), have it contains one Gateway.
 - Create a Route Group List (RGL), have it contains the RG just created.
 - Create a Route Pattern (9.XXXX) that reroute a 9XXXX call through the RGL.
 - Unregister the gateway.
 - Dial 9XXXX in one of the phone.
 - Then check if a “RouteListExhausted” Alarm/Alert/Trap is generated.
- MaliciousCallFailed trap
 - Similar as QRT, create a softkey template. In the template, add all available “MaliciousCall” softkey to the phone's different status.
 - Assign the new softkey template to real phones, reset the phones.
 - Making calls, select the “MaliciousCall” in the phone screen during or after the call.
 - Then check if a “MaliciousCallFailed” Alarm/Alert/Trap is generated

- GatewayFailed trap (Method 1)
 - Remove the configuration of the gateway from the database through Web Admin (or) Change the MAC address of the gateway to some invalid value and update.
 - Reboot the gateway
 - Another way is to restart the Cisco Unified CM service to which the gateway is connected.
- GatewayFailed trap (Method 2)
 - Set GatewayAlarmEnable=true in ccmAlarmConfigInfo mib table
 - In ccm serviceability->Snmp configuration page, make sure you have SNMP community string and trap destination set correctly.
 - Create a gateway failure event and the trap will be seen on the trap receiver.
 - To cause a gateway fail, Restart Cisco Unified CM service which will cause gateway failover to the redundant ccm manager server. On that server, the gateway should not be configured in the database.
- ccmGatewayLayer2Change trap
 - ccmGatewayLayer2Change trap is triggered during DChannelOOS(D Channel Out of service) or DChannelISV (D Channel Inservice) from Cisco Unified CM. Please check if any such events can be triggered to test it out
- ccmCallManagerFailed trap
 - The CallManager Failed Alarm is generated when an internal error is encountered. These include an internal thread dying due to lack of CPU, timer issues and a couple others. This trap would be something that is hard to reproduce unless the CallManager team give a friendly that intentionally causes one of these occurrences.

Q. If the Cisco Unified CM Agent consumes high CPU continuously, what needs to be done?

A. Collect the logs as mentioned above (under Troubleshooting) for analysis and refer to defect CSCsm74316 to check if it is being hit. Verify if the fix for the defect has gone into the Cisco Unified CM version used by the customer.

Q. If the CTI Routepoint is deleted from Cisco Unified CM Admin UI, an entry exists for that in ccmCTIDeviceTable mib. Why?

A. There is service parameter called "RIS Unused Cisco CallManager Device Store Period" which defines how long Unregistered devices (when a registered device is removed from db, it unregisters) will remain in RISDB and hence in the MIB. The ccmadmin page and the SNMP MIB WALK may or may not be in sync, since the ccmadmin page shows the info from the database however SNMP uses the RISDB.

Q. When ccmPhoneType is queried from ccmPhoneTable in Cisco-CCM-MIB, no information is returned. Why?

- A. The `ccmPhoneType` has been made obsolete. The same information can be retrieved from `ccmPhoneProductTypeIndex` against `CcmProductTypeEntry`. In the table, the indexes correspond to the index and name as listed in that table.

Some of other obsolete and alternate OIDs to be referred:

- `ccmGatewayType` is obsolete and need to refer `ccmGateWayProductTypeIndex`.
- `ccmMediaDeviceType` is obsolete and need to refer to `ccmMediaDeviceProductTypeIndex`
- `ccmCTIDeviceType` is obsolete and need to refer to `ccmCTIDeviceProductTypeIndex`

- Q. A query on `ccmPhoneProductTypeIndex` returns zero. Why?

- A. Verify that the Cisco Unified CM release that you are using has this capability.

- Q. While performing a WALK on `ccmPhoneTable`, `ccmPhoneUserName` is not returning any value. How are usernames associated to the IP Phones?

- A. Create an end user and then go to the phone that has been registered and associate the Owner User ID. Once this is done, the user will be shown by the OID in the SNMP Walk.

- Q. How do I get the firmware versions of each phone by using SNMP?

- A. `ccmPhoneLoadID` object in the `ccmPhoneTable` will give the firmware version of each phone. But this value may differ if new image download failed. In case of 7.x versions SNMP will expose both configured firmware ID (`ccmPhoneLoadID`) and the actual running firmware (`ccmPhoneActiveLoad`).

- Q. CCM MIB returns `ccmVersion` as 5.0.1, which is the incorrect.

- A. Verify the Cisco Unified CM release that you are using has this capability. If it does not, upgrade.

- Q. CCM MIB returns incorrect `ccmPhoneLoadID`

- A. `ccmPhoneLoadID` values are picked up from RISDB which is populated based on the alarm received during Phone registration. Perform the following steps and collect the logs for further analysis:

- 1 Go to **Serviceability web page > Alarm > Configuration > Service Group (CM Services) > Service (Cisco CallManager)**.
- 2 Check Local Syslog, SDI Trace, SDL Trace. Ensure the Alarm Event Level for these selected destinations is set to Informational.
- 3 Set the Cisco CallManager trace level to Detailed.
- 4 Reset the phones showing incorrect LoadID.
- 5 Collect the Syslog and Cisco CallManager traces.
- 6 Collect the phone details.

- Q. How Cisco Unified CM status (START/STOP) monitored?

- A. For service monitoring we have following options:

- SYSAPPL MIB

- HOST-RESOURCE-MIB
- CISCO-CCM-MIB (ccmStatus)
- SOAP interface
- Real-TimeMonitoringTool (RTMT) alerts

There is a `ccmCallManagerFailed` trap for Cisco Unified CM service failure. But this does not cover normal service stop and unknown crashes.

- Q.** The device pool information seems incorrect for any device polled for. The OID used is `ccmPhoneDevicePoolIndex`.
- A.** As stated in the CISCO-CCM-CAPABILITY MIB, `ccmPhoneDevicePoolIndex` is not supported, hence it returns 0. The CallManager device registration alarm currently does not contain the devicepool information.

VARIATION ccmPhoneFailedTable

DESCRIPTION The table containing the list of all phones which attempted to register with the local call manager and failed. The entries which have not been updated and kept at least for the duration specified in the ccmPhoneFailedStorePeriod will be deleted. Reasons for these failures could be due to configuration error, maximum number of phones has been reached, lost contact, etc.

VARIATION ccmPhoneStatusUpdateTableStateId

DESCRIPTION The current state of ccmPhoneStatusUpdateTable. The initial value of this object is 0 and it will be incremented everytime when there is a change (addition/deletion/modification) to the ccmPhoneStatusUpdateTable. This value and sysUpTime should be used together to find if the table has changed or not. When the SNMP service is restarted this value will be reset to 0.

VARIATION ccmPhStatUpdtTblLastAddedIndex

SYNTAX CcmIndexOrZero

DESCRIPTION The ccmPhoneStatusUpdateIndex value of the last entry that was added to the ccmPhoneStatusUpdateTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneStatusUpdateTable since their last poll. This value need not be the same as the highest index in the ccmPhoneStatusUpdateTable as the index could have wrapped around. The initial value of this object is 0 which indicates that there has been no entries added to this table. When the SNMP service is restarted this value will be reset to 0.

VARIATION ccmPhFailedTblLastAddedIndex

SYNTAX CcmIndexOrZero

DESCRIPTION The ccmPhoneFailedIndex value of the last entry that was added to the ccmPhoneFailedTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneFailedTable since their last poll. The initial value of this object is 0 which indicates that there has been no entries added to this table. When the SNMP service is restarted this value will be reset to 0.

VARIATION ccmPhoneFailedStorePeriod

DESCRIPTION The time duration for storing each entry in the ccmPhoneFailedTable. The entries which have not been updated and kept at least this period will be deleted. This value should ideally be set to a higher value than the ccmPhoneFailedAlarmInterval object. The default value is 1800 seconds.

DESCRIPTION

The ifIndex value of the local interface. For 802.3 Repeaters on which the repeater ports do not have ifIndex values assigned, this value is a unique value for the port, and greater than any ifIndex value supported by the repeater; in this case, the specific port is indicated by corresponding values of cdpInterfaceGroup and cdpInterfacePort, where these values correspond to the group number and port number values of RFC 1516.

::= { cdpInterfaceEntry 1 }

Troubleshoot CDP MIB for Linux and Cisco Unified CM Release 5.x, 6.x, 7.x

For Linux and Cisco Unified CM Release 5.x, 6.x, 7.x., collect the following logs and information for analysis:

- Use the **set trace enable Detailed cdpmib** CLI set the detailed trace for cdpAgt ().
- Restart the Cisco CDP Agent service from the serviceability Web Page (**Tools > Controlcenter- Network Services**) and wait for some time.
- Collect the following trace files:
 - Enable the Cisco CDP Agent traces by using the file get activelog cm/trace/cdpmib/sdi command and Cisco CDP daemon traces using the file get activelog cm/trace/cdp/sdi command.

- Enable the Cisco CDP Agent and daemon traces by using the Real-Time Monitoring Tool (RTMT) > Trace & Log Central > Collect Files > Cisco CallManager SNMP Service > Cisco CDP Agent and Cisco CDP.

- Once the logs are collected, reset the trace setting by using the set trace disable cdpmib command.

For Windows and Cisco Unified CM Release 4.x, perform the following to collect logs for analysis.

- Set TraceEnabled to true under the registry HKEY_LOCAL_MACHINE\SOFTWARE\Cisco Systems, Inc.\SnmpCDPAgent and restart SNMP service.
- After restarting SNMP service, another option TraceLevel displays. Set this to value 3.
- Restart SNMP service again.
- Do the walk on CDP MIB.
- Collect the log file from location C:\Program Files\Cisco\bin\SnmpCDPImp.log.
- Collect the output of c:\utils\tlist.exe snmp.exe and output of dir c:\program files\cisco\bin.

Frequently Asked Questions for CDP MIBs

- [The CDP interface table and globalinfo tables are blank.](#)
- [How is the MessageInterval value set in the Interface table as well as Global table in CDP MIB?](#)

The CDP interface table and globalinfo tables are blank.

Verify that you Cisco Unified CM release that you are using has this capability. If not, upgrade.

How is the MessageInterval value set in the Interface table as well as Global table in CDP MIB?

Check to see if the HoldTime value is greater than MessageInterval value. If it is less, then the MessageInterval value can not be set from both Interface table as well as Global table.

CISCO-SYSLOG-MIB

**Note**

This is a reformatted version of CISCO-SYSLOG-MIB. Download and compile all of the MIBs in this section from <http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2>.

This MIB provides a means to gather syslog messages generated by the Cisco IOS. Various textual messages are generated by the Cisco IOS. Cisco IOS can be configured such that these messages are sent to a syslog server. With this MIB these same messages can also be received via the SNMP. These messages are hereupon referred to as syslog messages in this document.

**Note**

Messages generated as a result of entering CLI debug commands are not made available via the SNMP at this time.

All Cisco IOS syslog messages have timestamps (optional), facility names (where the message came from), severity, message name, and message text. The following example is often seen: %SYS-5-CONFIG_I: configured from console where facility=SYS, severity=5, message name=CONFIG_I.

Before you can compile CISCO-SYSLOG-MIB, you need to compile the MIBs listed below in the order listed.

- 1 SNMPv2-SMI
- 2 SNMPv2-TC
- 3 SNMPv2-CONF
- 4 CISCO-SMI

STATUS current

DESCRIPTION

The number of clogMessageGenerated notifications that have been sent. This number may include notifications that were prevented from being transmitted due to reasons such as resource limitations and/or non-connectivity. If one is receiving notifications, one can periodically poll this object to determine if any notifications were missed. If so, a poll of the clogHistoryTable might be appropriate.

Troubleshoot Syslog Traps

Syslog has standard buffer size while generating a SNMP trap message; the data is trimmed to the specified field size (255). This avoids any errors caused by data that is too large for the field. For example, if you have specified the message text field to be 255 bytes, but a message arrives that is 300 bytes, the data will be truncated to 255 bytes before being logged.

Trap Setup

To configure the traps, set `clogsNotificationEnabled` (1.3.6.1.4.1.9.9.41.1.1.2) to `TRUE(1)` by using SNMP set operation in any SNMP management application. Set the severity using `clogMaxSeverity` (1.3.6.1.4.1.9.9.41.1.1.3) by using any SNMP management application. This object indicates the syslog severity level that needs to be processed. Any syslog message with a severity value greater than this value will be ignored by the agent. Severity numeric values increase as their severity decreases.

Collect the following logs and information:

- Set the detailed trace for `CiscoSyslogAgent` with the **set trace enable Detailed syslogmib** command.
- Restart the Cisco Syslog Agent service from the serviceability Web window **Tools > Control Center - Network Services** and wait for some time.
- Collect the Cisco Syslog Agent trace files by:
 - Using the **file get activelog** `cm/trace/syslogmib/sdi/` command.
 - Using **RTMT Trace & Log Central > Collect Files > Cisco CallManager SNMP Service > Cisco Syslog Agent**.
- Once the logs are collected, reset the trace settings by using the `set trace disable syslogmib` command.

Frequently Asked Questions for Syslog

Q. How is a remote syslog server configured?

A. You can configure a remote syslog server from Cisco Unified CM Administration **System > Enterprise Parameters** plus the following:

- Remote Syslog Server Name—You can enter the name or IP address of the remote Syslog server that you want to use to accept Syslog messages. If the server name is not specified, Cisco Unified Serviceability does not send the Syslog messages. Do not specify a Cisco Unified Communications Manager server as the destination because the Cisco Unified Communications Manager server does not accept Syslog messages from another server.
 - Maximum length: 255
 - Allowed values: Provide a valid remote syslog server name that comprises (A-Z,a-z,0-9,.,-)
- Syslog Severity For Remote Syslog messages—You can select the desired Syslog messages severity for remote syslog server. The system sends all the syslog messages with selected or higher severity levels to the remote syslog. If the remote server name is not specified, Cisco Unified Serviceability does not send the Syslog messages.

Q. How is a remote syslog server configured to redirect alarms specific to a particular service?

A. You can configure a remote syslog server from **Cisco Unified Serviceability** window **Alarm > Configuration**:

- Select the Service Group and Service from drop down list for the particular server.

- Enable Alarm for Remote Syslogs and set the desired Alarm Event Level. Enter the remote syslog server name or IP address for redirection.
- The system sends all the syslog messages for the particular service with selected or higher severity levels to the remote syslog.

Q. How are messages captured in the configured remote server?

A. Kiwi Syslog Daemon is a freeware tool which can be installed in the remote server to capture the syslog messages.

Q. What happens if the same remote server is configured from Enterprise Parameters and Alarm Configuration page?

- A.**
- Enterprise parameters configuration of remote syslog redirects all the syslog messages which have severity equal to or higher than configured severity. There is no classification done for different types of syslog messages. It is just a plain redirection of all the syslog messages generated.
 - Alarm configuration sends the specific service syslog messages to the configured remote server based on the severity.
 - Enterprise Parameters configuration is used by the Cisco Syslog Agent to send the messages. Corresponding application Alarm configuration will use the alarm interface to send to remote syslog server configured.
 - If the “Local Syslogs” Alarm is enabled in Alarm page, there will be duplication of the service specific messages, incase the same remote server is configured in both pages (provided the severity conditions are matched). For example: Enterprise window has severity level as “Error”, Alarm page has severity “Debug” and “Local syslogs” alarm is enabled. If a syslog message of a particular service configured via alarm page, has a severity higher than 'Debug' and 'Error', then it will be duplicated.

Q. Does the SysLog subagent generate traps for the alarms in Syslog automatically? Is there any configuration?

- A.** Syslog subagent can be configured to generate traps for the syslog alarms. Some limitations are:
- Traps are sent out based on selected severity. If the given alarm is of low severity then the management application needs to set the severity threshold lower to capture this low severity alarm/trap. In other words mgmt apps need to deal with flooding of other low severity traps.
 - SNMP Trap message size limited to 255 and not enabled by default. i.e. by default clogsNotificationEnabled (1.3.6.1.4.1.9.9.41.1.1.2) is set to FALSE (2).
