Overview

This chapter gives a conceptual overview of Cisco Unified Communications Manager (Cisco Unified CM) and Cisco Unified CM Business Edition 5000, possible deployment models, Simple Network Management Protocol (SNMP) including traps, Management Information Bases (MIBs), sylogs, and alerts/alarms.

Cisco Unified Communications Manager

The Cisco Unified CM serves as the software-based call-processing component of the Cisco Unified Communications family of products. A wide range of Cisco Media Convergence Servers provides high-availability server platforms for Cisco Unified Communications Manager call processing, services, and applications.

The Cisco Unified CM system extends enterprise telephony features and functions to packet telephony network devices such as IP phones, media processing devices, voice-over-IP (VoIP) gateways, and multimedia applications. Additional data, voice, and video services, such as unified messaging, multimedia conferencing, collaborative contact centers, and interactive multimedia response systems, interact through Cisco Unified CM open telephony application programming interface (API).

Cisco Unified CM provides signaling and call control services to Cisco integrated telephony applications as well as third-party applications. Cisco Unified CM performs the following primary functions—

- Call processing
• Signaling and device control
• Dial plan administration
• Phone feature administration
• Directory services
• Operations, administration, maintenance, and provisioning (OAM&P)
• Programming interface to external voice-processing applications such as Cisco IP Communicator, Cisco Unified IP Interactive Voice Response (IP IVR), and Cisco Unified Communications Manager Attendant Console

Deployment models

Three types of Cisco Unified CM supported deployments exist—Single site, multisite WAN with centralized call processing, and multisite WAN with distributed call processing. The following paragraphs describe each of these:

• Single Site—Consists of a call processing agent cluster that is located at a single site, or campus, with no telephony services that are provided over an IP WAN. An enterprise would typically deploy the single-site model over a LAN or metropolitan area network (MAN), which carries the voice traffic within the site. In this model, calls beyond the LAN or MAN use the public switched telephone network (PSTN).
• Multisite WAN with Centralized Call Processing—Consists of a single call processing agent cluster that provides services for many remote sites and uses the IP WAN to transport Cisco Unified Communications traffic between the sites. The IP WAN also carries call control signaling between the central site and the remote sites.
• Multisite WAN with Distributed Call Processing—Consists of multiple independent sites, each with its own call processing agent cluster that is connected to an IP WAN that carries voice traffic between the distributed sites.

Cisco Unified CMBE supports three main types of deployment models—Single-site, multisite WAN with centralized call processing, and multisite WAN deployment with distributed call processing. Cisco Unified CMBE is a single-platform deployment, running both Cisco Unified CM and Cisco Unity Connection on the same server. Each type is described in the following paragraphs:

• Single-Site—Consists of Cisco Unified CM and Cisco Unity Connection running on the same hardware platform located at a single site or campus, with no telephony services provided over an IP WAN.
• Multisite WAN with Centralized Call Processing—Consists of a single call processing appliance that provides services for up to 20 sites (one central site and 19 remote sites), and this model uses the IP WAN to transport IP telephony traffic between the sites. The IP WAN also carries call control signaling between the central site and the remote sites.
• Multisite WAN with Distributed Call Processing—Consists of independent sites, each with its own call processing agent connected to an IP WAN that carries voice traffic between the distributed sites. The multisite WAN deployment with distributed call processing enables Cisco Unified CMBE to operate with Cisco Unified CM or other Cisco Unified CMBE deployments. With this model, Cisco Unified CMBE supports the use of H.323 intercluster trunks as well as SIP trunks to interconnect with Cisco Unified CM deployments or other Cisco Unified CMBE deployments. Each site can be a single site with its own call processing agent, a centralized call processing site and all of its associated remote sites, or a legacy PBX with Voice over IP (VoIP) gateway.
Managed services

Two general types of managed services exist:

- Basic services that provide connectivity to the network—Routing, Domain Name System (DNS), and quality of service (QoS).
- High-valued services that the Service Provider offers to its customers—Videoconferencing, mobile IP, VPNs, VoIP, and Wireless. The high-valued services use the basic services as a backbone.

The service provider may require these server types and services:

- Web server with the ability to display web pages, even during high usage hours, to meet the demands of customers. The web pages get used to pay bills, check minutes of usage in the case of a cell phone, and buy new products. The web server and application server work together to display information that the service provider customer requires.
- Dedicated application server with the ability to advise customers when a product is out of stock, when bill is past due, or when need arises to buy more minutes.
- Mail server with the ability to notify customers to confirm an order or send a receipt for purchases.
- Secure gateway with VPN with the ability to have secure communications between the service provider and its customers and suppliers.

Be aware that any one of these services is critical to the operations of a service provider. Managing these services to ensure continuous operation requires a system that monitors fault, configuration, performance and security across all of the network elements. The introduction of element-to-element synchronization and the issues of using different vendor products complicates the task.

Cisco Unified Serviceability and SNMP attempt to address some of these network management issues:

- Are infrastructure elements functioning? If not, which are failing?
- What cause the failure? For example, recent configuration changes.
- What is the impact of the failure on the network as a whole and the impact on the elements within the network?
- What is the impact of the failure on services and customers?
- How long to correct the failure?
- Are there backup facilities?
- Are there any pending failures?
- How many packets were sent and received on a particular device? How many web pages were accessed.
- How were other devices used—how often and how long?

Cisco Unified CM supports SNMP v1, v2, and v3. SNMP remotely monitors, configures, and controls networks. SNMP sends fault messages to assigned managers as SNMP trap or inform request Protocol Data Units (PDUs).

Cisco Unified Serviceability, a component of Cisco Unified CM Administration includes its own set of error messages and alarms. Both applications use Management Information Base (MIB) text files to manage alarms and alerts, notifications, and error messages.
Related Topics
Cisco Unified Serviceability alarms and CiscoLog messages
Overview, on page 1

Cisco Unified Serviceability

Cisco Unified Serviceability, a web-based troubleshooting tool, enables the following functions:

• Saves alarms and events for troubleshooting and provides alarm definitions.
• Saves trace information to various log files for troubleshooting.
• Monitors real-time behavior of components by using the Cisco Unified Real-Time Monitoring Tool (RTMT).
• Provides feature services that you can activate, deactivate, and view through the Service Activation window.
• Provides an interface for starting and stopping feature and network services.
• Generates and archives daily reports; for example, alert summary or server statistic reports.
• Allows Cisco Unified Communications Manager to work as a managed device for SNMP remote management and troubleshooting.
• Monitors the disk usage of the log partition on a server.
• Monitors the number of threads and processes in the system; uses cache to enhance the performance.

For information about configuring service parameters, refer to the Cisco Unified Communications Manager Administration Guide. For information about configuring Serviceability features, refer to the Cisco Unified Serviceability Administration Guide.

Trace tools

Trace tools assist you in troubleshooting issues with your voice application. Cisco Unified Serviceability supports SDI (System Diagnostic Interface) trace, SDL (Signaling Distribution Layer) trace for Cisco CallManager and Cisco CTIManager services, and Log4J trace for Java applications.

You use the Trace Configuration window to specify the level of information that you want traced as well the type of information that you want to be included in each trace file. If the service is a call-processing application such as Cisco CallManager or Cisco CTIManager, you can configure a trace on devices such as phones and gateway.

In the Alarm Configuration window, you can direct alarms to various locations, including SDI trace log files or SDL trace log files. If you want to do so, you can configure trace for alerts in the RTMT. After you have configured information that you want to include in the trace files for the various services, you can collect and view trace files by using the trace and log central option in the RTMT.
Troubleshooting Trace

The Troubleshooting Trace Settings window allows you to choose the services in Cisco Unified Serviceability for which you want to set predetermined troubleshooting trace settings. In this window, you can choose a single service or multiple services and change the trace settings for those services to the predetermined trace settings.

If you have clusters (Cisco Unified Communications Manager only), you can choose the services on different Cisco Unified Communications Manager servers in the cluster, so the trace settings of the chosen services get changed to the predetermined trace settings. You can choose specific activated services for a single server, all activated services for the server, specific activated services for all servers in the cluster, or all activated services for all servers in the cluster. In the window, N/A displays next to inactive services.

When you open the Troubleshooting Trace Settings window after you apply troubleshooting trace settings to a service, the service that you set for troubleshooting displays as checked. In the Troubleshooting Trace Settings window, you can reset the trace settings to the original settings.

After you apply Troubleshooting Trace Setting to a service, the Trace Configuration window displays a message that troubleshooting trace is set for the given service(s). From the Related Links drop-down list box, you can choose the Troubleshooting Trace Settings option if you want to reset the settings for the service. For the given service, the Trace Configuration window displays all the settings as read-only, except for some parameters of trace output settings; for example, Maximum No. of Files. You can modify these parameters even after you apply troubleshooting trace settings.

Trace collection

Use Trace and Log Central, an option in the RTMT, to collect, view, and zip various service traces and/or other log files. With the Trace and Log Central option, you can collect SDL/SDI traces, Application Logs, System Logs (such as Event View Application, Security, and System logs), and crash dump files.

For more information on trace collection, refer to the Cisco Unified Real-Time Monitoring Tool Administration Guide.

Cisco Unified Reporting

Cisco Unified Reporting web application, which is accessed at the Cisco Unified Communications Manager console, generates reports for troubleshooting or inspecting cluster data. This tool provides a snapshot of cluster data without requiring multiple steps to find the data. The tool design facilitates gathering data from existing sources, comparing the data, and reporting irregularities.

A report combines data from one or more sources on one or more servers into one output view. For example, you can view a report that shows the hosts file for all servers in the cluster. The application gathers information from the publisher server and each subscriber server. A report provides data for all active cluster nodes that are accessible at the time that the report is generated.

Some reports run checks to identify conditions that could impact cluster operations. Status messages indicate the outcome of every data check that is run.

Only authorized users can access the Cisco Unified Reporting application. By default, this includes administrator users in the Standard Cisco Unified CM Super Users group. As an authorized user, you can view reports, generate new reports, or download reports at the graphical user interface (GUI).
Administrator users in the Standard Cisco Unified CM Super Users group can access all administrative applications in the Cisco Unified Communications Manager Administration navigation menu, including Cisco Unified Reporting, with a single sign on to one of the applications.

Cisco Unified Reporting includes the following capabilities:

- A user interface for generating, archiving, and downloading reports
- Notification message if a report will take excessive time to generate or consume excessive CPU

Generated reports in Cisco Unified Reporting may use any of the following data sources:

- RTMT counters
- CDR CAR
- Cisco Unified CM DB
- Disk files
- Operating System API calls
- Network API calls
- Prefs (Windows registry)
- CLI
- RIS

**Cisco Unified Real-Time Monitoring Tool**

RTMT is a client-side application that uses HTTPS and TCP to monitor system performance, device status, device discovery, CTI applications, and voice messaging ports. RTMT can connect directly to devices by using HTTPS to troubleshoot system issues. RTMT performs the following tasks:

- Monitor a set of predefined management objects that monitor the health of the system.
- Generate various alerts, in the form of e-mails, for objects when values go over/below user-configured thresholds.
- Collect and view traces in various default viewers that exist in RTMT.
- Translate Q931 messages.
- View syslog messages in SysLog Viewer.
- Work with performance-monitoring counters.

In addition to SNMP traps, RTMT can monitor and parse syslog messages that are provided by the hardware vendors, and then send these alerts to RTMT Alert Central. You can configure RTMT to notify the Cisco Unified CM system administrator if and when the alerts occur. You can configure the notifications for e-mail or Epage or both.

For more information, refer to *Cisco Unified Real-Time Monitoring Tool Administration Guide*. 
Call Detail Records and Call Management Records

Call Detail Records (CDRs) and Call Management Records (CMRs) get used for post-processing activities such as generating billing records and network analysis. When you install your system, the system enables CDRs by default. CMRs remain disabled by default. You can enable or disable CDRs or CMRs at any time that the system is in operation.

The CDR Management (CDRM) feature, a background application, supports the following capabilities:

- Collects the CDR/CMR files from the Cisco Unified Communications Manager server or node to the CDR Repository server or node.
- Collects and maintains the CDR/CMR files on the server where you configure CAR.
- Maintains the CDR/CMR files on the CDR Repository node or CDR server.
- Allows third-party applications to retrieve CDR/CMR files on demand through a SOAP interface.
- Accepts on-demand requests for searching file names.
- Pushes CDR/CMR files from individual nodes within a cluster to the CDR Repository server or node.
- Sends CDR/CMR files to up to three customer billing servers via FTP/SFTP.
- Monitors disk usage of CDR/CMR files on the server where you configure CAR or on the CDR Repository server or node.
- Periodically deletes CDR/CMR files that were successfully delivered. You can configure the amount of storage that is used to store flat files. Predefined storage limits exist. If the storage limits are exceeded, the CDR Repository Manager deletes old files to reduce the disk usage to the preconfigured low water mark. The post-processing applications can later retrieve the buffered historical data to re-get any lost, corrupted, or missing data. The CDRM feature, which is not aware of the flat file format, does not manipulate the file contents.

CDRM includes two default services, the CDR Agent and the CDR Repository Manager, and one activate service, CDR onDemand Service.

For more information, refer to the Cisco Unified Communications Manager Call Detail Records Administration Guide.

Call Detail Record Analysis and Reporting

Cisco Unified Serviceability supports Call Detail Record (CDR) Analysis and Reporting (CAR) and is available in the Tools menu. CAR generates reports for Quality of Service (QoS), traffic, and billing information. For its primary function, CAR generates reports about the users of Cisco Unified Communications Manager and reports on system status with respect to call processing. CAR also performs CAR database management activities. You can perform these tasks in one of the following ways:

- Automatically configure the required tasks to take place.
- Manually perform the tasks by using the web interface.

CAR processes the CDRs from flat files that the CDR repository service places in the repository folder structure. CAR processes CDRs at a scheduled time and frequency. By default, CDR data loads continuously...
24 hours per day and 7 days per week; however, you can set the loading time, interval, and duration as needed. In addition, the default setting loads only CDR records. CMR records do not get loaded by default.

CAR provides e-mail alerts for various events, including the following events:

- Charge Limit Notification indicates when the daily charge limit for a user exceeds the specified maximum.
- QoS Notification indicates when the percentage of good calls drops below a specified range or the percentage of poor calls exceeds a specified limit.

For more information, refer to the Cisco Unified Communications Manager CDR Analysis and Reporting Administration Guide.

Management Information Base

The Management Information Base (MIB) converts object identifiers (OIDs) that are numerical strings into an ASCII text file. The OIDs identify data objects. The OID represents specific characteristics of a device or application and can have one or more object instances (variables). Managed objects, alarms, notifications, and other valuable information get identified by the OID and get listed in the MIB.

The OID gets logically represented in a tree hierarchy. The root of the tree stays unnamed and splits into three main branches—Consultative Committee for International Telegraph and Telephone (CCITT), International Organization for Standardization (ISO), and joint ISO/CCITT.

These branches and those that fall below each category have short text strings and integers to identify them. Text strings describe object names, while integers allow computer software to create compact, encoded representations of the names. For example, the Cisco MIB variable authAddr represents an object name and gets denoted by the number 5, which is listed at the end of OID 1.3.6.1.4.1.9.2.1.5.

The OID in the Internet MIB hierarchy represents the sequence of numeric labels on the nodes along a path from the root to the object. The OID 1.3.6.1.2.1 represents the Internet standard MIB. It also can get expressed as iso.org.dod.internet.mgmt.mib.

The Cisco MIB set comprises a collection of variables that are private extensions to the Internet standard MIB II and many other Internet standard MIBs. RFC 1213, Management Information Base for Network Management of TCP/IP-based Internets—MIB-II documents MIB II.

Cisco Unified CM and Cisco Unified CMBE support the following MIBs:

- CISCO-CCM-MIB
- CISCO-CCM-CAPABILITY
- CISCO-CDP-MIB
- CISCO-SYSLOG-MIB
- HOST-RESOURCES-MIB
- MIB-II
- SYSAPPL-MIB
- Vendor-specific MIBs

Related Topics

Cisco Management Information Base
Cisco Unified Communications Manager systems management and monitoring

This chapter describes how to manage and monitor the health of Cisco Unified Communications Manager (Cisco Unified CM) systems.

Note

Serviceability APIs (AXL/SOAP) that are used for serviceability queries and Administrative XML (AXL) that are used as a provisioning read and write APIs are not covered in this document.

Supported interfaces

The following interfaces are supported on Cisco Unified CM servers:

- SNMP MIB/Trap—Supports polling and traps by using select MIBs from Cisco and the native platforms.
- SSH Secure Shell Client—Replaces telnet and ftp clients by using a more secure protocol. This application encrypts the entire network session and can use public-key authentication.
• Local and Remote Syslog—Contains types of platform and Cisco Unified CM application events, alerts, and alarms are written to syslog servers.

• HTTPS—Displays the following web pages by using HTTPS—Cisco Unified CM Administration, Cisco Unified Serviceability, Disaster Recovery System, and Unified OS Administration.

• Command Line Interface (CLI)—Used for a subset of functions available by using the web browser interfaces and primarily used to re-establish these interfaces if inoperable. The CLI is accessible by using SSH or a serial console port on the appliance. The complete set of CLI commands is described in the Cisco Unified Communications Operating System Administration Guide.

• Native Hardware Out of Band Management (OOB)—Supports select features of HP iLO and IBM RSA II.

• Secure FTP (SFTP)—Used for secure file push from or pull to the appliance, including CDR/CMR push, trace file push, push of backups or pull or restores, and pull of upgrade files.

• Third-party Network Management Systems (NMS)—Monitors appliances by leveraging the exact same interfaces exposed to Cisco network management applications. Certain functions of these applications may not be supported on the appliance if native platform access is required, such as account management, software configuration management, or other forms of native platform manipulation. For example, the system management portal web page on HP servers is not supported, but polling and alerting by using the HP System Insight Manager and the appliance MIB is supported.

• Cisco Unified Communications Real-Time Management Tool—Used for perfmon and TCT functions.

The following figure shows the supported interfaces in Cisco Unified CM Release 5.0 and later releases.

**Figure 1: Supported Management Interfaces in Cisco Unified CM Release 5.0 and Later Releases**

---

### Critical processes to monitor

#### Cisco Unified Communications Manager Critical Processes

The following tables describe Cisco Unified Communications Manager critical processes that require monitoring. Be aware of the following items while monitoring the processes:
The following table describes Cisco Unified Communications Manager critical services that require monitoring.

Cisco Unified Communications Manager systems management and monitoring

Cisco Unified Communications Manager Critical Processes
Service Manager

Service

Stop | Start | Restart

Instruction

Process

Name

Auto

Description

Auto-restarts according to 'init' rules (10 if instantaneous failure, otherwise higher).

Internet Key Exchange (IKE) daemon for automatically keying IPsec connections. Auto-restarts according to 'init' rules (10 if instantaneous failure, otherwise higher).

Auto-restarts according to 'init' rules (10 if instantaneous failure, otherwise higher).

*HOST-RESOURCES-MIB and possibly other MIBs fail to function or respond when this service is stopped.

**Only in Cisco Unified CM Release 5.1(3) and Release 6.1(1) and later releases.

***All of the listed processes may not be running as it is a function of the particular server model or what the service deems appropriate.

****There is more than one process by this name; second argument is relevant for distinction.

*****Feature Services are not activated by default.

The following table lists the critical SysLog test cases for Cisco Unified Communications Manager that require monitoring.

**Table 2: Critical SysLog Test Cases**

RTMT monitoring of Cisco Unified CM system health

The following topics related to RTM monitoring of Cisco Unified CM system health are provided:

- RTMT summary view
- CPU usage
- %IOWait monitoring
- Virtual memory
- Disk usage
RTMT summary view

The RTMT summary view displays the overall health of the system, which should be monitored daily, including:

- CPU utilization level
- Memory utilization level
- Phone registration status
- Call in progress
- Gateway status

If CPU and memory utilization levels exceed the 70 percent mark, then the Cisco Unified CM publisher and subscribers that are participating in call processing could be overloaded. Key indicators of system health and performance issues are:

- System Time, User Time, IOWait, soft irq, irq
- CPU Pegging Alerts
- Process using most CPU
- High % iowait
High % iowait due to common partition
• Process responsible for Disk IO
• CodeYellow

If you do not want the RTMT client running on your workstation or PC all the time, you can configure a threshold for each alert that is of interest to you and how you want to be notified. Then you can close the RTMT client on your workstation or PC.

The RTMT backend, AMC service, which is up and running as soon as the Cisco Unified CM server is up and running, collects and processes all the information needed, and notifies you according to how you configured the notification.

RTMT CPU and memory page reports CPU usage in terms of the following:
• %System—CPU utilization percentage that occurred while executing at the system level (kernel)
• %User—CPU utilization percentage that occurred while executing at the user level (application).
• %IOWait—CPU percentage of time of idle waiting for outstanding disk I/O request.
• %SoftIrq—Percentage of time that the processor is executing deferred IRQ processing (for example, processing of network packets).
• %Irq—Percentage of time that the processor is executing the interrupt request which is assigned to devices for interrupt or sending a signal to the computer when it is finished processing.

## CPU usage

High CPU utilization can impact the call processing by creating delays or interruptions in the service. It could affect the end user service. Sometimes high CPU utilization is indicative of a memory leak. RIS DataCollector PerfMonLog when enabled tracks CPU usage.

Note
Cisco recommends that RIS DataCollector PerfMonLog be enabled.

The following table shows CPU usage guidelines.

<table>
<thead>
<tr>
<th>Usage</th>
<th>MCS-7835</th>
<th>MCS-7845</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total CPU usage—Processor (_Total) \ % CPU Time</td>
<td>&lt; 68% is good 68–70% triggers a warning &gt; 80% is bad</td>
<td>&lt; 68% is good 68–70% triggers a warning &gt; 80% is bad</td>
</tr>
<tr>
<td>Process ccm CPU</td>
<td>&lt; 44%</td>
<td>&lt; 22%</td>
</tr>
<tr>
<td>IOWAIT—Processor (_Total) \ IOwait Percentage</td>
<td>&lt; 10% is good</td>
<td>&lt; 10% is good</td>
</tr>
<tr>
<td>CallManager Service Virtual Memory size</td>
<td>&lt; 2.1 GB</td>
<td>&lt; 2.1 GB</td>
</tr>
</tbody>
</table>
You can also monitor CPU usage by using APIs. Using the SOAP API, you can monitor the following perfmon counters:

- Under Processor object—% CPU Time, System Percentage, User Percentage, IOwait Percentage, Softirq Percentage, Iq Percentage
- Under Process object—% CPU Time

Using the SNMP interface, you can monitor the following perfmon counters:

- Host Resource MIB—hrProcessorLoad, hrSWRunPerfCPU
- CPQHOST-MIB—cpqHoCpuUtilMin, cpqHoCpuUtilFiveMin

If you see high CPU usage, identify which process is causing it. If %system and/or %user is high enough to generate CPUPegging alert, check the alert message to see the processes that are using the most CPU. You can go to the RTMT Process page, sort by %CPU to identify high CPU processes.

The following figure shows the CPU usage.

**Figure 2: Cisco Unified Serviceability CPU usage**

For analysis, RIS Data Collector PerfMonLog tracks processes %CPU usage at system level. RTMT monitors CPU usage and when CPU usage is above a threshold, RTMT generates CallProcessingNodeCPU Pegging alert. The following figure shows the alert status.

**Figure 3: RTMT Alert Central with alert status**

Monitor the “In Safe Range” column often. If it is marked “No,” then the condition is not corrected. For example, if In Safe Range column displays No for CallProcessingNodeCPU Pegging, then it means the CPU usage on that node is above the threshold and requires attention.
In addition to CallProcessingNodeCPUPegging, high CPU usage potentially causes the following alerts to trigger:

- CodeYellow
- CodeRed
- CoreDumpFileFound
- CriticalServiceDown
- LowCallManagerHeartbeatRate
- LowTFTPServerHeartbeatRate
- LowAttendantConsoleHeartbeatRate

When a service crashes, the corresponding trace files may have been overwritten. Cisco TAC needs the trace files to troubleshoot the crash. In the case of CoreDumpFileFound, CodeYellow, and CriticalServiceDown, the Enable Trace Download option should be enabled to assist Cisco TAC.

% IOwait monitoring

High %IOwait indicates high disk input/output (I/O) activities. Consider the following high IOwait conditions:

- Heavy memory swapping—Check %CPU Time for Swap Partition to see if there is high level of memory swapping activity. One potential cause of high memory swapping is memory leak.
- DB activity—Database accesses Active Partition. If %CPU Time for Active Partition is high, then most likely there are a lot of DB activities.
- Common (or Log) Partition in the trace and log files storage location—Check the following:
  - Trace Log Center to see if there is any trace collection activity going on. If call processing is impacted (ie, CodeYellow), then consider adjusting trace collection schedule. If zip option is used, please turning it off.
  - Trace setting at the detailed level because Cisco Unified CM generates a lot of trace. If high %iowait and/or Cisco Unified CM is in CodeYellow state, and Cisco Unified CM service trace setting is at Detailed, please change trace setting to “Error” to reduce the trace writing.

You can use RTMT to identify processes that are responsible for high %IOwait:

- If %IOwait is high enough to cause CPUPegging alert, check the alert message to check processes waiting for disk IO.
- Go to RTMT Process page, sort by Status. Check for processes in Uninterruptible Disk Sleep state
- Download RIS Data Collector PerfMonLog file to examine the process status for longer period of time.

The following figure shows an example of RTMT Process window sorted by Status. Check for processes in Uninterruptible Disk Sleep state. The FTP process is in the Uninterruptible Disk Sleep state.

*Figure 4: FTP process in Uninterruptible Disk Sleep state*
Virtual memory

Virtual memory consists of physical memory (RAM) and swap memory (Disk). The RTMT CPU and Memory window has system level memory usage information as the following:

- **Total**—total amount of physical memory
- **Free**—amount of free memory
- **Shared**—amount of shared memory used
- **Buffers**—amount of memory used for buffering purpose
- **Cached**—amount of cached memory
- **Used**—calculated as Total – Free – Buffers – Cached + Shared
- **Total Swap**—total amount of swap space
- **Used Swap**—the amount of swap space in use on the system.
- **Free Swap**—the amount of free swap space available on the system

**Note**
Using SOAP APIs, you can query memory information for the following perfmon counters:

- Under Memory object—% Mem Used, % VM Used, Total Kbytes, Total Swap Kbytes, Total VM Kbytes, Used Kbytes, Used Swap Kbytes, Used VM Kbytes
- Under Process object—VmSize, VmData, VmRSS, % Memory Usage

Using SNMP, you can query the following perfmon counters:

- Host Resource MIB—hrStorageSize, hrStorageUsed, hrStorageAllocationUnits, hrStorageDescr, hrStorageType, hrMemorySize
Note
You can download some historical information by using RTMT Trace Log Central. The Cisco AMC Service PerfMonLog is enabled by default. Deprecated in Cisco Unified CM Release 6.0 because Cisco RIS Data Collector PerfMonLog was introduced. The Cisco RIS Data Collector PerfMonLog disabled by default in Cisco Unified CM Release 5.x and enabled by default in Cisco Unified CM Release 6.0.

Note
Perfmon Virtual Memory refers to Total (Physical + Swap) memory whereas Host Resource MIB Virtual Memory refers to Swap memory only.

The RTMT Process window displays process level memory usage information as follows:
- VmSize—Total virtual memory used by the process
- VmRSS—Resident Set currently in physical memory used by the process including Code, Data and Stack
- VmData—Virtual memory usage of heap by the process
- Page Fault Count—Represents the number of major page faults that a process encountered that required the data to be loaded into physical memory

The following figure shows RTMT Process window. You can sort VmSize by clicking on VmSize tab. Then you can identify which process consumes more memory.

Figure 5: VmSize listed by RTMT Process

Possible memory leak causes can be from the VmSize continuously increasing.
When a process leaks memory, the system administrator should report it to Cisco and include trace files. Ris Data Collector PerfMonLog collects the data and it contains historical information on memory usage.

Disk usage

There are four disks or partitions in the Cisco Unified CM hard drive:
• Common partition (log partition)—Contains the trace/log files
• Active partition—Contains files (binaries, libraries and config files) of active OS and the Cisco Unified CM release
• Inactive partition—Contains files for alternative Cisco Unified CM release (for example, an older version that was upgraded from or newer version recently upgraded to but the server has not been toggled to this release).
• Swap partition—Used for swap space.

Using SOAP APIs, you can get partition information for the following perfmon counters:
• Under Partition object—Total Mbytes, Used Mbytes, Queue Length, Write Bytes Per Sec, Read Bytes Per Sec

Using the SNMP MIB, you can query the following information:
• Host Resource MIB—hrStorageSize, hrStorageUsed hrStorageAllocationUnits, hrStorageDescr, hrStorageType

You can download the following historical information by using RTMT Trace and Log Central:
• Cisco AMC Service PerfMonLog // enabled by default. Deprecated in Cisco Unified CM 6.0, because Cisco RIS Data Collector PerfMonLog is introduced.
• Cisco RIS Data Collector PerfMonLog // disabled by default in Cisco Unified CM 5.x; enabled by default in Cisco Unified CM 6.0

The following figure shows disk usage in RTMT.

**Figure 6: Disk usage by partition**
Disk name mapping

Perfmon instance names as shown in RTMT and SOAP are:

- Active
- Inactive
- Common
- Boot
- Swap
- SharedMemory

Names shown in Host Resource MIB hrStorage description are:

- /partB
- /common
- /grub
- Virtual Memory
- /dev/shm

The partition alerts are as follows:

- LogPartitionLowWaterMarkExceeded—Occurs when the percentage of used disk space in the log partition has exceeded the configured low water mark. This alert should be considered as early warning for an administrator to clean up disk space. You can use RMT Trace/Log Central to collect trace/log files and then delete these trace/log files from the server. In addition to manually clean up the traces/log files, the system administrator should also adjust the number of trace files to be kept to avoid hitting low water mark again.

- LogPartitionHighWaterMarkExceeded—Occurs when the percentage of used disk space in the log partition has exceeded the configured high water mark. When this alert is generated, Log Partition Monitoring (LPM) utility starts to delete files in Log Partition until the Log Partition is down to the low water mark to avoid running out of disk space. Since LPM may delete some files that you want to keep, you need to act upon receiving LogPartitionLowWaterMarkExceed alert.

- LowActivePartitionAvailableDiskSpace—Occurs when the percentage of available disk space of the Active Partition is lower than the configured value. Please use the default threshold that Cisco recommends. At default threshold, this alert should never be generated. If this alert occurs, a system administrator can adjust the threshold as temporary workaround but Cisco TAC should look into this. One place to look is /tmp using remote access. We have seen cases where large files are left there by 3rd party software.

- LowInactivePartitionAvailableDiskSpace—Occurs when the percentage of available disk space of the InActive Partition is lower than the configured value. Please use the default threshold that Cisco recommends. At default threshold, this alert should never be generated. If this alert occurs, a system administrator can adjust the threshold as temporary workaround but Cisco TAC should look into this.

The following table shows a comparison of disk-related perfmon counters between Cisco Unified CM Release 4.x and Cisco Unified CM Release 5.x.
Table 5: Disc-related perfmon counters

<table>
<thead>
<tr>
<th>Cisco Unified CM Release 4.x Perfmon Counters</th>
<th>Cisco Unified CM Release 5.x Perfmon Counters</th>
</tr>
</thead>
<tbody>

Database replication and Cisco Unified Communication Manager nodes

You can use RTMT Database Summary to monitor your database activities as shown in the following figure. For example, click **CallManager > Service > Database Summary**.

*Figure 7: Database Summary in RTMT*
ccm process and CPU usage

The Cisco Unified CM process is labeled “ccm.” The following table contains general guidelines for the ccm service CPU usage.

Table 6: Cisco Unified CM ccm process and CPU usage

<table>
<thead>
<tr>
<th>CPU usage Process (ccm)</th>
<th>% CPU Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>MCS-7835 Server</td>
<td>MCS-7845 Server</td>
</tr>
<tr>
<td>&lt; 44% is good</td>
<td>&lt; 22% is good</td>
</tr>
<tr>
<td>44-52% triggers a warning</td>
<td>22-36% triggers a warning</td>
</tr>
<tr>
<td>&gt; 60% is bad</td>
<td>&gt; 30% is bad</td>
</tr>
</tbody>
</table>

The MCS-7845 server has more processors and a lower threshold for CPU usage because the ccm process is a multithreaded application. But the main router thread does the bulk of call processing. A single thread can run only on one processor at any given time even when there are multiple processors available. That means ccm main router thread can run out of CPU resource even when there are idle processors.

With hyper-threading, the MCS-7845 server has 4 virtual processors. So on the server where the main router thread is running at full blast to do call processing, it is possible three other processors are near idle. In this situation UC Manager can get into Code Yellow state even when total CPU usage is 25 to 30 percent. (Similarly MCS-7835 server with two virtual processors, UC Manager could get into Code Yellow state at around 50 to 60 percent of CPU usage.

Use the following to query perfmon counters:

- **SOAP APIs:**
  - Perfmon counters
  - Device information
  - DB access
  - CDR access

- **SNMP:**
  - CISCO-CCM-MIB—ccmPhoneTable, ccmGatewayTable, etc.
  - Download historical information by using RTMT Trace/Log Central
  - Cisco AMC Service PerfMonLog is enabled by default. This was deprecated in Cisco Unified CM Release 6.0 because Cisco RIS Data Collector PerfMonLog was introduced.
  - Cisco RIS Data Collector PerfMonLog was disabled by default in Cisco Unified CM Release 5.x and enabled by default in Cisco Unified CM Release 6.0.
CodeYellow

CodeYellow state occurs when the ccm process is so overloaded that it cannot process incoming calls anymore. In this case, ccm initiates call throttling. This does not mean that one processor CPU usage is at 100 percent and the remaining processors are operating at 0 percent in RTMT.

Since the main thread can run on processor A for 1/10th of a second and processor B on the next 2/10th of a second, etc., the CPU usage shown in RTMT would be more balanced. By default RTMT shows average CPU usage for a 30-second duration.

You can configure the CodeYellow alert so that once it occurs, the trace files can be downloaded for troubleshooting purposes.

The AverageExpectedDelay counter represents the current average expected delay for handling any incoming message. If the value is above the value specified in “Code Yellow Entry Latency” service parameter, CodeYellow alarm is generated. This counter is one of key indicator of call processing performance issue.

If you see CodeYellow, but the total CPU usage is only 25 percent, it is because Cisco Unified CM needs one processor for call processing. When no processor resource is available, CodeYellow may occur even when the total CPU usage is only around 25 to 30 percent in a 4-virtual processor server. Similarly on a 2 processor server, CodeYellow is possible around 50 percent of total CPU usage.

Other perfmon counters should be monitored are:

- Cisco CallManager\CallsActive, CallsAttempted, EncryptedCallsActive, AuthenticatedCallsActive, VideoCallsActive
- Cisco CallManager\RegisteredHardwarePhones, RegisteredMGCPGateway
- Cisco CallManager\T1ChannelsActive, FXOPortsActive, MTPResourceActive, MOHMulticastResourceActive
- Cisco Locations\BandwidthAvailable
- Cisco CallManager System Performance\AverageExpectedDelay
- CodeYellow
- DBReplicationFailure
- LowCallManagerHeartbeat
- ExcessiveVoiceQualityReports
- MaliciousCallTrace
- CDRFileDeliveryFailure/CDRAgentSendFileFailed
- Critical Service Down
- CoreDumpFileFound

The following figure displays the RTMT performance window.

Figure 8: RTMT performance of stand alone clusters
In general, Cisco Unified CM Release 4.x perfmon counters have been preserved by using the same names and representing the same values.

### RIS Data Collector PerfMonLog

In Cisco Unified CM Release 5.x, the RIS Data Collector PerfMonLog file is not enabled by default. It is recommended that RIS Data Collector PerfMonLog is enabled to assist in troubleshooting. It tracks CPU, memory, disk, and the network. If you enable RIS Data Collector PerfMonLog, then you can disable AMC PerfMonLog. In Cisco Unified CM Release 6.x, RIS Data Collector PerfMonLog replaced AMC PerfMonLog.

With RIS Data Collector PerfMonLog enabled, the impact on the CPU is small, around 1%.

Use RTMT Trace and Log Center to download Cisco RIS Data Collector PerfMonLog files for the time period that you are interested in. Open the log file using Windows Perfmon Viewer (or RTMT Perfmon viewer), then add Performance counters of interest such as:

- CPU usage > Processor or Process % CPU
- Memory usage > Memory %VM Used
- Disk usage > Partition % Used
- Call Processing > Cisco CallManager CallsActive

The following figure shows the output of the Windows Perfmon Viewer.

*Figure 9: Windows Perfmon Viewer*
Critical service status

The RTMT Critical Service window provides current status of all critical services as shown in the following figure.

*Figure 10: Critical Service window in RTMT*
CriticalServiceDown alert is generated when any of service is down. By default, RTMT back-end service checks for the status every 30 seconds. It is possible if the service goes down and comes back up within that period, the CriticalServiceDown alert may not be generated.

CriticalServiceDown alert monitors only those services listed in RTMT Critical Services page. If you suspect if service got restarted without generating Core files, check the RTMT Critical Service page has elapsed time and Check RIS Troubleshooting perfmon log files and see if PID for service (process) is changed.

The following CLI can be used to check the logs of Service Manager:

- `file get activelog platform/servm_startup.log`
- `file get activelog platform/log/servm*.log`

The following CLI can be used to duplicate certain RTMT functions:

- `admin:utils service`
- `show perf`
- `show risdb`

CoreDumpFileFound alert is generated when RTMT backend service detects new Core Dump file. Both CriticalServiceDown and CoreDumpFileFound alert can be configured to download corresponding trace files for troubleshooting purpose. This helps to preserve trace files at the time of a crash.
RTMT syslog viewer

Syslog messages can be viewed using RTMT syslog viewer as shown in the following figure.

Figure 11: Syslog Viewer

Send syslog traps to remote server

To send syslog traps to a remote server for the CISCO-SYSLOG-MIB follow these steps:

Procedure

- **Step 1** Setup Trap (Notification) destination in Cisco Unified Serviceability SNMP window.
- **Step 2** Enable trap generation in CISCO-SYSLOG-MIB.
- **Step 3** Set the appropriate SysLog level in CISCO-SYSLOG-MIB.

If syslog traps are not being generated for some Cisco Unified CM service alarms, check the RTMT syslog viewer to see if the alarms are shown there. If not, adjust alarm configuration setting to send alarms to local syslog.

Syslogs generated due to hardware failures have an event severity of 4 or higher and contain one of the following patterns:
You can search for the above patterns to find hardware failure events in syslog.

For information on alarm configuration, refer to the Alarm Configuration section of the *Cisco Unified Serviceability Administration Guide* at http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/service/5_1_3/ccmsrva/saalarm.html

---

**RTMT alerts as syslog messages and traps**

RTMT alerts can be sent to a remote syslog server. To send to a local and remote syslog server, configure the AMC alarm in Cisco Unified Serviceability. The following figure shows the window.

**Figure 12: Local and remote syslog configuration**

---

**Recovery hardware migration and backup/restore**

**Backup/restore**

Cisco provides the following backup/restore utilities:

- Cisco Unified CM Release 4.x uses the Backup and Restore System (BARS) application
• Cisco Unified CM Release 5.x uses the Disaster Recovery Framework (DRF)
• Cisco Unified CM Release 6.x uses the Disaster Recovery System (DRS), essentially a renaming of DRF above

These tools support writing backup files to (or reading restore files from) a local tape drive, or a file on a network location. BARS uses Windows shares and DRF/DRS use SFTP to access the network location. If a third-party backup solution is desired, BARS/DRF/DRS can write to a network location for the third-party backup solution to pick up.

DRF/DRS perform a cluster-wide backup, meaning data from all nodes is backed up, but restores are only to the node(s) that need it.

For more details, including what is configured to be included in the backup or what files are created, refer to the following documents depending on release:

• Disaster Recovery Administration Guide
• Cisco IP Telephony Disaster Recovery Administration Guide
• Cisco IP Telephony Backup and Restore System (BARS) Administration Guide

It is recommended to take a fresh backup every time an install, upgrade or options install is done to the appliance, whether or not configuration data changes were made.

If a catastrophic hardware failure occurs and the hardware must be replaced, reinstall Cisco Unified CM on the new hardware, then perform a restore from your backup.

---

Note

Drive pull/swap is not supported as a fast recovery solution for the appliance.

Refer to the Replacing a Single Server or Cluster for Cisco Unified Communications Manager chapter of your release of Cisco Unified Communications Manager Install and Upgrade Guide at this index:

Platform monitoring

This section describes hardware-layer monitoring for system component temperature, fan status, power supply status, RAID and disk status, network status, and operational status. CPU status/utilization and Memory status/utilization are covered in another section.

SNMP MIBs

Cisco Unified CM hardware servers are monitored by using SNMP MIBs. The following MIBs are supported:

• Vendor-Specific MIBs
  ◦ IBM-SYSTEM-LMSENSOR
  ◦ IBM-SYSTEM-POWER
  ◦ IBM-SYSTEM-RAID
  ◦ IBM-SYSTEM-xxx-MIB
You configure SNMP in the network management applications to receive SNMP traps, notifications, and informs listed in the MIBs. Specific MIB support varies by Cisco Unified CM release and hardware vendor.

Related Topics

Vendor-specific Management Information Base, on page 1025

MIBs and MCS types

There are no specific OIDs available to directly give the MCS type. In the case of Linux appliances, the value of sysObjectID can be mapped to the server types. For instance sysobjectID returns 1.3.6.1.4.1.9.1.583 for a HP-7825 server.

In the case of Windows, there are no such specific values returned for server types except for OID does identify the server as a Windows server. Refer to http://www.oidview.com/mibs/9/CISCO-PRODUCTS-MIB.html for list of sysObjectIDs assigned to different hardware.

For Media Convergence Server (MCS) MIBs supported by Cisco Unified CM releases, go to this URL—http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/compat/cmmibcmp.xls.

How to use Command Line Interface

Hardware BIOS RAID and firmware view details commands

System BIOS is viewable during the server boot sequence. The following commands are useful to view details about hardware, BIOS, RAID, and firmware. These items are included as part of the Cisco Unified CM image and do not need to be managed separately as in Cisco Unified CM Release 4.x, but may need to be inspected during diagnostic activity.

```
show hardware
show environment [fans | power-supply | temperature]
show tech all
utils create report hardware
```

admin:utils fior CLI

You can also use the admin:utils fior status CLI to isolate which process causes high IOwait. Other available options to use with the admin:utils fior command are—enable, disable, start, stop, list, top. For example, at the command prompt type admin:utils fior list. This displays:

```
2007-05-31 Counters Reset
Time    Process   PID    State    Bytes Read    Bytes Written
17:02:45 rpmq    31206    Done  14173728  0
17:04:51 java    31147    Done  310724  3582
17:04:56 snmpget 31365    Done  989543  0

- `admin:utils diagnose fix CLI`, on page 43
- `admin:utils create report hardware CLI`, on page 43
- `admin:utils iostat CLI`, on page 43

**admin:utils diagnose list CLI**
Displays all available diagnostic tests as follows:

Available diagnostics modules
- `disk_space` - Check available disk space as well as any unusual disk usage
- `service_manager` - Check if service manager is running
- `tomcat` - Check if Tomcat is deadlocked or not running

**admin:utils diagnose test CLI**
Executes each diagnostic test. It will not attempt to repair anything. This displays:

Starting diagnostic test(s)-------------------------------
test - disk_space - Passed
test - service_manager - Passed
test - tomcat - Passed
Diagnostics Completed
admin:utils diagnose moduleName CLI

Executes a single diagnostic test and attempt to fix the problem. You can also use admin:utils diagnose fix CLI to run all of the diagnostic tests at once. For example, admin:utils diagnose module tomcat displays:

```
Starting diagnostic test(s)---------------------------
test - tomcat   -Passed
Diagnostics Completed
```

admin:utils diagnose fix CLI

Execute all diagnostic tests, and if possible, attempt to repair the system. This displays:

```
Starting diagnostic test(s)---------------------------
test - disk_space -Passed
test - service_manager -Passed
test - tomcat -Passed
Diagnostics Completed
```

admin:utils create report hardware CLI

Creates a system report containing disk array, remote console, diagnostic, and environmental data. No parameters are required. This displays:

```
*** W A R N I N G ***
This process can take several minutes as the disk array, remote console, system diagnostics and environmental systems are probed for their current values.
Continue? Press y or Y to continue, any other key to cancel request.
Continuing with System Report request...
Collecting Disk Array Data...SmartArray Equipped server detected...Done

CLI for intracluster connection management and monitoring

The following CLI can be used to monitor and manage intracluster connections:

- `admin:utils dbreplication status`
- `admin:utils dbreplication repair all/nodename`
- `admin:utils dbreplication reset all/nodename`
- `admin:utils dbreplication stop`
- `admin:utils dbreplication dropadmindb`
- `admin:utils dbreplication setrepltimeout`
- `show tech dbstateinfo`
- `show tech dbinuse`
- `show tech notify`
- `run sql <query>`

Hardware migration

Customers may wish to migrate their Cisco Unified CM to more powerful hardware, either to prepare for upgrading to a later Cisco Unified CM release that does not support the older hardware, or just to leverage capabilities only available in the more powerful hardware, such as increases in capacity/performance or RAID. The procedure is to backup from the old hardware, install the same Cisco Unified CM release to the new hardware, then restore on the new hardware.

Migrating to more powerful hardware may require a migration SKU to cover royalties Cisco owes to third-parties. If you are considering this, have your account team check the Guide to Cisco Unified CM Upgrades and Server Migrations, which is a supplement to the Cisco Unified CM Ordering Guide.

Platform security

Related Topics

- Locked-down system, on page 45
- Cisco Security Agent support, on page 45
- Security patching and updating, on page 45
- Role-Based Access Control, on page 45
Locked-down system

For security, Cisco Security Agent is included along with a built-in firewall controlling connectivity among all cluster nodes, via IP tables and sensitive ports defined by the application. No AntiVirus application is installed on the appliance. The native OS used by the appliance is also hardened to minimize attack surface and vulnerabilities; fewer than 200 of the thousands of available packages are used to eliminate unused software and the corresponding vulnerabilities.

No “on-box” e-mail clients or Web browsers are supported, all unnecessary logins have been removed or disabled, and all software is provided by Cisco and digitally signed to ensure it is authorized by Cisco. The GUI, CLI, and API interfaces that Cisco provides are the only methods to administer the system, and authentication is required for users to interact with them. It also useful to note that appliances of this sort are less frequently targets of malware than Microsoft Windows or other systems with open-system access to the native OS, so significantly fewer patches need to be applied to the base OS.

Cisco Unified CM regulates its TCP/UDP port usage. See the Cisco Unified Communications Manager TCP and UDP Port Usage document for each Cisco Unified CM release for the specific list.

Cisco Security Agent support

The Appliance supports the “headless” or unmanaged Cisco Security Agent. A future release will add support for the event monitoring features of Cisco Security Agent Management Center, but not for policy edits and distribution.

Security patching and updating

The Appliance's software image contains all security updates and patches made to firmware, drivers, native OS, database and Cisco Unified CM application components. Customers who keep current with Cisco maintenance releases are automatically covered for security updates. For more details, refer to the Application Note “Appliance Security Update Process for Cisco Unified Communications Manager” (C27-412838-00), available on request from your Cisco account team.

Role-Based Access Control

Cisco Unified CM uses Multi-Layer Admin (MLA) for RBAC control over authorization to Cisco Unified CM configuration.

Software configuration management

The Cisco Unified CM server uses a bundled image including all components needed for the system in a single set of DVDs or software downloads. Unlike Cisco Unified CM Release 4.x in which there were up to 6 different components to manage for a total of 18 updates per year on average to stay current, the server has 2 components with an average of 5 updates per year to stay current.

It is recommended that you keep your system current with the latest maintenance release for a major/minor feature release. Major and minor release install files are available on DVD media kits or on Product Upgrade Tool at http://www.cisco.com.

Rebuilds, upgrade files for minor and maintenance releases, and Cisco option files and tools are available as software downloads from Software Center at http://www.cisco.com/kobayashi/sw-center/sw-voice.shtml.
Customers wishing to receive automatic e-mail notification of availability of new files on Software Center should subscribe to the e-mail notification tool on that site. Engineering “special” releases are only available to customers by using Cisco Technical Assistance Center.

**General install and upgrade procedures**

Unattended first-time installs can be performed by using the Cisco Unified Communications Answer File Generator at [http://www.cisco.com/web/cuc_afg/index.html](http://www.cisco.com/web/cuc_afg/index.html). For other details, see the online help and the document Installing Cisco Unified Communications Manager.

For upgrades and from the list, find the appropriate release for your upgrade in the following index:

**Detect installed release and packages**

You have several methods to display the installed release and packages that are:

- show version [active | inactive] and show packages active commands
- Cisco Unified Operations Manager
- Unified OS Administration
- Cisco Unified Communications Manager
- SNMP

A third-party NMS can query the Cisco Unified CM release by using the following SNMP OID:

- .iso.org.dod.internet.private.enterprises.cisco.ciscoMgmt.ciscoCcmMIB.ciscoCcmMIBObjects.ccmGeneralInfo.ccmTable.ccmEntry.ccmVersion

The Cisco Unified CM licensing web page displays the uploaded license file release, which may or may not be an exact match for what is installed on the system.

**Available reports**

Three different reports are available:

- RTMT reports
- Serviceability reports
- Cisco Unified reporting

**RTMT reports**

RTMT has a number of pre-can screens for information such as Summary, Call Activity, Device Status, Server Status, Service Status, and Alert Status. RTMT “Summary” pre-can screen shows a summary view of Cisco Unified CM system health. It shows CPU, Memory, Registered Phones, CallsInProgress, and ActiveGateway
ports & channels. This should be one of the first thing you want to check each day to make sure CPU & memory usage are within normal range for your cluster and all phones are registered properly.

Phone Summary and Device Summary pre-can screens provide more detailed information about phone and gateway status. If there are a number of devices that fail to register, then you can use the Admin Find/List page or RTMT device search to get further information regarding the problem devices. Critical Services pre-can screen displays the current running/activation status of key services. You can access all the pre-can screens by simply clicking the corresponding icons on the left.

**Serviceability reports**

The Cisco Serviceability Reporter service generates daily reports in Cisco Unified CallManager Serviceability Web Page. Each report provides a summary that comprises different charts that display the statistics for that particular report. Reporter generates reports once a day on the basis of logged information, such as—

- Device Statistics Report
- Server Statistics Report
- Service Statistics Report
- Call Activities Report
- Alert Summary Report
- Performance Protection Report

For detailed information about each report, go to [http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/service/5_0_2/ccmsrvs/sssrvrep.html#wp1033420](http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/service/5_0_2/ccmsrvs/sssrvrep.html#wp1033420)

**Cisco Unified Reporting**

Cisco Unified Reporting is accessed at the Cisco Unified CM Administration console and generates reports for troubleshooting or inspecting cluster data. It provides cluster data without requiring multiple steps to find the data. The tool design facilitates gathering data from existing sources, comparing the data, and reporting
irregularities. The following figure displays the available reports. Refer to the Cisco Unified CM Administration Guide for further detailed information.

**Figure 13: System Reports**

![System Reports](image)

### General health and troubleshooting tips

For more information on troubleshooting, refer to the *Troubleshooting Guide for Cisco Unified Communications Manager* at the following index:

### Onboard agents support

Onboard agents are third-party software clients, agents or daemons installed on-box, including but not limited to:

- Anti-virus clients
- Uninterruptible Power Supply monitoring agents
- Management agents
Certain types of onboard agents are supported in Cisco Unified CM Release 4.x. The appliance used by Cisco Unified CM Release 5.0 and later releases does not support installation of onboard agents, rather it exposes APIs for third-party integration.

**Call Detail Records and Call Maintenance Records**

CDR and CMRs are used for a variety of uses including billing, chargeback, administrative oversight and diagnostics. In addition to a canned application for managing CDR/CMR, Cisco Unified CM Release 4.x supported various means of direct database access for external systems to access the CDR/CMR data. Cisco Unified CM Release 5.0 and later releases use SFTP to push formatted files off Cisco Unified CM to the requesting application.

When CDR is activated, a CPU utilization increase of 2% is typical, 4% if both CDR and CMR are activated.

**Perfmon counters**

The following table lists some equivalent perfmon counters between Cisco Unified CM Release 4.x and Release 5.x and later.

<table>
<thead>
<tr>
<th>Cisco Unified CM Release 4.x Perfmon Counters</th>
<th>Cisco Unified CM Release 5.x Perfmon Counters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process % Privileged Time</td>
<td>Process STime</td>
</tr>
<tr>
<td>% Processor Time</td>
<td>% CPU Time</td>
</tr>
<tr>
<td>Processor % UserTime</td>
<td>Processor User Percentage</td>
</tr>
<tr>
<td>% Privileged Time</td>
<td>System Percentage</td>
</tr>
<tr>
<td>% Idle Time</td>
<td>Nice Percentage</td>
</tr>
<tr>
<td>% Processor Time</td>
<td>% CPU Time</td>
</tr>
</tbody>
</table>

**Integration with Uninterruptible Power Supplies (UPS)**

As of Cisco Unified CM Release 6.0(1a) and later, the server supports integration with certain models of APC UPS for certain MCS 7800 models. Previous server releases rely on an external script monitoring the UPS and issuing the Cisco CLI for graceful shutdown. See the release notes for Cisco Unified CM 6.0(1b) for more details at http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/rel_notes/6_0_1/cucm-rel_note-601b.html.
Native hardware Out of Band management (OOB)

The supported features of HP iLO and IBM RSA II are enabled for the following areas:

- CPU status/utilization
- Memory status/utilization
- System components temperatures
- Fan status
- Power Supply status
- RAID & disk status
- Network status including NIC
- Operational status, including instrumentation of system/kernel status and data dumps following major system issues, indicating nature/type of the operational problem and degree of severity.

Support of these interfaces on the server includes the following capabilities (specific feature names vary by hardware vendor):

- Remote console (to access boot screens and the Cisco CLI)
- Remote power management

Phone registration status

Phone registration status needs to be monitored for sudden changes. If the registration status changes slightly and readjusts quickly over a short time frame, then it could be indicative of phone move, add, or change. A sudden smaller drop in phone registration counter can be indicative of a localized outage, for instance an access switch or a WAN circuit outage or malfunction. A significant drop in registered phone level needs immediate attention by the administrator. This counter especially needs to be monitored before and after the upgrades to ensure the system is restored completely.

Historical information download

You can also download some historical information using RTMT Trace Log Center or SOAP APIs, such as:

- Cisco AMC Service PerfMonLog is enabled by default but deprecated in Cisco Unified CM Release 6.0 because Cisco RIS Data Collector PerfMonLog is introduced.
- Cisco RIS Data Collector PerfMonLog is disabled by default in Cisco Unified CM Release 5.x and enabled by default in Cisco Unified CM Release 6.0.
Cisco CallManager service stops responding

When the Cisco CallManager service stops responding, the following message displays in the System Event log:

The Cisco CallManager service terminated unexpectedly. It has done this 1 time. The following corrective action will be taken in 60000 ms.
Restart the service.

Other messages you may see in this situation:
Timeout 3000 milliseconds waiting for Cisco CallManager service to connect.
The Cisco Communications Manager failed to start due to the following error:
The service did not respond to the start or control request in a timely fashion.

At this time when devices such as the Cisco Unified IP Phones and gateways, unregister from the Cisco Unified Communications Manager, users receive delayed dial tone, and/or the Cisco Unified Communications Manager server freezes due to high CPU usage. For event log messages that are not included here, view the Cisco Unified Communications Manager Event Logs.

Possible Cause The Cisco CallManager service can stop responding because the service does not have enough resources such as CPU or memory to function. Generally, the CPU utilization in the server is 100 percent at that time.

Solution Depending on what type of interruption you experience, you will need to gather different data that will help determine the root cause of the interruption.

Investigate Cisco CallManager service interruption

Depending on what type of service interruption you experience, you will need to gather different data that will help determine the root cause of the interruption.

You can do the following task if a lack of resources interruption occurs.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Collect Cisco CallManager traces 15 minutes before and after the interruption.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Collect SDL traces 15 minutes before and after the interruption.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Collect perfmon traces if available.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>If the traces are not available, start collecting the perfmon traces and track memory and CPU usage for each process that is running on the server. These will help in the event of another lack of resources interruption.</td>
</tr>
</tbody>
</table>
Database replication fails between the publisher and subscriber

Replicating the database represents a core function of Cisco Unified Communications Manager clusters. The server with the master copy of the database acts as the publisher (first node), while the servers that replicate the database comprise subscribers (subsequent nodes).

Tip

Before you install Cisco Unified Communications Manager on the subscriber server, you must add the subscriber to the Server Configuration window in Cisco Unified Communications Manager Administration to ensure that the subscriber replicates the database that exists on the publisher database server. After you add the subscriber server to the Server Configuration window and then install Cisco Unified Communications Manager on the subscriber, the subscriber receives a copy of the database that exists on the publisher server.

Changes that are made on the publisher server are not reflected on phones that are registered with the subscriber server.

Possible Cause Replication fails between the publisher and subscriber servers.

Solution Verify and, if necessary, repair database replication.

Related Topics

Verify and repair database replication, on page 52

Verify and repair database replication

Procedure

Step 1 Verify database replication. You can use the CLI, Cisco Unified Reporting, or RTMT to verify database replication.

a) To verify using the CLI, see Step 2, on page 52.
b) To verify using Cisco Unified Reporting, see Step 3, on page 53.
c) To verify using RTMT, see Step 4, on page 53.

Step 2 To verify database replication using the CLI, access the CLI and issue the following command to check replication on each node. You will need to run this CLI command on each node to check its replication status. Also, after a subscriber is installed, depending on the number of subscribers, it may take a considerable amount of time to achieve a status of 2:

```
admin: show perf query class "Number of Replicates Created and State of Replication"
=>query class :

- Perf class (Number of Replicates Created and State of Replication) has instances and values:
  ReplicateCount -> Number of Replicates Created = 344
  ReplicateCount -> Replicate_State = 2
```
Be aware that the Replicate_State object shows a value of 2 in this case. The following list shows the possible values for Replicate_State:

a) 0—This value indicates that replication did not start. Either no subsequent nodes (subscribers) exist, or the Cisco Database Layer Monitor service is not running and has not been running since the subscriber was installed.
b) 1—This value indicates that replicates have been created, but their count is incorrect.
c) 2—This value indicates that replication is good.
d) 3—This value indicates that replication is bad in the cluster.
e) 4—This value indicates that replication setup did not succeed.

**Step 3**
To verify database replication using Cisco Unified Reporting, perform the following tasks.

a) From the Navigation drop-down list box in the upper, right corner in Cisco Unified Communications Manager Administration, choose Cisco Unified Reporting.
b) After Cisco Unified Reporting displays, click **System Reports**.
c) Generate and view the **Cisco Unified CM Database Status** report, which provides debugging information for database replication. Once you have generated the report, open it and look at the **Cisco Unified CM Database Status**. It gives the RTMT replication counters for all servers in the cluster. All servers should have a replicate state of 2, and all servers should have the same number of replicates created.

If you see any servers whose replicate states are not equal to 2 in the above status check, inspect the “Replication Server List” on this report. It shows which servers are connected and communicating with each node. Each server should show itself as local (in its list) and the other servers as active connected. If you see any servers as dropped, it usually means there is a communication problem between the nodes.

d) If you want to do so, generate and view the **Cisco Unified CM Database Status** report, which provides a snapshot of the health of the Cisco Unified Communications Manager database.

**Step 4**
To verify database replication using RTMT, perform the following tasks:

a) Open the Cisco Unified Real-Time Monitoring Tool (RTMT).
b) Click the **CallManager** tab.
c) Click **Database Summary**. The Replication Status pane displays.

The following list shows the possible values for the Replication Status pane:

i) 0—This value indicates that replication has not started. Either no subsequent nodes (subscribers) exist, or the Cisco Database Layer Monitor service is not running and has not been running since the subscriber was installed.
j) 1—This value indicates that replicates have been created, but their count is incorrect.
k) 2—This value indicates that replication is good.
l) 3—This value indicates that replication is bad in the cluster.
m) 4—This value indicates that replication setup did not succeed.

i) To view the Replicate_State performance monitoring counter, choose **System > Performance > Open Performance Monitoring**. Double-click the publisher database server (first node) to expand the performance monitors. Click **Number of Replicates Created and State of Replication**. Double-click **Replicate_State**. Click **ReplicateCount** from the **Object Instances** window and click **Add**.

**Tip**  
To view the definition of the counter, right click the counter name and choose **Counter Description**.

**Step 5**
If all the servers have a good RTMT status, but you suspect the databases are not in sync, you can run the CLI command **utils dbreplication status** (If any of the servers showed an RTMT status of 4, proceed to **Step 6**, on page 54).
This status command can be run on all servers by using `utils dbreplication status all` or on one subscriber by using `utils dbreplication status <hostname>`.

The status report will tell you if any tables are suspect. If there are suspect tables, you will want to do a replication repair CLI command to sync the data from the publisher server to the subscriber servers.

The replication repair can be done on all subscriber servers (using the all parameter) or on just one subscriber server by using the following: `utils dbreplication repair usage:utils dbreplication repair [nodename]|all`.

After running the replication repair, which can take several minutes, you can run another status command to verify that all tables are now in sync. If tables are in sync after running the repair, you are successful in fixing replication.

**Note** Only do Step 6, on page 54 if one of the servers showed an RTMT status of 4, or had a status of 0 for more than four hours.

**Step 6** Generate and view the Cisco Unified CM Database Status report, which provides debugging information for database replication. For each subscriber server that has a bad RTMT status, check that the hosts, rhosts, sqlhosts, and services files have the appropriate information.

Generate and view the Cisco Unified CM Cluster Overview report. Verify that the subscriber servers have the same version, verify that connectivity is good, and verify that time delay is within tolerances.

If the preceding conditions are acceptable, do the following to reset replication on that subscriber server:

a) At the subscriber server, perform the CLI command `utils dbreplication stop`
b) Do this for all subscriber servers that have an RTMT value of 4
c) At the publisher server, perform the CLI command `utils dbreplication stop`
d) At the publisher server, perform the CLI command `utils dbreplication reset <hostname>` where `<hostname>` is the hostname of the subscriber server that needs to be reset. If all subscriber servers need to be reset, use command `utils dbreplication reset all`.

---

# Database replication does not occur on lost node

Database replication does not occur when connectivity is restored on lost node recovery. You can verify the state of replication. Only use the following procedure if you have already tried to reset replication on the node, and have been unsuccessful.

**Possible Cause**

The CDR check remains stuck in a loop, due to a delete on device table.

1. **Solution** Run `utils dbreplication stop` on the affected subscribers. You can run them all at once.

2. **Solution** Wait until step 1 completes, then run `utils dbreplication stop` on the affected publisher server.

3. **Solution** Run `utils dbreplication cluster reset` from the affected publisher server. When you run the command, the log name gets listed in the log file. Watch this file to monitor the process status. The path is: `/var/log/active/cm/trace/dbl/sdi`
4 **Solution** From the affected publisher, run `utils dbreplication reset all`.

5 **Solution** Stop and restart all the services on all the subscriber servers [or restart/reboot all the systems (subscriber servers)] in the cluster to get the service changes. Do this only after `utils dbreplication status` shows Status 2.

**Related Topics**

- Database replication fails between the publisher and subscriber, on page 52

### Database tables out of synchronization do not trigger alert

Out of sync means that two servers in the cluster do not contain the same information in a specific database table.

On Cisco Unified Communications Manager Version 6.x or later, the symptoms include unexpected call processing behaviors. Calls do get not routed or handled as expected. The symptoms may occur on either the publisher or on the subscriber servers.

On Cisco Unified Communications Manager Version 5.x, the symptoms include unexpected call processing behaviors. Calls do not get routed or handled as expected but only when the publisher server is offline. If you see these symptoms, you can run the `utils dbreplication status` command “Out of sync” displays. If “Out of sync” does not display, this is not the problem.

**Possible Cause** Database tables remain out of sync between nodes. Replication alerts only indicate failure in the replication process and do not indicate when database tables are out of sync. Normally, if replication is working, tables should remain in sync. Instances can occur in which replication appears to be working, but database tables are “Out of sync”.

1 **Solution** Reset cluster replication by using CLI commands. Ensure servers in the cluster are online with full IP connectivity for this to work. Confirm that all servers in the cluster are online by using platform CLI and Cisco Unified Reporting.

2 **Solution** If the servers are in Replication State 2, use the `utils dbreplication repair server name` command on the publisher server.

**Solution** If the servers are not in Replication State 2, use the `utils dbreplication stop` command on all subscriber servers.

**Solution** Then, use the `utils dbreplication stop` and then `utils dbreplication reset all` commands on the publisher server.
Reset database replication when reverting to prior release

If you revert the servers in a cluster to run an older product release, you must manually reset database replication within the cluster. To reset database replication after you revert all the cluster servers to the older product release, use the `utils dbreplication reset` command all on the publisher server.

When you switch versions by using Cisco Unified Communications Operating System Administration or the CLI, you get a message reminding you about the requirement to reset database replication if you are reverting to an older product release.

Useful commands and utilities

This section provides a quick reference for commands and utilities to help you troubleshoot a Cisco Unified Communications Manager server with root access disabled.

The following table provides a summary of the CLI commands and GUI selections that you can use to gather information to troubleshoot various system problems.

Table 8: Summary of CLI commands and GUI selections

Overview

Simple Network Management Protocol (SNMP), an application layer protocol, facilitates the exchange of management information among network devices, such as nodes and routers. It comprises part of the TCP/IP suite. System administrators can remotely manage network performance, find and solve network problems, and plan for network growth by using SNMP.

Instead of defining a large set of commands, SNMP places all operations in a get-request, get-next-request, get-bulk-request, and set-request format. For example, an SNMP manager can get a value from an SNMP agent or store a value in that SNMP agent. The SNMP manager can comprise part of a network management system (NMS), and the SNMP agent can reside on a networking device such as a router.

SNMP comprises of three parts—SNMP manager, SNMP agent, and MIBs. You can compile the Cisco MIB with your network management software.
The NMS uses the Cisco MIB variables to set device variables and to poll devices on the internetwork for specific information. The results of a poll can get graphed and analyzed to help you troubleshoot internetwork problems, increase network performance, verify the configuration of devices, and monitor traffic loads.

The SNMP agent gathers data from the MIB, which is the repository for information about device parameters and network data. The SNMP agent also can send traps (notifications) of certain events, to the SNMP manager. The Cisco host //ftp.cisco.com makes available the Cisco trap file, “mib.traps,” which documents the format of Cisco traps.

The SNMP manager uses information in the MIB to perform the operations as described:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieve a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieve the value following the named variable. Often used to retrieve variables from within a table. With this operation, an SNMP manager does not need to know the exact variable name. A sequential search gets performed to find the needed variable from within the MIB.</td>
</tr>
<tr>
<td>get-response</td>
<td>Reply to a get-request, get-next-request, get-bulk-request, and set-request that an NMS sent.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Fills the get-response with up to max-repetition number of get-next interactions, similar to get-next-request.</td>
</tr>
<tr>
<td>set-request</td>
<td>Store a value in a specific variable.</td>
</tr>
<tr>
<td>traps</td>
<td>Sent by an SNMP agent to an SNMP manager to indicate that some event occurred.</td>
</tr>
</tbody>
</table>

**SNMP versioning**

Three versions of SNMP exist: version 1 (SNMPv1), version 2 (SNMPv2), and version 3 (SNMPv3). SNMPv1 represents the initial implementation of SNMP that functions within the specifications of the Structure of Management Information (SMI) and operates over protocols, such as User Datagram Protocol (UDP) and IP.

The SNMPv1 SMI defines highly structured MIB tables that are used to group objects that contain multiple variables. Tables contain zero or more rows, which are indexed, so SNMP can retrieve or alter an entire row with a supported command.

With SNMPv1, the NMS issues a request, and managed devices return responses. Agents use the Trap operation to asynchronously inform the NMS of a significant event.

As with SNMPv1, SNMPv2c functions within the specifications of SMI. MIB modules contain definitions of interrelated managed objects. Be aware that the operations that are used in SNMPv1 are similar to those that are used in SNMPv2. The SNMPv2 trap operation, for example, serves the same function as that used in SNMPv1, but it uses a different message format and replaces the SNMPv1 trap.

The Inform operation in SNMPv2c enables one NMS to send trap information to another NMS and to receive a response from the NMS.

SNMPv3 provides the following security features:
• Authentication—Verifying that the request comes from a genuine source.
• Privacy—Encrypting data.
• Authorization—Verifying that the user allows the requested operation.
• Access control—Verifying that the user has access to the objects that are requested.

SNMPv3 prevents packets from being exposed on the network. Instead of using community strings like SNMP v1 and v2, SNMP v3 uses SNMP users.

Related Topics
   SNMP community strings and users, on page 62

**SNMP and Cisco Unified CM basics**

A network that uses SNMP requires three key components—managed devices, agents, and network management software (NMS).

- Managed devices—Devices that contain SNMP agents and reside on a network. Managed devices collect and store information and make it available by using SNMP.
  - The first node in the Cisco Unified CM cluster acts as the managed device. In Cisco Unified CM BE, the server on which Cisco Unified CM is installed acts as the managed device.

- Agents—Software modules that contain local knowledge of management information and translates it into a form that is compatible with SNMP.
  - Cisco Unified CM uses a master agent and subagent components to support SNMP. The master agent acts as the agent protocol engine and performs the authentication, authorization, access control, and privacy functions that relate to SNMP requests. It contains a few Management Information Base (MIB) variables. The master agent also connects and disconnects subagents after the subagent completes necessary tasks.
  - Cisco Unified CM uses a subagent to interact with the local Cisco Unified CM only. The Cisco Unified CM subagents send trap and information messages to the SNMP Master Agent, and the SNMP Master Agent communicates with the SNMP trap receiver (notification destination).

- NMS—SNMP management application that runs on a PC and provides the bulk of the processing and memory resources that are required for network management. It executes applications that monitor and control managed devices. Cisco Unified Communications Manager works with the following NMS:
  - CiscoWorks2000
  - HP OpenView
  - Third-party applications that support SNMP and Cisco Unified Communications Manager SNMP interfaces
SNMP basic commands

Managed devices get monitored and controlled by using four basic SNMP commands: read, write, trap, and traversal operations.

- NMS uses the read command to monitor managed devices. The NMS examines different variables that are maintained by managed devices.
- NMS uses the write command to control managed devices. The NMS changes the values of variables stored within managed devices.
- Managed devices use the trap command to asynchronously report events to the NMS. When certain types of events occur, a managed device sends a trap to the NMS.
- NMS uses traversal operations to determine which variables a managed device supports and to sequentially gather information in variable tables, such as a routing table.

SNMP community strings and users

Although SNMP community strings provide no security, the strings authenticate access to MIB objects and function as embedded passwords. You configure SNMP community strings for SNMP v1 and v2c only. SNMP v3 does not use community strings. It uses SNMP users that serve the same purpose as community strings but provide security because encryption or authentication is configured.

No default community string or user exists.

SNMP and Cisco MIBs

You can access the Cisco MIB variables by using SNMP which facilitates the exchange of management information between network devices. The SNMP system comprises three parts: SNMP manager, SNMP agent, and MIB.

Instead of defining a large set of commands, SNMP places all operations in a get-request, get-next-request, get-bulk-request, and set-request format. For example, an SNMP manager can get a value from an SNMP agent or store a value in that SNMP agent. The SNMP manager can comprise part of a network management system (NMS), and the SNMP agent can reside on a networking device such as a router. You can compile the Cisco MIB with your network management software. If SNMP is configured on a router, the SNMP agent can respond to MIB-related queries that are being sent by the NMS.

The NMS uses the Cisco MIB variables to set device variables and to poll devices on the internetwork for specific information. The results of a poll can get graphed and analyzed to help you troubleshoot internetwork problems, increase network performance, verify the configuration of devices, monitor traffic loads, and more.

The SNMP agent gathers data from the MIB, which provides the repository for information about device parameters and network data. The SNMP agent also can send traps (notifications) of certain events, to the SNMP manager. The Cisco host //ftp.cisco.com makes available the Cisco trap file, “mib.traps,” which documents the format of Cisco traps.

The SNMP manager uses information in the MIB to perform the operations as described:
<table>
<thead>
<tr>
<th>Operation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>get-request</td>
<td>Retrieve a value from a specific variable.</td>
</tr>
<tr>
<td>get-next-request</td>
<td>Retrieve the value following the named variable. Often used to retrieve variables from within a table. With this operation, an SNMP manager does not need to know the exact variable name. A sequential search is performed to find the needed variable from within the MIB.</td>
</tr>
<tr>
<td>get-response</td>
<td>The reply to a get-request, get-next-request, get-bulk-request, and set-request sent by an NMS.</td>
</tr>
<tr>
<td>get-bulk-request</td>
<td>Similar to get-next-request, but fills the get-response with up to max-repetition number of get-next interactions.</td>
</tr>
<tr>
<td>set-request</td>
<td>Store a value in a specific variable.</td>
</tr>
<tr>
<td>traps</td>
<td>An unsolicited message sent by an SNMP agent to an SNMP manager indicating that some event has occurred.</td>
</tr>
</tbody>
</table>

**SNMP traps and informs**

An SNMP agent sends notifications in the form of traps or informs to identify important system events. Traps do not receive acknowledgments from the destination whereas informs do receive acknowledgments.

**Note**

Cisco Unity Connection does not support SNMP traps.

For all notifications, the system sends traps immediately if the corresponding trap flags are enabled. In the case of the syslog agent, the Cisco Unified CM alarms and system-level log messages get sent to syslog daemon for logging. Also, some standard third-party applications send the log messages to syslog daemon for logging. These log messages get logged locally in the syslog files and also get converted into SNMP traps/notifications.

The following list contains Cisco Unified CM SNMP trap and inform messages that are sent to a configured trap destination:

- Cisco Unified CM failed
- Phone failed
- Phones status update
- Gateway failed
- Media resource list exhausted
- Route list exhausted
- Gateway layer 2 change
- Quality report
SNMP trace configuration

For Cisco Unified CM, you can configure traces for the SNMP agent in the Trace Configuration window in Cisco Unified Serviceability by choosing the Cisco Unified CM SNMP Service in the Performance and Monitoring Services service group. A default setting exists for all the agents. For Cisco CDP Agent and Cisco Syslog Agent, you use the command line interface (CLI) to change trace settings, as described in the Command Line Interface Reference Guide for Cisco Unified Solutions.

SNMP tips

Refer to the CISCO-CCM-CAPABILITY-MIB at http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2&mibName=CISCO-CCM-CAPABILITY or to the CISCO-CCM-CAPABILITY MIB topic in the related topics section.

As stated in the CISCO-CCM-CAPABILITY-MIB, ccmPhoneDevicePoolIndex does not get supported, so it returns a 0. The Callmanager device registration alarm currently does not contain the device pool information.

If Cisco CallManager SNMP service is not running, only the following tables in the MIB respond:

- ccmGroupTable
- ccmRegionTable
- ccmRegionPairTable
- ccmDevicePoolTable
- ccmProductTypeTable
- ccmQualityReportAlarmConfigInfo
- ccmGlobalInfo

To get Cisco CallManager SNMP service running, activate and start the service in Cisco Unified Serviceability. Query the following tables in the SYSAPPL-MIB:

- SysApplInstallPkgTable to get an inventory of Cisco Unified Communications Manager applications that are installed on the system.
- SysApplRunTable to get an inventory of Cisco Unified Communications Manager applications that are running on the system.
Cisco Unified Communications Manager uses the following Web application services and servlets: Cisco CallManager Admin, Cisco CallManager Cisco IP Phone Services, Cisco CallManager Personal Directory, Cisco CallManager Serviceability, Cisco CallManager Serviceability RTMT, Cisco Extension Mobility, Cisco Extension Mobility Application, Cisco RTMT Reporter Servlet, Cisco Tomcat Stats Servlet, Cisco Trace Collection Servlet, Cisco AXL Web Service, Cisco Unified Mobile Voice Access Service, Cisco Extension Mobility, Cisco IP Manager Assistant, Cisco Web Dialer Service, Cisco CAR Web Service, and Cisco Dialed Number Analyzer.

SNMP troubleshooting

In general ensure that all the feature and network services are running and verify that the community string or SNMP user is properly configured on the Cisco Unified CM system. You configure the SNMP community string or user by choosing SNMP > V1/V2 > Community String or SNMP > V3 > User in Cisco Unified Serviceability.

Other tips are as follows:

- Cannot poll any MIBs from the system—This condition means that the community string or the SNMP user is not configured on the system or they do not match with what is configured on the system. Check the configuration and reconfigure if necessary.

  Note

  By default, no community string or user is configured on the system.

- Cannot receive any notifications from the system—This condition means that the notification destination is not configured correctly on the system. Verify that you configured the notification destination properly in the Notification Destination (V1/V2c or V3) Configuration window.

- Cannot receive SNMP traps from Cisco Unified Communications Manager node—Verify that you configured the following MIB Object Identifiers (OIDs) that relate to phone registration/deregistration/failure to the following values (the default for both values equals 0):

  ◦ ccmPhoneFailedAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.2) set to 30-3600. You can use this CLI command: `snmpset -c <community string> -v2c <transmitter ipaddress> 1.3.6.1.4.1.9.9.156.1.9.2 .0 i <value>`

  ◦ ccmPhoneStatusUpdateAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.4) set to 30-3600. You can use this CLI command: `snmpset -c <community string> -v2c <transmitter ipaddress> 1.3.6.1.4.1.9.9.156.1.9.4.0 i <value>`

Verify that you configured the notification destination properly in the Notification Destination (V1/V2c or V3) Configuration window.

Verify that you configured the community string/user privileges correctly, including Notify permissions, in the Community String (V1/V2c) or User (V3) Configuration window.
Because System Application Agent cannot show services that are activated and deactivated or monitor Web App services or servlets, use this approach to monitor system health and service status for Cisco Unified Communications Manager applications:

- Use the Serviceability API `getservicestatus` to provide complete status information, including activation status, for both Web applications and non-Web applications. See the AXL Serviceability API Guide for more details.
- Check service status with this CLI command: `utils service list`
- Monitor the servM-generated messages with Syslog (see the following example):

```
Mar 18 16:40:52 ciscart26 local7 6 : 92: Mar 18 11:10:52.630 UTC :
%CCM_SERVICEMANAGER-SERVICEMANAGER-6-ServiceActivated: Service
Activated. Service Name: Cisco CallManager SNMP Service App ID: Cisco
Service Manager Cluster ID: Node ID: ciscart26
```

If an SNMP request specifies multiple OIDs and the variables are pointing to empty tables, you may get a NO_SUCH_NAME (for SNMP V1) or GENERIC ERROR (for SNMP V2c or V3) due to a timeout problem. A timeout can occur as a result of throttling enhancements to protect the Cisco Unified Communications Manager processing engine.

You can retrieve the count of entries in CCMH323DeviceTable and ccmSIPDeviceTable by using scalar objects, so the SNMP Manager (the client) can avoid unnecessary get/getnext operations on these tables when no entries exist. As an SNMP developer, you can use the following workaround for this problem:

- Use the available scalar variables (1.3.6.1.4.1.9.9.156.1.5) to determine table size before accessing the table or perform the `get` operation on the desired table; then, query the non-empty tables.
- Reduce the number of variables that are queried in a single request; for example, for empty tables, if the management application has the timeout set to 3 seconds, specify only 1 OID. (For non-empty tables, it takes 1 second to retrieve one row of data.)
- Increase the response timeout.
- Reduce the number of retries.
- Avoid using `getbulk` SNMP API. The `getbulk` API retrieves the number of records that is specified by MaxRepetitions, so even if the next object goes outside the table or MIB, it gets those objects. Empty tables cause even more delay. Use `getbulk` API for non-empty tables with a known number of records. In these circumstances, set MaxRepetitions to 5 seconds to require a response within 5 seconds.
- Structure SNMP queries to adapt to existing limits.
- Avoid performing multiple `getbulks` to walk the PhoneTable periodically in case a large number of phones are registered to Cisco CallManager. You can use the ccmPhoneStatusUpdateTable, which updates whenever there is a Phone update, to decide whether to walk the PhoneTable.

SNMP/R MIBs

When SNMP/R binaries spike the CPU, collect the following logs and information for analysis:

- Note the processes that are experiencing high CPU usage.
- Check to see if any SNMP polling is occurring and get the polling interval of the application.
- Note the SNMP versions by using the `show packages active snmp` command.
- Execute the `show process using-most cpu` command and collect the output.
- Collect the Perfmon logs by executing the `file get activelog /cm/log/ris/csv/` command.
- Collect the traces for SNMP Master Agent, and other binaries experiencing high CPU.
- Send the above information to Support for further troubleshooting.

When the SNMP Master Agent does not start, check to see if port 161 is open. If the port is open, collect the SNMP Master Agent traces for further analysis.

When migrating from Windows to Linux Cisco Unified CM, the `ccmH323DevRmtCM1InetAddress` has been defined as OctetString in Cisco Unified CM Release 5.x and later. So, the IP Address displays as Hexadecimal instead of the dotted decimal format as displayed in Cisco Unified CM Release 4.x.
Cisco Unified Real-Time Monitoring Tool Tracing PerfMon counters and alerts

This chapter briefly describes the Cisco Unified Communications Real-Time Monitoring Tool (RTMT) tracing capabilities, perfmon objects and counters, and alerts.

- Cisco Unified Real-Time Monitoring, page 69
- Performance monitoring in RTMT, page 70
- Cisco Intercompany Media Engine performance objects and alerts, page 152

Cisco Unified Real-Time Monitoring

The RTMT runs as a client-side application and uses HTTPS and TCP to monitor system performance, device status, device discovery, CTI applications, and voice messaging ports. RTMT can connect directly to devices by using HTTPS to troubleshoot system issues. Cisco Unified RTMT performs the following tasks:

- Monitor a set of predefined management objects that monitor the health of the system.
- Generate various alerts, in the form of e-mails, for objects when values go over/below user-configured thresholds.
- Collect and view traces in various default viewers that exist in RTMT.
- Translate Q931 messages.
- View syslog messages in SysLog Viewer.
- Work with performance-monitoring counters.

In addition to SNMP traps, Cisco Unified RTMT can monitor and parse syslog messages that are provided by the hardware vendors, and then send these alerts to RTMT Alert Central. You can configure RTMT to notify the Cisco Unified CM system administrator when the alerts occur. The notifications can occur by using e-mail or Epage or both.
Be aware the RTMT is best used for a single cluster. For large and enterprise networks that have multiple clusters deployed, Cisco recommends using Cisco Unified Operations Manager. For details about Cisco Unified Operations Manager, go to http://www.cisco.com/en/US/products/ps6535/index.htm.

Performance monitoring in RTMT

Cisco Unified Communications Manager updates performance counters (called PerfMon counters). The counters contain simple, useful information about the system and devices on the system, such as number of registered phones, number of active calls, number of available conference bridge resources, and voice messaging port usage.

You can monitor the performance of the components of the system and the components for the application on the system by choosing the counters for any object. The counters for each object display when the folder expands.

For Cisco Unified Communications Manager, the Cisco CallManager object contains most of the Cisco Unified Communications Manager performance counters, and these counters have only one instance. The instance-based counters that belong to the other objects can have zero or more instances. For example, if two phones are registered to Cisco Unified Communications Manager, two instances of each counter that belong to the Cisco phones object exist.

You can log perfmon counters locally on the computer and use the performance log viewer in RTMT to display the perfmon CSV log files that you collected or the Real-time Information Server Data Collection (RISDC) perfmon logs.

RTMT provides alert notifications for troubleshooting performance. It also periodically polls performance counters to display data for that counter. Performance monitoring allows you to perform the following tasks:

- Monitor performance counters including all the Cisco Unified Communications Manager servers in a cluster (if applicable), TFTP servers, and database servers.
- Continuously monitor a set of preconfigured objects and receive notification in the form of an e-mail message.
- Associate counter threshold settings to alert notification. An e-mail or popup message provides notification to the administrator.
- Save and restore settings, such as counters that get monitored, threshold settings, and alert notifications, for customized troubleshooting tasks.
- Display up to six perfmon counters in one chart for performance comparisons.

PerfMon alert notifications

The alert notifications keep you updated on system and Cisco Unified Communications Manager issues. You can use the parameters that are already contained in RTMT or configure your own. The following table lists the available settings and describes each. The Threshold, Value Calculated As, Duration, Frequency, and Schedule panes of RTMT contain the settings.
### Table 9: Counter alert configuration parameters

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Threshold Pane</strong></td>
<td></td>
</tr>
</tbody>
</table>
| Trigger alert when Over and Under conditions get met | Check the box and enter the value that applies.  
  • Over—Check this box to configure a maximum threshold that must be met before an alert notification is activated. In the Over value field, enter a value. For example, enter a value that equals the number of calls in progress.  
  • Under—Check this box to configure a minimum threshold that must be met before an alert notification is activated. In the Under value field, enter a value. For example, enter a value that equals the number of calls in progress.  
  **Tip** Use these boxes in conjunction with the Frequency and Schedule configuration parameters. |
| **Value Calculated As Pane** | Click the radio button that applies.  
  • Absolute—Choose Absolute to display the data at its current status. These counter values are cumulative.  
  • Delta—Choose Delta to display the difference between the current counter value and the previous counter value.  
  • Delta Percentage—Choose Delta Percentage to display the counter performance changes in percentage. |
| **Duration Pane**        |                                                                             |
| Trigger alert only when value constantly...; Trigger alert immediately | • Trigger alert only when value constantly...—If you want the alert notification only when the value is constantly below or over threshold for a desired number of seconds, click this radio button and enter seconds after which you want the alert to be sent.  
  • Trigger alert immediately—If you want the alert notification to be sent immediately, click this radio button. |
| **Frequency Pane**       |                                                                             |
Click the radio button that applies.

• Trigger alert on every poll—If you want the alert notification to activate on every poll when the threshold is met, click this radio button.
  
  For example, if the calls in progress continue to go over or under the threshold, the system does not send another alert notification. When the threshold is normal (between 50 and 100 calls in progress), the system deactivates the alert notification; however, if the threshold goes over or under the threshold value again, the system reactivates alert notification.

• Trigger up to...—If you want the alert notification to activate at certain intervals, click this radio button and enter the number of alerts that you want sent and the number of minutes within which you want them sent.

24-hours daily; start/stop

Click the radio button that applies:

• 24-hours daily—If you want the alert to be triggered 24 hours a day, click this radio button.

• Start/Stop—If you want the alert notification activated within a specific time frame, click the radio button and enter a start time and a stop time. If the check box is checked, enter the start and stop times of the daily task. For example, you can configure the counter to be checked every day from 9:00 am to 5:00 pm or from 9:00 pm to 9:00 am.

If you require an e-mail notifications, check the Enable E-mail box.

You can also use data sampling in RTMT. The perfmon counters that display in the RTMT Perfmon Monitoring pane have green dots that represent samples of data over time. You can configure the number of samples to collect and the number of data points to show in the chart. The following table lists and describes the parameters.

Table 10: Data sample parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Absolute</td>
<td>Because some counter values are accumulative, choose Absolute to display the data at its current status.</td>
</tr>
<tr>
<td>Delta</td>
<td>Choose Delta to display the difference between the current counter value and the previous counter value.</td>
</tr>
</tbody>
</table>
PerfMon objects and counters for Cisco Unified Communications Manager

This section provides information on Cisco Unified Communications Manager PerfMon objects and counters.

Cisco Analog Access

The Cisco Analog Access object provides information about registered Cisco Analog Access gateways. The following table contains information about Cisco Analog Access counters.

Table 11: Cisco Analog Access

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutboundBusyAttempts</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempts a call through the analog access gateway when all ports were busy.</td>
</tr>
<tr>
<td>PortsActive</td>
<td>This counter represents the number of ports that are currently in use (active). A port appears active when a call is in progress on that port.</td>
</tr>
<tr>
<td>PortsOutOfService</td>
<td>This counter represents the number of ports that are currently out of service. Counter applies only to loop-start and ground-start trunks.</td>
</tr>
</tbody>
</table>

Cisco Annunciator Device

The Cisco Annunciator Device object provides information about registered Cisco annunciator devices. The following table contains information about Cisco Annunciator counters.

Table 12: Cisco Annunciator Device

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate an annunciator resource from an annunciator device and failed; for example, because all resources were already in use.</td>
</tr>
<tr>
<td>ResourceActive</td>
<td>This counter represents the total number of annunciator resources that are currently active (in use) for an annunciator device.</td>
</tr>
</tbody>
</table>

Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delta Percentage</td>
<td>Choose Delta Percentage to display the counter performance changes in percentage.</td>
</tr>
</tbody>
</table>
Cisco CallManager

The Cisco CallManager object provides information about calls, applications, and devices that are registered with the Cisco Unified Communications Manager. The following table contains information about Cisco CallManager counters.

Table 13: Cisco CallManager

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AnnunciatorOutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate an annunciator resource from those that are registered to a Cisco Unified Communications Manager when none were available.</td>
</tr>
<tr>
<td>AnnunciatorResourceActive</td>
<td>This counter represents the total number of annunciator resources that are currently in use on all annunciator devices that are registered with a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>AnnunciatorResourceAvailable</td>
<td>This counter represents the total number of annunciator resources that are not active and are currently available.</td>
</tr>
<tr>
<td>AnnunciatorResourceTotal</td>
<td>This counter represents the total number of annunciator resources that are provided by all annunciator devices that are currently registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>AuthenticatedCallsActive</td>
<td>This counter represents the number of authenticated calls that are currently active (in use) on Cisco Unified Communications Manager. An authenticated call designates one in which all the endpoints that are participating in the call are authenticated. An authenticated phone uses the Transport Layer Security (TLS) authenticated Skinny protocol signaling with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>AuthenticatedCallsCompleted</td>
<td>This counter represents the number of authenticated calls that connected and subsequently disconnected through Cisco Unified Communications Manager. An authenticated call designates one in which all the endpoints that are participating in the call are authenticated. An authenticated phone uses the TLS authenticated Skinny protocol signaling with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>AuthenticatedPartiallyRegisteredPhone</td>
<td>This counter represents the number of partially registered, authenticated SIP phones.</td>
</tr>
<tr>
<td>AuthenticatedRegisteredPhones</td>
<td>This counter represents the total number of authenticated phones that are registered to Cisco Unified Communications Manager. An authenticated phone uses the TLS authenticated Skinny protocol signaling with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>BRIChannelsActive</td>
<td>This counter represents the number of BRI voice channels that are currently in an active call on this Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>BRISpansInService</td>
<td>This counter represents the number of BRI spans that are currently available for use.</td>
</tr>
<tr>
<td>CallManagerHeartBeat</td>
<td>This counter represents the heartbeat of Cisco Unified Communications Manager. This incremental count indicates that Cisco Unified Communications Manager is up and running. If the count does not increment, that indicates that Cisco Unified Communications Manager is down.</td>
</tr>
<tr>
<td>CallsActive</td>
<td>This counter represents the number of voice or video streaming connections that are currently in use (active); in other words, the number of calls that actually have a voice path that is connected on Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>CallsAttempted</td>
<td>This counter represents the total number of attempted calls. An attempted call occurs any time that a phone goes off hook and back on hook, regardless of whether any digits were dialed, or whether it connected to a destination. The system considers some call attempts during feature operations (such as transfer and conference) to be attempted calls.</td>
</tr>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the number of calls that were actually connected (a voice path or video stream was established) through Cisco Unified Communications Manager. This number increases when the call terminates.</td>
</tr>
</tbody>
</table>

Cisco Unified Real-Time Monitoring Tool Tracing PerfMon counters and alerts

PerfMon objects and counters for Cisco Unified Communications Manager
### Counter Description

**CallsInProgress**
This counter represents the number of voice or video calls that are currently in progress on Cisco Unified Communications Manager, including all active calls.

When a phone that is registered with Skinny Client Control Protocol (SCCP) goes off hook, the CallsInProgress progress counter increments until it goes back on hook.

For Cisco Unified IP Phones 7902, 7905, 7912, 7940, and 7960 that register with SIP, the CallsInProgress counter increments when the dial softkey is pressed.

For all other phones that are running SIP, the CallsInProgress counter increments when the first digit is pressed.

When all voice or video calls that are in progress are connected, the number of CallsInProgress represents the number of CallsActive. The counter decreases by one when a phone goes back on hook.

**CM_MediaTermPointsRequestsThrottled**
This counter represents the total number of media termination point (MTP) resource requests that have been denied due to throttling (a resource from this MTP was not allocated because, as specified by the Cisco CallManager service parameter, MTP and Transcoder Resource Throttling Percentage, the MTP was being utilized beyond the configured throttle percentage). This counter increments each time a request for an MTP on this Cisco Unified Communications Manager (Cisco Unified CM) node is requested and denied due to MTP throttling and reflects a running total since the start of the Cisco CallManager service.

**CM_TranscoderRequestsThrottled**
This counter represents the total number of transcoder resource requests that have been denied due to throttling (a resource from this transcoder was not allocated because, as specified by the Cisco CallManager service parameter MTP and Transcoder Resource Throttling Percentage, the transcoder was being utilized beyond the configured throttle percentage). This counter increments each time a request for a transcoder on this Cisco Unified Communications Manager (Cisco Unified CM) node is requested and denied due to transcoder throttling and reflects a running total since the start of the Cisco CallManager service.

**EncryptedCallsActive**
This counter represents the number of encrypted calls that are currently active (in use) on this Cisco Unified Communications Manager. An encrypted call represents one in which all the endpoints that are participating in the call are encrypted.

**EncryptedCallsCompleted**
This counter represents the number of encrypted calls that were connected and subsequently disconnected through this Cisco Unified Communications Manager. An encrypted call represents one in which all the endpoints that are participating in the call are encrypted.

**EncryptedPartiallyRegisteredPhones**
This counter represents the number of partially registered, encrypted SIP phones.
<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EncryptedRegisteredPhones</td>
<td>This counter represents the total number of encrypted phones that are registered on this Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>FXOPortsActive</td>
<td>This counter represents the number of FXO ports that are currently in use (active) on a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>FXOPortsInService</td>
<td>This counter represents the number of FXO ports that are currently available for use in the system.</td>
</tr>
<tr>
<td>FXSPortsActive</td>
<td>This counter represents the number of FXS ports that are currently in use (active) on a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>FXSPortsInService</td>
<td>This counter represents the number of FXS ports that are currently available for use in the system.</td>
</tr>
<tr>
<td>HuntListsInService</td>
<td>This counter represents the number of hunt lists that are currently in service on Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>HWConferenceActive</td>
<td>This counter represents the total number of hardware conference resources that are provided by all hardware conference bridge devices that are currently registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>HWConferenceCompleted</td>
<td>This counter represents the total number of conferences that used a hardware conference bridge (hardware-based conference devices such as Cisco Catalyst 6000, Catalyst 4000, Cisco VG200, Cisco series 26xx and 36xx) that is allocated from Cisco Unified Communications Manager and that have completed, which means that the conference bridge has been allocated and released. A conference activates when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>HWConferenceOutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate a hardware conference resource from those that are registered to a Cisco Unified Communications Manager when none was available.</td>
</tr>
<tr>
<td>HWConferenceResourceActive</td>
<td>This counter represents the total number of conference resources that are in use on all hardware conference devices (such as Cisco Catalyst 6000, Catalyst 4000, Cisco VG200, Cisco series 26xx and 36xx) that are registered with Cisco Unified Communications Manager. System considers conference to be active when one or more calls are connected to a bridge.</td>
</tr>
<tr>
<td>HWConferenceResourceAvailable</td>
<td>This counter represents the number of hardware conference resources that are not in use and that are available to be allocated on all hardware conference devices (such as Cisco Catalyst 6000, Cisco Catalyst 4000, Cisco VG200, Cisco series 26xx and 36xx) that are allocated from Cisco Unified Communications Manager and that have been completed, which means that the conference bridge has been allocated and released. A conference activates when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>

</tr>
<tr>
<td>HWConferenceResourceTotal</td>
<td>This counter represents the number of active conferences on all hardware conference devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>InitializationState</td>
<td>This counter represents the current initialization state of Cisco Unified Communications Manager. Cisco Unified Communications Manager includes the following initialization state values:</td>
</tr>
<tr>
<td></td>
<td>1-Database; 2-Regions; 3-Locations; 4-QoS Policy; 5-Time Of Day; 6-AAR Neighborhoods; 7-Digit Analysis; 8-Route Plan; 9-Call Control; 10-RSVP Session Manager; 11-Supplementary Services; 12-Directory; 13-SDL Link; 14-Device; 100-Initialization Complete.</td>
</tr>
<tr>
<td></td>
<td>Not all states display when this counter is used. This does not indicate that an error occurred; it simply indicates that the state(s) initialized and completed within the refresh period of the performance monitor.</td>
</tr>
<tr>
<td>LocationOutOfResources</td>
<td>This counter represents the total number of times that a call through Locations failed due to the lack of bandwidth.</td>
</tr>
<tr>
<td>MOHMulticastResourceActive</td>
<td>This counter represents the total number of multicast MOH resources that are currently in use (active) on all MOH servers that are registered with a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>MOHMulticastResourceAvailable</td>
<td>This counter represents the total number of active multicast MOH connections that are not being used on all MOH servers that are registered with a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>MOHOutOfResources</td>
<td>This counter represents the total number of times that the Media Resource Manager attempted to allocate an MOH resource when all available resources on all MOH servers that are registered with a Cisco Unified Communications Manager were already active.</td>
</tr>
<tr>
<td>MOHTotalMulticastResources</td>
<td>This counter represents the total number of multicast MOH resources or connections that are provided by all MOH servers that are currently registered with a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>MOHTotalUnicastResources</td>
<td>This counter represents the total number of unicast MOH resources or streams that are provided by all MOH servers that are currently registered with Cisco Unified Communications Manager. Each MOH unicast resource uses one stream.</td>
</tr>
<tr>
<td>MOHUnicastResourceActive</td>
<td>This counter represents the total number of unicast MOH resources that are currently in use (active) on all MOH servers that are registered with Cisco Unified Communications Manager. Each MOH unicast resource uses one stream.</td>
</tr>
<tr>

</tr>
<tr>
<td>MTPOutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted but failed to allocate an MTP resource from one MTP device that is registered with Cisco Unified Communications Manager. This also means that no transcoders were available to act as MTPs.</td>
</tr>
<tr>
<td>MTPResourceActive</td>
<td>This counter represents the total number of MTP resources that are currently in use (active) on all MTP devices that are registered with a Cisco Unified Communications Manager. Each MTP resource uses two streams. An MTP in use represents one MTP resource that has been allocated for use in a call.</td>
</tr>
<tr>
<td>MTPResourceAvailable</td>
<td>This counter represents the total number of MTP resources that are not in use and are available to be allocated on all MTP devices that are registered with Cisco Unified Communications Manager. Each MTP resource uses two streams. An MTP in use represents one MTP resource that has been allocated for use in a call.</td>
</tr>
<tr>
<td>MTPResourceTotal</td>
<td>This counter represents the total number of media termination point (MTP) resources that are provided by all MTP devices that are currently registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>MTP_RequestsThrottled</td>
<td>This counter represents the total number of media termination point (MTP) resource requests that have been denied due to throttling (a resource from this MTP was not allocated because, as specified by the Cisco CallManager service parameter MTP and Transcoder Resource Throttling Percentage, the MTP was being utilized beyond the configured throttle percentage). This counter increments each time a resource is requested from this MTP and is denied due to throttling. This counter reflects a running total since the MTP device registered with the Cisco CallManager service.</td>
</tr>
<tr>
<td>PartiallyRegisteredPhone</td>
<td>This counter represents the number of partially registered phones that are running SIP.</td>
</tr>
<tr>
<td>PRIChannelsActive</td>
<td>This counter represents the number of PRI voice channels that are in an active call on a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>PRISpansInService</td>
<td>This counter represents the number of PRI spans that are currently available for use.</td>
</tr>
<tr>
<td>RegisteredAnalogAccess</td>
<td>This counter represents the number of registered Cisco analog access gateways that are registered with system. The count does not include the number of Cisco analog access ports.</td>
</tr>
<tr>
<td>RegisteredHardwarePhones</td>
<td>This counter represents the number of Cisco hardware IP phones (for example, Cisco Unified IP Phones 7960, 7940, 7910, and so on.) that are currently registered in the system.</td>
</tr>
<tr>
<td>RegisteredMGCPGateway</td>
<td>This counter represents the number of MGCP gateways that are currently registered in the system.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RegisteredOtherStationDevices</td>
<td>This counter represents the number of station devices other than Cisco hardware IP phones that are currently registered in the system (for example, Cisco IP SoftPhone, CTI port, CTI route point, Cisco voice-mail port).</td>
</tr>
<tr>
<td>SIPLineServerAuthorizationChallenges</td>
<td>This counter represents the number of authentication challenges for incoming SIP requests that the Cisco Unified Communications Manager server issued to phones that are running SIP. An authentication challenge occurs when a phone that is running SIP with Digest Authentication enabled sends a SIP line request to Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>SIPLineServerAuthorizationFailures</td>
<td>This counter represents the number of authentication challenge failures for incoming SIP requests from SIP phones to the Cisco Unified Communications Manager server. An authentication failure occurs when a SIP phone with Digest Authentication enabled sends a SIP line request with bad credentials to Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>SIPTrunkAuthorization</td>
<td>This counter represents the number of application-level authorization checks for incoming SIP requests that Cisco Unified Communications Manager has issued to SIP trunks. An application-level authorization check occurs when Cisco Unified Communications Manager compares an incoming SIP request to the application-level settings on the SIP Trunk Security Profile Configuration window in Cisco Unified Communications Manager Administration.</td>
</tr>
<tr>
<td>SIPTrunkAuthorizationFailures</td>
<td>This counter represents the number of application-level authorization failures for incoming SIP requests that have occurred on Cisco Unified Communications Manager SIP trunks. An application-level authorization failure occurs when Cisco Unified Communications Manager compares an incoming SIP request to the application-level authorization settings on the SIP Trunk Security Profile Configuration window in Cisco Unified Communications Manager Administration and finds that authorization for one or more of the SIP features on that window is not allowed.</td>
</tr>
<tr>
<td>SIPTrunkServerAuthenticationChallenges</td>
<td>This counter represents the number of authentication challenges for incoming SIP requests that Cisco Unified Communications Manager issued to SIP trunks. An authentication challenge occurs when a SIP trunk with Digest Authentication enabled sends a SIP request to Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>SIPTrunkServerAuthenticationFailures</td>
<td>This counter represents the number of authentication challenge failuresthat occurred for incoming SIP requests from SIP trunks to Cisco Unified Communications Manager. An authentication failure occurs when a SIP trunk with Digest Authentication enabled sends a SIP request with bad credentials to Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>SWConferenceActive</td>
<td>This counter represents the number of active conferences on all software conference devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SWConferenceCompleted</td>
<td>This counter represents the total number of conferences that used a software conference bridge that was allocated from a Cisco Unified Communications Manager and that have been completed, which means that the conference bridge has been allocated and released. A conference activates when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>SWConferenceOutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate a software conference resource from those that are registered to Cisco Unified Communications Manager when none was available. Counter includes failed attempts to add a new participant to an existing conference.</td>
</tr>
<tr>
<td>SWConferenceResourceActive</td>
<td>This counter represents the total number of conference resources that are in use on all software conference devices that are registered with Cisco Unified Communications Manager. The system considers a conference to be active when one or more calls connect to a bridge. One resource equals one stream.</td>
</tr>
<tr>
<td>SWConferenceResourceAvailable</td>
<td>This counter represents the number of new software-based conferences that can be started at the same time, for Cisco Unified Communications Manager. You must have a minimum of three streams available for each new conference. One resource equals one stream.</td>
</tr>
<tr>
<td>SWConferenceResourceTotal</td>
<td>This counter represents the total number of software conference resources that are provided by all software conference bridge devices that are currently registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>SystemCallsAttempted</td>
<td>This counter represents the total number of server-originated calls and attempted calls to the Unity message waiting indicator (MWI).</td>
</tr>
<tr>
<td>T1ChannelsActive</td>
<td>This counter represents the number of T1 CAS voice channels that are in an active call on a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>T1SpansInService</td>
<td>This counter represents the number of T1 CAS spans that are currently available for use.</td>
</tr>
<tr>
<td>TLSConnectedSIPTrunks</td>
<td>This counter represents the number of SIP trunk connections that are configured and connected via Transport Layer Security (TLS).</td>
</tr>
<tr>
<td>TLSConnectedWSM</td>
<td>This counter represents the number of WSM Connectors that are configured and connected to Motorola WSM via Transport Layer Security (TLS).</td>
</tr>
<tr>
<td>TranscoderOutOfResources</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate a transcoder resource from a transcoder device that is registered to a Cisco Unified Communications Manager when none was available.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>TranscoderResourceActive</td>
<td>This counter represents the total number of transcoders that are in use on all transcoder devices that are registered with Cisco Unified Communications Manager. A transcoder in use represents one transcoder resource that has been allocated for use in a call. Each transcoder resource uses two streams.</td>
</tr>
<tr>
<td>TranscoderResourceAvailable</td>
<td>This counter represents the total number of transcoders that are not in use and that are available to be allocated on all transcoder devices that are registered with Cisco Unified Communications Manager. Each transcoder resource uses two streams.</td>
</tr>
<tr>
<td>TranscoderResourceTotal</td>
<td>This counter represents the total number of transcoder resources that are provided by all transcoder devices that are currently registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>VCBConferenceActive</td>
<td>This counter represents the total number of active video conferences on all video conference bridge devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>VCBConferenceAvailable</td>
<td>This counter represents the total number of new video conferences on all video conference bridge devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>VCBConferenceCompleted</td>
<td>This counter represents the total number of video conferences that used a video conference bridge that are allocated from Cisco Unified Communications Manager and that have been completed, which means that the conference bridge has been allocated and released. A conference activates when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>VCBConferenceTotal</td>
<td>This counter represents the total number of video conferences that are supported on all video conference bridge devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>VCBOutOfConferences</td>
<td>This counter represents the total number of times that Cisco Unified Communications Manager attempted to allocate a video conference resource from those that are registered to Cisco Unified Communications Manager when none was available.</td>
</tr>
<tr>
<td>VCBOutOfResources</td>
<td>This counter represents the total number of failed new video conference requests. A conference request can fail because, for example, the configured number of conferences is already in use.</td>
</tr>
<tr>
<td>VCBResourceActive</td>
<td>This counter represents the total number of video conference resources that are currently in use on all video conference devices that are registered with Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>VCBResourceAvailable</td>
<td>This counter represents the total number of video conference resources that are not active and are currently available.</td>
</tr>
</tbody>
</table>
Cisco CallManager External Call Control

The Cisco CallManager External Call Control feature provides information about the counters that are added to support the External Call Control feature. The following table contains information about the External Call Control counters.

### Table 14: Cisco CallManager External Call Control

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Unified Communication Manager (Cisco CallManager) Object</td>
<td>This counter specifies the total number of calls to devices that have the External Call Control feature enabled. This is a cumulative count of all calls to intercept-enabled patterns or DNs since the last restart of the Cisco CallManager service.</td>
</tr>
<tr>
<td>ExternalCallControlEnabledCallsAttempted</td>
<td>This counter specifies the total number of calls that were connected to a device that had the External Call Control feature enabled. This is a cumulative count of all calls to intercept-enabled patterns or DNs since the last restart of the Cisco CallManager service.</td>
</tr>
</tbody>
</table>
**Counter Description**

<table>
<thead>
<tr>
<th>Counter Description</th>
<th>Counters</th>
</tr>
</thead>
<tbody>
<tr>
<td>This counter specifies the total number of calls that were cleared or routed based on failure treatments (such as Allow or Deny) that are defined in the External Call Control profile.</td>
<td>ExternalCallControlEnabledFailureTreatmentApplied</td>
</tr>
<tr>
<td>This counter defines the total number of PDP servers in all External Call Control Profiles configured in Cisco Unified CM Administration. This counter increments when a new PDP server is added and decrements when a PDP server is removed.</td>
<td>PDPServersTotal</td>
</tr>
<tr>
<td>This counter defines the total number of in-service (active) PDP servers.</td>
<td>PDPserversInService</td>
</tr>
<tr>
<td>This counter defines the total number of times that PDP servers have transitioned from in-service to out-of-service. This is a cumulative count of out-of-service PDP servers since the last restart of the Cisco CallManager service.</td>
<td>PDPserversOutOfService</td>
</tr>
<tr>
<td>This counter specifies the total number of connections that Cisco Unified Communications Manager has established (currently active) with PDP servers.</td>
<td>ConnectionsActiveToPDPserver</td>
</tr>
<tr>
<td>This counter specifies the total number of times that active connections between Cisco Unified Communications Manager and the PDP servers were disconnected. This is a cumulative count since the last restart of the Cisco CallManager service.</td>
<td>ConnectionsLostToPDPserver</td>
</tr>
</tbody>
</table>

**Cisco CallManager SAF**

The Cisco SAF Client object provides information about SAF counters that are specific to each node. The following table contains information about Cisco SAF Client object counters.

**Table 15: Cisco CallManager SAF Client Object**

<table>
<thead>
<tr>
<th>Counter Description</th>
<th>Counters</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of SAF client connections currently active on this Unified CM node.</td>
<td>SAFConnectionsSucceeded (range from 0 to 2)</td>
</tr>
<tr>
<td>Total number of SAF client connections that failed on the Unified CM node. A failed connection is a connection that did not register with the SAF Forwarder.</td>
<td>SAFFConnectionsFailed (range from 0 to 2)</td>
</tr>
</tbody>
</table>

**Note**

A Cisco Unified CM node restart causes a counter reset.
See Real-Time Monitoring Tool Guide for more information.

**Cisco CallManager System Performance**

The Cisco CallManager System Performance object provides system performance information about Cisco Unified Communications Manager. The following table contains information about Cisco CallManager system performance counters.

**Table 16: Cisco CallManager System Performance**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AverageExpectedDelay</td>
<td>This counter represents the current average expected delay before any incoming message gets handled.</td>
</tr>
<tr>
<td>CallsRejectedDueToICTThrottling</td>
<td>This counter represents the total number of calls that were rejected since the start of Cisco CallManager service due to Intercluster Trunk (ICT) call throttling. When the threshold limit of 140 calls per 5 seconds is met, the ICT will start throttling (rejecting) new calls. One cause for ICT call throttling occurs when calls across an ICT enter a route loop condition.</td>
</tr>
<tr>
<td>CallThrottlingGenericCounter3</td>
<td>This counter represents a generic counter that is used for call-throttling purpose.</td>
</tr>
<tr>
<td>CodeRedEntryExit</td>
<td>This counter indicates whether Cisco Unified Communications Manager has entered or exited a Code state (call-throttling mode). Valid values include 0 (Exit) and 1 (Entry).</td>
</tr>
<tr>
<td>CodeYellowEntryExit</td>
<td>This counter indicates whether Cisco Unified Communications Manager has entered or exited a Code Yellow state (call-throttling mode). Valid values include 0 (Exit) and 1 (Entry).</td>
</tr>
<tr>
<td>EngineeringCounter1</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter2</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter3</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter4</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter5</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter6</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>EngineeringCounter7</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>EngineeringCounter8</td>
<td>Do not use this counter unless directed by a Cisco Engineering Special build. Cisco uses information in this counter for diagnostic purposes.</td>
</tr>
<tr>
<td>QueueSignalsPresent 1-High</td>
<td>This counter indicates the number of high-priority signals in the Cisco Unified Communications Manager queue. High-priority signals include timeout events, internal Cisco Unified Communications Manager keepalives, certain gatekeeper events, and internal process creation, among other events. A large number of high-priority events will cause degraded performance on Cisco Unified Communications Manager and result in slow call connection or loss of dial tone. Use this counter in conjunction with the QueueSignalsProcessed 1-High counter to determine the processing delay on Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>QueueSignalsPresent 2-Normal</td>
<td>This counter indicates the number of normal-priority signals in the Cisco Unified Communications Manager queue. Normal-priority signals include call-processing functions, key presses, on-hook and off-hook notifications, among other events. A large number of normal-priority events will cause degraded performance on Cisco Unified Communications Manager, sometimes resulting in delayed dial tone, slow call connection, or loss of dial tone. Use this counter in conjunction with the QueueSignalsProcessed 2-Normal counter to determine the call-processing delay on Cisco Unified Communications Manager. Remember that high-priority signals must complete before normal-priority signals begin to process, so check the high-priority counters as well to get an accurate picture of the potential delay.</td>
</tr>
<tr>
<td>QueueSignalsPresent 3-Low</td>
<td>This counter indicates the number of low-priority signals in the Cisco Unified Communications Manager queue. Low-priority signals include station device registration (except the initial station registration request message), among other events. A large number of signals in this queue could result in delayed device registration, among other events.</td>
</tr>
<tr>
<td>QueueSignalsPresent 4-Lowest</td>
<td>This counter indicates the number of lowest priority signals in the Cisco Unified Communications Manager queue. Lowest priority signals include the initial station registration request message during device registration, among other events. A large number of signals in this queue could result in delayed device registration, among other events.</td>
</tr>
<tr>
<td>QueueSignalsProcessed 1-High</td>
<td>This counter indicates the number of high-priority signals that Cisco Unified Communications Manager processes for each 1-second interval. Use this counter in conjunction with the QueueSignalsPresent 1-High counter to determine the processing delay on this queue.</td>
</tr>
<tr>
<td>QueueSignalsProcessed 2-Normal</td>
<td>This counter indicates the number of normal-priority signals that Cisco Unified Communications Manager processes for each 1-second interval. Use this counter in conjunction with the QueueSignalsPresent 2-Normal counter to determine the processing delay on this queue. Remember that high-priority signals get processed before normal-priority signals.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-----------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>QueueSignalsProcessed 3-Low</td>
<td>This counter indicates the number of low-priority signals that Cisco Unified Communications Manager processes for each 1-second interval. Use this counter in conjunction with the QueueSignalsPresent 3-Low counter to determine the processing delay on this queue. The number of signals processed gives an indication of how much device registration activity is being processed in this time interval.</td>
</tr>
<tr>
<td>QueueSignalsProcessed 4-Lowest</td>
<td>This counter indicates the number of lowest priority signals that Cisco Unified Communications Manager processes for each 1-second interval. Use this counter in conjunction with the QueueSignalsPresent 4-Lowest counter to determine the processing delay on this queue. The number of signals that are processed gives an indication of how many devices began the Cisco Unified Communications Manager registration process in this time interval.</td>
</tr>
<tr>
<td>QueueSignalsProcessed Total</td>
<td>This counter provides a sum total of all queue signals that Cisco Unified Communications Manager processes for each 1-second interval for all queue levels: high, normal, low, and lowest.</td>
</tr>
<tr>
<td>SkinnyDevicesThrottled</td>
<td>This counter represents the total number of Skinny devices that are being throttled. A Skinny device gets throttled (asked to shut down and reregister) when the total number of events that the Skinny device generated exceeds the configured maximum threshold value (default value specifies 2000 events) within a 5-second interval.</td>
</tr>
<tr>
<td>ThrottlingSampleActivity</td>
<td>This counter indicates how many samples, out of the configured sample size, have non-zero averageExpectedDelay values. This counter gets reset when any sample has an averageExpectedDelay value of zero. This process repeats for each batch of samples. A batch represents the configured sample size.</td>
</tr>
<tr>
<td>TotalCodeYellowEntry</td>
<td>This counter indicates the number of times that Cisco Unified Communications Manager call processing enters the code yellow state. This counter remains cumulative from the start of the Cisco Unified Communications Manager process.</td>
</tr>
</tbody>
</table>

**Cisco CTIManager**

The Cisco CTI Manager object provides information about Cisco CTI Manager. The following table contains information about Cisco CTIManager counters.

*Table 17: Cisco CTI Manager*

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CcmLinkActive</td>
<td>This counter represents the total number of active Cisco Unified Communications Manager links. CTI Manager maintains links to all active servers in a cluster, if applicable.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CTIConnectionActive</td>
<td>This counter represents the total number of CTI clients that are currently connected to the CTIManager. This counter increases by one when a new connection is established and decreases by one when a connection is released. The CTIManager service parameter MaxCTIConnections determines the maximum number of active connections.</td>
</tr>
<tr>
<td>DevicesOpen</td>
<td>This counter represents the total number of devices that are configured in Cisco Unified Communications Manager that CTI applications control and/or monitor. Devices include hardware IP phones, CTI ports, CTI route points, and so on.</td>
</tr>
<tr>
<td>LinesOpen</td>
<td>This counter represents the total number of lines that are configured in Cisco Unified Communications Manager that control and/or monitor CTI applications.</td>
</tr>
<tr>
<td>QbeVersion</td>
<td>This counter represents the version number of the Quick Buffer Encoding (QBE) interface that the CTIManager uses.</td>
</tr>
</tbody>
</table>

### Cisco Dual-Mode Mobility

The Cisco Dual-Mode Mobility object provides information about the dual-mode mobility application on Cisco Unified Communications Manager. The following table contains information about Cisco Dual-Mode Mobility counters.

**Table 18: Cisco Dual-Mode Mobility**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsAnchored</td>
<td>This counter represents the number of calls that are placed or received on dual-mode phones that are anchored in Cisco Unified Communications Manager. The counter increments when a call is received from or placed to a dual-mode phone. The counter increments twice if a dual-mode phone calls another dual-mode phone.</td>
</tr>
<tr>
<td>DMMSRegistered</td>
<td>This counter represents the number of Dual-mode Mobile Station (DMMS) subscribers that are registered in the wireless LAN (WLAN).</td>
</tr>
<tr>
<td>FollowMeAborted</td>
<td>This counter represents the number of failed follow-me operations.</td>
</tr>
<tr>
<td>FollowMeAttempted</td>
<td>This counter represents the number of follow-me operations that Cisco Unified Communications Manager attempted. The counter increments when a SIP 302 - Moved Temporarily message is received from the Wireless Service Manager (WSM) and Cisco Unified Communications Manager redirects the call to the DMMS in WLAN.</td>
</tr>
<tr>
<td>FollowMeCompleted</td>
<td>This counter represents the number of follow-me operations that were successfully completed. The counter increments when the DMMS in WLAN answers the call and the media (voice path) successfully gets established with the calling device.</td>
</tr>
</tbody>
</table>
### Counter Description

- **FollowMeInProgress**
  - This counter represents the number of follow-me operations that are currently in progress. The counter increments when a follow-me is attempted, and it decrements when the follow-me operation aborts or completes.

- **H1HandOutAttempted**
  - This counter represents the number of H1 hand-out operations that dual-mode phones attempt. The counter increments when Cisco Unified Communications Manager processes a call to the H1 number from a DMMS.

- **H1HandOutCompleted**
  - This counter represents the number of successfully completed H1 hand-out operations. The counter increments when the DMMS in WLAN successfully reestablishes a media (voice path).

- **H2HandOutCompleted**
  - This counter represents the number of successfully completed H2 hand-out operations. The counter increments when the DMMS in WLAN successfully reestablishes a media (voice path).

- **H2HandOutAttempted**
  - This counter represents the number of H2 hand-out operations that dual-mode phones attempt. The counter increments when Cisco Unified Communications Manager receives a call to the H2 number from a DMMS.

- **HandInAbort**
  - This counter represents the number of hand-in operations that failed.

- **HandInAttempted**
  - This counter represents the number of hand-in operations that dual-mode phones attempt.

- **HandInCompleted**
  - This counter represents the number of successfully completed hand-in operations. The counter increments when the DMMS in WLAN successfully reestablishes a media (voice path).

- **HandInInProgress**
  - This counter represents the number of hand-in operations that are currently in progress. The counter increments when a hand-in is attempted, and the counter decrements when the hand-in is aborted or completed.

- **HandOutAbort**
  - This counter represents the number of hand-out operations that failed.

- **HandOutInProgress**
  - This counter represents the number of H1 and H2 hand-out operations that are currently in progress. The counter increments when a H1 or H2 hand-out is attempted, and it decrements when the hand-out is aborted or completed.

---

**Cisco Extension Mobility**

The Cisco Extension Mobility object provides information about the extension mobility application. The following table contains information about Cisco Extension Mobility counters.
<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RequestsHandled</td>
<td>This counter represents the total number of HTTP requests that the extension mobility application handled since the last restart of the Cisco CallManager service. A typical login would constitute two HTTP requests: one to query the initial login state of the device and another to log in the user on a device. Similarly, a typical logout also results in two HTTP requests.</td>
</tr>
<tr>
<td>RequestsInProgress</td>
<td>This counter represents the number of HTTP requests that the extension mobility application currently is handling. A typical login would constitute two HTTP requests: one to query the initial login state of the device and another to log in the user on a device. Similarly, a typical logout also results in two HTTP requests.</td>
</tr>
<tr>
<td>RequestsThrottled</td>
<td>This counter represents the total number of Login/Logout Requests that failed due to throttling.</td>
</tr>
<tr>
<td>LoginsSuccessful</td>
<td>This counter represents the total number of successful login requests that were completed through Extension Mobility Service.</td>
</tr>
<tr>
<td>LogoutsSuccessful</td>
<td>This counter represents the total number of successful logout requests that were completed through Extension Mobility Service.</td>
</tr>
<tr>
<td>Total Login Logout Requests Attempted</td>
<td>This counter represents the total number of Login and Logout requests that were attempted through this Extension Mobility Service. This number includes both successful and unsuccessful attempts.</td>
</tr>
<tr>
<td>Total Number of EMCC Messages</td>
<td>This represents the total number of messages related to EMCC Requests that came from remote clusters.</td>
</tr>
<tr>
<td>Number of Remote Devices</td>
<td>This represents the total number of devices from other clusters that are currently using a EMCC Base Device (EMCC Logged in).</td>
</tr>
<tr>
<td>Number of Unknown Remote Users</td>
<td>This represents the total number of users who were not found in any of the remote cluster during inter-cluster extension mobility login.</td>
</tr>
<tr>
<td>Active Inter-cluster Sessions</td>
<td>This represents the total number of inter cluster Extension Mobility requests that are currently in progress.</td>
</tr>
<tr>
<td>Total Number of Remote Users</td>
<td>This represents the total number of users from other cluster who use a local device of this cluster and have logged into a remote cluster.</td>
</tr>
<tr>
<td>EMCC Check User Requests Handled</td>
<td>This represents the total number of EMCC check user requests that came from remote clusters.</td>
</tr>
</tbody>
</table>
Cisco Feature Control Policy

The Cisco Feature Control Policy feature provides information about the two new counters for TFTP. The following table contains information about Cisco Feature Control Policy feature counters.

Table 20: Cisco Feature Control Policy

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BuildFeaturePolicyCount</td>
<td>Indicates the number of built FCP files</td>
</tr>
<tr>
<td>FeaturePolicyChangeNotifications</td>
<td>Indicates the number of sent FCP change notifications</td>
</tr>
</tbody>
</table>

Cisco Gatekeeper

The Cisco Gatekeeper object provides information about registered Cisco gatekeeper devices. The following table contains information about Cisco gatekeeper device counters.

Table 21: Cisco Gatekeeper

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACFsReceived</td>
<td>This counter represents the total number of RAS Admission Confirm messages that are received from the configured gatekeeper and its alternate gatekeepers.</td>
</tr>
<tr>
<td>ARQsAttempted</td>
<td>This counter represents the total number of RAS Admission Request messages that are attempted by using the configured gatekeeper and its alternate gatekeepers.</td>
</tr>
<tr>
<td>RasRetries</td>
<td>This counter represents the number of retries due to loss or delay of all RAS acknowledgement messages on the configured gatekeeper and its alternate gatekeepers.</td>
</tr>
<tr>
<td>VideoOutOfResources</td>
<td>This counter represents the total number of video-stream requests to the configured gatekeeper or its alternate gatekeepers that failed, most likely due to lack of bandwidth.</td>
</tr>
</tbody>
</table>

Cisco H.323

The Cisco H.323 object provides information about registered Cisco H.323 devices. The following table contains information about Cisco H.323 device counters.
Table 22: Cisco H.323

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsActive</td>
<td>This counter represents the number of streaming connections that are currently active (in use) on the configured H.323 device; in other words, the number of calls that actually have a voice path that is connected.</td>
</tr>
<tr>
<td>Calls Attempted</td>
<td>This counter represents the total number of calls that have been attempted on a device, including both successful and unsuccessful call attempts.</td>
</tr>
<tr>
<td>Calls Completed</td>
<td>This counter represents the total number of successful calls that were made from a device.</td>
</tr>
<tr>
<td>Calls In Progress</td>
<td>This counter represents the number of calls that are currently in progress on a device.</td>
</tr>
<tr>
<td>Calls Rejected Due To ICT Call Throttling</td>
<td>This counter represents the total number of calls that are rejected due to Intercluster Trunk (ICT) call throttling since the start of the Cisco CallManager service. When the system reaches a threshold limit of 140 calls per 5 seconds, ICT will start throttling (rejecting) new calls. One cause for ICT call throttling occurs when calls across an ICT enter a route loop condition.</td>
</tr>
<tr>
<td>Video Calls Active</td>
<td>This counter represents the number of video calls with video streaming connections that are currently active (in use) on all H.323 trunks that are registered with a Cisco Unified Communications Manager; in other words, the number of calls that actually have video-streaming connections on a Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>Video Calls Completed</td>
<td>This counter represents the number of video calls that were actually connected with video streams for all H.323 trunks that were registered with a Cisco Unified Communications Manager. This number increases when the call terminates.</td>
</tr>
</tbody>
</table>

Cisco Hunt Lists

The Cisco Hunt Lists object provides information about the hunt lists that are defined in Cisco Unified Communications Manager Administration. The following table contains information about Cisco hunt list counters.

Table 23: Cisco Hunt Lists

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calls Abandoned</td>
<td>This counter represents the number of abandoned calls that occurred through a hunt list. An abandoned call represents one in which a caller hangs up before the call is answered.</td>
</tr>
</tbody>
</table>
### Counters

<table>
<thead>
<tr>
<th>Counter Description</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsActive</td>
<td>This counter represents the number of calls that are currently active (in use) that occurred through a hunt list. An active call represents one that gets distributed and answered, and to which a voice path connects.</td>
</tr>
<tr>
<td>CallsBusyAttempts</td>
<td>This counter represents the number of times that calls through a hunt list were attempted when all members of the line and/or route groups were busy.</td>
</tr>
<tr>
<td>CallsInProgress</td>
<td>This counter represents the number of calls that are currently in progress through a hunt list. A call in progress represents one that the call distributor is attempting to extend to a member of a line or route group and that has not yet been answered. Examples of a hunt list member include a line, a station device, a trunk device, or a port/channel of a trunk device.</td>
</tr>
<tr>
<td>CallsRingNoAnswer</td>
<td>This counter represents the total number of calls through a hunt list that rang but that called parties did not answer.</td>
</tr>
<tr>
<td>HuntListInService</td>
<td>This counter specifies whether the particular hunt list is currently in service. A value of 0 indicates that the hunt list is out of service; a value of 1 indicates that the hunt list is in service. Reasons that a hunt list could be out of service include the hunt list is not running on a primary Cisco Unified Communications Manager based on its Cisco Unified Communications Manager Group or the hunt list has been disabled in Cisco Unified Communications Manager Administration.</td>
</tr>
<tr>
<td>MembersAvailable</td>
<td>This counter represents the total number of available or idle members of line and route groups that belong to an in-service hunt list. An available member currently handles a call and will accept a new call. An idle member does not handle any call and will accept a new call. A hunt list member can comprise a route group, line group, or a combination. A member of a line group represents a directory number of a line on an IP phone or a voice-mail port. A member of a route group represents a station gateway, a trunk gateway, or port/channel of a trunk gateway.</td>
</tr>
</tbody>
</table>

### Cisco HW Conference Bridge Device

The Cisco HW Conference Bridge Device object provides information about registered Cisco hardware conference bridge devices. The following table contains information about Cisco hardware conference bridge device counters.

**Table 24: Cisco HW Conference Bridge Device**

<table>
<thead>
<tr>
<th>Counter Description</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWConferenceActive</td>
<td>This counter represents the number of conferences that are currently active (in use) on a HW conference bridge device. One resource represents one stream.</td>
</tr>
</tbody>
</table>
## Counters

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWConferenceCompleted</td>
<td>This counter represents the total number of conferences that have been allocated and released on a HW conference device. A conference starts when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that an attempt was made to allocate a conference resource from a HW conference device and failed, for example, because all resources were already in use.</td>
</tr>
<tr>
<td>ResourceActive</td>
<td>This counter represents the number of resources that are currently in use (active) for this HW conference device. One resource represents one stream.</td>
</tr>
<tr>
<td>ResourceAvailable</td>
<td>This counter represents the total number of resources that are not active and are still available to be used now for a HW conference device. One resource represents one stream.</td>
</tr>
<tr>
<td>ResourceTotal</td>
<td>This counter represents the total number of resources for a HW conference bridge device. This counter equals the sum of the counters ResourceAvailable and ResourceActive. One resource represents one stream.</td>
</tr>
</tbody>
</table>

## Cisco IP Manager Assistant

The Cisco IP Manager Assistant (IPMA) Service object provides information about the Cisco Unified Communications Manager Assistant application. The following table contains information on Cisco IPMA counters.

### Table 25: Cisco IP Manager Assistant Service

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AssistantsActive</td>
<td>This counter represents the number of assistant consoles that are currently active. An active assistant console exists when an assistant is logged in from the assistant console desktop application.</td>
</tr>
<tr>
<td>LinesOpen</td>
<td>This counter represents the number of phone lines that the Cisco Unified Communications Manager Assistant application opened. An open phone line exists when the application assumes line control from CTI.</td>
</tr>
<tr>
<td>ManagersActive</td>
<td>This counter represents the current number of managers that the Cisco IPMA is servicing.</td>
</tr>
<tr>
<td>SessionsCurrent</td>
<td>This counter represents the total number of managers assistants that are currently using the Cisco Unified Communications Manager Assistant application. Each manager and each assistant constitute an active session; so, for one manager/assistant pair, this counter would reflect two sessions.</td>
</tr>
</tbody>
</table>
## Cisco Lines

The Cisco Lines object represents the number of Cisco lines (directory numbers) that can dial and connect to a device. Lines represent all directory numbers that terminate on an endpoint. The directory number that is assigned to it identifies the line. The Cisco Lines object does not include directory numbers that include wildcards such as a pattern for a Digital or Analog Access gateway.

The Active counter represents the state of the line, either active or not active. A zero indicates that the line is not in use. When the number is greater than zero, this indicates that the line is active, and the number represents the number of calls that are currently in progress on that line. If more than one call is active, this indicates that the call is on hold either because of being placed on hold specifically (user hold) or because of a network hold operation (for example, a transfer is in progress, and it is on transfer hold). This applies to all directory numbers that are assigned to any device.

## Cisco Locations

The Cisco Location object provides information about locations that are defined in Cisco Unified Communications Manager. The following table contains information on Cisco location counters.

### Table 26: Cisco Locations

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BandwidthAvailable</td>
<td>This counter represents the current bandwidth in a given location. A value of 0 indicates that no bandwidth is available.</td>
</tr>
<tr>
<td>BandwidthMaximum</td>
<td>This counter represents the maximum bandwidth that is available in a given location. A value of 0 indicates that infinite bandwidth is available.</td>
</tr>
<tr>
<td>CallsInProgress</td>
<td>This counter represents the number of calls that are currently in progress on a particular Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that a call on a particular Cisco Unified Communications Manager through the location failed due to lack of bandwidth.</td>
</tr>
<tr>
<td>RSVP AudioReservationErrorCounts</td>
<td>This counter represents the number of RSVP reservation errors in the audio stream.</td>
</tr>
<tr>
<td>RSVP MandatoryConnectionsInProgress</td>
<td>This counter represents the number of connections with mandatory RSVP that are in progress.</td>
</tr>
<tr>
<td>RSVP OptionalConnectionsInProgress</td>
<td>This counter represents the number of connections with optional RSVP that are in progress.</td>
</tr>
<tr>
<td>RSVP TotalCallsFailed</td>
<td>This counter represents the total number of failed calls due to a RSVP reservation failure.</td>
</tr>
<tr>
<td>RSVP VideoCallsFailed</td>
<td>This counter represents the number of video calls that failed due to a RSVP reservation failure.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>----------------------------------------</td>
<td>--------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RSVP VideoReservationErrorCounts</td>
<td>This counter represents the number of RSVP reservation errors in the video stream</td>
</tr>
<tr>
<td>VideoBandwidthAvailable</td>
<td>This counter represents the bandwidth that is currently available for video in the location where the person who initiated the video conference resides. A value of 0 indicates that no bandwidth is available.</td>
</tr>
<tr>
<td>VideoBandwidthMaximum</td>
<td>This counter represents the maximum bandwidth that is available for video in the location where the person who initiated the video conference resides. A value of 0 indicates that no bandwidth is allocated for video.</td>
</tr>
<tr>
<td>VideoOutOfResources</td>
<td>This counter represents the total number of failed video-stream requests (most likely due to lack of bandwidth) in the location where the person who initiated the video conference resides.</td>
</tr>
</tbody>
</table>

**Cisco Media Streaming Application**

The Cisco IP Voice Media Streaming Application object provides information about the registered MTPs, MOH servers, conference bridge servers, and annunciators. The following table contains information on Cisco IP Voice Media Streaming Application counters.

**Note**

One object exists for each Cisco Unified Communications Manager in the Cisco Unified Communications Manager group that is associated with the device pool that the annunciator device is configured to use.

**Table 27: Cisco Media Streaming Application**

<table>
<thead>
<tr>
<th>Counter</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ANNConnectionsLost</td>
<td>This counter represents the total number of times since the last restart of the Cisco IP Voice Media Streaming Application that a Cisco Unified Communications Manager connection was lost.</td>
</tr>
<tr>
<td>ANNConnectionState</td>
<td>For each Cisco Unified Communications Manager that is associated with an annunciator, this counter represents the current registration state to Cisco Unified Communications Manager; 0 indicates no registration to Cisco Unified Communications Manager; 1 indicates registration to the primary Cisco Unified Communications Manager; 2 indicates connection to the secondary Cisco Unified Communications Manager (connected to Cisco Unified Communications Manager but not registered until the primary Cisco Unified Communications Manager connection fails).</td>
</tr>
<tr>
<td>ANNConnectionsTotal</td>
<td>This counter represents the total number of annunciator instances that have been started since the Cisco IP Voice Media Streaming Application service started.</td>
</tr>
<tr>
<td>Counter</td>
<td>Counter Description</td>
</tr>
<tr>
<td>----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ANNInstancesActive</td>
<td>This counter represents the number of actively playing (currently in use) announcements.</td>
</tr>
<tr>
<td>ANNSrreamsActive</td>
<td>This counter represents the total number of currently active simplex (one direction) streams for all connections. Each stream direction counts as one stream. One internal stream provides the audio input and another output stream to the endpoint device.</td>
</tr>
<tr>
<td>ANNSrreamsAvailable</td>
<td>This counter represents the remaining number of streams that are allocated for the annunciator device that are available for use. This counter starts as 2 multiplied by the number of configured connections (defined in the Cisco IP Voice Media Streaming App service parameter for the Annunciator, Call Count) and is reduced by one for each active stream that started.</td>
</tr>
<tr>
<td>ANNSrreamsTotal</td>
<td>This counter represents the total number of simplex (one direction) streams that connected to the annunciator device since the Cisco IP Voice Media Streaming Application service started.</td>
</tr>
<tr>
<td>CFBConferencesActive</td>
<td>This counter represents the number of active (currently in use) conferences.</td>
</tr>
<tr>
<td>CFBConferencesTotal</td>
<td>This counter represents the total number of conferences that started since the Cisco IP Voice Media Streaming Application service started.</td>
</tr>
<tr>
<td>CFBConnectionsLost</td>
<td>This counter represents the total number of times since the last restart of the Cisco IP Voice Media Streaming Application that a Cisco Unified Communications Manager connection was lost.</td>
</tr>
<tr>
<td>CFBConnectionState</td>
<td>For each Cisco Unified Communications Manager that is associated with a SW Conference Bridge, this counter represents the current registration state to Cisco Unified Communications Manager; 0 indicates no registration to Cisco Unified Communications Manager; 1 indicates registration to the primary Cisco Unified Communications Manager; 2 indicates connection to the secondary Cisco Unified Communications Manager (connected to Cisco Unified Communications Manager but not registered until the primary Cisco Unified Communications Manager connection fails).</td>
</tr>
<tr>
<td>CFBStreamsActive</td>
<td>This counter represents the total number of currently active simplex (one direction) streams for all conferences. Each stream direction counts as one stream. In a three-party conference, the number of active streams equals 6.</td>
</tr>
<tr>
<td>CFBStreamsAvailable</td>
<td>This counter represents the remaining number of streams that are allocated for the conference bridge that are available for use. This counter starts as 2 multiplied by the number of configured connections (defined in the Cisco IP Voice Media Streaming App service parameter for Conference Bridge, Call Count) and is reduced by one for each active stream that started.</td>
</tr>
<tr>

</tr>
<tr>
<td>Counter</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MOHAudioSourcesActive</td>
<td>This counter represents the number of active (currently in use) audio sources for this MOH server. Be aware that some of these audio sources may not be actively streaming audio data if no devices are listening. The exception exists for multicast audio sources, which will always be streaming audio. When an audio source is in use, even after the listener has disconnected, this counter will always have one input stream for each configured MOH codec. For unicast streams, the stream may exist in a suspended state where no audio data is received until a device connects to listen to the stream. Each MOH multicast resource uses one stream for each audio source and codec combination. For example, if the default audio source is configured for multicast, G.711 mu-law and wideband codecs, then two streams get used (default audio source + G.711 mu-law and default audio source + wideband).</td>
</tr>
<tr>
<td>MOHConnectionsLost</td>
<td>This counter represents the total number of times since the last restart of the Cisco IP Voice Media Streaming Application that a Cisco Unified Communications Manager connection was lost.</td>
</tr>
<tr>
<td>MOHConnectionState</td>
<td>For each Cisco Unified Communications Manager that is associated with an MOH, this counter represents the current registration state to Cisco Unified Communications Manager; 0 indicates no registration to Cisco Unified Communications Manager; 1 indicates registration to the primary Cisco Unified Communications Manager; 2 indicates connection to the secondary Cisco Unified Communications Manager (connected to Cisco Unified Communications Manager but not registered until the primary Cisco Unified Communications Manager connection fails).</td>
</tr>
<tr>
<td>MOHStreamsActive</td>
<td>This counter represents the total number of active (currently in use) simplex (one direction) streams for all connections. One output stream exists for each device that is listening to a unicast audio source, and one input stream exists for each active audio source, multiplied by the number of MOH codecs. When an audio source has been used once, it will always have one input stream for each configured MOH codec. For unicast streams, the stream may exist in a suspended state where no audio data is received until a device connects to listen to the stream. Each MOH multicast resource uses one stream for each audio source and codec combination. For example, if the default audio source is configured for multicast, G.711 mu-law and wideband codecs, then two streams get used (default audio source + G.711 mu-law and default audio source + wideband).</td>
</tr>
<tr>
<td>MOHStreamsAvailable</td>
<td>This counter represents the remaining number of streams that are allocated for the MOH device that are available for use. This counter starts as 408 plus the number of configured half-duplex unicast connections and is reduced by 1 for each active stream that started. The counter gets reduced by 2 for each multicast audio source, multiplied by the number of MOH codecs that are configured. The counter gets reduced by 1 for each unicast audio source, multiplied by the number of MOH codecs that are configured.</td>
</tr>
<tr>
<td>Counter</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>

</table>

**Cisco Messaging Interface**

The Cisco Messaging Interface object provides information about the Cisco Messaging Interface (CMI) service. The following table contains information on Cisco Messaging Interface (CMI) counters.
Table 28: Cisco Messaging Interface

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HeartBeat</td>
<td>This counter represents the heartbeat of the CMI service. This incremental count indicates that the CMI service is up and running. If the count does not increase (increment), this means that the CMI service is down.</td>
</tr>
<tr>
<td>SMDIMessageCountInbound</td>
<td>This counter represents the running count of inbound SMDI messages since the last restart of the CMI service.</td>
</tr>
<tr>
<td>SMDIMessageCountInbound24Hour</td>
<td>This counter represents the rolling count of inbound SMDI messages in the last 24 hours.</td>
</tr>
<tr>
<td>SMDIMessageCountOutbound</td>
<td>This counter represents the running count of outbound SMDI messages since the last restart of the CMI service.</td>
</tr>
<tr>
<td>SMDIMessageCountOutbound24Hour</td>
<td>This counter represents the rolling count of outbound SMDI messages in the last 24 hours.</td>
</tr>
<tr>
<td>StartTime</td>
<td>This counter represents the time in milliseconds when the CMI service started. The real-time clock in the computer, which simply acts as a reference point that indicates the current time and the time that has elapsed, in milliseconds, since the service started, provides the basis for this time. The reference point specifies midnight, January 1, 1970.</td>
</tr>
</tbody>
</table>

Cisco MGCP BRI Device

The Cisco Media Gateway Control Protocol (MGCP) Foreign Exchange Office (FXO) Device object provides information about registered Cisco MGCP BRI devices. The following table contains information on Cisco MGCP BRI device counters.

Table 29: Cisco MGCP BRI Device

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the total number of successful calls that were made from this MGCP Basic Rate Interface (BRI) device</td>
</tr>
<tr>
<td>Channel 1 Status</td>
<td>This counter represents the status of the indicated B-Channel that is associated with the MGCP BRI device. Possible values: 0 (Unknown) indicates the status of the channel could not be determined; 1 (Out of service) indicates that this channel is not available for use; 2 (Idle) indicates that this channel has no active call and is ready for use; 3 (Busy) indicates an active call on this channel; 4 (Reserved) indicates that this channel has been reserved for use as a D-channel or for use as a Synch-Channel for BRI.</td>
</tr>
</tbody>
</table>
Cisco MGCP FXO Device

The Cisco Media Gateway Control Protocol (MGCP) Foreign Exchange Office (FXO) Device object provides information about registered Cisco MGCP FXO devices. The following table contains information on Cisco MGCP FXO device counters.

Table 30: Cisco MGCP FXO Device

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the total number of successful calls that were made from the port on an MGCP FXO device.</td>
</tr>
<tr>
<td>OutboundBusyAttempts</td>
<td>This counter represents the total number of times that a call through the port on this MGCP FXO device was attempted when no voice channels were available.</td>
</tr>
<tr>
<td>PortStatus</td>
<td>This counter represents the status of the FXO port that is associated with this MGCP FXO device.</td>
</tr>
</tbody>
</table>

Cisco MGCP FXS Device

The Cisco MGCP Foreign Exchange Station (FXS) Device object provides information about registered Cisco MGCP FXS devices. One instance of this object gets created for each port on a Cisco Catalyst 6000 24 port FXS Analog Interface Module gateway. For example, a fully configured Catalyst 6000 Analog Interface Module would represent 24 separate instances of this object. The following table contains information on Cisco MGCP FXS device counters.
### Table 31: Cisco MGCP FXS Device

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the total number of successful calls that were made from this port on the MGCP FXS device.</td>

Possible values: 0 (Unknown) indicates the status of the channel could not be determined; 1 (Out of service) indicates that this channel is not available for use; 2 (Idle) indicates that this channel has no active call and is ready for use; 3 (Busy) indicates that an active call exists on this channel; 4 (Reserved) indicates that this channel has been reserved for use as a D-Channel or for use as a Synch-Channel for E-1.</td>
</tr>
<tr>
<td>OutboundBusyAttempts</td>
<td>This counter represents the total number of times that a call through the MGCP T1 CAS device was attempted when no voice channels were available.</td>
</tr>
</tbody>
</table>

Cisco Mobility Manager

The Cisco Mobility Manager object provides information on registered Cisco Unified Mobility Manager devices. The following table contains information on Cisco Unified Mobility Manager device counters.

Table 35: Cisco Mobility Manager

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MobileCallsAnchored</td>
<td>This counter represents the total number of paths that are associated with single-mode/dual-mode phone call that is currently anchored on a Cisco Unified Communications Manager. Call anchoring occurs when a call enters an enterprise gateway and connects to a mobility application that then uses redirection to send the call back out an enterprise gateway. For example, this counter increments twice for a dual-mode phone-to-dual-mode phone call: once for the originating call and once for the terminating call. When the call terminates, this counter decrements accordingly.</td>
</tr>
<tr>
<td>MobilityHandinsAborted</td>
<td>This counter represents the total number of aborted handins.</td>
</tr>
</tbody>
</table>
### Counter Description

**MobileHandinsCompleted**
This counter represents the total number of handins that were completed by dual-mode phones. A completed handin occurs when the call successfully connects in the enterprise network and the phone moves from WAN to WLAN.

**MobilityHandinsFailed**
This counter represents the total number of handins (calls on mobile devices that move from cellular to the wireless network) that failed.

**MobilityHandoutsAborted**
This counter represents the total number of aborted handouts.

**MobileHandoutsCompleted**
This counter represents the total number of handouts (calls on mobile devices that move from the enterprise WLAN network to the cellular network) that were completed. A completed handout occurs when the call successfully connects.

**MobileHandoutsFailed**
This counter represents the total number of handouts (calls on mobile devices that move from cellular to the wireless network) that failed.

**MobilityFollowMeCallsAttempted**
This counter represents the total number of follow-me calls that were attempted.

**MobilityFollowMeCallsIgnoredDueToAnswerTooSoon**
This counter represents the total number of follow-me calls that were ignored before the AnswerTooSoon timer went off.

**MobilityIVRCallsAttempted**
This counter represents the total number of attempted IVR calls.

**MobilityIVRCallsFailed**
This counter represents the total number of failed IVR calls.

**MobilityIVRCallsSucceeded**
This counter represents the total number of successful IVR calls.

**MobilitySCCPDualModeRegistered**
This counter represents the total number of dual-mode SCCP devices that are registered.

**MobilitySIPDualModeRegistered**
This counter represents the total number of dual-mode SIP devices that are registered.

---

**Cisco Music On Hold (MOH) Device**

The Cisco Music On Hold (MOH) Device object provides information about registered Cisco MOH devices. The following table contains information on Cisco MOH device counters.

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOHHighestActiveResources</td>
<td>This counter represents the largest number of simultaneously active MOH connections for an MOH server. This number includes both multicast and unicast connections.</td>
</tr>
</tbody>
</table>
### Counters

<table>
<thead>
<tr>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOHMulticastResourceActive</td>
</tr>
<tr>
<td>MOHMulticastResourceAvailable</td>
</tr>
<tr>
<td>MOHOutOfResources</td>
</tr>
<tr>
<td>MOHTotalMulticastResources</td>
</tr>
<tr>
<td>MOHTotalUnicastResources</td>
</tr>
<tr>
<td>MOHUnicastResourceActive</td>
</tr>
<tr>
<td>MOHUnicastResourceAvailable</td>
</tr>
</tbody>
</table>

**MOHMulticastResourceActive**
This counter represents the number of currently active multicast connections to multicast addresses that are served by an MOH server.
Each MOH multicast resource uses one stream for each audio source and codec combination. For example, if the default audio source is configured for multicast, G.711 mu-law and wideband codecs, two streams get used (default audio source + G.711 mu-law and default audio source + wideband).

**MOHMulticastResourceAvailable**
This counter represents the number of multicast MOH connections to multicast addresses that are served by an MOH server that are not active and are still available to be used now for the MOH server.
Each MOH multicast resource uses one stream for each audio source and codec combination. For example, if the default audio source is configured for multicast, G.711 mu-law and wideband codecs, two streams get used (default audio source + G.711 mu-law and default audio source + wideband).

**MOHOutOfResources**
This counter represents the total number of times that the Media Resource Manager attempted to allocate an MOH resource when all available resources on all MOH servers that are registered with a Cisco Unified Communications Manager were already active.

**MOHTotalMulticastResources**
This counter represents the total number of multicast MOH connections that are allowed to multicast addresses that are served by an MOH server.
Each MOH multicast resource uses one stream for each audio source and codec combination. For example, if the default audio source is configured for multicast, G.711 mu-law and wideband codecs, two streams get used (default audio source + G.711 mu-law and default audio source + wideband).

**MOHTotalUnicastResources**
This counter represents the total number of unicast MOH connections that are allowed by an MOH server.
Each MOH unicast resource uses one stream.

**MOHUnicastResourceActive**
This counter represents the number of active unicast MOH connections to an MOH server.
Each MOH unicast resource uses one stream.

**MOHUnicastResourceAvailable**
This counter represents the number of unicast MOH connections that are not active and are still available to be used now for an MOH server.
Each MOH unicast resource uses one stream.

---

**Cisco MTP Device**

The Cisco Media Termination Point (MTP) Device object provides information about registered Cisco MTP devices. The following table contains information on Cisco MTP device counters.
Table 37: Cisco MTP Device

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that an attempt was made to allocate an MTP resource from an MTP device and failed; for example, because all resources were already in use.</td>
</tr>
<tr>
<td>ResourceActive</td>
<td>This counter represents the number of MTP resources that are currently in use (active) for an MTP device. Each MTP resource uses two streams. An MTP in use represents one MTP resource that has been allocated for use in a call.</td>
</tr>
<tr>
<td>ResourceAvailable</td>
<td>This counter represents the total number of MTP resources that are not active and are still available to be used now for an MTP device. Each MTP resource uses two streams. An MTP in use represents one MTP resource that has been allocated for use in a call.</td>
</tr>
<tr>
<td>ResourceTotal</td>
<td>This counter represents the total number of MTP resources that an MTP device provides. This counter equals the sum of the counters ResourceAvailable and ResourceActive.</td>
</tr>
</tbody>
</table>

Cisco Phones

The Cisco Phones object provides information about the number of registered Cisco Unified IP Phones, including both hardware-based and other station devices.

The CallsAttempted counter represents the number of calls that have been attempted from this phone. This number increases each time that the phone goes off hook and on hook.

Cisco Presence Feature

The Cisco Presence object provides information about presence subscriptions, such as statistics that are related to the speed dial or call list Busy Lamp Field (BLF) subscriptions. The following table contains information on Cisco Presence feature.

Table 38: Cisco Presence

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ActiveCallListAndTrunkSubscriptions</td>
<td>This counter represents the active presence subscriptions for the call list feature as well as presence subscriptions through SIP trunk.</td>
</tr>
<tr>
<td>ActiveSubscriptions</td>
<td>This counter represents all active incoming and outgoing presence subscriptions.</td>
</tr>
<tr>
<td>CallListAndTrunkSubscriptionsThrottled</td>
<td>This counter represents the cumulative number of rejected call list and trunk side presence subscriptions due to throttling for the call list feature.</td>
</tr>
</tbody>
</table>
### Cisco QSIG Feature

The Cisco QSIG Feature object provides information regarding the operation of various QSIG features, such as call diversion and path replacement. The following table contains information on the Cisco QSIG feature counters.

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncomingLineSideSubscriptions</td>
<td>This counter represents the cumulative number of presence subscriptions that were received on the line side.</td>
</tr>
<tr>
<td>IncomingTrunkSideSubscriptions</td>
<td>This counter represents the cumulative number of presence subscriptions that were received on the trunk side.</td>
</tr>
<tr>
<td>OutgoingTrunkSideSubscriptions</td>
<td>This counter represents the cumulative number of presence subscriptions that were sent on the trunk side.</td>
</tr>
</tbody>
</table>

**Table 39: Cisco QSIG Feature**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallForwardByRerouteCompleted</td>
<td>This counter represents the number of successful calls that has been forwarded by rerouting. Call forward by rerouting enables the path for a forwarded call to be optimized (minimizes the number of B-Channels in use) from the originator perspective. This counter gets reset when the Cisco CallManager service parameter Call Forward by Reroute Enabled is enabled or disabled, or when the Cisco CallManager service restarts.</td>
</tr>
<tr>
<td>PathReplacementCompleted</td>
<td>This counter represents the number of successful path replacements that have occurred. Path replacement in a QSIG network optimizes the path between two edge PINX (PBXs) that are involved in a call. This counter resets when the Cisco CallManager service parameter Path Replacement Enabled is enabled or disabled, or when the Cisco CallManager service restarts.</td>
</tr>
</tbody>
</table>

### Cisco Signaling Performance

The Cisco Signaling Performance object provides call-signaling data on transport communications on Cisco Unified Communications Manager. The following table contains information on the Cisco Signaling Performance counter.

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallForwardByRerouteCompleted</td>
<td>This counter represents the number of successful calls that has been forwarded by rerouting. Call forward by rerouting enables the path for a forwarded call to be optimized (minimizes the number of B-Channels in use) from the originator perspective. This counter gets reset when the Cisco CallManager service parameter Call Forward by Reroute Enabled is enabled or disabled, or when the Cisco CallManager service restarts.</td>
</tr>
<tr>
<td>PathReplacementCompleted</td>
<td>This counter represents the number of successful path replacements that have occurred. Path replacement in a QSIG network optimizes the path between two edge PINX (PBXs) that are involved in a call. This counter resets when the Cisco CallManager service parameter Path Replacement Enabled is enabled or disabled, or when the Cisco CallManager service restarts.</td>
</tr>
</tbody>
</table>
### Table 40: Cisco Signaling Performance

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UDPPacketsThrottled</td>
<td>This counter represents the total number of incoming UDP packets that were throttled (dropped) because they exceeded the threshold for the number of incoming packets per second that is allowed from a single IP address. Configure the threshold via the SIP Station UDP Port Throttle Threshold and SIP Trunk UDP Port Throttle Threshold service parameters in Cisco Unified Communications Manager Administration. This counter increments for every throttled UDP packet that was received since the last restart of the Cisco CallManager Service.</td>
</tr>
</tbody>
</table>

### Cisco SIP

The Cisco Session Initiation Protocol (SIP) object provides information about configured SIP devices. The following table contains information on the Cisco SIP counters.

### Table 41: Cisco SIP

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsActive</td>
<td>This counter represents the number of calls that are currently active (in use) on this SIP device.</td>
</tr>
<tr>
<td>CallsAttempted</td>
<td>This counter represents the number of calls that have been attempted on this SIP device, including both successful and unsuccessful call attempts.</td>
</tr>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the number of calls that were actually connected (a voice path was established) from a SIP device. This number increases when the call terminates.</td>
</tr>
<tr>
<td>CallsInProgress</td>
<td>This counter represents the number of calls that are currently in progress on a SIP device, including all active calls. When all calls that are in progress are connected, the number of CallsInProgress equals the number of CallsActive.</td>
</tr>
<tr>
<td>VideoCallsActive</td>
<td>This counter represents the number of video calls with streaming video connections that are currently active (in use) on this SIP device.</td>
</tr>
<tr>
<td>VideoCallsCompleted</td>
<td>This counter represents the number of video calls that were actually connected with video streams for this SIP device. This number increments when the call terminates.</td>
</tr>
</tbody>
</table>

### Cisco SIP Normalization

The Cisco SIP Normalization performance object contains counters that allow you to monitor aspects of the normalization script, including initialization errors, runtime errors, and script status. Each device that has an
associated script causes a new instance of these counters to be created. The following table contains information on the Cisco SIP Normalization counters.

**Table 42: Cisco SIP Normalization**

<table>
<thead>
<tr>
<th>Display Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DeviceResetAutomatically</td>
<td>This counter indicates the number of times that Cisco Unified CM automatically resets the device (SIP trunk). The device reset is based on the values that are specified in the Script Execution Error Recovery Action and System Resource Error Recovery Action fields on the SIP Normalization Script Configuration window in Cisco Unified Communications Manager Administration. When the device (SIP trunk) is reset due to script errors, the counter value increments. This count restarts when the device is reset manually.</td>
</tr>
</tbody>
</table>
| DeviceResetManually        | This counter indicates the number of times that the device (SIP trunk) is reset manually in Cisco Unified Communications Manager Administration or by other methods, such as AXL. When the device associated with a script is reset due to configuration changes, the counter value increments. The counter restarts in the following situations:  
  - The SIP trunk is deleted.  
  - The script on the trunk gets changed or deleted.  
  - Cisco Unified Communications Manager restarts. |
| ErrorExecution             | This counter represents the number of execution errors that occurred while the script executed. Execution errors can occur while a message handler executes. Execution errors can be caused by resource errors, an argument mismatch in a function call, and so on.  
When an execution error occurs, Cisco Unified CM performs the following actions:  
  - Automatically restores the message to the original content before applying additional error handling actions.  
  - Increments the value of the counter.  
  - Takes appropriate action based on the configuration of the Script Execution Error Recovery Action and System Resource Error Recovery Action fields in Cisco Unified Communications Manager Administration.  
Check the SIPNormalizationScriptError alarm for details, including the line number in the script that failed. Correct the script problem, upload the corrected script as needed, and reset the trunk. This counter increments every time an execution error occurs. This counter provides a count from the most recent trunk reset that involved a script configuration change. (A device reset alone does not restart the count; the script configuration must also change before the reset occurs.) If the counter continues to increment after you fix the script problem, examine the script again. |
<table>
<thead>
<tr>
<th>Display Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ErrorInit</strong></td>
<td>This counter represents the number of times a script error occurred after the script successfully loaded into memory, but failed to initialize in Cisco Unified CM. A script can fail to initialize due to resource errors, an argument mismatch in a function call, the expected table was not returned, and so on. Check the SIPNormalizationScriptError alarm for details, including the line number in the script that failed. Correct the script problem, upload the corrected script as needed, and reset the trunk. This counter increments every time an initialization error occurs. This counter provides a count from the most recent trunk reset that was accompanied by a script configuration change. (A device reset alone does not restart the count; the script configuration must also change before the reset occurs.) If the counter continues to increment after you fix the script problem, examine the script again. When the error occurs during initialization, Cisco Unified CM automatically disables the script.</td>
</tr>
<tr>
<td><strong>ErrorInternal</strong></td>
<td>This counter indicates the number of internal errors that occurred while the script executed. Internal errors are very rare. If the value in this counter is higher than zero, a defect exists in the system that is not related to the script content or execution. Collect SDI traces and contact the Technical Assistance Center (TAC).</td>
</tr>
<tr>
<td><strong>ErrorLoad</strong></td>
<td>This counter represents the number of times a script error occurred when the script loaded into memory in Cisco Unified Communications Manager. A script can fail to load due to memory issues or syntax errors. Check the SIPNormalizationScriptError alarm for details. Check the script syntax for errors, upload the corrected script as needed, and reset the trunk. This counter increments every time a load error occurs. This counter provides a count from the most recent trunk reset that was accompanied by a script configuration change. (A device reset alone will not restart the count; the script configuration must also change before the reset occurs.) If the counter continues to increment even after you fix the script problem, examine the script again.</td>
</tr>
<tr>
<td><strong>ErrorResource</strong></td>
<td>This counter indicates whether the script encountered a resource error. Two kinds of resource errors exist: exceeding the value in the Memory Threshold field and exceeding the value in the Lua Instruction Threshold field. (Both fields display on the SIP Normalization Script Configuration window in Cisco Unified Communications Manager Administration.) If either condition occurs, Cisco Unified Communications Manager immediately closes the script and issues the SIPNormalizationScriptError alarm. If a resource error occurs while the script loads or initializes, the script is disabled. If a resource error occurs during execution, the configured system resource error recovery action is taken. (The setting of the System Resource Error Recovery Action field on the SIP Normalization Script Configuration window in Cisco Unified Communications Manager Administration defines this action.)</td>
</tr>
<tr>
<td>Display Name</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>MemoryUsage</td>
<td>This counter specifies the amount of memory, in bytes, that the script consumes. This counter increases and decreases to match the amount of memory that the script uses. This count gets cleared when the script closes (because a closed script does not consume memory) and restarts when the script opens (gets enabled). A high number in this counter indicates a resource problem. Check the MemoryUsagePercentage counter and the SIPNormalizationResourceWarning alarm, which occur when the resource consumption exceeds an internally set threshold.</td>
</tr>
<tr>
<td>MemoryUsagePercentage</td>
<td>This counter specifies the percentage of the total amount of memory that the script consumes. The value in this counter is derived by dividing the value in the MemoryUsage counter by the value in the Memory Threshold field (in the SIP Normalization Script Configuration window) and multiplying the result by 100 to arrive at a percentage. This counter increases and decreases in accordance with the MemoryUsage counter. This count gets cleared when the script closes (because closed scripts do not consume memory) and restarts when the script opens (gets enabled). When this counter reaches the internally controlled resource threshold, the SIPNormalizationResourceWarning alarm is issued.</td>
</tr>
<tr>
<td>MessageRollback</td>
<td>This counter indicates the number of times that the system automatically rolled back a message. The system rolls back the message by using the error handling that is specified in the Script Execution Error Recovery Action field in the SIP Normalization Script Configuration window in Cisco Unified CM Administration. When an execution error occurs, Cisco Unified CM automatically restores the message to the original content before applying additional error handling actions. If error handling specifies Rollback only, no further action is taken beyond rolling back to the original message before the normalization attempt. For the other possible Script Execution Error Recovery Actions, message rollback always occurs first, followed by the specified action, such as disabling the script, resetting the script automatically, or resetting the trunk automatically.</td>
</tr>
<tr>
<td>msgAddContentBody</td>
<td>This counter represents the number of times that the script added a content body to the message. If you are using the msg:addContentBody API in the script, this counter increases each time that the msg:addContentBody API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgAddHeader</td>
<td>This counter represents the number of times that the script added a SIP header to the message. If you are using the msg:addHeader API in the script, this counter increases each time that the msg:addHeader API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>msgAddHeaderUriParameter</td>
<td>This counter represents the number of times that the script added a SIP header URI parameter to a SIP header in the message. If you are using the msg:addHeaderUriParameter API in the script, this counter increases each time that the msg:addHeaderUriParameter API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgAddHeaderValueParameter</td>
<td>This counter represents the number of times that the script added a SIP header value parameter to a SIP header in the message. If you are using the msg:addHeaderValueParameter API in the script, this counter increases each time that the msg:addHeaderValueParameter API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgApplyNumberMask</td>
<td>This counter represents the number of times that the script applied a number mask to a SIP header in the message. If you are using the msg:applyNumberMask API in the script, this counter increases each time that the msg:applyNumberMask API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgBlock</td>
<td>This counter represents the number of times that the script blocked a message. If you are using the msg:block API in the script, this counter increases each time that the msg:block API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgConvertDiversionToHI</td>
<td>This counter represents the number of times that the script converted Diversion headers into History-Info headers in the message. If you are using the msg:convertDiversionToHI API in the script, this counter increases each time that the msg:convertDiversionToHI API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgConvertHToDiversion</td>
<td>This counter represents the number of times that the script converted Diversion headers into History-Info headers in the message. If you are using the msg:convertDiversionToHI API in the script, this counter increases each time that the msg:convertDiversionToHI API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgModifyHeader</td>
<td>This counter represents the number of times that the script modified a SIP header in the message. If you are using the msg:modifyHeader API in the script, this counter increases each time that the msg:modifyHeader API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgRemoveContentBody</td>
<td>This counter represents the number of times that the script removed a content body from the message. If you are using the msg:removeContentBody API in the script, this counter increases each time that the msg:removeContentBody API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>msgRemoveHeader</td>
<td>This counter represents the number of times that the script removed a SIP header from the message. If you are using the msg:removeHeader API in the script, this counter increases each time that the msg:removeHeader API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgRemoveHeaderValue</td>
<td>This counter represents the number of times that the script removed a SIP header value from the message. If you are using the msg:removeHeaderValue API in the script, this counter increases each time that the msg:removeHeaderValue API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgSetRequestUri</td>
<td>This counter represents the number of times that the script modified the request URI in the message. If you are using the msg:setRequestUri API in the script, this counter increases each time that the msg:setRequestUri API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgSetResponseCode</td>
<td>This counter represents the number of times that the script modified the response code and/or response phrase in the message. If you are using the msg:setResponseCode API in the script, this counter increases each time that the msg:setResponseCode API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>msgSetSdp</td>
<td>This counter represents the number of times that the script set the SDP in the message. If you are using the msg:setSdp API in the script, this counter increases each time that the msg:setSdp API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>ptAddContentBody</td>
<td>This counter represents the number of times that the script added a content body to the PassThrough (pt) object. If you are using the pt:addContentBody API in the script, this counter increases each time that the pt:addContentBody API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>ptAddHeader</td>
<td>This counter represents the number of times that the script added a SIP header to the PassThrough (pt) object. If you are using the pt:addHeader API in the script, this counter increases each time that the pt:addHeader API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>ptAddHeaderUriParameter</td>
<td>This counter represents the number of times that the script added a SIP header URI parameter to the PassThrough (pt) object. If you are using the pt:addHeaderUriParameter API in the script, this counter increases each time that the pt:addHeaderUriParameter API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>Display Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ptAddHeaderValueParameter</td>
<td>This counter represents the number of times that the script added a SIP header value parameter to the PassThrough (pt) object. If you are using the pt:addHeaderValueParameter API in the script, this counter increases each time that the pt:addHeaderValueParameter API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
<tr>
<td>ptAddRequestUriParameter</td>
<td>This counter represents the number of times that the script added a request URI parameter to the PassThrough (pt) object. If you are using the pt:addRequestUriParameter API in the script, this counter increases each time that the pt:addRequestUriParameter API executes successfully. If the counter behavior is not as expected, examine the script logic for errors.</td>
</tr>
</tbody>
</table>
| ScriptActive                       | This counter indicates whether the script is currently active (running on the trunk). The following values display for the counter:  
  • 0—Indicates that the script is closed (disabled).  
  • 1—Indicates that the script is open and operational.  

To open the script that should be running on this trunk, perform the following actions:  
1. Check for any alarms that might indicate why the script is not open.  
2. Correct any errors.  
3. Upload a new script if necessary.  
4. Reset the trunk.                                                                 |
| ScriptClosed                       | This counter indicates the number of times that Cisco Unified Communications Manager has closed the script. When the script is closed, it is not enabled on this device. Cisco Unified CM closes the script under one of the following conditions:  
  • The device was reset manually.  
  • The device was reset automatically (due to an error).  
  • The device was deleted.  

This count restarts when the SIP trunk is reset after a change to the script configuration and when Cisco Unified CM restarts. |
<table>
<thead>
<tr>
<th>Display Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| ScriptDisabledAutomatically | This counter indicates the number of times that the system automatically disabled the script. The values that are specified in the Script Execution Error Recovery Action and System Resource Error Recovery Action fields in the SIP Normalization Script Configuration window in Cisco Unified CM Administration determine whether the script is disabled. The script also gets disabled as a result of script error conditions that are encountered during loading and initialization. This counter provides a count from the most recent manual device reset that involved a script configuration change (a device reset alone does not restart the count; the script must also have changed before the reset occurs). This counter increments every time Cisco Unified CM automatically disables a script due to script errors. If the number in this counter is higher than expected, perform the following actions:  
  - Check for SIPNormalizationScriptError alarm and SIPNormalizationAutoResetDisabled alarm.  
  - Check for any resource-related alarms and counters in RTMT to determine whether a resource issue is occurring.  
  - Check for any unexpected SIP normalization events in the SDI trace files. |
| ScriptOpened             | This counter indicates the number of times that the Cisco Unified CM attempted to open the script. For the a script to open, it must load into memory in Cisco Unified CM, initialize, and be operational. A number greater than one in this counter means that Cisco Unified CM has made more than one attempt to open the script on this SIP trunk, either for an expected reason or due to an error during loading or initialization. The error can occur due to execution errors or resource errors or invalid syntax in the script. Expect this counter to be greater than one if any of these counters increment: DeviceResetManually, DeviceResetAutomatically, or ScriptResetAutomatically. The DeviceResetManually counter increments when an expected event, such as a maintenance window on the SIP trunk, causes the script to close. If the number in this counter is high for an unexpected reason, perform the following actions:  
  - Check for alarms, such as the SIPNormalizationScriptClosed, SIPNormalizationScriptError, or SIPNormalizationResourceWarning.  
  - Check resource-related alarms and counters in RTMT to determine whether a resource issue is occurring.  
  - Check for any unexpected SIP normalization events in the SDI trace files. This count restarts when the SIP trunk resets after a script configuration change and when Cisco Unified CM restarts. |
This counter indicates the number of times that the system automatically reset the script. The script resets based on the values that are specified in the Script Execution Error Recovery Action and System Resource Error Recovery Action fields in the SIP Normalization Script Configuration window in Cisco Unified CM Administration. This counter specifies a count of the number of automatic script resets after the last manual device reset; this counter increments every time the Cisco Unified CM automatically resets a script due to script errors.

If the number in this counter is higher than expected, perform the following actions:

- Check for a SIPNormalizationScriptError alarm.
- Check for any resource-related alarms and counters in RTMT to determine whether a resource issue is occurring.
- Check for any unexpected SIP normalization events in the SDI trace files.

## Cisco SIP Stack

The Cisco SIP Stack object provides information about Session Initiation Protocol (SIP) stack statistics that are generated or used by SIP devices such as SIP Proxy, SIP Redirect Server, SIP Registrar, and SIP User Agent. The following table contains information on Cisco SIP Stack counters.

### Table 43: Cisco SIP Stack

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AckIns</td>
<td>This counter represents the total number of ACK requests that the SIP device received.</td>
</tr>
<tr>
<td>AckOuts</td>
<td>This counter represents the total number of ACK requests that the SIP device sent.</td>
</tr>
<tr>
<td>ByeIns</td>
<td>This counter represents the total number of BYE requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>ByeOuts</td>
<td>This counter represents the total number of BYE requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>CancelIns</td>
<td>This counter represents the total number of CANCEL requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>CancelOuts</td>
<td>This counter represents the total number of CANCEL requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>CCBsAllocated</td>
<td>This counter represents the number of Call Control Blocks (CCB) that are currently in use by the SIP stack. Each active SIP dialog uses one CCB.</td>
</tr>
<tr>
<td>Counter</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>GlobalFailedClassIns</td>
<td>This counter represents the total number of 6xx class SIP responses that the SIP device received. This number includes retransmission. This class of responses indicates that a SIP device, that is providing a client function, received a failure response message. Generally, the responses indicate that a server had definitive information on a particular called party and not just the particular instance in the Request-URI.</td>
</tr>
<tr>
<td>GlobalFailedClassOuts</td>
<td>This counter represents the total number of 6xx class SIP responses that the SIP device sent. This number includes retransmission. This class of responses indicates that a SIP device, that is providing a server function, received a failure response message. Generally, the responses indicate that a server had definitive information on a particular called party and not just the particular instance in the Request-URI.</td>
</tr>
<tr>
<td>InfoClassIns</td>
<td>This counter represents the total number of 1xx class SIP responses that the SIP device received. This includes retransmission. This class of responses provides information on the progress of a SIP request.</td>
</tr>
<tr>
<td>InfoClassOuts</td>
<td>This counter represents the total number of 1xx class SIP responses that the SIP device sent. This includes retransmission. This class of responses provides information on the progress of processing a SIP request.</td>
</tr>
<tr>
<td>InfoIns</td>
<td>This counter represents the total number of INFO requests that the SIP device has received. This number includes retransmission.</td>
</tr>
<tr>
<td>InfoOuts</td>
<td>This counter represents the total number of INFO requests that the SIP device has sent. This number includes retransmission.</td>
</tr>
<tr>
<td>InviteIns</td>
<td>This counter represents the total number of INVITE requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>InviteOuts</td>
<td>This counter represents the total number of INVITE requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>NotifyIns</td>
<td>This counter represents the total number of NOTIFY requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>NotifyOuts</td>
<td>This counter represents the total number of NOTIFY requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>OptionsIns</td>
<td>This counter represents the total number of OPTIONS requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>OptionsOuts</td>
<td>This counter represents the total number of OPTIONS requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>PRAckIns</td>
<td>This counter represents the total number of PRACK requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>PRAckOuts</td>
<td>This counter represents the total number of PRACK requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>PublishIns</td>
<td>This counter represents the total number of PUBLISH requests that the SIP device received. This number includes retransmissions.</td>
</tr>
<tr>
<td>PublishOuts</td>
<td>This counter represents the total number of PUBLISH requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>RedirClassIns</td>
<td>This counter represents the total number of 3xx class SIP responses that the SIP device received. This number includes retransmission. This class of responses provides information about redirections to addresses where the callee may be reachable.</td>
</tr>
<tr>
<td>RedirClassOuts</td>
<td>This counter represents the total number of 3xx class SIP responses that the SIP device sent. This number includes retransmission. This class of responses provides information about redirections to addresses where the callee may be reachable.</td>
</tr>
<tr>
<td>ReferIns</td>
<td>This counter represents the total number of REFER requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>ReferOuts</td>
<td>This counter represents the total number of REFER requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>RegisterIns</td>
<td>This counter represents the total number of REGISTER requests that the SIP device received. This number includes retransmission.</td>
</tr>
<tr>
<td>RegisterOuts</td>
<td>This counter represents the total number of REGISTER requests that the SIP device sent. This number includes retransmission.</td>
</tr>
<tr>
<td>RequestsFailedClassIns</td>
<td>This counter represents the total number of 4xx class SIP responses that the SIP device received. This number includes retransmission. This class of responses indicates a request failure by a SIP device that is providing a client function.</td>
</tr>
<tr>
<td>RequestsFailedClassOuts</td>
<td>This counter represents the total number of 4xx class SIP responses that the SIP device sent. This number includes retransmission. This class of responses indicates a request failure by a SIP device that is providing a server function.</td>
</tr>
<tr>
<td>RetryByes</td>
<td>This counter represents the total number of BYE retries that the SIP device sent. To determine the number of first BYE attempts, subtract the value of this counter from the value of the sipStatsByeOuts counter.</td>
</tr>
<tr>
<td>RetryCancels</td>
<td>This counter represents the total number of CANCEL retries that the SIP device sent. To determine the number of first CANCEL attempts, subtract the value of this counter from the value of the sipStatsCancelOuts counter.</td>
</tr>

### Counter Description

This counter represents the total number of 4xx response messages, including retransmission, that the SIP device sent. This count includes the following 4xx responses:

- 400 BadRequest
- 401 Unauthorized
- 402 Payment Required
- 403 Forbidden
- 404 Not Found
- 405 Method Not Allowed
- 406 Not Acceptable
- 407 Proxy Authentication Required
- 408 Request Timeout
- 409 Conflict
- 410 Gone
- 413 Request Entity Too Large
- 414 Request-URI Too Long
- 415 Unsupported Media Type
- 416 Unsupported URI Scheme
- 417 Unknown Resource Priority
- 420 Bad Extension
- 422 Session Expires Value Too Small
- 423 Interval Too Brief
- 480 Temporarily Unavailable
- 481 Call/Transaction Does Not Exist
- 482 Loop Detected
- 483 Too Many Hops
- 484 Address Incomplete
- 485 Ambiguous
- 486 Busy Here
- 487 Request Terminated
- 488 Not Acceptable Here
- 489 Bad Subscription Event
- 491 Request Pending

Cisco SIP Station

The Cisco SIP Station object provides information about SIP line-side devices. The following table contains information on the Cisco SIP Station counters.

Table 44: Cisco SIP Station

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConfigMismatchesPersistent</td>
<td>This counter represents the number of times that a phone that is running SIP was persistently unable to register due to a configuration version mismatch between the TFTP server and Cisco Unified Communications Manager since the last restart of the Cisco Unified Communications Manager. This counter increments each time that Cisco Unified Communications Manager cannot resolve the mismatch and manual intervention is required (such as a configuration update or device reset).</td>
</tr>
<tr>
<td>ConfigMismatchesTemporary</td>
<td>This counter represents the number of times that a phone that is running SIP was temporarily unable to register due to a configuration version mismatch between the TFTP server and Cisco Unified Communications Manager since the last restart of the Cisco CallManager service. This counter increments each time Cisco Unified Communications Manager can resolve the mismatch automatically.</td>
</tr>
<tr>
<td>DBTimeouts</td>
<td>This counter represents the number of new registrations that failed because a timeout occurred while the system was attempting to retrieve the device configuration from the database.</td>
</tr>
<tr>
<td>NewRegAccepted</td>
<td>This counter represents the total number of new REGISTRATION requests that have been removed from the NewRegistration queue and processed since the last restart of the Cisco CallManager service.</td>
</tr>
<tr>
<td>NewRegQueueSize</td>
<td>This counter represents the number of REGISTRATION requests that are currently on the NewRegistration queue. The system places REGISTRATION requests that are received from devices that are not currently registered on this queue before they are processed.</td>
</tr>
<tr>
<td>NewRegRejected</td>
<td>This counter represents the total number of new REGISTRATION requests that were rejected with a 486 Busy Here response and not placed on the NewRegistration queue since the last restart of the Cisco CallManager service. The system rejects REGISTRATION requests if the NewRegistration queue exceeds a programmed size.</td>
</tr>
<tr>
<td>TokensAccepted</td>
<td>This counter represents the total number of token requests that have been granted since the last Cisco Communications Manager restart. Cisco Unified Communications Manager grants tokens as long as the number of outstanding tokens remains below the number that is specified in the Cisco CallManager service parameter Maximum Phone Fallback Queue Depth.</td>
</tr>
</tbody>
</table>
Counter Description

This counter represents the number of devices that have been granted a token but have not yet registered. The system requires that devices that are reconnecting to a higher priority Cisco Unified Communications Manager server be granted a token before registering. Tokens protect Cisco Unified Communications Manager from being overloaded with registration requests when it comes back online after a failover situation.

TokensRejected

This counter represents the total number of token requests that have been rejected since the last Cisco Unified Communications Manager restart. Cisco Unified Communications Manager will reject token request if the number of outstanding tokens is greater than the number that is specified in the Cisco CallManager service parameter Maximum Phone Fallback Queue Depth.

Cisco SW Conf Bridge Device

The Cisco SW Conference Bridge Device object provides information about registered Cisco software conference bridge devices. The following table contains information on the Cisco software conference bridge device counters.

**Table 45: Cisco SW Conf Bridge Device**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that an attempt was made to allocate a conference resource from a SW conference device and failed because all resources were already in use.</td>
</tr>
<tr>
<td>ResourceActive</td>
<td>This counter represents the number of resources that are currently in use (active) for a SW conference device. One resource represents one stream.</td>
</tr>
<tr>
<td>ResourceAvailable</td>
<td>This counter represents the total number of resources that are not active and are still available to be used now for a SW conference device. One resource represents one stream.</td>
</tr>
<tr>
<td>ResourceTotal</td>
<td>This counter represents the total number of conference resources that a SW conference device provides. One resource represents one stream. This counter equals the sum of the ResourceAvailable and ResourceActive counters.</td>
</tr>
<tr>
<td>SWConferenceActive</td>
<td>This counter represents the number of software-based conferences that are currently active (in use) on a SW conference device.</td>
</tr>
<tr>
<td>SWConferenceCompleted</td>
<td>This counter represents the total number of conferences that have been allocated and released on a SW conference device. A conference starts when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
</tbody>
</table>
### Cisco TFTP Server

The Cisco Trivial File Transfer Protocol (TFTP) Server object provides information about the Cisco TFTP server. The following table contains information on Cisco TFTP server counters.

#### Table 46: Cisco TFTP Server

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BuildAbortCount</td>
<td>This counter represents the number of times that the build process aborted when it received a Build all request. This counter increases when building of device/unit/softkey/dial rules gets aborted as a result of group level change notifications.</td>
</tr>
<tr>
<td>BuildCount</td>
<td>This counter represents the number of times since the TFTP service started that the TFTP server has built all the configuration files in response to a database change notification that affects all devices. This counter increases by one every time the TFTP server performs a new build of all the configuration files.</td>
</tr>
<tr>
<td>BuildDeviceCount</td>
<td>This counter represents the number of devices that were processed in the last build of all the configuration files. This counter also updates while processing device change notifications. The counter increases when a new device is added and decreases when an existing device is deleted.</td>
</tr>
<tr>
<td>BuildDialruleCount</td>
<td>This counter represents the number of dial rules that were processed in the last build of the configuration files. This counter also updates while processing dial rule change notifications. The counter increases when a new dial rule is added and decreases when an existing dial rule is deleted.</td>
</tr>
<tr>
<td>BuildDuration</td>
<td>This counter represents the time in seconds that it took to build the last configuration files.</td>
</tr>
<tr>
<td>BuildSignCount</td>
<td>This counter represents the number of security-enabled phone devices for which the configuration file was digitally signed with the Cisco Unified Communications Manager server key in the last build of all the configuration files. This counter also updates while processing security-enabled phone device change notifications.</td>
</tr>
<tr>
<td>BuildSoftKeyCount</td>
<td>This counter represents the number of softkeys that were processed in the last build of the configuration files. This counter increments when a new softkey is added and decrements when an existing softkey is deleted.</td>
</tr>
<tr>
<td>BuildUnitCount</td>
<td>This counter represents the number of gateways that were processed in the last build of all the configuration files. This counter also updates while processing unit change notifications. The counter increases when a new gateway is added and decreases when an existing gateway is deleted.</td>
</tr>
<tr>
<td>Counter Description</td>
<td>Counter Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>ChangeNotifications</td>
<td>This counter represents the total number of all the Cisco Unified Communications Manager database change notifications that the TFTP server received. Each time that a device configuration is updated in Cisco Unified Communications Manager Administration, the TFTP server gets sent a database change notification to rebuild the XML file for the updated device.</td>
</tr>
<tr>
<td>DeviceChangeNotifications</td>
<td>This counter represents the number of times that the TFTP server received database change notification to create, update, or delete configuration files for devices.</td>
</tr>
<tr>
<td>DialruleChangeNotifications</td>
<td>This counter represents the number of times that the TFTP server received database change notification to create, update, or delete configuration files for dial rules.</td>
</tr>
<tr>
<td>EncryptCount</td>
<td>This counter represents the number of configuration files that were encrypted. This counter gets updated each time a configuration file is successfully encrypted.</td>
</tr>
<tr>
<td>GKFoundCount</td>
<td>This counter represents the number of GK files that were found in the cache. This counter gets updated each time a GK file is found in the cache.</td>
</tr>
<tr>
<td>GKNotFoundCount</td>
<td>This counter represents the number of GK files that were not found in the cache. This counter gets updated each time a request to get a GK file results in the cache not finding it.</td>
</tr>
<tr>
<td>HeartBeat</td>
<td>This counter represents the heartbeat of the TFTP server. This incremental count indicates that the TFTP server is up and running. If the count does not increase, this means that the TFTP server is down.</td>
</tr>
<tr>
<td>HttpConnectRequests</td>
<td>This counter represents the number of clients that are currently requesting the HTTP GET file request.</td>
</tr>
<tr>
<td>HttpRequests</td>
<td>This counter represents the total number of file requests (such as requests for XML configuration files, phone firmware files, audio files, and so on.) that the HTTP server handled. This counter represents the sum total of the following counters since the HTTP service started: RequestsProcessed, RequestsNotFound, RequestsOverflow, RequestsAborted, and RequestsInProgress.</td>
</tr>
<tr>
<td>HttpRequestsAborted</td>
<td>This counter represents the total number of HTTP requests that the HTTP server canceled (aborted) unexpectedly. Requests could get aborted if the requesting device cannot be reached (for instance, the device lost power) or if the file transfer was interrupted due to network connectivity problems.</td>
</tr>
<tr>
<td>HttpRequestsNotFound</td>
<td>This counter represents the total number of HTTP requests where the requested file was not found. When the HTTP server does not find the requested file, a message gets sent to the requesting device.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HttpRequestsOverflow</td>
<td>This counter represents the total number of HTTP requests that were rejected when the maximum number of allowable client connections was reached. The requests may have arrived while the TFTP server was building the configuration files or because of some other resource limitation. The Cisco TFTP advanced service parameter, Maximum Serving Count, sets the maximum number of allowable connections.</td>
</tr>
<tr>
<td>HttpRequestsProcessed</td>
<td>This counter represents the total number of HTTP requests that the HTTP server successfully processed.</td>
</tr>
<tr>
<td>HttpServedFromDisk</td>
<td>This counter represents the number of requests that the HTTP server completed with the files that are on disk and not cached in memory.</td>
</tr>
<tr>
<td>LDFoundCount</td>
<td>This counter represents the number of LD files that were found in the cache. This counter gets updated each time that a LD file is found in cache memory.</td>
</tr>
<tr>
<td>LDNotFoundCount</td>
<td>This counter represents the number of LD files that were not found in cache memory. This counter gets updated each time that a request to get an LD file results in the cache not finding it.</td>
</tr>
<tr>
<td>MaxServingCount</td>
<td>This counter represents the maximum number of client connections that the TFTP can serve simultaneously. The Cisco TFTP advanced service parameter, Maximum Serving Count, sets this value.</td>
</tr>
<tr>
<td>Requests</td>
<td>This counter represents the total number of file requests (such as requests for XML configuration files, phone firmware files, audio files, and so on.) that the TFTP server handles. This counter represents the sum total of the following counters since the TFTP service started: RequestsProcessed, RequestsNotFound, RequestsOverflow, RequestsAborted, and RequestsInProgress.</td>
</tr>
<tr>
<td>RequestsAborted</td>
<td>This counter represents the total number of TFTP requests that the TFTP server canceled (aborted) unexpectedly. Requests could get aborted if the requesting device cannot be reached (for instance, the device lost power) or if the file transfer was interrupted due to network connectivity problems.</td>
</tr>
<tr>
<td>RequestsInProgress</td>
<td>This counter represents the number of file requests that the TFTP server currently is processing. This counter increases for each new file request and decreases for each file request that completes. This counter indicates the current load of the TFTP server.</td>
</tr>
<tr>
<td>RequestsNotFound</td>
<td>This counter represents the total number of TFTP requests for which the requested file was not found. When the TFTP server does not find the requested file, a message gets sent to the requesting device. If this counter increments in a cluster that is configured as secure, this event usually indicates an error condition. If, however, the cluster is configured as non-secure, it is normal for the CTL file to be absent (not found), which results in a message being sent to the requesting device and a corresponding increment in this counter. For non-secure clusters, this normal occurrence does not represent an error condition.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>RequestsOverflow</td>
<td>This counter represents the total number of TFTP requests that were rejected because the maximum number of allowable client connections was exceeded, because requests arrived while the TFTP server was building the configuration files, or because of some other resource limitation. The Cisco TFTP advanced service parameter, Maximum Serving Count, sets the maximum number of allowable connections.</td>
</tr>
<tr>
<td>RequestsProcessed</td>
<td>This counter represents the total number of TFTP requests that the TFTP server successfully processed.</td>
</tr>
<tr>
<td>SegmentsAcknowledged</td>
<td>This counter represents the total number of data segments that the client devices acknowledged. Files get sent to the requesting device in data segments of 512 bytes, and for each 512-byte segment, the device sends the TFTP server an acknowledgment message. Each additional data segment gets sent upon receipt of the acknowledgment for the previous data segment until the complete file successfully gets transmitted to the requesting device.</td>
</tr>
<tr>
<td>SegmentsFromDisk</td>
<td>This counter represents the number of data segments that the TFTP server reads from the files on disk, while serving files.</td>
</tr>
<tr>
<td>SegmentSent</td>
<td>This counter represents the total number of data segments that the TFTP server sent. Files get sent to the requesting device in data segments of 512 bytes.</td>
</tr>
<tr>
<td>SEPFoundCount</td>
<td>This counter represents the number of SEP files that were successfully found in the cache. This counter gets updated each time that a SEP file is found in the cache.</td>
</tr>
<tr>
<td>SEPNotFoundCount</td>
<td>This counter represents the number of SEP files that were not found in the cache. This counter gets updated each time that a request to get a SEP file produces a not found in cache memory result.</td>
</tr>
<tr>
<td>SIPFoundCount</td>
<td>This counter represents the number of SIP files that were successfully found in the cache. This counter gets updated each time that a SIP file is found in the cache.</td>
</tr>
<tr>
<td>SIPNotFoundCount</td>
<td>This counter represents the number of SIP files that were not found in the cache. This counter gets updated each time that a request to get a SIP file produces a not found in cache memory result.</td>
</tr>
<tr>
<td>SoftkeyChangeNotifications</td>
<td>This counter represents the number of times that the TFTP server received database change notification to create, update, or delete configuration files for softkeys.</td>
</tr>
<tr>
<td>UnitChangeNotifications</td>
<td>This counter represents the number of times that the TFTP server received database change notification to create, update, or delete gateway-related configuration files.</td>
</tr>
</tbody>
</table>
Cisco Transcode Device

The Cisco Transcode Device object provides information about registered Cisco transcoding devices. The following table contains information on Cisco transcoder device counters.

**Table 47: Cisco Transcode Device**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OutOfResources</td>
<td>This counter represents the total number of times that an attempt was made to allocate a transcoder resource from a transcoder device and failed; for example, because all resources were already in use.</td>
</tr>
<tr>
<td>ResourceActive</td>
<td>This counter represents the number of transcoder resources that are currently in use (active) for a transcoder device. Each transcoder resource uses two streams.</td>
</tr>
<tr>
<td>ResourceAvailable</td>
<td>This counter represents the total number of resources that are not active and are still available to be used now for a transcoder device. Each transcoder resource uses two streams.</td>
</tr>
<tr>
<td>ResourceTotal</td>
<td>This counter represents the total number of transcoder resources that a transcoder device provided. This counter equals the sum of the ResourceActive and ResourceAvailable counters.</td>
</tr>
</tbody>
</table>

Cisco Video Conference Bridge

The Cisco Video Conference Bridge object provides information about registered Cisco video conference bridge devices. The following table contains information on Cisco video conference bridge device counters.

**Table 48: Cisco Video Conference Bridge**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ConferencesActive</td>
<td>This counter represents the total number of video conferences that are currently active (in use) on a video conference bridge device. The system specifies a conference as active when the first call connects to the bridge.</td>
</tr>
<tr>
<td>ConferencesAvailable</td>
<td>This counter represents the number of video conferences that are not active and are still available on a video conference device.</td>
</tr>
<tr>
<td>ConferencesCompleted</td>
<td>This counter represents the total number of video conferences that have been allocated and released on a video conference device. A conference starts when the first call connects to the bridge. The conference completes when the last call disconnects from the bridge.</td>
</tr>
<tr>
<td>ConferencesTotal</td>
<td>This counter represents the total number of video conferences that are configured for a video conference device.</td>
</tr>
</tbody>
</table>
Counter Description
---
-OutOfConferences: This counter represents the total number of times that an attempt was made to initiate a video conference from a video conference device and failed because the device already had the maximum number of active conferences that is allowed (as specified by the TotalConferences counter).
-OutOfResources: This counter represents the total number of times that an attempt was made to allocate a conference resource from a video conference device and failed, for example, because all resources were already in use.
-ResourceActive: This counter represents the total number of resources that are currently active (in use) on a video conference bridge device. One resource gets used per participant.
-ResourceAvailable: This counter represents the total number of resources that are not active and are still available on a device to handle additional participants for a video conference bridge device.
-ResourceTotal: This counter represents the total number of resources that are configured on a video conference bridge device. One resource gets used per participant.

Cisco Web Dialer

The Cisco Web Dialer object provides information about the Cisco Web Dialer application and the Redirector servlet. The following table contains information on the Cisco Web Dialer counters.

Table 49: Cisco Web Dialer

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the number of Make Call and End Call requests that the Cisco Web Dialer application successfully completed.</td>
</tr>
<tr>
<td>CallsFailed</td>
<td>This counter represents the number of Make Call and End Call requests that were unsuccessful.</td>
</tr>
<tr>
<td>RedirectorSessionsHandled</td>
<td>This counter represents the total number of HTTP sessions that the Redirector servlet handled since the last service startup.</td>
</tr>
<tr>
<td>RedirectorSessionsInProgress</td>
<td>This counter represents the number of HTTP sessions that are currently being serviced by the Redirector servlet.</td>
</tr>
<tr>
<td>RequestsCompleted</td>
<td>This counter represents the number of Make Call and End Call requests that the Web Dialer servlet successfully completed.</td>
</tr>
<tr>
<td>RequestsFailed</td>
<td>This counter represents the number of Make Call and End Call requests that failed.</td>
</tr>
</tbody>
</table>
### Counters

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SessionsHandled</td>
<td>This counter represents the total number of CTI sessions that the Cisco Web Dialer servlet handled since the last service startup.</td>
</tr>
<tr>
<td>SessionsInProgress</td>
<td>This counter represents the number of CTI sessions that the Cisco Web Dialer servlet is currently servicing.</td>
</tr>
</tbody>
</table>

---

**Cisco WSM Connector**

The WSM object provides information on WSMConnectors that are configured on Cisco Unified Communications Manager. Each WSMConnector represents a physical Motorola WSM device. The following table contains information on the Cisco WSM Connector counters.

**Table 50: Cisco WSM Connector**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsActive</td>
<td>This counter represents the number of calls that are currently active (in use) on the WSMConnector device.</td>
</tr>
<tr>
<td>CallsAttempted</td>
<td>This counter represents the number of calls that have been attempted on the WSMConnector device, including both successful and unsuccessful call attempts.</td>
</tr>
<tr>
<td>CallsCompleted</td>
<td>This counter represents the number of calls that are connected (a voice path was established) through the WSMConnector device. The counter increments when the call terminates.</td>
</tr>
<tr>
<td>CallsInProgress</td>
<td>This counter represents the number of calls that are currently in progress on the WSMConnector device. This includes all active calls. When the number of CallsInProgress equals the number of CallsActive, this indicates that all calls are connected.</td>
</tr>
<tr>
<td>DMMSRegistered</td>
<td>This counter represents the number of DMMS subscribers that are registered to the WSM.</td>
</tr>
</tbody>
</table>

---

**PerfMon objects and counters for system**

This section provides information on Cisco Unified Communications Manager System PerfMon objects and counters.

**Cisco Tomcat Connector**

The Tomcat Hypertext Transport Protocol (HTTP)/HTTP Secure (HTTPS) Connector object provides information about Tomcat connectors. A Tomcat HTTP connector represents an endpoint that receives requests
and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related web pages are accessed. The Secure Socket Layer (SSL) status of the URLs for web applications provides the basis for the instance name for each Tomcat HTTP Connector. For example, https://<IP Address>:8443 for SSL or http://<IP Address>:8080 for non-SSL. The following table contains information on the Tomcat HTTP connector counters.

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Errors</td>
<td>This counter represents the total number of HTTP errors (for example, 401 Unauthorized) that the connector encountered. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
<tr>
<td>MBytesReceived</td>
<td>This counter represents the amount of data that the connector received. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
<tr>
<td>MBytesSent</td>
<td>This counter represents the amount of data that the connector sent. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
<tr>
<td>Requests</td>
<td>This counter represents the total number of request that the connector handled. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
</tbody>
</table>
Cisco Unified Real-Time Monitoring Tool Tracing PerfMon counters and alerts

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ThreadsTotal</td>
<td>This counter represents the current total number of request processing threads, including available and in-use threads, for the connector. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
<tr>
<td>ThreadsMax</td>
<td>This counter represents the maximum number of request processing threads for the connector. Each incoming request on a Cisco Unified Communications Manager related window requires a thread for the duration of that request. If more simultaneous requests are received than the currently available request processing threads can handle, additional threads will get created up to the configured maximum shown in this counter. If still more simultaneous requests are received, they accumulate within the server socket that the connector created, up to an internally specified maximum number. Any further simultaneous requests will receive connection refused messages until resources are available to process them. A Tomcat HTTP connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when Cisco Unified Communications Manager related windows are accessed. The Secure Socket Layer (SSL) status of the URLs for the web application provides basis for the instance name for each Tomcat HTTP connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
<tr>
<td>ThreadsBusy</td>
<td>This counter represents the current number of busy/in-use request processing threads for the connector. A Tomcat Connector represents an endpoint that receives requests and sends responses. The connector handles HTTP/HTTPS requests and sends HTTP/HTTPS responses that occur when web pages that are related to Cisco Unified Communications Manager are accessed. The Secure Sockets Layer (SSL) status of the URLs for the web application provides the basis for the instance name for each Tomcat connector. For example, https://&lt;IP Address&gt;:8443 for SSL or http://&lt;IP Address&gt;:8080 for non-SSL.</td>
</tr>
</tbody>
</table>

**Cisco Tomcat JVM**

The Cisco Tomcat Java Virtual Machine (JVM) object provides information about the Tomcat JVM, which represents, among other things, a pool of common resource memory that Cisco Unified Communications Manager related web applications such as Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, Cisco Unity Connection Administration, and more use. The following table contains information on the Tomcat JVM counters.
### Table 52: Tomcat JVM

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>KBytesMemoryFree</td>
<td>This counter represents the amount of free dynamic memory block (heap memory) in the Tomcat Java Virtual Machine. The dynamic memory block stores all objects that Tomcat and its web applications, such as Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, and Cisco Unity Connection create. When the amount of free dynamic memory is low, more memory gets automatically allocated, and total memory size (represented by the KbytesMemoryTotal counter) increases but only up to the maximum (represented by the KbytesMemoryMax counter). You can determine the amount of memory in use by subtracting KBytesMemoryFree from KbytesMemoryTotal.</td>
</tr>
<tr>
<td>KBytesMemoryMax</td>
<td>This counter represents the amount of free dynamic memory block (heap memory) in the Tomcat Java Virtual Machine. The dynamic memory block stores all objects that Tomcat and its web applications, such as Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, and Cisco Unity Connection Administration, create.</td>
</tr>
<tr>
<td>KBytesMemoryTotal</td>
<td>This counter represents the current total dynamic memory block size, including free and in-use memory, of Tomcat Java Virtual Machine. The dynamic memory block stores all objects that Tomcat and its web applications, such as Cisco Unified Communications Manager Administration, Cisco Unified Serviceability, and Cisco Unity Connection Administration, create.</td>
</tr>
</tbody>
</table>

### Cisco Tomcat Web Application

The Cisco Tomcat Web Application object provides information about how to run CiscoUnified Communications Manager web applications. The URLs for the web application provide basis for the instance name for each Tomcat Web Application. For example, Cisco Unified Communications Manager Administration (https://<IP Address>:8443/ccmadmin) gets identified by ccmadmin, Cisco Unified Serviceability gets identified by ccmservice, Cisco Unified Communications Manager User Options gets identified by ccmuser, Cisco Unity Connection Administration (https://<IP Address>:8443/cuadmin) gets identified by cuadmin, and URLs that do not have an extension, such as https://<IP Address>:8443 or http://<IP Address>:8080, get identified by _root. The following table contains information on the Tomcat Web Application counters.
Table 53: Tomcat Web Application

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Errors</td>
<td>This counter represents the total number of HTTP errors (for example, 401 Unauthorized) that a Cisco Unified Communications Manager related web application encountered. The URLs for the web application provide the basis instance name for each Tomcat Web Application. For example, Cisco Unified Communications Manager Administration (https://&lt;IP Address&gt;:8443/ccmadmin) gets identified by ccmadmin, Cisco Unified Serviceability gets identified by ccmservice, Cisco Unified Communications Manager User Options gets identified by ccmuser, Cisco Unity Connection Administration (https://&lt;IP Address&gt;:8443/cuadmin) gets identified by cuadmin, and URLs that do not have an extension, such as https://&lt;IP Address&gt;:8443 or http://&lt;IP Address&gt;:8080, get identified by _root.</td>
</tr>
<tr>
<td>Requests</td>
<td>This counter represents the total number of requests that the web application handles. Each time that a web application is accessed, its Requests counter increments accordingly. The URLs for the web application provide the basis instance name for each Tomcat Web Application. For example, Cisco Unified Communications Manager Administration (https://&lt;IP Address&gt;:8443/ccmadmin) gets identified by ccmadmin, Cisco Unified Serviceability gets identified by ccmservice, Cisco Unified Communications Manager User Options gets identified by ccmuser, Cisco Unity Connection Administration (https://&lt;IP Address&gt;:8443/cuadmin) gets identified by cuadmin, and URLs that do not have an extension, such as https://&lt;IP Address&gt;:8443 or http://&lt;IP Address&gt;:8080, get identified by _root.</td>
</tr>
<tr>
<td>SessionsActive</td>
<td>This counter represents the number of sessions that the web application currently has active (in use). The URLs for the web application provide the basis instance name for each Tomcat Web Application. For example, Cisco Unified Communications Manager Administration (https://&lt;IP Address&gt;:8443/ccmadmin) gets identified by ccmadmin, Cisco Unified Serviceability gets identified by ccmservice, Cisco Unified Communications Manager User Options gets identified by ccmuser, Cisco Unity Connection Administration (https://&lt;IP Address&gt;:8443/cuadmin) gets identified by cuadmin, and URLs that do not have an extension, such as https://&lt;IP Address&gt;:8443 or http://&lt;IP Address&gt;:8080, get identified by _root.</td>
</tr>
</tbody>
</table>

Database Change Notification Client

The Database Change Notification Client object provides information on change notification clients. The following table contains information on the Database Change Notification Client counters.
Table 54: Database Change Notification Client

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>MessagesProcessed</td>
<td>This counter represents the number of database change notifications that have been processed. This counter refreshes every 15 seconds.</td>
</tr>
<tr>
<td>MessagesProcessing</td>
<td>This counter represents the number of change notification messages that are currently being processed or are waiting to be processed in the change notification queue for this client. This counter refreshes every 15 seconds.</td>
</tr>
<tr>
<td>QueueHeadPointer</td>
<td>This counter represents the head pointer to the change notification queue. The head pointer acts as the starting point in the change notification queue. To determine the number of notifications in the queue, subtract the head pointer value from the tail pointer value. By default, this counter refreshes every 15 seconds.</td>
</tr>
<tr>
<td>QueueMax</td>
<td>This counter represents the largest number of change notification messages that will be processed for this client. This counter remains cumulative since the last restart of the Cisco Database Layer Monitor service.</td>
</tr>
<tr>
<td>QueueTailPointer</td>
<td>This counter represents the tail pointer to the change notification queue. The tail pointer represents the ending point in the change notification queue. To determine the number of notifications in the queue, subtract the head pointer value from the tail pointer value. By default, this counter refreshes every 15 seconds.</td>
</tr>
<tr>
<td>TablesSubscribed</td>
<td>This counter represents the number of tables in which this client has subscribed.</td>
</tr>
</tbody>
</table>

Database Change Notification Server

The Database Change Notification Server object provides information on different change-notification-related statistics. The following table contains information on the Database Change Notification Server counters.

Table 55: Database Change Notification Server

<table>
<thead>
<tr>
<th>Counter</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clients</td>
<td>This counter represents the number of change notification clients (services/servlets) that have subscribed for change notification.</td>
</tr>
<tr>
<td>Counter Descriptions</td>
<td>Counter</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Queue Delay</td>
<td>This counter provides the number of seconds that the change notification process has messages to process but is not processing them. This condition is true if:</td>
</tr>
<tr>
<td></td>
<td>• Either Change Notification Requests Queued in Database (QueuedRequestsInDB) and Change Notification Requests Queued in Memory (QueuedRequestsInMemory) are non-zero, or</td>
</tr>
<tr>
<td></td>
<td>• The Latest Change Notification Messages Processed count is not changing.</td>
</tr>
</tbody>
</table>

This condition gets checked every 15 seconds.

<table>
<thead>
<tr>
<th>QueuedRequestsInDB</th>
<th>This counter represents the number of change notification records that are in the DBCNQueue (Database Change Notification Queue) table via direct TCP/IP connection (not queued in shared memory). This counter refreshes every 15 seconds.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>QueuedRequestsInMemory</th>
<th>This counter represents the number of change notification requests that are queued in shared memory.</th>
</tr>
</thead>
</table>

### Database Change Notification Subscription

The Database Change Notification Subscription object displays the names of tables where the client will receive Change Notifications.

The SubscribedTable object displays the table with the service or servlet that will receive change notifications. Because the counter does not increment, this display occurs for informational purposes only.

### Database Local DSN

The Database Local Data Source Name (DSN) object and LocalDSN counter provide the DSN information for the local machine. The following table contains information on the Database local DSN.

#### Table 56: Database Local Data Source Name

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>CcmDbSpace_Used</td>
<td>This counter represents the amount of Ccm DbSpace that is being consumed.</td>
</tr>
<tr>
<td>CcmtempDbSpace_Used</td>
<td>This counter represents the amount of Ccmtemp DbSpace that is being consumed.</td>
</tr>
<tr>
<td>CNDbSpace_Used</td>
<td>This counter represents the percentage of CN dbspace consumed.</td>
</tr>
<tr>
<td>LocalDSN</td>
<td>This counter represents the data source name (DSN) that is being referenced from the local machine.</td>
</tr>
<tr>
<td>SharedMemory_Free</td>
<td>This counter represents total shared memory that is free.</td>
</tr>
</tbody>
</table>
## Counter Descriptions

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>SharedMemory_Used</td>
<td>This counter total shared memory that is used.</td>
</tr>
<tr>
<td>RootDbSpace_Used</td>
<td>This counter represents the amount of RootDbSpace that is being consumed.</td>
</tr>
</tbody>
</table>

## DB User Host Information Counters

The DB User Host Information object provides information on DB User Host. The DB:User:Host Instance object displays the number of connections that are present for each instance of DB:User:Host.

## Enterprise Replication DBSpace Monitors

The enterprise replication DBSpace monitors object displays the usage of various ER DbSpaces. The following table contains information on the enterprise replication DB monitors.

### Table 57: Enterprise Replication DBSpace Monitors

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERDbSpace_Used</td>
<td>This counter represents the amount of enterprise replication DbSpace that was consumed.</td>
</tr>
<tr>
<td>ERSBDbSpace_Used</td>
<td>This counter represents the amount of ERDbSpace that was consumed.</td>
</tr>
</tbody>
</table>

## Enterprise Replication Perfmon Counters

The Enterprise Replication Perfmon Counter object provides information on the various replication counters. The ServerName:ReplicationQueueDepth counter displays the server name followed by the replication queue depth.

## IP

The IP object provides information on the IP statistics on your system. The following table contains information on the IP counters.

### Table 58: IP

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frag Creates</td>
<td>This counter represents the number of IP datagrams fragments that have been generated at this entity.</td>
</tr>
<tr>
<td>Frag Fails</td>
<td>This counter represents the number of IP datagrams that were discarded at this entity because the datagrams could not be fragmented, such as datagrams where the Do not Fragment flag was set.</td>
</tr>
</tbody>
</table>
## Counters and Counter Descriptions

<table>
<thead>
<tr>
<th>Counter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Frag OKs</td>
<td>This counter represents the number of IP datagrams that were successfully fragmented at this entity.</td>
</tr>
<tr>
<td>In Delivers</td>
<td>This counter represents the number of input datagrams that were delivered to IP user protocols. This includes Internet Control Message Protocol (ICMP).</td>
</tr>
<tr>
<td>In Discards</td>
<td>This counter represents the number of discarded input IP datagrams when no problems were encountered. Lack of buffer space provides one possible reason.</td>
</tr>
<tr>
<td>In HdrErrors</td>
<td>This counter represents the number of discarded input datagrams that had header errors. This includes bad checksums, version number mismatch, other format errors, time-to-live exceeded, and other errors that were discovered in processing IP options.</td>
</tr>
<tr>
<td>In Receives</td>
<td>This counter represents the number of input datagrams that were received from all network interfaces. This counter includes datagrams that were received with errors.</td>
</tr>
<tr>
<td>In UnknownProtos</td>
<td>This counter represents the number of locally addressed datagrams that were received successfully but discarded because of an unknown or unsupported protocol.</td>
</tr>
<tr>
<td>InOut Requests</td>
<td>This counter represents the number of incoming IP datagrams that were received and the number of outgoing IP datagrams that were sent.</td>
</tr>
<tr>
<td>Out Discards</td>
<td>This counter represents the number of output IP datagrams that were not transmitted and were discarded. Lack of buffer space provides one possible reason.</td>
</tr>
<tr>
<td>Out Requests</td>
<td>This counter represents the total number of IP datagrams that local IP protocols, including ICMP, supply to IP in requests transmission. This counter does not include any datagrams that were counted in ForwDatagrams.</td>
</tr>
<tr>
<td>Reasm Fails</td>
<td>This counter represents the number of IP reassembly failures that the IP reassembly algorithm detected, including time outs, errors, and so on. This counter does not represent the discarded IP fragments because some algorithms, such as the algorithm in RFC 815, can lose track of the number of fragments because it combines them as they are received.</td>
</tr>
<tr>
<td>Reasm OKs</td>
<td>This counter represents the number of IP datagrams that were successfully reassembled.</td>
</tr>
<tr>
<td>Reasm Reqds</td>
<td>This counter represents the number of IP fragments that were received that required reassembly at this entity.</td>
</tr>
</tbody>
</table>
## Memory

The memory object provides information about the usage of physical memory and swap memory on the server. The following table contains information on memory counters.

### Table 59: Memory

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>% Mem Used</td>
<td>This counter displays the system physical memory utilization as a percentage. The value of this counter equals ((\text{Total KBytes} - \text{Free KBytes} - \text{Buffers KBytes} - \text{Cached KBytes} + \text{Shared KBytes}) / \text{Total KBytes}), which also corresponds to the Used KBytes/Total KBytes.</td>
</tr>
<tr>
<td>% Page Usage</td>
<td>This counter represents the percentage of active pages.</td>
</tr>
<tr>
<td>% VM Used</td>
<td>This counter displays the system virtual memory utilization as a percentage. The value of this counter equals ((\text{Total KBytes} - \text{Free KBytes} - \text{Buffers KBytes} - \text{Cached KBytes} + \text{Shared KBytes} + \text{Used Swap KBytes}) / (\text{Total KBytes} + \text{Total Swap KBytes})), which also corresponds to Used VM KBytes/Total VM KBytes.</td>
</tr>
<tr>
<td>Buffers KBytes</td>
<td>This counter represents the capacity of buffers in your system in kilobytes.</td>
</tr>
<tr>
<td>Cached KBytes</td>
<td>This counter represents the amount of cached memory in kilobytes.</td>
</tr>
<tr>
<td>Free KBytes</td>
<td>This counter represents the total amount of memory that is available in your system in kilobytes.</td>
</tr>
<tr>
<td>Free Swap KBytes</td>
<td>This counter represents the amount of free swap space that is available in your system in kilobytes.</td>
</tr>
<tr>
<td>Faults Per Sec</td>
<td>This counter represents the number of page faults (both major and minor) that the system made per second (post 2.5 kernels only). This does not necessarily represent a count of page faults that generate I/O because some page faults can get resolved without I/O.</td>
</tr>
<tr>
<td>Low Total</td>
<td>This counter represents the total low (non-paged) memory for kernel.</td>
</tr>
<tr>
<td>Low Free</td>
<td>This counter represents the total free low (non-paged) memory for kernel.</td>
</tr>
<tr>
<td>Major Faults Per Sec</td>
<td>This counter represents the number of major faults that the system has made per second that have required loading a memory page from disk (post 2.5 kernels only).</td>
</tr>
<tr>
<td>Pages</td>
<td>This counter represents the number of pages that the system paged in from the disk plus the number of pages that the system paged out to the disk.</td>
</tr>
<tr>
<td>Pages Input</td>
<td>This counter represents the number of pages that the system paged in from the disk.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Descriptions</td>
</tr>
<tr>
<td>--------------------------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Pages Input Per Sec</td>
<td>This counter represents the total number of kilobytes that the system paged in from the disk per second.</td>
</tr>
<tr>
<td>Pages Output</td>
<td>This counter represents the number of pages that the system paged out to the disk.</td>
</tr>
<tr>
<td>Pages Output Per Sec</td>
<td>This counter represents the total number of kilobytes that the system paged out to the disk per second.</td>
</tr>
<tr>
<td>Shared KBytes</td>
<td>This counter represents the amount of shared memory in your system in kilobytes.</td>
</tr>
<tr>
<td>Total KBytes</td>
<td>This counter represents the total amount of memory in your system in kilobytes.</td>
</tr>
<tr>
<td>Total Swap KBytes</td>
<td>This counter represents the total amount of swap space in your system in kilobytes.</td>
</tr>
<tr>
<td>Total VM KBytes</td>
<td>This counter represents the total amount of system physical and memory and swap space (Total Kbytes + Total Swap Kbytes) that is in use in your system in kilobytes.</td>
</tr>
<tr>
<td>Used KBytes</td>
<td>This counter represents the amount of system physical memory that is in use in kilobytes. The value of the Used KBytes counter equals Total KBytes minus Free KBytes minus Buffers KBytes minus Cached KBytes plus Shared KBytes. In a Linux environment, the Used KBytes value that displays in the top or free command output equals the difference of Total KBytes and Free KBytes and also includes the sum of Buffers KBytes and Cached KBytes.</td>
</tr>
<tr>
<td>Used Swap KBytes</td>
<td>This counter represents the amount of swap space that is in use on your system in kilobytes.</td>
</tr>
<tr>
<td>Used VM KBytes</td>
<td>This counter represents the system physical memory and the amount of swap space that is in use on your system in kilobytes. The value equals Total KBytes - Free KBytes - Buffers KBytes - Cached KBytes + Shared KBytes + Used Swap KBytes. This corresponds to Used Mem KBytes + Used Swap KBytes.</td>
</tr>
</tbody>
</table>

**Network Interface**

The network interface object provides information about the network interfaces on the system. The following table contains information on network interface counters.

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rx Bytes</td>
<td>This counter represents the number of bytes, including framing characters, that were received on the interface.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Descriptions</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rx Dropped</td>
<td>This counter represents the number of inbound packets that were chosen to be discarded even though no errors had been detected. This prevents the packet from being delivered to a higher layer protocol. Discarding packets to free up buffer space provides one reason.</td>
</tr>
<tr>
<td>Rx Errors</td>
<td>This counter represents the number of inbound packets (packet-oriented interfaces) and the number of inbound transmission units (character-oriented or fixed-length interfaces) that contained errors that prevented them from being deliverable to a higher layer protocol.</td>
</tr>
<tr>
<td>Rx Multicast</td>
<td>This counter represents the number of multicast packets that were received on this interface.</td>
</tr>
<tr>
<td>Rx Packets</td>
<td>This counter represents the number of packets that this sublayer delivered to a higher sublayer. This does not include the packets that were addressed to a multicast or broadcast address at this sublayer.</td>
</tr>
<tr>
<td>Total Bytes</td>
<td>This counter represents the total number of received (Rx) bytes and transmitted (Tx) bytes.</td>
</tr>
<tr>
<td>Total Packets</td>
<td>This counter represents the total number of Rx packets and Tx packets.</td>
</tr>
<tr>
<td>Tx Bytes</td>
<td>This counter represents the total number of octets, including framing characters, that were transmitted out from the interface.</td>
</tr>
<tr>
<td>Tx Dropped</td>
<td>This counter represents the number of outbound packets that were chosen to be discarded even though no errors were detected. This action prevents the packet from being delivered to a higher layer protocol. Discarding a packet to free up buffer space represents one reason.</td>
</tr>
<tr>
<td>Tx Errors</td>
<td>This counter represents the number of outbound packets (packet-oriented interfaces) and the number of outbound transmission units (character-oriented or fixed-length interfaces) that could not be transmitted because of errors.</td>
</tr>
<tr>
<td>Tx Packets</td>
<td>This counter represents the total number of packets that the higher level protocols requested for transmission, including those that were discarded or not sent. This does not include packets that were addressed to a multicast or broadcast address at this sublayer.</td>
</tr>
<tr>
<td>Tx QueueLen</td>
<td>This counter represents the length of the output packet queue (in packets).</td>
</tr>
</tbody>
</table>

**Number of Replicates Created and State of Replication**

The Number of Replicates Created and State of Replication object provides real-time replication information for the system. The following table contains information on replication counters.
**Table 61: Number of Replicates Created and State of Replication**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Replicates Created</td>
<td>This counter displays the number of replicates that were created by Informix for the DB tables. This counter displays information during Replication Setup.</td>
</tr>
<tr>
<td>Replicate_State</td>
<td>This counter represents the state of replication. The following list provides possible values:</td>
</tr>
<tr>
<td></td>
<td>• 0—Initializing. The counter equals 0 when the server is not defined or when the server is defined but the template has not completed.</td>
</tr>
<tr>
<td></td>
<td>• 1—Replication setup script fired from this node. Cisco recommends that you run utils dbreplication status on the CLI to determine the location and cause of the failure.</td>
</tr>
<tr>
<td></td>
<td>• 2—Good Replication.</td>
</tr>
<tr>
<td></td>
<td>• 3—Bad Replication. A counter value of 3 indicates replication in the cluster is bad. It does not mean that replication failed on a particular server in the cluster. Cisco recommends that you run utils dbreplication status on the CLI to determine the location and cause of the failure.</td>
</tr>
<tr>
<td></td>
<td>• 4—Replication setup did not succeed.</td>

</tbody>
</table>

**Partition**

The partition object provides information about the file system and its usage in the system. The following table contains information on partition counters. Be aware that these counters are available for the spare partition, if present.

**Table 62: Partition**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>% CPU Time</td>
<td>This counter represents the percentage of CPU time that is dedicated to handling I/O requests that were issued to the disk. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>% Used</td>
<td>This counter represents the percentage of disk space that is in use on this file system.</td>
</tr>
<tr>
<td>% Wait in Read</td>
<td>Not Used. The Await Read Time counter replaces this counter. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>% Wait in Write</td>
<td>Not Used. The Await Write Time counter replaces this counter. This counter is no longer valid when the counter value equals -1.</td>
</tr>
</tbody>
</table>
## PerfMon objects and counters for system

### Counter Descriptions

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Await Read Time</td>
<td>This counter represents the average time, measured in milliseconds, for Read requests that are issued to the device to be served. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>Await Time</td>
<td>This counter represents the average time, measured in milliseconds, for I/O requests that were issued to the device to be served. This includes the time that the requests spent in queue and the time that was spent servicing them. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>Await Write Time</td>
<td>This counter represents the average time, measured in milliseconds, for write requests that are issued to the device to be served. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>Queue Length</td>
<td>This counter represents the average queue length for the requests that were issued to the disk. This counter is no longer valid when the counter value equals -1.</td>
</tr>
<tr>
<td>Read Bytes Per Sec</td>
<td>This counter represents the amount of data in bytes per second that was read from the disk.</td>
</tr>
<tr>
<td>Total Mbytes</td>
<td>This counter represents the amount of total disk space in megabytes that is on this file system.</td>
</tr>
<tr>
<td>Used Mbytes</td>
<td>This counter represents the amount of disk space in megabytes that is in use on this file system.</td>
</tr>
<tr>
<td>Write Bytes Per Sec</td>
<td>This counter represents the amount of data that was written to the disk in bytes per second.</td>
</tr>
</tbody>
</table>

### Process

The process object provides information about the processes that are running on the system. The following table contains information on process counters.

#### Table 63: Process

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>% CPU Time</td>
<td>This counter, which is expressed as a percentage of total CPU time, represents the tasks share of the elapsed CPU time since the last update.</td>
</tr>
<tr>
<td>% MemoryUsage</td>
<td>This counter represents the percentage of physical memory that a task is currently using.</td>
</tr>
<tr>
<td>Data Stack Size</td>
<td>This counter represents the stack size for task memory status.</td>
</tr>
</tbody>
</table>
### Counters

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nice</td>
<td>This counter represents the nice value of the task. A negative nice value indicates that the process has a higher priority while a positive nice value indicates that the process has a lower priority. If the nice value equals zero, do not adjust the priority when you are determining the dispatchability of a task.</td>
</tr>
<tr>
<td>Page Fault Count</td>
<td>This counter represents the number of major page faults that a task encountered that required the data to be loaded into memory.</td>
</tr>
<tr>
<td>PID</td>
<td>This counter displays the task-unique process ID. The ID periodically wraps, but the value will never equal zero.</td>
</tr>
<tr>
<td>Process Status</td>
<td>This counter displays the process status:</td>
</tr>
<tr>
<td></td>
<td>• 0—Running</td>
</tr>
<tr>
<td></td>
<td>• 1—Sleeping</td>
</tr>
<tr>
<td></td>
<td>• 2—Uninterruptible disk sleep</td>
</tr>
<tr>
<td></td>
<td>• 3—Zombie</td>
</tr>
<tr>
<td></td>
<td>• 4—Stopped</td>
</tr>
<tr>
<td></td>
<td>• 5— Paging</td>
</tr>
<tr>
<td></td>
<td>• 6—Unknown</td>
</tr>
<tr>
<td>Shared Memory Size</td>
<td>This counter displays the amount of shared memory (KB) that a task is using. Other processes could potentially share the same memory.</td>
</tr>
<tr>
<td>STime</td>
<td>This counter displays the system time (STime), measured in jiffies, that this process has scheduled in kernel mode. A jiffy corresponds to a unit of CPU time and gets used as a base of measurement. One second comprises 100 jiffies.</td>
</tr>
<tr>
<td>Thread Count</td>
<td>This counter displays the number of threads that are currently grouped with a task. A negative value (-1) indicates that this counter is currently not available. This happens when thread statistics (which includes all performance counters in the Thread object as well as the Thread Count counter in the Process object) are turned off because the system total processes and threads exceeded the default threshold value.</td>
</tr>
<tr>
<td>Total CPU Time Used</td>
<td>This counter displays the total CPU time in jiffies that the task used in user mode and kernel mode since the start of the task. A jiffy corresponds to a unit of CPU time and gets used as a base of measurement. One second comprises 100 jiffies.</td>
</tr>
<tr>
<td>UTime</td>
<td>This counter displays the time, measured in jiffies, that a task has scheduled in user mode.</td>
</tr>
<tr>
<td>VmData</td>
<td>This counter displays the virtual memory usage of the heap for the task in kilobytes (KB).</td>
</tr>
</tbody>
</table>
**Counters** | **Counter Descriptions**
---|---
VmRSS | This counter displays the virtual memory (Vm) resident set size (RSS) that is currently in physical memory in kilobytes (KB). This includes the code, data, and stack.
VmSize | This counter displays the total virtual memory usage for a task in kilobytes (KB). It includes all code, data, shared libraries, and pages that have been swapped out: Virtual Image = swapped size + resident size.
Wchan | This counter displays the channel (system call) in which the process is waiting.

**Processor**

The processor object provides information on different processor time usage in percentages. The following table contains information on processor counters.

**Table 64: Processor**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>% CPU Time</td>
<td>This counter displays the processors share of the elapsed CPU time, excluding idle time, since the last update. This share gets expressed as a percentage of total CPU time.</td>
</tr>
<tr>
<td>Idle Percentage</td>
<td>This counter displays the percentage of time that the processor is in the idle state and did not have an outstanding disk I/O request.</td>
</tr>
<tr>
<td>IOwait Percentage</td>
<td>This counter represents the percentage of time that the processor is in the idle state while the system had an outstanding disk I/O request.</td>
</tr>
<tr>
<td>IReq Percentage</td>
<td>This counter represents the percentage of time that the processor spends executing the interrupt request that is assigned to devices, including the time that the processor spends sending a signal to the computer.</td>
</tr>
<tr>
<td>Nice Percentage</td>
<td>This counter displays the percentage of time that the processor spends executing at the user level with nice priority.</td>
</tr>
<tr>
<td>Softirq Percentage</td>
<td>This counter represents the percentage of time that the processor spends executing the soft IRQ and deferring task switching to get better CPU performance.</td>
</tr>
<tr>
<td>System Percentage</td>
<td>This counter displays the percentage of time that the processor is executing processes in system (kernel) level.</td>
</tr>
<tr>
<td>User Percentage</td>
<td>This counter displays the percentage of time that the processor is executing normal processes in user (application) level.</td>
</tr>
</tbody>
</table>
System

The System object provides information on file descriptors on your system. The following table contains information on system counters.

Table 65: System

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Descriptions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allocated FDs</td>
<td>This counter represents the total number of allocated file descriptors.</td>
</tr>
<tr>
<td>Being Used FDs</td>
<td>This counter represents the number of file descriptors that are currently in use in</td>
</tr>
<tr>
<td></td>
<td>the system.</td>
</tr>
<tr>
<td>Freed FDs</td>
<td>This counter represents the total number of allocated file descriptors on the system</td>
</tr>
<tr>
<td></td>
<td>that are freed.</td>
</tr>
<tr>
<td>Max FDs</td>
<td>This counter represents the maximum number of file descriptors that are allowed on</td>
</tr>
<tr>
<td></td>
<td>the system.</td>
</tr>
<tr>
<td>Total CPU Time</td>
<td>This counter represents the total time in jiffies that the system has been up and</td>
</tr>
<tr>
<td></td>
<td>running.</td>
</tr>
<tr>
<td>Total Processes</td>
<td>This counter represents the total number of processes on the system.</td>
</tr>
<tr>
<td>Total Threads</td>
<td>This counter represents the total number of threads on the system.</td>
</tr>
</tbody>
</table>

TCP

The TCP object provides information on the TCP statistics on your system. The following table contains information on the TCP counters.

Table 66: TCP

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Opens</td>
<td>This counter displays the number of times that the TCP connections made a direct</td>
</tr>
<tr>
<td></td>
<td>transition to the SYN-SENT state from the CLOSED state.</td>
</tr>
<tr>
<td>Attempt Fails</td>
<td>This counter displays the number of times that the TCP connections have made a</td>
</tr>
<tr>
<td></td>
<td>direct transition to the CLOSED state from either the SYN-RCVD state or the SYN-</td>
</tr>
<tr>
<td></td>
<td>RCVD state, plus the number of times TCP connections have made a direct transition</td>
</tr>
<tr>
<td></td>
<td>to the LISTEN state from the SYS-RCVD state.</td>
</tr>
<tr>
<td>Curr Estab</td>
<td>This counter displays the number of TCP connections where the current state is</td>
</tr>
<tr>
<td></td>
<td>either ESTABLISHED or CLOSE- WAIT.</td>
</tr>
</tbody>
</table>
**Counters**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estab Resets</td>
<td>This counter displays the number of times that the TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.</td>
</tr>
<tr>
<td>In Segs</td>
<td>This counter displays the total number of segments that were received, including those received in error. This count only includes segments that are received on currently established connections.</td>
</tr>
<tr>
<td>InOut Segs</td>
<td>This counter displays the total number of segments that were sent and the total number of segments that were received.</td>
</tr>
<tr>
<td>Out Segs</td>
<td>This counter displays the total number of segments that were sent. This count only includes segments that are sent on currently established connections, but excludes retransmitted octets.</td>
</tr>
<tr>
<td>Passive Opens</td>
<td>This counter displays the number of times that TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.</td>
</tr>
<tr>
<td>RetransSegs</td>
<td>This counter displays the total number of segments that were retransmitted because the segment contains one or more previously transmitted octets.</td>
</tr>
</tbody>
</table>

**Thread**

The Thread object provides a list of running threads on your system. The following table contains information on the Thread counters.

**Table 67: Thread**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>% CPU Time</td>
<td>This counter displays the thread share of the elapsed CPU time since the last update. This counter expresses the share as a percentage of the total CPU time.</td>
</tr>
<tr>
<td>PID</td>
<td>This counter displays the threads leader process ID.</td>
</tr>
</tbody>
</table>

**Cisco Intercompany Media Engine performance objects and alerts**

This section provides information on new performance objects, and alerts for both the Cisco Unified Communications Manager server and the Cisco Intercompany Media Engine server.

**Related Topics**

IME Configuration Manager

The IME Configuration Manager object provides information about the IME distributed cache certificate. The following table contains information on the Cisco IME configuration counters.

Table 68: IME Configuration Manager

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DaysUntilCertExpiry</td>
<td>This counter indicates the number of days that remain until the IME distributed cache certificate expires. You must replace the certificate before it expires. When the value of this counter falls below 14, an alert gets generated once every day until the value exceeds 14.</td>
</tr>
</tbody>
</table>

IME Server

The IME Server object provides information about the Cisco IME server. The following table contains information on the Cisco IME Server counters.

Table 69: IME Server

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BlockedValidationOrigTLSLimit</td>
<td>This counter indicates the total number of blocked validations that occurred because the TLSValidationThreshold was reached.</td>
</tr>
<tr>
<td>BlockedValidationTermTLSLimit</td>
<td>This counter indicates the total number of blocked validations that occurred because the TLSValidationThreshold was reached.</td>
</tr>
</tbody>
</table>
## Counters

<table>
<thead>
<tr>
<th>Counter Description</th>
<th>Counters</th>
</tr>
</thead>
<tbody>
<tr>
<td>This counter indicates the number of Cisco IME clients that are currently connected to the Cisco IME server.</td>
<td>ClientsRegistered</td>
</tr>
<tr>
<td>The counter indicates the health of the IME distributed cache. The following values may display:</td>
<td>IMEDistributedCacheHealth</td>
</tr>
<tr>
<td>- 0 (red)—Warns that the IME distributed cache is not functioning properly; for example, the Cisco IME cannot resolve issues after the network has been partitioned. In this case, validation attempts might fail. For example, the Cisco IME service is not connected to the network and is unable to reach the bootstrap servers. An alert gets generated once every hour until the value changes from red status.</td>
<td></td>
</tr>
<tr>
<td>- 1 (yellow)—Indicates that the Cisco IME network is experiencing minor issues, such as connectivity between bootstrap servers or other Cisco IME network issues. (Check the Cisco IME alarms to determine network issues.)</td>
<td></td>
</tr>
<tr>
<td>- 2 (green)—Indicates that the Cisco IME is functioning normally and is considered healthy.</td>
<td></td>
</tr>
<tr>
<td>The counter is an integer that indicates an approximation of the total number of nodes in the IME distributed cache. Since each physical Cisco IME server hosts multiple nodes, this counter does not directly indicate the number of physical Cisco IME servers that participate in the IME distributed cache. This counter can provide an indication of the health of the IME distributed cache; for example, a problem may exist with the IME distributed cache if an expected value displays on one day (for example, 300), but then on the next day, the value drops dramatically (for example, to 10 or 2).</td>
<td>IMEDistributedCacheNodeCount</td>
</tr>
<tr>
<td>Indicates the number of individual DIDs that can be written into the IME Distributed Cache, by Cisco Unified CMs attached to this IME server. This number is determined by the overall configuration of the IME Distributed Cache, and the IME license installed on the IME server.</td>
<td>IMEDistributedCacheQuota</td>
</tr>
<tr>
<td>Indicates the total number of unique DID numbers that have been configured, to be published via enrolled patterns for Intercompany Media Services, by Cisco Unified CMs currently attached to this IME server.</td>
<td>IMEDistributedCacheQuotaUsed</td>
</tr>
<tr>
<td>This counter indicates the total number of reads that the Cisco IME server has attempted into the IME distributed cache. This number serves as an indicator of whether the Cisco IME server is functional; that is, whether the server is interacting with other nodes.</td>
<td>IMEDistributedCacheReads</td>
</tr>
<tr>
<td>This counter indicates the amount of IME distributed cache storage, measured in bytes, that this Cisco IME server provides.</td>
<td>IMEDistributedCacheStoredData</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IMEDistributedCacheStores</td>
<td>This counter indicates the total number of stores (published numbers) that the Cisco IME server has attempted into the IME distributed cache. This number serves as an indicator of whether the Cisco IME server is functional.</td>
</tr>
<tr>
<td>InternetBandwidthRecv</td>
<td>This counter measures the amount of downlink Internet bandwidth, in Kbits/s, that the Cisco IME server is consuming.</td>
</tr>
<tr>
<td>InternetBandwidthSend</td>
<td>This counter measures the amount of uplink Internet bandwidth that the Cisco IME server is consuming in Kbits/s.</td>
</tr>
<tr>
<td>TerminatingVCRs</td>
<td>This counter indicates the total Cisco IME voice call records (VCRs) that are stored on the Cisco IME server after receiving calls. You can use these records for validating learned routes.</td>
</tr>
<tr>
<td>ValidationAttempts</td>
<td>This counter indicates the total number of attempts that the Cisco IME server has made at performing a validation because the dialed number was found in the Cisco IME network. This counter provides an overall indication of system usage.</td>
</tr>
<tr>
<td>ValidationsAwaitingConfirmation</td>
<td>This counter indicates the total number of destination phone numbers that have been validated, but that are awaiting further calls to improve the security of the system. If you use a higher level of security for learning new routes, the Cisco IME server requires multiple successful validations for a route before that route is available for calls over IP. This counter tracks the number of successful validations that have not resulted in available IP routes.</td>
</tr>
<tr>
<td>ValidationsPending</td>
<td>This counter, which is an integer, indicates the number of scheduled validation attempts to retrieve a learned route. This value indicates the backlog of work for the Cisco IME service on the Cisco IME server. An alert gets generated when the value rises either above the high watermark or falls below the low watermark. After the high watermark is reached, an alert gets sent immediately and then once an hour until the value falls below the high watermark. When the high watermark is reached, the Cisco IME service cannot clear the backlog of work prior to the expiration of data; this situation causes records to drop, and validation may not occur. To reduce the workload, add more Cisco IME servers that can share the workload.</td>
</tr>
<tr>
<td>ValidationsBlocked</td>
<td>This counter indicates the number of times that the Cisco IME service rejected a validation attempt because the calling party was not trusted; that is, the party was on a blacklist or not on a whitelist. This value provides an indication of the number of cases where a VoIP call cannot happen in the future because of the blocked validation.</td>
</tr>
</tbody>
</table>
**IME Server System Performance**

The Cisco IME System Performance object provides information about performance on the Cisco IME server. The following table contains information on the Cisco IME server system performance counters.

**Table 70: IME Server System Performance**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>QueueSignalsPresent 1-High</td>
<td>This counter indicates the number of high-priority signals in the queue on the Cisco IME server. High-priority signals include timeout events, internal KeepAlive messages, internal process creation, and so on. A large number of high-priority events causes degraded performance of the Cisco IME service and results in slower or failed validations. Use this counter in conjunction with the QueueSignalsProcessed 1-High counter to determine the processing delay on the Cisco IME server.</td>
</tr>
<tr>
<td>QueueSignalsPresent 2-Normal</td>
<td>This counter indicates the number of normal-priority signals in the queue on the Cisco IME server. Normal-priority signals include call validations, IME distributed cache operations such as stores and reads, and so on. A large number of normal-priority events causes degraded performance of the Cisco IME service and may result in slower or failed validations or disruption to IME distributed cache connectivity. Use this counter in conjunction with the QueueSignalsProcessed 2-Normal counter to determine the processing delay on the Cisco IME server. Since high-priority signal must complete before normal priority signals begin to process, check the high-priority counters to accurately understand why a delay occurs.</td>
</tr>
<tr>
<td>QueueSignalsPresent 3-Low</td>
<td>This counter indicates the number of low-priority signals in the queue on the Cisco IME server. Low-priority signals include IME distributed cache signaling and other events. A large number of signals in this queue may disrupt IME distributed cache connectivity or other events.</td>
</tr>
<tr>
<td>QueueSignalsPresent 4-Lowest</td>
<td>This counter indicates the number of lowest-priority signals in the queue on the Cisco IME server. A large number of signals in this queue may disrupt IME distributed cache connectivity and other events.</td>
</tr>
<tr>
<td>QueueSignalsProcessed 1-High</td>
<td>This counter indicates the number of high-priority signals that the Cisco IME service processes for each one-second interval. Use this counter in conjunction with the QueueSignalsPresent 1-High counter to determine the processing delay for this queue.</td>
</tr>
<tr>
<td>QueueSignalsProcessed 2-Normal</td>
<td>This counter indicates the number of normal-priority signals that the Cisco IME service processes for each one-second interval. Use this counter in conjunction with the QueueSignalsPresent 1-High counter to determine the processing delay for this queue. High-priority signals are processed before normal-priority signals.</td>
</tr>
</tbody>
</table>
Cisco Intercompany Media Engine server alerts

Cisco Intercompany Media Engine server alerts are available on the Cisco Intercompany Media Engine server to support the Cisco Intercompany Media Engine feature. For descriptions and default configuration settings, refer to the Cisco Intercompany Media Engine Installation and Configuration Guide.

Cisco Unified Communications Manager server objects

Cisco Unified Communications Manager server objects are available on the Cisco Unified Communications Manager server to support Cisco Intercompany Media Engine.

Related Topics
- IME Client, on page 158
- IME Client Instance, on page 159
IME Client

The IME Client object provides information about the Cisco IME client on the Cisco Unified Communications Manager server. It contains information on the Cisco IME client counters.

Table 71: Cisco IME Client

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallsAccepted</td>
<td>This counter indicates the number of Cisco IME calls that the Cisco Unified Communications Manager received successfully and that the called party answered, resulting in an IP call.</td>
</tr>
<tr>
<td>CallsAttempted</td>
<td>This counter indicates the number of calls that the Cisco Unified Communications Manager received through Cisco IME. This number includes accepted calls, failed calls, and busy, no-answer calls. The counter increments each time that Cisco Unified Communications Manager receives a call through Cisco IME.</td>
</tr>
<tr>
<td>CallsReceived</td>
<td>This counter indicates the number of calls that Cisco Unified Communications Manager receives through Cisco IME. This number includes accepted calls, failed calls, and busy, no-answer calls. The counter increments on call initiation.</td>
</tr>
<tr>
<td>CallsSetup</td>
<td>This counter indicates the number of Cisco IME calls that Cisco Unified Communications Manager placed successfully and that the remote party answered, resulting in an IP call.</td>
</tr>
<tr>
<td>DomainsUnique</td>
<td>This counter indicates the number of unique domain names of peer enterprises that the Cisco IME client discovered. The counter serves as an indicator of overall system usage.</td>
</tr>
<tr>
<td>FallbackCallsFailed</td>
<td>This counter indicates the total number of failed fallback attempts.</td>
</tr>
<tr>
<td>FallbackCallsSuccessful</td>
<td>This counter indicates the total number of Cisco IME calls that have fallen back to the PSTN mid-call due to a quality problem. The counter includes calls initiated and calls received by this Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>IMESetupsFailed</td>
<td>This counter indicates the total number of call attempts for which a Cisco IME route was available but that were set up through the PSTN due to a failure to connect to the target over the IP network.</td>
</tr>
<tr>
<td>RoutesLearned</td>
<td>This counter indicates the total number of distinct phone numbers that the Cisco IME has learned and that are present as routes in the Cisco Unified Communications Manager routing tables. If this number grows too large, the server may exceed the per-cluster limit, and you may need to add additional servers to your cluster.</td>
</tr>
<tr>
<td>Counters</td>
<td>Counter Description</td>
</tr>
<tr>
<td>-----------------------</td>
<td>---------------------</td>
</tr>
<tr>
<td>RoutesPublished</td>
<td>This counter indicates the total number of DIDs that were published successfully into the IME distributed cache across all Cisco IME client instances. The counter provides a dynamic measurement that gives you an indication of your own provisioned usage and a sense of how successful the system has been in storing the DIDs in the network.</td>
</tr>
<tr>
<td>RoutesRejected</td>
<td>This counter indicates the number of learned routes that were rejected because the administrator blacklisted the number or domain. This counter provides an indication of the number of cases where a VoIP call cannot happen in the future because of the blocked validation.</td>
</tr>
<tr>
<td>VCRUploadRequests</td>
<td>This counter indicates the number of voice call record (VCR) upload requests that the Cisco Unified Communications Manager has sent to the Cisco IME server to be stored in the IME distributed cache.</td>
</tr>
</tbody>
</table>

**IME Client Instance**

The IME Client Instance object provides information about the Cisco IME client instance on the Cisco Unified Communications Manager server. The following table contains information on the Cisco IME client instance counters.

**Table 72: IME Client Instance**

<table>
<thead>
<tr>
<th>Counters</th>
<th>Counter Description</th>
</tr>
</thead>
</table>
| IMEServiceStatus      | This counter indicates the overall health of the connection to the Cisco IME services for a particular Cisco IME client instance (Cisco Unified Communications Manager). The following values may display for the counter:  
0—Indicates an unknown state (which may mean that the Cisco IME service is not active).  
If the value specifies 0, an alert gets generated once per hour while the connection remains in the unknown state.  
1—Indicates a healthy state; that is, the Cisco IME service is active, and the Cisco Unified Communications Manager has successfully established a connection to its primary and backup servers for the Cisco IME client instance, if configured.  
2—Indicates an unhealthy state; that is, the Cisco IME service is active, but the Cisco Unified Communications Manager has not successfully established a connection to its primary and backup servers for the Cisco IME client instance, if configured. |
Cisco Unified Communications Manager server alerts

The following alerts are available on the Cisco Unified Communications Manager server to support Cisco Intercompany Media Engine. For descriptions and default configuration settings, refer to the *Cisco Intercompany Media Engine Installation and Configuration Guide*.

- IMEDistributedCacheInactive
- IMEOverQuota
- IMEQualityAlert
- InsufficientFallbackIdentifiers
- IMEServiceStatus
- InvalidCredentials

- TLSConnectionToIMEFailed
Cisco Unified Serviceability alarms and CiscoLog messages

This chapter describes the Cisco Unified Serviceability alarms and error messages and CiscoLog message format. Network alarms tracked by Cisco Unified Serviceability for Cisco Unified Communications Manager generate the error messages.

A History table lists Cisco Unified Serviceability error messages that have been added, changed, or removed beginning in Cisco Unified Communications Manager Release 7.0(1).

- Cisco Unified Serviceability alarms and CiscoLog messages, page 161
- Preconfigured system alarm notifications, page 179
- Preconfigured CallManager alarm notifications, page 193
- Emergency-level alarms, page 218
- Alert-level alarms, page 228
- Critical-Level Alarms, page 248
- Error-level alarms, page 262
- Warning-level alarms, page 388
- Notice-level alarms, page 525
- Informational-level alarms, page 551
- Cisco Unified Communications Manager release 8.0(1) obsolete alarms, page 646

Cisco Unified Serviceability alarms and CiscoLog messages

Cisco Unified Serviceability alarms provide information on runtime status and the state of the system, so you can troubleshoot problems that are associated with your system. The alarm or error message information includes the application name, machine name, and recommended action and other critical information to help you troubleshoot.
You configure the alarm interface to send alarm information to multiple locations, and each location can have its own alarm event level (from debug to emergency). You can direct alarms to the Syslog Viewer (local syslog), SNMP traps, Syslog file (remote syslog), SDI trace log file, SDL trace log file (for Cisco Unified CM and CTIManager services only), or to all destinations.

You use the Trace and Log Central option in the Cisco Unified Real-Time Monitoring Tool (RTMT) to collect alarms that get sent to an SDI or SDL trace log file. To view the alarm information sent to the local syslog, use the SysLog Viewer in RTMT.

**Note**

All the alarms are logged based on their severity and settings of alarm event level. For information on viewing the alarm configuration settings, refer to the *Cisco Unified Serviceability Administration Guide*.

---

**CiscoLog format**

CiscoLog, a specification for unified logging in Cisco software applications, gets used in the Cisco Unified RTMT. It defines the message format when messages are logged into file or by using the syslog protocol. The output that is provided by Cisco software applications gets used for auditing, fault-management, and troubleshooting of the services that are provided by these applications.

Be aware that CiscoLog message format is compatible with one of the message formats that is produced by Cisco IOS Release 12.3 by using the syslog protocol when Cisco IOS Software is configured with the following commands:

- **service sequence-numbers**—A default sequence number that is produced by Cisco IOS. An additional sequence number can also be enabled with this command. This command forces sequence numbers to be shown in terminal output, but results in two sequence numbers in the syslog output. CiscoLog standardizes on a format with just one sequence number. Thus, the compliant Cisco IOS Software configuration occurs when the second number is disabled by using the no service sequence-numbers command.

- **logging origin-id hostname**—The CiscoLog HOST field remains consistent with that produced by the Cisco IOS Release 12.3 when configured with this command. This command does not get documented in the Cisco IOS Software documentation but is available in Cisco IOS Release 12.3. CiscoLog stays compatible with the results that Cisco IOS Software produces in this field.

- **service timestamps log datetime localtime msec show-timezone year**—The CiscoLog TIMESTAM field remains consistent with the timestamp format produced by Cisco IOS Release 12.3 when configured with this command.

**Note**

CiscoLog uses the same field delimiters as Cisco IOS Software Release 12.3.

---

**Log file and syslog outputs**

When CiscoLog messages are written directly into a log file by an application, each message is on a separate line. The line separator should be a standard line separator used on a given platform. On Windows, the line separator must be the sequence of carriage return and line feed characters (ASCII decimal values 13 and 10; often designated as “\r\n” in programming languages). On Solaris and Linux, the line separator is a single line.
feed character (ASCII decimal value 10 and in programming languages typically “\n”). Two line separators must never appear one after another, for example, you cannot have “\r\n\r\n” on Windows, but “\r\n” is fine because these two characters are a single line separator.

In practical terms, this means that applications should be careful when appending data to an existing log. In some cases an initial line break is required and in others not. For example, if application crashes when writing CiscoLog message, but before it wrote a line break to file, then when the application starts up, it should print an initial line break before printing the next message. An application can determine if an initial line break is necessary during startup by checking the last character sequence in the log file that will be used for appending.

CiscoLog message format is identical for messages written directly to a log file or those generated by using the syslog protocol with two minor exceptions. When CiscoLog messages are written directly into to a file they must be appended with line separators. When CiscoLog messages are sent by using the syslog protocol then the syslog RFC 3164 protocol PRI header must be prepended to each CiscoLog message.

The syslog PRI field encodes syslog message severity and syslog facility. The severity encoded in the PRI field must match the value of the CiscoLog SEVERITY field. Any syslog facility can be used regardless of the content of the message. Typically, a given application is configured to send all its messages to a single syslog facility (usually RFC 3164 facilities local 0 through local 7). Refer to RFC 3164 for details about how to encode the PRI field. Below is an example of a CiscoLog message with the syslog protocol PRI field <165> which encodes the severity level of notice (5) and facility value local4.

```<165>11: host.cisco.com: Jun 13 2003 12:11:52.454 UTC: %BACC-5-CONFIG: Configured from console by vty0 [10.0.0.0]```

Messages as shown in the example above can be sent to UDP port 514 if using RFC 3164 logging mechanism.

Syslog RFC 3164 provides additional guidelines for message content formatting beyond the PRI field. However, RFC 3164 is purely information (not on IETF standards track) and actually allows messages in any format to be generated to the syslog UDP port 514 (see section 4.2 of RFC 3164). The RFC provides observation about content structure often encountered in implementations, but does not dictate or recommend its use. CiscoLog format does not follow these observations due to practical limitations of the format defined in the RFC. For example, the time stamp is specified without a year, time zone or milliseconds while the hostname can only be provided without the domain name.

CiscoLog messages must remain unaltered when relayed. The PRI field is not part of a CiscoLog message, but rather a protocol header. It can be stripped or replaced if necessary. Additional headers or footers can be added to and stripped from the CiscoLog message for transport purposes.

### Standard syslog server implementations

Standard syslog server implementations can be configured to forward received log messages or to store the messages locally. Most syslog server implementations strip the PRI field from the received messages and prefix additional information to the message before storage. This additional information typically includes two extra fields: the local time stamp and the host identifier (IP or DNS name) of the server, which generated or relayed the message.

The following example of a CiscoLog message shown the output after being logged by the Solaris 8 syslog server:

```Jun 13 12:12:09 host.cisco.com 11: host.cisco.com: Jun 13 2003 12:11:52.454 UTC: %BACC-5-CONFIG: Configured from console by vty0 [10.0.0.0]```

There is no standard that defines how syslog servers must store messages. Implementations vary greatly. CiscoLog only addresses the format in which messages are sent to the syslog server, not how they are stored by the server that receives them. Specifically, the format and presence of any additional header fields in syslog log files is outside of the scope of this specification.
The CiscoLog specification recommends that the syslog server implementation store CiscoLog messages in exactly the same format as it receives them only stripping the PRI field and without any extra headers. This would provide an identical storage format for CiscoLog messages written directly to the log file by an application or logged through syslog protocol.

Clock synchronization

It is important that the clocks of all hosts of a distributed application be synchronized with one authoritative clock. This can be accomplished by using protocols such as NTP. Clock synchronization is recommended because the time stamps in log messages are required in order to be able to reconstruct the correct sequence of events based on messages originating from multiple processes or multiple hosts. Clock drifts can still occur, but ongoing synchronization should reduce this issue to a minimum.

Multipart messages

ASCII control characters are not permitted in any of the fields of CiscoLog message format. Control characters include characters such as line feed, form feed and carriage returns. This means that multi-line messages are not allowed unless to allow:

- Better presentation (for example, a stack trace)
- Fragmenting messages which exceed 800 octet limit

Multi-part CiscoLog message consists of a set of multiple valid CiscoLog messages. Messages are grouped together using a special tag key “part”, which identifies the part number and the sequence number of the original message.

All messages which are part of a multi-part message must have a “part” tag as well as identical values for the HOST, TIMESTAMP, APPNAME, SEVERITY fields and other TAG values. However, the sequence number of each message has to be incremented as usual.

Example of a multi-part message:

In this example, the first message has part number 1 and its sequence number, 16, embedded in the part tag. Subsequent messages embed the sequence number of the first message part and provide their own part number. The trailing “/3” in each part tag value means that the message consists of three parts.

CiscoLog message format

The CiscoLog message format follows:

<SEQNUM>: <HOST>: <TIMESTAMP>: %<HEADER>: [TAGS:]<MESSAGE>
All fields get separated by a single colon character (ASCII decimal value 58) and a single space character (ASCII decimal value 32). The HEADER field is also preceded by a percent character (ASCII decimal value 37).

The TIMESTAMP, HEADER, and TAGS fields have internal formatting. Below is a complete format with details for TIMESTAMP and HEADER fields:

```
<SEQNUM>: <HOST>: [ACCURACY] <MONTH> <DAY> <YEAR>
<HOUR>: <MINUTES>: <SECONDS>: <MILLISECONDS> <TIMEZONE>:
%<APPNAME>-<SEVERITY>-<MSGNAME>: [TAGS: ] <MESSAGE>
```

All fields except for ACCURACY and TAGS are required.

The following example shows a CiscoLog message:

```
11: host.cisco.com: Jun 13 2003 23:11:52.454 UTC: %BACC-5-CONFIG: Configured from console by vty0 [10.10.10.0]
```

The following example shows the optional TAGS and ACCURACY fields in a CiscoLog message:

```
```

The values of the specific fields in the above example are as follows:

- SEQNUM – “12”
- HOST – “host.cisco.com”
- ACCURACY – “*”
- MONTH – “Jun”
- DAY – “13”
- YEAR – “2003”
- HOUR – “23”
- MINUTES – “11”
- SECONDS – “52”
- MILLISECONDS – “454”
- TIMEZONE – “UTC”
- APPNAME – “BACC”
- SEVERITY – “4”
- MSGNAME – “BAD_REQUEST”
- TAGS – “%[pname.orig=rdu][comp=parser][mac=1,6,aa:bb:cc:11:22:33][txn=mytxn123]”
- MESSAGE – “Bad request received from device [1,6,aa:bb:cc:11:22:33]. Header missing.”

**Message length limit**

The maximum length of a complete CiscoLog message must not exceed 800 octets. The term octet is used for 8-bit data type instead of byte because byte is not 8 bits on some platforms. The words “character” and “octet” are not synonyms in parts of this specification because in places were internationalization is supported a single character may need to be represented with multiple octets. This limit is dictated by RFC 3164. The limit of
1024 octets reserves some extra space for syslog forwarding headers and/or fields that may be formalized in later specifications.

When CiscoLog message includes the syslog PRI field, then the combined CiscoLog messages and PRI field length must not exceed 805 octets.

### SEQNUM field

The SEQNUM field contains a sequence number, which can be used to order messages in the time sequence order when multiple messages are produced with the same time stamp by the same process. The sequence number begins at 0 for the first message fired by a process since the last startup and is incremented by 1 for every subsequent logging message originated by the same process. Every time the application process is restarted, its sequence number is reset back to 0. The sequence number of each message must be in the exact order in which messages are fired/logged by the application.

This may mean that in a multi-threaded application there must be some kind of synchronization to ensure this and another consideration may have to be made for Java applications that have some native (C) code in JNI. If log messages originate in both native and Java parts of the same process, the implementation needs to be synchronized to use the same sequence number counter across the two process parts and to fire messages in the order of sequence numbers.

The maximum numeric value of the SEQNUM field is 4,294,967,295 at which point the counter must be reset back to 0. The maximum positive value of a 32-bit unsigned integer as used in Cisco IOS. Cisco IOS uses ulong for the sequence number counter and ulong is a 32-bit unsigned integer on all current Cisco IOS platforms including mips, ppc, and 68k.

Sequence numbers are process specific. If application architecture has multiple application processes on a single host, which share a single logging daemon, the sequence number still has to be process-specific. Thus, each process has its own sequence number which it increments.

Sequence numbers also help detect lost messages. Therefore, sequence numbers cannot be skipped. In other words, a message must be produced for every number in the sequence order.

### HOST field

The HOST field identifies the system originating the message with a Fully Qualified DNS Name (FQDN), hostname or an IPv4/IPv6 address. If the FQDN or hostname is known, one of the two has to appear in the HOST field. It is expected that in most deployments the hostname is sufficient. However, if a deployment spans multiple domains, then using FQDNs is recommend. If an application is expected to be deployed in both scenarios, then it is recommended that the application default to the FQDNs, but make it a configurable option.

If neither FQDN nor hostname can be identified, then the IP address of the host must be used. If the IP address cannot be identified, then a constant “0.0.0.0” (without quotes) must appear in place of the HOST field.

---

**Note**

With regards to the compliance with Cisco IOS format. Cisco IOS Release 12.3 supports producing hostname, IP address, or any user-defined string in the HOST field. If it is configured to provide a hostname and it is not set on the device, it will use a string such as “Router.”

The length of the HOST field must not exceed 255 octets.
**FQDN and hostname**

If multiple FQDNs or hostnames are known for a given system, applications must use the primary FQDN/hostname or an arbitrary one if no primary is designated. However, applications must use the same HOST field value until some relevant configuration change takes place. In other words, the FQDN/hostname value should not arbitrarily change from message to message if system is configured with multiple FQDNs/hostnames.

Only printable US ASCII characters (those with decimal values 32-126) and foreign language characters are allowed in the HOST field when encoding an FQDN or hostname. The appropriate character set and encoding for HOST should be compliant with RFC 1123 / STD-3.

The acceptable character set per these standards includes US ASCII letters, numbers, dash and dot separator characters (although not starting or ending with a dash). The reason that these are only recommendations of adhering to these standards is that, in practice, many hosts do not follow the convention and use characters such as underscore in the hostname. However, the HOST field cannot contain a character sequence of “: ” (colon and space) as this sequence is used as a field delimiter in the CiscoLog format.

Foreign language characters outside of the printable US ASCII characters have to be encoded according to internationalization rules.

Use of non-printable (control) ASCII characters is not allowed in the HOST field. Control characters include characters with ASCII decimal values 0-31 and 127. If an application provides a CiscoLog-compliant library with a host string, which includes one or more control characters, the logging library must do the following. If the horizontal tab character (ASCII decimal value 9) is encountered, it must be replaced with one or more space characters (ASCII decimal value 32). Eight spaces per tab are recommended because this is a convention on most Unix and Windows platforms. Other control characters must each be replaced with a question mark character (ASCII decimal value 63).

While DNS is letter-case agnostic, CiscoLog places an additional recommendation of using only lower-case characters in the HOST field for ease of readability. The use of the trailing dot at the end of the FQDN is optional. The following examples are valid HOST fields:

- host123
- host-123
- host123.cisco.com
- host123.cisco.com.

**IP addresses**

The IP address value used in the HOST field can be either an IPv4 or IPv6 address. If a device has multiple IP addresses, the primary IP address of the device must be used regardless of the interface through which the CiscoLog message is sent to syslog server. If no primary IP address is designated, a fixed/static IP address is preferred to a dynamically assigned one. If multiple static IP addresses exist, any one can be used, but it must be used consistently in all messages until a relevant configuration event occurs on the system.

- IPv4 Address—IPv4 address should be represented in dot notation “x.x.x.x”, where x is a decimal value from 0 to 255 encoded as ASCII text. If an IP address is unknown, “0.0.0.0” (without quotes) must be used as a place holder. Examples of valid IPv4 addresses are 0.0.0.0 and 212.1.122.11.

Below is an example of a message with an IPv4 address in the HOST field:

11: 212.1.122.11: Jun 13 2003 23:11:52,454 UTC: %BACC-3-BAD_REQUEST: Bad request received from device [1.2.3.4]. Missing header.
Below is an example of a CiscoLog message when FQDN, hostname or IP are all unknown:

```
11: 0.0.0.0: Jun 13 2003 23:11:52.454 UTC:
%BACC-3-BAD_REQUEST: Bad request received from device [1.2.3.4]. Missing header.
```

- IPv6 Address—IPv6 address representation must follow conventions outlined in RFC 3513, sections 2.2.1, 2.2.2 and 2.2.3. Specifically, all three conventions are supported. Both lower-case and upper-case letters can be used in the IPv6 address, but the lower-case letters are recommended. If an IP address is unknown, “0.0.0.0” (without quotes) should be used as the IP address. Examples of valid IPv6 addresses:
  - 1080:0:0:800:ba98:3210:11aa:12dd (full notation)
  - 1080::800:ba98:3210:11aa:12dd (use of “::” convention)
  - 0:0:0:0:13.1.68.3 (last 4 octets expanded as in IPv4)
  - 0.0.0.0 (unknown FQDN, hostname and IP address)

Below is an example of a message with an IPv6 address in the HOST field:

```
%BACC-3-BAD_REQUEST: Bad request received from device [1.2.3.4]. Missing header.
```

**TIMESTAMP field**

The TIMESTAMP field provides date with year, time with milliseconds and a time zone identifier in the following format:

```
[ACCURACY]<MONTH><DAY><YEAR><HOUR>:<MINUTES>:<SECONDS>.<MILLISECONDS><TIMEZONE>
```

Below are several examples of valid time stamps:

- Jun 13 2003 23:11:52.454 UTC
- Jun 22 2003 05:11:52.525 -0300
- *Feb 14 2003 01:02:03.005 EST*

In some cases, it is possible that a device may not have the knowledge of the date and/or time due to hardware or software limitations. In such circumstances, the following string must be produced TIMESTAMP field: "--- 00 0000 00:00:00.000 ---". Below is an example of a CiscoLog message from a device which has no knowledge of date and/or time:

```
11: host.domain.com: --- 00 0000 00:00:00.000 ---: %BACC-3-BAD_REQUEST: Bad request received from device [1.2.3.4]. Missing header.
```

Devices which are not aware of their clock, may choose to provide an uptime as a relative measure of time. If device is capable of providing uptime, it is recommended that does so as a substitute for unavailable time stamp. If uptime is provided it must be provided with a standard uptime tag as outlined in the CiscoLog Standard Tags specification.

The following table details each field specification.
### Table 73: TIMESTAMP field specifications

<table>
<thead>
<tr>
<th>Field</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCURACY</td>
<td>This is an optional field. If present, it must be either a single asterisk character (ASCII decimal value 42), or a single dot character (ASCII decimal value 46). No separator character is used after this field. This field indicates the status of clock synchronization. Cisco IOS uses a special convention for time prefixes to indicate the accuracy of the time stamp. If dot character appears before the date, it means that the local time was synchronized at some point via NTP, but currently no NTP servers are available. The asterisk character in front of the date means that the local time is not authoritative, i.e. NTP servers are not setup. CiscoLog supports the use of this convention, but does not require it. If an application is integrated with NTP client software, and knows that its time is out of sync, then it can optionally prefix the message with asterisk character. However, because applications may choose not to use this scheme, the lack of “•” or “*” in CiscoLog messages should not be interpreted to mean that the local time is synchronized.</td>
</tr>
<tr>
<td>MONTH</td>
<td>Must be one of the following three-character month designations followed by a single space (ASCII decimal value 32) as a delimiter character: Jan, Feb, Mar, Apr, May, Jun, Jul, Sep, Oct, Nov or Dec.</td>
</tr>
<tr>
<td>DAY</td>
<td>Must consist of two characters. If day is a single digit, it must be prefixed with a single space character. The acceptable range of values is from 1 to 31. The day value must be followed by a single space as a delimiter character.</td>
</tr>
<tr>
<td>YEAR</td>
<td>Must consist of exactly 4 digit characters followed by a space as a delimiter character.</td>
</tr>
<tr>
<td>HOUR</td>
<td>Must consist of exactly two number characters. The hour value is based on a 24-hour clock. Values range from 00 to 23. If hour value is a single digit, it must be prefixed with a single zero character. The hour value must be followed by a single colon as a delimiter character.</td>
</tr>
<tr>
<td>MINUTES</td>
<td>Must consist of exactly two number characters. Values range from 00 to 59. If minute value is a single digit, it must be prefixed with a single zero character. The minutes value must be followed by a single colon as a delimiter character.</td>
</tr>
<tr>
<td>SECONDS</td>
<td>Must consist of exactly two number characters. Values range from 00 to 59. If seconds value is a single digit, it must be prefixed with a single zero character. The seconds value must be followed by a period as a delimiter character.</td>
</tr>
<tr>
<td>MILLISECONDS</td>
<td>Must consist of exactly 3 digit characters. Values range from 000 to 999. If milliseconds value is less then 3 digits in length it must be prefixed with extra zeros to make it a 3-character field. The milliseconds value is followed by a space as a delimiter character.</td>
</tr>
</tbody>
</table>
TIMEZONE

Must consist of at least one, but no more than 7 characters in the following ASCII decimal value range: 32-126. The value must not include a combination of colon-space-percent of characters – “: %” (ASCII decimal values 58, 32, 37) – as this character combination is reserved as a field delimiter that follows the time stamp.

There is no standard set of acronyms for time zones. A list of common time zone acronyms and corresponding time offsets from UTC is provided in the UTC specification.

Uppercase letters are recommended for time zone acronym values. CiscoLog recommends the use of time offset instead of time zone identifier in this field. The offset, if provided, must follow the following format “-hhmm” or “+hhmm” to indicate hour and minute offset from UTC.

In this format time zone field must always contain 5 characters, with the last 4 characters being constrained to numbers only. Unlike a textual time zone identifier, this format provides a specific time offset from universal standard time.

Cisco IOS Release 12.3 supports any 7-character string as a time zone identifier, so it can be configured in a way which is compatible with this recommendation. Multiple messages may and sometimes must be produced with exactly the same time stamp. This can happen naturally on a non-preemptive operating system or may need to be deliberately induced as in the case of multi-part messages. Sequence numbers then become helpful for establishing message order. Time stamp should always be accurate to the millisecond unless it can significantly hinder performance of the application.

In either case, applications must always provide the administrator with an option to output messages with exact time stamp in milliseconds. If an application uses time stamp with accuracy to the second (instead of a millisecond), it must put the last known milliseconds value or 000 in place of the milliseconds. Whatever convention is chosen by the application, it should be followed consistently.

**HEADER field**

The HEADER field has the following format:

```<APPNAME>-<SEVERITY>-<MSGNAME>```

A single dash character (ASCII decimal value 45) serves a separator for the three fields.

---

1 Neither Cisco IOS nor CiscoLog define a standard set of time zone acronyms because there is no single established standard.
APPNAME field

The APPNAME field in the HEADER defines the name of the application producing the message. Cisco IOS uses FACILITY in place of APPNAME that names the logical component producing the message. Cisco IOS 12.3 defines approximately 287 facilities for 3950 messages. Example of some easily recognizable facilities: AAAA, SYS, ATM, BGP, CRYPTO, ETHERNET, FTPSERVER, CONFIG_I, IP, ISDN, RADIUS, SNMP, SYS, TCP, UBR7200, X25. A complete list of defined facilities is available in Cisco IOS documentation at http://.

Outside of the Cisco IOS, there can be multiple applications on the same host originating log messages. Therefore, it is necessary that APPNAME field identify the specific application. Additional source identifiers are available in the HOST field as well as various standard TAGS field values (pname, pid, comp, etc).

The APPNAME field must consist of at least two uppercase letters or digits and may include underscore characters. More precisely, the acceptable character set is limited to characters with the following ASCII decimal values: 48-57 (numbers), 65-90 (upper-case letters) and 95 (underscore).

The length of the APPNAME field must not exceed 24 characters.

Application names cannot conflict with other Cisco software applications and with Cisco IOS facilities.

On the Solaris platform, it is recommended (not required) that the application name values used in the APPNAME field be consistent with those used for the application installation package name, only in upper case and without the CSCO prefix. For example, an application registering as “CSCOabc” on Solaris should use “BACC” as the value of the APPNAME field.

Some applications may choose to specify a version as part of the APPNAME field. This is acceptable and may be useful in cases where the meaning of certain messages is redefined from one release to another. For example, an APPNAME value could be “BACC_2_5” for BACC version 2.5. The use the version within an application name is optional and may be introduced by applications in any release.

SEVERITY field

The SEVERITY field is a numeric value from 0 to 7, providing eight different severities. The severities defined below match Cisco IOS severity levels. They are also standard syslog severities.

It is important that messages use the correct severity. An error in a certain component may be severe as far as the component is concerned, but if the overall application handles it gracefully, then the severity may be lower for the application as a whole. The following table lists guidelines that should be followed in determining the severity of a message.

<table>
<thead>
<tr>
<th>Name/Severity Level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Emergency (0)</td>
<td>System or service is unusable. Examples:</td>
</tr>
<tr>
<td></td>
<td>• Service repeatedly fails to startup</td>
</tr>
<tr>
<td></td>
<td>• System ran out of disk space while disk space is essential for this system to operate</td>
</tr>
<tr>
<td></td>
<td>• Application requires root privileges to run but does not have them</td>
</tr>
<tr>
<td>Name/Severity Level</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| Alert (1)           | Action must be taken immediately. Examples:  
  • Application is about to run out of licenses  
  • Application is about to run out of disk space  
  • Too many unauthorized access attempts detected  
  • Denial of service attack is detected |
| Critical (2)        | Critical condition. Similar to alert, but not necessarily requiring an immediate action. Examples:  
  • Received an invalid authentication request  
  • Service crashed due to an error that could not be handled, like an out of memory condition, (provided it has a watchdog process to restart it, it does not necessarily require immediate action)  
  • Unexpected code error that could not be handled |
| Error (3)           | An error condition, which does not necessarily impact the ability of the service to continue to function. Examples:  
  • Problem parsing/processing a particular request which does not prevent the application from handling other requests  
  • Unexpected, but handled code exception |
| Warning (4)         | A warning about some bad condition, which is not necessarily an error. Examples:  
  • Lost network connection to some resource  
  • Timed out waiting for a response |
| Notice (5)          | Notifications about system-level conditions, which are not error conditions. Examples:  
  • Configuration was updated (not audit level information)  
  • Process has started  
  • Process is shutting down gracefully on request |
Informational messages are distinguished from notification in that they provide information for internal flows of the application or per-request information instead of system-wide notifications. Informational messages are used for troubleshooting by users who are familiar with the basic flows of the application. Examples:

- Request received
- Request was parsed successfully
- Request being processed
- Response sent back
- Acknowledgement received
- Detailed audit information

Debugging messages are similar to informational messages, but provide more detail and require the user to have better knowledge of system internal processing. These messages are typically reserved for very advanced users or Cisco technical support. Examples:

- Complete details for a request packet
- Internal state machine state changes
- Internal profiling statistics
- Internal events

If an application uses a default severity level to determine which messages should be logged, then it is recommended that this level be set at 5 (notice). This ensures that all messages of severity 5 or higher are logged by default.

**MSGNAME field**

The MSGNAME field of the HEADER uniquely identifies the message within the context of a given APPNAME. A fixed severity and logical meaning is associated with a specific MSGNAME within a specific APPNAME. In other words, the same message name cannot appear with different severity or a completely different logical meaning for the same APPNAME value even if the message is originated by a different process.

Message names are only unique within a given application (a given APPNAME value) unless the message is one of the standard messages. Thus, applications interpreting CiscoLog messages should be careful not to assume that a message with a given name has the same meaning for all applications that may use this message name. Indeed, if the message is not one of the standard messages, it may have a different severity and meaning in a different application.

The MSGNAME field must consist of at least two characters. Acceptable characters are limited to the following ASCII decimal values: 48-57 (numbers), 65-90 (upper-case letters) and 95 (underscore). While IOS allows lower-case letters as well, the vast majority of IOS messages use only the upper-case letters. In order to be
consistent with established conventions we opted to restrict the character set to upper-case letters, numbers and underscore characters.

Both numeric-only or alphanumeric message names are acceptable. However, per IOS convention, it is recommended that a user-friendly alphanumeric label be preferred to a numeric-only label. For example, “NO_MEMORY” message name is preferred to a “341234” identifier.

A special tag mid is defined in the CiscoLog Standard Tags specification for identifying a numeric id corresponding to a message name. This tag can be used to provide a numeric message in addition to the MSGNAME. When this tag is used, a given MSGNAME must always correspond to a single message id value. CiscoLog defines mid tag values for each standard message.

The length of the MSGNAME field must not exceed 30 characters, but most message names should be more concise. MSGNAME value may not conflict with the names defined in this standard.

A separate message name must be defined for each logically different message. In other words, while the message text for a given message name can vary by virtue of some substitutable parameters, logically different messages must have different message names.

The following is an example of correct use of message name:

11: host.cisco.com: Jun 13 2003 23:11:52.454 UTC: %BACC-4-CONNECTION_LOST: %{pname.orig=rdu}: Server lost connection to host [1.1.1.1]
12: host.cisco.com: Jun 13 2003 23:11:52.458 UTC: %BACC-4-CONNECTION_LOST: %{pname.orig=rdu}: Server lost connection to host [2.2.2.2]

Notice that while the IP address of the host changes, it is still logically the same type of message. The following is an example of an INCORRECT use of the message name:

15: host.cisco.com: Jun 13 2003 23:11:52.458 UTC: %BACC-4-CONNECTION: %{pname.orig=rdu}: Server lost connection to host [2.2.2.2]
16: host.cisco.com: Jun 13 2003 23:11:52.468 UTC: %BACC-4-CONNECTION: %{pname.orig=rdu}: Server re-established connection to host [2.2.2.2]

The use of a single message name for two different events in the above example is wrong and unacceptable. This is referred to as a “catch-all” message name and they must be avoided. Another extreme example is defining a message named “ERROR” and providing all error log messages under the same message name. This defeats the purpose of having the message name field, which is to enable external filtering of messages or easily trigger actions.

The only exception to the “no-catch-all” rule is when message cannot be identified ahead of time with anything better than a generic description or the users will not benefit from distinguishing the various subtypes of the message.

Although some applications may choose to do so, there is generally no need to define a separate message name for all debugging messages because debugging messages are not intended for automated filtering and action triggering based on message name. The sheer number of debugging messages and the highly dynamic nature of what is produced in them makes it very hard to define separate messages.

This specification proposes establishing a mailing list that could be used by groups for consulting purposes when in doubt about how to define certain messages. Currently, the mailing list alias used for this purpose is “cmn-logging”.

### TAGS field

The TAGS field is optional in the message format. It provides a standard mechanism for applications to provide structured content in the form of key-value pairs which can be used to categorize or filter a set of messages externally.

Tags can be used to identify virtual logging channels. A set of messages flagged with the same tag can later be grouped together. For example, an application may flag messages belonging to a particular thread by supplying the corresponding tag. This would then allow filtering and viewing messages based on threads.
Virtual logging channels can also be established across multiple applications. For example, if all applications could tag requests from a device with device id (mac, ip, etc), then it would be easy to filter all messages related to that device even thought it communicates with multiple components.

Each application may define its own set of supported tags. A single tag consists of key and value pair separated by the equals sign and surrounded by square bracket characters as in the following format: [KEY=VALUE]. This is an example of a valid tag key-value pair [ip=123.23.22.22].

The TAGS field is prefixed with a percent character (ASCII decimal value 37) and ends with a sequence of colon and space characters (ASCII decimal values 58 and 32). When multiple tags are assembled together, no characters should appear between the tags as separators. The following example has a complete CiscoLog message with four tags:

```
12: host.cisco.com: Jun 13 2003 23:11:52.454 UTC: %BACC-4-BAD_REQUEST: 
```

If TAGS field is missing, the percent character prefix and the trailing colon and space must be omitted. Thus, when the TAGS field is missing, the HEADER and MESSAGE fields must be separated by just a single colon and a space which follows the HEADER field. For example:

```
```

Multiple tags with the same tag key can be provided in the same message. This essentially provides the capability for handling multi-valued keys. Below is an example of a message produced from a device which has two IP addresses where the application chose to provide both IP addresses in the TAGS field as well as the process name:

```
12: host.cisco.com: Jun 13 2003 23:11:52.454 UTC: %BACC-4-BAD_REQUEST: 
%[pname.orig=rdu][ip.orig=1.1.1.1][ip.orig=1.1.1.2]: Bad request received from device [1,6,aa:bb:cc:11:22:33]. Missing header.
```

Any number of tags can be provided in a given message. The only limit is the overall length limit of the CiscoLog message of 800 octets.

If multiple tags are present, it is recommended that they appear in the alphanumeric order of the keys. This insures that tags are always produced in the same order. However, a different order may be chosen by an application if the order of tags is used to communicate some semantic value.

### Tag keys

Tag key must contain at least one character. The characters are limited to ASCII characters with decimal values 48-57 (numbers), 65-90 (upper-case letters), 95 (underscore), 97-122 (lower case letters). Use of lower-case letters is recommended. There is no strict limit on tag key length, although a general message limit of 800 octets applies and dictates that one should attempt to define short tag key names.

### Tag semantic extensions

In some cases, a tag can have a standard value syntax, but different meaning depending on the content in which it is used. Tag semantic extensions are used to differentiate the contextual meaning of tags.

The semantic extension tags are created by appending the tag key with a single dot character (ASCII decimal value 46) and a text string consisting of characters from a proper character set.

For example, an “ip” tag defines syntax for an IP address representation, but no semantic value. An “ip” tag found in a CiscoLog message generally means only that this IP address is somehow related to the message. In some cases, such vague association is sufficient. However, sometimes, communicating semantic value could be useful.
A message may have two IP address tags associated with it, for example, from and to IP addresses. In this case, using tags “ip.from” and “ip.to” would communicate both the syntax of the tags and some semantic value. Another example, is a standard tag “ip.orig”, which specifies the IP address of the host which originated the message. The following is an example of all three tags appearing together:

[ip.from=1.1.1.1][ip.to=2.2.2.2][ip.orig=123.12.111.1]

Multiple levels of semantic extension tags are allowed with each extension providing meaning that is more specific. For example, tag key “ip.to.primary” is valid and could mean the primary IP address of the destination host.

The semantic value is much harder to standardize than the syntax because there can an infinite number of meanings for a given value depending on the context. Thus, it is anticipated that defining tag semantics extensions will be largely application specific.

**Tag values**

Tag values may contain zero or more characters. The empty (zero characters) value is interpreted as unknown or undetermined value. The value must only include printable US ASCII characters (those in the ASCII decimal value range 32-126) and foreign language characters.

There is a restriction on the use of three characters: “[”, “]”, and “\”. The bracket characters (ASCII decimal values 91 & 93) must be escaped with a back slash character (ASCII decimal value 92). This helps to avoid confusion with the brackets that signify the start/end of the tag. Thus, when the tag value needs to represent characters “[“ or “]”, a sequence of “\[“ or “\]” is used instead respectively. When the escape character itself needs to be represented in the tag value, then instead of the “\” character a sequence of “\" character is used.

Use of non-printable (control) ASCII characters is not allowed in the TAG value field. Control characters include characters with ASCII decimal values 0-31 and 127. If application provides to a CiscoLog-compliant library a tag value string, which includes one or more control characters, the logging library must do the following. If the horizontal tab character (ASCII decimal value 9) is encountered, it must be replaced with one or more space characters (ASCII decimal value 32). Eight spaces per tab are recommended because this is a convention on most Unix and Windows platforms. Other control characters must each be replaced with a question mark character (ASCII decimal value 63). Technically, we only need to require escaping a closing bracket. However, requiring escaping both open and closing brackets simplifies parser code and provides for a more consistent display in raw form. There is no strict limit on tag value length; although a general message length limit of 800 octets applies and dictates that one must be conservative.

**Tag guidelines**

The TAGS field is optional in the CiscoLog message format. Tags do not replace substitutable parameters in the message body. Tags merely provide an additional way to identify and categorize messages.

Since tags are optional, they can be enabled or disabled by the application/user as required. There is no requirement for the same message to always be produced with the same set of tags. If the application supports a given tag, it does not necessarily mean that it must always produce it. This can be configurable. Indeed, it is recommended that applications provide the administrator with at least limited control over which tags get produces.

Application developers have a choice as to what information to make available in the tags and what in the message body. In some cases, the information may be duplicated between the two. This is acceptable.

The general guideline is to put all required information in the message body and make appropriate information available via tags. In other words, the message should provide sufficient meaning even when all tags are
disabled. Tags merely provide additional useful information and a way to present it in a standard, easily filtered, form.

The following are two valid examples of a message where both the message and the message tags contain a MAC address. Example with tags disabled:

```
```

In the above example, the MAC address appears as part of the message field – it is not a tag. In the following example, the tags are enabled. Even though MAC address is duplicated between the tag and the message, it is acceptable.

```
```

### Process identification tag

One of the standard tags, `pname.orig`, is used to identify the logical process name which originates the message. Any application that seeks to provide originating process information must do so using the “`pname.orig`” tag.

This tag is extremely valuable in addition to information in the `APPNAME` field because some applications consist of multiple processes, each of which may originate logging messages. It is recommended that any application which consists of multiple processes always provide the “`pname.orig`” tag.

### MESSAGE field

The `MESSAGE` field provides a descriptive message about the logging event. This field may consist of one or more characters. The character set is limited to printable US ASCII characters (ASCII decimal values 32-126) and foreign language characters.

Use of non-printable (control) ASCII characters is not permitted in the `MESSAGE` field. Control characters include characters with ASCII decimal values 0-31 and 127. If application provides a CiscoLog-compliant library with message string, which includes one or more control characters, the logging library must do the following. If the horizontal tab character (ASCII decimal value 9) is encountered, it must be replaced with one or more space characters (ASCII decimal value 32). Eight spaces per tab are recommended because this is a convention on most Unix and Windows platforms. Other control characters must each be replaced with a question mark character (ASCII decimal value 63).

The maximum length of the `MESSAGE` field is constrained only by the maximum length of the entire message. The maximum length of the CiscoLog message must not exceed 800 octets. Another practical limitation is a potentially highly variable length of the `TAGS` field.

Message text may contain substitutable parameters, which provide necessary details about the message. For example, the IP address in the following example is a substitutable parameter.

```
```

It is recommended (but not required) that substitutable parameters be surrounded by bracket characters “`[`“ and “`]`” as in the above example. It is further recommended that the message text and values of substitutable parameters do not include bracket characters. When it is not possible to avoid brackets characters in the values of substitutable parameters, it is recommended that the value at least does not include unbalances brackets (like an opening bracket without a closing one). When these recommendations are followed, it would be possible to programmatically extract substitutable parameter values out of a CiscoLog message. However, this recommendation is not a strict requirement.

Message text should be spell-checked. Editorial review is recommended. This includes all messages that can be seen by the customers, even debugging messages.
If the first word of the message is an English word, the first letter should be capitalized. Single sentence messages do not require a period at the end.

**Internationalization**

Foreign language characters are defined as characters with ASCII decimal values 0-126. Foreign language characters are supported in the HOST field, the value part of the TAGS field and the MESSAGE field.

Foreign language characters must be encoded using the Unicode standard UTF-8. UTF-8 provides encoding for any language without requiring the application to know local encoding/decoding rules for a particular language. In fact, the application encoding the message does not even need to know the language of the message. UTF-8 can encode any Unicode character.

UTF-8 encodes US ASCII characters exactly as they would normally be encoded in a 7-bit ASCII convention. This means that applications interpreting CiscoLog messages can assume that entire messages are encoded in UTF-8. On the other hand, applications producing CiscoLog messages can encode the entire message using US-ASCII 7-bit convention if they are known not to support foreign languages in their products.

Since UTF-8 can encode characters in any language, it is possible to mix and match languages. For example, it is anticipated that a one use-case would be the inclusion of just some parameters in foreign language in an otherwise English message. For example, an English message about user authentication could have a username in Japanese. Similarly, any number of languages can be combined in a CiscoLog message.

In order to take advantage of messages, which include a foreign language, a log viewer capable of interpreting UTF-8 would be necessary. Most likely, the log viewer would also require that the appropriate language fonts be installed on a given system. In a US-ASCII only editor, the user will see garbage for non-US-ASCII characters encoded in UTF-8, but should be able to see all US-ASCII text.

Internationalization support can be readily used with CiscoLog messages written to a local file. Syslog RFC 3164, however, does not currently define foreign language support. Thus, in order to take advantage of internationalization with a syslog server, one would need to use a server implementation, which was tested to correctly relay or store all 8-bits of each octet unchanged. This would ensure that UTF-8 encoded parts of the message retain all their information when foreign languages are used.

In UTF-8, a single character is encoded with one or more octets. The CiscoLog message length limit is specified as 800 octets. Developers must be aware that with foreign languages, the 800-octet length limit may mean fewer than 800 characters. When a message is split into a multi-part message, octets belonging to a single character must never be split into separate lines.

Multipart messages, on page 164

**Versioning**

CiscoLog does not provide any versioning information in the message format. Extensions to the format must be made within the restrictions of the format. CiscoLog message formats provides for extensions by way of defining additional tags.

If applications require changes to existing messages, the value of APPNAME can redefine message within the new space. For example, the application version can be appended to the application name as BACC_2_5 for BACC 2.5.
Preconfigured system alarm notifications

There are preconfigured system alerts in RTMT. Refer to the Real-Time Monitoring Tool Administration Guide for information on configuration.

AuthenticationFailed

Authentication validates the user ID and password that are submitted during log in. An alarm gets raised when an invalid user ID and/or the password gets used.

LogPartitionHighWaterMarkExceeded

This alert occurs when the percentage of used disk space in the log partition exceeds the configured high water mark. When this alert gets generated, LPM deletes files in the log partition (down to low water mark) to avoid running out of disk space.

Note
LPM may delete files that you want to keep. You should act immediately when you receive the LogPartitionHighWaterMarkExceeded alert.

Table 82: Default configuration for the LogPartitionHighWaterMarkExceeded RTMT alert

</tbody>
</table>

LogPartitionLowWaterMarkExceeded

This alert occurs when the LogPartitionLowWaterMarkExceeded event gets generated. This indicates that the percentage of used disk space in the log partition exceeded the configured low water mark.
Be aware that this alert is an early warning. The administrator should start freeing up disk space. Using RTMT/TLC, you can collect trace/log files and delete them from the server. The administrator should adjust the number of trace files that are kept to avoid hitting the low water mark again.

Table 83: Default configuration for the LogPartitionLowWaterMarkExceeded RTMT alert

</tr>
</tbody>
</table>

LowSwapPartitionAvailableDiskSpace

This alert indicates that the available disk space on the swap partition is low.

Note

The swap partition makes up part of virtual memory, so low available swap partition disk space means low virtual memory as well.

Table 87: Default configuration for the LowSwapPartitionAvailableDiskSpace RTMT alert

<table>
<thead>

ServerDown

This alert occurs when a remote node cannot be reached.

Note
Cisco Unified CM clusters only—The ServerDown alert gets generated when the currently “active” AMC (primary AMC or the backup AMC, if the primary is not available) cannot reach another server in a cluster. This alert identifies network connectivity issues in addition to a server down condition.

Table 88: Default configuration for the ServerDown RTMT alert

</tbody>
</table>
SparePartitionHighWaterMarkExceeded

This alert occurs when the SparePartitionHighWaterMarkExceeded event gets generated. It indicates that the percentage of used disk space in the spare partition exceeds the configured high water mark. Some core file or log files are purged until the percentage of used disk space in the spare partition is below the configured low water mark. Check if the configured high water mark for used disk space in the spare partition is too low.

Cisco Log Partition Monitoring Tool (LPM) starts purging trace log files in the spare partition and keeps deleting trace log files in the spare partition until spare partition disk usage is just below the low water mark.

Name of the service generating this alarm is Cisco Log Partition Monitoring Tool.

Check if the configured high water mark for used disk space in the spare partition is too low; if it is, change the high water mark setting to a higher value. Also examine each application trace log files under spare partition and delete those trace log files that are too old or too big.

Note
Spare Partition is not used for Intercompany Media Engine server. So this alert will not be triggered for Intercompany Media Engine.

Table 89: Default configuration for the SparePartitionHighWaterMarkExceeded RTMT alert

</table>
SparePartitionLowWaterMarkExceeded

This alert occurs when the SparePartitionLowWaterMarkExceeded event gets generated. It indicates that the percentage of used disk space in the spare partition has exceeded the configured low water mark threshold. There are files to be purged by Cisco Log Partition Monitoring Tool (LPM). If the spare partition disk usage keeps increasing until it exceeded the configured high water mark, Cisco LPM starts purging the trace log files in the spare partition. Cisco LPM sends the alarm periodically if the spare partition disk usage has not changed.

Name of the service generating this alarm is Cisco Log Partition Monitoring Tool.

Check if the configured low water mark for used disk space in the spare partition is too low; if, change the low/high water mark settings to the higher values. Also examine each application trace log files under spare partition and clean up those trace log files that are too old or too big before the used disk space exceeds the high water mark.

**Note**

Spare Partition is not used for Intercompany Media Engine server. So this alert will not be triggered for Intercompany Media Engine.

</tbody>
</table>
TotalProcessesAndThreadsExceededThreshold

This alert occurs when the TotalProcessesAndThreadsExceededThreshold event gets generated. The alert indicates that the current total number of processes and threads exceeds the maximum number of tasks that are configured for the Cisco RIS Data Collector Service Parameter. This situation could indicate that a process is leaking or that a process has thread leaking.

Table 94: Default configuration for the TotalProcessesAndThreadsExceededThreshold RTMT alert

BeginThrottlingCallListBLFSubscriptions

This alert occurs when the BeginThrottlingCallListBLFSubscriptions event gets generated. This indicates that the Cisco Unified Communications Manager initiated a throttling of the CallList BLF Subscriptions to prevent a system overload.

<table>

</table>
### CallProcessingNodeCpuPegging

This alert occurs when the percentage of CPU load on a call processing server exceeds the configured percentage for the configured time.

**Note**

If the administrator takes no action, high CPU pegging can lead to a crash, especially in CallManager service. CoreDumpFound and CriticalServiceDown alerts might also get issued.

The CallProcessingNodeCpuPegging alert gives you time to work proactively to avoid a Cisco Unified Communications Manager crash.

</tbody>
</table>

CodeYellow

The AverageExpectedDelay counter represents the current average expected delay to handle any incoming message. If the value exceeds the value that is specified in Code Yellow Entry Latency service parameter, the CodeYellow alarm gets generated. You can configure the CodeYellow alert to download trace files for troubleshooting purposes.

Table 101: Default Configuration for the CodeYellow RTMT Alert

</tr>
</tbody>
</table>
**DBChangeNotifyFailure**

This alert occurs when the Cisco Database Notification Service experiences problems and might stop. This condition indicates change notification requests that are queued in the database got stuck and changes made to the system will not take effect. Ensure that the Cisco Database Layer Monitor is running on the node where the alert exists. If it is, restart the service. If that does not return this alert to safe range, collect the output of `show tech notify` and `show tech dbstatinfo` and contact TAC for information about how to proceed.

</tr>
</tbody>
</table>
**DBReplicationFailure**

This alarm indicates a failure in IDS replication and requires database administrator intervention.

---

**Note**

Be aware that DBReplicationFailure is based on the replication status perfmon counter (instead of DBReplicationFailure alarm as was previously the case). This alert gets triggered whenever the corresponding replication status perfmon counter specifies a value of 3 (Bad Replication) or 4 (Replication Setup Not Successful).

---

</tr>
</tbody>
</table>
**DDRBlockPrevention**

This alert gets triggered when the IDSReplicationFailure alarm with alarm number 31 occurs, which invokes a proactive procedure to avoid denial of service. This procedure does not impact call processing; you can ignore replication alarms during this process.

The procedure takes up to 60 minutes to finish. Check that RTMT replication status equals 2 on each node to make sure that the procedure is complete. Do not perform a system reboot during this process.

*Table 104: Default Configuration for the DDRBlockPrevention RTMT Alert*

<table>

<td>Default</td>
</tr>
</tbody>
</table>

**DDRDown**

This alert gets triggered when the IDSReplicationFailure alarm with alarm number 32 occurs. An auto recover procedure runs in the background, and no action is needed.

The procedure takes about 15 minutes to finish. Check that RTMT replication status equals 2 on each node to make sure the procedure is complete.

*Table 105: Default Configuration for the DDRDown RTMT Alert*

<table>
<thead>
<tr>

### ExcessiveVoiceQualityReports

This alert gets generated when the number of QRT problems that are reported during the configured time interval exceed the configured value. The default threshold specifies 0 within 60 minutes.

**Table 106: Default Configuration for the ExcessiveVoiceQualityReports RTMT Alert**

<table>
<thead>
<tr>

</tbody>
</table>
### IMEDistributedCacheInactive

This alarm gets generated when a Cisco Unified Communications Manager attempts to connect to the Cisco IME server, but the IME distributed cache is not currently active.

Ensure that the certificate for the Cisco IME server is provisioned and that the IME distributed cache has been activated via the CLI.

#### Default Configuration

**Table 107: Default Configuration for the IMEDistributedCacheInactive RTMT Alert**

<table>
<thead>
<tr>
<th>Value</th>
<th>Default Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable E-mail</td>
<td>Selected</td>
</tr>
<tr>
<td>Trigger Alert Action</td>
<td>Default</td>
</tr>
</tbody>
</table>

### IMEOverQuota

This alert indicates that the Cisco Unified Communications Manager servers that use this Cisco IME service have exceed the quota for published direct inward dialing numbers (DIDs) to the IME distributed cache. The alert includes the name of the Cisco IME server as well as the current and target quota values.
Ensure that you have correctly provisioned the DID prefixes on all of the Cisco Unified Communications Manager servers that use this Cisco IME service.

If you have provisioned the prefixes correctly, you have exceeded the capacity of your Cisco IME service, and you need to configure another service and divide the DID prefixes across the Cisco IME client instances (Cisco Unified Communications Managers) on different Cisco IME services.

**Default Configuration**

**Table 108: Default Configuration for the IMEOverQuota Alert**

</tr>
</tbody>
</table>

**IMEQualityAlert**

This alert gets generated when Cisco Unified Communications Manager determines that a substantial number of Cisco IME calls fail back to PSTN or fail to be set up due to IP network quality problems. Two types of events trigger this alert:

A large number of the currently active Cisco IME calls have all requested fallback or have fallen back to the PSTN.

A large number of the recent call attempts have gone to the PSTN and not been made over IP.

When you receive this alert, check your IP connectivity. If no problems exist with the IP connectivity, you may need to review the CDRs, CMRs, and logs from the firewalls to determine why calls have fallen back to the PSTN or have not been made over IP.
Default Configuration

</tr>
</tbody>
</table>

**InsufficientFallbackIdentifiers**

This alert gets generated when too many Cisco IME calls that are currently in progress use the same fallback DID and no more DTMF digit sequences exist to allocate to a new Cisco IME call that Cisco Unified Communications Manager is processing. The new call continues, but the call cannot fallback to the PSTN if voice-quality deteriorates.

If this alert gets generated, note the fallback profile that associates with this call. Check that profile in Cisco Unified Communications Manager Administration, and examine the current setting for the “Fallback Number of Correlation DTMF Digits” field. Increase the value of that field by one, and check whether the new value eliminates these alerts. In general, this parameter should be large enough so that the number of simultaneous Cisco IME calls that are made to enrolled numbers that associate with that profile is always substantially less than 10 raised to the power of this number. For example, if you always have fewer than 10,000 simultaneous Cisco IME calls for the patterns that associate with this fallback profile, setting this value to 5 (10 to the power of 5 equals 100,000) should keep Cisco Unified Communications Manager from generating this alert.

However, increasing this value results in a small increase in the amount of time it takes to perform the fallback. As such, you should set the “Fallback Number of Correlation DTMF Digits” field to a value just large enough to prevent this alert from getting generated.

Instead of increasing the value of the DTMF digits field, you can add another fallback profile with a different fallback DID and associate that fallback profile with a smaller number of enrolled patterns. If you use this method, you can use a smaller number of digits.
Default Configuration

IMEServiceStatus

This alert indicates the overall health of the connection to the Cisco IME services for a particular Cisco IME client instance (Cisco Unified Communications Manager). The alert indicates the following states:

- 0—Unknown. Likely indicates that the Cisco IME service has not been activated.
- 1—Healthy. Indicates that the Cisco Unified Communications Manager has successfully established a connection to its primary and backup servers for the Cisco IME client instance, if configured.
- 2—Unhealthy. Indicates that the Cisco IME has been activated but has not successfully completed handshake procedures with the Cisco IME server. Note that this counter reflects the handshake status of both the primary and the secondary IME servers.

Default Configuration

Table 111: Default Configuration for the IMEServiceStatus Alert

<table>

</tbody>
</table>
### InvalidCredentials

The alert indicates that the Cisco Unified Communications Manager cannot connect to the Cisco IME server because the username and/or password configured on Cisco Unified Communications Manager do not match those configured on the Cisco IME server.

The alert includes the username and password that were used to connect to the Cisco IME server as well as the IP address and name of the target Cisco IME server. To resolve this alert, log into the Cisco IME server and check that the configured username and password match the username and password that are configured in Cisco Unified Communications Manager.

---

**InvalidCredentials**

The alert indicates that the Cisco Unified Communications Manager cannot connect to the Cisco IME server because the username and/or password configured on Cisco Unified Communications Manager do not match those configured on the Cisco IME server.

The alert includes the username and password that were used to connect to the Cisco IME server as well as the IP address and name of the target Cisco IME server. To resolve this alert, log into the Cisco IME server and check that the configured username and password match the username and password that are configured in Cisco Unified Communications Manager.

</tbody>
</table>

SDLinkOutOfService

This alert occurs when the SDLinkOutOfService event gets generated. This event indicates that the local Cisco Unified Communications Manager cannot communicate with the remote Cisco Unified Communications Manager. This event usually indicates network errors or a nonrunning, remote Cisco Unified Communications Manager.
Table 125: Default Configuration for the SDLLinkOutOfService RTMT Alert

</tr>
</tbody>
</table>

TCPSetupToIMEFailed

This alert occurs when Cisco Unified Communications Manager cannot establish a TCP connection to a Cisco IME server. This alert typically occurs when the IP address and port of the Cisco IME server are misconfigured in Cisco Unified Communications Manager Administration or when an Intranet connectivity problem exists and prevents the connection from being set up.

Ensure that the IP address and port of the Cisco IME server in the alert are valid. If the problem persists, test the connectivity between the Cisco Unified Communications Manager servers and the Cisco IME server.

Default Configuration

Table 126: Default Configuration for the TCPSetupToIMEFailed Alert

</table>
Emergency-level alarms

The emergency-level alarm equals zero (0) and means that your system or service is unusable. These alarms generally indicate platform failures. Examples follow:

- Service repeatedly fails to startup
- System ran out of disk space while disk space is essential for this system to operate
- System ran out of memory
- Motherboard failure occurred

This level is not suitable for events associated with an individual end point.

Alert-level alarms

The alert-level alarm equals 1 and action must take place immediately. A system error occurred and will not recover without manual intervention. Examples follow:

- Application is about to run out of licenses
- Application is about to run out of disk space
- Application is almost out of memory
- 100% CPU occurs for long period of time

Be aware that this level is not suitable for events that are associated with an individual end point.

CertValidLessthanADay

Certificate is about to expire in less than 24 hours or has expired.

CertValidLessthanADay

Certificate is about to expire in less than 24 hours or has expired.

CertValidLessthanADay

Certificate is about to expire in less than 24 hours or has expired.
Recommended Action

Regenerate the certificate that is about to expire by accessing the Cisco Unified Operating System and go to Certificate Management. If the certificate is issued by a CA, generate a CSR, submit the CSR to CA, obtain a fresh certificate from CA, and upload it to Cisco Unified CM.

CMIException

Error while reading the database.

This alarm is always associated with other alarms, which are triggered due to configuring CMI service parameter with invalid values or due to invalid handle value returned by the serial port.

Recommended Action

Refer to the associated alarm for further information.

CMOverallInitTimeExceeded

Initialization of the Cisco Unified Communications Manager system has taken longer than allowed by the value specified in the System Initialization Timer service parameter; as a result, the system will automatically restart now to attempt initialization again. Initialization may have failed due a database error, or due to a large amount of new devices added to the system, or any number of other potential causes. The required time to initialize Cisco Unified Communications Manager has exceeded the time allowed by the Cisco CallManager service parameter, System Initialization Timer. This could be due to an increase in system size.

Facility/Sub-Facility

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

Alert

Parameters

Cisco Unified Communications Manager Overall Initialization Time (in minutes) [Int]

Recommended Action

Try increasing the value of the Cisco CallManager service parameter, System Initialization Timer, in the Service Parameters Configuration window in Cisco Unified CM Administration. Use RTMT to discover the number of devices and number of users in the system and evaluate whether the numbers seem accurate. Try increasing the value of the Cisco CallManager service parameter, System Initialization Timer, in the Service Parameters Configuration window in Cisco Unified CM Administration. If increasing the time in the System Initialization Timer service parameter does not correct this issue, contact the Cisco Technical Assistance Center (TAC).

ConfigThreadChangeNotifyServerInstanceFailed

Failed to allocate resources to handle configuration change notification from database. This usually indicates a lack of memory when there is a system issue such as running out of resources.

History

<table>
<thead>
<tr>
<th>Cisco Unified CommunicationsRelease</th>

Cisco Unified Serviceability Alarm Definition Catalog

System/DB

Severity

Alert (1)
Recommended Action

In Cisco Unified Serviceability, enable Detailed level traces in the Trace Configuration window for the Cisco Database Layer Monitor service. Check network connectivity and operation of SQL Server services.

ParityConfigurationException

The CMI service parameter, Parity, has an invalid configuration.

An invalid parity has been configured for the serial port that CMI uses to connect to the voice messaging system. It is possible that the parity value has been updated via AXL or a CLI command where validation of the value was not performed. For this reason, it is best to set this value in the Service Parameter Configuration window in Cisco Unified CM Administration and the value can be validated against the accepted range of values for this field.

History

CMIAlarmCatalog/CMI

Severity

ALERT

Routing List

Event Log
SDI

Parameter(s)

Illegal Parity(String)

Recommended Action

Verify that the Cisco Messaging Interface service parameter Parity is set to a valid (allowable) value.

SerialPortOpeningError

When CMI tries to open the serial port, the operating system returns an error.

For a system running CMI, the serial port through which the voice messaging system is connected is always USB0, and that value is configured in the Cisco Messaging Interface service parameter, Serial Port. It is possible that the Serial Port value has been updated via AXL or a CLI command where validation of the value
was not performed. CMI triggers this alarm if the value in the Serial Port service parameter is anything other than USB0.

### Facility/Sub-Facility

CCM_TFTP_TFTP
Cisco Unified Serviceability Alarm Definition Catalog

System/TFTP

Severity
Alert

Parameters
Error [Int] Reason [String]

Recommended Action
In Cisco Unified Serviceability, enable Detailed level traces in the Trace Configuration window for TFTP and Cisco Database Layer Monitor services. Also, use RTMT to look for errors that may have occurred around the time of the alarm. Ensure that the database server is running, and that the Cisco Database Layer Monitor service is running without problems. If this alarm persists, contact the Cisco Technical Assistance Center (TAC) with TFTP service and database trace files.

SDLLinkOOS

SDL link to remote application out of service. This alarm indicates that the local Unified CM has lost communication with the remote Unified CM. This alarm usually indicates that a node has gone out of service (whether intentionally for maintenance or to install a new load for example; or unintentionally due to a service failure or connectivity failure).

History

<table>
<thead>
<tr>

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity
Alert

Parameters
Recommended Action

In the Cisco Unified Reporting tool, run a CM Cluster Overview report and check to see if all servers can talk to the Publisher. Also check for any alarms that might have indicated a CallManager failure and take appropriate action for the indicated failure. If the node was taken out of service intentionally, bring the node back into service.

Severity

Alert (1)

Parameters

Error [Int] Reason [String]
Recommended Action

Verify that the TFTP service parameter, TFTPIPAddress, accurately specifies the IP address of the NIC card to use for serving files via TFTP. See the help for the (advanced) TFTPIPAddress service parameter for more information. If the problem persists, go to Cisco Unified Serviceability and enable Detailed level traces in the Trace Configuration window for the TFTP service and contact the Cisco Technical Assistance Center (TAC).

StopBitConfigurationError

The Cisco Messaging Interface service parameter, Stop Bits, has an invalid configuration.

An invalid stop bit has been configured for the serial port that CMI uses to connect to the voice messaging system. It is possible that the Stop Bits value has been updated via AXL or a CLI command where validation of the value was not performed. For this reason, it is best to set this value in the Service Parameter Configuration window in Cisco Unified CM Administration and the value can be validated against the accepted range of values for this field.

**UnknownException**

Unknown error while connecting to database.

When CMI service is started, it tries to read CMI service parameters from DB. During this, if there is an unknown error, CMI triggers this alarm.

**Cisco Unified Serviceability Alarm Definition Catalog**

CMIAAlarmCatalog/CMI
VMDNConfigurationError

The Voice Mail DN for CMI is invalid.

CMI cannot register with Cisco Unified Communications Manager because of an invalid Voice Mail DN. This alarm occurs because the Cisco Messaging Interface service parameter, Voice Mail DN, is empty or has invalid characters other than digits (0-9). It is possible that the Voice Mail DN value has been updated via AXL or a CLI command where validation of the value was not performed. For this reason, it is best to set this value in the Service Parameter Configuration window in Cisco Unified CM Administration and the value can be validated against the accepted range of values for this field.

Parameter(s)

Invalid Voice Mail DN(String)

Recommended Action

Check the CMI service parameter Voice Mail DN to confirm that a valid directory number has been configured.
Critical-Level Alarms

The critical-level alarm equals 2 and action may need to be taken immediately; auto-recovery is expected, but monitor the condition.

This alarm acts similar to the alert-level alarm but not necessarily requiring an immediate action. A system-affecting service had a failure but recovered without intervention. Examples follow:

- Service crashed due to an error that could not be handled but a watchdog process exists that will restart the service. The crash does not necessarily require immediate action. Examples are:
  - Out of memory conditions
  - Uninitialized variables
  - Memory scribblers

- Unexpected code error occurred that could not be handled but for which the system automatically restarts.

BChannelOOS

The B-channel is out of service. The B-channel indicated by this alarm has gone out of service. Some of the more common reasons for a B-channel to go out of service include are as follows:

- Taking the channel out of service intentionally to perform maintenance on either the near- or far-end
- MGCP gateway returns an error code 501 or 510 for a MGCP command sent from Cisco Unified Communications Manager (Cisco Unified CM)
- MGCP gateway does not respond to an MGCP command sent by Cisco Unified CM three times
- Speed and duplex mismatch exists on the Ethernet port between Cisco Unified CM and the MGCP gateway.

</table>

CertExpiryCritical
Certificate is about to expire in less than 7 days. Regenerate or reimport certificate. Name of the service
generating this alarm is Cisco Certificate Expiry Monitor. The alarms are generated when any certificate
generated by the system or uploaded into the system expires. Cisco Unified CM uses certificates for Tomcat
(Web Server), CallManager, IPSec and Directory. Refer Security guide for more details on various certificates.
When a certificate generated by Cisco Unified CM, the default validity of the self-signed certificate is for 5
years. In case of Certificates signed by a CA, the validity is dependent on the Expiry date set by CA while
issuing the certificate. Once a certificate is about to expire “Cisco Certificate Expiry Monitor” service generates
alarms. The severity of the alarm is dependent on how much time is left for the certificate to expire.

The impact to system operation depends on the which certificate expired. This information is contained in the
alarm. If Tomcat certificate expired, while connecting to Cisco Unified CM web pages, browser will throw
an error stating certificate has expired. One can still ignore the warning and continue to connect to Cisco
Unified CM pages.
In case of Directory-trust, if Directory trust certificate uploaded to Cisco Unified CM expires, Cisco Unified CM may not be able to establish SSL connection with external LDAP server. The overall impact is that SSL connection between Cisco Unified CM and other external Servers will fail.

Parameters
Message(String)

Recommended Action
Regenerate the certificate that is about to expire by accessing the Cisco Unified Operating System and go to Certificate Management. If the certificate is issued by a CA, generate a CSR, submit the CSR to CA, obtain a fresh certificate from CA, and upload it to Cisco Unified CM.

CDRMaximumDiskSpaceExceeded

The CDR files disk usage exceeded maximum disk allocation. Some undeliverable files may have been deleted to bring disk usage down. The CDR files disk usage has exceeded the maximum allocated disk space. CDRM may have deleted some CDR files that have not been sent to the outside billing servers yet, in order to bring the disk usage down to below High Water Mark. The decision whether to delete undeliverable files or not depends on how deletionDisable flag is configured at CDRM Configuration page. E-mail alert will be sent to the admin.

CodeRedEntry

Unified CM has entered Code Red condition and will restart.

Unified CM has been in Code Yellow state for an extended period and is unlikely to recover on its own. The Cisco CallManager service automatically restarts in an attempt to clear the condition that is causing the Code Yellow state. The amount of time that the system will remain in Code Yellow state is configurable in the Code Yellow Duration service parameter. If the duration of this parameter is set to 99999, Code Red condition will never occur.

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager
Severity
Critical

Parameters

Recommended Action
Memory problems or high CPU usage are generally at the root of a Code Yellow state. A bad disk could also be the cause. Also, trace level settings can consume tremendous amounts of CPU (especially when the Enable SDL TCP Event Trace checkbox is enabled on the SDL Trace Configuration window in Cisco Unified Serviceability). Check these areas to try to correct the Code Yellow condition. You can also determine the level of fragmentation on the hard disk by issuing the File Fragmentation command from the CLI for the trace directories. Monitor the situation and collect existing trace files. If the CodeYellowExit alarm is not issued in a reasonable amount of time as deemed by your organization, or if the system is frequently entering Code Yellow state, contact TAC and supply the trace information you have collected.

CoreDumpFileFound
The new core dump files have been found in the system. One of the component has crashed and generated a core dump. Use admin cli or RTMT to fetch the backtrace.

Facility/Sub-Facility
CCM_TCT-LPMTCT

Cisco Unified Serviceability Alarm Definition Catalog
System/LpmTct

Severity
Critical (2)

Parameters

Recommended Action
This serious internal error should be investigated by the Cisco Technical Assistance Center (TAC). Before contacting TAC, Login to cli on CCM serve and run “active analyze core file name” to generate the backtrace of the core dump. The core file name is listed in the alert details. After the analyze command is executed, collect the backtrace using cli command “file get activelog analyze” or “Collect Traces” option from RTMT. Send these backtraces to Cisco TAC for further analysis.
DChannelOOS

The D-channel is out of service. D-channel indicated by this alarm has gone out of service. Common reasons for a D-channel going out of service include losing T1/E1/BRI cable connectivity; losing the gateway data link (Layer 2) due to an internal or external problem; or gateway reset.

**History**

<table>
<thead>
<tr>

Parameters
Switch Duplex Settings(String)
Local Interface Duplex Settings(String)

Recommended Action
Ensure that duplex settings are set to auto or full on local interface as well as switch interface.

ErrorChangeNotifyClientBlock

A change notification client is busy (blocked). If the change notification client continues to be blocked for 10 minutes, the system automatically clears the block and change notification should resume successfully. Changes made to the database are not being consumed by one of the recipients. This does not always represent an issue. However, if the change notification client continues to be blocked for 10 minutes, the system automatically clears the block for all clients except the blocked one, which means that change notifications should resume successfully for all other clients. To clear the blocked client, you must restart the server.

CCM_DB_LAYER-DB

Cisco Unified Serviceability Alarm Definition Catalog
System/DB

Severity
Critical (2)
**Recommended Action**

At the command line interface (CLI) on the database server, execute the following command:

```
show tech notify
```

The CLI command output will provide information about the block. Use Cisco Unified Serviceability to restart the server that was indicated in the alarm. You may also want to gather traces to examine them for anomalous activity during the time that client was blocked. In Cisco Unified Serviceability, enable Detailed level traces in the Trace Configuration window for the Cisco Database Layer Monitor service. Also, use RTMT to look for a change that may have occurred around the time of the alarm.

---

**LogPartitionHighWaterMarkExceeded**

The percentage of used disk space in the log partition has exceeded the configured high water mark. Some of the core file and / or trace files will be purged until the percentage of used disk space in the log partition gets below the configured low water mark.

**History**

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity

Critical

Parameters

Description [Int]

Recommended Action

In the Real-Time Monitoring Tool, check the CallsActive counter in the Cisco CallManager object for an unusually high number of calls. Internal mechanisms will attempt to correct this condition. If this alarm continues to occur, collect existing SDL and CCM trace files and check to be sure that CM Services trace collection in Cisco Unified CM Serviceability is set to Detailed level.

MGCPGatewayLostComm

The MGCP gateway is no longer in communication with Cisco Unified Communications Manager (Cisco Unified CM). This could occur because Cisco Unified CM receives an MGCP unregister signal from the gateway such as RSIP graceful/forced; Cisco Unified CM doesn't receive the MGCP KeepAlive signal from the gateway; the MGCP gateway doesn't response to an MGCP command sent by Cisco Unified CM three times; a speed and duplex mismatch exists on the Ethernet port between Cisco Unified CM and the MGCP gateway; the gateway has reset.

Facility/Sub-Facility

CCM_CALLMANAGER-CALLMANAGER
Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity
Critical (2)

Parameters
Device Name [String]

Recommended Action
Reset the MGCP gateway in an attempt to restore communication with Cisco Unified CM; check the speed and duplex settings on the Ethernet port. In the case of an unwanted reset of the gateway which caused communication to be lost, take precautions to ensure that no unauthorized personnel resets the gateway from Cisco Unified CM Administration or via the gateway terminal.

Critical

Recommended Action

If this alarm occurs at the same general day or time, or if it occurs with increasing frequency, collect all system performance data in Real-Time Monitoring Tool as well as all trace information for the 30 minutes prior to the time that this alarm occurred and contact TAC.

Error-level alarms

The error-level alarm is 3 and you should investigate important devices or subsystems and determine if immediate action is needed. Errors that do not necessarily impact the ability of the service to continue to function and do not create a system outage. More related to device or subsystems.
An example would be a device or subsystem failing for an unexpected reason.

**ANNDeviceRecoveryCreateFailed**

ANN device recovery create failure. The ANN device recovery class create failed, possibly due to lack of memory. If the error code is non-zero it may help determine the cause of the error. The announcement device will not be available.

### Recommended Action

Restart the Cisco IP Voice Media Streaming App service or restart server.

**AwaitingResponseFromPDPTimeout**

Cisco Unified Communication Manager timed out waiting for the routing response from the policy decision point. Cisco Unified Communications Manager (Unified CM) did not receive a call routing response from
the policy decision point (PDP) within the time specified by the Cisco CallManager service parameter, Call Intercept Routing Request Timer, or on the Call Intercept Profile Configuration window in Cisco Unified CM Administration.

CallManager/CallManager

**Severity**
ERROR_ALARM

**Routing List**
SDL
SDI
Sys Log
Event Log

**Parameter(s)**
Policy Decision Point(String)

**Recommended Action**
Check whether the PDP is in service and working normally. Verify that the PDP is not overloaded; if it is, take appropriate action to reduce the load on the PDP by following some or all of these recommendations:

- Consider adding more PDPS and provisioning Unified CM with additional call intercept profiles and call intercept trigger points in the various configuration pages under the Call Routing menu in Cisco Unified CM Administration.

- Provision a pair of policy servers per call-intercept profile to enable load balancing.

OR

- Verify that the PDP server in your deployment meets or exceed the hardware requirements specified in the documentation for Cisco Enterprise Policy Manager (CEPM) or the third-party PDP solution you have deployed. If necessary, increase the value in the Cisco CallManager service parameter, Call Intercept Routing Request Timer or the value in the Call Intercept Profile for this PDP.

**BadCDRFileFound**

Bad CDR or CMR flat file found during CDR Load to CAR database. The file could be corrupted. However, CAR loader is able to skip the bad records and load the good ones to CAR database. The name of the service generating this alarm is CAR Loader (DailyCdrLoad) job. Part of Cisco CAR Scheduler service.

**Recommended Action**
See application logs for details.

### CARSchedulerJobError

CAR scheduled job failed. A normal CAR scheduled job failed such as the pre-generated Daily/Weekly/Monthly/ Monthly-Bill reports jobs. The particular CAR scheduler job that fails cannot be run properly. This does not cause any significant impact on CAR functions. For pre-generated CAR report, this would result failure to run on a particular report, which leads to missing of CAR report.

CallManager/CAR

Severity

Error (3)

Parameters

Job Name(String)
Job Failure Cause(String)
Job Failure Detail(String)

Recommended Action

1. Check the status of Cisco CAR Scheduler service.
2. Check the Event Log from CAR page.
3. Check the contents in tbl_system_preferences table.
4. Check the number of records in tbl_billing_data, tbl_billing_error, and tbl_error_id_map tables.
5. Check if the scheduled job configuration is correct from CAR page.
6. Collect and check the CAR Scheduler traces for more details.

CARSchedulerJobFailed

Critical CAR scheduled job failed. The jobs are PopulateSchedules, DailyCdrLoad, TaskMonitor, or DatabaseMaintenance. The particular CAR scheduler job that failed cannot be run properly. This can cause significant impact on CAR functions.

- If PopulateSchedules job fails, CAR scheduler cannot schedule jobs to run for the day; this would result some/all of CAR scheduler jobs cannot start.
- If DailyCdrLoad job fails, CAR loader would not be able to load CDR/CMR records from CDR/CMR flat files into CAR database; this would result records found upon running CAR reports, and causes accumulation of CDR/CMR flat files unprocessed.
- If TaskMonitor job fails, CAR scheduler will not be able to perform the daily DB IDS memory clean up task; this would result higher DB shared memory usage.
- If DatabaseMaintenance job fails, CAR scheduler will not be able to perform the daily optimized database maintenance Update statistics procedures; this would result CAR database not optimized for its operations.

Name of the service generating this alarm is CAR Scheduler service.

### CCDIPReachableTimeOut

CCD Requesting Service IP Reachable Duration times out.

The CCD requesting service detected that it can no longer reach the learned patterns through IP. All learned patterns from this forward will be marked as unreachable (via IP) and to allow calls to learned patterns to
continue to be routed until IP becomes reachable again, all calls to learned patterns will be routed through the PSTN. Calls can be routed through the PSTN for a certain period of time before PSTN failover times out.

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
ERROR

Routing List
SDL
SDI
Sys Log
Event Log

Recommended Action
Check IP connectivity and resolve any TCP or IP problems in the network.

CCDPSTNFailOverDurationTimeOut

The internal limit on PSTN failover has expired.
When learned patterns are not reachable through IP, Unified CM routes calls through the PSTN instead. Calls can be routed through PSTN for an internally-controlled duration. When this alarm occurs, the PSTN failover duration has expired and calls to learned patterns cannot be routed. All learned patterns will be purged from Unified CM.

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
ERROR

Routing List
SDL
SDI

ConflictingDataIE

A call has been rejected because the incoming PRI/BRI Setup message had an invalid IE.
A call has been rejected because an incoming PRI/BRI Setup message contained an invalid Coding Standard value in the Bearer Capability information element (IE). Unified CM only accepts PRI/BRI Setup messages with Coding Standard values of 0 or 1. When an invalid IE is received, Unified CM rejects the call setup and issues this alarm.

ConnectionFailureToPDP

A connection request from Unified CM to the policy decision point (PDP) failed. The failure may have been a result of the following conditions:

- Network error causing limited or no connectivity between Unified CM and the PDP
- Authentication errors when Unified CM established an HTTPS connection to the PDP
- PDP was not in service.

Data Collector

Parameters
Policy Decision Point(String)
The cause of the connection failure(String)

Recommended Action
Verify the network connectivity between Unified CM and the PDP by pinging the policy server host from Cisco Unified OS Administration and take steps to establish connectivity if it has been lost. If the connection failure is due to an authentication problem, verify that the valid certificate of the PDP has been imported to Cisco Unified OS Administration and certificates from every node in the Unified CM cluster have been imported to every node in the PDP. Also, check whether the PDP service is active.

CNFFBuffWriteToFileopenfailed
Failed to create Config File on disk or update existing Config File on disk. This may happen if disk is full or the file is in use.

<table>

System/TFTP
Severity
Error

Parameters
FileName [String]

Recommended Action
Using RTMT, check the disk utilization and correct any issue discovered. If you do not discover a disk space issue, try restarting the TFTP service from Cisco Unified Serviceability (Tools > Control Center - Feature Services). Stopping and restarting the TFTP service is useful because the Config File that the TFTP service is trying to save might be an existing file that is in use. If you still get this error, go to Cisco Unified Serviceability and enable Detailed level traces in the Trace Configuration window for the TFTP service and contact the Cisco Technical Assistance Center (TAC).

CNFFBuffWriteToFilefwritefailed

Failed to save Config File to disk. This may happen if disk is full or the file is in use.

DeviceTypeMismatch

Device type mismatch between the information contained in the device TFTP config file and what is configured in the database for that device.

The device type indicated in the device configuration file does not match the database configuration. This could indicate that a change was made in the database configuration that failed to get updated at the device itself.

Severity
Error

Parameters
Database device type [Enum]Device type. [Enum]Name of device. [String]

Recommended Action
Check the Unified CM Database Status report in Cisco Unified Reporting to verify that database replication is working. You can also go to Real-Time Reporting Tool (RTMT) and check the Replication Status in the
Database Summary page. If status shows 2, then replication is working. Restart the phone to download a new configuration file from TFTP. Also, refer to the reason code definitions for additional recommended actions.

Parameter(s)
Name of Device(String)

Recommended Action
Investigate configuration for identified device.

DeviceCloseMaxEventsExceeded

The TCP socket for the SCCP device has been closed due to excessive events in a 5-second period. Under normal conditions, the device will reregister automatically.

The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device. Events can be phone calls, KeepAlive messages, or excessive SCCP or non-SCCP messages. The maximum number of allowed events is controlled by the Cisco CallManager service parameter, Max Events Allowed. When an individual device exceeds the number configured in that service parameter, Unified CM closes the TCP connection to the device; automatic reregistration generally follows. This action is an attempt to stop malicious attacks on Unified CM or to ward off excessive CPU usage.

Facility/Sub-Facility
CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
Error (3)
Parameters
Total Events Received [UInt] IP Address [String] TCP Handle [String] Max Events Allowed [UInt] Number Of Skinny Device Throttled [UInt]

Recommended Action
Check the CCM trace data for the indicated SCCP device to determine the reason for the high number of events. Confirm that the value configured in the Cisco CallManager service parameter, Max Events Allowed, is a suitable number for your deployment.

DeviceInitTimeout
Device initialization timeout occurred. This alarm does not occur under normal working conditions; it will only occur if a device fails to respond to an initialize request.

Check if local location exists and is accessible.

**DuplicateLearnedPattern**

This alarm occurs when CCD requesting service received a duplicate Hosted DN.

The Call Control Discovery (CCD) requesting service received the same hosted DN from multiple call control entities such as Unified CM Express or another Unified CM cluster. The Cisco CallManager service parameter, Issue Alarm for Duplicate Learned Patterns, controls whether this alarm gets issued.

*Cisco Unified Serviceability Alarm Definition Catalog*

**Severity**
ERROR

**Routing List**

SDL
SDI
Sys Log
Event Log

**Parameter(s)**
Client Handle(String)
Recommended Action

In RTMT, check the Pattern Report (CallManager > Report > Learned Pattern) and look for the duplicate pattern identified in this alarm. Learned patterns must be unique. Determine which call control entity (such as Unified CM or Unified CM Express) needs to be changed so that there is no duplicate pattern. Refer to the call control entity's configuration guide (help text) to learn how to update a hosted DN pattern. In Unified CM, to change the Hosted DN Pattern go to Cisco Unified CM Administration to update the Hosted DN Pattern configuration (Call Routing > Call Control Discovery > Hosted DN Patterns).

EMAppInitializationFailed

Recommended Action
Action See application logs for error. Default location for the logs are at /var/log/active/tomcat/logs/em/log4j/

EMCCFailedInLocalCluster

EMCC login failure occurred due to one of the following conditions:

• Devices are incompatible with EMCC.
• Unable to retrieve remote cluster information.
• EMCC is restricted by the local cluster.
• Untrusted certificate received from the remote end while trying to establish a connection

Reason Codes:
• 31—User is not enabled for EMCC
• 211/38—EMCC or PSTN is not activated in InterClusterServiceProfile page
• 23—User does not exist in the end user table
• 35—No remote cluster entry is present for the home cluster

Event Log
Alert Manager

Parameters
Device Name(String)
Login Date/Time(String)
Login UserID(String)
Reason(String)

Recommended Action
Perform the following:

1 Validate if the device model supports EMCC.

2 Ensure that every remote cluster added for EMCC has valid hostname/IP address for EM and PSTN access in the Remote Cluster administration window (From Unified CM Administration window, go to System > EMCC > Remote Cluster).

3 Ensure that the entries are enabled.

4 Ensure that a bundle of all Tomcat certificates (PKCS12) has been imported into the local tomcat-trust keystore (From the OS Administration window, go to Security > Certificate Management and check the certificates in tomcat-trust).
EMServiceConnectionError

EM Service not reachable. EM Service might be down in one or more nodes in the cluster.

Parameter(s)
Servlet Name(String)

Recommended Action
Check if Cisco Extension Mobility service is running on all nodes of the cluster where the service is activated.

EndPointTransientConnection

End point transient connection attempt.
A connection was established and immediately dropped before completing registration. Incomplete registration
may indicate that a device is rehoming in the middle of registration. The alarm could also indicate a device
misconfiguration, database error, or an illegal/unknown device trying to attempt a connection. Network
connectivity problems can affect device registration, or the restoration of a primary Unified CM may interrupt
registration.

**Parameter(s)**
- Device IP address(String)
- Device name(String)
- Device MAC address(String)
- Protocol(String)
- Device type(Enum)
- Reason Code(Enum)
- Connecting Port(UInt)
- Registering SIP User(String)
- IPv6Address(String)
- IPAddressAttributes(Enum)
- IPv6AddressAttributes(Enum)

**Recommended Action**
Investigate any network connectivity problems in the system. It's possible that you have reached the maximum number of devices; the Cisco Unified Communications Manager service parameter, Maximum Number of Registered Devices, controls the number of devices allowed in the system. Taking licensing, system hardware and other related concerns into consideration, you could increase the value of the service parameter. Also, refer to the reason code definitions for recommended actions. No action is required if this event was issued as a result of a normal device rehome.

**Reason Code Enum definitions for EndPointTransientConnection**

<table>
<thead>
<tr>
<th>Value</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unknown—(SCCP only) The device failed to register for an unknown reason. If this persists, collect SDL/SDI traces with “Enable SCCP Keep Alive Trace” enabled and contact TAC.</td>
</tr>
<tr>
<td>2</td>
<td>NoEntryInDatabase—(MGCP only) The device is not configured in the Cisco Unified CM database and auto-registration is either not supported for the device type or is not enabled. To correct this problem, configure this device via Cisco Unified CM Administration.</td>
</tr>
<tr>
<td>3</td>
<td>DatabaseConfigurationError—The device is not configured in the Cisco Unified CM database and auto-registration is either not supported for the device type or is not enabled. To correct this problem, configure this device via Cisco Unified CM Administration.</td>
</tr>
<tr>
<td>4</td>
<td>DeviceNameUnresolveable—For SIP third-party devices, this reason code means that Cisco Unified CM could not determine the name of the device from the Authorization header in the REGISTER message. The device did not provide an Authorization header after Cisco Unified CM challenged with a 401 Unauthorized message. Verify the device is configured with digest credentials and is able to respond to 401 challenges with an Authorization header. If this is a Cisco IP phone, the configuration may be out-of-sync. First go to the Cisco Unified Reporting web page, generate a Unified CM Database Status report, and verify “all servers have a good replication status”. If DB replications looks good, reset the phone. If that still doesn't fix the problem, restart the TFTP and the Cisco CallManager services. For all other devices, this reason code means that DNS lookup failed. Verify the DNS server configured via the OS Administration CLI is correct and that the DNS name used by the device is configured in the DNS server.</td>
</tr>
<tr>
<td>5</td>
<td>maxDevRegExceeded—Maximum number of device registrations have been reached.</td>
</tr>
<tr>
<td>6</td>
<td>ConnectivityError - The network connection between the device and Cisco Unified CM dropped before the device was fully registered. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops and packet corruption. It is also possible to get this error if the Cisco Unified CM node is experiencing high CPU usage. Verify the device is powered up and operating, verify network connectivity between the device and Cisco Unified CM, and verify the CPU utilization is in the safe range (this can be monitored using RTMT via CPU Pegging Alert).</td>
</tr>
<tr>
<td>Value</td>
<td>Definition</td>
</tr>
<tr>
<td>-------</td>
<td>------------</td>
</tr>
<tr>
<td>7</td>
<td>InitializationError—An internal error occurred within Cisco Unified CM while processing the device registration. It is recommended to restart the Cisco CallManager service. If this occurs repeatedly, collect SDL/SDI detailed traces with “Enable SIP Keep Alive (REGISTER Refresh) Trace” and “Enable SCCP Keep Alive Trace” under Cisco CallManager services turned on and contact TAC.</td>
</tr>
<tr>
<td>8</td>
<td>DeviceInitiatedReset—Indicates that the error was due to device initiated reset.</td>
</tr>
<tr>
<td>9</td>
<td>CallManagerReset—Indicates that the error was due to call manager reset.</td>
</tr>
<tr>
<td>10</td>
<td>AuthenticationError—The device failed either TLS or SIP digest security authentication. If the device is a SIP phone and is enabled for digest authentication (on the System &gt; Security Profile &gt; Phone Security Profile, check if “Enable Digest Authentication” checkbox is checked), verify the “Digest Credentials” in the End User config page are configured. Also, check the phone config page to see if the phone is associated with the specified end user in the Digest User drop box. If the device is a third-party SIP device, verify the digest credentials configured on the phone match the “Digest Credentials” configured in the End User page.</td>
</tr>
<tr>
<td>11</td>
<td>InvalidX509NameInCertificate—Configured “X.509 Subject Name” doesn't match what is in the certificate from the device. Check the Security Profile of the indicated device and verify the “Device Security Mode” is either “Authenticated” or “Encrypted”. Verify the “X.509 Subject Name” field has the right content. It should match the Subject Name in the certificate from the peer.</td>
</tr>
<tr>
<td>12</td>
<td>InvalidTLSCipher—Unsupported cipher algorithm used by the device; Cisco Unified CM only supports AES_128_SHA cipher algorithm. Recommended action is for the device to regenerate its certificate with the AES_128_SHA cipher algorithm.</td>
</tr>
<tr>
<td>13</td>
<td>DirectoryNumberMismatch—Indicates mismatch between the directory number that the SIP device is trying to register with and the directory number configured in the Cisco Unified CM for the SIP device.</td>
</tr>
<tr>
<td>14</td>
<td>MalformedRegisterMsg—(SIP only) A SIP REGISTER message could not be processed because of an illegal format. Possible causes include a missing Call-ID header, a missing AoR in the To header, and an expires value too small. Verify the REGISTER message does not suffer from any of these ills.</td>
</tr>
<tr>
<td>Value</td>
<td>Definition</td>
</tr>
<tr>
<td>-------</td>
<td>------------</td>
</tr>
</tbody>
</table>
| 15    | ProtocolMismatch—The protocol of the device (SIP or SCCP) does not match the configured protocol in Cisco Unified CM.  
Recommended actions:
1. Verify the device is configured with the desired protocol.  
2. Verify the firmware load ID on the Device Defaults page is correct and actually exists on the TFTP server.  
3. If there is a firmware load ID configured on the device page, verify it is correct and exists on the TFTP server (On Cisco Unified OS Administration page, Software Upgrades > TFTP File Management, look for the file name as specified by load ID).  
4. Restart the TFTP and Cisco CallManager services. Use the Cisco Unified OS Administration TFTP File Management page to verify the configured firmware loads exist. |
| 16    | DeviceNotActive—The device has not been activated. |
| 17    | AuthenticatedDeviceAlreadyExists—A device with the same name is already registered. If this occurs repeatedly, collect SDL/SDI detailed traces with “Enable SIP Keep Alive (REGISTER Refresh) Trace” and “Enable SCCP Keep Alive Trace” under Cisco CallManager services turned on and contact TAC. There may be an attempt by unauthorized devices to register. |
| 18    | ObsoleteProtocolVersion—(SCCP only) A SCCP device registered with an obsolete protocol version. Power cycle the phone. Verify that the TFTP service is activated. Verify that the TFTP server is reachable from the device. If there is a firmware load ID configured on the Phone Config page, verify that the firmware load ID exists on the TFTP server (On Cisco Unified OS Administration page, Software Upgrades > TFTP File Management, look for the file name as specified by load ID). |
| 23    | DatabaseTimeout—Cisco Unified CM requested device configuration data from the database but did not receive a response within 10 minutes. |
| 25    | RegistrationSequenceError—(SCCP only) A device requested configuration information from the Cisco Unified CM at an unexpected time. The Cisco Unified CM had not yet obtained the requested information. |
| 26    | InvalidCapabilities— (SCCP only) Cisco Unified CM detected an error in the media capabilities reported by the device during registration. The device reported the capabilities in the StationCapabilitiesRes message. |
| 27    | CapabilityResponseTimeout— (SCCP only) Cisco Unified CM timed out while waiting for the device to respond to a request to report its media capabilities. |
SecurityMismatch—Cisco Unified CM detected a mismatch in the security settings of
the device and/or the Unified CM. The following mismatches are detected:

1. The device established a secure connection, yet reported that it does not have the
ability to do authenticated signaling.
2. The device did not establish a secure connection, but the security mode configured
for the device indicates that it should have done so.
3. The device established a secure connection, but the security mode configured for the
device indicates that it should not have done so.

AutoRegisterDBError—(SCCP only) Auto-registration of a device failed for one of the
following reasons:
1. Auto-registration is not allowed for the device type.
2. An error occurred in the auto-registration stored procedure.

DBAccessError—(SCCP only) Auto-registration of a device failed because of an error
that occurred while building the station registration profile.

AutoRegisterDBConfigTimeout—(SCCP only) Cisco Unified CM timed out during
auto-registration of a device. The registration profile of the device did not get inserted
into the database in time.

DeviceTypeMismatch—(SCCP only) The device type reported by the device does not
match the device type configured on the Cisco Unified CM.

AddressingModeMismatch—(SCCP only) Cisco Unified CM detected an error related
to the addressing mode configured for the device. One of the following errors was detected:
1. The device is configured to use only IPv4 addressing, but did not specify an IPv4
   address.
2. The device is configured to use only IPv6 addressing, but did not specify an IPv6
   address.

IPAddressAttributes Enum definitions for EndPointTransientConnection

<table>

<td>Administrative and signal—The device has indicated that this IPv6 address is used for administrative communication (web interface) and control signaling</td>
</tr>
</tbody>
</table>

### EndPointUnregistered

An endpoint that has previously registered with Cisco Unified Communications Manager has unregistered. In cases of normal unregistration with reason code “CallManagerReset”, “CallManagerRestart”, “DeviceInitiatedReset”, “EMLoginLogout”, or “EMCCLoginLogout”, the severity of this alarm is lowered to INFORMATIONAL. An endpoint can unregister for many reasons, both intentional, such as manually resetting the device after a configuration change, or unintentional, such as loss of network connectivity. Other causes for this alarm could include a phone being registered to a secondary node and then the primary node come back online, causing the phone to rehome to the primary Cisco Unified CM node or lack of a KeepAlive being returned from the Cisco Unified CM node to which this endpoint was registered. Unregistration also occurs if Cisco Unified CM receives a duplicate registration request for this same device.

**Recommended Action**
Actions to take vary depending on the reason specified for the endpoint unregistration. If the reason is ConfigurationMismatch, go to the Device Configuration page in Cisco Unified CM Administration, make a change to the Description field for this device, click Save, then reset the device. In the case of a network connectivity or loss of KeepAlives problem, use network diagnostic tools and the Cisco Unified CM Reporting tool to fix any reported network or Unified CM system errors. In the case of an endpoint rehomming to the primary Unified CM node, watch for a successful registration of the device on the primary node. In the case of a duplicate registration request, it may be a non-malicious occurrence due to timing of an endpoint registering and unregistering; if duplicate registration requests continue or if the same endpoint has different IP addresses, confirm the IP address on the physical device itself by checking the settings on the device (settings button). If unregistration of this device was expected, no action is required. Also, refer to the reason code descriptions for recommended actions.

#### Unknown
The device has unregistered for an unknown reason. If the device does not reregister within 5 minutes, verify it is powered-up and verify network connectivity between the device and Cisco Unified CM.

#### NoEntryInDatabase
Device not configured properly in the Cisco Unified CM database.

#### DatabaseConfigurationError
Device configuration error in the Cisco Unified CM database.

#### DeviceNameUnresolveable
The Cisco Unified CM is unable to resolve the device name to an IP Address internally.

#### MaxDevRegExceeded
Maximum number of device registrations have been reached.

#### ConnectivityError
Network communication between the device and Cisco Unified CM has been interrupted. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops and packet corruption. It is also possible to get this error if the Cisco Unified CM node is experiencing high CPU usage. Verify the device is powered up and operating, verify network connectivity between the device and Cisco Unified CM, and verify the CPU utilization is in the safe range (this can be monitored using RTMT via CPU Pegging Alert).

#### InitializationError
Indicates that an error occurred when the Cisco Unified CM tries to initialize the device.

#### DeviceInitiatedReset
The device has initiated a reset, possibly due to a power cycle or internal error. No action required; the device will reregister automatically.

#### CallManagerReset
A device reset was initiated from Cisco Unified CM Administration, either due to an explicit command from an administrator, or due to internal errors encountered. No action necessary, the device will reregister automatically.
<table>
<thead>
<tr>
<th>Value</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>DeviceUnregistered—The device has explicitly unregistered. Possible causes include a change in the IP address or port of the device. No action is necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>11</td>
<td>MalformedRegisterMsg—(SIP only) A SIP REGISTER message could not be processed because of an illegal format. Possible causes include a missing Call-ID header, a missing AoR in the To header, and an expires value too small. Verify the REGISTER message does not suffer from any of these ills.</td>
</tr>
<tr>
<td>12</td>
<td>SCCPDeviceThrottling—(SCCP only) The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device. Events can be phone calls, KeepAlive messages, or excessive SCCP or non-SCCP messages. The maximum number of allowed events is controlled by the Cisco CallManager service parameter, Max Events Allowed. When an individual device exceeds the number configured in that service parameter, Unified CM closes the TCP connection to the device; automatic reregistration generally follows. This action is an attempt to stop malicious attacks on Unified CM or to ward off excessive CPU usage. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>13</td>
<td>KeepAliveTimeout—A KeepAlive message was not received. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops and packet corruption. It is also possible to get this error if the Unified CM node is experiencing high CPU usage. Verify the device is powered up and operating, verify network connectivity between the device and Unified CM, and verify the CPU utilization is in the safe range (this can be monitored using RTMT via CPU Pegging Alert). No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>14</td>
<td>ConfigurationMismatch—(SIP only) The configuration on the device does not match the configuration in Unified CM. This can be caused by database replication errors or other internal Unified CM communication errors. First go to the Cisco Unified Reporting web page, generate a Unified CM Database Status report, and verify &quot;all servers have a good replication status&quot;. If this device continues to unregister with this reason code, go to the Cisco Unified CMAadmin Device web page for the device and click Save. This allows a change notify to be generated to the Unified CM and TFTP services and rebuild a new config file. If the problem still persists, restart the TFTP service and Unified CM service.</td>
</tr>
<tr>
<td>15</td>
<td>CallManagerRestart—A device restart was initiated from Cisco Unified CM, either due to an explicit command from an administrator, or due to a configuration change such as adding, deleting or changing a DN associated with the device. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>16</td>
<td>DuplicateRegistration—Cisco Unified CM detected that the device attempted to register to two nodes at the same time. Cisco Unified CM initiated a restart to the phone to force it to rehome to a single node. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>17</td>
<td>CallManagerApplyConfig—An ApplyConfig command was invoked from Unified CM Administration resulting in an unregistration. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>Value</td>
<td>Definition</td>
</tr>
<tr>
<td>-------</td>
<td>------------</td>
</tr>
<tr>
<td>18</td>
<td>DeviceNoResponse—The device did not respond to a reset or restart notification, so it is being forcefully reset. If the device does not reregister within 5 minutes, confirm it is powered-up and confirm network connectivity between the device and Cisco Unified CM.</td>
</tr>
<tr>
<td>19</td>
<td>EMLoginLogout — The device has been unregistered due to an Extension Mobility login or logout.</td>
</tr>
<tr>
<td>20</td>
<td>EMCCLoginLogout—The device has been unregistered due to an Extension Mobility Cross Cluster login or logout.</td>
</tr>
<tr>
<td>21</td>
<td>PowerSavePlus—The device powered off as a result of the Power Save Plus feature that is enabled for this device. When the device powers off, it remains unregistered from Unified CM until the Phone On Time defined in the Product Specific Configuration for this device.</td>
</tr>
<tr>
<td>22</td>
<td>CallManagerForcedRestart—(SIP Only) The device did not respond to an Apply Config request and as a result, Unified CM sent a restart request to the device. The device may be offline due to a power outage or network problem. Confirm that the device is powered-up and that network connectivity exists between the device and Unified CM.</td>
</tr>
<tr>
<td>23</td>
<td>SourceIPAddrChanged—(SIP Only) The device has been unregistered because the IP address in the Contact header of the REGISTER message has changed. The device will be automatically re-registered. No action is necessary.</td>
</tr>
<tr>
<td>24</td>
<td>SourcePortChanged—(SIP Only) The device has been unregistered because the port number in the Contact header of the REGISTER message has changed. The device will be automatically re-registered. No action is necessary.</td>
</tr>
<tr>
<td>25</td>
<td>RegistrationSequenceError—(SCCP only) A device requested configuration information from the Unified CM at an unexpected time. The Unified CM no longer had the requested information in memory.</td>
</tr>
<tr>
<td>26</td>
<td>InvalidCapabilities—(SCCP only) Unified CM detected an error in the updated media capabilities reported by the device. The device reported the capabilities in one of the StationUpdateCapabilities message variants.</td>
</tr>
<tr>
<td>28</td>
<td>FallbackInitiated—The device has initiated a fallback and will automatically reregister to a higher-priority Unified CM. No action is necessary.</td>
</tr>
<tr>
<td>29</td>
<td>DeviceSwitch—A second instance of an endpoint with the same device name has registered and assumed control. No action is necessary.</td>

Recommended Action
Rebooting the box will clear this situation. Alternatively, dbnotify trace could be analyzed to find the client that was removed and that service could be restarted in Cisco Unified Serviceability.

ErrorParsingDirectiveFromPDP

Cisco Unified Communications Manager (Unified CM) failed to parse the call routing directive or the diversion destination in the call routing response from the policy decision point (PDP).

A routing response was received but Cisco Unified Communications Manager (Unified CM) failed to parse the mandatory elements in the response. This means that a call routing directive or the call diversion destination could not be parsed correctly, or that the call routing directive was not recognized. The error may due to a syntax error or because the call routing directive is missing or the call diversion destination is missing in the call routing response.

**Severity**
Error (3)

**Recommended Action**
Report this error to the administrator.

**FailureResponseFromPDP**

The policy decision point (PDP) returned a 4xx (client) or 5xx (server) status code in the HTTP response. Cisco Unified Communications Manager (Unified CM) received a 4xx or 5xx response from the policy decision point (PDP). A 4xx response indicates errors in the call routing request from Unified CM, for example: a 400 response indicates the call routing request could not be understood by the PDP; a 404 indicates that the PDP did not find a matching request URI. A 5xx error indicates a PDP server error, for example: a 500 response indicates a PDP internal error; A 501 response indicates that the PDP does not support the functionality to generate a call routing response; a 503 indicates that the PDP is busy and temporarily cannot generate a response; a 505 indicates that the HTTP version number included in the call routing request from Unified CM is not supported. Other such errors may be responsible; please refer to generally available guidelines on HTTP or check the RFC 2616 for detailed explanations about HTTP Status Code definitions.

CallManager/CallManager
Severity
ERROR

Routing List
SDL
SDI
Sys Log
Event Log

Parameter(s)
Policy Decision Point(String)
The status code and reason phrase for the failure(String)

Recommended Action
If a 4xx response caused the alarm, verify that the PDP has been accurately configured for the functionality and call routing that you expect it to perform. If a 500 response causes the alarm, check whether the PDP service is active and check the PDP server's log files for any errors. If a 503 causes the alarm, the PDP may be overloaded by requests. Take appropriate action to reduce the load on the PDP by following some or all of these recommendations: 1) consider adding more PDPs and provisioning Unified CM with additional call intercept profiles and call intercept trigger points in the various configuration pages under the Call Routing menu in Cisco Unified CM Administration; 2) provision a pair of policy servers per call-intercept profile to enable load balancing; or 3) verify that the PDP server in your deployment meets or exceed the hardware requirements specified in the documentation for Cisco Enterprise Policy Manager (CEPM) or the third-party PDP solution you have deployed. If a 505 response causes the alarm, check to be sure that the PDP supports HTTP version 1.1.

FailedToReadConfig
Service Manager failed to read configuration file.

**Parameter(s)**

IP address(String)
Port number(UInt)

**ICTCallThrottlingStart**

Cisco CallManager stops handling calls for the indicated H.323 device due to heavy traffic or a route loop over the H.323 trunk.

Cisco Unified Communications Manager has detected a route loop over the H.323 trunk indicated in this alarm. As a result, Unified CM has temporarily stopped accepting calls for the indicated H.323 trunk. It's also possible that a high volume of calls are occurring over the intercluster trunk, which has triggered throttling.

**Facility/Sub-Facility**

CCM_CALLMANAGER-CALLMANAGER
Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
Error (3)

Parameters

Enum Definitions for DeviceType
125—TRUNK

Recommended Action
In Real-Time Monitoring Tool, check the CallsActive and CallsInProgress counters for unusual activity on the indicated H.323 trunk. If the CallsActive count is significantly higher than usual, a traffic load issue may be occurring where the demand to send calls over the trunk is greater than the trunk's capacity. Monitor the situation and collect existing trace files. If the ICT Call Throttling End alarm is not issued in a reasonable amount of time as deemed by your organization, contact TAC and supply the trace information you have collected. For a routing loop condition, the CallsInProgress counter will be significantly higher than usual. By examining trace files and CDR data for calls that occurred over the indicated trunk, you may be able to detect a translation pattern, route list or other routing mechanism that is part of the loop. Update the routing mechanism that resulted in the loop (generally the same number is configured on both near end and far end devices) and then reset the affected route list in an attempt to clear the route loop and if that fails, reset the affected trunk.

IDSEngineCritical
This alarm does not compromise data or prevent the use of the system but need to be monitored by the Administrator.

InsufficientFallbackIdentifiers

Cannot allocate fallback identifier.
This alarm is generated when Unified CM is processing a IME call, and is attempting to allocate a PSTN fallback DID and a DTMF digit sequence to associate with this call. However, there are too many IME calls currently in progress which are utilizing this same fallback DID, and as a result, there are no more DTMF digit sequences which could be allocated to this call. As such, this call will proceed, however mid-call fallback will not be possible for this call.

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
ERROR

Routing List
SDL
SDI
Sys Log
Event Log
Alert Manager

**Parameter(s)**
- Fallback profile name(String)
- Fallback E.164 number(UInt)
- Current number of DTMF digits(UInt)
- E.164 called party number(String)

**Recommended Action**
Your first course of action should be to identify the fallback profile associated with this call. Its name will be present in the alarm. Check that profile from the admin interface, and examine the current setting for “Fallback Number of Correlation DTMF Digits”. Increase that value by one, and check if that eliminates these alarms. In general, this parameter should be large enough such that the number of simultaneous IME calls made to enrolled numbers associated with that profile is always substantially less than 10 raised to the power of this number. “Substantially” should be at least a factor of ten. For example, if you always have less than 10,000 simultaneous IME calls for the patterns associated with this fallback profile, setting this value to 5 (10 to the power of 5 is 100,000) will give you plenty of headroom and you will not see this alarm.

However, increasing this value also results in a small increase in the amount of time it takes to perform the fallback. As such, it should not be set arbitrarily large; it should be set just large enough to keep clear of this alarm. Another alternative to increasing this parameter is to add another fallback profile with a different fallback DID, and associate that fallback profile with a smaller number of enrolled DID patterns. This will allow you to get by with a smaller number of digits.

**InvalidIPNetPattern**

An invalid IP address is configured in one or more SIP route patterns in Cisco Unified CM Administration.

**Facility/Sub-Facility**

**Cisco Unified Serviceability Alarm Definition Catalog**
CallManager/CallManager

**Severity**
Error (3)

**Parameters**
- Description(String)
- IPAddress(String)
- DeviceName(String)
**Recommended Action**
In Cisco Unified CM Administration, verify that the route pattern associated with the device that is identified in this alarm has an accurate and working IP address. You can learn more how to ensure that the IP address is valid by reviewing RFC 2373.

**InvalidPortHandle**

The handle for the opened serial port is invalid.
CMI cannot read/write to the serial port because the serial port returned an invalid handle value to CMI. The serial port may have returned an invalid handle because the system did not properly detect the USB cable.

**Severity**

Error (3)

**Recommended Action**

Verify that the ANN Call Count service parameter is correct. A server restart may be needed to recover resources.

**LostConnectionToSAFForwarder**

Connection to the SAF Forwarder has been lost.

A TCP connection failure caused the connection between the SAF Forwarder and Unified CM to be lost. When the TCP connection is restored, Unified CM attempts to connect to the SAF Forwarder automatically. If IP connectivity is unreachable for longer than the duration of the Cisco CallManager service parameter CCD Learned Pattern IP Reachable Duration, calls to learned patterns will be routed through the PSTN instead. Calls through the PSTN to learned patterns will be maintained for a certain period of time before the PSTN failover times out.

**Cisco Unified Serviceability Alarm Catalog**

CallManager/CallManager

**Recommended Action**

Verify that the Enterprise parameter setting for User Locale is configured using the CCM Admin web page. Restart the Cisco IP Voice Media Streaming App service.

Recommended Action

1. Ensure that “tomcat-trust” keystore on each CCM node contains the tomcat certificates for every other node within a cluster (Logon to OS Administration Page > Security > Certificate Management > Check the certificates in tomcat-trust).

2. If EMCC is enabled, then ensure that a bundle of all tomcat certificates (PKCS12) has been imported into the local tomcat-trust keystore (Logon to OS Administration Page > Security > Certificate Management > Look for certificates in tomcat-trust).

NumDevRegExceeded

The allowed number of registered devices was exceeded.

Facility/Sub-Facility
CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
Error (3)
Parameters

Maximum Devices [Int]

Recommended Action

If you did not expect to exceed the number of devices and you have auto-registration enabled, go to Device > Phones in Cisco Unified CM Administration and search for phones starting with “auto”. If you see any unexpected devices which may not belong in the system (such as intruder devices) locate that device using the IP address and remove it from the system. Or, if your licenses and system resources allow, increase the value in the Cisco CallManager service parameter, Maximum Number of Registered Devices.

PublishFailedOverQuota

Each IME server has a fixed quota on the total number of DIDs it can write into the IME distributed cache. When this alarm is generated, it means that, even though you should be under quota, due to an extremely unlikely statistical anomaly, the IME distributed cache rejected your publication, believing you were over quota. You should only see this alarm if you are near, but below, your quota. This error is likely to be persistent, so that the corresponding E.164 number from the alarm will not be published into the IME distributed cache. This means that you will not receive VoIP calls towards that number - they will remain over the PSTN.

History

<table>

<tbody>
<tr>
<td>8.0(1)</td>
<td>New Alarm for this release.</td>
</tr>
</tbody>
</table>

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

ERROR_ALARM

Recommended Action

The alarm will include the name of the IME server, and the current and target quota values. The first thing to check is to make sure that you have correctly provisioned the right set of DID prefixes on all of the Unified CM clusters sharing that same IME server on the same IME distributed cache. If that is correct, it means you have exceeded the capacity of your IME server, and you require another. Once you have another, you can now split your DID prefixes across two different IME client instances, each on a different IME server. That will alleviate the quota problem.

Recommended Action

Make sure that the cable connecting the USB0 port and voice messaging system is firmly connected.

RsvpNoMoreResourcesAvailable

RSVP Agent resource allocation failed.

The alarm occurs when allocation of an RSVP Agent fails for all the registered RSVP Agents (RSVP Agents are basically MTPs or transcoder devices which provide RSVP functionalities) belonging to the Media Resource Group List and Default List. Each RSVP Agent may fail for different reasons. Following are some of the reasons that could cause an RSVP Agent allocation to fail: available MTP/transcoders do not support RSVP functionality; a capability mismatch between the device endpoint and MTP/transcoder, codec mismatch between the endpoint and the MTP/transcoder; a lack of available bandwidth between the endpoint and the MTP/transcoder; or because the MTP/transcoder resources are already in use.

A capability mismatch may be due to the MTP/transcoder not supporting one or more of the required capabilities for the call such as Transfer Relay Point (which is needed for QoS or firewall traversal), RFC 2833 DTMF (which is necessary when one side of the call does not support RFC 2833 format for transmitting DTMF digits and the other side must receive the DTMF digits in RFC2833 format, resulting in conversion of the DTMF digits), RFC 2833 DTMF passthrough (in this case, the MTP or transcoder does not need to convert the DTMF digits from one format to another format but it needs to receive DTMF digits from one endpoint and transmit them to the other endpoint without performing any modifications), passthrough (where no codec conversion will occur, meaning the media device will receive media streams in any codec format and transmit them to the other side without performing any codec conversion), IPv4 to IPv6 conversion (when one side of the call supports only IPv4 and the other side of the call supports only IPv6 and so MTP needs to be inserted to perform the necessary conversion between IPv4 and IPv6 packets), or multimedia capability (if a call involving video
and/or data in addition to audio requires insertion of an MTP or transcoder then the MTP/transcoder which supports multimedia will be inserted).

</table>

**Facility/Sub-Facility**

CCM_CALLMANAGER-CALLMANAGER

**Cisco Unified Serviceability Alarm Definition Catalog**

CallManager/CallManager

**Severity**

Error (3)

**Parameter(s)**

Media Resource List Name(String)

**Recommended Action**

RSVP Agents are basically Cisco IOS MTPs or transcoder devices which provide RSVP functionalities. Check the user manual of the configured MTPs and transcoders to see whether they support RSVP functionality. If none of them support RSVP functionality either they need to be upgraded (if upgraded version support RSVP functionality) or additional MTP or transcoders need to be installed which support RSVP functionality. If the RSVP Agent (MTP or transcoder) allocation is failing due to a capability mismatch, it's possible that the media device does not support the requested capability (such as IPv4 to IPv6 conversion, passthrough) or the capability might not be configured in the device. Please check the user guide and documentation of the media device to make sure that device supports all the necessary capabilities.

Also, caution should be taken care if all the MTP or transcoders are configured with all the supported capabilities. There are certain capabilities (such as RFC 2833 DTMF or RFC 2833 DTMF passthrough or passthrough) which could be supported by most of the MTPs or transcoders and there may be certain capabilities (such as IPv4 to IPv6 conversion and vice versa or RSVP Agent functionality or Transfer Relay Point or multimedia capability) which can be supported by only by a single MTP or transcoder depending on the devices that you have.

For example, you may have end devices belonging to different locations and may need to reserve the bandwidth only between two locations; calls between other locations may not need to reserve the bandwidth. Now, suppose all the MTPs or transcoders are configured with all the supported capabilities and only one MTP/transcoder supports RSVP functionality; if this MTP/transcoder is configured with all the supported capabilities (which all the other MTPs or transcoders in the same MRGL or default MRGL also support) it may happen that this MTP can get allocated for Transfer Relay Point or RFC 2833 DTMF or RFC 2833 DTMF passthrough or passthrough instead. As a result, when a need arises to reserve the bandwidth (which other MTPs or transcoders in the same MRGL or default MRGL do not support), all the resources of this MTP/transcoder may be in use and the RSVP Agent allocation may fail.
To avoid this situation, set the priority of the media resources appropriately. This can be done only in the Media Resource Group List and not in the Default List of the media resources. In any Media Resource Group List all the Media Resource Groups have different priorities and during allocation the first Media Resource Group is checked for availability of the requested type of the media devices. The first Media Resource Group in the Media Resource Group List will have the highest priority, then the second one and so on. To check all the Media Resource Groups and their priority go the Media Resources and Media Resource Group List of Cisco Unified CM Administration page and click the appropriate Media Resource Group List and check the Selected Media Resource Groups; the priority decreases from top to bottom. Position the MTP or transcoder that you want to be selected for the basic functionalities in the higher priority Media Resource Groups whereas the ones with more rare functionality can be positioned in the Media Resource Groups with lower priority. RSVP Agent allocation may fail due to codec mismatch between the end point and the RSVP Agent or MTP/transcoder.

A solution may be to configure the MTP/transcoder with all the supported codecs (as specified in the user guide of the MTP/transcoder), but be aware that doing so might result in too much bandwidth being allocated for calls. You'll need to weigh different factors such as the total amount of available bandwidth, the average number of calls, approximate bandwidth use per call (not involving MTP/transcoder), and so on, and accordingly calculate the maximum bandwidth that can be allocated per call involving an MTP/transcoder and take that into consideration when configuring the supported codecs in the MTPs and transcoders. A good idea is to configure the media devices with all the supported codecs and set the region bandwidths to restrict too much bandwidth usage (refer to the Unified CM documentation for details on region and location settings).

Also, there may be codec mismatch between the endpoint and the MTP/transcoders after considering the region bandwidth between the MTP/transcoder and the endpoint. Increasing the region bandwidth may be a solution to the problem, but that decision should be made after careful consideration of the amount of bandwidth you're willing to allocate per call between the set of regions.

Another possible cause that an MTP/transcoder did not get allocated is because there was not enough available bandwidth for the call. This can happen if the MTP/transcoder and endpoint belong to different locations and the bandwidth that is set between the locations is already in use by other calls. Examine the bandwidth requirements in your deployment to determine whether bandwidth between the locations can be increased. However, note that increasing the bandwidth between these two locations means that you may need to reduce the bandwidth between other locations.

Refer to the System Guide, SRNDs, and related Unified CM documentation for more details. Be aware that reducing the bandwidth or removing the higher bandwidth codecs from configuration may result in poor voice quality during call. Consider increasing the total amount of network bandwidth. Finally, if RSVP Agent allocation fails due to MTP/transcoder not supporting RSVP functionality or capability mismatch or all the resources being in use, consider installing additional MTP or transcoder devices which support RSVP functionality.

---

<td>435</td>
<td><strong>INFO LEVEL</strong> SAF_MISSING_NONCE - A nonce (a random parameter generated when the message is sent) is missing from the message. The system will resend with a new nonce automatically. No action is required.</td>
</tr>
<tr>
<td>436</td>
<td>SAF_UNKNOWN_USERNAME - Unified CM sent the SAF Forwarder an Application User name that is not configured on the router or that does not match the router's configuration. Check the Application User Name on the router and in the Application User Configuration window in Cisco Unified CM Administration to be sure they match.</td>
</tr>
<tr>
<td>438</td>
<td><strong>INFO LEVEL</strong> SAF_STALE_NONCE - A nonce (a random parameter generated when the message is sent) has aged out (gone stale). The system will resend with a new nonce automatically. No action is required.</td>
</tr>
<tr>
<td>471</td>
<td><strong>INFO LEVEL</strong> SAF_BAD_CLIENT_HANDLE - SAF_BAD_CLIENT_HANDLE - Unified CM sent the SAF Forwarder a Register message (for KeepAlive purposes) or unregister message with the mandatory CLIENT_HANDLE value, but the SAF Forwarder did not recognize the client handle. Unified CM will attempt to reregister with the SAF Forwarder without a client handle. This alarm is for informational purposes only; no action is required.</td>
</tr>
<tr>
<td>472</td>
<td><strong>INFO LEVEL</strong> SAF_VERSION_NUMBER_TOO_LOW - Unified CM published a service (such as Hosted DN) whose version number is now lower than when it was previously published to the SAF Forwarder. The service is out of sync with the SAF Forwarder. Unified CM will republish the service in an attempt to resynch with the SAF Forwarder. This alarm is for informational purposes only; no action is required.</td>
</tr>
<tr>
<td>473</td>
<td><strong>INFO LEVEL</strong> SAF_UNKNOWN_SERVICE - Unified CM attempted to unpublish a service from the SAF network but the SAF Forwarder does not have a publish record for that service. This alarm is for informational purposes only; no action is required.</td>
</tr>
<tr>
<td>474</td>
<td><strong>INFO LEVEL</strong> SAF_UNREGISTERED - Unified CM attempted to publish or subscribe to the SAF Forwarder, but Unified CM is not registered with SAF Forwarder. Unified CM will automatically reregister with the SAF Forwarder before attempting to publish or subscribe. This alarm is for informational purposes only; no action is required.</td>
</tr>
<tr>
<td>475</td>
<td><strong>INFO LEVEL</strong> SAF_BAD_FILTER - Unified CM attempted to subscribe to the SAF Forwarder with a filter that does not match any of the SAF Forwarder's current filters. Unified CM will resend the subscribe message with the appropriate filter value. This alarm is for informational purposes only; no action is required.</td>
</tr>
<tr>
<td>476</td>
<td>SAF_UNKNOWN_SUBSCRIPTION - Unified CM sent a subscribe or unsubscribe message to the SAF Forwarder but the message contained a Service ID that was not familiar to the SAF Forwarder. Without a recognized Service ID, Unified CM cannot subscribe to the SAF Forwarder. Recommended action is to contact the Cisco Technical Assistance Center (TAC).</td>
</tr>
</tbody>
</table>
**INFO LEVEL** **SAF_ALREADY_REGISTERED** - Unified CM attempted to register with the SAF Forwarder but SAF Forwarder indicates that Unified CM is already registered. Unified CM will close and reopen the TCP connection and send a new register request without a client handle to SAF Forwarder. This alarm is for informational purposes only; no action is required.

478  
SAF_UNSUPPORTED_PROTOCOL_VERSION - Unified CM attempted to register with the SAF Forwarder using a SAF protocol version number that is greater than the protocol version number supported by the SAF Forwarder. Issue a show version command on the SAF Forwarder CLI to determine the SAF Forwarder protocol version; refer to the information in this alarm for the SAF protocol version number. If the versions do not match, check the Cisco Unified Communications Manager Software Compatibility Matrix (available on Cisco.com) to determine whether the SAF protocol version number that is in use on this Unified CM is compatible with the SAF Forwarder protocol version. If it is not, upgrade the lower-versioned component so that both Unified CM and the SAF Forwarder use the same, compatible version.

479  
SAF_UNKNOWN_AS - Unified CM attempted to register to the SAF Forwarder but the registration message contained a Client Label that was not familiar to the Autonomous System (AS) on the SAF Forwarder router. Recommended action is to issue the appropriate CLI commands on the SAF Forwarder to associate the Client Label with the autonomous system on the router (refer to the Configuration Guide for the router) and configure the same Client Label in the Client Label field on the SAF Forwarder Configuration window in Cisco Unified CM Administration and click Save. When the Client Label is saved in Cisco Unified CM Administration, Unified CM automatically sends a new registration request to the SAF Forwarder with the updated Client Label information.

500  
**INFO LEVEL** **SAF_RESPONDER_ERROR** - Unified CM sent a message (such as register/unregister/publish/unpublish/subscribe) to the SAF Forwarder but the SAF Forwarder responded that it is unable to process the message at this time. This might be due to heavy message queuing, internal resource issues, and so on. Unified CM will wait several seconds and then retry the request. This alarm is for informational purposes only; no action is required.

1000  
SAF_INVALID_CONNECTION_DETAILS

---

**SAFResponderError**

SAF Responder Error 500.
This is raised when SAF forwarder doesn't know the transaction ID within SAF response from this Cisco Unified CM.

SIPNormalizationResourceWarning

The normalization script has exceeded an internal resource threshold.
The normalization script for the indicated SIP device has exceeded an internal threshold for resource consumption. This alarm can occur for memory consumption, or when the script is close to exceeding the configured allowance of Lua instructions. When the amount of memory (as defined in the Memory Threshold field) or the number of Lua instructions utilized by this script (as defined by the Lua Instruction Threshold) exceeds an internal threshold, this alarm is triggered.

Examples
1 If the memory threshold is set to 100 KB and the internal threshold is 80%, this alarm will occur when this script has consumed 80 KB of memory. The internal threshold is not configurable and may fluctuate from Cisco Unified CM release to release.
2 If the Lua Instruction Threshold is set to 2000 and the internal threshold is 50%, this alarm will occur when the script has executed 1000 Lua instructions.

This alarm warns that the resources (either memory or Lua instructions) have crossed an internal mark, where investigation into the consumption of those resources may be advisable to ensure the health of the script.

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
Error

Routing List
SDI
Sys Log
Event Log

Parameters
Device Name(String)
Script Name(String)
Script Function(String)
Script Type(String)
Reason Code(Enum)
Reason Text(String)
In Use Memory(UInt)
Memory Threshold (UInt)
In Use Lua Instructions(UInt)
Lua Instruction Threshold(UInt)

Recommended Action
1. Examine the thresholds (Memory Threshold and Lua Instruction Threshold) configured in the SIP Normalization Script Configuration window.
2. Evaluate if the thresholds can be increased (take into consideration the CPU resources and memory when deciding to increase these values), or examine the script to determine if the message handlers can be written more efficiently to reduce the number of instructions in the script.
3. Examine the script for logic errors. If the script is functioning normally but contains extensive logic, consider increasing the value in the Lua Instruction Threshold field. Be aware that more computing resources will be consumed as a result. You can also examine SDI trace files for additional details about this resource condition. For scripts provided by Cisco, contact the Cisco Technical Assistance Center (TAC).
4. Investigate and correct the resource issue before the script closes. When the values that have been configured in the Memory Threshold field, or Lua Instruction Threshold field or both the fields on the SIP Normalization Script Configuration window are met, the script closes and the SIPNormalizationScriptClosed
alarm also occurs. For additional information when troubleshooting, check the SIP Normalization counter, MemoryUsagePercentage to learn the current resource usage.

</table>

SIPNormalizationScriptError

Description
A script error occurred.

Explanation
Cisco Unified CM encountered an error during loading, initializing, or during execution of the SIP normalization script for the indicated SIP device. If the error was due to a resource issue, the SIPNormalizationResourceWarning alarm will also be issued. The Configured Action shown in this alarm may differ from the Resulting Action shown in this alarm because certain errors, such as those occurring during loading or initialization, cannot be configured. If the script closes three times within a 10 minute window due to errors, Cisco Unified CM will follow the configured action three times; on the fourth occurrence of the error, Unified CM disables the script and issues the SIPNormalizationAutoResetDisabled alarm.

SIPTrunkOOS

All remote peers are out of service and unable to handle calls for this SIP trunk.

This alarm provides the list of unavailable remote peers, where each peer is separated by semicolon. It also provides the reason code received by the SIP trunk, in response to an Options request sent to remote peer. For each peer, the alarm provides the hostname or SRV (if configured on SIP trunk), resolved IP address, port number, and reason code in the following format:

ReasonCodeType=ReasonCode.

The ReasonCodeType depends on a SIP response from the remote peer as defined in SIP RFCs (remote), or depends on a reason code provided by Unified CM (local).

The examples of possible reason codes include:

- Remote = 503 (“503 Service Unavailable” a standard SIP RFC error code)
- Remote = 408 (“408 Request Timeout” a standard SIP RFC error code)
- Local = 1 (request timeout)
- Local = 2 (local SIP stack is unable to create a socket connection with remote peer)
- Local = 3 (DNS query failed)

For Local=3, IP address in the alarm is represented as zero, and when DNS SRV is configured on SIP trunk then the port is represented as zero.

CallManager/CallManager

Severity
Error

Routing List
SDL
SDI
Sys Log
Event Log

Parameters
SIP Trunk Name(String)
Unavailable remote peers with Reason Code(String)

Recommended Action

- For Remote = 503, the possible reasons include:
  - Route/SIP trunk for originating side does not exist on remote peer. If remote peer is Unified CM, add a new SIP trunk in Unified CM Administration for the remote peer (Device > Trunk) and ensure the Destination Address and Destination Port fields are configured to point to the originating host (the originating host is the same node on which this alarm was generated).
  - Route/SIP trunk for originating side does exist on remote peer but the port is either used for a SIP phone or a different SIP trunk. If remote peer is Unified CM, in the Unified CM Administration for the remote peer (Device > Trunk), ensure the Destination Port on the originating side is configured to be the same as the incoming port on the terminating side SIP Trunk Security Profile.
  - Remote peer has limited resources to handle new calls. If remote peer is administered by a different system administrator, communicate the resource issue with the other administrator.

- For Remote = 408, the possible reason includes:
  - Remote peer has limited resources to handle new calls. If remote peer is administered by a different system administrator, communicate the resource issue with the other administrator.

- For Local = 1, the possible reason could be that no responses are received for OPTIONS request after all retries, when UDP transport is configured in the SIP trunk Security Profile assigned to the SIP trunk on the originating side.

To fix this issue, perform the following steps:
If remote peer is Unified CM, in the remote peer Serviceability application, choose Tools > Control Center (Feature Services) and ensure the Cisco CallManager service is activated and started.

In the Unified CM Administration for the remote peer, choose Device > Trunk, and ensure the SIP trunk exists with the incoming port in associated SIP Trunk Security Profile configured to be same as originating side SIP Trunk destination port.

Check the network connectivity by using the CLI command utils network ping <remote peer> at the originating side.

• For Local = 2, the possible reason could be that Unified CM is unable to create the socket connection with remote peer.

To fix this issue, perform the following steps:

1. If remote peer is Unified CM, in the remote peer Serviceability application, choose Tools > Control Center (Feature Services) and ensure the Cisco CallManager service is activated and started.
2. In the Unified CM Administration for the remote peer, choose Device > Trunk and ensure the SIP trunk exists with the incoming port in associated SIP Trunk Security Profile configured to be same as originating side SIP Trunk destination port.
3. Check the network connectivity by using the CLI command utils network ping <remote peer> at the originating side.

• For Local = 3, the possible reason could be that DNS server is not reachable, or DNS is not properly configured to resolve the hostname or SRV which is configured on the local SIP trunk.

To fix this issue, perform the following steps:

1. In the OS Administration, choose Show > Network and verify whether the DNS details are correct. If it is not correct, configure the correct DNS server information by using the CLI command set network dns primary.
2. Check the network connectivity with DNS server by using the CLI command utils network ping <remote peer>, and ensure the DNS server is properly configured.

---

**SparePartitionLowWaterMarkExceeded**

The percentage of used disk space in the spare partition has exceeded the configured low water mark.

**Note**

Spare Partition is not used for Intercompany Media Engine server. So this alert will not be triggered for Intercompany Media Engine.

Warning-level alarms
The warning-level alarm is 4 and action is needed but priority of action is determined by the condition. A warning about some bad condition, which is not necessarily an error. Configuration error or an alarm that by itself does not indicate a warning but several instances of the same alarm do. Examples are:

• Configuration error
• One alarm of this level may not mean that an error has occurred but multiple of these would be considered an error

AnnunciatorNoMoreResourcesAvailable
No more Annunciator resources available.
Annunciator resource allocation failed for one or more of the following reasons: all Annunciator resources are already in use; there was a codec or capability mismatch (such as the endpoint using one type of IP addressing such as IPv6, while the Annunciator supports only IPv4) between the endpoint and the Annunciator resource; not enough bandwidth existed between the endpoint and the Annunciator.

### Facility/Sub-Facility

CCM_CALLMANAGER-CALLMANAGER

### Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

### Severity

Warning

### Parameter(s)

Media Resource List Name(String)

### Recommended Action

If all the resources of the Annunciator are already in use, check to be sure that all the Annunciators that belong to the Media Resource Groups of the indicated Media Resource Group List and Default List are configured and registered in all the applicable Unified CM nodes of the cluster. To check the registration status go to the Media Resources > Annunciator menu and click the Find button. It will display all the Annunciators with their status, device pool, and so on.

Check the status field to see whether it is registered with Unified CM. Note that the display on the status field is not a confirmation that the device is registered to Unified CM. It may happen in a Unified CM cluster that the Publisher can only write to the Unified CM database before the Publisher goes down. Because the Subscriber may not be able to write to the database, the devices may still display registered in Unified CM Administration after they are actually unregistered. However, if the Publisher is down that should generate another alarm with higher priority than this alarm.

The Annunciator allocation can fail due to codec mismatch or capability mismatch between the endpoint and the Annunciator. If there is a codec mismatch or capability mismatch (such as the endpoint using IPv6 addressing but Annunciator supporting only IPv4), an MTP or transcoder should be allocated. So, if the MTP or transcoder is not allocated then either MediaResourceListExhausted (with Media Resource Type as Media termination point or transcoder) or MtpNoMoreResourcesAvailable alarm will be generated for the same Media Resource Group List and you should first concentrate on that.

The Annunciator allocation may even fail after checking the region bandwidth between the regions to which the held party belongs and the region to which the Annunciator belongs. Increasing the region bandwidth may be a solution to the problem, but that decision should be made after careful consideration of the amount of
bandwidth you're willing to allocate per call between the set of regions. You'll need to weigh different factors such as the total amount of available bandwidth, the average number of calls, the average number of calls using the Annunciator, approximate bandwidth use per call, and so on, and accordingly calculate the region bandwidth.

Another possible cause is that the bandwidth needed for the call may not be available. This can happen if the Annunciator and endpoint belong to different locations and the bandwidth that is set between the locations is already in use by other calls. Examine the bandwidth requirements in your deployment to determine whether bandwidth between the locations can be increased.

However, note that increasing the bandwidth between these two locations means that you may need to reduce the bandwidth between other locations. Refer to the System Guide, SRNDs, and related Unified CM documentation for more details. Be aware that reducing the bandwidth or removing the higher bandwidth codecs from configuration may result in poor voice quality during call. Consider increasing the total amount of network bandwidth.

### ApplicationConnectionDropped

Application has dropped the connection to CTIManager. TCP or TLS connection between CTIManager and Application is disconnected.

CallAttemptBlockedByPolicy

A call was attempted but blocked or rejected by the policy decision point (PDP).

A call was rejected or blocked because it violated the enterprise policy as defined in a policy decision point (PDP) that was configured in Cisco Unified Communications Manager (Unified CM). The policy server returns a call reject decision stating that a policy violation was the reason for rejecting the call. Calls may be rejected because an unauthorized user attempted to dial a DN or pattern that is not allowed for him or her or because a call forward directive was invoked and the destination specified in the call forward operation violated the policy. Depending on email configuration in Real-Time Monitoring Tool (RTMT), the system may have generated an email alert when the call was rejected.

System Limit of CCD Learned Patterns (UInt)

**Recommended Action**

This alarm displays the value that is configured in the Cisco CallManager service parameter, CCD Maximum Numbers of Learned Patterns, as well as the maximum number of learned patterns that are allowed by the system (an internally-controlled maximum).

Consider whether the specified maximum number of learned patterns is correct for your deployment. If it is too low, compare it with the number shown in the SystemLimitCCDLearnedPatterns in this alarm. If the Max number is below the System Limit, you can go to the Service Parameters Configuration window and increase the CCD Maximum Numbers of Learned Patterns service parameter. If the Max and System Limit numbers match, the system is already configured to run at capacity of learned patterns; no action is required.
**CDRHWMExceeded**

The CDR files disk usage has exceeded the High Water Mark. CDRM deleted some successfully delivered CDR files that are still within the preservation duration, in order to bring the disk usage down to below HWM. E-mail alert will be sent to the admin.

Parameters
Message(String)

Recommended Action
Regenerate the certificate that is about to expire by accessing the Cisco Unified Operating System and go to Certificate Management. If the certificate is issued by a CA, generate a CSR, submit the CSR to CA, obtain a fresh certificate from CA, and upload it to Cisco Unified CM.

ConferenceNoMoreResourcesAvailable

Conference resource allocation failed for one or more of the following reasons: the required number of conference resources were not available; for an IOS-based conference bridge, the number of participants to be added to the conference bridge exceeded the maximum number of participants allowed per conference; no lower precedence conference was available for preemption although MLPP preemption was enabled; a lower-precedence conference bridge was not preempted.

**Severity**
Warning (4)

**Parameters**
- DeviceName(String)
- IPAddress(String)
- Active(String)
- Inactive(String)
- FailedLoadId(String)
- Method(Enum)
- FailureReason(Enum)
- Server(String)

**Recommended Action**
Verify that the IP address or hostname of the image download server (either the Load server or the TFTP server) is correct. If you're using a hostname, verify that the Domain Name Server (DNS) is accessible from the phone and can resolve the hostname. Verify that the TFTP service is activated and running on the Load server or TFTP server (the server you are using to serve firmware load files). Verify that the Load server or TFTP server is accessible from the phone. Also, refer to the reason code descriptions for recommended actions.

<table>
<thead>
<tr>
<th>Code</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>A TFTP server error occurred - examine the TFTP log to determine whether other errors occurred at the same time the device was attempting to download its firmware and correct any TFTP errors that may have occurred. Also, investigate the load on the TFTP server to ensure that device download requests are being processed; check network connectivity to the TFTP server.</td>
</tr>
<tr>
<td>2</td>
<td>Specified firmware load ID is not found on the TFTP server. Check that file name is correct, or load (image) file exist on TFTP server.</td>
</tr>
<tr>
<td>3</td>
<td>An internal phone error occurred during the download attempt; reset the phone to correct the issue.</td>
</tr>
<tr>
<td>4</td>
<td>The Load server or TFTP server could not process the phone's firmware load request. It is possible that congestion is causing a delay in TFTP response. To allow the phone to attempt the download again, wait a few minutes then reset the phone. The phone will attempt to download its firmware load again. If resetting the phone does not solve the issue, restart the Load server or TFTP server (whichever server provides firmware loads).</td>
</tr>
<tr>
<td>5</td>
<td>An encryption error occurred on the phone while trying to load the new firmware load (image); reset the phone to correct the issue.</td>
</tr>
<tr>
<td>6</td>
<td>The downloaded firmware load (image) is not encrypted. Verify that correct load (image) name is provided to the phone and that the server that provides firmware loads has that encrypted load (image) file.</td>
</tr>
<tr>
<td>7</td>
<td>The downloaded firmware load (image) cannot be decrypted using the decryption key on the phone (resulting in an encryption key mismatch). If you have provided the image encryption key, try re-encrypting the image with the key that matches the key already on the phone, then attempt the download again. Otherwise, collect the phone logs from the time of this alarm (review the steps in the Administration Guide for the appropriate phone model to learn how to access the phone logs) and contact the Cisco Technical Assistance Center (TAC).</td>
</tr>
<tr>
<td>8</td>
<td>There is a problem with the encryption of the downloaded firmware load (image). Collect pertinent details such as the device's MAC address, device type, the firmware load ID, and phone logs from the time of this alarm (review the steps in the Administration Guide for the appropriate phone model to learn how to access the phone logs), and contact the Cisco Technical Assistance Center (TAC).</td>
</tr>
<tr>
<td>9</td>
<td>The phone did not receive a load server name or IP address and as a result, does not have the server information needed to download a firmware load. Check the Device Configuration page in Cisco Unified CM Administration to ensure that the IP address of the Load server or TFTP server is accurately configured. If the information is inaccurate or not present, supply the correct information and restart the phone. If the information is accurate, restart the phone. If this alarm recurs, contact the Cisco Technical Assistance Center (TAC).</td>
</tr>
<tr>
<td>Code</td>
<td>Definition</td>
</tr>
<tr>
<td>------</td>
<td>------------</td>

CallManager/CallManager

Severity

Warning (4)

Parameters

Recommended Action

In the Cisco Unified Reporting tool, run the Unified CM Multi-Line Devices report and check the number of lines that are supposed to be configured on the device identified in this alarm. If the device has registered an inconsistent number of lines compared to the Multi-Lines report for this device, restart the device so that it can reregister all lines. If this alarm persists, verify that the appropriate number of lines has been configured on the device, and that the appropriate directory numbers have been configured. If the device is a third-party SIP phone, verify that the directory numbers configured on the phone match the directory numbers configured on the device in Unified CM Administration.

## DeviceTransientConnection

A connection was established and immediately dropped before completing registration. Incomplete registration may indicate that a device is rehoming in the middle of registration. The alarm could also indicate a device misconfiguration, database error, or an illegal/unknown device trying to attempt a connection. Network connectivity problems can affect device registration, or the restoration of a primary Unified CM may interrupt registration.

CallManager/CallManager

Severity

Warning

Parameters

Device IP address [Optional].[String]  
Device name [Optional].[String]  
Device MAC address [Optional].[String]  
Protocol.[String]  
Device type. [Optional][Enum]  
Reason Code [Optional].[Enum]  
Connecting Port [UInt]  
Registering SIP User. [Optional].[String]  
IPV6Address [Optional].[String]  
IPAddressAttributes [Optional].[Enum]  
IPV6AddressAttributes [Optional].[Enum]
Recommended Action

In the Cisco Unified Reporting tool, check the Active Services section of the Unified CM Cluster Overview report to confirm that any failover/fallback scenarios have completed. Confirm that auto-registration is enabled if the phone attempting to connect is set to auto-register, or locate the phone that is attempting to auto-register if auto-registration has been intentionally disabled. Check the device indicated in this alarm and confirm that the device registration details in Cisco Unified CM Administration are accurate. Also, refer to the reason code definitions for recommended actions. No action is required if this event was issued as a result of a normal device rehome.

Enum definitions for DeviceTransientConnection

<table>
<thead>
<tr>
<th>Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Unknown—(SCCP only) The device failed to register for an unknown reason. If this persists, collect SDL/SDI traces with “Enable SCCP Keep Alive Trace” enabled and contact TAC.</td>
</tr>
<tr>
<td>2</td>
<td>NoEntryInDatabase—(MGCP only) The device is not configured in the Unified CM Administration database and auto-registration is either not supported for the device type or is not enabled. To correct this problem, configure this device in Unified CM Administration.</td>
</tr>
<tr>
<td>3</td>
<td>DatabaseConfigurationException—The device is not configured in the Unified CM Administration database and auto-registration is either not supported for the device type or is not enabled. To correct this problem, configure this device in Unified CM Administration.</td>
</tr>
<tr>
<td>4</td>
<td>DeviceNameUnresolvable—For SIP third-party devices this means that Unified CM could not determine the name of the device from the Authorization header in the REGISTER message. The device did not provide an Authorization header after Unified CM challenged with a 401 Unauthorized message. Verify that the device is configured with digest credentials and is able to respond to 401 challenges with an Authorization header. If this is a Cisco IP phone, the configuration may be out-of-sync. First, go to the Cisco Unified Reporting web page, generate a Unified CM Database Status report, and verify “all servers have a good replication status”. If DB replications looks good, reset the phone. If that still doesn't fix the problem, restart the TFTP and the Cisco CallManager services. For all other devices, this reason code means that DNS lookup failed. Verify the DNS server configured via the OS Administration CLI is correct and that the DNS name used by the device is configured in the DNS server.</td>
</tr>
<tr>
<td>Code</td>
<td>Reason</td>
</tr>
<tr>
<td>------</td>
<td>--------</td>
</tr>
<tr>
<td>6</td>
<td>ConnectivityError—The network connection between the device and Cisco Unified CM dropped before the device was fully registered. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops and packet corruption. It is also possible to get this error if the Cisco Unified CM node is experiencing high CPU usage. Verify the device is powered up and operating, verify network connectivity between the device and Cisco Unified CM, and verify the CPU utilization is in the safe range (this can be monitored using RTMT via CPU Pegging Alert).</td>
</tr>
<tr>
<td>7</td>
<td>InitializationError—An internal error occurred within Cisco Unified CM while processing the device registration. It is recommended to restart the Cisco CallManager service. If this occurs repeatedly, collect SDL/SDI detailed traces with “Enable SIP Keep Alive (REGISTER Refresh) Trace” and “Enable SCCP Keep Alive Trace” under Cisco CallManager services turned on and contact TAC.</td>
</tr>
<tr>
<td>10</td>
<td>AuthenticationError—The device failed either TLS or SIP digest security authentication. If the device is a SIP phone and is enabled for digest authentication (on the System &gt; Security Profile &gt; Phone Security Profile, check if “Enable Digest Authentication” checkbox is checked), verify the “Digest Credentials” in the End User config page are configured. Also, check the phone config page to see if the phone is associated with the specified end user in the Digest User drop box. If the device is a third-party SIP device, verify the digest credentials configured on the phone match the “Digest Credentials” configured in the End User page.</td>
</tr>
<tr>
<td>11</td>
<td>InvalidX509NameInCertificate—Configured “X.509 Subject Name” doesn't match what's in the certificate from the device. Check the Security profile of the indicated device and verify the “Device Security Mode” is either “Authenticated” or “Encrypted”. Verify the “X.509 Subject Name” field has the right content. It should match the Subject Name in the certificate from the peer.</td>
</tr>
<tr>
<td>12</td>
<td>InvalidTLSCipher—Unsupported cipher algorithm used by the device; Cisco Unified CM only supports AES_128_SHA cipher algorithm. Recommended action is for the device to regenerate its certificate with the AES_128_SHA cipher algorithm.</td>
</tr>
<tr>
<td>14</td>
<td>MalformedRegisterMsg—(SIP only) A SIP REGISTER message could not be processed because of an illegal format. Possible causes include a missing Call-ID header, a missing AoR in the To header, and an expires value too small. Verify the REGISTER message does not suffer from any of these ills.</td>
</tr>
</tbody>
</table>
Reason Code
ProtocolMismatch—The protocol of the device (SIP or SCCP) does not match the configured protocol in Cisco Unified CM. Recommended actions:

1. Verify the device is configured with the desired protocol.
2. Verify the firmware load ID on the Device Defaults page is correct and actually exists on the TFTP server.
3. If there is a firmware load ID configured on the device page, verify it is correct and exists on the TFTP server (On Cisco Unified OS Administration page, Software Upgrades > TFTP File Management, look for the file name as specified by load ID).
4. Restart the TFTP and Cisco CallManager services. Use the Cisco Unified OS Administration TFTP File Management page to verify the configured firmware loads exist.

DeviceNotActive—The device has not been activated

AuthenticatedDeviceAlreadyExists—A device with the same name is already registered. If this occurs repeatedly, collect SDL/SDI detailed traces with “Enable SIP Keep Alive (REGISTER Refresh) Trace” and “Enable SCCP Keep Alive Trace” under Cisco CallManager services turned on and contact TAC. There may be an attempt by unauthorized devices to register.

ObsoleteProtocolVersion—(SCCP only) A SCCP device registered with an obsolete protocol version. Power cycle the phone. Verify that the TFTP service is activated. Verify that the TFTP server is reachable from the device. If there is a firmware load ID configured on the Phone Config page, verify that the firmware load ID exists on the TFTP server (On Cisco Unified OS Administration page, Software Upgrades > TFTP File Management, look for the file name as specified by load ID).

</tr>
</tbody>
</table>

**DeviceUnregistered**

A device that has previously registered with Cisco CallManager has unregistered. In cases of normal unregistration with reason code “CallManagerReset”, “CallManagerRestart”, or “DeviceInitiatedReset”, the severity of this alarm is lowered to INFORMATIONAL. A device can unregister for many reasons, both intentional, such as manually resetting the device after a configuration change, or unintentional, such as loss of network connectivity. Other causes for this alarm could include a phone being registered to a secondary node and then the primary node come back online, causing the phone to rehome to the primary Unified CM node or lack of a KeepAlive being returned from the Unified CM node to which this device was registered. Unregistration also occurs if Unified CM receives a duplicate registration request for this same device.

Recommended Action
Actions to take vary depending on the reason specified for the device unregistration. If the reason is ConfigurationMismatch, go to the Device Configuration page in Cisco Unified CM Administration, make a change to the Description field for this device, click Save, then reset the device. In the case of a network connectivity or loss of KeepAlives problem, use network diagnostic tools and the Cisco Unified CM Reporting tool to fix any reported network or Unified CM system errors. In the case of a device rehoming to the primary Unified CM node, watch for a successful registration of the device on the primary node. In the case of a duplicate registration request, it may be a non-malicious occurrence due to timing of a device registering and unregistering; if duplicate registration requests continue or if the same device has different IP addresses, confirm the IP address on the physical device itself by checking the settings on the device (settings button). If unregistration of this device was expected, no action is required. Also, refer to the reason code descriptions for recommended actions.

</table>
Reason Code: SCCPDeviceThrottling (SCCP only)

The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device. Events can be phone calls, KeepAlive messages, or excessive SCCP or non-SCCP messages. The maximum number of allowed events is controlled by the Cisco CallManager service parameter, Max Events Allowed. When an Cisco Unified Communications Manager Managed Services Guide, Release 9.1(1)
ReasonCode:

individual device exceeds the number configured in that service parameter, Unified CM closes the TCP connection to the device; automatic reregistration generally follows. This action is an attempt to stop malicious attacks on Unified CM or to ward off excessive CPU usage.

Cisco Unified Communications Manager Managed Services Guide, Release 9.1(1)
<table>
<thead>
<tr>
<th>Code</th>
</tr>

</tbody>
</table>
ReasonCode
a new config file.
If the problem still persists, restart the TFTP service and Cisco Unified CM service.
Reason Code: CallManagerRestart

- A device restart was initiated from Cisco Unified CM, either due to an explicit command from an administrator, or due to a configuration change such as adding, deleting or changing a DN associated with the device. No action necessary, the device will reregister automatically.
Cisco Unified CM detected that the device attempted to register to 2 nodes at the same time. Cisco Unified CM initiated a restart to the phone to force it to rehome to a single node. No action necessary, the device will reregister automatically.

<table>
<thead>
<tr>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
</tr>
</tbody>
</table>
A `CallManagerApplyConfig` command was invoked from Unified CM Administration resulting in an unregistration. No action necessary, the device will reregister automatically.

<table>
<thead>
<tr>
<th>Code</th>
<th>Reason Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>17</td>
<td>DeviceUnregistered</td>
</tr>
</tbody>
</table>
The device did not respond to a reset or restart notification, so it is being forcefully reset.

If the device does not reregister within 5 minutes, confirm it is powered-up and confirm network connectivity between the device and Cisco Unified CM.

**DigitAnalysisTimeoutAwaitingResponse**

Cisco Unified Communications Manager sent a routing request to the policy decision point but the request timed out without a response.

Cisco Unified Communications Manager (Unified CM) was unable to complete the routing request before timing out. This time out could occur due to low system resources, high CPU usage, or a high volume of call activities on this Unified CM node. Unified CM applies the Call Treatment on Failure that is configured for the External Call Control Profile associated with this call.

Parameter(s)
Translation Pattern Triggering Point(String)
Policy Decision Point(String)

Recommended Action
• Check the External Call Control object in Real-Time Monitoring Tool (RTMT) to see whether the ExternalCallControlEnabledCallAttempted counter is spiking. If so, this indicates an unusually high number of calls at this time which could result in reduced system resources.
• Check the QueueSignalsPresent2-Normal for persistent long high signal queue. If the long signal queue exists, check whether the Code Yellow alarm has already issued and check the system CPU and memory usage for this Unified CM node.
• Follow the recommended actions for Code Yellow alarm if the Code Yellow alarm has fired.

For high CPU usage, use RTMT to determine which areas may be contributing to the high CPU usage. If this alarm persists, collect system performance data (such as the percentage of Memory, Page and VM usage, partition read and write bytes per second, the percentage of CPU usages of all the processes, and the processor IOWait percentage) and contact Cisco Technical Assistance Center (TAC).

DirSyncNoSchedulesFound
No schedules found in DB for directory synchronization. No automatic LDAP directory synchronization possible.

EMCCFailedInRemoteCluster

There was an EMCC login failure at a remote Unified CM. EMCC login could fail due to the following reasons:

- User does not exist in any of the configured remote cluster.
- User is not enabled for EMCC.
- No free EMCC base device.
- EMCC access was prevented by remote cluster.
- Untrusted certificate received from the remote end while trying to establish a connection.

Reason Codes:

- 38—EMCC or PSTN is not activated in InterClusterServiceProfile page
- 31—User is not enabled for EMCC
- 39—Default and Backup TFTP Service is not configured

Parameters

Device Name(String)
Login Date/Time(String)
Login UserID(String)
Reason(String)

Recommended Action

Do the following:

Ensure that the user is a valid EMCC user and that user home cluster is added as a EMCC remote cluster (From Unified CM Administration window, go to System > EMCC > Remote Cluster > Add New).

Contact remote site administrator to enable user for EMCC (From Unified CM Administration window, go to User Management > End User > Select User > Enable Extension Mobility Cross Cluster checkbox).
Contact remote site administrator for adding or freeing EMCC Base Devices (From Unified CM Administration window, go to **Bulk Administration** > **EMCC** > **Insert/Update EMCC**).

Contact remote site administrator to validate the remote cluster setting for this cluster.

Ensure that a bundle of all Tomcat certificates (PKCS12) got imported into the local tomcat-trust keystore (From the OS Administration window, go to **Security** > **Certificate Management**.

---

**ErrorParsingResponseFromPDP**

Cisco Unified Communications Manager failed to parse one or multiple optional elements or attributes in the call routing response from the policy decision point.

A routing response was received from the policy decision point (PDP) but Cisco Unified Communications Manager (Unified CM) failed to parse the optional elements in the response. Optional elements may include modified calling numbers or called numbers, call reject or call diversion reasons, and so on. The cause may be a syntax error or missing attributes in the call routing response.

---

**Cisco Unified Serviceability Alarm Definition Catalog**

**CallManager/CallManager**

**Severity**

WARNING

**Routing List**

SDL

Event Log

**Parameter(s)**

- Policy Decision Point(String)  
- Called Party Number(String)  
- Calling Party Number(String)  
- Calling User Id(String)  
- Request XML Data(String)

**Recommended Action**

Check if call routing response from the policy decision point complies with the guidelines specified for external call control in the Cisco Unified Communications Manager documentation. Check if any optional elements included as the policy obligations in the call routing response are correctly entered according to the external call control documentation, including any applicable API documentation.
FailedToFulfillDirectiveFromPDP

Cisco Unified Communications Manager cannot fulfill the call routing directive returned by the PDP. The failure can occur because of the following conditions:

- Call was cleared by a CTI application before Cisco Unified Communications Manager was able to route it to the location defined by the PDP.
- Call that was allowed by a policy server was redirected by the CTI application to a destination.
- Annunciator ID was misconfigured in the PDP.
- Unified CM attempted to invoke a media resource such as Annunciator but no resources were available.

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

Warning(4)

Routing List

SDL
SDI
Sys Log
Event Log

Parameters

Policy Decision Point(String)
Reason, Unified CM failed to fulfill the directive(String)
Called Party Number(String)
Calling Party Number(String)
Calling User Id(String)

Recommended Action

In many cases, the cause for a failure occurs because of the intervention by a CTI application which scoops up the call before Unified CM is able to fulfill the routing directive in the PDP. Examine the CTI application to ensure that the call is in alerting or connected state before the CTI begins to interact with it.

If the failure is caused by a problem with the annunciator ID, ensure the ID has been accurately configured in the PDP and that it exists in Unified CM Administration.

If the failure was caused by a lack of media resources, try increasing the Annunciator Call Count service parameter in the Cisco IP Voice Media Streaming App service.
H323Stopped

Cisco CallManager is not ready to handle calls for the indicated H323 device.
Cisco Unified Communications Manager (Unified CM) is not ready to handle calls for the indicated H.323 device. This could be due to Unified CM being unable to resolve the gateway name to IP address. For trunks, this alarm should only occur when a system administrator has made a configuration change such as resetting the H.323 trunk. For H.323 clients, this alarm occurrence is normal on lower-priority Unified CM nodes when a high-priority Unified CM node starts.

**Facility/Sub-Facility**

CCM_CALLMANAGER-CALLMANAGER

**Cisco Unified Serviceability Alarm Definition Catalog**

CallManager/CallManager

**Severity**

Warning (4)

**Parameters**

Media Resource Type [Enum]Media Resource List Name [String]

**Recommended Action**

First, go to Cisco Unified CM Administration to check the configuration of the devices that are part of the Media Resource Groups in the Media Resource Group List that was specified in the alarm (Media Resource Group List Configuration window and Media Resource Group Configuration window in Unified CM Administration).

Check whether the requested type of device is configured in any of the Media Resource Groups in that particular Media Resource Group List in Cisco Unified CM Administration; for RSVP Agent, check whether any media termination point or transcoder is configured in any of the Media Resource Groups in that particular Media Resource Group List. Next, go to the Media Resources menu in Cisco Unified CM Administration to see all the devices of the requested type and then check all the Media Resource Groups (irrespective of whether they
belong to the Media Resource Group List for which the alarm is generated) to see whether the devices belong to at least one Media Resource Group.

If there exists some media resources of the requested type which do not belong to any Media Resource Groups, then these devices will belong to the default list. If the requested type of devices are not configured in any of the Media Resource Groups of the Media Resource Group List for which the alarm is generated or the Default List, add the requested type of device to a Media Resource Group in the specified Media Resource Group List or add it to the Default List.

To add a media resource to the Default List remove the Media Device from all the Media Resource Groups. In general, when a new media device is initially added to Unified CM it will automatically be added to the Default List. This Default List can be used by any device or trunk. But when the media device is added to any particular Media Resource Group it will not be available to the Default List. It can only be used by devices and trunks that are configured with the Media Resource Group List which have that particular Media Resource Group.

Note that a particular Media Resource Group can be added to multiple Media Resource Group Lists. If the requested device is properly configured in Cisco Unified CM Administration, check whether the device is registered to Unified CM. To do that go to the Media Resources menu of the requested type of device (such as Annunciator or Conference Bridge or Media Termination Point or Music On Hold Server or Transcoder) and click the Find button. It will display all the devices of that type with their status, device pool, etc. Check the status field to see whether it is registered with the Cisco Unified CallManager. Note that the display on the status field is not a confirmation that the device is registered to Unified CM. It may happen in a Unified CM cluster that the Publisher can only write to the Unified CM database and suppose the Publisher goes down. Because the Subscriber may not be able to write to the database the devices may still display as registered in Unified CM Administration after they are unregistered. However, if the Publisher is down that should generate another alarm with higher priority than this alarm. If the device is not registered, click on the name of that particular device and check the type of the device.

Device types including Cisco Conference Bridge Software, Cisco Media Termination Point Software, or that specify a server name that is the same name as a Unified CM node of the cluster indicate that the requested device is a software device and is part of the Cisco IP Voice Media Streaming application. Check to be sure that the IP Voice Media Streaming App service is enabled on that Unified CM node (Cisco Unified Serviceability > Tools > Service Activation) and if it is not enabled, activate the Cisco IP Voice Media Streaming App service. App service should try to register. You can also check the status of the service to be sure it is showing as Started (Tools > Control Center > Feature Services). If the device type is a type other than Cisco Conference Bridge Software, Cisco Media Termination Point Software, or a server name that is the same name as a Unified CM node, that indicates that the device is an external media resource to Unified CM.

Check the configuration (such as Conference Bridge type, MAC address, and conference bridge name in the case of a conference bridge; Media Termination Point name in the case of a Media Termination Point; Transcoder type, MAC address, and Transcoder name in the case of a Transcoder) of the device in Cisco Unified CM Administration and compare it with the configuration of the actual device. To check the configuration of the actual device you may need to refer to the user manual of the media device.

The user manual should provide all the details such as connecting to the media device to check the configuration, commands needed to view and update the configuration, and so on. If configuration in Unified CM and on the actual devices are different, make the necessary changes so that the configurations match. If the configuration matches and the device is still not registered, restart the external media device or the service associated with the external media device. If the external media device continues to fail to register with Unified CM, check the network connectivity between Unified CM and the media device.

Parameter(s)
Memory Allocation Failure(String)

Recommended Action
Use the Real-Time Monitoring Tool to check the performance counters related to system memory, to learn whether any memory leaks or spikes in CPU are occurring. Correct any anomalous memory issues you find.
If you do not find any issues with memory, collect the system/application event logs and the performance (perfmmon) logs and report this alarm to the Cisco Technical Assistance Center (TAC).

MohNoMoreResourcesAvailable

No more MOH resources available.

This alarm occurs when allocation of Music On Hold fails for all the registered MOH servers belonging to the Media Resource Group List and Default List. Each MOH server may fail for different reasons. Following are some of the reasons that could cause an MOH server allocation to fail: All the resources of MOH server are already in use; No matching codecs or capability mismatch between the held party and MOH server; Not enough bandwidth between the held party and MOH source; No audio stream available for the MOH server.

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

Warning

Recommended Action

If all the resources of the MOH servers are already in use, check to be sure that all the MOH servers that belong to the Media Resource Groups of the indicated Media Resource Group List and Default List are configured and registered in all the applicable Unified CM nodes. To check the registration status go to the Media Resources > Music On Hold Server menu and click the Find button. It will display all the MOH servers with their status, device pool, and so on.

Check the status field to discover whether it is registered with Unified CM. Note that the display on the status field is not a confirmation that the device is registered to Unified CM. It may happen in a Unified CM cluster that the Publisher can only write to the Unified CM database and the Publisher goes down. Because the Subscriber may not be able to write to the database, the devices may still display as registered in Unified CM Administration after they are actually unregistered. However, if the Publisher is down that should generate another alarm with higher priority than this alarm.

The MOH allocation can also fail due to codec mismatch or capability mismatch between the endpoint and the MOH server. If there is a codec mismatch or capability mismatch (such as the endpoint using IPv6 addressing but MOH server supporting only IPv4), an MTP or transcoder should be allocated. If the MTP or transcoder is not allocated then either MediaResourceListExhausted (with Media Resource Type as Media
termination point or transcoder) or MtpNoMoreResourcesAvailable alarm will be generated for the same Media Resource Group List and you should first concentrate on that alarm.

The MOH allocation may even fail after checking the region bandwidth between the regions to which the held party belongs and the region to which the MOH server belongs. Increasing the region bandwidth may be a solution to the problem, but that decision should be made after careful consideration of the amount of bandwidth you're willing to allocate per call between the set of regions.

You'll need to weigh different factors such as the total amount of available bandwidth, the average number of calls, the average number of calls using the MOH servers, approximate bandwidth use per call, and so on, and accordingly calculate the region bandwidth. Another possible cause is that the bandwidth needed for the call may not be available. This can occur if the MOH server and endpoint belong to different locations and the bandwidth that is set between the locations is already in use by other calls.

Examine the bandwidth requirements in your deployment to determine whether bandwidth between the locations can be increased. However, please note that increasing the bandwidth between these two locations means that you may need to reduce the bandwidth between other locations.

Refer to the System Guide, SRNDs, and related Unified CM documentation for more details. Be aware that reducing the bandwidth or removing the higher bandwidth codecs from configuration may result in poor voice quality during call. Consider increasing the total amount of network bandwidth. Another reason for the MOH allocation failure may be due to meeting the maximum number of unicast or multicast streams supported by the MOH server.

If all available streams are already in use, none can be allocated. Finally, check the Music On Hold Audio Source Configuration window in Cisco Unified CM Administration to confirm that at least one audio source is configured. If an audio source is not configured, upload an audio file and then configure the audio source in Cisco Unified CM Administration (refer to the Music On Hold configuration documentation for specific details).

**MtpNoMoreResourcesAvailable**

Media termination point or transcoder allocation failed.

The alarm occurs when allocation of a media termination point (MTP) or transcoder fails for all the registered MTPs or transcoders belonging to the Media Resource Group List and Default List. Each MTP or transcoder may fail for different reasons. Following are some of the reasons that could cause an MTP or transcoder allocation to fail: a capability mismatch between the device endpoint and MTP/transcoder, codec mismatch between the endpoint and the MTP/transcoder; a lack of available bandwidth between the endpoint and the MTP/transcoder; or because the MTP/transcoders resources are already in use.

A capability mismatch may be due to the MTP/transcoder not supporting one or more of the required capabilities for the call such as Transfer Relay Point (which is needed for QoS or firewall traversal), RFC 2833 DTMF (which is necessary when one side of the call does not support RFC 2833 format for transmitting DTMF digits and the other side must receive the DTMF digits in RFC2833 format, resulting in conversion of the DTMF digits), RFC 2833 DTMF passthrough (in this case, the MTP or transcoder does not need to convert the DTMF digits from one format to another format but it needs to receive DTMF digits from one endpoint and transmit them to the other endpoint without performing any modifications), passthrough (where no codec conversion will occur, meaning the media device will receive media streams in any codec format and transmit them to the other side without performing any codec conversion), IPv4 to IPv6 conversion (when one side of the call supports only IPv4 and the other side of the call supports only IPv6 and so an MTP needs to be inserted to perform the necessary conversion between IPv4 and IPv6 packets), or multimedia capability (if a call involving video and/or data in addition to audio requires insertion of an MTP or transcoder then the MTP/transcoder which supports multimedia will be inserted).

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

Warning

Parameter(s)

Media Resource List Name(String)

Recommended Action

If the MTP or transcoder allocation is failing due to a capability mismatch, it's possible that the media device does not support the capability (such as IPv4 to IPv6 conversion, passthrough) or the capability might not be configured in the device. Please check the user guide and documentation of the media device to make sure that device supports all the necessary capabilities. Also, caution should be taken care if all the MTP or transcoders are configured with all the supported capabilities.

There are certain capabilities (such as RFC 2833 DTMF or RFC 2833 DTMF passthrough or passthrough) which could be supported by most of the MTPs or transcoders and there may be certain capabilities (such as IPv4 to IPv6 conversion and vice versa or Transfer Relay Point or multimedia capability) which can be supported by only by a single MTP or transcoder depending on the devices that you have. For example, you may have IP phones that support only IPv4 protocol and there may also be IP phones that support only IPv6 protocol.

To make a call between IPv4-only and IPv6-only phones, you need to have an MTP configured to perform the conversion of IPv4 to IPv6 and vice versa. However, suppose all the MTPs or transcoders are configured with all the supported capabilities and only one MTP supports IPv4 to IPv6 conversion; if this MTP is configured with all the supported capabilities (which all the other MTPs or transcoders in the same MRGL or default MRGL also support) it may happen that this MTP can get allocated for Transfer Relay Point or RFC 2833 DTMF or RFC 2833 DTMF passthrough or passthrough instead. As a result, when the need arises for IPv4 to IPv6 conversion (which other MTPs or transcoders in the same MRGL or default MRGL do not support), all the resources of MTP may be in use and the IPv4 to IPv6 conversion may fail. To avoid this kind of problem, setting the priority of the media resources may be a good idea.

This can be done only in the Media Resource Group List and not in the Default List of the media resources. In any Media Resource Group List all the Media Resource Groups have different priorities; during allocation the first Media Resource Group is always checked for availability of the requested type of the media devices.
The first Media Resource Group in the Media Resource Group List will have the highest priority, then the second one, and so on.

To check all the Media Resource Groups and their priority go the Media Resources and Media Resource Group List of Cisco Unified CM Administration page and click the appropriate Media Resource Group List and check the Selected Media Resource Groups; the priority decreases from top to bottom. So, the MTP or transcoder that you want to be selected for the most basic functionalities should be positioned in the higher priority Media Resource Groups whereas the ones with more rare functionality should be positioned in the Media Resource Groups with lower priority. MTP/transcoder allocation may fail due to codec mismatch between the endpoint and the MTP/transcoder.

A solution may be to configure the MTP/transcoder with all the supported codecs (as specified in the user guide of the MTP/transcoder), but be aware that doing so might result in too much bandwidth being allocated for calls. You'll need to weigh different factors such as the total amount of available bandwidth, the average number of calls, approximate bandwidth use per call (not involving MTP/transcoder), and so on, and accordingly calculate the maximum bandwidth that can be allocated per call involving an MTP/transcoder and take that into consideration when configuring the supported codecs in the MTPs and transcoders. A good idea is to configure the media devices with all the supported codecs and set the region bandwidths to restrict too much bandwidth usage (refer to the Unified CM documentation for details on region and location settings).

Also, there may be a codec mismatch between the endpoint and the MTP/transcoders after considering the region bandwidth between the MTP/transcoder and the endpoint. Increasing the region bandwidth may be a solution to the problem, but again, that decision should be made after careful consideration of the amount of bandwidth you're willing to allocate per call between the set of regions. Another possible cause that an MTP/transcoder did not get allocated is because there was not enough available bandwidth for the call.

This can happen if the MTP/transcoder and endpoint belong to different locations and the bandwidth that is set between the locations is already in use by other calls. Examine the bandwidth requirements in your deployment to determine whether bandwidth between the locations can be increased.

However, please note that increasing the bandwidth between these two locations means that you may need to reduce the bandwidth between other locations. Refer to the System Guide, SRNDs, and related Unified CM documentation for more details. Be aware that reducing the bandwidth or removing the higher bandwidth codecs from configuration may result in poor voice quality during call. Consider increasing the total amount of network bandwidth available. Finally, if MTP or transcoding allocation fails due to capability mismatch or all the resources being in use, consider installing additional MTP or transcoder devices.

### MTPDeviceRecoveryCreateFailed

MTP device recovery create failure. An error was encountered trying to restart the Media Termination Point device. This may be due to a shortage of application memory.

Restart the IP Voice Media Streaming App service or restart the server.

NotEnoughChans

Call attempt was rejected because requested gateway channel(s) could not be allocated. Some of the more common reasons for the lack of channel to place outgoing calls include: High call traffic volume that has the B-channels in the device fully utilized; B-channels have gone out of service for the following reasons: Taking the channel out of service intentionally to perform maintenance on either the near- or far-end; MGCP gateway returns an error code 501 or 510 for a MGCP command sent from Cisco Unified Communications Manager; MGCP gateway doesn't respond to an MGCP command sent by Unified CM three times; a speed and duplex mismatch exists on the Ethernet port between Unified CM and the MGCP gateway.

Warning

Parameters
Error [String]

Recommended Action
In Cisco Unified CM Administration (System > Cisco Unified CM Group), configure at least one Cisco Unified CM node for the Cisco Unified CM Group referenced in this alarm. The Cisco Unified CM Group is part of the device pool to which the specified phone belongs.
PublishFailed

Publish Failed.

Unified CM attempted to store a number into the IME distributed cache, but the attempt failed. This is typically due to a transient problem in the IME distributed cache. The problem will self-repair under normal conditions. However, you should be aware that, as a consequence of this failure, the E.164 DID listed as part of the alarm will not be present in the IME distributed cache for a brief interval. Consequently, this may delay the amount of time until which you will receive VoIP calls made to that number - they may continue over the PSTN for some callers. It is useful to be aware of this, in case you are trying to understand why a call is not being made over VoIP.

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity
WARNING

Recommended Action
If you notice single small numbers of these alarms in isolation, no action is required on your part. However, a large number of them indicates a problem in the IME distributed cache, most likely due to problems with Internet connectivity. Check your Internet connectivity.

---

**RouteListExhausted**

An available route could not be found in the indicated route list. This alarm is generated when all members' status is unavailable or busy or when the member is down (out of service), not registered, or busy.

**Facility/Sub-Facility**

CCM_CALLMANAGER-CALLMANAGER

**Cisco Unified Serviceability Alarm Definition Catalog**

CallManager/CallManager

**Severity**

Warning (4)

**Parameters**

Route List Name [String]

**Recommended Action**

Consider adding additional routes in the indicated route list. For shared line when some phones are not ringing, check the busy trigger and maximum call settings of shared line phones; check whether there are some outstanding calls on that DN.

When one shared line phone answers an incoming call, the other shared line phone cannot see that remote-in-use call; check the privacy setting of the phone that answers the call.

Try to make a call directly to the member, bypassing the route list, to verify that there is not a device or connectivity issue. If you cannot identify the cause through these steps, gather the CCM (SDI) trace and contact the Cisco Technical Assistance Center; TAC may be able to locate a cause code which may provide additional explanation for this alarm.
**ServiceStartupFailed**

Service startup failure.

System/TFTP

**Severity**

Warning (4)

**Parameters**

**Recommended Action**

You can safely ignore this alarm if the reason shown in this alarm is “File not found” and if that file is the MAC address-based file name for a phone that you are auto-registering; in that case, the phone is not yet registered with the database and so it is normal for the phone's file not be found. In the case that auto-registration is disabled, this alarm shows that the phone or device is not added to Cisco Unified Communications Manager (Cisco Unified CM). Either add the phone to Cisco Unified CM or remove the phone from the network. If you still get this error after removing the phone(s), go to Cisco Unified Serviceability and enable Detailed level traces in the Trace Configuration window for the TFTP service and contact the Cisco Technical Assistance Center (TAC).

**SparePartitionHighWaterMarkExceeded**

The percentage of used disk space in the spare partition has exceeded the configured high water mark. Some of the trace files will be purged until the percentage of used disk space in the spare partition gets below the configured low water mark.

---

**Note**

Spare Partition is not used for Intercompany Media Engine server. So this alert will not be triggered for Intercompany Media Engine.

</table>

---

## SIPTrunkPartiallyISV

Some of the remote peers are not available to handle calls for this SIP Trunk.

The alarm provides a list of available remote peers and a list of unavailable remote peers, where each peer is separated by semicolon. For each available peer, the alarm provides resolved IP address and port number, and hostname or SRV (if configured on SIP trunk). For each unavailable peer, the alarm provides the hostname or SRV (if configured on SIP trunk), resolved IP address, port number, and reason code in the following format: ReasonCodeType=ReasonCode.

The ReasonCodeType depends on a SIP response from remote peer as defined in SIP RFCs (Remote), or depends on a reason code provided by Unified CM (Local).

The examples of possible reason codes include:

- Remote = 503 (“503 Service Unavailable” a standard SIP RFC error code)
- Remote = 408 (“408 Request Timeout” a standard SIP RFC error code)
- Local = 1 (“Request Timeout”)
- Local = 2 (local SIP stack is unable to create a socket connection with remote peer)
- Local = 3 (DNS query failed)

  For Local=3, IP address in the alarm is represented as zero, and when DNS SRV is configured on SIP trunk then port is represented as zero.

CCM_CALLMANAGER-CALLMANAGER

### Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager
Severity
Warning

Routing List
SDL
SDI
Sys Log
Event Log

Parameters
SIP Trunk Name(String)
Unavailable remote peers with Reason Code(String)
Available remote peers for this SIP trunk(String)

Recommended Action
The available peer list is for notification purposes only; no action is required. For unavailable peers, the following corrective action should be taken.

• For Remote = 503, the possible reasons are:
  ◦ Route/SIP trunk for originating side does not exist on remote peer. If remote peer is Unified CM, add a new SIP trunk in Unified CM Administration for the remote peer (Device > Trunk) and ensure the Destination Address and Destination Port fields are configured to point to the originating host (the originating host is the same node on which this alarm was generated). Also ensure the new SIP trunk has the incoming port in associated SIP Trunk Security Profile configured to be the same as originating side SIP Trunk destination port.
  ◦ Route/SIP trunk for originating side does exist on remote peer but port is either used for SIP phone or other SIP trunk. If remote peer is Unified CM, in the Unified CM Administration for the remote peer (Device > Trunk), ensure the incoming port in associated SIP Trunk Security Profile is configured to be same as originating side SIP Trunk destination port.
  ◦ Remote peer has limited resources to handle new calls. If remote peer is administered by a different system administrator, communicate the resource issue with the other administrator.

• For Remote = 408, the possible reason includes:
  ◦ Remote peer has limited resources to handle new calls. If remote peer is administered by a different system administrator, communicate the resource issue with the other administrator.

• For Local = 1, the possible reason could be that no responses are received for OPTIONS request after all retries, when UDP transport is configured in SIP Trunk Security Profile assigned to the SIP trunk on originating side.
To fix this issue, perform the following steps:
  ◦ If remote peer is Unified CM, in the remote peer Serviceability application, choose Tools > Control Center (Feature Services) and ensure the Cisco CallManager service is activated and started.
In the Unified CM Administration for the remote peer, choose **Device > Trunk**, and ensure the SIP trunk exists with the incoming port in associated SIP Trunk Security Profile configured to be same as originating side SIP Trunk destination port.

Check the network connectivity by using the CLI command `utils network ping <remote peer>` at the originating side.

For Local = 2, the possible reason could be that Unified CM is unable to create the socket connection with remote peer.

To fix this issue, perform the following steps:

- If remote peer is Unified CM, in the remote peer Serviceability application, choose **Tools > Control Center** (Feature Services) and ensure the Cisco CallManager service is activated and started.
- In the Unified CM Administration for the remote peer, choose **Device > Trunk**, and ensure the SIP trunk exists with the incoming port in associated SIP Trunk Security Profile configured to be same as originating side SIP Trunk destination port.
- Check the network connectivity by using the CLI command `utils network ping <remote peer>` at the originating side.

For Local = 3, the possible reason could be that DNS server is not reachable, or DNS is not properly configured to resolve the hostname or SRV which is configured on the local SIP trunk.

To fix this issue, perform the following steps:

- In the OS Administration, choose **Show > Network**, and verify that the DNS Details are correct. If it is not correct, then configure the correct DNS server information by using the CLI command `set network dns primary`.
- Check the network connectivity with DNS server by using the CLI command `utils network ping <remote peer>`, and ensure the DNS server is properly configured.

---

**SoftwareLicenseNotValid**

There is no valid software license; the Cisco IP Voice Media Streaming App service requires a valid software license to operate.

TotalProcessesAndThreadsExceededThresholdStart

The current total number of processes and threads has exceeded the maximum number of tasks configured for Cisco RIS Data Collector service parameter. This situation could indicate some process is leaking or some process has thread leaking.

Facility/Sub-Facility
CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
System/System Access

Severity
Warning (4)

Parameters

Recommended Action
Check the Cisco RIS Data Collector service parameter, Maximum Number of Processes and Threads, to see if the parameter has been set to a low value. If it has been, set the value higher or use the default value. Another possible action is that when a new Cisco product is integrated into Cisco Unified Communications Manager (Cisco Unified CM), new processes or threads are added to the system. Even in the normal process load situation, it's possible that the total number of processes and threads has exceeded the configured or default value of the Cisco RIS Data Collector service parameter, Maximum Number of Processes and Threads. Set that parameter to the maximum allowed value.

You can also review the details of this alarm to check the ProcessWithMostThreads description and the ProcessWithMostInstances description to discover which processes have the most threads and the most instances. Determine whether these values are reasonable for this process; if not, contact the owner of the process for troubleshooting the reasons why the thread count or the number of process instances is so high.
It is also possible that Cisco RIS Data Collector sent a false alarm, which would indicate a defect in the Cisco RIS Data Collector service.

To determine if this is the cause of the alarm - after you have checked all the other errors described here - use RTMT to check the System object for performance counters Total Threads and Total Processes to confirm that the values in those counters do not exceed the value configured in the Cisco RIS Data Collector service parameter, Maximum Number of Processes and Threads. If the counters do not show a value that is higher than what is configured in the service parameter, restart Cisco RIS Data Collector service. If the alarm persists after restarting the service, go to Cisco Unified Serviceability and collect trace logs (Trace > Configuration) for Cisco Syslog, Cisco RIS Data Collector, Cisco AMC Service, and Cisco RIS Perfmon Logs and contact Cisco Technical Assistance Center (TAC) for detailed assistance.

**ThreadKillingError**

An error occurred when CMI tried to stop the CMI service.

As a normal part of the process of stopping the CMI service, open threads are closed (killed). This alarm indicates that a timeout has occurred which means that the shutdown process is taking longer than expected, causing the operating system to return an error.

CCM_CALLMANAGER-CALLMANAGER

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
Warning

Parameters
Device Name. [String] Reason Code [Enum]

Recommended Action
For HopCountExceeded alarm, the recommended action is to check that no routing loops exist across the Unified CM trunk interfaces (PRI, intercluster trunk, and so on) and gateway (H.323) devices related to the indicated failed call. By examining trace files and CDR data in all Unified CM nodes and route patterns in gateways (H.323) that are involved in routing of the indicated failed call, you may be able to detect a translation pattern, route list or other routing mechanism that is part of the loop.

Update the routing mechanism that resulted in the loop, and then if the looping route pattern was on a Unified CM, reset the affected route list/pattern in an attempt to clear the route loop; if that fails, reset the affected
trunk/gateway or if the looping route pattern was on a H.323 gateway, restart the gateway. For call failure reason UserUserIEDropped, if the indicated device is an H.323 intercluster trunk then the recommended action is to verify that the Passing Precedence Level Through UEUIE checkbox has been enabled on the Trunk Configuration window. If the indicated device is an MGCP gateway with Device Protocol set to Digital Access PRI and Passing Precedence Level Through UEUIE is enabled on the gateway, then verify that the far-end side of the configured PRI trunk interface supports PRI 4ESS UEUIE-based MLPP and sends the UEUIE message with IEID value set to USER_USER_IE (126) and the User specific protocol ID value set to PRI_4ESS_UUIE_DEFAULT_PROT_DISC (0x00).

Notice-level alarms

The notice-level alarm is 5 and no action is needed unless the information is unexpected. Notifications about interesting system-level conditions which are not error conditions. Informational in nature but having a more important need-to-know status. Examples are:

- System-wide notifications
- Process is shutting down gracefully on request
- Clearing of previously raised conditions
• A device or subsystem un-registering or shutting down for expected and normal reason (for individual phone related expected and normal unregistering or shutting down, informational level should be used)
• Password change notification and upgrade notification

### H323Started

Cisco CallManager is ready to handle calls for the indicated H323 device. Cisco Unified Communications Manager is ready to communicate with the indicated H.323 device. Note that this alarm describes the readiness of Unified CM to communicate with the indicated device, but does not provide information about the state of the H.323 device (whether it is ready to communicate as well).

### Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

**Severity**

Notice
MaxCallDurationTimeout

An active call was cleared because the amount of time specified in the Maximum Call Duration Timer service parameter had elapsed. If the allowed call duration is too short, you can increase the value. If you do not want a limit on the duration of an active call, you can disable the limit. If the duration is correct but you did not expect a call to ever exceed that duration, check the trace information around the time that this alarm occurred to try to determine if a gateway port had failed to release a call.

Cisco Unified Serviceability Alarm Definition Catalog

CallManager/CallManager

Severity

Notice

Parameters

Maximum Call Duration (minutes) [ UInt ]
Originating Device name(String)
Destination Device name(String)
Call start time(UInt)
Call stop time(UInt)
Calling Party Number(String)
Called Party Number(String)

**Recommended Action**

If the duration of the call is too short, increase the value in the Cisco CallManager service parameter or disable the maximum duration by setting the Maximum Call Duration Timer parameter to zero. If you suspect a hung gateway port, check the trace files around the time that this alarm occurred to search for the gateway that was involved in the call, then check the status of that gateway to determine if all ports are functioning normally.

**SDLLinkISV**

SDL link to remote application is restored. This alarm indicates that the local Cisco CallManager has gained communication with the remote Cisco CallManager.

**Note**
The remote Cisco CallManager should also indicate SDLLinkISV with a different LinkID.

SIPNormalizationScriptClosed
Cisco Unified CM has closed the script for the SIP device. The script is closed at one of the following conditions:
  • The indicated device (SIP trunk) was reset manually or automatically.
  • The trunk was deleted manually.
  • Due to script error or resource error or internal error.

When the script is closed, Cisco Unified CM will not invoke normalization script message handlers for the indicated SIP device.

**Parameters**

SIP Trunk Name(String)
Available remote peers for this SIP trunk(String)

**Recommended Action**

Notification purpose only; no action is required.
SMDICmdError

CMI receives an invalid incoming SMDI message.

There are two kinds of incoming messages that Cisco Unified Communications Manager can accept from the voice messaging system; they are OP:MWI(SP)nnnnnnn!(D) and RMV:MWI(SP)nnnnnnn!(D) (where:nnnnnnnn = station number (can be 7 or 10 digits), (D) = End Of Transmission, (SP) = space). The first message activates the message waiting indicator (MWI). The second deactivates the message waiting indicator. CMI triggers this alarm if the received MWI message does not have one of the acceptable formats as described.

</thead>
<tbody>
<tr>
<td>8.0(1)</td>
<td>Name changed from kSMDIMessageError.</td>
</tr>
</tbody>
</table>

Some voice messaging systems send SMDI messages to Cisco Unified Communications Manager (Unified CM) with an invalid DN specifically for the purpose of verifying that Unified CM is functioning properly. In such cases, if the Validate DNs service parameter is set to True, CMI triggers this alarm because the DN cannot be found in the Unified CM database.

TotalProcessesAndThreadsExceededThresholdEnd

The current total number of processes and threads is less than the maximum number of tasks configured in the Cisco RIS Data Collector service parameter, Maximum Number of Processes and Threads. This can occur because a product which was integrated into Cisco Unified Communications Manager has been disabled or deactivated, which reduces the total number of processes and threads running on the system. Another cause for the number of processes or thread to decrease is that one or more processes has been stopped, which reduces the total number of processes and threads running on the system.

Informational-level alarms

The informational-level of alarm is 6 and no action is needed. Informational messages provide historical data such as internal flows of the application or per-request information. Informational messages are used for troubleshooting by users who are familiar with the basic flows of the application. An example would be a normal (expected) event occurred that the customer may want to be notified about.

AdministrativeEvent

Failed to write into the primary file path. Audit Event is generated by this application.

DeviceApplyConfigInitiated

Device Apply Config initiated.

This alarm occurs when a system administrator presses the Apply Config button in Cisco Unified Communications Manager (Unified CM). The Apply Config button initiates a conditional restart on devices that support conditional restart. This button triggers the system to determine if any relevant configuration has changed for the device. If the configuration changes can be applied dynamically, they are made without service interruption. If a change requires that the device reregister with Unified CM, reregistration occurs automatically. If a change requires a restart, the device will be automatically restarted. If the load ID for a device changes, the device will initiate a background download of the new firmware. The new firmware can then be applied immediately or at a later time. For phones and devices that do not support conditional restart, clicking Apply Config causes these devices to restart.

**DeviceResetInitiated**

Device reset initiated on the specified device.

This alarm occurs when a device is reset via the Reset button in Cisco Unified CM Administration. Reset may cause the device to shut down and come back in service. A device can be reset only when it is registered with Cisco Unified Communications Manager.

Device Restart Initiated

Device restart initiated or Apply Config initiated on the specified device.

This alarm occurs when a device is restarted via the Restart button in Cisco Unified CM Administration window or when a system administrator presses the Apply Config button for a device that does not support conditional restart. Restart causes the device to unregister, receive updated configuration, and reregister with Cisco Unified Communications Manager (Unified CM) without shutting down. A device can be restarted only when it is registered with Unified CM.

## EndPointRestartInitiated

Device restart initiated or Apply Config initiated on the specified device.

This alarm occurs when a device is restarted via the Restart button in Cisco Unified CM Administration window or when a system administrator presses the Apply Config button for a device that does not support conditional restart. Restart causes the device to unregister, receive an updated configuration file, and reregister with Cisco Unified Communications Manager (Unified CM) without shutting down. A device can be restarted only when it is registered with Unified CM.

Completion of publication of published DID patterns.
This alarm is generated when Unified CM completes a publication of the DID patterns into the IME network.

Cisco Unified Serviceability Alarm Definition Catalog
CallManager/CallManager

Severity
INFORMATIONAL

Recommended Action
This alarm is provided for historic and informational purposes. It can be used to give you feedback that the system is working and is correctly publishing numbers into the IME network. It can also be used for troubleshooting. If some of the publishes fail for some reason, the alarm will contain a list of those numbers which were not published. If your users are receiving calls, and they are not over IP but you think they ought to be, you can check the history of these alarms to see if the number failed to be published into the network.

**RouteRemoved**

Route removed automatically.

This alarm is generated when UC Manager removes a route from its routing tables because the route is stale and has expired, or because the far end has indicated the number is no longer reachable at that domain.

Event Log

Parameter(s)
E.164 number(String)
Domain name(String)
Route learned time(String)
Reason Code(Enum)

Recommended Action
This alarm is provided for historic and informational purposes. It helps you understand why certain numbers are in your routing tables, and why others are not. This historical information is useful to help determine why a call to a particular number is not going over IP, when you expect it to.

SAFPublishRevoke

A CLI command revoked the publish action for the specified service or subservice ID.
A system administrator issued a CLI command on the SAF Forwarder router to revoke the publish action for the service or subservice ID specified in this alarm.

Parameter(s)
Client Handle(String)
Service ID(UInt)
Sub Service ID(UInt)
InstanceID1(UInt)
InstanceId2(UInt)
InstanceId3(UInt)
InstanceId4(UInt)

Recommended Action
Informational purposes only; no action is required.

SAFUnknownService
Unified CM does not recognize the service ID in a publish revoke or withdraw message.
Unified CM received a Publish Revoke message or Withdraw message from the SAF Forwarder but the service ID in the message is not recognized by Unified CM. Unified CM may not recognize the service ID if the service ID was mistyped in the publish revoke CLI command, or if the service was previously withdrawn.

Reason Code Enum definitions for StationConnectionError

<table>
<thead>
<tr>
<th>Code</th>
<th>Reason</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>deviceInitiatedReset—The device has initiated a reset, possibly due to a power cycle or internal error. No action required; the device will reregister automatically.</td>
</tr>
<tr>
<td>1</td>
<td>sccpDeviceThrottling—(SCCP only) The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device. Events can be phone calls, KeepAlive messages, or excessive SCCP or non-SCCP messages. The maximum number of allowed events is controlled by the Cisco CallManager service parameter, Max Events Allowed. When an individual device exceeds the number configured in that service parameter, Unified CM closes the TCP connection to the device; automatic reregistration generally follows. This action is an attempt to stop malicious attacks on Unified CM or to ward off excessive CPU usage. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>2</td>
<td>keepAliveTimeout—Unified CM did not receive a KeepAlive message from the device. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops and packet corruption. It is also possible to get this error if the Unified CM node is experiencing high CPU usage. Verify the device is powered up and operating, verify network connectivity between the device and Unified CM, and verify the CPU utilization is in the safe range (this can be monitored using RTMT via CPU Pegging Alert). No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>3</td>
<td>dbChangeNotify—An ApplyConfig command was invoked from Unified CM Administration resulting in an unregistration. No action necessary, the device will reregister automatically.</td>
</tr>
<tr>
<td>4</td>
<td>deviceRegistrationSuperceded—An initial device registration request was received but authentication had not yet completed before a new registration request was received. The first registration request was discarded and reregistration should proceed normally. No action is required, the device will reregister automatically.</td>
</tr>

CHAPTER 6

Cisco Management Information Base

This chapter describes the Management Information Base (MIB) text files that are supported by Cisco Unified Communications Manager (Cisco Unified CM) and are used with Simple Network Management Protocol (SNMP).

- CISCO-CCM-MIB, page 655
- CISCO-CCM-CAPABILITY, page 807
- CISCO-CDP-MIB, page 814
- CISCO-SYSLOG-MIB, page 834
- CISCO-SYSLOG-EXT-MIB, page 844

CISCO-CCM-MIB

This is a reformatted version of CISCO-CCM-MIB. Download and compile all of the MIBs in this section from http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.

This MIB manages the Cisco Unified Communications Manager (Cisco Unified CM) application running with a Cisco Communication Network (CCN) system. Cisco Unified CM is an IP-PBX that controls the call processing of a VoIP network.

A CCN system comprises multiple regions, with each region consisting of several Cisco Unified CM groups with multiple Cisco Unified CM servers. The MIB can be used by the Cisco Unified CM application, Cisco Unified CM Administration, to present provision and statistics information.

The following terminology applies to this MIB:

- SCCP—Skinny Client Control Protocol
- SIP—Session Initiation Protocol
- TLS—Transport Layer Security
- MGCP—Media Gateway Control Protocol
Before you can compile CISCO-CCM-MIB, you need to download and compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
3. SNMPv2-CONF
4. CISCO-SMI
5. INET-ADDRESS-MIB
6. SNMP-FRAMEWORK-MIB
7. RFC1155-SMI
8. RFC1212
9. SNMPv2-TC-v1
10. CISCO-CCM-MIB

Additional downloads are:
   • OID File: CISCO-CCM-MIB.OID
   • Capability File: CISCO-CCM-CAPABILITY

**CISCO-CCM-MIB revisions**

The following table lists the revisions to this MIB beginning with the latest revision first.

*Table 129: History of CISCO-CCM-MIB revisions*

### CISCO-CCM-MIB definitions

The following definitions are imported for CISCO-CCM-MIB:

- MODULE-IDENTITY, OBJECT-TYPE, NOTIFICATION-TYPE, IpAddress, Counter32, Integer32, Unsigned32
- From SNMPv2-SMI—DateAndTime, TruthValue, MacAddress, TEXTUAL-CONVENTION
- From SNMPv2-TC—SnmpAdminString
- From SNMP-FRAMEWORK-MIB—MODULE-COMPLIANCE, OBJECT-GROUP, NOTIFICATION-GROUP
• From SNMPv2-CONF—ciscoMgmt
• From CISCO-SMI—InetAddressType, InetAddress, InetPortNumber
• From INET-ADDRESS-MIB

**CISCO-CCM-MIB textual conventions**

**CcmlIndex ::= TEXTUAL-CONVENTION**

DISPLAY-HINT d
STATUS current
DESCRIPTION
This syntax is used as the Index into a table. A positive value is used to identify a unique entry in the table.
SYNTAX Unsigned32(1..4294967295)

**CcmlIndexOrZero ::= TEXTUAL-CONVENTION**

DISPLAY-HINT d
STATUS current
DESCRIPTION
This textual convention is an extension of the CcmIndex convention. The latter defines a greater than zero to identify an entry of the CCM MIB table in the managed system. This extension permits the additional value of zero. The value zero is object-specific and must be defined as part of the description of any object that uses this syntax.
SYNTAX Unsigned32 (0..4294967295)
CcmDevRegFailCauseCode ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
This syntax is used as means of identifying the reasons for a device registration failure. The scope of this enumeration can expand to comply with RFC 2578.

noError: No Error
unknown: Unknown error cause
noEntryInDatabase: Device not configured properly in the Cisco Unified CM database
databaseConfigurationError: Device configuration error in the Cisco Unified CM database
deviceNameUnresolvable: The Cisco Unified CM is unable to resolve the device name to an IP Address internally
maxDevRegExceeded: Maximum number of device registrations have been reached
connectivityError: Cisco Unified CM is unable to establish communication with the device during registration
initializationError: Indicates an error occurred when the Cisco Unified CM tries to initialize the device
deviceInitiatedReset: Indicates that the error was due to device initiated reset
callManagerReset: Indicates that the error was due to Cisco Unified CM reset
authenticationError: Indicates mismatch between configured authentication mode and the authentication mode that the device is using to connect to the Cisco Unified CM
invalidX509NameInCertificate: Indicates mismatch between the peer X.509 certificate subject name and what is configured for the device
invalidTLSCipher: Indicates Cipher mismatch during TLS handshake process
directoryNumberMismatch: Indicates mismatch between the directory number that the SIP device is trying to register with and the directory number configured in the Cisco Unified CM for the SIP device
malformedRegisterMsg: Indicates that SIP device attempted to register with Cisco Unified CM, but the REGISTER message contained formatting errors
protocolMismatch: The protocol of the device (SIP or SCCP) does not match the configured protocol in Cisco Unified CM
deviceNotActive: The device has not been activated
authenticatedDeviceAlreadyExists: A device with the same name is already registered with Cisco Unified CM
obsoleteProtocolVersion: The SCCP device registered with an obsolete protocol version
databaseTimeout: Cisco Unified CM requested device configuration data from the database but did not receive a response within 10 minutes
registrationSequenceError: (SCCP only) A device requested configuration information from the Cisco Unified CM at an unexpected time. The Cisco Unified CM had not yet obtained the requested information. The device will automatically attempt to register again. If this alarm occurs again, manually reset the device. If this alarm continues to occur after the manual reset, there may be an internal firmware error
invalidCapabilities: (SCCP only) The Cisco Unified CM detected an error in the media capabilities reported in the StationCapabilitiesRes message by the device during registration. The device will automatically attempt to register again. If this alarm occurs again, manually reset the device. If this
alarm continues to occur after the manual reset, there may be a protocol error

capabilityResponseTimeout: (SCCP only) The Cisco Unified CM timed out while waiting for the device
to respond to a request to report its media capabilities. Possible causes include device power outage,
network power outage, network configuration error, network delay, packet drops, and packet corruption.
It is also possible to get this error if the Cisco Unified CM node is experiencing high CPU usage. Verify
that the device is powered up and operating. Verify that network connectivity exists between the device
and Cisco Unified CM, and verify that the CPU utilization is in the safe range

securityMismatch: The Cisco Unified CM detected a mismatch in the security settings of the device and/or the Cisco Unified CM. The mismatches that can be detected are:

- The device established a secure connection, yet reported that it does not have the ability to do
  authenticated signaling.
- The device did not establish a secure connection, but the security mode configured for the device
  indicates that it should have done so.
- The device established a secure connection, but the security mode configured for the device
  indicates that it should not have done so.

autoRegisterDBError—Auto-registration of a device failed for one of the following reasons:

- Auto-registration is not allowed for the device type.
- An error occurred while adding the auto-registering device to the database (stored procedure).

dbAccessError: Device registration failed because of an error that occurred while building the station
registration profile. This usually indicates a synchronization problem with the database

autoRegisterDBConfigTimeout: (SCCP only) The Cisco Unified CM timed out during auto-registration
of a device. The registration profile of the device did not get inserted into the database in time. The
device will automatically attempt to register again

deviceTypeMismatch: The device type reported by the device does not match the device type configured
on the Cisco Unified CM addressing

ModeMismatch: (SCCP only) The Cisco Unified CM detected an
error related to the addressing mode configured for the device. One of the following errors were detected:

- The device is configured to use only IPv4 addressing, but did not specify an IPv4 address.
- The device is configured to use only IPv6 addressing, but did not specify an IPv6 address.

SYNTAX INTEGER {

CcmDevUnregCauseCode ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
This syntax is used as means of identifying the reasons for a device getting unregistered. The scope of this enumeration can expand to comply with RFC 2578.

noError: No Error
unknown: Unknown error cause
noEntryInDatabase: Device not configured properly in the Cisco Unified CM database
databaseConfigurationError: Device configuration error in the Cisco Unified CM database
deviceNameUnresolvable: The Cisco Unified CM is unable to resolve the device name to an IP Address internally
maxDevRegExceeded: Maximum number of device registrations have been reached
connectivityError: Cisco Unified CM is unable to establish communication with the device during registration
initializationError: Indicates that an error occurred when the Cisco Unified CM tries to initialize the device
deviceInitiatedReset: Indicates that the error was due to device initiated reset
callManagerReset: Indicates that the error was due to Cisco Unified CM reset.
deviceUnregistered: DeviceUnregistered.
malformedRegisterMsg: Indicates that SIP device attempted to register with Cisco Unified CM, but the REGISTER message contained formatting errors.
sccpDeviceThrottling: The indicated SCCP device exceeded the maximum number of events allowed per-SCCP device.
keepAliveTimeout: A KeepAlive message was not received. Possible causes include device power outage, network power outage, network configuration error, network delay, packet drops, packet corruption and Cisco Unified CM node experiencing high CPU usage.
configurationMismatch: The configuration on the SIP device does not match the configuration in Cisco Unified CM.
callManagerRestart: A device restart was initiated from Cisco Unified CM Administration, either due to an explicit command from an administrator or due to a configuration change such as adding, deleting or changing a directory number associated with the device.
duplicateRegistration: Cisco Unified CM detected that the device attempted to register to two nodes at the same time. Cisco Unified CM initiated a restart to the phone to force it to re-home to a single node.
callManagerApplyConfig: Cisco Unified CM configuration is changed.
deviceNoResponse: Device is not responding Service Control Notify from Cisco Unified CM.
emLoginLogout: The device has been unregistered due to an Extension Mobility login or logout.
emccLoginLogout: The device has been unregistered due to an Extension Mobility Cross Cluster login or logout.
powerSavePlus: The device powered off as a result of the Power Save Plus feature that is enabled for this device. When the device powers off, it remains unregistered from Cisco Unified CM until the Phone On Time defined in the Product Specific Configuration for this device.
callManagerForcedRestart: (SIP Only) The device did not respond to an Apply Config request and as a result, Cisco Unified CM had sent a restart request to the device. The device may be offline due to a power outage or network problem. Confirm that the device is powered-up and that network connectivity exists between the device and Cisco Unified CM.

deviceIPAddrChanged: (SIP Only) The device has been unregistered because the IP address in the Contact header of the REGISTER message has changed. The device will be automatically reregistered. No action is necessary.

devicePortChanged: (SIP Only) The device has been unregistered because the port number in the Contact header of the REGISTER message has changed. The device will be automatically reregistered. No action is necessary.

registrationSequenceError: (SCCP only) A device requested configuration information from the Cisco Unified CM at an unexpected time. The Cisco Unified CM no longer had the requested information in memory.

invalidCapabilities: (SCCP only) The Cisco Unified CM detected an error in the updated media capabilities reported by the device. The device reported the capabilities in one of the StationUpdateCapabilities message variants.

fallbackInitiated: The device has initiated a fallback and will automatically reregister to a higher-priority Cisco Unified CM. No action is necessary.

deviceSwitch: A second instance of an endpoint with the same device name has registered and assumed control. No action is necessary.

CcmDeviceStatus ::= TEXTUAL-CONVENTION
STATUS current
DESCRIPTION
This syntax is used to identify the registration status of a device with the local Cisco Unified CM. The
status is as follows:
• unknown—The registration status of the device is unknown
• registered—The device has successfully registered with the local Cisco Unified CM.
• unregistered—The device is no longer registered with the local Cisco Unified CM.
• rejected—Registration request from the device was rejected by the local Cisco Unified CM.
• partiallyregistered—At least one but not all of the lines are successfully registered to the Cisco
Unified CM. Applicable only to SIP Phones.

SYNTAX INTEGER { unknown (1), registered (2), unregistered (3), rejected (4), partiallyregistered (5)}
CcmPhoneProtocolType ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
  This syntax is used to identify the protocol between phone and Cisco Unified CM. The protocols are as follows:
  • unknown—The phone protocol is unknown
  • sccp—The phone protocol is SCCP
  • sip—The phone protocol is SIP
  SYNTAX INTEGER { unknown(1), sccp (2), sip(3) }

CcmDeviceLineStatus ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
  This syntax is used to identify the registration status of a line of the device with the local Cisco Unified CM. The status is as follows:
  • unknown—The registration status of the device line is unknown
  • registered—The device line has successfully registered with the local Cisco Unified CM.
  • unregistered—The device line is no longer registered with the local Cisco Unified CM.
  • rejected—Registration request from the device line was rejected by the local Cisco Unified CM.
  SYNTAX INTEGER { unknown (1), registered(2), unregistered (3), rejected (4) }

CcmSIPTransportProtocolType ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
  This textual convention defines the possible transport protocol types that are used for setting up SIP calls unknown. The possible transport types are:
  • unknown—The SIP Trunk transport type is unknown
  • tcp—The SIP Trunk transport type is tcp
  • udp—The SIP Trunk transport type is udp
  • tcpAndUdp—The SIP Trunk transport type is tcp and udp
  • tls—Applicable only for InTransportProtocolType is tls. The SIP Trunk transport type is tls.
  SYNTAX INTEGER { unknown(1), tcp(2), udp(3), tcpAndUdp (4), tls(5) }

CISCO-CCM-MIB tables

Cisco Unified CM Group table

ccmGroupTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmGroupEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the CallManager groups in a Cisco Unified CM cluster.
 ::= { ccmGeneralInfo 1 }
ccmGroupEntry OBJECT-TYPE
SYNTAX CcmGroupEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the CallManager Group table, containing the information about a CallManager group in a Cisco Unified CM cluster. An entry is created to represent a CallManager Group. New entries to the CallManager Group table in the database are created when the User inserts a new CallManager Group via the CallManager Web Admin pages. This entry is subsequently picked up by the Cisco Unified CM SNMP Agent.
INDEX { ccmGroupIndex }
::= { ccmGroupTable 1 }

CcmGroupEntry
::= SEQUENCE
{
    ccmGroupIndex CcmIndex,
    ccmGroupName SnmpAdminString,
    ccmGroupTftpDefault TruthValue
}

ccmGroupIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM that uniquely identifies a Cisco Unified CM Group.
::= { ccmGroupEntry 1 }

ccmGroupName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The name of the Cisco Unified CM Group.
::= { ccmGroupEntry 2 }
ccmGroupTftpDefault OBJECT-TYPE
   SYNTAX TruthValue
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Whether this is the default TFTP server group or not.
   ::= { ccmGroupEntry 3 }

Cisco Unified CM table

ccmTable OBJECT-TYPE
   SYNTAX SEQUENCE of CcmEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The table containing information of all the Cisco Unified CMs in a Cisco Unified CM cluster that the local Cisco Unified CM knows about. When the local Cisco Unified CM is restarted, this table will be refreshed.
   ::= { ccmGeneralInfo 2 }
**ccmEntry OBJECT-TYPE**

SYNTAX CcmEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An entry (conceptual row) in the CallManager table, containing the information about a CallManager.

INDEX { ccmIndex }

::= { ccmTable 1 }

CcmEntry ::= SEQUENCE {

ccmIndex CcmIndex,

ccmName SnmpAdminString,

ccmDescription SnmpAdminString,

ccmVersion SnmpAdminString,

ccmStatus Integer,

ccmInetAddressType InetAddressType,

ccmInetAddress InetAddress,

ccmClusterId SnmpAdminString,

ccmInetAddress2Type InetAddressType,

ccmInetAddress2 InetAddress

}

**ccmIndex OBJECT-TYPE**

SYNTAX CcmIndex

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a CallManager in a Cisco Unified CM cluster.

::= { ccmEntry 1 }
ccmName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The host name of the CallManager.
::= { ccmEntry 2 }

ccmDescription OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The description for the CallManager.
::= { ccmEntry 3 }

ccmVersion OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..24))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The version number of the CallManager software.
::= { ccmEntry 4 }
**ccmStatus** OBJECT-TYPE

SYNTAX INTEGER

{
  unknown(1),
  up(2),
  down(3)
}

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The current status of the CallManager. A CallManager is up if the SNMP Agent received a system up event from the local Cisco Unified CM:

- unknown: Current status of the CallManager is Unknown
- up: CallManager is running and is able to communicate with other CallManagers
- down: CallManager is down or the Agent is unable to communicate with the local CallManager.

::= { ccmEntry 5 }

**ccmInetAddressType** OBJECT-TYPE

SYNTAX InetAddressType

MAX-ACCESS read-only

STATUS current

DESCRIPTION

This object identifies the IP address type of the Cisco Unified CM defined in ccmInetAddress.

::= { ccmEntry 6 }

**ccmInetAddress** OBJECT-TYPE

SYNTAX InetAddress

MAX-ACCESS read-only

STATUS current

DESCRIPTION

This object identifies IP address of the Cisco Unified CM. The type of address for this is identified by ccmInetAddressType.

::= { ccmEntry 7 }
ccmClusterId OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The unique ID of the Cluster to which this Cisco Unified CM belongs. At any point in time, the Cluster ID helps in associating a Cisco Unified CM to any given Cluster.
::= { ccmEntry 8 }

ccmInetAddress2Type OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies IP address type of the Cisco Unified Communications Manager defined in ccmInetAddress2.
::= { ccmEntry 9 }

ccmInetAddress2 OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the additional IP(v4/v6) address details of Cisco Unified Communications Manager. The type of address for this object is identified by ccmInetAddress2Type.
::= { ccmEntry 10 }

Cisco Unified CM Group Mapping table

ccmGroupMappingTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmGroupMappingEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all CallManager to group mappings in a Cisco Unified CM cluster. When the local Cisco Unified CM is down, this table will be empty.
::= { ccmGeneralInfo 3 }
ccmGroupMappingEntry OBJECT-TYPE
SYNTAX CcmGroupMappingEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the CallManager group Mapping table, containing the information about a mapping between a CallManager and a CallManager group.
INDEX { ccmGroupIndex, ccmIndex }
::= { ccmGroupMappingTable 1 }
CcmGroupMappingEntry ::= SEQUENCE {
ccmCMGroupMappingCMPriority Unsigned32
}

ccmCMGroupMappingCMPriority OBJECT-TYPE
SYNTAX Unsigned32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The priority of the CallManager in the group. Sets the order of the CallManager in the list.
::= { ccmGroupMappingEntry 1 }

Cisco Unified CM Region table

ccmRegionTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmRegionEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all geographically separated regions in a CCN system.
::= { ccmGeneralInfo 4 }
ccmRegionEntry OBJECT-TYPE
   SYNTAX CcmRegionEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry (conceptual row) in the Region Table, containing the information about a region.
   INDEX { ccmRegionIndex }
   ::= { ccmRegionTable 1 }
   CcmRegionEntry ::= SEQUENCE {
      ccmRegionIndex CcmIndex,
      ccmRegionName SnmpAdminString
   }

ccmRegionIndex OBJECT-TYPE
   SYNTAX CcmIndex
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a Region Name in the table.
   ::= { ccmRegionEntry 1 }

ccmRegionName OBJECT-TYPE
   SYNTAX SnmpAdminString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The name of the CallManager region.
   ::= { ccmRegionEntry 2 }
Cisco Unified CM Region Pair table

ccmRegionPairTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmRegionPairEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all geographical region pairs defined for a Cisco Unified CM cluster. The pair consists of the Source region and Destination region.
::= { ccmGeneralInfo 5 }

ccmRegionPairEntry OBJECT-TYPE
SYNTAX CcmRegionPairEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the Region Pair Table, containing the information about bandwidth restrictions when communicating between the two specified regions.
INDEX { ccmRegionSrcIndex, ccmRegionDestIndex }
::= { ccmRegionPairTable 1 }
CcmRegionPairEntry ::= SEQUENCE {
ccmRegionSrcIndex CcmIndex,
ccmRegionDestIndex CcmIndex,
ccmRegionAvailableBandWidth INTEGER
}

ccmRegionSrcIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The index of the Source Region in the Region table.
::= { ccmRegionPairEntry 1 }
**ccmRegionDestIndex OBJECT-TYPE**

SYNTAX CcmIndex

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

The index of the Destination Region in the Region table.

::= { ccmRegionPairEntry 2 }

**ccmRegionAvailableBandWidth OBJECT-TYPE**

SYNTAX INTEGER {

    unknown(1),
    other(2),
    bwG723(3),
    bwG729(4),
    bwG711(5),
    bwGSM(6),
    bwWideband(7)
}

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The maximum available bandwidth between the two given regions.

    unknown: Unknown Bandwidth
    other: Unidentified Bandwidth
    bwG723: For low bandwidth using G.723 codec
    bwG729: For low bandwidth using G.729 codec
    bwG711: For high bandwidth using G.711 codec
    bwGSM: For GSM bandwidth 13K
    bwWideband: For Wideband 256K.

::= { ccmRegionPairEntry 3 }
Cisco Unified CM Time Zone table

ccmTimeZoneTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmTimeZoneEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all time zone groups in a call manager cluster.
::= { ccmGeneralInfo 6 }

ccmTimeZoneEntry OBJECT-TYPE
SYNTAX CcmTimeZoneEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the time zone Table, containing the information about a particular time zone group.
INDEX { ccmTimeZoneIndex }
::= { ccmTimeZoneTable 1 }

   CcmTimeZoneEntry ::= SEQUENCE {
       ccmTimeZoneIndex CcmIndex,
       ccmTimeZoneName SnmpAdminString,
       ccmTimeZoneOffset Integer32,
       ccmTimeZoneOffsetHours Integer32,
       ccmTimeZoneOffsetMinutes Integer32
   }

ccmTimeZoneIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a Time Zone group entry in the table.
::= { ccmTimeZoneEntry 1 }
**Device Pool table**

**ccmDevicePoolTable** OBJECT-TYPE

SYNTAX SEQUENCE OF CcmDevicePoolEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

The table containing the list of all device pools in a call manager cluster. A Device Pool contains Region, Date/Time Group and CallManager Group criteria that will be common among many devices.

::= { ccmGeneralInfo 7 }
**ccmDevicePoolEntry** OBJECT-TYPE

SYNTAX CcmDevicePoolEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An entry (conceptual row) in the device pool Table, containing the information about a particular device pool.

INDEX { ccmDevicePoolIndex }

 ::= { ccmDevicePoolTable 1 }

CcmDevicePoolEntry

 ::= SEQUENCE {
      ccmDevicePoolIndex CcmIndex, ccmDevicePoolName SnmpAdminString, ccmDevicePoolRegionIndex CcmIndexOrZero, ccmDeviceTimeZoneIndex CcmIndexOrZero, ccmDevicePoolGroupIndex CcmIndexOrZero
  }

**ccmDevicePoolIndex** OBJECT-TYPE

SYNTAX CcmIndex

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a Device Pool entry in the table. Each entry contains Region, Date/Time Group and CallManager Group criteria that will be common among many devices, for that entry.

 ::= { ccmDevicePoolEntry 1 }

**ccmDevicePoolName** OBJECT-TYPE

SYNTAX SnmpAdminString (SIZE (0..128))

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The name of the device pool.

 ::= { ccmDevicePoolEntry 2 }
ccmDevicePoolRegionIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the Region to which this Device Pool entry belongs. A value of zero indicates that the index to the Region table is Unknown.
::= { ccmDevicePoolEntry 3 }

ccmDevicePoolTimeZoneIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the TimeZone to which this Device Pool entry belongs. A value of zero indicates that the index to the TimeZone table is Unknown.
::= { ccmDevicePoolEntry 4 }

ccmDevicePoolGroupIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the CallManager Group to which this Device Pool entry belongs. A value of zero indicates that the index to the CallManager Group table is Unknown.
::= { ccmDevicePoolEntry 5 }

Cisco Unified CM Product Type table
ccmProductTypeTable OBJECT-TYPE
SYNTAX CcmProductTypeEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of product types supported in a call manager cluster. The product types will include the list of phone types, gateway types, media device types, H323 device types, CTI device types, Voice Messaging device types and SIP device types.
::= { ccmGeneralInfo 8 }
**ccmProductTypeEntry OBJECT-TYPE**

SYNTAX CcmProductTypeEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An entry (conceptual row) in the ccmProductTypeTable, containing the information about a product type supported in a call manager cluster. An entry is created to represent a product type.

INDEX { ccmProductTypeIndex }

 ::= { ccmProductTypeTable 1 }

CcmProductTypeEntry ::= SEQUENCE {

  ccmProductTypeIndex CcmIndex,
  ccmProductType Unsigned32,
  ccmProductName SnmpAdminString,
  ccmProductCategory INTEGER

}

**ccmProductTypeIndex OBJECT-TYPE**

SYNTAX CcmIndex

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies an entry in the ccmProductTypeTable.

 ::= { ccmProductTypeEntry 1 }

**ccmProductType OBJECT-TYPE**

SYNTAX Unsigned32

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The type of the product as defined in the Cisco Unified CM database.

 ::= { ccmProductTypeEntry 2 }
ccmProductName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..100))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The name of the product as defined in the Cisco Unified CM database.
::= { ccmProductTypeEntry 3 }

ccmProductCategory OBJECT-TYPE
SYNTAX INTEGER {
unknown(-1),
notApplicable(0),
phone(1),
gateway(2),
h323Device(3),
ctiDevice(4),
voiceMailDevice(5),
mediaResourceDevice(6),
huntListDevice(7),
sipDevice(8)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The category of the product.
unknown: Unknown product category
notApplicable: Not Applicable
phone: Phone
gateway: Gateway
h323Device: H323 Device
ctiDevice: CTI Device
voiceMailDevice: Voice Messaging Device
mediaResourceDevice: Media Resource Device
huntListDevice: Hunt List Device
sipDevice: SIP Device.
::= { ccmProductTypeEntry 4 }
Phone table

ccmPhoneTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmPhoneEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all IP Phone devices that have tried to register with the local Cisco Unified CM at least once. When the local Cisco Unified CM is restarted, this table will be refreshed.
::= { ccmPhoneInfo 1 }
ccmPhoneEntry OBJECT-TYPE
SYNTAX CcmPhoneEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the phone Table, containing information about a particular phone device.
INDEX { ccmPhoneIndex }
::= { ccmPhoneTable 1 }
CcmPhoneEntry ::= SEQUENCE {
ccmPhoneIndex CcmIndex,
ccmPhonePhysicalAddress MacAddress,

ccmPhoneUnregReason CcmDevUnregCauseCode,
ccmPhoneRegFailReason CcmDevRegFailCauseCode
}
ccmPhoneIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a Phone within
the Cisco Unified CM.
::= { ccmPhoneEntry 1 }

ccmPhonePhysicalAddress OBJECT-TYPE
SYNTAX MacAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The physical address(MAC address) of the IP phone.
::= { ccmPhoneEntry 2 }

ccmPhoneDescription OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The description of the phone.
::= { ccmPhoneEntry 4 }

ccmPhoneUserName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The name of the user of the phone. When the phone is not in use, the name would refer to the last known
user of the phone.
::= { ccmPhoneEntry 5 }
ccmPhoneStatus OBJECT-TYPE
SYNTAX CcmDeviceStatus
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The status of the phone. The status of the Phone changes from Unknown to registered when it registers itself with the local Cisco Unified CM.
::= { ccmPhoneEntry 7 }

ccmPhoneTimeLastRegistered OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time when the phone last registered with the Cisco Unified CM.
::= { ccmPhoneEntry 8 }

ccmPhoneE911Location OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The E911 location of the phone.
::= { ccmPhoneEntry 9 }

ccmPhoneLoadID OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the configured load ID for the phone device.
::= { ccmPhoneEntry 10 }
**ccmPhoneDevicePoolIndex** 
OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the Device Pool to which this Phone entry belongs. A value of 0 indicates that the index to the Device Pool table is Unknown.
::= { ccmPhoneEntry 13 }

**ccmPhoneInetAddressType** 
OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION
This object identifies the IP address type of the phone.
::= { ccmPhoneEntry 14 }

**ccmPhoneInetAddress** 
OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the last known IP address of the phone. The type of address for this is identified by ccmPhoneInetAddressType.
::= { ccmPhoneEntry 15 }

**ccmPhoneTimeLastStatusUpdt** 
OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the status of the phone changed.
::= { ccmPhoneEntry 17 }
ccmPhoneProductTypeIndex OBJECT-TYPE
   SYNTAX CcmIndexOrZero
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of 0 indicates that the index to the ccmProductTypeTable is Unknown.
   ::= { ccmPhoneEntry 18 }

ccmPhoneProtocol OBJECT-TYPE
   SYNTAX CcmPhoneProtocolType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The protocol used between the phone and Cisco Unified CM.
   ::= { ccmPhoneEntry 19 }

ccmPhoneName OBJECT-TYPE
   SYNTAX SnmpAdminString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The name of the phone. The name of the phone can be <prefix> + MAC Address, where <prefix> is SEP for Cisco SCCP and SIP Phones. In the case of other phones such as communicator (soft phone) it can be free-form name, a string that uniquely identifies the phone.
   ::= { ccmPhoneEntry 20 }

ccmPhoneInetAddressIPv4 OBJECT-TYPE
   SYNTAX InetAddressIPv4
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the last known primary IPv4 address of the Phone Device. This object contains value zero if IPV4 address is not available.
   ::= { ccmPhoneEntry 21 }
ccmPhoneInetAddressIPv6 OBJECT-TYPE
   SYNTAX InetAddressIPv6
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the last known primary IPv6 address of the Phone device. This object contains value zero if IPV6 address is not available.
   ::= { ccmPhoneEntry 22 }

ccmPhoneIPv4Attribute OBJECT-TYPE
   SYNTAX INTEGER {
   unknown(0),
   adminOnly(1),
   controlOnly(2),
   adminAndControl(3)
   }
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the scope of ccmPhoneInetAddressIPv4. unknown(0): It is not known if ccmPhoneInetAddressIPv4 is used for Administration purpose or Controlling purpose.
   adminOnly(1): ccmPhoneInetAddressIPv4 is used for the serviceability or administrative purpose.
   controlOnly(2): ccmPhoneInetAddressIPv4 is used for signaling or registration purpose.
   adminAndControl(3): ccmPhoneInetAddressIPv4 is used for controlling as well as administrative purpose.
   ::= { ccmPhoneEntry 23 }
ccmPhoneIPv6Attribute OBJECT-TYPE
SYNTAX INTEGER {
  unknown(0),
  adminOnly(1),
  controlOnly(2),
  adminAndControl(3)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the scope of ccmPhoneInetAddressIPv6.
unknown(0): It is not known if ccmPhoneInetAddressIPv6 is used for Administration purpose or Controlling purpose.
adminOnly(1): ccmPhoneInetAddressIPv6 is used for the serviceability or administrative purpose.
controlOnly(2): ccmPhoneInetAddressIPv6 is used for signaling or registration purpose.
adminAndControl(3): ccmPhoneInetAddressIPv6 is used for controlling as well as administrative purpose.
 ::= { ccmPhoneEntry 24 }

ccmPhoneActiveLoadID OBJECT-TYPE
SYNTAX SnmpAdminString
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the ID of actual load that is successfully loaded and running on the phone device. If the phone is successfully upgraded to the new load then ccmPhoneLoadID and ccmPhoneActiveLoadID will have same value. If the upgrade fails then the ccmPhoneLoadID has the configured load ID and ccmPhoneActiveLoadID has the actual load ID that is running on the phone.
 ::= { ccmPhoneEntry 25 }

ccmPhoneUnregReason OBJECT-TYPE
SYNTAX CcmDevUnregCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with unregistered phone.
 ::= { ccmPhoneEntry 26 }
**ccmPhoneRegFailReason** OBJECT-TYPE
SYNTAX CcmDevRegFailCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with registration failed phone.
::= { ccmPhoneEntry 27 }

**Phone Failed table**

**ccmPhoneFailedTable** OBJECT-TYPE
SYNTAX SEQUENCE OF CcmPhoneFailedEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all phones that attempted to register with the local call manager and failed. The entries that have not been updated and kept at least for the duration specified in the ccmPhoneFailedStorePeriod will be deleted. Reasons for these failures could be due to configuration error, maximum number of phones has been reached, lost contact, etc.
::= { ccmPhoneInfo 3 }
ccmPhoneFailedEntry OBJECT-TYPE
   SYNTAX CcmPhoneFailedEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry (conceptual row) in the PhoneFailed Table, one for each phone failure in the Cisco Unified CM.
   INDEX { ccmPhoneFailedIndex }
   ::= { ccmPhoneFailedTable 1 }
   CcmPhoneFailedEntry ::= SEQUENCE {
      ccmPhoneFailedIndex CcmIndex,
      ccmPhoneFailedTime DateAndTime,

      ccmPhoneFailedIPv6Attribute INTEGER,
      ccmPhoneFailedRegFailReason CcmDevRegFailCauseCode
   }

ccmPhoneFailedIndex OBJECT-TYPE
   SYNTAX CcmIndex
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An arbitrary integer, selected by the local Cisco Unified CM, that is incremented with each new entry in the ccmPhoneFailedTable. This integer value will wrap if needed.
   ::= { ccmPhoneFailedEntry 1 }
ccmPhoneFailedTime OBJECT-TYPE
   SYNTAX DateAndTime
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The time when the phone failed to register with the Cisco Unified CM.
   ::= { ccmPhoneFailedEntry 2 }

ccmPhoneFailedMacAddress OBJECT-TYPE
   SYNTAX MacAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The MAC address of the failed phone.
   ::= { ccmPhoneFailedEntry 7 }

ccmPhoneFailedInetAddressIPv4 OBJECT-TYPE
   SYNTAX InetAddressIPv4
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the last known primary IPv4 address of the phone experiencing a communication failure. This object contains value zero if IPV4 address is not available.
   ::= { ccmPhoneFailedEntry 8 }

ccmPhoneFailedInetAddressIPv6 OBJECT-TYPE
   SYNTAX InetAddressIPv6
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the last known primary IPv6 address of the phone experiencing a communication failure. This object contains value zero if IPV6 address is not available.
   ::= { ccmPhoneFailedEntry 9 }
ccmPhoneFailedIPv4Attribute OBJECT-TYPE

SYNTAX INTEGER
{
  unknown(0),
  adminOnly(1),
  controlOnly(2),

   }
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the scope of ccmPhoneFailedInetAddressIPv6.
   unknown(0): It is not known if ccmPhoneFailedInetAddressIPv6 is used for Administration purpose or Controlling purpose.
   adminOnly(1): ccmPhoneFailedInetAddressIPv6 is used for the serviceability or administrative purpose.
   controlOnly(2): ccmPhoneFailedInetAddressIPv6 is used for signaling or registration purpose.
   adminAndControl(3): ccmPhoneFailedInetAddressIPv6 is used for controlling as well as administrative purpose.
   ::= { ccmPhoneFailedEntry 11 }

ccmPhoneFailedRegFailReason OBJECT-TYPE
   SYNTAX CcmDevRegFailCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with registration failed phone.
   ::= { ccmPhoneFailedEntry 12 }
Phone Status Update table

ccmPhoneStatusUpdateTable OBJECT-TYPE
   SYNTAX SEQUENCE OF CcmPhoneStatusUpdateEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The table containing the list of all phone status updates with respect to the local call manager. This table will only have registered, unregistered, and partially-registered status updates. The rejected phones are stored in the ccmPhoneFailedTable. Each entry of this table is stored at least for the duration specified in the ccmPhoneStatusUpdateStorePeriod object, after that it will be deleted.
   ::= { ccmPhoneInfo 4 }

ccmPhoneStatusUpdateEntry OBJECT-TYPE
   SYNTAX CcmPhoneStatusUpdateEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry (conceptual row) in the PhoneStatusUpdate Table, one for each phone status update in the Cisco Unified CM.
   INDEX { ccmPhoneStatusUpdateIndex }
   ::= { ccmPhoneStatusUpdateTable 1 }
   CcmPhoneStatusUpdateEntry ::= SEQUENCE {
      ccmPhoneStatusUpdateIndex CcmIndex,
      ccmPhoneStatusPhoneIndex CcmIndexOrZero,
      ccmPhoneStatusUpdateTime DateAndTime,
      ccmPhoneStatusUpdateType INTEGER,
      ccmPhoneStatusUpdateReason CcmDevFailCauseCode
      ccmPhoneStatusUnregReason CcmDevUnregCauseCode,
      ccmPhoneStatusRegFailReason CcmDevRegFailCauseCode
   }
ccmPhoneStatusUpdateIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that is incremented with each new entry in the ccmPhoneStatusUpdateTable. This integer value will wrap if needed.
 ::= { ccmPhoneStatusUpdateEntry 1 }

ccmPhoneStatusPhoneIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify an entry in the ccmPhoneTable. A value of zero indicates that the index to the ccmPhoneTable is Unknown.
 ::= { ccmPhoneStatusUpdateEntry 2 }

ccmPhoneStatusUpdateTime OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time of the phone's registration status change.
 ::= { ccmPhoneStatusUpdateEntry 3 }
ccmPhoneStatusUpdateType OBJECT-TYPE
  SYNTAX INTEGER {
    unknown(1),
    phoneRegistered(2),
    phoneUnregistered(3),
    phonePartiallyregistered(4)
  }
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  States the type of phone status change.
  unknown: Unknown status
  phoneRegistered: Phone has registered with the Cisco Unified CM
  phoneUnregistered: Phone is no longer registered with the Cisco Unified CM
  phonePartiallyregistered: Phone is partially registered with the Cisco Unified CM
  ::= { ccmPhoneStatusUpdateEntry 4 }

ccmPhoneStatusUnregReason OBJECT-TYPE
  SYNTAX CcmDevUnregCauseCode
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The reason code associated with unregistered phone.
  ::= { ccmPhoneStatusUpdateEntry 6 }

ccmPhoneStatusRegFailReason OBJECT-TYPE
  SYNTAX CcmDevRegFailCauseCode
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The reason code associated with registration failed phone.
  ::= { ccmPhoneStatusUpdateEntry 7 }
Enhanced Phone Extension table with combination index

ccmPhoneExtnTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmPhoneExtnEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing the list of all phone extensions associated with the registered and unregistered phones in the ccmPhoneTable. This table has combination index ccmPhoneIndex, ccmPhoneExtnIndex so the ccmPhoneTable and the ccmPhoneExtnTable entries can be related.
::= { ccmPhoneInfo 5 }

ccmPhoneExtnEntry OBJECT-TYPE
SYNTAX CcmPhoneExtnEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the phone extension Table, containing the information about a particular phone extension.
INDEX { ccmPhoneIndex, ccmPhoneExtnIndex }
::= { ccmPhoneExtnTable 1 }
CcmPhoneExtnEntry ::= SEQUENCE {
ccmPhoneExtnIndex CcmIndex,

ccmPhoneExtnStatus CcmDeviceLineStatus
}

ccmPhoneExtnIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that uniquely identifies a Phone Extension within the Cisco Unified CM.
::= { ccmPhoneExtnEntry 1 }
ccmPhoneExtn OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..24))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The extension number of the extension.
::= { ccmPhoneExtnEntry 2 }

ccmPhoneExtnMultiLines OBJECT-TYPE
SYNTAX Unsigned32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of multiline appearances for each phone extension.
::= { ccmPhoneExtnEntry 3 }

ccmPhoneExtnInetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the phone extension.
::= { ccmPhoneExtnEntry 4 }

ccmPhoneExtnInetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address of the phone extension. The type of address for this is identified by ccmPhoneExtnInetAddressType.
::= { ccmPhoneExtnEntry 5 }
**Gateway table**

`ccmGatewayTable` OBJECT-TYPE

SYNTAX SEQUENCE OF `CcmGatewayEntry`

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

The table containing the list of all gateway devices that have tried to register with the local Cisco Unified CM at least once. When the local Cisco Unified CM is restarted, this table will be refreshed.

 ::= { `ccmGatewayInfo` 1 }
ccmGatewayEntry OBJECT-TYPE
   SYNTAX CcmGatewayEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry (conceptual row) in the gateway Table, one for each gateway device in the Cisco Unified CM.
   INDEX { ccmGatewayIndex }
   ::= { ccmGatewayTable 1 }

}
ccmGatewayDescription OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The description attached to the gateway device.
::= { ccmGatewayEntry 4 }

ccmGatewayStatus OBJECT-TYPE
SYNTAX CcmDeviceStatus
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The status of the gateway. The Gateway status changes from Unknown to Registered when the Gateway registers itself with the local Cisco Unified CM.
::= { ccmGatewayEntry 5 }

ccmGatewayDevicePoolIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the Device Pool to which this Gateway entry belongs. A value of zero indicates that the index to the Device Pool table is Unknown.
::= { ccmGatewayEntry 6 }
ccmGatewayInetAddressType OBJECT-TYPE
  SYNTAX InetAddressType
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  This object identifies the IP address type of the Gateway device. The value of this object is 'unknown(0)' if the IP address of a Gateway device is not available.
  ::= {ccmGatewayEntry 7 }

ccmGatewayInetAddress OBJECT-TYPE
  SYNTAX InetAddress
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  This object identifies last known IPAddress of the gateway. If the IP address is not available then this object contains an empty string. The type of address for this is identified by ccmGatewayInetAddressType.
  ::= {ccmGatewayEntry 8 }

ccmGatewayTimeLastStatusUpdt OBJECT-TYPE
  SYNTAX DateAndTime
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The time the status of the gateway changed.
  ::= {ccmGatewayEntry 11 }

ccmGatewayTimeLastRegistered OBJECT-TYPE
  SYNTAX DateAndTime
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The time the gateway last registered with the call manager.
  ::= {ccmGatewayEntry 12 }
**ccmGatewayDChannelStatus OBJECT-TYPE**

SYNTAX INTEGER {
active(1),
inActive(2),
unknown(3),
notApplicable(4)
}

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The D-Channel status of the gateway.

  active(1): The D-Channel is up
  inActive(1): The D-Channel is down
  unknown(3): The D-Channel status is unknown
  notApplicable(4): The D-channel status is not applicable for this gateway.

::= { ccmGatewayEntry 13 }

**ccmGatewayDChannelNumber OBJECT-TYPE**

SYNTAX Integer32 (-1..24)

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The D-Channel number of the gateway. A value of -1 in this field indicates that the DChannel number is not applicable for this gateway.

::= { ccmGatewayEntry 14 }

**ccmGatewayProductTypeIndex OBJECT-TYPE**

SYNTAX CcmIndexOrZero

MAX-ACCESS read-only

STATUS current

DESCRIPTION

A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of 0 indicates that the index to the ccmProductTypeTable is Unknown.

::= { ccmGatewayEntry 15 }
ccmGatewayUnregReason OBJECT-TYPE
SYNTAX CcmDevUnregCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with unregistered gateway.
::= { ccmGatewayEntry 16 }

ccmGatewayRegFailReason OBJECT-TYPE
SYNTAX CcmDevRegFailCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with registration failed gateway.
::= { ccmGatewayEntry 17 }

Gateway Trunk table

CcmGatewayTrunkEntry
::= SEQUENCE {

}

All scalar objects

ccmRegisteredPhones OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of phones that are registered and actively in communication with the local call manager.
::= { ccmGlobalInfo 5 }
ccmUnregisteredPhones OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of phones that are unregistered or have lost contact with the local call manager.
::= {ccmGlobalInfo 6 }

ccmRejectedPhones OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of phones whose registration requests were rejected by the local call manager.
::= {ccmGlobalInfo 7 }

ccmRegisteredGateways OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of gateways that are registered and actively in communication with the local call manager.
::= {ccmGlobalInfo 8 }

ccmUnregisteredGateways OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of gateways that are unregistered or have lost contact with the local call manager.
::= {ccmGlobalInfo 9 }
ccmRejectedGateways OBJECT-TYPE
    SYNTAX Counter32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The number of gateways whose registration requests were rejected by the local call manager.
    ::= { ccmGlobalInfo 10 }

ccmRegisteredMediaDevices OBJECT-TYPE
    SYNTAX Counter32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The number of media devices that are registered and actively in communication with the local call manager.
    ::= { ccmGlobalInfo 11 }

ccmUnregisteredMediaDevices OBJECT-TYPE
    SYNTAX Counter32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The number of media devices that are unregistered or have lost contact with the local call manager.
    ::= { ccmGlobalInfo 12 }

ccmRejectedMediaDevices OBJECT-TYPE
    SYNTAX Counter32
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The number of media devices whose registration requests were rejected by the local call manager.
    ::= { ccmGlobalInfo 13 }
ccmRegisteredCTIDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of CTI devices that are registered and actively in communication with the local call manager.
 ::= { ccmGlobalInfo 14 }

ccmUnregisteredCTIDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of CTI devices that are unregistered or have lost contact with the local call manager.
 ::= { ccmGlobalInfo 15 }

ccmRejectedCTIDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of CTI devices whose registration requests were rejected by the local call manager.
 ::= { ccmGlobalInfo 16 }

ccmRegisteredVoiceMailDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of voice messaging devices that are registered and actively in communication with the local call manager.
 ::= { ccmGlobalInfo 17 }
ccmUnregisteredVoiceMailDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of voice messaging devices that are unregistered or have lost contact with the local call manager.
::= { ccmGlobalInfo 18 }

ccmRejectedVoiceMailDevices OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of voice messaging devices whose registration requests were rejected by the local call manager.
::= { ccmGlobalInfo 19 }

ccmCallManagerStartTime OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The last time the local call manager service started. This is available only when the local call manager is up and running.
::= { ccmGlobalInfo 20 }

ccmPhoneTableStateId OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmPhoneTable. The initial value of this object is 0 and it will be incremented every time when there is a change (addition/deletion/modification) to the ccmPhoneTable. This value and ccmCallManagerStartTime should be used together to find if the table has changed or not. When the call manager is restarted, this will be reset to 0.
::= { ccmGlobalInfo 21 }
ccmPhoneExtensionTableStateId OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmPhoneExtensionTable. The initial value of this object is 0 and it will be incremented every time when there is a change (addition/deletion/modification) to the ccmPhoneExtensionTable. This value and ccmCallManagerStartTime should be used together to find if the table has changed or not. When the call manager is restarted, this will be reset to 0.
 ::= { ccmGlobalInfo 22 }

ccmPhoneStatusUpdateTableStateId OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmPhoneStatusUpdateTable. The initial value of this object is 0 and it will be incremented every time when there is a change (addition/deletion/modification) to the ccmPhoneStatusUpdateTable. This value and sysUpTime should be used together to find if the table has changed or not. When the SNMP service is restarted this value will be reset to 0.
 ::= { ccmGlobalInfo 23 }

ccmGatewayTableStateId OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmGatewayTable. The initial value of this object is 0 and it will be incremented every time when there is a change (addition/deletion/modification) to the ccmGatewayTable. This value and ccmCallManagerStartTime should be used together to find if the table has changed or not. When the call manager is restarted, this will be reset to 0.
 ::= { ccmGlobalInfo 24 }
ccmCTIDeviceTableStateId OBJECT-TYPE
SYNTAX  Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmCTIDeviceTable. The initial value of this object is 0 and it will be increased every time there is a change (addition/deletion/modification) to the ccmCTIDeviceTable. This value and ccmCallManagerStartTime should be used together to find if the table has changed or not. When the call manager is restarted, this will be reset to 0.

::= { ccmGlobalInfo 25 }

ccmCTIDeviceDirNumTableStateId OBJECT-TYPE
SYNTAX  Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of ccmCTIDeviceDirNumTable. The initial value of this object is 0 and it will be increased every time there is a change (addition/deletion/modification) to the ccmCTIDeviceDirNumTable. This value and ccmCallManagerStartTime should be used together to find if the table has changed or not. When the call manager is restarted, this will be reset to 0.

::= { ccmGlobalInfo 26 }

ccmPhStatUpdtTblLastAddedIndex OBJECT-TYPE
SYNTAX  CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The ccmPhoneStatusUpdateIndex value of the last entry that was added to the ccmPhoneStatusUpdateTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneStatusUpdateTable since their last poll. This value need not be the same as the highest index in the ccmPhoneStatusUpdateTable as the index could have wrapped around. The initial value of this object is 0, which indicates that no entries have been added to this table. When the SNMP service is restarted this value will be reset to 0.

::= { ccmGlobalInfo 27 }
ccmPhFailedTblLastAddedIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The ccmPhoneFailedIndex value of the last entry that was added to the ccmPhoneFailedTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneFailedTable since their last poll. This value need not be the same as the highest index in the ccmPhoneFailedTable as the index could have wrapped around. The initial value of this object is 0, which indicates that no entries have been added to this table. When the SNMP service is restarted this value will be reset to 0.
::= { ccmGlobalInfo 28 }

ccmSystemVersion OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The installed version of the local Cisco Unified CM system.
::= { ccmGlobalInfo 29 }

ccmInstallationId OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The installation component identifier of the local Cisco Unified CM component(ccm.exe).
::= { ccmGlobalInfo 30 }

ccmPartiallyRegisteredPhones OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of phones that are partially registered with the local Cisco Unified CM.
::= { ccmGlobalInfo 31 }
**ccmH323TableEntries OBJECT-TYPE**

SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current number of entries in ccmH323DeviceTable. The initial value of this object is 0 and it will be incremented every time when there is an addition to the ccmH323DeviceTable. When the Cisco Unified CM is restarted, this will be reset to 0.

 ::= { ccmGlobalInfo 32 }

**ccmSIPTableEntries OBJECT-TYPE**

SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current number of entries in ccmSIPDeviceTable. The initial value of this object is 0 and it will be incremented every time when there is an addition to the ccmSIPDeviceTable. When the Cisco Unified CM is restarted, this will be reset to zero.

 ::= { ccmGlobalInfo 33 }

**Media Device table**

**ccmMediaDeviceTable OBJECT-TYPE**

SYNTAX SEQUENCE OF CcmMediaDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing a list of all Media Devices that have tried to register with the local Cisco Unified CM at least once. When the local Cisco Unified CM is restarted, this table will be refreshed.

 ::= { ccmMediaDeviceInfo 1 }
ccmMediaDeviceEntry OBJECT-TYPE
SYNTAX CcmMediaDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the MediaDevice Table, containing the information about a particular Media Resource device.
INDEX { ccmMediaDeviceIndex }
::={ ccmMediaDeviceTable 1 }
CcmMediaDeviceEntry ::= SEQUENCE {
ccmMediaDeviceIndex CcmIndex,
ccmMediaDeviceName SnmpAdminString,
ccmMediaDeviceType INTEGER,
ccmMediaDeviceDescription SnmpAdminString,
ccmMediaDeviceStatus CcmDeviceStatus,
ccmMediaDeviceDevicePoolIndex CcmIndexOrZero,
ccmMediaDeviceInetAddressType InetAddressType,
ccmMediaDeviceInetAddress InetAddress,
ccmMediaDeviceStatusReason CcmDevFailCauseCode,
ccmMediaDeviceTimeLastStatusUpdt DateAndTime,
ccmMediaDeviceTimeLastRegistered DateAndTime,
ccmMediaDeviceProductTypeIndex CcmIndexOrZero
ccmMediaDeviceInetAddressIPv4 InetAddressIPv4,
ccmMediaDeviceInetAddressIPv6 InetAddressIPv6,
ccmMediaDeviceUnregReason CcmDevUnregCauseCode,
ccmMediaDeviceRegFailReason CcmDevRegFailCauseCode
}

ccmMediaDeviceIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that identifies a Media Device entry in the table.
::={ ccmMediaDeviceEntry 1 }
ccmMediaDeviceName OBJECT-TYPE
   SYNTAX SnmpAdminString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This is the device name assigned to the Media Device. This name is assigned when a new device of this
   type is added to the Cisco Unified CM.
   ::= { ccmMediaDeviceEntry 2 }

ccmMediaDeviceDescription OBJECT-TYPE
   SYNTAX SnmpAdminString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This description is given when the device is configured in the Cisco Unified CM.
   ::= { ccmMediaDeviceEntry 4 }

ccmMediaDeviceStatus OBJECT-TYPE
   SYNTAX CcmDeviceStatus
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The status of the Media Device. The status changes from unknown to registered when it registers itself
   with the local Cisco Unified CM.
   ::= { ccmMediaDeviceEntry 5 }

ccmMediaDeviceDevicePoolIndex OBJECT-TYPE
   SYNTAX CcmIndexOrZero
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A positive value of this index is used to identify the Device Pool to which this MediaDevice entry
   belongs. A value of zero indicates that the index to the Device Pool table is Unknown.
   ::= { ccmMediaDeviceEntry 6 }
ccmMediaDeviceTimeLastStatusUpdt OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the status of the media device changed.
::= {ccmMediaDeviceEntry 10 }

ccmMediaDeviceTimeLastRegistered OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the media device last registered with the call manager.
::= {ccmMediaDeviceEntry 11 }

ccmMediaDeviceProductTypeIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of zero indicates that the index to the ccmProductTypeTable is Unknown.
::= {ccmMediaDeviceEntry 12 }

ccmMediaDeviceInetAddressIPv4 OBJECT-TYPE
SYNTAX InetAddressIPv4
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the last known primary IPv4 address of the Media Device. This object contains value zero if IPv4 address is not available.
::= {ccmMediaDeviceEntry 13 }
ccmMediaDeviceInetAddressIPv6 OBJECT-TYPE
SYNTAX InetAddressIPv6
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the last known primary IPv6 address of the Media Device. This object contains value zero if IPv6 address is not available.
::= {ccmMediaDeviceEntry 14 }

ccmMediaDeviceUnregReason OBJECT-TYPE
SYNTAX CcmDevUnregCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with unregistered Media Device.
::= {ccmMediaDeviceEntry 15 }

ccmMediaDeviceRegFailReason OBJECT-TYPE
SYNTAX CcmDevRegFailCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with registration failed Media Device.
::= {ccmMediaDeviceEntry 16 }

CTI Device table

ccmCTIDeviceTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmCTIDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION—The table containing a list of all CTI (Computer Telephony Integration) Devices that have tried to register with the local Cisco Unified CM at least once. When the local Cisco Unified CM is restarted, this table will be refreshed.
::= {ccmCTIDeviceInfo 1 }
ccmCTIDeviceEntry OBJECT-TYPE
SYNTAX CcmCTIDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION—An entry (conceptual row) in the CTIDevice Table, containing the information about a particular CTI Device.
INDEX { ccmCTIDeviceIndex }
::= { ccmCTIDeviceTable 1 }
CcmCTIDeviceEntry ::= SEQUENCE {
  ccmCTIDeviceIndexCcmIndex,

  ccmCTIDeviceInetAddressIPv6InetAddressIPv6,
  ccmCTIDeviceUnregReasonCcmDevUnregCauseCode,
  ccmCTIDeviceRegFailReasonCcmDevRegFailCauseCode
}

ccmCTIDeviceIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that identifies a CTI Device entry in the table.
::= { ccmCTIDeviceEntry 1 }
ccmCTIDeviceName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..64))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The name of the CTI Device. This name is assigned to the CTI Device when it is added to the Cisco Unified CM.
::= { ccmCTIDeviceEntry 2 }

ccmCTIDeviceDescription OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A description of the CTI Device. This description is given when the CTI Device is configured in the Cisco Unified CM.
::= { ccmCTIDeviceEntry 4 }

ccmCTIDeviceStatus OBJECT-TYPE
SYNTAX CcmDeviceStatus
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The status of the CTI Device. The CTI Device status changes from unknown to registered when it registers itself with the local Cisco Unified CM.
::= { ccmCTIDeviceEntry 5 }

ccmCTIDevicePoolIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the Device Pool to which this CTI Device entry belongs. A value of zero indicates that the index to the Device Pool table is Unknown.
::= { ccmCTIDeviceEntry 6 }
ccmCTIDeviceTimeLastStatusUpdt OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the status of the CTI device changed.
::= { ccmCTIDeviceEntry 11 }

ccmCTIDeviceTimeLastRegistered OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the CTI Device last registered with the call manager.
::= { ccmCTIDeviceEntry 12 }

ccmCTIDeviceProductTypeIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of 0 indicates that the index to the ccmProductTypeTable is Unknown.
::= { ccmCTIDeviceEntry 13 }

ccmCTIDeviceInetAddressIPv4 OBJECT-TYPE
SYNTAX InetAddressIPv4
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies IPv4 Address of the host where this CTI Device is running. If the IPv4 address is not available then this object contains an empty string.
::= { ccmCTIDeviceEntry 14 }
ccmCTIDeviceInetAddressIPv6 OBJECT-TYPE
   SYNTAX InetAddressIPv6
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies IPv6 Address of the host where this CTI Device is running. If the IPv6 address is not available then this object contains an empty string.
   ::= { ccmCTIDeviceEntry 15 }

ccmCTIDeviceUnregReason OBJECT-TYPE
   SYNTAX CcmDevUnregCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with unregistered CTI Device.
   ::= { ccmCTIDeviceEntry 16 }

ccmCTIDeviceRegFailReason OBJECT-TYPE
   SYNTAX CcmDevRegFailCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with registration failed CTI Device.
   ::= { ccmCTIDeviceEntry 17 }

CTI Device Directory Number table

ccmCTIDeviceDirNumTable OBJECT-TYPE
   SYNTAX SEQUENCE OF CcmCTIDeviceDirNumEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The table containing a list of directory numbers that are assigned to all of the registered and unregistered CTI Devices in the ccmCTIDeviceTable.
   ::= { ccmCTIDeviceInfo 2 }

Cisco Unified Communications Manager Managed Services Guide, Release 9.1(1)
**ccmCTIDeviceDirNumEntry OBJECT-TYPE**

SYNTAX CcmCTIDeviceDirNumEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the CTIDeviceDirNum Table, containing the information about a particular CTI Device extension.
INDEX { ccmCTIDeviceIndex, ccmCTIDeviceDirNumIndex }
::= { ccmCTIDeviceDirNumTable 1 }
CcmCTIDeviceDirNumEntry ::= SEQUENCE {
  ccmCTIDeviceDirNumIndex CcmIndex,
  ccmCTIDeviceDirNum SnmpAdminString
}

**ccmCTIDeviceDirNumIndex OBJECT-TYPE**

SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local system, that identifies a Directory Number of a CTI Device.
::= { ccmCTIDeviceDirNumEntry 1 }

**ccmCTIDeviceDirNum OBJECT-TYPE**

SYNTAX SnmpAdminString (SIZE(0..24))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A Directory Number of the CTI Device.
::= { ccmCTIDeviceDirNumEntry 2 }

--
Alarms

Cisco Unified CM Alarm Enable

ccmCallManagerAlarmEnable OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-write
STATUS current
DESCRIPTION
Allows the generation of alarms in response to Cisco Unified CM general failures.
true(1): Enabling this object will allow the Cisco Unified CM agent to generate the following alarms:

  ccmCallManagerFailure,  
  ccmMediaResourceListExhausted,  
  ccmRouteListExhausted and  
  ccmTLSConnectionFailure. This is the default value.

false(2): Disabling this object will stop the generation of the following alarms by the Cisco Unified CM agent:

  ccmCallManagerFailure  
  ccmMediaResourceListExhausted,  
  ccmRouteListExhausted and  
  ccmTLSConnectionFailure.

DEFVAL { true }
::= { ccmAlarmConfigInfo1 }
Phone Failed Config objects

ccmPhoneFailedAlarmInterval OBJECT-TYPE
SYNTAX Integer32 (0 | 30..3600)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The minimum interval between sending of the ccmPhoneFailed notification in seconds. The ccmPhoneFailed notification is only sent when there is at least one entry in the ccmPhoneFailedTable and the notification has not been sent for the last ccmPhoneFailedAlarmInterval defined in this object. A value of zero indicates that the alarm notification is disabled.
DEFVAL { 0 }
::= { ccmAlarmConfigInfo 2 }

ccmPhoneFailedStorePeriod OBJECT-TYPE
SYNTAX Integer32 (1800..3600)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The time duration for storing each entry in the ccmPhoneFailedTable. The entries that have not been updated and kept at least this period will be deleted. This value should ideally be set to a higher value than the ccmPhoneFailedAlarmInterval object.
DEFVAL { 1800 }
::= { ccmAlarmConfigInfo 3 }
Phone Status Update Config objects

ccmPhoneStatusUpdateAlarmInterv OBJECT-TYPE
SYNTAX Integer32 (0 | 30..3600)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The minimum interval between sending of the ccmPhoneStatusUpdate notification in seconds. The ccmPhoneStatusUpdate notification is only sent when there is at least one entry in the ccmPhoneStatusUpdateTable and the notification has not been sent for the last ccmPhoneStatusUpdateAlarmInterv defined in this object. A value of zero indicates that the alarm notification is disabled.
DEFVAL { 0 }
 ::= { ccmAlarmConfigInfo 4 }

ccmPhoneStatusUpdateStorePeriod OBJECT-TYPE
SYNTAX Integer32 (1800..3600)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The time duration for storing each entry in the ccmPhoneStatusUpdateTable. The entries that have been kept at least this period will be deleted. This value should ideally be set to a higher value than the ccmPhoneStatusUpdateAlarmInterv object.
DEFVAL { 1800 }
 ::= { ccmAlarmConfigInfo 5 }
**Gateway Alarm Enable**

**ccmGatewayAlarmEnable OBJECT-TYPE**

SYNTAX TruthValue

MAX-ACCESS read-write

STATUS current

DESCRIPTION

Allows the generation of alarms in response to Gateway general failures that the Cisco Unified CM is aware of.

true(1): Enabling this object will allow the Cisco Unified CM agent to generate the following alarms:

- ccmGatewayFailedReason
- ccmGatewayLayer2Change (This is the default value.)

false(2): Disabling this object will stop the generation of the following alarms by the Cisco Unified agent:

- ccmGatewayFailed
- ccmGatewayLayer2Change.

DEFVAL { true }

::={ ccmAlarmConfigInfo 6 }

**Malicious Call Alarm Enable**

**ccmMaliciousCallAlarmEnable OBJECT-TYPE**

SYNTAX TruthValue

MAX-ACCESS read-write

STATUS current

DESCRIPTION

Allows the generation of alarms for malicious calls that the local call manager is aware of.

true(1): Enabling this object will allow the Cisco Unified CM agent to generate the ccmMaliciousCall alarm. This is the default value.

false(2): Disabling this object will stop the generation of the ccmMaliciousCall alarm.

DEFVAL { true }

::={ ccmAlarmConfigInfo 7 }
Notification and alarms

ccmAlarmSeverity OBJECT-TYPE
SYNTAX INTEGER {
  emergency(1),
  alert(2),
  critical(3),
  error(4),
  warning(5),
  notice(6),
  informational(7)
}
MAX-ACCESS accessible-for-notify
STATUS current
DESCRIPTION
The Alarm Severity code.
  emergency: System unusable
  alert: Immediate response needed
  critical: Critical condition
  error: Error condition
  warning: Warning condition
  notice: Normal but significant condition
  informational: Informational situation.
::= { ccmNotificationsInfo 1 }

STATUS current

DESCRIPTION

The table containing a list of all H323 devices in the Cisco Unified CM cluster that the local Cisco Unified CM is aware of. When the local Cisco Unified CM is restarted, this table will be refreshed.

::= { ccmH323DeviceInfo 1 }
ccmH323DeviceEntry OBJECT-TYPE
SYNTAX CcmH323DeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the H323Device Table, containing the information about a particular
H323 Device.
INDEX { ccmH323DevIndex }
::= { ccmH323DeviceTable 1 }
CcmH323DeviceEntry ::= SEQUENCE {
  ccmH323DevIndex CcmIndex,
  ccmH323DevName SnmpAdminString,
  ccmH323DevProductId CcmDeviceProductId,
  ccmH323DevDESCRIPTION SnmpAdminString,
  ccmH323DevInetAddressType InetAddressType,
  ccmH323DevInetAddress InetAddress,

ccmH323DevUnregReason CcmDevUnregCauseCode,
ccmH323DevRegFailReason CcmDevRegFailCauseCode
}

ccmH323DevIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that identifies a H323 Device entry in the table.
 ::= { ccmH323DeviceEntry 1 }

ccmH323DevName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The device name assigned to the H323 Device. This name is assigned when a new H323 device is added to the Cisco Unified CM.
 ::= { ccmH323DeviceEntry 2 }

ccmH323DevDESCRIPTION OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A DESCRIPTION
A description of the H323 device. This description is given when the H323 device is configured in the Cisco Unified CM.
 ::= { ccmH323DeviceEntry 4 }
ccmH323DevInetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the H323 device. The value of this object is 'unknown(0)' if the IP address of a H323 device is not available.
::= {ccmH323DeviceEntry 5 }

ccmH323DevInetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies last known IP Address of the H323 device. If the IP address is not available then this object contains an empty string. The type of address for this is identified by ccmH323DevInetAddressType.
::= {ccmH323DeviceEntry 6 }

ccmH323DevCnfgGKInetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the gatekeeper device. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
::= {ccmH323DeviceEntry 7 }

ccmH323DevCnfgGKInetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object represents configured gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no H323 gatekeeper configured, this object contains an empty string. The type of address for this is identified by ccmH323DevCnfgGKInetAddressType.
::= {ccmH323DeviceEntry 8 }
ccmH323DevAltGK1InetAddressType OBJECT-TYPE
   SYNTAX InetAddressType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the IP address type of the first alternate gatekeeper. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
   ::= { ccmH323DeviceEntry 9 }

ccmH323DevAltGK1InetAddress OBJECT-TYPE
   SYNTAX InetAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the first alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no first alternate H323 gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevAltGK1InetAddressType.
   ::= { ccmH323DeviceEntry 10 }

ccmH323DevAltGK2InetAddressType OBJECT-TYPE
   SYNTAX InetAddressType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the IP address type of the second alternate gatekeeper. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
   ::= { ccmH323DeviceEntry 11 }

ccmH323DevAltGK2InetAddress OBJECT-TYPE
   SYNTAX InetAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the second alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no second alternate H323 gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevAltGK2InetAddressType.
   ::= { ccmH323DeviceEntry 12 }
Cisco Management Information Base

ccmH323DevAltGK3InetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the third alternate gatekeeper. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
::= { ccmH323DeviceEntry 13 }

ccmH323DevAltGK3InetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the third alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no third alternate H323 gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevAltGK3InetAddressType.
::= { ccmH323DeviceEntry 14 }

ccmH323DevAltGK4InetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the fourth alternate gatekeeper. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
::= { ccmH323DeviceEntry 15 }

ccmH323DevAltGK4InetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the fourth alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no fourth H323 alternate gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevAltGK4InetAddressType.
::= { ccmH323DeviceEntry 16 }
ccmH323DevAltGK5InetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the fifth alternate gatekeeper. The value of this object is 'unknown(0)' if the IP address of a H323 gatekeeper is not available.
 ::= { ccmH323DeviceEntry 17 }

ccmH323DevAltGK5InetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the fifth alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no fifth H323 alternate gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevAltGK5InetAddressType.
 ::= { ccmH323DeviceEntry 18 }

ccmH323DevActGKInetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the active gatekeeper. The value of this object is 'unknown(0)' if the IP address of a gatekeeper is not available.
 ::= { ccmH323DeviceEntry 19 }

ccmH323DevActGKInetAddress OBJECT-TYPE
SYNTAX InetAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the active alternate gatekeeper DNS name or IP address for this H323 device. This is applicable only for H323 devices with gatekeepers configured. When there is no active alternate H323 gatekeeper, this object contains an empty string. The type of address for this is identified by ccmH323DevActGKInetAddressType.
 ::= { ccmH323DeviceEntry 20 }
ccmH323DevStatus OBJECT-TYPE
SYNTAX INTEGER {
    notApplicable(0),
    unknown(1),
    registered(2),
    unregistered(3),
    rejected(4)
}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The H323 device registration status with the gatekeeper. The status changes from unknown to registered when the H323 device successfully registers itself with the gatekeeper.

notApplicable: The registration status is not applicable for this H323 device
unknown: The registration status of the H323 device with the gatekeeper is unknown
registered: The H323 device has registered with the gatekeeper successfully
unregistered: The H323 device is no longer registered with the gatekeeper
rejected: Registration request from the H323 device was rejected by the gatekeeper.

::= {ccmH323DeviceEntry 21 }

ccmH323DevTimeLastStatusUpdt OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the registration status with the gatekeeper changed. This is applicable only for H323 devices with gatekeepers configured.

::= {ccmH323DeviceEntry 23 }

ccmH323DevTimeLastRegistered OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time when the H323 device last registered with the gatekeeper. This is applicable only for H323 devices with gatekeepers configured.

::= {ccmH323DeviceEntry 24 }
ccmH323DevRmtCM1InetAddressType OBJECT-TYPE
   SYNTAX InetAddressType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the IP address type of the first remote call manager. The value of this object is 'unknown(0)' if the first remote call manager is not configured.
   ::= { ccmH323DeviceEntry 25 }

ccmH323DevRmtCM1InetAddress OBJECT-TYPE
   SYNTAX InetAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the first remote call manager DNS name or IP address configured for this H323 device. When there is no first remote call manager configured, this object contains an empty string. The type of address for this is identified by ccmH323DevRmtCM1InetAddressType.
   ::= { ccmH323DeviceEntry 26 }

ccmH323DevRmtCM2InetAddressType OBJECT-TYPE
   SYNTAX InetAddressType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the IP address type of the second remote call manager. The value of this object is 'unknown(0)' if the second remote call manager is not configured.
   ::= { ccmH323DeviceEntry 27 }

ccmH323DevRmtCM2InetAddress OBJECT-TYPE
   SYNTAX InetAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the second remote call manager DNS name or IP address configured for this H323 device. When there is no second remote call manager configured, this object contains an empty string. The type of address for this is identified by ccmH323DevRmtCM2InetAddressType.
   ::= { ccmH323DeviceEntry 28 }
ccmH323DevRmtCM3InetAddressType OBJECT-TYPE
   SYNTAX InetAddressType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the IP address type of the third remote call manager. The value of this object is 'unknown(0)' if the third remote call manager is not configured.
   ::= { ccmH323DeviceEntry 29 }

ccmH323DevRmtCM3InetAddress OBJECT-TYPE
   SYNTAX InetAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the third remote call manager DNS name or IP address configured for this H323 device. When there is no third remote call manager configured, this object contains an empty string. The type of address for this is identified by ccmH323DevRmtCM3InetAddressType.
   ::= { ccmH323DeviceEntry 30 }

ccmH323DevProductTypeIndex OBJECT-TYPE
   SYNTAX CcmIndexOrZero
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of zero indicates that the index to the ccmProductTypeTable is Unknown.
   ::= { ccmH323DeviceEntry 31 }

ccmH323DevUnregReason OBJECT-TYPE
   SYNTAX CcmDevUnregCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with unregistered H323 Device. This is applicable only for H323 devices with gatekeepers configured.
   ::= { ccmH323DeviceEntry 32 }
ccmH323DevRegFailReason OBJECT-TYPE
SYNTAX CcmDevRegFailCauseCode
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The reason code associated with registration failed H323 Device. This is applicable only for H323 devices with gatekeepers configured.
::= {ccmH323DeviceEntry 33 }

Voice Mail Device table

ccmVoiceMailDeviceTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmVoiceMailDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing a list of all voice messaging devices that have tried to register with the local Cisco Unified CM at least once. When the local Cisco Unified CM is restarted, this table will be refreshed.
::= {ccmVoiceMailDeviceInfo 1 }
ccmVoiceMailDeviceEntry OBJECT-TYPE
SYNTAX CcmVoiceMailDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the VoiceMailDevice Table, containing the information about a particular Voice Messaging Device.
INDEX { ccmVMailDevIndex }
::= { ccmVoicMailDeviceTable 1 }
CcmVoiceMailDeviceEntry ::= SEQUENCE {
  ccmVMailDevIndex CcmIndex,
  ccmVMailDevName SnmpAdminString,
  ccmVMailDevProductId CcmDeviceProductId,
  ccmVMailDevDescription, SnmpAdminString,
  ccmVMailDevStatus CcmDeviceStatus,
  ccmVMailDevInetAddressType InetAddressType,
  ccmVMailDevInetAddress InetAddress,
  ccmVMailDevStatusReason CcmDevFailCauseCode,
  ccmVMailDevTimeLastStatusUpdt DateAndTime,
  ccmVMailDevTimeLastRegistered DateAndTime,
  ccmVMailDevProductTypeIndex CcmIndexOrZero
  ccmVMailDevUnregReason CcmDevUnregCauseCode,
  ccmVMailDevRegFailReason CcmDevRegFailCauseCode
}

ccmVMailDevIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that identifies a voice messaging device entry in the table.
::= { ccmVoiceMailDeviceEntry 1 }
ccmVMailDevName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The name of the Voice Messaging Device. This name is assigned to the Voice Messaging Device when it is added to the Cisco Unified CM.
::= { ccmVoiceMailDeviceEntry 2 }

ccmVMailDevDESCRIPTION OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The description of the Voice Messaging Device. This description is given when the Voice Messaging Device is configured in the Cisco Unified CM.
::= { ccmVoiceMailDeviceEntry 4 }

ccmVMailDevStatus OBJECT-TYPE
SYNTAX CcmDeviceStatus
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The status of the Voice Messaging Device. The Voice Messaging Device status changes from unknown to registered when it registers itself with the local Cisco Unified CM.
::= { ccmVoiceMailDeviceEntry 5 }

ccmVMailDevInetAddressType OBJECT-TYPE
SYNTAX InetAddressType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the IP address type of the Voice Messaging device. The value of this object is 'unknown(0)' if the IP address of the Voice Messaging device is not available.
::= { ccmVoiceMailDeviceEntry 6 }
**ccmVMailDevInetAddress OBJECT-TYPE**

SYNTAX InetAddress

MAX-ACCESS read-only

STATUS current

DESCRIPTION

This object identifies the IP Address of the Voice Messaging Device. If the IP Address is not available then this object contains an empty string. The type of address for this is identified by ccmVMailDevInetAddressType.

::= { ccmVoiceMailDeviceEntry 7 }

**ccmVMailDevTimeLastStatusUpdt OBJECT-TYPE**

SYNTAX DateAndTime

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The time the status of the voice messaging device changed.

::= { ccmVoiceMailDeviceEntry 9 }

**ccmVMailDevTimeLastRegistered OBJECT-TYPE**

SYNTAX DateAndTime

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The time the Voice Messaging Device has last registered with the call manager.

::= { ccmVoiceMailDeviceEntry 10 }

**ccmVMailDevProductTypeIndex OBJECT-TYPE**

SYNTAX CcmIndexOrZero

MAX-ACCESS read-only

STATUS current

DESCRIPTION

A positive value of this index is used to identify the related product type entry in the ccmProductTypeTable. A value of 0 indicates that the index to the ccmProductTypeTable is Unknown.

::= { ccmVoiceMailDeviceEntry 11 }
ccmVMailDevUnregReason OBJECT-TYPE
   SYNTAX CcmDevUnregCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with unregistered Voice Messaging Device.
   ::= { ccmVoiceMailDeviceEntry 12 }

ccmVMailDevRegFailReason OBJECT-TYPE
   SYNTAX CcmDevRegFailCauseCode
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The reason code associated with registration failed Voice Messaging Device.
   ::= { ccmVoiceMailDeviceEntry 13 }

**Voice Mail Directory Number table**

ccmVoiceMailDeviceDirNumTable OBJECT-TYPE
   SYNTAX SEQUENCE OF CcmVoiceMailDeviceDirNumEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The table containing a list of directory numbers that are assigned to all of the registered and unregistered Voice Messaging Devices in the ccmVoiceMailDeviceTable.
   ::= { ccmVoiceMailDeviceInfo 2 }
ccmVoiceMailDeviceDirNumEntry OBJECT-TYPE
SYNTAX CcmVoiceMailDeviceDirNumEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the VoiceMailDirNum Table, has the associated directory number for a Voice Messaging Device.
INDEX { ccmVMailDevIndex, ccmVMailDevDirNumIndex }
::= { ccmVoiceMailDeviceDirNumTable 1 }
CcmVoiceMailDeviceDirNumEntry ::= SEQUENCE {
ccmVMailDevDirNumIndex CcmIndex,
ccmVMailDevDirNum SnmpAdminString
}

ccmVMailDevDirNumIndex OBJECT-TYPE
SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local system, that identifies a Directory Number of a Voice Messaging Device.
::= { ccmVoiceMailDeviceDirNumEntry 1 }

ccmVMailDevDirNum OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..24))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The Directory Number of the Voice Messaging Device.
::= { ccmVoiceMailDeviceDirNumEntry 2 }
Quality Report Alarm configuration information

ccmQualityReportAlarmEnable OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-write
STATUS current
DESCRIPTION
Allows the generation of the quality report alarm.
true(1): Enabling this object will allow the Cisco Unified CM agent to generate the ccmQualityReport alarm. This is the default value.
false(2): Disabling this object will stop the generation of the ccmQualityReport alarm by the Cisco Unified CM agent.

DEFVAL { true }
::= { ccmQualityReportAlarmConfigInfo 1 }

Sip Device table

ccmSIPDeviceTable OBJECT-TYPE
SYNTAX SEQUENCE OF CcmSIPDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing a list of all SIP trunks in the Cisco Unified CM cluster that the local Cisco Unified CM is aware of. When the local Cisco Unified CM is restarted, this table will be refreshed. If the local Cisco Unified CM is down, then this table will be empty.

::= { ccmSIPDeviceInfo 1 }
**ccmSIPDeviceEntry OBJECT-TYPE**

SYNTAX CcmSIPDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the SIP Device Table, containing the information about a particular SIP Trunk Device.
INDEX { ccmSIPDevIndex }
::= { ccmSIPDeviceTable 1 }
CcmSIPDeviceEntry ::= SEQUENCE {
  ccmSIPDevIndex CcmIndex,
  ccmSIPDevName SnmpAdminString,
  ccmSIPDevProductTypeIndex CcmIndexOrZero,
  ccmSIPDevDescription SnmpAdminString,
  ccmSIPDevInetAddressType InetAddressType,
  ccmSIPDevInetAddress InetAddress,
  ccmSIPInTransportProtocolType CcmSIPTransportProtocolType,
  ccmSIPInPortNumber InetPortNumber,
  ccmSIPOutTransportProtocolType CcmSIPTransportProtocolType,
  ccmSIPOutPortNumber InetPortNumber
  ccmSIPDevInetAddressIPv4 InetAddressIPv4,
  ccmSIPDevInetAddressIPv6 InetAddressIPv6
}

**ccmSIPDevIndex OBJECT-TYPE**

SYNTAX CcmIndex
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer, selected by the local Cisco Unified CM, that identifies a SIP Trunk Device entry in the table.
::= { ccmSIPDeviceEntry 1 }
ccmSIPDevName OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The device name assigned to the SIP Trunk Device. This name is assigned when a new SIP Trunk
device is added to the Cisco Unified CM.
::= { ccmSIPDeviceEntry 2 }

ccmSIPDevProductTypeIndex OBJECT-TYPE
SYNTAX CcmIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A positive value of this index is used to identify the related product type entry in the
ccmProductTypeTable. A value of zero indicates that the index to the ccmProductTypeTable is Unknown.
::= { ccmSIPDeviceEntry 3 }

ccmSIPDevDescription OBJECT-TYPE
SYNTAX SnmpAdminString (SIZE(0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A description of the SIP Trunk device. This Description is given when the SIP Trunk device is configured
in the Cisco Unified CM.
::= { ccmSIPDeviceEntry 4 }

ccmSIPInTransportProtocolType OBJECT-TYPE
SYNTAX CcmSIPTransportProtocolType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Specifies the transport protocol type used by Cisco Unified CM for setting up incoming SIP call.
::= { ccmSIPDeviceEntry 7 }
ccmSIPInPortNumber OBJECT-TYPE
   SYNTAX InetPortNumber
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Specifies the port number used by Cisco Unified CM for setting up incoming SIP call.
   ::= { ccmSIPDeviceEntry 8 }

ccmSIPOutTransportProtocolType OBJECT-TYPE
   SYNTAX CcmSIPTransportProtocolType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Specifies the transport protocol type used by Cisco Unified CM for setting up outgoing SIP call.
   ::= { ccmSIPDeviceEntry 9 }

ccmSIPOutPortNumber OBJECT-TYPE
   SYNTAX InetPortNumber
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Specifies the port number used by Cisco Unified CM for setting up outgoing SIP call.
   ::= { ccmSIPDeviceEntry 10 }

ccmSIPDevInetAddressIPv4 OBJECT-TYPE
   SYNTAX InetAddressIPv4
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object identifies the last known primary IPv4 address of the SIP Trunk Device. This object contains value zero if IPv4 address is not available.
   ::= { ccmSIPDeviceEntry 11 }
ccmSIPDevInetAddressIPv6 OBJECT-TYPE
SYNTAX InetAddressIPv6
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object identifies the last known primary IPv6 address of the SIP Trunk Device. This object contains value zero if IPV6 address is not available.
 ::= { ccmSIPDeviceEntry 12 }

Notifications types

ccmMIBNotificationPrefix OBJECT IDENTIFIER
 ::= { ciscoCcmMIB 2 }

ccmMIBNotifications OBJECT IDENTIFIER
 ::= { ccmMIBNotificationsPrefix 0 }

ccmCallManagerFailed NOTIFICATION-TYPE
 OBJECTS {
  ccmAlarmSeverity,
  ccmFailCauseCode
 }
STATUS current
DESCRIPTION
This Notification signifies that the Cisco Unified CM process detects a failure in one of its critical subsystems. It can also be detected from a heartbeat/event monitoring process.
 ::= { ccmMIBNotifications 1 }

ccmPhoneFailed NOTIFICATION-TYPE
 OBJECTS {
  ccmAlarmSeverity,
  ccmPhoneFailures
 }
STATUS current
DESCRIPTION
This Notification will be generated in the intervals specified in ccmPhoneFailedAlarmInterval if there is at least one entry in the ccmPhoneFailedTable.
 ::= { ccmMIBNotifications 2 }
ccmPhoneStatusUpdate NOTIFICATION-TYPE
OBJECTS {
  ccmAlarmSeverity,
  ccmPhoneUpdates
}
STATUS current
DESCRIPTION
This Notification will be generated in the intervals specified in ccmPhoneStatusUpdateInterv if there is at least one entry in the ccmPhoneStatusUpdateTable.
::= { ccmMIBNotifications 3 }

ccmMediaResourceListExhausted NOTIFICATION-TYPE
OBJECTS {
  ccmAlarmSeverity,
  ccmMediaResourceType,
  ccmMediaResourceListName
}
STATUS current
DESCRIPTION
This Notification indicates that the Cisco Unified CM has run out a certain specified type of resource.
::= { ccmMIBNotifications 5 }

ccmRouteListExhausted NOTIFICATION-TYPE
OBJECTS {
  ccmAlarmSeverity,
  ccmRouteListName
}
STATUS current
DESCRIPTION
This Notification indicates that the Cisco Unified CM could not find an available route in the indicated route list.
::= { ccmMIBNotifications 6 }
ccmGatewayLayer2Change NOTIFICATION-TYPE

OBJECTS {
    ccmAlarmSeverity,
    ccmGatewayName,
    ccmGatewayInetAddressType,
    ccmGatewayInetAddress,
    ccmGatewayPhysIfIndex,
    ccmGatewayPhysIfL2Status
}

STATUS current

DESCRIPTION
This Notification is sent when the D-Channel/Layer 2 of an interface in a skinny gateway that has registered with the Cisco Unified CM changes state.

::= { ccmMIBNotifications 7 }

ccmMaliciousCall NOTIFICATION-TYPE

OBJECTS {
    ccmAlarmSeverity,
    ccmMaliCallCalledPartyName,
    ccmMaliCallCalledPartyNumber,
    ccmMaliCallCalledDeviceName,
    ccmMaliCallCallingPartyName,
    ccmMaliCallCallingPartyNumber,
    ccmMaliCallCallingDeviceName,
    ccmMaliCallTime
}

STATUS current

DESCRIPTION
This Notification is sent when a user registers a call as malicious with the local call manager.

::= { ccmMIBNotifications 8 }
**ccmQualityReport** NOTIFICATION-TYPE

OBJECTS {
  ccmAlarmSeverity,
  ccmQualityRprtSourceDevName,
  ccmQualityRprtClusterId,
  ccmQualityRprtCategory,
  ccmQualityRprtReasonCode,
  ccmQualityRprtTime
}

STATUS current

DESCRIPTION
This Notification is sent when a user reports a quality problem using the Quality Report Tool.

::= { ccmMIBNotifications 9 }

**ccmTLSConnectionFailure** NOTIFICATION-TYPE

OBJECTS {
  ccmAlarmSeverity,
  ccmTLSDevName,
  ccmTLSDevInetAddressType,
  ccmTLSDevInetAddress,
  ccmTLSConnectionFailReasonCode,
  ccmTLSConnFailTime
}

STATUS current

DESCRIPTION
This Notification is sent when Cisco Unified CM fails to open TLS connection for the indicated device.

::= { ccmMIBNotifications 10 }
ccmGatewayFailedReason NOTIFICATION-TYPE

OBJECTS {
  ccmAlarmSeverity,
  ccmGatewayName,
  ccmGatewayInetAddressType,
  ccmGatewayInetAddress,
  ccmGatewayRegFailCauseCode
}

STATUS current

DESCRIPTION
This Notification indicates that at least one gateway has attempted to register or communicate with the Cisco Unified CM and failed.

::= { ccmMIBNotifications 11 }

MIB conformance statements

ciscoCcmMIBConformance OBJECT IDENTIFIER

::= { ciscoCcmMIB 3 }

ciscoCcmMIBCompliances OBJECT IDENTIFIER

::= { ciscoCcmMIBConformance 1 }

ciscoCcmMIBGroups OBJECT IDENTIFIER

</tbody>
</table>
Cisco Unified CM alarms to enable

Enabling the `ccmCallManagerAlarmEnable` object in the CISCO-CCM-MIB allows the Cisco Unified CM agent to generate traps and send the following alarms:

- `ccmCallManagerFailed`
- `ccmGatewayFailed`
- `ccmPhoneFailed`
- `ccmMediaResourceListExhausted`
- `ccmRouteListExhausted`
- `ccmGatewayLayer2Change`
- `ccmMaliciousCall`
- `ccmQualityReport`
- `ccmTLSConnectionFailure`

Traps to monitor

The following are Cisco Unified CM traps to monitor:

- `ccmCallManagerFailed`. This trap means that Cisco Unified CM has detected a failure in one of its critical subsystems. It can also be detected from a heartbeat/event monitoring process. The OID is 1.3.6.1.4.1.9.9.156.2.0.1. The trap components are `ccmAlarmSeverity` and `ccmFailCauseCode`.
  
  - `ccmAlarmSeverity` OID is 1.3.6.1.4.1.9.9.156.1.10.1. The values are:
    1—Emergency
    2—Alert
    3—Critical
    4—Error
    5—Warning
    6—Notice
    7—Informational
  
  - `ccmFailCauseCode` is derived from a monitoring thread in the Cisco Unified CM or from a heartbeat monitoring process. OID is 1.3.6.1.4.1.9.9.156.1.10.2. The values are:
    1—Unknown
    2—Heart Beat Stopped
    3—Router Thread Died
    4—Timer Thread Died
    5—Critical Thread Died
    6—Device MgrInit Failed
7—Digit Analysis Init Failed
8—Call Control Init Failed
9—Link Mgr Init Failed
10—DB Mgr Init Failed
11—Msg Translator Init Failed
12—Supp Services Init Failed

- Cisco Phone Failures—CISCO-CCM-MIB::ccmPhoneFailed. This notification is generated in the intervals specified in ccmPhoneFailedAlarmInterval if there is at least one entry in the ccmPhoneFailedTable. The OID is 1.3.6.1.4.1.9.9.156.2.0.2. The trap components are ccmAlarmSeverity and ccmPhoneFailedReasons. See ccmAlarmSeverity for more information. The ccmPhoneFailedReasons OID is 1.3.6.1.4.1.9.9.156.1.10.3 and the ccmPhoneFailedTable should be checked for phone initialization and communication failures.

- Cisco Unified CM Gateway Failure—CISCO-CCM-MIB::ccmGatewayFailed. This notification indicates that at least one gateway has attempted to register or communicate with the Cisco Unified CM and failed. The OID is 1.3.6.1.4.1.9.9.156.2.0.4. The trap components are:
  - ccmAlarmSeverity OID is 1.3.6.1.4.1.9.9.156.1.10.1. The values are:
    1—Emergency
    2—Alert
    3—Critical
    4—Error
    5—Warning
    6—Notice
    7—Informational
  - ccmGatewayFailCauseCode OID is 1.3.6.1.4.1.9.9.156.1.10.5. The type is CcmDevFailCauseCode and contains the following values:
    0—No Error
    1—Unknown
    2—No Entry In Database
    3—Database Configuration Error
    4—Device Name Unresolveable
    5—Max Dev Reg Reached
    6—Connectivity Error
    7—Initialization Error
    8—Device Initiated Reset
    9—Cisco Unified CM Reset
    10—Authentication Error
    11—Invalid X509 Name In Certificate
    12—Invalid TLS Cipher
13—Directory Number Mismatch
14—Malformed Register Msg

Note: CcmDevFailCauseCode is deprecated and replaced by CcmDevRegFailCauseCode and CcmDevUnregCauseCode.

- Cisco Unified CM Media Resource Exhausted—CISCO-CCM-MIB::ccmMediaResourceListExhausted. This notification indicates that Cisco Unified CM has run out a certain specified type of resource. The OID is 1.3.6.1.4.1.9.9.156.2.0.5. The critical trap components are:
  - ccmAlarmSeverity OID is 1.3.6.1.4.1.9.9.156.1.10.1. The values are:
    1—Emergency
    2—Alert
    3—Critical
    4—Error
    5—Warning
    6—Notice
    7—Informational
  - ccmMediaResourceType OID is 1.3.6.1.4.1.9.9.156.1.10.6. The values are:
    1—Unknown
    2—Media Termination Point
    3—Transcoder
    4—Conference Bridge
    5—Music On Hold

- 1.3.6.1.4.1.9.9.156.2.0.6 ccmRouteListExhausted
- 1.3.6.1.4.1.9.9.156.2.0.7 ccmGatewayLayer2Change
- 1.3.6.1.4.1.9.9.156.2.0.8 ccmMaliciousCall
- 1.3.6.1.4.1.9.9.156.2.0.9 ccmQualityReport
- 1.3.6.1.4.1.9.9.156.2.0.10 ccmTLSConnectionFailure

**Dynamic table objects**

The following table lists the objects that are populated only if the Cisco Unified Communications Manager service is up and running or the local Cisco Unified Communications Manager service in the case of a Cisco Unified Communications Manager cluster configuration.
Table 131: CISCO-CCM-MIB dynamic tables

<table>
<thead>
<tr>
<th>Object</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccmTable</td>
<td>This table stores the version and installation ID for the local Cisco Unified CM. The table also stores information about all the Cisco Unified CMs in a cluster that the local Cisco Unified CM knows about but shows “unknown” for the version detail. If the local Cisco Unified CM is down, the table remains empty, except for the version and installation ID values.</td>
</tr>
<tr>
<td>ccmPhoneFailed, ccmPhoneStatusUpdate, ccmPhoneExtn, ccmPhone, ccmPhoneExtension</td>
<td>For the Cisco Unified IP Phone, the number of registered phones in ccmPhoneTable should match Cisco Unified Communications Manager/RegisteredHardwarePhones perfmon counter. The ccmPhoneTable includes one entry for each registered, unregistered, or rejected Cisco Unified IP Phone. The ccmPhoneExtnTable uses a combined index, ccmPhoneIndex and ccmPhoneExtnIndex, for relating the entries in the ccmPhoneTable and ccmPhoneExtnTable.</td>
</tr>
<tr>
<td>ccmCTIDevice, ccmCTIDeviceDirNum</td>
<td>The ccmCTIDeviceTable stores each CTI device as one device. Based on the registration status of the CTI Route Point or CTI Port, the ccmRegisteredCTIDevices, ccmUnregisteredCTIDevices, and ccmRejectedCTIDevices counters in the Cisco Unified Communications Manager MIB get updated.</td>
</tr>
<tr>
<td>ccmSIPDevice</td>
<td>The CCMSIPDeviceTable stores each SIP trunk as one device.</td>
</tr>
<tr>
<td>ccmH323Device</td>
<td>The ccmH323DeviceTable contains the list of H323 devices for which Cisco Unified Communications Manager contains information (or the local Cisco Unified Communications Manager in the case of a cluster configuration). For H.323 phones or H.323 gateways, the ccmH.323DeviceTable contains one entry for each H.323 device. (The H.323 phone and gateway do not register with Cisco Unified Communications Manager. Cisco Unified Communications Manager generates the H.323Started alarm when it is ready to handle calls for the indicated H.323 phone and gateway.) The system provides the gatekeeper information as part of the H323 trunk information.</td>
</tr>
<tr>
<td>ccmVoiceMailDevice, ccmVoiceMailDirNum</td>
<td>For Cisco uOne, ActiveVoice, the ccmVoiceMailDeviceTable includes one entry for each voice-messaging device. Based on the registration status, the ccmRegisteredVoiceMailDevices, ccmUnregisteredVoiceMailDevices, and ccmRejectedVoiceMailDevices counters in the Cisco Unified Communications Manager MIB get updated.</td>
</tr>
</tbody>
</table>
The ccmRegisteredGateways, ccmUnregisteredGateways, and ccmRejectedGateways keep track of the number of registered gateway devices or ports, number of unregistered gateway devices or ports, and number of rejected gateway devices or ports, respectively.

Cisco Unified Communications Manager generates alarms at the device or port level. The ccmGatewayTable, based on Cisco Unified CM alarms, contains device- or port-level information. Each registered, unregistered, or rejected device or port has one entry in ccmGatewayTable. The VG200 with two FXS ports and one T1 port has three entries in ccmGatewayTable. The ccmActiveGateway and ccmInActiveGateway counters track number of active (registered) and lost contact with (unregistered or rejected) gateway devices or ports.

Based on the registration status, ccmRegisteredGateways, ccmUnregisteredGateways, and ccmRejectedGateways counters get updated.

### Static table objects

The following table lists the objects that get populated when the Cisco Unified Communications Manager SNMP Service is running.

Table 132: CISCO-CCM-MIB static tables

<table>
<thead>
<tr>
<th>Object</th>
<th>Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccmProductType</td>
<td>The table contains the list of product types that are supported with Cisco Unified Communications Manager (or cluster, in the case of a Cisco Unified Communications Manager cluster configuration), including phone types, gateway types, media device types, H323 device types, CTI device types, voice-messaging device types, and SIP device types.</td>
</tr>
<tr>
<td>ccmRegion, ccmRegionPair</td>
<td>ccmRegionTable contains the list of all geographically separated regions in a Cisco Communications Network (CCN) system. The ccmRegionPairTable contains the list of geographical region pairs for a Cisco Unified Communications Manager cluster. Geographical region pairs are defined by Source region and Destination region.</td>
</tr>
</tbody>
</table>
Object | Content
---|---
ccmTimeZone | The table contains the list of all time zone groups in a Cisco Unified Communications Manager cluster.
ccmDevicePool | The tables contain the list of all device pools in a Cisco Unified Communications Manager cluster. Device pools are defined by Region, Date/Time Group, and Cisco Unified CM Group.

**Troubleshoot SNMP**

**General tips**

The following are general troubleshooting tips:

- Check the community string or snmp user is properly configured on the system using the SNMP configuration web pages.
- Check if Cisco Unified CM SNMP Service is activated and running by checking the ccmsservice window and clicking **Tools > Service Activation/ControlCenter - Feature Services**.
- Check if SNMP Master Agent is running by checking the ccmsservice window and clicking **Tools > Service Activation/ControlCenter - Network Services**.
- Check if Cisco Unified CM is running.
- If Cisco Unified CM is not running, only the following MIB tables respond:
  - ccmGroupTable
  - ccmRegionTable
  - ccmRegionPairTable
  - ccmDevicePoolTable
  - ccmProductTypeTable
  - ccmQualityReportAlarmConfigInfo
  - ccmGlobalInfo
- For the rest of the tables to respond Cisco Unified CM needs to be running.
- Set the debug trace level to detailed for Cisco CallManager SNMP Service. Go to the Serviceability web window and click **Trace > Configuration > <select serverCisco> Performance and Monitoring Services > CallManager SNMP Service**.
- Execute the CLI command: `utils snmp walk 2c < community > <ipaddress > 1.3.6.1.4.1.9.9.156` or execute the walk from any other management application on this OID.
- Get the Cisco Unified Communication Manager release details, Cisco SNMP CallManager Service trace, and SNMP Master agent traces after the testing above for troubleshooting reference.
Review this section for Cisco CallManager SNMP Service Troubleshooting tips:

- Be sure to set the trace setting to detailed for Cisco CallManager SNMP Service (see the “SNMP Trace Configuration” chapter of the Cisco Unified Serviceability Administration Guide).
- Execute the command: `snmp walk -c <community> -v2c <ipaddress> 1.3.6.1.4.1.9.9.156.1.1.2`
- Get the Cisco Unified Communications Manager version details
- Collect the following logs and information:
  - SNMP Master Agent (path: `platform/snmp/snmpdm/*`) and Cisco CallManager SNMP Service (path: `cm/trace/ccmmib/sdi/*`) by using TLC in RTMT or this CLI command: `file get activelog`
  - SNMP package version by using this CLI command: `show packages active snmp`
  - MMF Spy output for phone by using this CLI command: `show risdb query phone`
- Send the trace logs and MMFSpy data for further analysis

The following table provides procedures for verifying that CISCO-CCM-MIB SNMP traps get sent.

**Table 133: How to check CISCO-CCM-MIB SNMP traps**

<table>
<thead>
<tr>
<th>Trap</th>
<th>Verification procedure</th>
</tr>
</thead>
<tbody>
<tr>
<td>ccmPhoneStatusUpdate</td>
<td>1 Set MaxSeverity=Info in CiscoSyslog-&gt;dogBasic MIB table.</td>
</tr>
<tr>
<td></td>
<td>2 Set PhoneStatusUpdateAlarmInterv=30 or higher in ccmAlarmConfigInfo MIB table.</td>
</tr>
<tr>
<td></td>
<td>3 Disconnect a Cisco Unified CM server that your phones point to.</td>
</tr>
<tr>
<td></td>
<td>4 Phones will unregister.</td>
</tr>
<tr>
<td></td>
<td>5 Connect the Cisco Unified CM server again.</td>
</tr>
<tr>
<td></td>
<td>6 Phones will re-register.</td>
</tr>
<tr>
<td></td>
<td>7 Check that the ccmPhoneStatusUpdate trap is generated.</td>
</tr>
<tr>
<td>ccmPhoneFailed</td>
<td>1 Set MaxSeverity=Info in CiscoSyslog-&gt;clogBasic MIB table.</td>
</tr>
<tr>
<td></td>
<td>2 Set PhoneFailedAlarmInterv=30 or higher in ccmAlarmConfigInfo MIB table.</td>
</tr>
<tr>
<td></td>
<td>3 Make a phone fail. Delete a phone Cisco Unified Communications Manager Administration and register the phone again.</td>
</tr>
<tr>
<td></td>
<td>4 Check that the ccmPhoneFailed trap is generated.</td>
</tr>
</tbody>
</table>
### Verification procedure

<table>
<thead>
<tr>
<th>Trap</th>
<th>Verification procedure</th>
</tr>
</thead>
</table>
| MediaResourceListExhausted  | 1. Create a Media Resource Group (MRG) that contains one of the standard Conference Bridge resources (CFB-2).  
2. Create a Media Resource Group List (MRGL) that contains the MRG just created.  
3. In the Phone Configuration window (for actual phones), set MRGL as the phone Media Resource Group List.  
4. Stop the IPVMS, which makes the Conference Bridge resource (CFB-2) stop working.  
5. If you make conference calls with phones that use the media list, you will see "No Conference Bridge available" in the phone screen.  
6. Check that a MediaListExhausted Alarm/Alert/Trap is generated. |
| RouteListExhausted          | 1. Create a Route Group (RG) that contains one gateway.  
2. Create a Route Group List (RGL) that contains the RG that was just created.  
3. Create a Route Pattern (9.XXXX) that routes a 9XXXX call through the RGL.  
4. Unregister the gateway.  
5. Dial 9XXXX on one of the phones.  
6. Check that a RouteListExhausted Alarm/Alert/Trap is generated. |
| MaliciousCallFailed         | 1. Similar to QRT, create a softkey template. In the template, add all available “MaliciousCall” softkey to the phone different status.  
2. Assign the new softkey template to actual phones; reset the phones.  
3. Make some calls and select the “MaliciousCall” softkey in the phone screen during or after the call.  
4. Check that a “MaliciousCallFailed” Alarm/Alert/Trap is generated. |

---

### Logs and analytical information for Linux and Cisco Unified CM releases 5.x 6.x 7.x

Collect the following logs and information for analysis:

- SNMP Master Agent (Path: `/platform/snmp/snmpdm/*`)
- Cisco CallManager SNMP Service (Path: `/cm/trace/ccmmib/sdi/*`)

---
• The files can be collected using TLC (Real Time Monitoring Tool (RTMT)) or CLI by using the following command: `file get activelog <path mentioned above>`.

• All the files in `/usr/local/Snmpri/conf` folder. (This is possible only if ROOT/REMOTE login is available)

• The 'ls -l' listing of the above folder. (This is possible only if ROOT/REMOTE login is available)

• Collect Perfmon logs. Execute the following CLI command: `file get activelog /cm/log/ris/csv/`.

• Details of the set of actions performed that resulted in the issue.

• Ccmsg service logs. Execute the following CLI command: `file get activelog /tomcat/logs/ccmsgservice/log4j/`.

• Collect the SNMP package version. Use the `show packages activesnmp` CLI command.

• Get the MMF Spy output for Phone. Use the `show risdb query phone` CLI command.

Logs and analytical information for Windows and Cisco Unified CM version 4.x

Collect the following logs for analysis:

• Set the Alarm level from the ccmsg service Alarm Configuration window for Cisco Unified CM to Detailed.

• Set the RIS Trace configuration from the ccmsg service window to Detailed.

• Do a snmpwalk on the ccm MIB from the network management application or execute command from any Linux box by using the `snmpwalk -c <community>-v2c <ipaddress> 1.3.6.1.4.1.9.9.156`.

• Capture the output of the snmpwalk.

• Collect the logs under `C:\Program Files\Cisco\Trace\RIS\CCMSNMP_*.*.log`.

• Collect the logs under `C:\Program Files\Cisco\Trace\DBL\ DBL_SNMP*.txt`.

• Event logs (both application and system).

• mmmSpy output for 'misc', 'CMnode' tables.

• MMFSpy tool to dump registration status (`C:\Program Files\Cisco\Bin\MMFSpy.exe`, gives different options). Usage: "mmFSpy -j > OutputFileName".

CISCO-CCM-MIB only supports a limited amount of configuration information about a device. For more complete configuration information, the AXL interface accessing the data in DB serves the purpose.

The list of MMFs that are created by the Cisco Unified CM Agent are as follows:

• cmnode

• cmgroup

• cmgroupmember

• region

• regionmatrix

• timezone
• devicepool
• phonefailed
• phonestatsupd
• cmproduct
• cmmodel

Limitations

If multiple OIDs are specified in the SNMP request and if the variables are pointing to empty tables in CISCO-CCM-MIB, then the request will take longer. In case the getbulk/getnext/getmany request has multiple OIDs in its request PDU with the subsequent tables being empty in the CISCO-CCM-MIB, the responses may be NO_SUCH_NAME for SNMP v1 version or GENERIC_ERROR for SNMP v2c or v3 version.

• Reason—This timeout occurs due to the code added to enhance the performance of the CCMAgent and throttle when it gets a large number of queries thus protecting the priority of Cisco Unified CM call processing engine.

• Workaround:
  ◦ Use the available scalar variables (1.3.6.1.4.1.9.9.156.1.5) to determine the table size before accessing the table. Or do the get operation on the desired table first and then query the non empty tables.
  ◦ Reduce the number of variables queried in a single request. For example, for empty tables. if Management application has timeout set at 3 sec, then recommendations is to specify no more than 1 OID. For non-empty tables it takes 1 second to retrieve 1 row of data.
  ◦ Increase the response timeout.
  ◦ Reduce the number of retries.
  ◦ Avoid using getbulk SNMP API. Getbulk API gets number of records specified by MaxRepetitions. This means even if the next object goes outside the table or MIB, it gets those objects. So if the CISCO-CCM -MIB has empty tables then it goes to next MIB and so will more time to respond. Use getbulk API when it is known that the table is not empty, and also know the number of records. Under this condition limit the max repetition counts to 5 to get response within 5 sec.
  ◦ Structured SNMP queries to adapt to current limits.
  ◦ Avoid doing a number of getbulks on the PhoneTable in case there are a number of phones registered to the Cisco Unified CM, walking it periodically may not be optimal. In such a scenario whenever there is an update, ccmPhoneStatusUpdateTable will be updated, use this information to decide whether to walk the PhoneTable.

Frequently asked questions

Q. Not getting any SNMP traps from the Cisco Unified Communication Manager node for the CISCO-CCM-MIB.
A. For receiving SNMP traps in CISCO-CCM-MIB, you need to ensure that the value of the following MIB OIDs are set to appropriate values: ccmPhoneFailedAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.2) and ccmPhoneStatusUpdateAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.4) are set between 30 and 3600. The default is set to 0.

Execute the following commands from any Linux machine:

- `snmpset -c <Community String> -v2c <transmitter ip address> 1.3.6.1.4.1.9.9.156.1.9.2.0i <value>`
- `snmpset -c <Community String> -v2c <transmitter ip address> 1.3.6.1.4.1.9.9.156.1.9.4.0i <value>`

These are related to registration/deregistration/failure of phones.

You need to ensure that notification destinations are configured. This can be done from the Serviceability Web window. There is a menu for SNMP > Notification destination.

Before you configure notification destination, verify that the required SNMP services are activated and running (SNMP Master Agent and Cisco CallManager SNMP Services). Also, make sure that you configured the privileges for the community string/user correctly which should contain Notify permissions as well.

If still Traps are not generated check if corresponding alarms are generated. Since these traps are generated based on the alarm events, ensure that SNMP agents are getting these alarm events. Enable 'Local Syslog', setup the Cisco Unified CM Alarm configuration to 'Informational' level for 'Local Syslog' destination from the Alarm configuration available on Cisco Unified CM Serviceability web page->Alarm->Configuration. Then repro the traps and see if corresponding alarms are logged in CiscoSyslog file.

Receiving syslog messages as traps—To receive syslog messages above a particular severity as traps, set the following 2 MIB objects in the cLogBasic table:

- `clogNotificationsEnabled (1.3.6.1.4.1.9.9.41.1.1.2)—Set this to true(1) to enable syslog trap notification. Default value is false (2). For example, snmpset -c <Community String> -v2c 1.3.6.1.4.1.9.9.41.1.1.2.0i <value>`.
- `clogMaxSeverity (1.3.6.1.4.1.9.9.41.1.1.3)—Set the severity level above which traps are desired. Default value is warning (5). All syslog messages with alarm severity lesser than or equal to configured severity level will be sent as traps if notification is enabled. For example, snmpset -c <Community String> -v2c 1.3.6.1.4.1.9.9.41.1.1.3.0i <value>`.

Q. What are the different traps defined for Cisco Unified Communication Manager?

A. The CISCO-CCM-MIB contains the traps related information. Following are the list of defined traps defined:

- `ccmCallManagerFailed—Indication that the CallManager process detects a failure in one of its critical subsystems. It can also be detected from a heartbeat/event monitoring process.`
- `ccmPhoneFailed—Notification that the intervals specified in ccmPhoneFailedAlarmInterval indicate at least one entry in the ccmPhoneFailedTable.`
- `ccmPhoneStatusUpdate—Notification that is generated in the intervals specified in ccmPhoneStatusUpdateInterval if there is at least one entry in the ccmPhoneStatusUpdateTable.`
- `ccmGatewayFailed—Indication that at least one gateway has attempted to register or communicate with the CallManager and failed.`
**Note**

ccmGatewayFailed is deprecated and replaced by ccmGatewayFailedReason.

- **ccmMediaResourceListExhausted**—Indication that the CallManager has run out a certain specified type of resource.
- **ccmRouteListExhausted**—Indication that the CallManager could not find an available route in the indicated route list.
- **ccmGatewayLayer2Change**—Sent when the D-Channel/Layer 2 of an interface in a skinny gateway that has registered with the CallManager changes state.
- **ccmMaliciousCall**—Sent when a user registers a call as malicious with the local Cisco Unified CM
- **ccmQualityReport**—Sent when a user reports a quality problem using the Quality Report Tool
- **ccmTLSConnectionFailure**—Sent when CallManager fails to open TLS connection for the indicated device

The mapping of the traps to alarms is as follows:

- **ccmCallManagerFailed**—CallManagerFailure
- **ccmPhoneFailed**—DeviceTransientConnection
- **ccmPhoneStatusUpdate**
- **ccmGatewayFailed**—DeviceTransientConnection
- **ccmMaliciousCall**—MaliciousCall
- **ccmMediaResourceListExhausted**—MediaResourceListExhausted
- **ccmQualityReportRequest**—QRTRequest
- **ccmRouteListExhausted**—RouteListExhausted
- **ccmGatewayLayer2Change**—DChannelOOS, DChannelISV

**Q.** How can different SNMP traps from Cisco Unified Communication Manager be checked?

**A.** Following is the procedure for triggering few traps:

- **ccmPhoneStatusUpdate trap**
  - Set `ccmPhoneStatusUpdateAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.4)` to 30 or higher in `ccmAlarmConfigInfo MIB table`.
  - Disconnect a `ccm` server that your phones are pointing to.
  - Phones will unregister.
  - Connect the `ccm` server again.
  - Phones will re-register.
  - Will get the `ccmPhoneStatusUpdate` trap.

- **ccmPhoneFailed trap**
• Set ccmPhoneFailedAlarmInterval (1.3.6.1.4.1.9.9.156.1.9.2) to 30 or higher in ccmAlarmConfigInfo MIB table.

• Make a phone fail. Delete a phone from CM and register the phone again.

• For phone failed traps two different scenarios can be tried:
  Set the phone to point to tftp/ccm server A. plugin the phone to ccm server B on different switch. The phone status is unknown. Will see following: 2007-10-31:2007-10-31 14:53:40
  Local7.Debug 172.19.240.221 community=public, enterprise=1.3.6.1.4.1.9.9.156.2.0.2, enterprise_mib_name=ccmPhoneFailed, uptime=7988879, agent_ip=128.107.143.68, version=Ver2, ccmAlarmSeverity=error, ccmPhoneFailures=1.
  Register a 7960 phone as 7940 phone in the Cisco Unified CM and thus cause the db issue that makes the phone fail trap.

• MediaResourceListExhausted trap
  Create a Media Resource Group (MRG), have it contains one of the standard ConferenceBridge resource (CFB-2).
  Create a Media Resource Group List (MRGL), have it contains the MRG just created.
  In the Phone Configuration page for real phones, set MRGL as the phone Media Resource Group List.
  Stop the IPVMS which make the ConferenceBridge resource (CFB-2) stop working.
  Make conference calls with phones that using the media list, you will see “No Conference Bridge available” in the phone screen.
  Then check if a “MediaListExhausted” Alarm/Alert/Trap is generated.

• RouteListExhausted trap
  Create a Route Group (RG), have it contains one Gateway.
  Create a Route Group List (RGL), have it contains the RG just created.
  Create a Route Pattern (9.XXXX) that reroute a 9XXXX call through the RGL.
  Unregister the gateway.
  Dial 9XXXX in one of the phone.
  Then check if a “RouteListExhausted” Alarm/Alert/Trap is generated.

• MaliciousCallFailed trap
  Similar as QRT, create a softkey template. In the template, add all available “MaliciousCall” softkey to the phone's different status.
  Assign the new softkey template to real phones, reset the phones.
  Making calls, select the “MaliciousCall” in the phone screen during or after the call.
  Then check if a “MaliciousCallFailed” Alarm/Alert/Trap is generated

• GatewayFailed trap (Method 1)
• Remove the configuration of the gateway from the database through Web Admin (or) Change the MAC address of the gateway to some invalid value and update.
• Reboot the gateway
• Another way is to restart the Cisco Unified CM service to which the gateway is connected.

• GatewayFailed trap (Method 2)
  - Set GatewayAlarmEnable=true in ccmAlarmConfigInfo mib table
  - In ccm serviceability->Snmp configuration page, make sure you have SNMP community string and trap destination set correctly.
  - Create a gateway failure event and the trap will be seen on the trap receiver.
  - To cause a gateway fail, Restart Cisco Unified CM service which will cause gateway failover to the redundant ccm manager server. On that server, the gateway should not be configured in the database.

• ccmGatewayLayer2Changetrap
  - ccmGatewayLayer2Changetrap is triggered during DChannelOOS(D Channel Out of service) or DChannelISV (D Channel Inservice) from Cisco Unified CM. Please check if any such events can be triggered to test it out

• ccmCallManagerFailed trap
  - The CallManager Failed Alarm is generated when an internal error is encountered. These include an internal thread dying due to lack of CPU, timer issues and a couple others. This trap would be something that is hard to reproduce unless the CallManager team give a friendly that intentionally causes one of these occurrences.

Q. If the Cisco Unified CM Agent consumes high CPU continuously, what needs to be done?
A. Collect the logs as mentioned above (under Troubleshooting) for analysis and refer to defect CSCsm74316 to check if it is being hit. Verify if the fix for the defect has gone into the Cisco Unified CM version used by the customer.

Q. If the CTI Routepoint is deleted from Cisco Unified CM Admin UI, an entry exists for that in ccmCTIDeviceTable mib. Why?
A. There is service parameter called “RIS Unused Cisco CallManager Device Store Period” which defines how long Unregistered devices (when a registered device is removed from db, it unregisters) will remain in RISDB and hence in the MIB. The ccmadmin page and the SNMP MIB WALK may or may not be in sync, since the ccmadmin page shows the info from the database however SNMP uses the RISDB.

Q. When ccmPhoneType is queried from ccmPhoneTable in Cisco-CCM-MIB, no information is returned. Why?
A. The ccmPhoneType has been made obsolete. The same information can be retrieved from ccmPhoneProductTypeIndex against CcmProductTypeEntry. In the table, the indexes correspond to the index and name as listed in that table.
Some of other obsolete and alternate OIDs to be referred:

• ccmGatewayType is obsolete and need to refer ccmGateWayProductTypeIndex.
• ccmMediaDeviceType is obsolete and need to refer to ccmMediaDeviceProductTypeIndex
• ccmCTIDeviceType is obsolete and need to refer to ccmCTIDeviceProductTypeIndex

Q. A query on ccmPhoneProductTypeIndex returns zero. Why?
A. Verify that the Cisco Unified CM release that you are using has this capability.

Q. While performing a WALK on ccmPhoneTable, ccmPhoneUserName is not returning any value. How are usernames associated to the IP Phones?
A. Create an end user and then go to the phone that has been registered and associate the Owner User ID. Once this is done, the user will be shown by the OID in the SNMP Walk.

Q. How do I get the firmware versions of each phone by using SNMP?
A. ccmPhoneLoadID object in the ccmPhoneTable will give the firmware version of each phone. But this value may differ if new image download failed. In case of 7.x versions SNMP will expose both configured firmware ID (ccmPhoneLoadID) and the actual running firmware (ccmPhoneActiveLoad).

Q. CCM MIB returns ccmVersion as 5.0.1, which is the incorrect.
A. Verify the Cisco Unified CM release that you are using has this capability. If it does not, upgrade.

Q. CCM MIB returns incorrect ccmPhoneLoadID
A. ccmPhoneLoadID values are picked up from RISDB which is populated based on the alarm received during Phone registration. Perform the following steps and collect the logs for further analysis:

1. Go to Serviceability web page > Alarm > Configuration > Service Group (CM Services) > Service (Cisco CallManager).
2. Check Local Syslog, SDI Trace, SDL Trace. Ensure the Alarm Event Level for these selected destinations is set to Informational.
3. Set the Cisco CallManager trace level to Detailed.
4. Reset the phones showing incorrect LoadID.
5. Collect the Syslog and Cisco CallManager traces.
6. Collect the phone details.

Q. How Cisco Unified CM status (START/STOP) monitored?
A. For service monitoring we have following options:
   • SYSAPPL MIB
   • HOST-RESOURCE-MIB
   • CISCO-CCM-MIB (ccmStatus)
• SOAP interface
• Real-Time Monitoring Tool (RTMT) alerts

There is a ccmCallManagerFailed trap for Cisco Unified CM service failure. But this does not cover normal service stop and unknown crashes.

Q. The device pool information seems incorrect for any device polled for. The OID used is ccmPhoneDevicePoolIndex.
A. As stated in the CISCO-CCM-CAPABILITY MIB, ccmPhoneDevicePoolIndex is not supported, hence it returns 0. The CallManager device registration alarm currently does not contain the device pool information.

---

**CISCO-CCM-CAPABILITY**

**Note**

**Note**
This MIB is not meant to perform SNMP queries like MIB walk as there is no agent supporting this MIB. It is only used as documentation supplement to the CISCO-CCM-MIB.

Before you can compile CISCO-CCM-CAPABILITY, you need to compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
3. SNMPv2-CONF
4. SNMPv2-MIB
5. IANAifType-MIB
6. IF-MIB
7. CISCO-SMI
8. SNMP-FRAMEWORK-MIB
9. RMON-MIB
10. CISCO-TC
11. CISCO-VTP-MIB
12. RFC1155-SMI
13. RFC-1212
14. SNMPv2-TC-v1
15 CISCO-CDP-MIB
16 CISCO-CCM-CAPABILITY

VARIATION ccmPhoneFailedTable
DESCRIPTION The table containing the list of all phones which attempted to register with the local call manager and failed. The entries which have not been updated and kept at least for the duration specified in the ccmPhoneFailedStorePeriod will be deleted. Reasons for these failures could be due to configuration error, maximum number of phones has been reached, lost contact, etc.
VARIATION ccmPhoneStatusUpdateTableStatId
DESCRIPTION The current state of ccmPhoneStatusUpdateTable. The initial value of this object is 0 and it will be incremented everytime when there is a change (addition/deletion/modification) to the ccmPhoneStatusUpdateTable. This value and sysUpTime should be used together to find if the table has changed or not. When the SNMP service is restarted this value will be reset to 0.
VARIATION ccmPhStatUpdtTblLastAddedIndex
SYNTAX CcmIndexOrZero
DESCRIPTION The ccmPhoneStatusUpdateIndex value of the last entry that was added to the ccmPhoneStatusUpdateTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneStatusUpdateTable since their last poll. This value need not be the same as the highest index in the ccmPhoneStatusUpdateTable as the index could have wrapped around. The initial value of this object is 0 which indicates that there has been no entries added to this table. When the SNMP service is restarted this value will be reset to 0.
VARIATION ccmPhFailedTblLastAddedIndex
SYNTAX CcmIndexOrZero
DESCRIPTION The ccmPhoneFailedIndex value of the last entry that was added to the ccmPhoneFailedTable. This value together with sysUpTime can be used by the manager applications to identify the new entries in the ccmPhoneFailedTable since their last poll. This value need not be the same as the highest index in the ccmPhoneFailedTable as the index could have wrapped around.
The initial value of this object is 0 which indicates that there has been no entries added to this table. When the SNMP service is restarted this value will be reset to 0.

**VARIATION ccmPhoneFailedStorePeriod**

**DESCRIPTION** The time duration for storing each entry in the ccmPhoneFailedTable. The entries which have not been updated and kept at least this period will be deleted. This value should ideally be set to a higher value than the ccmPhoneFailedAlarmInterval object. The default value is 1800 seconds.

- From IF-MIB—ciscoCdpMIB MODULE-IDENTITY
CDP Interface group

cdpInterfaceTable OBJECT-TYPE
SYNTAX SEQUENCE OF CdpInterfaceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table containing the status of CDP on the device interfaces.
 ::= { cdpInterface 1 }

cdpInterfaceEntry OBJECT-TYPE
SYNTAX CdpInterfaceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the cdpInterfaceTable, containing the status of CDP on an interface.
INDEX { cdpInterfaceIfIndex }
 ::= { cdpInterfaceTable 1 }
CdpInterfaceEntry ::= SEQUENCE {
   cdpInterfaceIfIndex Integer32,
   cdpInterfaceEnableTruthValue,
   cdpInterfaceMessageInterval INTEGER,
   cdpInterfaceGroup Integer32,
   cdpInterfacePort Integer32
}

cdpInterfaceIfIndex OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The ifIndex value of the local interface. For 802.3 Repeaters on which the repeater ports do not have ifIndex values assigned, this value is a unique value for the port, and greater than any ifIndex value supported by the repeater; in this case, the specific port is indicated by corresponding values of cdpInterfaceGroup and cdpInterfacePort, where these values correspond to the group number and port number values of RFC 1516.
 ::= { cdpInterfaceEntry 1 }
cdpInterfaceEnable OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-write
STATUS current
DESCRIPTION
An indication of whether the Cisco Discovery Protocol is currently running on this interface. This
variable has no effect when CDP is disabled (cdpGlobalRun = FALSE).
::= { cdpInterfaceEntry 2 }

cdpInterfaceMessageInterval OBJECT-TYPE
SYNTAX INTEGER (5..254)
UNIT seconds
MAX-ACCESS read-write
STATUS obsolete and replaced by cdpGlobalMessageInterval. This object should be applied to the
whole system instead of per interface.
DESCRIPTION
The interval at which CDP messages are to be generated on this interface. The default value is 60
seconds.
::= { cdpInterfaceEntry 3 }

cdpInterfaceGroup OBJECT-TYPE
SYNTAX Integer32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object is only relevant to interfaces which are repeater ports on 802.3 repeaters. In this situation,
it indicates the RFC1516 group number of the repeater port which corresponds to this interface.
::= { cdpInterfaceEntry 4 }

cdpInterfacePort OBJECT-TYPE
SYNTAX Integer32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object is only relevant to interfaces which are repeater ports on 802.3 repeaters. In this situation,
it indicates the RFC1516 port number of the repeater port which corresponds to this interface.
::= { cdpInterfaceEntry 5 }
cdpInterfaceExtTable OBJECT-TYPE
   SYNTAX SEQUENCE OF CdpInterfaceExtEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   This table contains the additional CDP configuration on the device interfaces.
   ::= { cdpInterface 2 }

cdpInterfaceExtEntry OBJECT-TYPE
   SYNTAX CdpInterfaceExtEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry in the cdpInterfaceExtTable contains the values configured for Extended Trust TLV and COS (Class of Service) for Untrusted Ports TLV on an interface which supports the sending of these TLVs.
   INDEX { ifIndex }
   ::= { cdpInterfaceExtTable 1 }
   CdpInterfaceExtEntry ::= SEQUENCE {
      cdpInterfaceExtendedTrust INTEGER,
      cdpInterfaceCosForUntrustedPort Unsigned32
   }

cdpInterfaceExtendedTrust OBJECT-TYPE
   SYNTAX INTEGER {trusted(1), noTrust(2) }
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   Indicates the value to be sent by Extended Trust TLV. If trusted(1) is configured, the value of Extended Trust TLV is one byte in length with its least significant bit equal to 1 to indicate extended trust. All other bits are 0. If noTrust(2) is configured, the value of Extended Trust TLV is one byte in length with its least significant bit equal to 0 to indicate no extended trust. All other bits are 0.
   ::= { cdpInterfaceExtEntry 1 }
cdpInterfaceCosForUntrustedPort OBJECT-TYPE
   SYNTAX Unsigned32 (0..7)
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   Indicates the value to be sent by COS for Untrusted Ports TLV.
   ::= { cdpInterfaceExtEntry 2 }

CDP Address Cache group

cdpCacheTable OBJECT-TYPE
   SYNTAX SEQUENCE OF CdpCacheEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The (conceptual) table containing the cached information obtained via receiving CDP messages.
   ::= { cdpCache 1 }
cdpCacheEntry OBJECT-TYPE
SYNTAX CdpCacheEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An entry (conceptual row) in the cdpCacheTable, containing the information received via CDP on one interface from one device. Entries appear when a CDP advertisement is received from a neighbor device. Entries disappear when CDP is disabled on the interface, or globally.
INDEX { cdpCacheIfIndex, cdpCacheDeviceIndex }
 ::= { cdpCacheTable 1 }
CdpCacheEntry ::= SEQUENCE {
  cdpCacheIfIndex Integer32,
  cdpCacheDeviceIndex Integer32,
  cdpCacheAddressType CiscoNetworkProtocol,
  cdpCacheAddressCiscoNetworkAddress,
  cdpCacheVersionDisplayString,
  cdpCacheDeviceIdDisplayString,
  cdpCacheDevicePortDisplayString,
  cdpCachePlatformDisplayString,
  cdpCacheCapabilitiesOCTET STRING,
  cdpCacheVTPMgmtDomainDisplayString,
  cdpCacheNativeVLAN VlanIndex,
  cdpCacheDuplex INTEGER,
  cdpCacheApplianceID Unsigned32,
  cdpCacheVlanID Unsigned32,
  cdpCachePowerConsumptionUnsigned32,
  cdpCacheMTUUnsigned32,
  cdpCacheSysNameDisplayString,
  cdpCacheSysObjectId OBJECT IDENTIFIER,
  cdpCachePrimaryMgmtAddrType CiscoNetworkProtocol,
  cdpCachePrimaryMgmtAddr CiscoNetworkAddress,
  cdpCacheSecondaryMgmtAddrType CiscoNetworkProtocol,
  cdpCacheSecondaryMgmtAddr CiscoNetworkAddress,
  cdpCachePhysLocationDisplayString,
  cdpCacheLastChange TimeStamp
}
cdpCacheIfIndex OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
Normally, the ifIndex value of the local interface. For 802.3 repeaters for which the repeater ports do not have ifIndex values assigned, this value is a unique value for the port, and greater than any ifIndex value supported by the repeater; the specific port number in this case, is given by the corresponding value of cdpInterfacePort.
::= { cdpCacheEntry 1 }

cdpCacheDeviceIndex OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A unique value for each device from which CDP messages are being received.
::= { cdpCacheEntry 2 }

cdpCacheAddressType OBJECT-TYPE
SYNTAX CiscoNetworkProtocol
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication of the type of address contained in the corresponding instance of cdpCacheAddress.
::= { cdpCacheEntry 3 }

cdpCacheAddress OBJECT-TYPE
SYNTAX CiscoNetworkAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The (first) network-layer address of the device's SNMP-agent as reported in the Address TLV of the most recently received CDP message. For example, if the corresponding instance of cacheAddressType had the value 'ip(1)', then this object would be an IP-address.
::= { cdpCacheEntry 4 }
cdpCacheVersion OBJECT-TYPE
SYNTAX DisplayString
MAX-ACCESS read-only
STATUS current
DESCRIPTION The Version string as reported in the most recent CDP message. The zero-length string indicates no Version field (TLV) was reported in the most recent CDP message.
::= {cdpCacheEntry 5 }

cdpCacheDeviceId OBJECT-TYPE
SYNTAX DisplayString
STATUS current
DESCRIPTION The Device-ID string as reported in the most recent CDP message. The zero-length string indicates no Device-ID field (TLV) was reported in the most recent CDP message.
MAX-ACCESS read-only
::= {cdpCacheEntry 6 }

cdpCacheDevicePort OBJECT-TYPE
SYNTAX DisplayString
MAX-ACCESS read-only
STATUS current
DESCRIPTION The Port-ID string as reported in the most recent CDP message. This will typically be the value of the ifName object (e.g. Ethernet0). The zero-length string indicates no Port-ID field (TLV) was reported in the most recent CDP message.
::= {cdpCacheEntry 7 }

cdpCachePlatform OBJECT-TYPE
SYNTAX DisplayString
MAX-ACCESS read-only
STATUS current
DESCRIPTION The Device Hardware Platform as reported in the most recent CDP message. The zero-length string indicates that no Platform field (TLV) was reported in the most recent CDP message.
::= {cdpCacheEntry 8 }
cdpCacheCapabilities OBJECT-TYPE
SYNTAX OCTET STRING (SIZE (0..4))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The Device Functional Capabilities as reported in the most recent CDP message. For latest set of specific values, see the latest version of the CDP specification. The zero-length string indicates no Capabilities field (TLV) was reported in the most recent CDP message.
REFERENCE Cisco Discovery Protocol Specification, 10/19/94.
::= { cdpCacheEntry 9 }

cdpCacheVTPMgmtDomain OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..32))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The VTP Management Domain for the remote device interface, as reported in the most recently received CDP message. This object is not instantiated if no VTP Management Domain field (TLV) was reported in the most recently received CDP message.
REFERENCE managementDomainName in CISCO-VTP-MIB
::= { cdpCacheEntry 10 }

cdpCacheNativeVLAN OBJECT-TYPE
SYNTAX VlanIndex
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The remote device interface native VLAN, as reported in the most recent CDP message. The value 0 indicates no native VLAN field (TLV) was reported in the most recent CDP message.
::= { cdpCacheEntry 11 }

cdpCacheDuplex OBJECT-TYPE
SYNTAX INTEGER { unknown(1), halfduplex(2), fullduplex(3) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The remote device interface duplex mode, as reported in the most recent CDP message. The value unknown(1) indicates no duplex mode field (TLV) was reported in the most recent CDP message.
::= { cdpCacheEntry 12 }
cdpCacheApplianceID OBJECT-TYPE
SYNTAX Unsigned32 (0..255)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The remote device Appliance ID, as reported in the most recent CDP message. This object is not instantiated if no Appliance VLAN-ID field (TLV) was reported in the most recently received CDP message.
 ::= { cdpCacheEntry 13 }

cdpCacheVlanID OBJECT-TYPE
SYNTAX Unsigned32 (0..4095)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The remote device VoIP VLAN ID, as reported in the most recent CDP message. This object is not instantiated if no Appliance VLAN-ID field (TLV) was reported in the most recently received CDP message.
 ::= { cdpCacheEntry 14 }

cdpCachePowerConsumption OBJECT-TYPE
SYNTAX Unsigned32
UNITS milliwatts
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The amount of power consumed by remote device, as reported in the most recent CDP message. This object is not instantiated if no Power Consumption field (TLV) was reported in the most recently received CDP message.
 ::= { cdpCacheEntry 15 }
cdpCacheMTU OBJECT-TYPE
SYNTAX Unsigned32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Indicates the size of the largest datagram that can be sent/received by remote device, as reported in the most recent CDP message. This object is not instantiated if no MTU field (TLV) was reported in the most recently received CDP message.
::= { cdpCacheEntry 16 }

cdpCacheSysName OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Indicates the value of the remote device sysName MIB object. By convention, it is the device fully qualified domain name. This object is not instantiated if no sysName field (TLV) was reported in the most recently received CDP message.
::= { cdpCacheEntry 17 }

cdpCacheSysObjectID OBJECT-TYPE
SYNTAX OBJECTIDENTIFIER
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Indicates the value of the remote device sysObjectID MIB object. This object is not instantiated if no sysObjectID field (TLV) was reported in the most recently received CDP message.
::= { cdpCacheEntry 18 }

cdpCachePrimaryMgmtAddrType OBJECT-TYPE
SYNTAX CiscoNetworkProtocol
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication of the type of address contained in the corresponding instance of cdpCachePrimaryMgmtAddress.
::= { cdpCacheEntry 19 }
cdpCachePrimaryMgmtAddr OBJECT-TYPE
SYNTAX CiscoNetworkAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object indicates the (first) network layer address at which the device will accept SNMP messages as reported in the most recently received CDP message. If the corresponding instance of cdpCachePrimaryMgmtAddrType has the value ip(1), then this object would be an IP-address. If the remote device is not currently manageable via any network protocol, this object has the special value of the IPv4 address 0.0.0.0. If the most recently received CDP message did not contain any primary address at which the device prefers to receive SNMP messages, then this object is not instanstiated.
::= { cdpcacheEntry 20 }

cdpCacheSecondaryMgmtAddrType OBJECT-TYPE
SYNTAX CiscoNetworkProtocol
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication of the type of address contained in the corresponding instance of cdpCacheSecondaryMgmtAddress.
::= { cdpcacheEntry 21 }

cdpCacheSecondaryMgmtAddr OBJECT-TYPE
SYNTAX CiscoNetworkAddress
MAX-ACCESS read-only
STATUS current
DESCRIPTION
This object indicates the alternate network layer address (other than the one indicated by cdpCachePrimaryMgmtAddr) at which the device will accept SNMP messages as reported in the most recently received CDP message. If the corresponding instance of cdpCacheSecondaryMgmtAddrType has the value ip(1), then this object would be an IP-address. If the most recently received CDP message did not contain such an alternate network layer address, then this object is not instanstiated.
::= { cdpcacheEntry 22 }
cdpCachePhysLocation OBJECT-TYPE
   SYNTAX DisplayString
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Indicates the physical location, as reported by the most recent CDP message, of a connector which is
   on, or physically connected to, the remote device's interface over which the CDP packet is sent. This
   object is not instantiated if no Physical Location field (TLV) was reported by the most recently received
   CDP message.
   ::= { cdpCacheEntry 23 }

cdpCacheLastChange OBJECT-TYPE
   SYNTAX TimeStamp
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Indicates the time when this cache entry was last changed. This object is initialised to the current time
   when the entry gets created and updated to the current time whenever the value of any (other) object
   instance in the corresponding row is modified.
   ::= { cdpCacheEntry 24 }

CDP Global group

cdpGlobalRun OBJECT-TYPE
   SYNTAX TruthValue
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   An indication of whether the Cisco Discovery Protocol is currently running. Entries in cdpCacheTable
   are deleted when CDP is disabled.
   DEFVAL { true }
   ::= { cdpGlobal 1 }
cdpGlobalMessageInterval OBJECT-TYPE
   SYNTAX INTEGER (5..254)
   UNITS seconds
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   The interval at which CDP messages are to be generated. The default value is 60 seconds.
   DEFVAL { 60 }
   ::= { cdpGlobal 2 }

cdpGlobalHoldTime OBJECT-TYPE
   SYNTAX INTEGER (10..255)
   UNITS seconds
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   The time for the receiving device holds CDP message. The default value is 180 seconds.
   DEFVAL { 180 }
   ::= { cdpGlobal 3 }

cdpGlobalDeviceId OBJECT-TYPE
   SYNTAX DisplayString
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The device ID advertised by this device. The format of this device id is characterized by the value of cdpGlobalDeviceIdFormat object.
   ::= { cdpGlobal 4 }

cdpGlobalLastChange OBJECT-TYPE
   SYNTAX TimeStamp
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   Indicates the time when the cache table was last changed. It is the most recent time at which any row was last created, modified or deleted.
   ::= { cdpGlobal 5 }
cdpGlobalDeviceIdFormatCpb OBJECT-TYPE
SYNTAX BITS { serialNumber(0), macAddress(1), other (2) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Indicates the Device-Id format capability of the device. The serialNumber(0) indicates that the device supports using serial number as the format for its DeviceId. The macAddress(1) indicates that the device supports using layer 2 MAC address as the format for its DeviceId. The other(2) indicates that the device supports using its platform specific format as the format for its DeviceId.
::= { cdpGlobal 6 }

cdpGlobalDeviceIdFormat OBJECT-TYPE
SYNTAX INTEGER { serialNumber(1), macAddress(2), other(3) }
MAX-ACCESS read-write
STATUS current
DESCRIPTION
An indication of the format of Device-Id contained in the corresponding instance of cdpGlobalDeviceId. User can only specify the formats that the device is capable of as denoted in cdpGlobalDeviceIdFormatCpb object. The serialNumber(1) indicates that the value of cdpGlobalDeviceId object is in the form of an ASCII string contain the device serial number. The macAddress(2) indicates that the value of cdpGlobalDeviceId object is in the form of Layer 2 MAC address. The other(3) indicates that the value of cdpGlobalDeviceId object is in the form of a platform specific ASCII string contain info that identifies the device. For example: ASCII string contains serialNumber appended/prepended with system name.
::= { cdpGlobal 7 }

CDP MIB conformance information

ciscoCdpMIBConformance OBJECT IDENTIFIER ::= { ciscoCdpMIB 2 }

STATUS current

DESCRIPTION

A collection of objects for use with the Cisco Discovery Protocol version 2 to configure the value for Extended Trust TLV and COS for Untrusted Port TLV.

::= { ciscoCdpMIBGroups 7 }

Troubleshoot CDP MIB for Linux and Cisco Unified CM Release 5.x, 6.x, 7.x

For Linux and Cisco Unified CM Release 5.x, 6.x, 7.x., collect the following logs and information for analysis:

- Use the set trace enable Detailed cdpmib CLI set the detailed trace for cdpAgt ()
- Restart the Cisco CDP Agent service from the serviceability Web Page (Tools > Controlcenter- Network Services) and wait for some time.
- Collect the following trace files:
  - Enable the Cisco CDP Agent traces by using the file get activelog cm/trace/cdpmib/sdi command and Cisco CDP daemon traces using the file get activelog cm/trace/cdp/sdi command.
Enable the Cisco CDP Agent and daemon traces by using the Real-Time Monitoring Tool (RTMT) > Trace & Log Central > Collect Files > Cisco CallManager SNMP Service > Cisco CDP Agent and Cisco CDP.

- Once the logs are collected, reset the trace setting by using the set trace disable cdpmib command.

For Windows and Cisco Unified CM Release 4.x, perform the following to collect logs for analysis.

- Set TraceEnabled to true under the registry HKEY_LOCAL_MACHINE\SOFTWARE\CiscoSystems, Inc.\SnmpCDPAgent and restart SNMP service.
- After restarting SNMP service, another option TraceLevel displays. Set this to value 3.
- Do the walk on CDP MIB.
- Collect the log file from location C:\Program Files\Cisco\bin\SnmpCDPImpl.log.
- Collect the output of c:\utils\tlist.exe snmp.exe and output of dir c:\program files\cisco\bin.

Frequently asked questions for CDP MIBs

- The CDP interface table and globalinfo tables are blank.

- How is the MessageInterval value set in the Interface table as well as Global table in CDP MIB?

The CDP interface table and globalinfo tables are blank.
Verify that you Cisco Unified CM release that you are using has this capability. If not, upgrade.

How is the MessageInterval value set in the Interface table as well as Global table in CDP MIB?
Check to see if the HoldTime value is greater than MessageInterval value. If it is less, then the MessageInterval value cannot be set from both Interface table as well as Global table.

CISCO-SYSLOG-MIB

This is a reformatted version of CISCO-SYSLOG-MIB. Download and compile all of the MIBs in this section from http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.

This MIB provides a means to gather syslog messages generated by the Cisco IOS. Various textual messages are generated by the Cisco IOS. Cisco IOS can be configured such that these messages are sent to a syslog server. With this MIB these same messages can also be received via the SNMP. These messages are hereupon referred to as syslog messages in this document.
Messages generated as a result of entering CLI debug commands are not made available via the SNMP at this time.

All Cisco IOS syslog messages have timestamps (optional), facility names (where the message came from), severity, message name, and message text. The following example is often seen: %SYS-5-CONFIG_I: configured from console where facility=SYS, severity=5, message name=CONFIG_I.

Before you can compile CISCO-SYSLOG-MIB, you need to compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
3. SNMPv2-CONF
4. CISCO-SMI
5. INET-ADDRESS-MIB
6. SNMP-FRAMEWORK-MIB
7. RFC1155-SMI
8. RFC-1212
9. RFC-1215
10. SNMPv2-TC-v1
11. CISCO-SYSLOG-MIB

Additional downloads are:
- OID File: CISCO-SYSLOG-MIB.oid
- Capability File: CISCO-SYSLOG-CAPABILITY

**CISCO-SYSLOG-MIB revisions**

The following table lists the revisions to the MIB beginning with the latest revision.

*Table 136: History of revisions*

<table>
<thead>
<tr>
<th>Date</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>08-07-1995</td>

<td>The MIB module describes how to store the system messages generated by the Cisco IOS software. ::= { ciscoMgmt 41 }</td>
</tr>
</tbody>
</table>
CISCO-SYSLOG-MIB definitions

The following definitions are imported for CISCO-SYSLOG-MIB:

- MODULE-IDENTITY, NOTIFICATION-TYPE, OBJECT-TYPE, Integer32, Counter32
- From SNMPv2-SMI—TEXTUAL-CONVENTION, DisplayString, TimeStamp, TruthValue
- From SNMPv2-TC—MODULE-COMPLIANCE, OBJECT-GROUP
- From SNMPv2-CONF—ciscoMgmt
- From CISCO-SMI—ciscoSyslogMIB MODULE-IDENTITY

```
ciscoSyslogMIBObjects OBJECT IDENTIFIER ::= { ciscoSyslogMIB 1 }
```

CISCO-SYSLOG-MIB object identifiers

```
clogBasicOBJECT IDENTIFIER ::= { ciscoSyslogMIBObjects 1 }
clogHistoryOBJECT IDENTIFIER ::= { ciscoSyslogMIBObjects 2 }
```

Syslog MIB textual conventions

```
SyslogSeverity ::= TEXTUAL-CONVENTION
  STATUS current
  DESCRIPTION
    The severity of a syslog message. The enumeration values are equal to the values that syslog uses + 1. For example, with syslog, emergency=0.
  SYNTAX INTEGER { emergency(1), alert(2), critical(3), error(4), warning(5), notice(6), info(7), debug(8) }
```
Basic syslog objects

clogNotificationsSent OBJECT-TYPE
SYNTAX Counter32
UNITS notifications
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of clogMessageGenerated notifications that have been sent. This number may include
notifications that were prevented from being transmitted due to reasons such as resource limitations
and/or non-connectivity. If one is receiving notifications, one can periodically poll this object to
determine if any notifications were missed. If so, a poll of the clogHistoryTable might be appropriate.
::= { clogBasic 1 }

clogNotificationsEnabled OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-write
STATUS current
DESCRIPTION
Indicates whether clogMessageGenerated notifications will or will not be sent when a syslog message
is generated by the device. Disabling notifications does not prevent syslog messages from being added
to the clogHistoryTable.
DEFVAL { false }
::= { clogBasic 2 }

clogMaxSeverity OBJECT-TYPE
SYNTAX SyslogSeverity
MAX-ACCESS read-write
STATUS current
DESCRIPTION
Indicates which syslog severity levels will be processed. Any syslog message with a severity value
greater than this value will be ignored by the agent.

Note
Severity numeric values increase as their severity decreases, e.g. error(4) is
more severe than debug(8).

DEFVAL { warning }
::= { clogBasic 3 }
clogMsgIgnores OBJECT-TYPE
  SYNTAX Counter32
  UNITS messages
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of syslog messages which were ignored. A message will be ignored if it has a severity value greater than clogMaxSeverity.
  ::= { clogBasic 4 }

clogMsgDrops OBJECT-TYPE
  SYNTAX Counter32
  UNITS messages
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of syslog messages which could not be processed due to lack of system resources. Most likely this will occur at the same time that syslog messages are generated to indicate this lack of resources. Increases in this object’s value may serve as an indication that system resource levels should be examined via other mib objects. A message that is dropped will not appear in the history table and no notification will be sent for this message.
  ::= { clogBasic 5 }

Syslog MIB message history table

clogHistTableMaxLength OBJECT-TYPE
  SYNTAX Integer32 (0..500)
  UNITS entries
  MAX-ACCESS read-write
  STATUS current
  DESCRIPTION
  The upper limit on the number of entries that the clogHistoryTable may contain. A value of zero prevents any history from being retained. When this table is full, the oldest entry will be deleted and a new one will be created.
  DEFVAL { 1 }
  ::= { clogHistory 1 }
clogHistMsgsFlushed OBJECT-TYPE
   SYNTAX Counter32
   UNITS messages
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The number of entries that have been removed from the clogHistoryTable in order to make room for
   new entries. This object can be utilized to determine whether your polling frequency on the history
   table is fast enough and/or the size of your history table is large enough such that you are not missing
   messages.
   ::= { clogHistory 2 }

clogHistoryTable OBJECT-TYPE
   SYNTAX SEQUENCE OF ClogHistoryEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   A table of syslog messages generated by this device. All 'interesting' syslog messages (i.e. severity <=
clogMaxSeverity) are entered into this table.
   ::= { clogHistory 3 }

clogHistoryEntry OBJECT-TYPE
   SYNTAX ClogHistoryEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   A syslog message that was previously generated by this device. Each entry is indexed by a message
   index.
   INDEX{ clogHistIndex }
   ::= { clogHistoryTable 1 }
   ClogHistoryEntry ::= SEQUENCE { clogHistIndex Integer32, clogHistFacility DisplayString, clogHistSeverity SyslogSeverity, clogHistMsgName DisplayString, clogHistMsgText DisplayString, clogHistTimestamp TimeStamp }
clogHistIndex OBJECT-TYPE
    SYNTAX Integer32 (1..2147483647)
    MAX-ACCESS not-accessible
    STATUS current
    DESCRIPTION
    A monotonically increasing integer for the sole purpose of indexing messages. When it reaches the maximum value the agent flushes the table and wraps the value back to 1.
    ::= { clogHistoryEntry 1 }

clogHistFacility OBJECT-TYPE
    SYNTAX DisplayString (SIZE (1..20))
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    Name of the facility that generated this message. For example: 'SYS'.
    ::= { clogHistoryEntry 2 }

clogHistSeverity OBJECT-TYPE
    SYNTAX SyslogSeverity
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The severity of the message.
    ::= { clogHistoryEntry 3 }

clogHistMsgName OBJECT-TYPE
    SYNTAX DisplayString (SIZE (1..30))
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    A textual identification for the message type. A facility name in conjunction with a message name uniquely identifies a message type.
    ::= { clogHistoryEntry 4 }
clogHistMsgText OBJECT-TYPE
   SYNTAX DisplayString (SIZE (1..255))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The text of the message. If the text of the message exceeds 255 bytes, the message will be truncated to
   254 bytes and a '*' character will be appended indicating that the message has been truncated.
   ::= { clogHistoryEntry 5 }

clogHistTimestamp OBJECT-TYPE
   SYNTAX TimeStamp
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The value of sysUpTime when this message was generated.
   ::= { clogHistoryEntry 6 }

Syslog MIB notifications

ciscoSyslogMIBNotificationPrefix OBJECT IDENTIFIER
   ::= { ciscoSyslogMIB 2 }

ciscoSyslogMIBNotifications OBJECT IDENTIFIER
   ::= { ciscoSyslogMIBNotifications 0 }

clogMessageGenerated NOTIFICATION-TYPE
   OBJECTS {clogHistFacility, clogHistSeverity, clogHistMsgName, clogHistMsgText, clogHistTimestamp }
   STATUS current
   DESCRIPTION
   When a syslog message is generated by the device a clogMessageGenerated notification is sent. The
   sending of these notifications can be enabled/disabled via the clogNotificationsEnabled object.
   ::= { ciscoSyslogMIBNotifications 1 }
Syslog MIB conformance information

ciscoSyslogMIBConformance OBJECT IDENTIFIER
   ::= { ciscoSyslogMIB 3 }

ciscoSyslogMIBCompliances OBJECT IDENTIFIER
   ::= { ciscoSyslogMIBConformance 1 }

ciscoSyslogMIBGroups OBJECT IDENTIFIER
   ::= { ciscoSyslogMIBConformance 2 }

Syslog MIB compliance statements

ciscoSyslogMIBCompliance MODULE-COMPLIANCE
   STATUS current
   DESCRIPTION
   The compliance statement for entities which implement the Cisco syslog MIB.
   MANDATORY-GROUPS { ciscoSyslogMIBGroup }
   ::= { ciscoSyslogMIBCompliances 1 }

Syslog MIB units of conformance

ciscoSyslogMIBGroup OBJECT-GROUP
   OBJECTS { clogNotificationsSent, clogNotificationsEnabled, clogMaxSeverity, clogMsgIgnores,
            clogMsgDrops, clogHistTableMaxLength, clogHistMsgsFlushed, clogHistFacility, clogHistSeverity,
            clogHistMsgName, clogHistMsgText, clogHistTimestamp }
   STATUS current
   DESCRIPTION
   A collection of objects providing the syslog MIB capability.
   ::= { ciscoSyslogMIBGroups 1 }

Troubleshoot syslog traps

Syslog has standard buffer size while generating a SNMP trap message; the data is trimmed to the specified
field size (255). This avoids any errors caused by data that is too large for the field. For example, if you have
specified the message text field to be 255 bytes, but a message arrives that is 300 bytes, the data will be
truncated to 255 bytes before being logged.
Trap setup

To configure the traps, set clogsNotificationEnabled (1.3.6.1.4.1.9.9.41.1.1.2) to TRUE(1) by using SNMP set operation in any SNMP management application. Set the severity using clogMaxSeverity (1.3.6.1.4.1.9.9.41.1.1.3) by using any SNMP management application. This object indicates the syslog severity level that needs to be processed. Any syslog message with a severity value greater than this value will be ignored by the agent. Severity numeric values increase as their severity decreases.

Collect the following logs and information:

- Set the detailed trace for CiscoSyslogAgent with the set trace enable Detailed syslogmib command.
- Restart the Cisco Syslog Agent service from the serviceability Web window Tools > Control Center - Network Services and wait for some time.
- Collect the Cisco Syslog Agent trace files by:
  - Using the file get activelog cm/trace/syslogmib/sdi/ command.
  - Using RTMT Trace & Log Central > Collect Files > Cisco CallManager SNMP Service > Cisco Syslog Agent.
- Once the logs are collected, reset the trace settings by using the set trace disable syslogmib command.

Frequently asked questions for syslog

Q. How is a remote syslog server configured?

A. You can configure a remote syslog server from Cisco Unified Communications Manager Administration System > Enterprise Parameters plus the following:

- Remote Syslog Server Name—You can enter the name or IP address of the remote Syslog server that you want to use to accept Syslog messages. If the server name is not specified, Cisco Unified Serviceability does not send the Syslog messages. Do not specify a Cisco Unified Communications Manager server as the destination because the Cisco Unified Communications Manager server does not accept Syslog messages from another server.
  - Maximum length: 255
  - Allowed values: Provide a valid remote syslog server name that comprises (A-Z,a-z,0-9,..)

- Syslog Severity For Remote Syslog messages—You can select the desired Syslog messages severity for remote syslog server. The system sends all the syslog messages with selected or higher severity levels to the remote syslog. If the remote server name is not specified, Cisco Unified Serviceability does not send the Syslog messages.

Q. How is a remote syslog server configured to redirect alarms specific to a particular service?

A. You can configure a remote syslog server from Cisco Unified Serviceability window Alarm > Configuration:

- Select the Service Group and Service from drop down list for the particular server.
• Enable Alarm for Remote Syslogs and set the desired Alarm Event Level. Enter the remote syslog server name or IP address for redirection.

• The system sends all the syslog messages for the particular service with selected or higher severity levels to the remote syslog.

Q. How are messages captured in the configured remote server?
A. Kiwi Syslog Daemon is a freeware tool which can be installed in the remote server to capture the syslog messages.

Q. What happens if the same remote server is configured from Enterprise Parameters and Alarm Configuration page?
A.
- Enterprise parameters configuration of remote syslog redirects all the syslog messages which have severity equal to or higher than configured severity. There is no classification done for different types of syslog messages. It is just a plain redirection of all the syslog messages generated.
- Alarm configuration sends the specific service syslog messages to the configured remote server based on the severity.
- Enterprise Parameters configuration is used by the Cisco Syslog Agent to send the messages. Corresponding application Alarm configuration will use the alarm interface to send to remote syslog server configured.
- If the “Local Syslogs” Alarm is enabled in Alarm page, there will be duplication of the service specific messages, incase the same remote server is configured in both pages (provided the severity conditions are matched). For example: Enterprise window has severity level as “Error”, Alarm page has severity “Debug” and “Local syslogs” alarm is enabled. If a syslog message of a particular service configured via alarm page, has a severity higher than 'Debug' and 'Error', then it will be duplicated.

Q. Does the SysLog subagent generate traps for the alarms in Syslog automatically? Is there any configuration?
A. Syslog subagent can be configured to generate traps for the syslog alarms. Some limitations are:

- Traps are sent out based on selected severity. If the given alarm is of low severity then the management application needs to set the severity threshold lower to capture this low severity alarm/trap. In other words mgmt apps need to deal with flooding of other low severity traps.
- SNMP Trap message size limited to 255 and not enabled by default. i.e. by default clogsNotificationEnabled (1.3.6.1.4.1.9.9.41.1.1.2) is set to FALSE (2).

CISCO-SYSLOG-EXT-MIB

Note
This is a reformatted version of CISCO-SYSLOG-EXT-MIB. Download and compile all of the MIBs in this section from http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.
Before you can compile CISCO-SYSLOG-EXT-MIB, you need to download and compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
3. SNMPv2-CONF
4. CISCO-SMI
5. INET-ADDRESS-MIB
6. SNMP-FRAMEWORK-MIB
7. CISCO-SYSLOG-MIB
8. RFC1155-SMI
9. RFC-1212
10. SNMPv2-TC-v1
11. CISCO-SYSLOG-EXT-MIB

Additional downloads are:

- OID File: CISCO-SYSLOG-EXT-MIB.oid

Industry-Standard Management Information Base

This chapter describes the industry-standard Management Information Base (MIB) text files that are supported by Cisco Unified Communications Manager (Cisco Unified CM) and used with Simple Network Management Protocol (SNMP).

- **SYSAPPL-MIB**, page 857
- **RFC1213-MIB (MIB-II)**, page 889
- **HOST-RESOURCES-MIB**, page 944
- **IF-MIB**, page 983

### SYSAPPL-MIB

The MIB module defines management objects that model applications as collections of executables and files installed and executing on a host system. The MIB presents a system-level view of applications; i.e., objects in this MIB are limited to those attributes that can typically be obtained from the system itself without adding special instrumentation to the applications.

Before you can compile SYSAPPL-MIB, you need to compile the MIBs listed below in the order listed.

1. RFC1155-SMI
2. RFC-1212
3. SNMPv2-SMI-v1
4. SNMPv2-TC-v1
5. SYSAPPL-MIB

Installed application groups

This group provides information about application packages that have been installed on the host computer. The group contains two tables as follows:

- **sysApplInstallPkgTable**: Describes the application packages
- **sysApplInstallElmtTable**: Describes the constituent elements (files and executables) which compose an application package
In order to appear in the group, an application and its component files must be discoverable by the system itself, possibly through some type of software installation mechanism or registry.

**sysAppInstallPkgTable**

The system installed application packages table provides information on the software packages installed on a system. These packages may consist of many different files including executable and non-executable files.

**sysAppInstallPkgTable OBJECT-TYPE**

SYNTAX SysAppInstallPkgEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table listing the software application packages installed on a host computer. In order to appear in this table, it may be necessary for the application to be installed using some type of software installation mechanism or global registry so that its existence can be detected by the agent implementation.

 ::= { sysAppInstalled 1 }

**sysAppInstallPkgEntry OBJECT-TYPE**

SYNTAX SysAppInstallPkgEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The logical row describing an installed application package.

INDEX { sysAppInstallPkgIndex }

 ::= { sysAppInstallPkgTable 1 }

SysAppInstallPkgEntry ::= SEQUENCE { sysAppInstallPkgIndex Unsigned32, sysAppInstallPkgManufacturer Utf8String, sysAppInstallPkgProductName Utf8String, sysAppInstallPkgVersion Utf8String, sysAppInstallPkgSerialNumber Utf8String, sysAppInstallPkgDate DateAndTime, sysAppInstallPkgLocation LongUtf8String }
sysAppInstallPkgIndex OBJECT-TYPE
SYNTAX Unsigned32 (1..ffffffffh)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An integer used only for indexing purposes. Generally monotonically increasing from 1 as new applications are installed. The value for each installed application must remain constant at least from one re-initialization of the network management entity which implements this MIB module to the next re-initialization. The specific value is meaningful only within a given SNMP entity. A sysAppInstallPkgIndex value must not be re-used until the next agent entity restart in the event the installed application entry is deleted.
 ::= {sysApplInstallPkgEntry 1 }

sysAppInstallPkgManufacturer OBJECT-TYPE
SYNTAX Utf8String
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The Manufacturer of the software application package.
 ::= {sysApplInstallPkgEntry 2 }

MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The logical row describing an element of an installed application. The element may be an executable or non-executable file.
INDEX {sysApplInstallPkgIndex, sysApplInstallElmtIndex}
::= { sysApplInstallElmtTable 1 }
SysApplInstallElmtEntry ::= SEQUENCE { sysApplInstallElmtIndex Unsigned32, sysApplInstallElmtNameUtf8String, sysApplInstallElmtTypeINTEGER, sysApplInstallElmtPathLongUtf8String, sysApplInstallElmtSizeHighUnsigned32, sysApplInstallElmtSizeLowUnsigned32, sysApplInstallElmtRoleBITS, sysApplInstallElmtRoleOCTETSTRING, sysApplInstallElmtModifyDate DateAndTime, sysApplInstallElmtCurSizeHighUnsigned32, sysApplInstallElmtCurSizeLowUnsigned32 }

sysApplInstallElmtIndex OBJECT-TYPE
SYNTAX Unsigned32 (1...ffffffffh)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
An arbitrary integer used for indexing. The value of this index is unique among all rows in this table that exist or have existed since the last agent restart.
::= { sysApplInstallElmtEntry 1 }
sysApplInstallElmtName OBJECT-TYPE
    SYNTAX Utf8String
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The name of this element which is contained in the application.
    ::= { sysApplInstallElmtEntry 2 }

sysApplInstallElmtType OBJECT-TYPE
    SYNTAX INTEGER { unknown(1), nonexecutable(2), operatingSystem(3), executable deviceDriver(4), executable application(5), executable }
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The type of element that is part of the installed application.
    ::= { sysApplInstallElmtEntry 3 }

sysApplInstallElmtDate OBJECT-TYPE
    SYNTAX DateAndTime
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The date and time that this component was installed on the system.
    ::= { sysApplInstallElmtEntry 4 }

sysApplInstallElmtPath OBJECT-TYPE
    SYNTAX LongUtf8String
    MAX-ACCESS read-only
    STATUS current
    DESCRIPTION
    The full directory path where this element is installed. For example, the value would be /opt/EMPuma/bin for an element installed in the directory /opt/EMPuma/bin. Most application packages include information about the elements contained in the package. In addition, elements are typically installed in sub-directories under the package installation directory. In cases where the element path names are not included in the package information itself, the path can usually be determined by a simple search of the sub-directories. If the element is not installed in that location and there is no other information available to the agent implementation, then the path is unknown and null is returned.
    ::= { sysApplInstallElmtEntry 5 }

  STATUS current
  DESCRIPTION
  The installed file size modulo $2^{32}$ bytes. This is the size of the file on disk immediately after installation. For example, for a file with a total size of 4,294,967,296 bytes this variable would have a value of 0; for a file with a total size of 4,294,967,295 bytes this variable would be 4,294,967,295.
  ::= { sysApplInstallElmtEntry 7 }
sysApplInstallElmtRole OBJECT-TYPE

SYNTAX OCTET STRING (SIZE(1))

SYNTAX BITS { executable (0), exclusive (1), primary (2), required (3), dependent (4), unknown(5) }

MAX-ACCESS read-write

STATUS current

DESCRIPTION

An operator assigned value used in the determination of application status. This value is used by the agent to determine both the mapping of started processes to the initiation of an application, as well as to allow for a determination of application health. The default value, unknown(5), is used when an operator has not yet assigned one of the other values. If unknown(5) is set, bits 1 - 4 have no meaning. The possible values are:

- executable (0)—An application may have one or more executable elements. The rest of the bits have no meaning if the element is not executable.
- exclusive(1)—Only one copy of an exclusive element may be running per invocation of the running application.
- primary(2)—The primary executable. An application can have one, and only one element that is designated as the primary executable. The execution of this element constitutes an invocation of the application. This is used by the agent implementation to determine the initiation of an application. The primary executable must remain running long enough for the agent implementation to detect its presence.
- required(3)—An application may have zero or more required elements. All required elements must be running in order for the application to be judged to be running and healthy.
- dependent(4)—An application may have zero or more dependent elements. Dependent elements may not be running unless required elements are.
- unknown(5)—Default value for the case when an operator has not yet assigned one of the other values. When set, bits 1, 2, 3, and 4 have no meaning.

sysApplInstallElmtRole is used by the agent implementation in determining the initiation of an application, the current state of a running application (see sysApplRunCurrentState), when an application invocation is no longer running, and the exit status of a terminated application invocation (see sysApplPastRunExitState).

DEFVAL { 5 }

this variable would have a value of 0; for a file with a total size of 4,294,967,295 bytes this variable
would be 4,294,967,295.
   ::= { sysAppInstallElmtEntry 11 }

sysApplRun group

This group models activity information for applications that have been invoked and are either currently running,
or have previously run on the host system. Likewise, the individual elements of an invoked application are
also modeled to show currently running processes, and processes that have run in the past.

sysApplRunTable

The sysApplRunTable contains the application instances which are currently running on the host. Since a
single application might be invoked multiple times, an entry is added to this table for each INVOCATION
of an application. The table is indexed by sysApplInstallPkgIndex, sysApplRunIndex to enable managers to easily locate all invocations of a particular application package.

sysApplRunTable OBJECT-TYPE
SYNTAX SEQUENCE OF SysApplRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table describes the applications which are executing on the host. Each time an application is invoked, an entry is created in this table. When an application ends, the entry is removed from this table and a corresponding entry is created in the SysApplPastRunTable.
A new entry is created in this table whenever the agent implementation detects a new running process that is an installed application element whose sysApplInstallElmtRole designates it as being the application's primary executable (sysApplInstallElmtRole = primary(2)).
The table is indexed by sysApplInstallPkgIndex, sysApplRunIndex to enable managers to easily locate all invocations of a particular application package.
 ::= { sysApplRun 1 }

sysApplRunEntry OBJECT-TYPE
SYNTAX SysApplRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The logical row describing an application which is currently running on this host.
INDEX { sysApplInstallPkgIndex, sysApplRunIndex }
 ::= { sysApplRunTable 1 }
SysApplRunEntry ::= SEQUENCE { sysApplRunIndex Unsigned32, sysApplRunStarted DateAndTime, sysApplRunCurrentState RunState }
sysApplRunIndex OBJECT-TYPE
  SYNTAX Unsigned32 (1..'ffffffff'h)
  MAX-ACCESS not-accessible
  STATUS current
  DESCRIPTION
  Part of the index for this table. An arbitrary integer used only for indexing purposes. Generally monotonically increasing from 1 as new applications are started on the host, it uniquely identifies application invocations.
  The numbering for this index increases by 1 for each INVOCATION of an application, regardless of which installed application package this entry represents a running instance of. An example of the indexing for a couple of entries is shown below.
  sysApplRunStarted.17.14
  sysApplRunStarted.17.63
  sysApplRunStarted.18.13
  :
  In this example, the agent has observed 12 application invocations when the application represented by entry 18 in the sysApplInstallPkgTable is invoked. The next invocation detected by the agent is an invocation of installed application package 17. Some time later, installed application 17 is invoked a second time.

  Note
  This index is not intended to reflect a real-time (wall clock time) ordering of application invocations; it is merely intended to uniquely identify running instances of applications. Although the sysApplInstallPkgIndex is included in the INDEX clause for this table, it serves only to ease searching of this table by installed application and does not contribute to uniquely identifying table entries.

::= {sysApplRunEntry 1 }

sysApplRunStarted OBJECT-TYPE
  SYNTAX DateAndTime
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The date and time that the application was started.

::= { sysApplRunEntry 2 }
sysApplRunCurrentState OBJECT-TYPE
SYNTAX RunState
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current state of the running application instance. The possible values are running(1), runnable(2) but waiting for a resource such as CPU, waiting(3) for an event, exiting(4), or other(5). This value is based on an evaluation of the running elements of this application instance (see sysApplElmRunState) and their Roles as defined by sysApplInstallElmtRole. An agent implementation may detect that an application instance is in the process of exiting if one or more of its REQUIRED elements are no longer running. Most agent implementations will wait until a second internal poll has been completed to give the system time to start REQUIRED elements before marking the application instance as exiting.

::= { sysApplRunEntry 3 }

sysApplPastRunTable

The sysApplPastRunTable provides a history of applications previously run on the host computer. Entries are removed from the sysApplRunTable and corresponding entries are added to this table when an application becomes inactive. Entries remain in this table until they are aged out when either the table size reaches a maximum as determined by the sysApplPastRunMaxRows, or when an entry has aged to exceed a time limit as set be sysApplPastRunTblTimeLimit.

When aging out entries, the oldest entry, as determined by the value of sysApplPastRunTimeEnded, will be removed first.
sysApplPastRunTable OBJECT-TYPE

SYNTAX SEQUENCE OF SysApplPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A history of the applications that have previously run on the host computer. An entry's information is moved to this table from the sysApplRunTable when the invoked application represented by the entry ceases to be running. An agent implementation can determine that an application invocation is no longer running by evaluating the running elements of the application instance and their Roles as defined by sysApplInstallElmtRole. Obviously, if there are no running elements for the application instance, then the application invocation is no longer running.

If any one of the REQUIRED elements is not running, the application instance may be in the process of exiting. Most agent implementations will wait until a second internal poll has been completed to give the system time to either restart partial failures or to give all elements time to exit. If, after the second poll, there are REQUIRED elements that are not running, then the application instance may be considered by the agent implementation to no longer be running.

Entries remain in the sysApplPastRunTable until they are aged out when either the table size reaches a maximum as determined by the sysApplPastRunMaxRows, or when an entry has aged to exceed a time limit as set by sysApplPastRunTblTimeLimit.

Entries in this table are indexed by sysApplInstallPkgIndex, sysApplPastRunIndex to facilitate retrieval of all past run invocations of a particular installed application.

::= { sysApplRun 2 }

sysApplPastRunEntry OBJECT-TYPE

SYNTAX SysApplPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The logical row describing an invocation of an application which was previously run and has terminated. The entry is basically copied from the sysApplRunTable when the application instance terminates. Hence, the entry's value for sysApplPastRunIndex is the same as its value was for sysApplRunIndex.
INDEX { sysApplInstallPkgIndex, sysApplPastRunIndex }

::= { sysApplPastRunTable 1 }

  STATUS current
  DESCRIPTION
  The DateAndTime the application instance was determined to be no longer running.
  ::= { sysApplPastRunEntry 4 }

sysApplElmtRunTable

The sysApplElmtRunTable contains an entry for each process that is currently running on the host. An entry is created in this table for each process at the time it is started, and will remain in the table until the process terminates. The table is indexed by sysApplElmtRunInstallPkg, sysApplElmtRunInvocID, and sysApplElmtRunIndex to make it easy to locate all running elements of a particular invoked application which has been installed on the system.

sysApplElmtRunTable OBJECT-TYPE

  SYNTAX SEQUENCE OF SysApplElmtRunEntry
  MAX-ACCESS not-accessible
  STATUS current
  DESCRIPTION
  The table describes the processes which are currently executing on the host system. Each entry represents a running process and is associated with the invoked application of which that process is a part, if possible. This table contains an entry for every process currently running on the system, regardless of whether its 'parent' application can be determined. So, for example, processes like 'ps' and 'grep' will have entries though they are not associated with an installed application package.

  Because a running application may involve more than one executable, it is possible to have multiple entries in this table for each application. Entries are removed from this table when the process terminates. The table is indexed by sysApplElmtRunInstallPkg, sysApplElmtRunInvocID, and sysApplElmtRunIndex to facilitate the retrieval of all running elements of a particular invoked application which has been installed on the system.

  ::= { sysApplRun 3 }

SYNTAX Utf8String
MAX-ACCESS read-only
STATUS current

DESCRIPTION
The process owner's login name (e.g. root).

::= { sysApplElmtRunEntry 12 }

sysApplElmtPastRunTable

The sysApplElmtPastRunTable maintains a history of processes which have previously executed on the host as part of an application. Upon termination of a process, the entry representing the process is removed from the sysApplElmtRunTable and a corresponding entry is created in this table provided that the process was part of an identifiable application. If the process could not be associated with an invoked application, no corresponding entry is created.

Hence, whereas the sysApplElmtRunTable contains an entry for every process currently executing on the system, the sysApplElmtPastRunTable only contains entries for processes that previously executed as part of an invoked application.

Entries remain in this table until they are aged out when either the number of entries in the table reaches a maximum as determined by sysApplElmtPastRunMaxRows, or when an entry has aged to exceed a time limit as set by sysApplElmtPastRunTblTimeLimit. When aging out entries, the oldest entry, as determined by the value of sysApplElmtPastRunTimeEnded, will be removed first.

The table is indexed by sysApplInstallPkgIndex (from the sysApplInstallPkgTable), sysApplElmtPastRunInvocID, and sysApplElmtPastRunIndex to make it easy to locate all previously executed processes of a particular invoked application that has been installed on the system.
sysApplElmtPastRunTable OBJECT-TYPE

SYNTAX SEQUENCE OF SysApplElmtPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table describes the processes which have previously executed on the host system as part of an application. Each entry represents a process which has previously executed and is associated with the invoked application of which it was a part. Because an invoked application may involve more than one executable, it is possible to have multiple entries in this table for each application invocation. Entries are added to this table when the corresponding process in the sysApplElmtRunTable terminates.

Entries remain in this table until they are aged out when either the number of entries in the table reaches a maximum as determined by sysApplElmtPastRunMaxRows, or when an entry has aged to exceed a time limit as set by sysApplElmtPastRunTblTimeLimit. When aging out entries, the oldest entry, as determined by the value of sysApplElmtPastRunTimeEnded, will be removed first.

The table is indexed by sysApplInstallPkgIndex (from the sysApplInstallPkgTable), sysApplElmtPastRunInvocID, and sysApplElmtPastRunIndex to make it easy to locate all previously executed processes of a particular invoked application that has been installed on the system.

::={sysApplRun 4 }

sysApplElmtPastRunEntry OBJECT-TYPE

SYNTAX SysApplElmtPastRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The logical row describing a process which was previously executed on this host as part of an installed application. The entry is basically copied from the sysApplElmtRunTable when the process terminates. Hence, the entry's value for sysApplElmtPastRunIndex is the same as its value was for sysApplElmtRunIndex. Note carefully: only those processes which could be associated with an identified application are included in this table.

INDEX { sysApplInstallPkgIndex, sysApplElmtPastRunInvocID, sysApplElmtPastRunIndex }

::={ sysApplElmtPastRunTable 1 }

sysApplElmtPastRunInvocID OBJECT-TYPE
SYNTAX Unsigned32 (1..ffffffffh)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
Part of the index for this table, this value identifies the invocation of an application of which the process represented by this entry was a part. The value of this object is the same value as the sysApplRunIndex for the corresponding application invocation in the sysApplRunTable. If the invoked application as a whole has terminated, it will be the same as the sysApplPastRunIndex.
::= { sysApplElmtPastRunEntry 1 }

descr

sysApplElmtPastRunIndex OBJECT-TYPE
SYNTAX Unsigned32 (0..ffffffffh)
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
Part of the index for this table. An integer assigned by the agent equal to the corresponding sysApplElmtRunIndex which was removed from the sysApplElmtRunTable and moved to this table when the element terminated. Note that entries in this table are indexed by sysApplElmtPastRunInvocID, sysApplElmtPastRunIndex.

The possibility exists, though unlikely, of a collision occurring by a new entry which was run by the same invoked application (InvocID), and was assigned the same process identification number (ElmtRunIndex) as an element which was previously run by the same invoked application.

Should this situation occur, the new entry replaces the old entry.

See the Implementation Issues section, sysApplElmtPastRunTable Entry Collisions for the conditions that would have to occur in order for a collision to occur.
::= { sysApplElmtPastRunEntry 2 }

sysApplElmtPastRunInstallID OBJECT-TYPE
SYNTAX Unsigned32 (1..ffffffffh)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The index into the installed element table. The value of this object is the same value as the sysApplInstallElmtIndex for the application element of which this entry represents a previously executed process.
::= { sysApplElmtPastRunEntry 3 }

sysApplElmtPastRunTimeStarted OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the process was started.
::= { sysApplElmtPastRunEntry 4 }

sysApplElmtPastRunTimeEnded OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The time the process ended.
::= { sysApplElmtPastRunEntry 5 }

sysApplElmtPastRunName OBJECT-TYPE
SYNTAX LongUtf8String
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The full path and filename of the process. For example, '/opt/MYYpkg/bin/myyproc' would be returned for process 'myyproc' whose execution path was '/opt/MYYpkg/bin/myyproc'.
::= { sysApplElmtPastRunEntry 6 }

sysApplElmtPastRunParameters OBJECT-TYPE
SYNTAX Utf8String
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The starting parameters for the process.
::= { sysApplElmtPastRunEntry 7 }
sysAppElmtPastRunCPU OBJECT-TYPE
SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The last known number of centi-seconds of the total system's CPU resources consumed by this process. Note that on a multi-processor system, this value may increment by more than one centi-second in one centi-second of real (wall clock) time.
::= { sysAppElmtPastRunEntry 8 }

sysAppElmtPastRunMemory OBJECT-TYPE
SYNTAX Unsigned32 (0..'ffffffff'h)
UNITS Kbytes
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The last known total amount of real system memory measured in Kbytes allocated to this process before it terminated.
::= { sysAppElmtPastRunEntry 9 }

sysAppElmtPastRunNumFiles OBJECT-TYPE
SYNTAX Unsigned32 (0..'ffffffff'h)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The last known number of files open by the process before it terminated. Transport connections (sockets) should NOT be included in the calculation of this value.
::= { sysAppElmtPastRunEntry 10 }

sysAppElmtPastRunUser OBJECT-TYPE
SYNTAX Utf8String
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The process owner's login name (e.g. root).
::= { sysAppElmtPastRunEntry 11 }
Additional scalar objects controlling table sizes

sysApplPastRunMaxRows OBJECT-TYPE
SYNTAX Unsigned32 (0..ffffffff'h)
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The maximum number of entries allowed in the sysApplPastRunTable. Once the number of rows in the sysApplPastRunTable reaches this value, the management subsystem will remove the oldest entry in the table to make room for the new entry to be added. Entries will be removed on the basis of oldest sysApplPastRunTimeEnded value first.
This object may be used to control the amount of system resources that can used for sysApplPastRunTable entries. A conforming implementation should attempt to support the default value, however, a lesser value may be necessary due to implementation-dependent issues and resource availability.
DEFVAL { 500 }
 ::= { sysApplRun 5 }

sysApplPastRunTableRemItems OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A counter of the number of entries removed from the sysApplPastRunTable because of table size limitations as set in sysApplPastRunMaxRows. This counter is the number of entries the management subsystem has had to remove in order to make room for new entries (so as not to exceed the limit set by sysApplPastRunMaxRows) since the last initialization of the management subsystem.
 ::= { sysApplRun 6 }
sysApplPastRunTblTimeLimit OBJECT-TYPE
SYNTAX Unsigned32 (0..'ffffffff'h)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The maximum time in seconds which an entry in the sysApplPastRunTable may exist before it is removed. Any entry that is older than this value will be removed (aged out) from the table. Note that an entry may be aged out prior to reaching this time limit if it is the oldest entry in the table and must be removed to make space for a new entry so as to not exceed sysApplPastRunMaxRows.
DEFVAL { 7200 }
::= { sysApplRun 7 }

sysApplElemPastRunMaxRows OBJECT-TYPE
SYNTAX Unsigned32 (0..'ffffffff'h)
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The maximum number of entries allowed in the sysApplElmtPastRunTable. Once the number of rows in the sysApplElmtPastRunTable reaches this value, the management subsystem will remove the oldest entry to make room for the new entry to be added. Entries will be removed on the basis of oldest sysApplElmtPastRunTimeEnded value first. This object may be used to control the amount of system resources that can used for sysApplElmtPastRunTable entries. A conforming implementation should attempt to support the default value, however, a lesser value may be necessary due to implementation-dependent issues and resource availability.
DEFVAL { 500 }
::= { sysApplRun 8 }

sysApplElemPastRunTableRemItems OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A counter of the number of entries removed from the sysApplElemPastRunTable because of table size limitations as set in sysApplElemPastRunMaxRows. This counter is the number of entries the management subsystem has had to remove in order to make room for new entries (so as not to exceed the limit set by sysApplElemPastRunMaxRows) since the last initialization of the management subsystem.
::= { sysApplRun 9 }
sysApplElemPastRunTblTimeLimit OBJECT-TYPE
SYNTAX Unsigned32 (0..ffffffff'h)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The maximum time in seconds which an entry in the sysApplElemPastRunTable may exist before it is removed. Any entry that is older than this value will be removed (aged out) from the table. Note that an entry may be aged out prior to reaching this time limit if it is the oldest entry in the table and must be removed to make space for a new entry so as to not exceed sysApplElemPastRunMaxRows.
DEFVAL {7200}
::={sysApplRun 10}

sysApplAgentPollInterval OBJECT-TYPE
SYNTAX Unsigned32 (0..ffffffff'h)
UNITS seconds
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The minimum interval in seconds that the management subsystem implementing this MIB will poll the status of the managed resources. Because of the non-trivial effort involved in polling the managed resources, and because the method for obtaining the status of the managed resources is implementation-dependent, a conformant implementation may chose a lower bound greater than 0.
A value of 0 indicates that there is no delay in the passing of information from the managed resources to the agent.
DEFVAL {60}
::={sysApplRun 11}

sysApplMap group

This group contains a table, the sysApplMapTable, whose sole purpose is to provide a 'backwards' mapping so that, given a known sysApplElmtRunIndex (process identification number), the corresponding invoked application (sysApplRunIndex), installed element (sysApplInstallElmtIndex), and installed application package (sysApplInstallPkgIndex) can be quickly determined. The table will contain one entry for each process currently running on the system.

A backwards mapping is extremely useful since the tables in this MIB module are typically indexed with the installed application package (sysApplInstallPkgIndex) as the primary key, and on down as required by the specific table, with the process ID number (sysApplElmtRunIndex) being the least significant key.
It is expected that management applications will use this mapping table by doing a 'GetNext' operation with the known process ID number (sysApplElmtRunIndex) as the partial instance identifier. Assuming that there is an entry for the process, the result should return a single columnar value, the sysApplMapInstallPkgIndex,
with the sysApplElmtRunIndex, sysApplRunIndex, and sysApplInstallElmtIndex contained in the instance identifier for the returned MIB object value.

---

**Note**

If the process cannot be associated back to an invoked application installed on the system, then the value returned for the columnar value sysApplMapInstallPkgIndex will be '0' and the instance portion of the object-identifier will be the process ID number (sysApplElmtRunIndex) followed by 0.0.

---

**sysApplMapTable OBJECT-TYPE**

SYNTAX SEQUENCE OF SysApplMapEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

The sole purpose of this table is to provide a 'backwards' mapping so that, given a known sysApplElmtRunIndex (process identification number), the corresponding invoked application (sysApplRunIndex), installed element (sysApplInstallElmtIndex), and installed application package (sysApplInstallPkgIndex) can be quickly determined.

::= {sysApplMap 1}

**sysApplMapEntry OBJECT-TYPE**

SYNTAX SysApplMapEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

A logical row representing a process currently running on the system. This entry provides the index mapping from process identifier, back to the invoked application, installed element, and finally, the installed application package. The entry includes only one accessible columnar object, the sysApplMapInstallPkgIndex, but the invoked application and installed element can be determined from the instance identifier since they form part of the index clause.

INDEX { sysApplElmtRunIndex, sysApplElmtRunInvocID, sysApplMapInstallElmtIndex }

SysApplMapEntry ::= SEQUENCE { sysApplMapInstallElmtIndexUnsigned32, sysApplMapInstallPkgIndexUnsigned32 }

::= { sysApplMapTable 1 }
sysApplMapInstallElmtIndex OBJECT-TYPE
   SYNTAX Unsigned32 (0..ffffffff'h)
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   The index into the sysApplInstallElmtTable. The value of this object is the same value as the
   sysApplInstallElmtIndex for the application element of which this entry represents a running instance.
   If this process cannot be associated to an installed executable, the value should be '0'.
   ::= { sysApplMapEntry 1 }

sysApplMapInstallPkgIndex OBJECT-TYPE
   SYNTAX Unsigned32 (0..ffffffff'h)
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The value of this object identifies the installed software package for the application of which this process
   is a part. Provided that the process's 'parent' application can be determined, the value of this object is
   the same value as the sysApplInstallPkgIndex for the entry in the sysApplInstallPkgTable that
   corresponds to the installed application of which this process is a part.
   If, however, the 'parent' application cannot be determined, (for example the process is not part of a
   particular installed application), the value for this object is then '0', signifying that this process cannot
   be related back to an application, and in turn, an installed software package.

Troubleshoot system application MIB

Linux and Cisco Unified CM releases 5.x 6.x 7.x

Collect the following logs and information for analysis. Execute the command `file get activelog <paths below>`

- SNMP Master Agent Path: /platform/snmp/snmpdm/*
- System Application Agent Path: /platform/snmp/sappagt/*

Windows and Cisco Unified CM release 4.x

Collect the following logs and information for analysis:

- Set the sysapp trace level to Detailed as follows, Enable TraceEnabled to “true” and TraceLevel to 3 from Registry HKEY_LOCAL_MACHINE\SOFTWARE\Cisco Systems, Inc.\SnmpSysAppAgent.
- Once you have edited it, restart the SNMP Service from the Services tab. You will see a trace file C:\Program Files\Cisco\bin\SnmpSysAppImpl.log created.
- Run a snmpwalk on the sysAppInstallPkgTable.
- Run a snmpwalk on the SysAppRunTable.
- Collect the C:\Program Files\Cisco\bin\SnmpSysAppImpl.log log file once walk is completed.
- Collect the application and event logs from the event log viewer.

Servlets for Cisco Unified CM 7.x

The SysAppl MIB provides a way to get inventory of what is installed and running at a given time. SysAppl agent cannot give the list of services activated or deactivated. It can only provide the running/not running states of the application/services. Web App services/Servlets cannot be monitored using the SysAppl MIB. Following are servlets for a 7.x system:

- Cisco CallManager Admin
- Cisco CallManager Cisco IP Phone Services
- Cisco CallManager Personal Directory
- Cisco CallManager Serviceability
- Cisco CallManager Serviceability RTMT
- Cisco Dialed Number Analyzer
- Cisco Extension Mobility
- Cisco Extension Mobility Application
- Cisco RTMT Reporter Servlet
For monitoring important service status for system health purposes, the following approaches are recommended:

- Use the Serviceability API called GetServiceStatus. This API can provide complete status information including activation status for both web application type and non web app services. (See AXL Serviceability API Guide for more details.)

- Use the `utils service list` command to check the status of different services.

- Use the Syslog message and monitor the servM generated messages. For example:

```
```

**Frequently asked questions for system application MIB**

When the CCMVersion MIB and sysApplRunCurrentState returns incorrect values in Cisco Unified CM Release 4.x, refer to CSCSk74156 to check if it is being hit. Verify if the fix for the defect has gone into the Cisco Unified CM version used by customer.

When the SNMP walk on sysApp MIB is not responding, refer to CSCSh72473 to check if it is being hit. Verify if the fix for the defect has gone into the Cisco Unified CM version used by customer.

**RFC1213-MIB (MIB-II)**

*Note*

This is a reformatted version of MIB-II. Download and compile all of the MIBs in this section from [http://tools.cisco.com/Support SNMP/do/BrowseMIB.do?local=en&step=2](http://tools.cisco.com/Support SNMP/do/BrowseMIB.do?local=en&step=2)

Before you can compile RFC1213-MIB, you need to compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
RFC1213-MIB revisions

The following changes have been applied:

- The enumerations unknown(4) and dormant(5) have been added to ifOperStatus to reflect a change to the ifTable introduced in RFC 1573.
- The SYNTAX of ifType has been changed to IANAifType, to reflect the change to the ifTable introduced in RFC 1573.

RFC1213-MIB definitions

The following definitions are imported for MIB-II:

- mgmt, NetworkAddress, IpAddress, Counter, Gauge, TimeTicks
- From RFC1155-SMI—OBJECT-TYPE
- From RFC-1212—TEXTUAL-CONVENTION
- From SNMPv2-TC—IANAifType
- From IANAifType-MIB;

RFC1213-MIB object identifiers

This MIB module uses the extended OBJECT-TYPE macro as defined in [14]. MIB-II (same prefix as MIB-I) mib-2 OBJECT IDENTIFIER ::= { mgmt 1 }.

RFC1213-MIB textual conventions

DisplayString ::= OCTET STRING

This data type is used to model textual information taken from the NVT ASCII character set. By convention, objects with this syntax are declared as having SIZE (0..255).

PhysAddress ::= OCTET STRING

This data type is used to model media addresses. For many types of media, this will be in a binary representation. For example, an ethernet address would be represented as a string of 6 octets.
Groups in MIB-II

systemOBJECT IDENTIFIER ::= { mib-2 1 }
interfacesOBJECT IDENTIFIER ::= { mib-2 2 }
atOBJECT IDENTIFIER ::= { mib-2 3 }
ipOBJECT IDENTIFIER ::= { mib-2 4 }
icmpOBJECT IDENTIFIER ::= { mib-2 5 }
tcpOBJECT IDENTIFIER ::= { mib-2 6 }
udpOBJECT IDENTIFIER ::= { mib-2 7 }
egpOBJECT IDENTIFIER ::= { mib-2 8 }

Historical

cmotOBJECT IDENTIFIER ::= { mib-2 9 }
transmissionOBJECT IDENTIFIER ::= { mib-2 10 }
snmpOBJECT IDENTIFIER ::= { mib-2 11 }

System group

Implementation of the system group is mandatory for all systems. If an agent is not configured to have a value for any of these variables, a string of length 0 is returned.

sysDescr OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
ACCESS read-only
STATUS mandatory
DESCRIPTION
A textual description of the entity. This value should include the full name and version identification of the system's hardware type, software operating-system, and networking software. It is mandatory that this only contain printable ASCII characters.
::= { system 1 }
sysObjectID OBJECT-TYPE
SYNTAX Object Identifier
ACCESS read-only
STATUS mandatory
DESCRIPTION
The vendor authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining “what kind of box” is being managed. For example, if vendor “Flintstones, Inc.” was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its “Fred Router”.
 ::= { system 2 }

sysUpTime OBJECT-TYPE
SYNTAX TimeTicks
ACCESS read-only
STATUS mandatory
DESCRIPTION
The time (in hundredths of a second) since the network management portion of the system was last re-initialized.
 ::= { system 3 }

sysContact OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
ACCESS read-write
STATUS mandatory
DESCRIPTION
The textual identification of the contact person for this managed node, together with information on how to contact this person.
 ::= { system 4 }

sysName OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
ACCESS read-write
STATUS mandatory
DESCRIPTION
An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name.
 ::= { system 5 }
sysLocation OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..255))
ACCESS read-write
STATUS mandatory
DESCRIPTION
The physical location of this node (e.g., telephone closet, 3rd floor).
::= { system 6 }

sysServices OBJECT-TYPE
SYNTAX Integer (0..127)
ACCESS read-only
STATUS mandatory
DESCRIPTION
A value which indicates the set of services that this entity primarily offers. The value is a sum. This
sum initially takes the value zero, Then, for each layer, L, in the range 1 through 7, that this node
performs transactions for, 2 raised to (L - 1) is added to the sum. For example, a node which performs
primarily routing functions would have a value of 4 (2^(3-1)). In contrast, a node which is a host offering
application services would have a value of 72 (2^(4-1) + 2^(7-1)). Note that in the context of the Internet
suite of protocols, values should be calculated accordingly (layer first, then functionality):
1 physical (e.g., repeaters)
2 datalink/subnetwork (e.g., bridges)
3 internet (e.g., IP gateways)
4 end-to-end (e.g., IP hosts)
7 applications (e.g., mail relays)
For systems including OSI protocols, layers 5 and 6 may also be counted.
::= { system 7 }

Interfaces group
Implementation of the Interfaces group is mandatory for all systems.

ifNumber OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of network interfaces (regardless of their current state) present on this system.
::= { interfaces 1 }
Interfaces table

The interfaces table contains information on the entity interfaces. Each interface is thought of as being attached to a subnetwork. Note that this term should not be confused with subnet which refers to an addressing partitioning scheme used in the Internet suite of protocols.

ifTable OBJECT-TYPE
SYNTAX Sequence of ifEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
A list of interface entries. The number of entries is given by the value of ifNumber.
 ::= { interfaces 2 }

ifEntry OBJECT-TYPE
SYNTAX IfEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
An interface entry containing objects at the subnetwork layer and below for a particular interface.
INDEX { ifIndex }
 ::= { ifTable 1 }
IfEntry ::= 
SEQUENCE { ifIndex INTEGER, ifDescr DisplayString, ifType IANAIfType, ifMtu INTEGER, ifSpeed Gauge, ifPhysAddress PhysAddress, ifAdminStatus INTEGER, ifOperStatus INTEGER, ifLastChange TimeTicks, ifInOctets Counter, ifInUcastPkts Counter, ifInNUcastPkts Counter, ifInDiscards Counter, ifInErrors Counter, ifInUnknownProtos Counter, ifOutOctets Counter, ifOutUcastPkts Counter, ifOutNUcastPkts Counter, ifOutDiscards Counter, ifOutErrors Counter, ifOutQLen Gauge, ifSpecific OBJECT IDENTIFIER }
ifDescr OBJECT-TYPE
  SYNTAX DisplayString (SIZE (0..255))
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  A textual string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the hardware interface.
  ::= { ifEntry 2 }

ifType OBJECT-TYPE
  SYNTAX IANAifType
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The type of interface. Additional values for ifType are assigned by the Internet Assigned Numbers Authority (IANA), through updating the syntax of the IANAifType textual convention.
  ::= { ifEntry 3 }

ifMtu OBJECT-TYPE
  SYNTAX Integer
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.
  ::= { ifEntry 4 }

ifSpeed OBJECT-TYPE
  SYNTAX Gauge
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  An estimate of the interface current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth.
  ::= { ifEntry 5 }
ifPhysAddress OBJECT-TYPE
SYNTAX PhysAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
The interface address at the protocol layer immediately below the network layer in the protocol stack. For interfaces which do not have such an address (e.g., a serial line), this object should contain an octet string of zero length.
 ::= { ifEntry 6 }

ifAdminStatus OBJECT-TYPE
SYNTAX Integer { up(1), ready to pass packets down(2), testing(3) in some test mode }
ACCESS read-write
STATUS mandatory
DESCRIPTION
The desired state of the interface. The testing(3) state indicates that no operational packets can be passed.
 ::= { ifEntry 7 }

ifOperStatus OBJECT-TYPE
SYNTAX INTEGER { up(1), -- ready to pass packets down(2), testing(3), -- in some test mode
unknown(4), dormant(5) }
ACCESS read-only
STATUS mandatory
DESCRIPTION
The current operational state of the interface. The testing(3) state indicates that no operational packets can be passed.
 ::= { ifEntry 8 }

ifLastChange OBJECT-TYPE
SYNTAX TimeTicks
ACCESS read-only
STATUS mandatory
DESCRIPTION
The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.
 ::= { ifEntry 9 }
ifInOctets OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION The total number of octets received on the interface, including framing characters.
::= { ifEntry 10 }

ifInUcastPkts OBJECT-TYPE
SYNTAX  Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of subnetwork-unicast packets delivered to a higher-layer protocol.
::= { ifEntry 11 }

ifInNUcastPkts OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of non-unicast (i.e., subnetwork- broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol.
::= { ifEntry 12 }

ifInDiscards OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space.
::= { ifEntry 13 }
**ifInErrors OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol.
::= { ifEntry 14 }

**ifInUnknownProtos OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of packets received via the interface which were discarded because of an unknown or unsupported protocol.
::= { ifEntry 15 }

**ifOutOctets OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of octets transmitted out of the interface, including framing characters.
::= { ifEntry 16 }

**ifOutUcastPkts OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.
::= { ifEntry 17 }
ifOutNUcastPkt OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of packets that higher-level protocols requested be transmitted to a non-unicast (i.e., a subnetwork-broadcast or subnetwork-multicast) address, including those that were discarded or not sent.
::= { ifEntry 18 }

ifOutDiscards OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.
::= { ifEntry 19 }

ifOutErrors OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of outbound packets that could not be transmitted because of errors.
::= { ifEntry 20 }

ifOutQLen OBJECT-TYPE
SYNTAX Gauge
ACCESS read-only
STATUS mandatory
DESCRIPTION
The length of the output packet queue (in packets).
::= { ifEntry 21 }
Address Translation group

Implementation of the Address Translation group is mandatory for all systems. Note however that this group is deprecated by MIB-II. That is, it is being included solely for compatibility with MIB-I nodes, and will most likely be excluded from MIB-III nodes. From MIB-II and onwards, each network protocol group contains its own address translation tables. The Address Translation group contains one table which is the union across all interfaces of the translation tables for converting a NetworkAddress (e.g., an IP address) into a subnetwork-specific address. For lack of a better term, this document refers to such a subnetwork-specific address as a physical address.

Examples of such translation tables are: for broadcast media where ARP is in use, the translation table is equivalent to the ARP cache; or, on an X.25 network where non-algorithmic translation to X.121 addresses is required, the translation table contains the NetworkAddress to X.121 address equivalences.

atTable OBJECT-TYPE
SYNTAX Sequence of atEntry
ACCESS not-accessible
STATUS deprecated
DESCRIPTION
The Address Translation tables contain the NetworkAddress to physical address equivalences. Some interfaces do not use translation tables for determining address equivalences (e.g., DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, i.e., has zero entries.

::= { at 1 }

atEntry OBJECT-TYPE
SYNTAX AtEntry
ACCESS not-accessible
STATUS deprecated
DESCRIPTION
Each entry contains one NetworkAddress to physical address equivalence.
INDEX { atIfIndex, atNetAddress }
::= { atTable 1 }
AtEntry ::= SEQUENCE { atIfIndex INTEGER, atPhysAddress PhysAddress, atNetAddress NetworkAddress }

atIfIndex OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS deprecated
DESCRIPTION
The interface on which this entry equivalence is effective. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.
::= { atEntry 1 }

atPhysAddress OBJECT-TYPE
SYNTAX PhysAddress
ACCESS read-write
STATUS deprecated
DESCRIPTION
The media-dependent physical address. Setting this object to a null string (one of zero length) has the effect of invaliding the corresponding entry in the atTable object. That is, it effectively disassociates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use.
Proper interpretation of such entries requires examination of the relevant atPhysAddress object.
::= { atEntry 2 }
atNetAddress OBJECT-TYPE
  SYNTAX NetworkAddress
  ACCESS read-write
  STATUS deprecated
  DESCRIPTION
  The NetworkAddress (e.g., the IP address) corresponding to the media-dependent physical address.
  ::= { atEntry 3 }

IP group

Implementation of the IP group is mandatory for all systems.

ipForwarding OBJECT-TYPE
  SYNTAX INTEGER { forwarding(1), -- acting as a gateway not-forwarding(2) -- NOT acting as a gateway }
  ACCESS read-write
  STATUS mandatory
  DESCRIPTION
  The indication of whether this entity is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this entity. IP gateways forward datagrams. IP hosts do not (except those source-routed via the host). Note that for some managed nodes, this object may take on only a subset of the values possible. Accordingly, it is appropriate for an agent to return a badValue response if a management station attempts to change this object to an inappropriate value.
  ::= { ip 1 }

ipDefaultTTL OBJECT-TYPE
  SYNTAX Integer
  ACCESS read-write
  STATUS mandatory
  DESCRIPTION
  The default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity, whenever a TTL value is not supplied by the transport layer protocol.
  ::= { ip 2 }
ipInReceives OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of input datagrams received from interfaces, including those received in error.
 ::= { ip 3 }

ipInHdrErrors OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, etc.
 ::= { ip 4 }

ipInAddrErrors OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (e.g., 0.0.0.0) and addresses of unsupported Classes (e.g., Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.
 ::= { ip 5 }
ipForwDatagrams OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

::= { ip 6 }

ipInUnknownProtos OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.

::= { ip 7 }

ipInDiscards OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). Note that this counter does not include any datagrams discarded while awaiting re-assembly.

::= { ip 8 }

ipInDelivers OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).

::= { ip 9 }
ipOutRequests OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in
requests for transmission. Note that this counter does not include any datagrams counted in
ipForwDatagrams.
 ::= { ip 10 }

ipOutDiscards OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of output IP datagrams for which no problem was encountered to prevent their transmission
to their destination, but which were discarded (e.g., for lack of buffer space). Note that this counter
would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary)
discard criterion.
 ::= { ip 11 }

ipOutNoRoutes OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of IP datagrams discarded because no route could be found to transmit them to their
destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this
no-route criterion. Note that this includes any datagrams which a host cannot route because all of its
default gateways are down.
 ::= { ip 12 }
ipReasmTimeout OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.
 ::= { ip 13 }

ipReasmReqds OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of IP fragments received which needed to be reassembled at this entity.
 ::= { ip 14 }

ipReasmOKs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of IP datagrams successfully re-assembled.
 ::= { ip 15 }

ipReasmFails OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc). Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.
 ::= { ip 16 }
ipFragOKs OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The number of IP datagrams that have been successfully fragmented at this entity.
  ::= { ip 17 }

ipFragFails OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be, e.g., because their Don't Fragment flag was set.
  ::= { ip 18 }

ipFragCreates OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.
  ::= { ip 19 }

**IP address table**

The IP address table contains this entity IP addressing information.

ipAddrTable OBJECT-TYPE
  SYNTAX Sequence of ipAddrEntry
  ACCESS not-accessible
  STATUS mandatory
  DESCRIPTION
  The table of addressing information relevant to this entity IP addresses.
  ::= { ip 20 }
ipAddrEntry OBJECT-TYPE
SYNTAX IpAddrEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
The addressing information for one of this entity IP addresses.
INDEX { ipAdEntAddr }
 ::= { ipAddrTable 1 }
IpAddrEntry ::= SEQUENCE { ipAdEntAddr IpAddress, ipAdEntIfIndex INTEGER, ipAdEntNetMask IpAddress, ipAdEntBcastAddr INTEGER, ipAdEntReasmMaxSize INTEGER (0..65535) }

ipAdEntAddr OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
The IP address to which this entry addressing information pertains.
 ::= { ipAddrEntry 1 }

ipAdEntIfIndex OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The index value which uniquely identifies the interface to which this entry is applicable. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.
 ::= { ipAddrEntry 2 }

ipAdEntNetMask OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
The subnet mask associated with the IP address of this entry. The value of the mask is an IP address with all the network bits set to 1 and all the hosts bits set to 0.
 ::= { ipAddrEntry 3 }
ipAdEntBcastAddr OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The value of the least-significant bit in the IP broadcast address used for sending datagrams on the
(logical) interface associated with the IP address of this entry. For example, when the Internet standard
all-ones broadcast address is used, the value will be 1. This value applies to both the subnet and network
broadcasts addresses used by the entity on this (logical) interface.
 ::= { ipAddrEntry 4 }

ipAdEntReasmMaxSize OBJECT-TYPE
SYNTAX Integer(0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
The size of the largest IP datagram which this entity can re-assemble from incoming IP fragmented
datagrams received on this interface.
 ::= { ipAddrEntry 5 }

IP routing table
-- The IP routing table contains an entry for each route
-- presently known to this entity.

ipRouteTable OBJECT-TYPE
SYNTAX Sequence of ipRouteEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
This entity IP Routing table.
 ::= { ip 21 }
ipRouteEntry OBJECT-TYPE
SYNTAX IpRouteEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
A route to a particular destination.
INDEX { ipRouteDest }
 ::= { ipRouteTable 1 }
IpRouteEntry ::= 
 SEQUENCE { ipRouteDestIpAddress, ipRouteIfIndex INTEGER, ipRouteMetric1 INTEGER,
ipRouteMetric2 INTEGER, ipRouteMetric3 INTEGER, ipRouteMetric4 INTEGER, ipRouteNextHopIpAddress, ipRouteType INTEGER, ipRouteProto INTEGER, ipRouteAge INTEGER, ipRouteMaskIpAddress, ipRouteMetric5 INTEGER, ipRouteInfo OBJECT IDENTIFIER }

ipRouteDest OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
The destination IP address of this route. An entry with a value of 0.0.0.0 is considered a default route. Multiple routes to a single destination can appear in the table, but access to such multiple entries is dependent on the table-access mechanisms defined by the network management protocol in use.
 ::= { ipRouteEntry 1 }

ipRouteIfIndex OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
The index value which uniquely identifies the local interface through which the next hop of this route should be reached. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.
 ::= { ipRouteEntry 2 }
ipRouteMetric1 OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
The primary routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route ipRouteProto value. If this metric is not used, its value should be set to -1.
 ::= { ipRouteEntry 3 }

ipRouteMetric2 OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route ipRouteProto value. If this metric is not used, its value should be set to -1.
 ::= { ipRouteEntry 4 }

ipRouteMetric3 OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route ipRouteProto value. If this metric is not used, its value should be set to -1.
 ::= { ipRouteEntry 5 }

ipRouteMetric4 OBJECT-TYPE
SYNTAX Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route ipRouteProto value. If this metric is not used, its value should be set to -1.
 ::= { ipRouteEntry 6 }
ipRouteNextHop OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
The IP address of the next hop of this route. (In the case of a route bound to an interface which is realized via a broadcast media, the value of this field is the agent's IP address on that interface.)
::= { ipRouteEntry 7 }

ipRouteType OBJECT-TYPE
SYNTAX Integer { other(1), -- none of the following invalid(2), -- an invalidated route -- route to directly direct(3), -- connected (sub-)network -- route to a non-local indirect(4) -- host/network/sub-network }
ACCESS read-write
STATUS mandatory
DESCRIPTION
The type of route. Note that the values direct(3) and indirect(4) refer to the notion of direct and indirect routing in the IP architecture. Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipRouteTable object. That is, it effectively disassociates the destination identified with said entry from the route identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table.
Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipRouteType object.
::= { ipRouteEntry 8 }

ipRouteProto OBJECT-TYPE
SYNTAX INTEGER { other(1), -- none of the following -- non-protocol information, -- e.g., manually configured local(2), -- entries -- set via a network netmgmt(3), -- management protocol -- obtained via ICMP, icmp(4), -- e.g., Redirect -- the remaining values are -- all gateway routing -- protocols egp(5), ggp(6), hello(7), rip(8), is-is(9), e-is(is(10), ciscoIgrp(11), bbnSpfIgp(12), ospf(13), bgp(14) }
ACCESS read-only
STATUS mandatory
DESCRIPTION
The routing mechanism via which this route was learned. Inclusion of values for gateway routing protocols is not intended to imply that hosts should support those protocols.
::= { ipRouteEntry 9 }
ipRouteAge OBJECT-TYPE
SYNTAX  Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
The number of seconds since this route was last updated or otherwise determined to be correct. Note that no semantics of too old can be implied except through knowledge of the routing protocol by which the route was learned.
::= { ipRouteEntry 10 }

ipRouteMask OBJECT-TYPE
SYNTAX  IpAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
Indicate the mask to be logical-ANDed with the destination address before being compared to the value in the ipRouteDest field. For those systems that do not support arbitrary subnet masks, an agent constructs the value of the ipRouteMask by determining whether the value of the correspondent ipRouteDest field belong to a class-A, B, or C network, and then using one of: mask network 255.0.0.0 class-A, 255.255.0.0 class-B, 255.255.255.0 class-C. If the value of the ipRouteDest is 0.0.0.0 (a default route), then the mask value is also 0.0.0.0. It should be noted that all IP routing subsystems implicitly use this mechanism.
::= { ipRouteEntry 11 }

ipRouteMetric5 OBJECT-TYPE
SYNTAX  Integer
ACCESS read-write
STATUS mandatory
DESCRIPTION
An alternate routing metric for this route. The semantics of this metric are determined by the routing-protocol specified in the route ipRouteProto value. If this metric is not used, its value should be set to -1.
::= { ipRouteEntry 12 }
ipRouteInfo OBJECT-TYPE
SYNTAX OBJECT IDENTIFIER
ACCESS read-only
STATUS mandatory
DESCRIPTION
A reference to MIB definitions specific to the particular routing protocol which is responsible for this route, as determined by the value specified in the route ipRouteProto value. If this information is not present, its value should be set to the OBJECT IDENTIFIER { 0 0 }, which is a syntactically valid object identifier, and any conformant implementation of ASN.1 and BER must be able to generate and recognize this value.
 ::= { ipRouteEntry 13 }

IP address translation table
The IP address translation table contains the IP Address to physical address equivalences. Some interfaces do not use translation tables for determining address equivalences (e.g., DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, i.e., has zero entries.

ipNetToMediaTable OBJECT-TYPE
SYNTAX Sequence of ipNetToMediaEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
The IP Address Translation table used for mapping from IP addresses to physical addresses.
 ::= { ip 22 }

ipNetToMediaEntry OBJECT-TYPE
SYNTAX IpNetToMediaEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
Each entry contains one IP Address to physical address equivalence.
INDEX { ipNetToMediaIfIndex, ipNetToMediaNetAddress }
 ::= { ipNetToMediaTable 1 }
IpNetToMediaEntry ::= SEQUENCE { ipNetToMediaIfIndex INTEGER, ipNetToMediaPhysAddress PhysAddress, ipNetToMediaNetAddress IpAddress, ipNetToMediaType INTEGER }
ipNetToMediaIfIndex OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-write
STATUS mandatory
DESCRIPTION
The interface on which this entry's equivalence is effective. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.
::= { ipNetToMediaEntry 1 }

ipNetToMediaPhysAddress OBJECT-TYPE
SYNTAX PhysAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
The media-dependent physical address.
::= { ipNetToMediaEntry 2 }

ipNetToMediaNetAddress OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-write
STATUS mandatory
DESCRIPTION
The IpAddress corresponding to the media-dependent physical address.
::= { ipNetToMediaEntry 3 }

ipNetToMediaType OBJECT-TYPE
SYNTAX Integer { other(1), -- none of the following invalid(2), -- an invalidated mapping dynamic(3), static(4) }
ACCESS read-write
STATUS mandatory
DESCRIPTION
The type of mapping. Setting this object to the value invalid(2) has the effect of invalidating the corresponding entry in the ipNetToMediaTable. That is, it effectively disassociates the interface identified with said entry from the mapping identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipNetToMediaType object.
::= { ipNetToMediaEntry 4 }
Additional IP objects

ipRoutingDiscards OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of routing entries which were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free-up buffer space for other routing entries.
::= \{ ip 23 \}

ICMP group

Implementation of the ICMP group is mandatory for all systems.

icmpInMsgs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of ICMP messages which the entity received. Note that this counter includes all those counted by icmpInErrors.
::= \{ icmp 1 \}

   The number of ICMP Address Mask Reply messages sent.
   ::= { icmp 26 }

TCP group

Implementation of the TCP group is mandatory for all systems that implement the TCP. Note that instances of object types that represent information about a particular TCP connection are transient; they persist only as long as the connection in question.
tcpRtoAlgorithm OBJECT-TYPE
SYNTAX Integer { other(1), -- none of the following constant(2), -- a constant rto rsre(3), --
ACCESS read-only
STATUS mandatory
DESCRIPTION
The algorithm used to determine the timeout value used for retransmitting unacknowledged octets.
::= { tcp 1 }

tcpRtoMin OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only
STATUS mandatory
DESCRIPTION
The minimum value permitted by a TCP implementation for the retransmission timeout, measured in
milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine
the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type
has the semantics of the LBOUND quantity described in RFC 793.
::= { tcp 2 }

tcpRtoMax OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The maximum value permitted by a TCP implementation for the retransmission timeout, measured in
milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine
the retransmission timeout. In particular, when the timeout algorithm is rsre(3), an object of this type
has the semantics of the UBOUND quantity described in RFC 793.
::= { tcp 3 }

tcpMaxConn OBJECT-TYPE
SYNTAX Integer
ACCESS read-only
STATUS mandatory
DESCRIPTION
The limit on the total number of TCP connections the entity can support. In entities where the maximum
number of connections is dynamic, this object should contain the value -1.
::= { tcp 4 }
tcpActiveOpens OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.
::= { tcp 5 }

tcpPassiveOpens OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.
::= { tcp 6 }

tcpAttemptFails OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.
::= { tcp 7 }

tcpEstabResets OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.
::= { tcp 8 }
tcpCurrEstab OBJECT-TYPE
SYNTAX Gauge
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of TCP connections for which the current state is either ESTABLISHED or CLOSED-WAIT.
::= { tcp 9 }

tcpInSegs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of segments received, including those received in error. This count includes segments received on currently established connections.
::= { tcp 10 }

tcpOutSegs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.
::= { tcp 11 }

tcpRetransSegs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of segments retransmitted that is, the number of TCP segments transmitted containing one or more previously transmitted octets.
::= { tcp 12 }
TCP connection table

The TCP connection table contains information about this entity existing TCP connections.

tcpConnTable OBJECT-TYPE
SYNTAX Sequence of tcpConnEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
A table containing TCP connection-specific information.
::={tcp 13}

tcpConnEntry OBJECT-TYPE
SYNTAX TcpConnEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
Information about a particular current TCP connection. An object of this type is transient, in that it ceases to exist when (or soon after) the connection makes the transition to the CLOSED state.
INDEX { tcpConnLocalAddress, tcpConnLocalPort, tcpConnRemAddress, tcpConnRemPort }
::={ tcpConnTable 1 }
TcpConnEntry ::= SEQUENCE { tcpConnState INTEGER, tcpConnLocalAddress IpAddress, tcpConnLocalPort INTEGER (0..65535), tcpConnRemAddress IpAddress, tcpConnRemPort INTEGER (0..65535) }

tcpConnState OBJECT-TYPE
SYNTAX INTEGER { closed(1), listen(2), synSent(3), synReceived(4), established(5), finWait1(6), finWait2(7), closeWait(8), lastAck(9), closing(10), timeWait(11), deleteTCB(12) }
ACCESS read-write
STATUS mandatory
DESCRIPTION
The state of this TCP connection. The only value which may be set by a management station is deleteTCB(12). Accordingly, it is appropriate for an agent to return a badValue response if a management station attempts to set this object to any other value. If a management station sets this object to the value deleteTCB(12), then this has the effect of deleting the TCB (as defined in RFC 793) of the corresponding connection on the managed node, resulting in immediate termination of the connection.
As an implementation-specific option, a RST segment may be sent from the managed node to the other TCP endpoint (note however that RST segments are not sent reliably).
::={ tcpConnEntry 1 }
tcpConnLocalAddress OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
The local IP address for this TCP connection. In the case of a connection in the listen state which is willing to accept connections for any IP interface associated with the node, the value 0.0.0.0 is used.
::= { tcpConnEntry 2 }

tcpConnLocalPort OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
The local port number for this TCP connection.
::= { tcpConnEntry 3 }

tcpConnRemAddress OBJECT-TYPE
SYNTAX IpAddress
ACCESS read-only
STATUS mandatory
DESCRIPTION
The remote IP address for this TCP connection.
::= { tcpConnEntry 4 }

tcpConnRemPort OBJECT-TYPE
SYNTAX INTEGER (0..65535)
ACCESS read-only
STATUS mandatory
DESCRIPTION
The remote port number for this TCP connection.
::= { tcpConnEntry 5 }
Additional TCP objects

tcpInErrs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of segments received in error (e.g., bad TCP checksums).
::= { tcp 14 }

tcpOutRsts OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of TCP segments sent containing the RST flag.
::= { tcp 15 }

UDP group

Implementation of the UDP group is mandatory for all systems which implement the UDP.

udpInDatagrams OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of UDP datagrams delivered to UDP users.
::= { udp 1 }

udpNoPorts OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of received UDP datagrams for which there was no application at the destination port.
::= { udp 2 }
udpInErrors OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of received UDP datagrams that could not be delivered for reasons other than the lack of 
an application at the destination port.
   ::= { udp 3 }

udpOutDatagrams OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The total number of UDP datagrams sent from this entity.
   ::= { udp 4 }

UDP listener table
The UDP listener table contains information about this entity UDP end-points on which a local application 
is currently accepting datagrams.

udpTable OBJECT-TYPE
   SYNTAX SEQUENCE OF UdpEntry
   ACCESS not-accessible
   STATUS mandatory
   DESCRIPTION
   A table containing UDP listener information.
   ::= { udp 5 }
udpEntry OBJECT-TYPE
   SYNTAX UdpEntry
   ACCESS not-accessible
   STATUS mandatory
   DESCRIPTION
   Information about a particular current UDP listener.
   INDEX { udpLocalAddress, udpLocalPort }
   ::= { udpTable 1 }
   UdpEntry ::= SEQUENCE { udpLocalAddress IpAddress, udpLocalPort INTEGER (0..65535) }

udpLocalAddress OBJECT-TYPE
   SYNTAX IpAddress
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The local IP address for this UDP listener. In the case of a UDP listener which is willing to accept
datagrams for any IP interface associated with the node, the value 0.0.0.0 is used.
   ::= { udpEntry 1 }

udpLocalPort OBJECT-TYPE
   SYNTAX INTEGER (0..65535)
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The local port number for this UDP listener.
   ::= { udpEntry 2 }

EGP group

Implementation of the EGP group is mandatory for all systems which implement the EGP.
egpInMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP messages received without error.
   ::= { egp 1 }

egpInErrors OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP messages received that proved to be in error.
   ::= { egp 2 }

egpOutMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The total number of locally generated EGP messages.
   ::= { egp 3 }

egpOutErrors OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of locally generated EGP messages not sent due to resource limitations within an EGP entity.
   ::= { egp 4 }

**EGP neighbor table**

The EGP neighbor table contains information about this entity EGP neighbors.
egpNeighTable OBJECT-TYPE
SYNTAX SEQUENCE OF EgpNeighEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
The EGP neighbor table.
 ::= { egp 5 }

egpNeighEntry OBJECT-TYPE
SYNTAX EgpNeighEntry
ACCESS not-accessible
STATUS mandatory
DESCRIPTION
Information about this entity's relationship with a particular EGP neighbor.
INDEX { egpNeighAddr }
 ::= { egpNeighTable 1 }

EgpNeighEntry ::= SEQUENCE {
egpNeighState INTEGER, egpNeighAddr IpAddress, egpNeighAs INTEGER,
egpNeighInMsgs Counter, egpNeighInErrs Counter, egpNeighOutMsgs Counter, egpNeighOutErrs
Counter, egpNeighInErrMsgs Counter, egpNeighOutErrMsgs Counter, egpNeighStateUps Counter,
egpNeighStateDowns Counter, egpNeighIntervalHello INTEGER, egpNeighIntervalPoll INTEGER,
egpNeighMode INTEGER, egpNeighEventTrigger INTEGER }

egpNeighState OBJECT-TYPE
SYNTAX Integer { idle(1), acquisition(2), down(3), up(4), cease(5) }
ACCESS read-only
STATUS mandatory
DESCRIPTION
The EGP state of the local system with respect to the entry EGP neighbor. Each EGP state is represented
by a value that is one greater than the numerical value associated with said state in RFC 904.
 ::= { egpNeighEntry 1 }
egpNeighAddr OBJECT-TYPE
   SYNTAX IpAddress
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The IP address of this entry's EGP neighbor.
   ::= { egpNeighEntry 2 }

egpNeighAs OBJECT-TYPE
   SYNTAX Integer
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The autonomous system of this EGP peer. Zero should be specified if the autonomous system number
   of the neighbor is not yet known.
   ::= { egpNeighEntry 3 }

egpNeighInMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP messages received without error from this EGP peer.
   ::= { egpNeighEntry 4 }

egpNeighInErrs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP messages received from this EGP peer that proved to be in error (e.g., bad EGP
   checksum).
   ::= { egpNeighEntry 5 }
egpNeighOutMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of locally generated EGP messages to this EGP peer.
   ::= { egpNeighEntry 6 }

egpNeighOutErrs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of locally generated EGP messages not sent to this EGP peer due to resource limitations within an EGP entity.
   ::= { egpNeighEntry 7 }

egpNeighInErrMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP-defined error messages received from this EGP peer.
   ::= { egpNeighEntry 8 }

egpNeighOutErrMsgs OBJECT-TYPE
   SYNTAX Counter
   ACCESS read-only
   STATUS mandatory
   DESCRIPTION
   The number of EGP-defined error messages sent to this EGP peer.
   ::= { egpNeighEntry 9 }
egpNeighStateUps OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of EGP state transitions to the UP state with this EGP peer.
::= { egpNeighEntry 10 }

egpNeighStateDowns OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The number of EGP state transitions from the UP state to any other state with this EGP peer.
::= { egpNeighEntry 11 }

egpNeighIntervalHello OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only
STATUS mandatory
DESCRIPTION
The interval between EGP Hello command retransmissions (in hundredths of a second). This represents the t1 timer as defined in RFC 904.
::= { egpNeighEntry 12 }

egpNeighIntervalPoll OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only
STATUS mandatory
DESCRIPTION
The interval between EGP poll command retransmissions (in hundredths of a second). This represents the t3 timer as defined in RFC 904.
::= { egpNeighEntry 13 }
egpNeighMode OBJECT-TYPE
SYNTAX INTEGER { active(1), passive(2) }
ACCESS read-only
STATUS mandatory
DESCRIPTION
The polling mode of this EGP entity, either passive or active.
 ::= { egpNeighEntry 14 }

egpNeighEventTrigger OBJECT-TYPE
SYNTAX INTEGER { start(1), stop(2) }
ACCESS read-write
STATUS mandatory
DESCRIPTION
A control variable used to trigger operator-initiated Start and Stop events. When read, this variable always returns the most recent value that egpNeighEventTrigger was set to. If it has not been set since the last initialization of the network management subsystem on the node, it returns a value of stop. When set, this variable causes a Start or Stop event on the specified neighbor, as specified on pages 8-10 of RFC 904. Briefly, a Start event causes an Idle peer to begin neighbor acquisition and a non-Idle peer to reinitiate neighbor acquisition. A stop event causes a non-Idle peer to return to the Idle state until a Start event occurs, either via egpNeighEventTrigger or otherwise.
 ::= { egpNeighEntry 15 }

Additional EGP objects

egpAs OBJECT-TYPE
SYNTAX INTEGER
ACCESS read-only
STATUS mandatory
DESCRIPTION
The autonomous system number of this EGP entity.
 ::= { egp 6 }

Transmission group

Based on the transmission media underlying each interface on a system, the corresponding portion of the Transmission group is mandatory for that system. When Internet-standard definitions for managing transmission media are defined, the transmission group is used to provide a prefix for the names of those objects. Typically, such definitions reside in the experimental portion of the MIB until they are proven, then as a part of the Internet standardization process, the definitions are accordingly elevated and a new object identifier, under the transmission group is defined. By convention, the name assigned is: type OBJECT IDENTIFIER ::= {
transmission number \} where type is the symbolic value used for the media in the ifType column of the ifTable
object, and number is the actual integer value corresponding to the symbol.

**SNMP group**

Implementation of the SNMP group is mandatory for all systems which support an SNMP protocol entity. Some of the objects defined below will be zero-valued in those SNMP implementations that are optimized to support only those functions specific to either a management agent or a management station. In particular, it should be observed that the objects below refer to an SNMP entity, and there may be several SNMP entities residing on a managed node (e.g., if the node is hosting acting as a management station).

**snmpInPkts OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of Messages delivered to the SNMP entity from the transport service.
::= { snmp 1 }

**snmpOutPkts OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.
::= { snmp 2 }

**snmpInBadVersions OBJECT-TYPE**

SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Messages which were delivered to the SNMP protocol entity and were for an unsupported SNMP version.
::= { snmp 3 }
snmpInBadCommunityNames OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Messages delivered to the SNMP protocol entity which used a SNMP community name not known to said entity.
 ::= { snmp 4 }

snmpInBadCommunityUses OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Messages delivered to the SNMP protocol entity which represented an SNMP operation which was not allowed by the SNMP community named in the Message.
 ::= { snmp 5 }

snmpInASNParseErrs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of ASN.1 or BER errors encountered by the SNMP protocol entity when decoding received SNMP Messages.
 ::= { snmp 6 }
-- { snmp 7 } is not used

snmpInTooBigs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is tooBig.
 ::= { snmp 8 }
snmpInNoSuchNames OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is noSuchName.
 ::= { snmp 9 }

snmpInBadValues OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is 'badValue'.
 ::= { snmp 10 }

snmpInReadOnlys OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is readOnly. It should be noted that it is a protocol error to generate an SNMP PDU which contains the value readOnly in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.
 ::= { snmp 11 }

snmpInGenErrs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is genErr.
 ::= { snmp 12 }
snmpInTotalReqVars OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.
 ::= { snmp 13 }

snmpInTotalSetVars OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.
 ::= { snmp 14 }

snmpInGetRequests OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.
 ::= { snmp 15 }

snmpInGetNexts OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.
 ::= { snmp 16 }
**snmpInSetRequests** - OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.

::= { snmp 17 }

**snmpInGetResponses** - OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.

::= { snmp 18 }

**snmpInTraps** - OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.

::= { snmp 19 }

**snmpOutTooBigs** - OBJECT-TYPE

SYNTAX Counter

ACCESS read-only

STATUS mandatory

DESCRIPTION

The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is tooBig.

::= { snmp 20 }
snmpOutNoSuchNames OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is noSuchName.
::= \{ snmp 21 \}

snmpOutBadValues OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is badValue.
::= \{ snmp 22 \}
-- \{ snmp 23 \} is not used

snmpOutGenErrs OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is genErr.
::= \{ snmp 24 \}

snmpOutGetRequests OBJECT-TYPE
SYNTAX Counter
ACCESS read-only
STATUS mandatory
DESCRIPTION
The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.
::= \{ snmp 25 \}
snmpOutGetNexts OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.
  ::= { snmp 26 }

snmpOutSetRequests OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.
  ::= { snmp 27 }

snmpOutGetResponses OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.
  ::= { snmp 28 }

snmpOutTraps OBJECT-TYPE
  SYNTAX Counter
  ACCESS read-only
  STATUS mandatory
  DESCRIPTION
  The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.
  ::= { snmp 29 }
**snmpEnableAuthenTraps OBJECT-TYPE**

SYNTAX Integer { enabled(1), disabled(2) }  
ACCESS read-write  
STATUS mandatory  
DESCRIPTION  
Indicates whether the SNMP agent process is permitted to generate authentication-failure traps. The value of this object overrides any configuration information; as such, it provides a means whereby all authentication-failure traps may be disabled. Note that it is strongly recommended that this object be stored in non-volatile memory so that it remains constant between re-initializations of the network management system.

::= { snmp 30 }

---

**HOST-RESOURCES-MIB**

---

**Note**  

This MIB manages host systems. The term “host” means any computer that communicates with other similar computers attached to the internet and that is directly used by one or more human beings. Although this MIB does not necessarily apply to devices whose primary function is communications services (terminal servers, routers, bridges, and monitoring equipment), such relevance is not explicitly precluded. This MIB contains attributes that are common to all internet hosts including, for example, both personal computers and systems that run variants of Unix.

Before you can compile HOST-RESOURCES-MIB, you need to compile the MIBs listed below in the order listed.

1. SNMPv2-SMI  
2. SNMPv2-TC  
3. SNMPv2-CONF  
4. SNMPv2-MIB  
5. IANAifType-MIB  
6. IF-MIB  
7. RFC1155-SMI  
8. RFC-1212  
9. SNMPv2-SMI-v1  
10. SNMPv2-TC-v1

HOST-RESOURCES-MIB definitions

The following definitions are imported for HOST-RESOURCES-MIB:

- MODULE-IDENTITY, OBJECT-TYPE, mib-2, Integer32, Counter32, Gauge32, TimeTicks
- From SNMPv2-SMI—TEXTUAL-CONVENTION, DisplayString, TruthValue, DateAndTime, AutonomousType
- From SNMPv2-TC—MODULE-COMPLIANCE, OBJECT-GROUP
- From SNMPv2-CONF—InterfaceIndexOrZero
- From IF-MIB—hostResourcesMibModule MODULE-IDENTITY

HOST-RESOURCES-MIB object identifiers

host OBJECT IDENTIFIER ::= { mib-2 25 }
hrSystem OBJECT IDENTIFIER ::= { host 1 }
hrStorage OBJECT IDENTIFIER ::= { host 2 }
hrDevice OBJECT IDENTIFIER ::= { host 3 }
hrSWRun OBJECT IDENTIFIER ::= { host 4 }
hrSWRunPerf OBJECT IDENTIFIER ::= { host 5 }
hrSWInstalled OBJECT IDENTIFIER ::= { host 6 }
hrMIBAdminInfo OBJECT IDENTIFIER ::= { host 7 }

Host resources MIB textual conventions

KBytes ::= TEXTUAL-CONVENTION

STATUS current
DESCRIPTION
Storage size, expressed in units of 1024 bytes.
SYNTAX Integer32 (0..2147483647)
ProductID ::= TEXTUAL-CONVENTION

STATUS current
DESCRIPTION
This textual convention is intended to identify the manufacturer, model, and version of a specific
hardware or software product. It is suggested that these OBJECT IDENTIFIERS are allocated such that
all products from a particular manufacturer are registered under a subtree distinct to that manufacturer.
In addition, all versions of a product should be registered under a subtree distinct to that product. With
this strategy, a management station may uniquely determine the manufacturer and/or model of a product
whose productID is unknown to the management station. Objects of this type may be useful for inventory
purposes or for automatically detecting incompatibilities or version mismatches between various
hardware and software components on a system.

For example, the product ID for the ACME 4860 66MHz clock doubled processor might be:
enterprises.acme.acmeProcessors.a4860DX2.MHz66. A software product might be registered as:
enterprises.acme.acmeOperatingSystems.acmeDOS.six(6).one(1).

SYNTAX OBJECT IDENTIFIER
UnknownProduct will be used for any unknown ProductID. UnknownProduct OBJECT IDENTIFIER
::= { 0 0 }.

InternationalDisplayString ::= TEXTUAL-CONVENTION

STATUS current
DESCRIPTION
This data type is used to model textual information in some character set. A network management
station should use a local algorithm to determine which character set is in use and how it should be
displayed. Note that this character set may be encoded with more than one octet per symbol, but will
most often be NVT ASCII. When a size clause is specified for an object of this type, the size refers to
the length in octets, not the number of symbols.

SYNTAX OCTET STRING

Host resources system group

hrSystemUptime OBJECT-TYPE

SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The amount of time since this host was last initialized. Note that this is different from sysUpTime in
the SNMPv2-MIB [RFC1907] because sysUpTime is the uptime of the network management portion
of the system.
::= { hrSystem 1 }
hrSystemDate OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The host's notion of the local date and time of day.
::= { hrSystem 2 }

hrSystemInitialLoadDevice OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The index of the hrDeviceEntry for the device from which this host is configured to load its initial operating system configuration (i.e., which operating system code and/or boot parameters). Note that writing to this object just changes the configuration that will be used the next time the operating system is loaded and does not actually cause the reload to occur.
::= { hrSystem 3 }

hrSystemInitialLoadParameters OBJECT-TYPE
SYNTAX InternationalDisplayString (SIZE (0..128))
MAX-ACCESS read-write
STATUS current
DESCRIPTION
This object contains the parameters (e.g. a pathname and parameter) supplied to the load device when requesting the initial operating system configuration from that device. Note that writing to this object just changes the configuration that will be used the next time the operating system is loaded and does not actually cause the reload to occur.
::= { hrSystem 4 }

hrSystemNumUsers OBJECT-TYPE
SYNTAX Gauge32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of user sessions for which this host is storing state information. A session is a collection of processes requiring a single act of user authentication and possibly subject to collective job control.
::= { hrSystem 5 }
hrSystemProcesses OBJECT-TYPE
  SYNTAX Gauge32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of process contexts currently loaded or running on this system.
  ::= { hrSystem 6 }

hrSystemMaxProcesses OBJECT-TYPE
  SYNTAX Integer32 (0..2147483647)
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The maximum number of process contexts this system can support. If there is no fixed maximum, the value should be zero. On systems that have a fixed maximum, this object can help diagnose failures that occur when this maximum is reached.
  ::= { hrSystem 7 }

Host resources storage group

Registration point for storage types, for use with hrStorageType. These are defined in the HOST-RESOURCES-TYPES module.

hrStorageTypes OBJECT IDENTIFIER ::= { hrStorage 1 }
  hrMemorySize OBJECT-TYPE
  SYNTAX KBytes
  UNITS KBytes
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The amount of physical read-write main memory, typically RAM, contained by the host.
  ::= { hrStorage 2 }
hrStorageTable OBJECT-TYPE
SYNTAX Sequence of HrStorageEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of logical storage areas on the host. An entry shall be placed in the storage table for each logical area of storage that is allocated and has fixed resource limits. The amount of storage represented in an entity is the amount actually usable by the requesting entity, and excludes loss due to formatting or file system reference information.

These entries are associated with logical storage areas, as might be seen by an application, rather than physical storage entities which are typically seen by an operating system. Storage such as tapes and floppies without file systems on them are typically not allocated in chunks by the operating system to requesting applications, and therefore shouldn’t appear in this table. Examples of valid storage for this table include disk partitions, file systems, RAM (for some architectures this is further segmented into regular memory, extended memory, and so on), backing store for virtual memory (‘swap space’).

This table is intended to be a useful diagnostic for “out of memory” and “out of buffers” types of failures. In addition, it can be a useful performance monitoring tool for tracking memory, disk, or buffer usage.

::= { hrStorage 3 }

hrStorageEntry OBJECT-TYPE
SYNTAX HrStorageEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one logical storage area on the host. As an example, an instance of the hrStorageType object might be named hrStorageType.3

INDEX { hrStorageIndex }
::= { hrStorageTable 1 }

hrStorageEntry ::= SEQUENCE { hrStorageIndex Integer32, hrStorageTypeAutonomousType, hrStorageDescr DisplayString, hrStorageAllocationUnits Integer32, hrStorageSizeInteger32, hrStorageUsedInteger32, hrStorageAllocationFailures Counter32 }

hrStorageIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A unique value for each logical storage area contained by the host.

::= { hrStorageEntry 1 }
hrStorageType OBJECT-TYPE
   SYNTAX AutonomousType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The type of storage represented by this entry.
   ::= { hrStorageEntry 2 }

hrStorageDescr OBJECT-TYPE
   SYNTAX DisplayString
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A description of the type and instance of the storage described by this entry.
   ::= { hrStorageEntry 3 }

hrStorageAllocationUnits OBJECT-TYPE
   SYNTAX Integer32 (1..2147483647)
   UNITS Bytes
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The size, in bytes, of the data objects allocated from this pool. If this entry is monitoring sectors, blocks, buffers, or packets, for example, this number will commonly be greater than one. Otherwise this number will typically be one.
   ::= { hrStorageEntry 4 }

hrStorageSize OBJECT-TYPE
   SYNTAX Integer32 (0..2147483647)
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   The size of the storage represented by this entry, in units of hrStorageAllocationUnits. This object is writable to allow remote configuration of the size of the storage area in those cases where such an operation makes sense and is possible on the underlying system. For example, the amount of main memory allocated to a buffer pool might be modified or the amount of disk space allocated to virtual memory might be modified.
   ::= { hrStorageEntry 5 }
hrStorageUsed OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The amount of the storage represented by this entry that is allocated, in units of hrStorageAllocationUnits.
 ::= { hrStorageEntry 6 }

hrStorageAllocationFailures OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of requests for storage represented by this entry that could not be honored due to not enough storage. It should be noted that as this object has a SYNTAX of Counter32, that it does not have a defined initial value. However, it is recommended that this object be initialized to zero, even though management stations must not depend on such an initialization.
 ::= { hrStorageEntry 7 }

Host resources device group

The device group is useful for identifying and diagnosing the devices on a system. The hrDeviceTable contains common information for any type of device. In addition, some devices have device-specific tables for more detailed information. More such tables may be defined in the future for other device types. Registration point for device types, for use with hrDeviceType. These are defined in the HOST-RESOURCES-TYPES module.

hrDeviceTypes OBJECT IDENTIFIER ::= { hrDevice 1 }

hrDeviceTable OBJECT-TYPE
SYNTAX Sequence of hrDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of devices contained by the host.
 ::= { hrDevice 2 }
hrDeviceEntry OBJECT-TYPE
SYNTAX hrDeviceEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one device contained by the host. As an example, an instance of the
hrDeviceType object might be named hrDeviceType.3
INDEX { hrDeviceIndex }
 ::= { hrDeviceTable 1 }
HrDeviceEntry ::= SEQUENCE { hrDeviceIndex Integer32, hrDeviceTypeAutonomousType,
hrDeviceDescr DisplayString, hrDeviceID ProductID, hrDeviceStatus INTEGER, hrDeviceErrors
Counter32 }

hrDeviceIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A unique value for each device contained by the host. The value for each device must remain constant
at least from one re-initialization of the agent to the next re-initialization.
 ::= { hrDeviceEntry 1 }

hrDeviceType OBJECT-TYPE
SYNTAX AutonomousType
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication of the type of device. If this value is “hrDeviceProcessor { hrDeviceTypes 3 }” then an
entry exists in the hrProcessorTable which corresponds to this device. If this value is “hrDeviceNetwork
{ hrDeviceTypes 4 }”, then an entry exists in the hrNetworkTable which corresponds to this device. If
this value is “hrDevicePrinter { hrDeviceTypes 5 }”, then an entry exists in the hrPrinterTable which
 corresponds to this device.
If this value is “hrDeviceDiskStorage { hrDeviceTypes 6 }”, then an entry exists in the
hrDiskStorageTable which corresponds to this device.
 ::= { hrDeviceEntry 2 }
hrDeviceDescr OBJECT-TYPE
SYNTAX DisplayString (SIZE (0..64))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A textual description of this device, including the device's manufacturer and revision, and optionally, its serial number.
::= { hrDeviceEntry 3 }

hrDeviceID OBJECT-TYPE
SYNTAX ProductID
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The product ID for this device.
::= { hrDeviceEntry 4 }

hrDeviceStatus OBJECT-TYPE
SYNTAX INTEGER { unknown(1), running(2), warning(3), testing(4), down(5) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current operational state of the device described by this row of the table. A value unknown(1) indicates that the current state of the device is unknown. running(2) indicates that the device is up and running and that no unusual error conditions are known. The warning(3) state indicates that agent has been informed of an unusual error condition by the operational software (e.g., a disk device driver) but that the device is still 'operational'. An example would be a high number of soft errors on a disk. A value of testing(4), indicates that the device is not available for use because it is in the testing state. The state of down(5) is used only when the agent has been informed that the device is not available for any use.
::= { hrDeviceEntry 5 }
hrDeviceErrors OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of errors detected on this device. It should be noted that as this object has a SYNTAX of Counter32, that it does not have a defined initial value. However, it is recommended that this object be initialized to zero, even though management stations must not depend on such an initialization.
 ::= { hrDeviceEntry 6 }

hrProcessorTable OBJECT-TYPE
SYNTAX Sequence of hrProcessorEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of processors contained by the host. Note that this table is potentially sparse: a (conceptual) entry exists only if the correspondent value of the hrDeviceType object is hrDeviceProcessor.
 ::= { hrDevice 3 }

hrProcessorEntry OBJECT-TYPE
SYNTAX hrProcessorEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one processor contained by the host. The hrDeviceIndex in the index represents the entry in the hrDeviceTable that corresponds to the hrProcessorEntry. As an example of how objects in this table are named, an instance of the hrProcessorFwId object might be named hrProcessorFwId.3 INDEX { hrDeviceIndex }
 ::= { hrProcessorTable 1 }

hrProcessorFwId OBJECT-TYPE
SYNTAX ProductID
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The product ID of the firmware associated with the processor.
 ::= { hrProcessorEntry 1 }
hrProcessorLoad OBJECT-TYPE
SYNTAX Integer32 (0..100)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The average, over the last minute, of the percentage of time that this processor was not idle.
Implementations may approximate this one minute smoothing period if necessary.
::= { hrProcessorEntry 2 }

hrNetworkTable OBJECT-TYPE
SYNTAX Sequence of hrNetworkEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of network devices contained by the host. Note that this table is potentially
sparse: a (conceptual) entry exists only if the correspondent value of the hrDeviceType object is
hrDeviceNetwork.
::= { hrDevice 4 }

hrNetworkEntry OBJECT-TYPE
SYNTAX hrNetworkEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one network device contained by the host. The hrDeviceIndex in the index
represents the entry in the hrDeviceTable that corresponds to the hrNetworkEntry. As an example of
how objects in this table are named, an instance of the hrNetworkIfIndex object might be named
hrNetworkIfIndex.3.
INDEX { hrDeviceIndex }
::= { hrNetworkTable 1 }
hrNetworkEntry ::= SEQUENCE { hrNetworkIfIndexInterfaceIndexOrZero }
hrNetworkIfIndex OBJECT-TYPE
SYNTAX InterfaceIndexOrZero
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of ifIndex which corresponds to this network device. If this device is not represented in the ifTable, then this value shall be zero.
::= { hrNetworkEntry 1 }

hrPrinterTable OBJECT-TYPE
SYNTAX Sequence of hrPrinterEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of printers local to the host. Note that this table is potentially sparse: a (conceptual) entry exists only if the correspondent value of the hrDeviceType object is hrDevicePrinter.
::= { hrDevice 5 }

hrPrinterEntry OBJECT-TYPE
SYNTAX hrPrinterEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one printer local to the host. The hrDeviceIndex in the index represents the entry in the hrDeviceTable that corresponds to the hrPrinterEntry.
As an example of how objects in this table are named, an instance of the hrPrinterStatus object might be named hrPrinterStatus.3
INDEX { hrDeviceIndex }
::= { hrPrinterTable 1 }
hrPrinterEntry ::= SEQUENCE { hrPrinterStatus INTEGER, hrPrinterDetectedErrorState OCTET STRING }

Cisco Unified Communications Manager Managed Services Guide, Release 9.1(1)
hrPrinterStatus OBJECT-TYPE
   SYNTAX INTEGER { other(1), unknown(2), idle(3), printing(4), warmup(5) }
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The current status of this printer device.
   ::= { hrPrinterEntry 1 }

hrPrinterDetectedErrorState OBJECT-TYPE
   SYNTAX OCTET STRING
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   This object represents any error conditions detected by the printer. The error conditions are encoded as bits in an octet string, with the following definitions (condition first then bit number):
   - lowPaper 0
   - noPaper 1
   - lowToner 2
   - noToner 3
   - doorOpen 4
   - jammed 5
   - offline 6
   - serviceRequested 7
   - inputTrayMissing 8
   - outputTrayMissing 9
   - markerSupplyMissing 10
   - outputNearFull 11
   - outputFull 12
   - inputTrayEmpty 13
   - overduePreventMaint 14

   Bits are numbered starting with the most significant bit of the first byte being bit 0, the least significant bit of the first byte being bit 7, the most significant bit of the second byte being bit 8, and so on. A one bit encodes that the condition was detected, while a zero bit encodes that the condition was not detected.

   This object is useful for alerting an operator to specific warning or error conditions that may occur, especially those requiring human intervention.
   ::= { hrPrinterEntry 2 }
hrDiskStorageTable OBJECT-TYPE
SYNTAX Sequence of hrDiskStorageEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of long-term storage devices contained by the host. In particular, disk devices accessed remotely over a network are not included here. Note that this table is potentially sparse: a (conceptual) entry exists only if the correspondent value of the hrDeviceType object is hrDeviceDiskStorage.
::= { hrDevice 6 }

hrDiskStorageEntry OBJECT-TYPE
SYNTAX hrDiskStorageEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one long-term storage device contained by the host. The hrDeviceIndex in the index represents the entry in the hrDeviceTable that corresponds to the hrDiskStorageEntry. As an example, an instance of the hrDiskStorageCapacity object might be named hrDiskStorageCapacity.
INDEX { hrDeviceIndex }
::= { hrDiskStorageTable 1 }
hrDiskStorageEntry ::= SEQUENCE { hrDiskStorageAccess INTEGER, hrDiskStorageMedia INTEGER, hrDiskStorageRemoveble TruthValue, hrDiskStorageCapacity KBytes }

hrDiskStorageAccess OBJECT-TYPE
SYNTAX INTEGER { readWrite(1), readOnly(2) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication if this long-term storage device is readable and writable or only readable. This should reflect the media type, any write-protect mechanism, and any device configuration that affects the entire device.
::= { hrDiskStorageEntry 1 }
hrDiskStorageMedia OBJECT-TYPE

SYNTAX INTEGER { other(1), unknown(2), hardDisk(3), floppyDisk(4), opticalDiskROM(5),
opticalDiskWORM(6), --Write Once Read Many-- opticalDiskRW(7), ramDisk(8) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An indication of the type of media used in this long-term storage device.
::={ hrDiskStorageEntry 2 }

hrDiskStorageRemoveable OBJECT-TYPE

SYNTAX TruthValue
MAX-ACCESS read-only
STATUS current
DESCRIPTION
Denotes whether or not the disk media may be removed from the drive.
::={ hrDiskStorageEntry 3 }

hrDiskStorageCapacity OBJECT-TYPE

SYNTAX KBytes
UNITS KBytes
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total size for this long-term storage device. If the media is removable and is currently removed,
this value should be zero.
::={ hrDiskStorageEntry 4 }

hrPartitionTable OBJECT-TYPE

SYNTAX Sequence of hrPartitionEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of partitions for long-term storage devices contained by the host. In particular,
partitions accessed remotely over a network are not included here.
::={ hrDevice 7 }
hrPartitionEntry OBJECT-TYPE

SYNTAX hrPartitionEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one partition. The hrDeviceIndex in the index represents the entry in the
hrDeviceTable that corresponds to the hrPartitionEntry.
As an example of how objects in this table are named, an instance of the hrPartitionSize object might
be named hrPartitionSize.3.1
INDEX { hrDeviceIndex, hrPartitionIndex }
::= { hrPartitionTable 1 }
hrPartitionEntry ::= SEQUENCE { hrPartitionIndex Integer32,
hrPartitionLabel InternationalDisplayString, hrPartitionID OCTET STRING, hrPartitionSize Bytes,
hrPartitionFSIndex Integer32 }

hrPartitionIndex OBJECT-TYPE

SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A unique value for each partition on this long-term storage device. The value for each long-term storage
device must remain constant at least from one re-initialization of the agent to the next re-initialization.
::= { hrPartitionEntry 1 }

hrPartitionLabel OBJECT-TYPE

SYNTAX InternationalDisplayString (SIZE (0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A textual description of this partition.
::= { hrPartitionEntry 2 }
hrPartitionID OBJECT-TYPE  
SYNTAX OCTET STRING  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
A descriptor which uniquely represents this partition to the responsible operating system. On some  
systems, this might take on a binary representation.  
 ::= { hrPartitionEntry 3 }  

hrPartitionSize OBJECT-TYPE  
SYNTAX KBytes  
UNITS KBytes  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
The size of this partition.  
 ::= { hrPartitionEntry 4 }  

hrPartitionFSIndex OBJECT-TYPE  
SYNTAX Integer32 (0..2147483647)  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
The index of the file system mounted on this partition. If no file system is mounted on this partition,  
then this value shall be zero. Note that multiple partitions may point to one file system, denoting that  
that file system resides on those partitions. Multiple file systems may not reside on one partition.  
 ::= { hrPartitionEntry 5 }  

File system table  
Registration point for popular File System types, for use with hrFSType. These are defined in the  
HOST-RESOURCES-TYPES module.  

hrFSTypes OBJECT IDENTIFIER  
 ::= { hrDevice 9 }
hrFSTable OBJECT-TYPE
SYNTAX Sequence of hrFSEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of file systems local to this host or remotely mounted from a file server. File systems that are in only one user's environment on a multi-user system will not be included in this table.
 ::= { hrDevice 8 }

hrFSEntry OBJECT-TYPE
SYNTAX hrFSEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one file system local to this host or remotely mounted from a file server. File systems that are in only one user's environment on a multi-user system will not be included in this table.
As an example of how objects in this table are named, an instance of the hrFSMountPoint object might be named hrFSMountPoint.3
INDEX { hrFSIndex }
 ::= { hrFSTable 1 }
hrFSEntry ::= SEQUENCE { hrFSIndex Integer32, hrFSMountPoint InternationalDisplayString, hrFSRemoteMountPointInternationalDisplayString, hrFSTypeAutonomousType, hrFSAccess INTEGER, hrFSBootableTruthValue, hrFSStorageIndexInteger32, hrFSLastFullBackupDate DateAndTime, hrFSLastPartialBackupDate DateAndTime }

hrFSIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A unique value for each file system local to this host. The value for each file system must remain constant at least from one re-initialization of the agent to the next re-initialization.
 ::= { hrFSEntry 1 }
hrFSMountPoint OBJECT-TYPE
   SYNTAX InternationalDisplayString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The path name of the root of this file system.
   ::= { hrFSEntry 2 }

hrFSRemoteMountPoint OBJECT-TYPE
   SYNTAX InternationalDisplayString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A description of the name and/or address of the server that this file system is mounted from. This may
   also include parameters such as the mount point on the remote file system. If this is not a remote file
   system, this string should have a length of zero.
   ::= { hrFSEntry 3 }

hrFSType OBJECT-TYPE
   SYNTAX AutonomousType
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The value of this object identifies the type of this file system.
   ::= { hrFSEntry 4 }

hrFSAccess OBJECT-TYPE
   SYNTAX Integer { readWrite(1), readOnly(2) }
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   An indication if this file system is logically configured by the operating system to be readable and
   writable or only readable. This does not represent any local access-control policy, except one that is
   applied to the file system as a whole.
   ::= { hrFSEntry 5 }
hrFSBootable OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A flag indicating whether this file system is bootable.
 ::= { hrFSEntry 6 }

hrFSStorageIndex OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The index of the hrStorageEntry that represents information about this file system. If there is no such
information available, then this value shall be zero. The relevant storage entry will be useful in tracking
the percent usage of this file system and diagnosing errors that may occur when it runs out of space.
 ::= { hrFSEntry 7 }

hrFSLastFullBackupDate OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The last date at which this complete file system was copied to another storage device for backup. This
information is useful for ensuring that backups are being performed regularly. If this information is not
known, then this variable shall have the value corresponding to January 1, year 0000, 00:00:00.0, which
is encoded as (hex) 00 00 01 01 00 00 00 00.
 ::= { hrFSEntry 8 }

hrFSLastPartialBackupDate OBJECT-TYPE
SYNTAX DateAndTime
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The last date at which a portion of this file system was copied to another storage device for backup.
This information is useful for ensuring that backups are being performed regularly. If this information
is not known, then this variable shall have the value corresponding to January 1, year 0000, 00:00:00.0,
which is encoded as (hex) 00 00 01 01 00 00 00 00.
 ::= { hrFSEntry 9 }
Host resources running software group

The hrSWRunTable contains an entry for each distinct piece of software that is running or loaded into physical or virtual memory in preparation for running. This includes the host’s operating system, device drivers, and applications.

hrSWOSIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of the hrSWRunIndex for the hrSWRunEntry that represents the primary operating system running on this host. This object is useful for quickly and uniquely identifying that primary operating system.
::= { hrSWRun 1 }

hrSWRunTable OBJECT-TYPE
SYNTAX Sequence of hrSWRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of software running on the host.
::= { hrSWRun 2 }

hrSWRunEntry OBJECT-TYPE
SYNTAX hrSWRunEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for one piece of software running on the host. Note that because the installed software table only contains information for software stored locally on this host, not every piece of running software will be found in the installed software table. This is true of software that was loaded and run from a non-local source, such as a network-mounted file system.

As an example of how objects in this table are named, an instance of the hrSWRunName object might be named hrSWRunName.1287
INDEX { hrSWRunIndex }
::= { hrSWRunTable 1 }

hrSWRunEntry ::= SEQUENCE { hrSWRunIndex Integer32, hrSWRunNameInternationalDisplayString, hrSWRunID ProductID, hrSWRunPathInternationalDisplayString, hrSWRunParameters InternationalDisplayString, hrSWRunTypeINTEGER, hrSWRunStatus INTEGER }
hrSWRunIndex OBJECT-TYPE
   SYNTAX Integer32 (1..2147483647)
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A unique value for each piece of software running on the host. Wherever possible, this should be the
   system's native, unique identification number.
   ::= { hrSWRunEntry 1 }

hrSWRunName OBJECT-TYPE
   SYNTAX InternationalDisplayString (SIZE (0..64))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A textual description of this running piece of software, including the manufacturer, revision, and the
   name by which it is commonly known. If this software was installed locally, this should be the same
   string as used in the corresponding hrSWInstalledName.
   ::= { hrSWRunEntry 2 }

hrSWRunID OBJECT-TYPE
   SYNTAX ProductID
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The product ID of this running piece of software.
   ::= { hrSWRunEntry 3 }

hrSWRunPath OBJECT-TYPE
   SYNTAX InternationalDisplayString (SIZE(0..128))
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A description of the location on long-term storage (e.g. a disk drive) from which this software was
   loaded.
   ::= { hrSWRunEntry 4 }
hrSWRunParameters OBJECT-TYPE
SYNTAX InternationalDisplayString (SIZE(0..128))
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A description of the parameters supplied to this software when it was initially loaded.
::= { hrSWRunEntry 5 }

hrSWRunType OBJECT-TYPE
SYNTAX INTEGER { unknown(1), operatingSystem(2), deviceDriver(3), application(4) }
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The type of this software.
::= { hrSWRunEntry 6 }

hrSWRunStatus OBJECT-TYPE
SYNTAX INTEGER { running(1), runnable(2), -- waiting for resource -- (i.e., CPU, memory, IO) notRunnable(3), -- loaded but waiting for event invalid(4) -- not loaded }
MAX-ACCESS read-write
STATUS current
DESCRIPTION
The status of this running piece of software. Setting this value to invalid(4) shall cause this software to stop running and to be unloaded. Sets to other values are not valid.
::= { hrSWRunEntry 7 }

Host resources running software performance group

The hrSWRunPerfTable contains an entry corresponding to each entry in the hrSWRunTable.

hrSWRunPerfTable OBJECT-TYPE
SYNTAX Sequence of hrSWRunPerfEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of running software performance metrics.
::= { hrSWRunPerf 1 }
hrSWRunPerfEntry OBJECT-TYPE
SYNTAX hrSWRunPerfEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry containing software performance metrics. As an example, an instance of the hrSWRunPerfCPU object might be named hrSWRunPerfCPU.1287. This table augments information in the hrSWRunTable.
AUGMENTS { hrSWRunEntry }
::= { hrSWRunPerfTable 1 }
hrSWRunPerfEntry ::= SEQUENCE { hrSWRunPerfCPU Integer32, hrSWRunPerfMem KBytes }

hrSWRunPerfCPU OBJECT-TYPE
SYNTAX Integer32 (0..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The number of centi-seconds of the total system's CPU resources consumed by this process. Note that on a multi-processor system, this value may increment by more than one centi-second in one centi-second of real (wall clock) time.
::= { hrSWRunPerfEntry 1 }

hrSWRunPerfMem OBJECT-TYPE
SYNTAX KBytes
UNITS KBytes
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total amount of real system memory allocated to this process.
::= { hrSWRunPerfEntry 2 }

Host resources installed software group

The hrSWInstalledTable contains an entry for each piece of software installed in long-term storage (e.g. a disk drive) locally on this host. Note that this does not include software loadable remotely from a network server. Different implementations may track software in varying ways. For example, while some implementations may track executable files as distinct pieces of software, other implementations may use other strategies such as keeping track of software packages (e.g., related groups of files) or keeping track of system or application patches.
This table is useful for identifying and inventoring software on a host and for diagnosing incompatibility and version mismatch problems between various pieces of hardware and software.

**hrSWInstalledLastChange OBJECT-TYPE**

SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of sysUpTime when an entry in the hrSWInstalledTable was last added, renamed, or deleted. Because this table is likely to contain many entries, polling of this object allows a management station to determine when re-downloading of the table might be useful.

 ::= { hrSWInstalled 1 }

**hrSWInstalledLastUpdateTime OBJECT-TYPE**

SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of sysUpTime when the hrSWInstalledTable was last completely updated. Because caching of this data will be a popular implementation strategy, retrieval of this object allows a management station to obtain a guarantee that no data in this table is older than the indicated time.

 ::= { hrSWInstalled 2 }

**hrSWInstalledTable OBJECT-TYPE**

SYNTAX SEQUENCE OF HrSWInstalledEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The (conceptual) table of software installed on this host.

 ::= { hrSWInstalled 3 }
hrSWInstalledEntry OBJECT-TYPE
SYNTAX HrSWInstalledEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
A (conceptual) entry for a piece of software installed on this host. As an example of how objects in this
table are named, an instance of the hrSWInstalledName object might be named hrSWInstalledName.96
INDEX { hrSWInstalledIndex }
 ::= { hrSWInstalledTable 1 }
hrSWInstalledEntry ::= SEQUENCE { hrSWInstalledIndex Integer32,
 hrSWInstalledNameInternationalDisplayString, hrSWInstalledID ProductID,
 hrSWInstalledType INTEGER, hrSWInstalledDate DateAndTime }

hrSWInstalledIndex OBJECT-TYPE
SYNTAX Integer32 (1..2147483647)
MAX-ACCESS read-only
STATUS current
DESCRIPTION
A unique value for each piece of software installed on the host. This value shall be in the range from
1 to the number of pieces of software installed on the host.
 ::= { hrSWInstalledEntry 1 }

hrSWInstalledName OBJECT-TYPE
SYNTAX InternationalDisplayString (SIZE (0..64))
MAX-ACCESS read-only
STATUS current
DESCRIPTION

### Troubleshoot host resources MIB

The following logs and information needs to be collected for troubleshooting purpose:

- The hostagt log files by executing the `file get activelog /platform/snmp/hostagt/` command.
- The syslog files by executing the `file get activelog /syslog/` command.
- Master SNMP Agent log files by executing the `file get activelog /platform/snmp/snmpdm/` command.
- Sequence of operations performed.

### Frequent asked questions for host resources MIB

**Q.** Can the HOST-RESOURCES-MIB be used for process monitoring?

**A.** Host resources MIB does retrieve the information about the processes running on the system in `hrSwRunTable`. But this monitors all the processes running in the system. If you need to monitor only the installed Cisco Application, then the best way is to use SYSAPPL-MIB.

**Q.** How is the memory usage values shown by RTMT mapped to the HOST-RESOURCES-MIB?

**A.** The following table lists the memory usage values.

<table>
<thead>
<tr>
<th>Memory Usages</th>
<th>RTMT Counter</th>
<th>HOST-RESOURCES-MIB</th>
</tr>
</thead>
<tbody>
<tr>
<td>SWAP memory Usage</td>
<td>Memory\Used Swap Kbytes</td>
<td>hrStorageUsed.2 (whose description is Virtual Memory)</td>
</tr>
</tbody>
</table>

---

<table>
<thead>
<tr>
<th>Cisco Unified CM Release 6.x Network Services</th>
<th>hrSWRunName OIDs</th>
<th>Clearing Values(Positive String)</th>
<th>Object Responses</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST-RESOURCES MIB activation on system</td>
<td>1.3.6.1.2.1.25</td>
<td>host_agent.pl</td>
<td>Host MIB Query Capabilities Disabled</td>
</tr>
<tr>
<td>Tomcat Service</td>
<td>tomat</td>
<td></td>
<td>Tomcat Service Failure</td>

<td>HOST-RESOURCES-MIB</td>
<td></td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------------------------</td>
<td>--------------------------------------------------------</td>
<td></td>
</tr>
<tr>
<td>Physical Memory Usage</td>
<td>Memory\Used Kbytes</td>
<td>hrStorageUsed.1 (whose description is Physical RAM)</td>
<td></td>
</tr>
<tr>
<td>Total memory (physical +</td>
<td>Memory\Used VM Kbytes</td>
<td>No equivalent. Basically need to add hrStorageUsed.2</td>
<td></td>
</tr>
<tr>
<td>swap) usage</td>
<td></td>
<td>and hrStorageUsed.1</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Since swap memory may not be used at all on lightly</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>used servers, HR Virtual Memory may return 0. To</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>validate HR VM is returning correctly, that value</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>needs to be compared against RTMT Memory\Used Swap</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>KBytes. It's unfortunate that RTMT and HR use the</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>term &quot;Virtual memory&quot; differently but that's what we</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>have to work with. The hrStorageUsed for physical</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>memory shows the data in terms of used - (buffers +</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>cache).</td>
<td></td>
</tr>
</tbody>
</table>

The hrStorageUsed for physical memory shows the data in terms of used that is buffers + cache.

The shared memory info that is exposed by the MIB is HOST-RESOURCES-MIB::hrStorageDescr.10

= STRING: /dev/shm. The virtual memory reported by HOST-RESOURCES-MIB is what is considered as swap memory by RTMT.

For HOST RESOURCES MIB, the following is used:

- \%Physical memory usage = (Physical RAM
  hrStorageUsed + /dev/shm hrStorageUsed)
  / (Physical RAM hrStorageSize)

- \%VM used = (Physical RAM
  hrStorageUsed + /dev/shm hrStorageUsed + Virtual Memory hrStorageUsed) /
  (Physical RAM hrStorageSize + Virtual Memory hrStorageSize)

---

**Q.** Why do the disk space values shown by RTMT and the HOST-RESOURCES-MIB differ?

**A.** In general the df size will not match the used and available disk space data shown. This is because of minfree percentage of reserved filesystem disk blocks. The minfree value for a Cisco Unified Communication Manager in Releases 6.x and 7.0 systems is 1%. So there will be difference of 1% between the disk space used value shown in RTMT and HOST-RESOURCES-MIB.

In RTMT, the disk space used value is shown from df reported values: [(Total Space - Available Space) /Total Space] * 100 where the Total Space includes the minfree also. For the HOST-RESOURCES-MIB,
this is calculated by \([\text{hrStorageUsed}/\text{hrStorageSize}] \times 100\) wherein the hrStorageSize does not include the minfree.

Q. How does the Host Agent display the value in hrStorageUsed?
A. The hrStorageUsed for physical RAM was corrected to show the data in terms of used (buffers + cache).
To check if the host agent version is correct, collect the snmp-rpm version installed in the system by using the show packages active snmp command.

How the memory capacity/usage values compare to those of HOST-RESOURCES-MIB?
In the HOST-RESOURCES-MIB the size and storage used are represented in terms of hrStorageUnits. If for that storage type, the hrStorageUnits is 4096 bytes then the hrStorageUsed or hrStorageSize value queried in the MIB value should be multiplied by 4096. For example, the show status command displays the Total Memory as 4090068K for Physical RAM.
If hrStorageUnits for physicalRAM storage type is 4096 bytes, then hrStorageSize for Physical RAM will be shown as 1022517 which is 4090068K \([\frac{1022517 \times 4096}{1024} = 4090068K}\).

Q. An SNMP query on hrSWRunName in HOST-RESOURCES-MIB intermittently returns incorrect entries in Windows.
A. The Microsoft SNMP extension agent (hostmib.dll) supports the HOST-RESOURCE-MIB. So Microsoft support may be able to help on this. If the problem is persistent then following is recommended:

- Use the tlist snmp.exe file to verify the hostmib.dll is listed in the output.
- Verify there are no error/warning messages from SNMP, in the event viewer, when SNMP service is started.
- Make sure the community string used has been configured with read privilege under snmp service properties.
- Use MSSQL-MIB (MssqlSrvInfoTable) to confirm sql process status

Q. Monitoring Processes
A. HOST-RESOURCES-MIB retrieves information about all the processes that are running on the system from hrSWRunTable. Use this MIB for monitoring all the processes that are running in the system. To monitor the only the installed Cisco application, use SYSAPPL-MIB.Disk Space and RTMT

The used and available disk space values that are shown by HOST-RESOURCES-MIB may not match the disk space values that are shown by RTMT due to the minfree percentage of reserved file system disk blocks. Because the minfree value for Cisco Unified Communications Manager in 6.x and 7.0 systems is 1 percent, you will see a 1 percent difference between the used disk space value that is shown by RTMT and HOST-RESOURCES-MIB.

- In RTMT, the disk space used value gets shown from df reported values: \([(\text{Total Space} – \text{Available Space}) / \text{Total Space}] \times 100\) where the Total Space includes the minfree also.
- For Host Resources MIB, the disk space used value calculated by \([\text{hrStorageUsed}/\text{hrStorageSize}] \times 100\) where the hrStorageSize does not include the minfree.
IF-MIB

This is a reformatted version of IF-MIB. Download and compile all of the MIBs in this section from http://tools.cisco.com/Support/SNMP/do/BrowseMIB.do?local=en&step=2.

Before you can compile IF-MIB, you need to compile the MIBs listed below in the order listed.

1. SNMPv2-SMI
2. SNMPv2-TC
3. SNMPv2-CONF
4. SNMPv2-MIB
5. IANAifType-MIB
6. RFC1155-SMI
7. RFC-1212
8. SNMPv2-SMI-v1
9. RFC-1215
10. SNMPv2-TC-v1
11. IF-MIB

Additional downloads are:

- OID File: IF-MIB.oid

IF-MIB revisions

IF-MIB textual conventions

Note: OwnerString has the same semantics as used in RFC 1271.
OwnerString ::= TEXTUAL-CONVENTION

DISPLAY-HINT 255a

STATUS deprecated

DESCRIPTION

This data type is used to model an administratively assigned name of the owner of a resource. This information is taken from the NVT ASCII character set. It is suggested that this name contain one or more of the following: ASCII form of the manager station's transport address, management station name (e.g., domain name), network management personnel's name, location, or phone number. In some cases the agent itself will be the owner of an entry. In these cases, this string shall be set to a string starting with agent.

A value which indicates the set of services that this entity may potentially offers. The value is a sum. This sum initially takes the value zero, Then, for each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L - 1) is added to the sum. For example, a node which performs only routing functions would have a value of 4 (2^3). In contrast, a node which is a host offering application services would have a value of 72 (2^4 + 2^7). Note that in the context of the Internet suite of protocols, values should be calculated accordingly:

Layer functionality:

- 1—physical (e.g., repeaters)
- 2—datalink/subnetwork (e.g., bridges)
- 3—internet (e.g., supports the IP)
- 4—end-to-end (e.g., supports the TCP)
- 7—applications (e.g., supports the SMTP)

For systems including OSI protocols, layers 5 and 6 may also be counted.

SYNTAX Octet String (SIZE(0..255))

Interface index

The Interface Index contains the semantics of ifIndex and should be used for any objects defined in other MIB modules that need these semantics.

InterfaceIndex ::= TEXTUAL-CONVENTION

DISPLAY-HINT d

STATUS current

DESCRIPTION

A unique value, greater than zero, for each interface or interface sub-layer in the managed system. It is recommended that values are assigned contiguously starting from 1. The value for each interface sub-layer must remain constant at least from one re-initialization of the entity's network management system to the next re-initialization.

SYNTAX Integer32 (1..2147483647)
**InterfaceIndexOrZero ::= TEXTUAL-CONVENTION**

DISPLAY-HINT d  
STATUS current  
DESCRIPTION  
This textual convention is an extension of the InterfaceIndex convention. The latter defines a greater than zero value used to identify an interface or interface sub-layer in the managed system. This extension permits the additional value of zero. The value zero is object-specific and must therefore be defined as part of the description of any object which uses this syntax. Examples of the usage of zero might include situations where interface was unknown, or when none or all interfaces need to be referenced. 
SYNTAX Integer32 (0..2147483647)

**ifNumber OBJECT-TYPE**  
SYNTAX Integer32  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
The number of network interfaces (regardless of their current state) present on this system. 
::= { interfaces 1 }

**ifTableLastChange OBJECT-TYPE**  
SYNTAX TimeTicks  
MAX-ACCESS read-only  
STATUS current  
DESCRIPTION  
The value of sysUpTime at the time of the last creation or deletion of an entry in the ifTable. If the number of entries has been unchanged since the last re-initialization of the local network management subsystem, then this object contains a zero value. 
::= {ifMIBObjects 5}

---

**Interfaces table**

The Interfaces table contains information on the entity's interfaces. Each sub-layer below the internetwork-layer of a network interface is considered to be an interface.
ifTable OBJECT-TYPE
   SYNTAX Sequence of IfEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   A list of interface entries. The number of entries is given by the value of ifNumber.
   ::= {interfaces 2}

IfEntry OBJECT-TYPE
   SYNTAX IfEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An entry containing management information applicable to a particular interface.
   INDEX {ifIndex}
   ::= {ifTable 1}
   IfEntry ::= SEQUENCE
      {ifIndex InterfaceIndex, ifDescr DisplayString, ifType IANAifType, ifMtu Integer32,
      filespec Gauge32, ifPhysAddress PhysAddress, ifAdminStatus INTEGER, ifOperStatus INTEGER,

      -- deprecated}

ifIndex OBJECT-TYPE
   SYNTAX InterfaceIndex
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   A unique value, greater than zero, for each interface. It is recommended that values are assigned
   contiguously starting from 1. The value for each interface sub-layer must remain constant at least from
   one re-initialization of the entity's network management system to the next re-initialization.
   ::= {ifEntry 1}
ifDescr OBJECT-TYPE
  SYNTAX DisplayString (SIZE (0..255))
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  A textual string containing information about the interface. This string should include the name of the manufacturer, the product name and the version of the interface hardware/software.
  ::= {ifEntry 2}

ifType OBJECT-TYPE
  SYNTAX IANAifType
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The type of interface. Additional values for ifType are assigned by the Internet Assigned Numbers Authority (IANA), through updating the syntax of the IANAifType textual convention.
  ::= {ifEntry 3}

ifMtu OBJECT-TYPE
  SYNTAX Integer32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The size of the largest packet which can be sent/received on the interface, specified in octets. For interfaces that are used for transmitting network datagrams, this is the size of the largest network datagram that can be sent on the interface.
  ::= {ifEntry 4}
ifSpeed OBJECT-TYPE
   SYNTAX Gauge32
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   An estimate of the interface current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth. If the bandwidth of the interface is greater than the maximum value reportable by this object then this object should report its maximum value (4,294,967,295) and ifHighSpeed must be used to report the interface speed. For a sub-layer which has no concept of bandwidth, this object should be zero.
   ::= {ifEntry 5}

ifPhysAddress OBJECT-TYPE
   SYNTAX PhysAddress
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The interface's address at its protocol sub-layer. For example, for an 802.x interface, this object normally contains a MAC address. The interface's media-specific MIB must define the bit and byte ordering and the format of the value of this object. For interfaces which do not have such an address (e.g., a serial line), this object should contain an octet string of zero length.
   ::= {ifEntry 6}

ifAdminStatus OBJECT-TYPE
   SYNTAX Integer {up(1), -- ready to pass packets down(2), testing(3) -- in some test mode}
   MAX-ACCESS read-write
   STATUS current
   DESCRIPTION
   The desired state of the interface. The testing(3) state indicates that no operational packets can be passed. When a managed system initializes, all interfaces start with ifAdminStatus in the down(2) state. As a result of either explicit management action or per configuration information retained by the managed system, ifAdminStatus is then changed to either the up(1) or testing(3) states (or remains in the down(2) state).
   ::= {if Entry 7}
ifOperStatus OBJECT-TYPE
SYNTAX INTEGER {up(1), down(2), testing(3), unknown(4), dormant(5), notPresent(6)}
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The current operational state of the interface. The testing(3) state indicates that no operational packets can be passed. If ifAdminStatus is down(2) then ifOperStatus should be down(2). If ifAdminStatus is changed to up(1) then ifOperStatus should change to up(1) if the interface is ready to transmit and receive network traffic; it should change to dormant(5) if the interface is waiting for external actions (such as a serial line waiting for an incoming connection); it should remain in the down(2) state if and only if there is a fault that prevents it from going to the up(1) state; it should remain in the notPresent(6) state if the interface has missing (typically, hardware) components.
 ::= {ifEntry 8}

ifLastChange OBJECT-TYPE
SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.
 ::= {ifEntry 9}

ifInOctets OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total number of octets received on the interface, including framing characters. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
 ::= { ifEntry 10 }
ifInUcastPkts OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  ::= { ifEntry 11 }

ifInNUcastPkts OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS deprecated
  DESCRIPTION
  The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast or broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  This object is deprecated in favour of ifInMulticastPkts and ifInBroadcastPkts.
  ::= { ifEntry 12 }

ifInDiscards OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  ::= { ifEntry 13 }
ifInErrors OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
For packet-oriented interfaces, the number of inbound packets that contained errors preventing them
from being deliverable to a higher-layer protocol. For character-oriented or fixed-length interfaces, the
number of inbound transmission units that contained errors preventing them from being deliverable to
a higher-layer protocol.
Discontinuities in the value of this counter can occur at re-initialization of the management system,
and at other times as indicated by the value of ifCounterDiscontinuityTime.
::= { ifEntry 14 }

ifInUnknownProtos OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
For packet-oriented interfaces, the number of packets received via the interface which were discarded
because of an unknown or unsupported protocol. For character-oriented or fixed-length interfaces that
support protocol multiplexing the number of transmission units received via the interface which were
discarded because of an unknown or unsupported protocol. For any interface that does not support
protocol multiplexing, this counter will always be 0.
Discontinuities in the value of this counter can occur at re-initialization of the management system,
and at other times as indicated by the value of ifCounterDiscontinuityTime.
::= { ifEntry 15 }

ifOutOctets OBJECT-TYPE
SYNTAX Counter32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total number of octets transmitted out of the interface, including framing characters. Discontinuities
in the value of this counter can occur at re-initialization of the management system, and at other times
as indicated by the value of ifCounterDiscontinuityTime.
::= { ifEntry 16 }
ifOutUcastPkts OBJECT-TYPE
   SYNTAX Counter32
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The total number of packets that higher-level protocols requested be transmitted, and which were not
   addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or
   not sent. Discontinuities in the value of this counter can occur at re-initialization of the management
   system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifEntry 17 }

ifOutNUcastPkts OBJECT-TYPE
   SYNTAX Counter32
   MAX-ACCESS read-only
   STATUS deprecated
   DESCRIPTION
   The total number of packets that higher-level protocols requested be transmitted, and which were
   addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or
   not sent. Discontinuities in the value of this counter can occur at re-initialization of the management
   system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   This object is deprecated in favour of ifOutMulticastPkts and ifOutBroadcastPkts.
   ::= { ifEntry 18 }

ifOutDiscards OBJECT-TYPE
   SYNTAX Counter32
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The number of outbound packets which were chosen to be discarded even though no errors had been
   detected to prevent their being transmitted. One possible reason for discarding such a packet could be
   to free up buffer space. Discontinuities in the value of this counter can occur at re-initialization of the
   management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifEntry 19 }
ifOutErrors OBJECT-TYPE
   SYNTAX Counter32
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   For packet-oriented interfaces, the number of outbound packets that could not be transmitted because of errors. For character-oriented or fixed-length interfaces, the number of outbound transmission units that could not be transmitted because of errors. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifEntry 20 }

ifOutQLen OBJECT-TYPE
   SYNTAX Gauge32
   MAX-ACCESS read-only
   STATUS deprecated
   DESCRIPTION
   The length of the output packet queue (in packets).
   ::= { ifEntry 21 }

ifSpecific OBJECT-TYPE
   SYNTAX OBJECT IDENTIFIER
   MAX-ACCESS read-only
   STATUS deprecated
   DESCRIPTION
   A reference to MIB definitions specific to the particular media being used to realize the interface. It is recommended that this value point to an instance of a MIB object in the media-specific MIB, i.e., that this object have the semantics associated with the InstancePointer textual convention defined in RFC 2579. In fact, it is recommended that the media-specific MIB specify what value ifSpecific should/can take for values of ifType. If no MIB definitions specific to the particular media are available, the value should be set to the OBJECT IDENTIFIER { 0 0 }.
   ::= { ifEntry 22 }

Extension to the interface table

This table replaces the ifExtmsTable table.
**ifXTable**

**OBJECT-TYPE**

SYNTAX Sequence of IfXEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

A list of interface entries. The number of entries is given by the value of ifNumber. This table contains additional objects for the interface table.

::= { ifMIBObjects 1 }

**ifXEntry**

**OBJECT-TYPE**

SYNTAX IfXEntry

MAX-ACCESS not-accessible

STATUS current

DESCRIPTION

An entry containing additional management information applicable to a particular interface.

AUGMENTS { ifEntry }

::= { ifXTable 1 }

IfXEntry ::= SEQUENCE { ifName DisplayString, ifInMulticastPkts Counter32, ifInBroadcastPkts Counter32, ifOutMulticastPkts Counter32, ifOutBroadcastPkts Counter32, ifHCInOctetsCounter64, ifHCInUcastPkts Counter64, ifHCInMulticastPktsCounter64, ifHCInBroadcastPktsCounter64, ifHCOutOctetsCounter64, ifHCOutUcastPktsCounter64, ifHCOutMulticastPktsCounter64, ifHCOutBroadcastPktsCounter64, ifLinkUpDownTrapEnable INTEGER, ifHighSpeed Gauge32, ifPromiscuousMode TruthValue, ifConnectorPresent TruthValue, ifAlias DisplayString, ifCounterDiscontinuityTime Time Stamp }

**ifName**

**OBJECT-TYPE**

SYNTAX DisplayString

MAX-ACCESS read-only

STATUS current

DESCRIPTION

The textual name of the interface. The value of this object should be the name of the interface as assigned by the local device and should be suitable for use in commands entered at the device's 'console'. This might be a text name, such as 'le0' or a simple port number, such as '1', depending on the interface naming syntax of the device. If several entries in the ifTable together represent a single interface as named by the device, then each will have the same value of ifName. Note that for an agent which responds to SNMP queries concerning an interface on some other (proxied) device, then the value of ifName for such an interface is the proxied device's local name for it. If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string.

::= { ifXEntry 1 }
ifInMulticastPkts OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  ::= { ifXEntry 2 }

ifInBroadcastPkts OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  ::= { ifXEntry 3 }

ifOutMulticastPkts OBJECT-TYPE
  SYNTAX Counter32
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
  ::= { ifXEntry 4 }
ifOutBroadcastPkts OBJECT-TYPE
   SYNTAX Counter32
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The total number of packets that higher-level protocols requested be transmitted, and which were
   addressed to a broadcast address at this sub-layer, including those that were discarded or not sent.
   Discontinuities in the value of this counter can occur at re-initialization of the management system,
   and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 5 }

High capacity counter objects

These objects are all 64 bit versions of the basic ifTable counters. These objects all have the same basic
semantics as their 32-bit counterparts, however, their syntax has been extended to 64 bits.

ifHCInOctets OBJECT-TYPE
   SYNTAX Counter64
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The total number of octets received on the interface, including framing characters. This object is a
   64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of
   the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 6 }

ifHCInUcastPkts OBJECT-TYPE
   SYNTAX Counter64
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed
   to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts.
   Discontinuities in the value of this counter can occur at re-initialization of the management system,
   and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 7 }
ifHCInMulticastPkts OBJECT-TYPE
   SYNTAX Counter64
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts.
   Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 8 }

ifHCInBroadcastPkts OBJECT-TYPE
   SYNTAX Counter64
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts.
   Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 9 }

ifHCOOutOctets OBJECT-TYPE
   SYNTAX Counter64
   MAX-ACCESS read-only
   STATUS current
   DESCRIPTION
   The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets.
   Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
   ::= { ifXEntry 10 }
ifHCOutUcastPkts OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts.
Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
::= {ifXEntry 11 }

ifHCOutMulticastPkts OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts.
Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
::= {ifXEntry 12 }

ifHCOutBroadcastPkts OBJECT-TYPE
SYNTAX Counter64
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts.
Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime.
::= {ifXEntry 13 }
ifLinkUpDownTrapEnable OBJECT-TYPE
SYNTAX Integer { enabled(1), disabled(2) }
MAX-ACCESS read-write
STATUS current
DESCRIPTION
Indicates whether linkUp/linkDown traps should be generated for this interface. By default, this object should have the value enabled(1) for interfaces which do not operate on 'top' of any other interface (as defined in the ifStackTable), and disabled(2) otherwise.
::= { ifXEntry 14 }

ifHighSpeed OBJECT-TYPE
SYNTAX Gauge32
MAX-ACCESS read-only
STATUS current
DESCRIPTION
An estimate of the interface's current bandwidth in units of 1,000,000 bits per second. If this object reports a value of 'n' then the speed of the interface is somewhere in the range of 'n-500,000' to 'n+499,999'. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth. For a sub-layer which has no concept of bandwidth, this object should be zero.
::= { ifXEntry 15 }

ifPromiscuousMode OBJECT-TYPE
SYNTAX TruthValue
MAX-ACCESS read-write
STATUS current
DESCRIPTION
This object has a value of false(2) if this interface only accepts packets/frames that are addressed to this station. This object has a value of true(1) when the station accepts all packets/frames transmitted on the media. The value true(1) is only legal on certain types of media. If legal, setting this object to a value of true(1) may require the interface to be reset before becoming effective.
The value of ifPromiscuousMode does not affect the reception of broadcast and multicast packets/frames by the interface.
::= { ifXEntry 16 }
ifConnectorPresent OBJECT-TYPE
  SYNTAX TruthValue
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  This object has the value 'true(1)' if the interface sublayer has a physical connector and the value 'false(2)' otherwise.
  ::= { iXEntry 17 }

ifAlias OBJECT-TYPE
  SYNTAX DisplayString (SIZE(0..64))
  MAX-ACCESS read-write
  STATUS current
  DESCRIPTION
  This object is an alias name for the interface as specified by a network manager, and provides a non-volatile handle for the interface.
  On the first instantiation of an interface, the value of ifAlias associated with that interface is the zero-length string. As and when a value is written into an instance of ifAlias through a network management set operation, then the agent must retain the supplied value in the ifAlias instance associated with the same interface for as long as that interface remains instantiated, including across all re-initializations/reboots of the network management system, including those which result in a change of the interface's ifIndex value.
  An example of the value which a network manager might store in this object for a WAN interface is the (Telco's) circuit number/identifier of the interface.
  Some agents may support write-access only for interfaces having particular values of ifType. An agent which supports write access to this object is required to keep the value in non-volatile storage, but it may limit the length of new values depending on how much storage is already occupied by the current values for other interfaces.
  ::= { iXEntry 18 }

ifCounterDiscontinuityTime OBJECT-TYPE
  SYNTAX TimeStamp
  MAX-ACCESS read-only
  STATUS current
  DESCRIPTION
  The value of sysUpTime on the most recent occasion at which any one or more of this interface's counters suffered a discontinuity. The relevant counters are the specific instances associated with this interface of any Counter32 or Counter64 object contained in the ifTable or ifXTable. If no such discontinuities have occurred since the last re-initialization of the local management subsystem, then this object contains a zero value.
  ::= { iXEntry 19 }
Interface stack group

Implementation of this group is optional, but strongly recommended for all systems.

ifStackTable OBJECT-TYPE
SYNTAX Sequence of IfStackEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The table containing information on the relationships between the multiple sub-layers of network interfaces. In particular, it contains information on which sub-layers run 'on top of' which other sub-layers, where each sub-layer corresponds to a conceptual row in the ifTable. For example, when the sub-layer with ifIndex value x runs over the sub-layer with ifIndex value y, then this table contains ifStackStatus.x.y=active.

For each ifIndex value, I, which identifies an active interface, there are always at least two instantiated rows in this table associated with I. For one of these rows, I is the value of ifStackHigherLayer; for the other, I is the value of ifStackLowerLayer. (If I is not involved in multiplexing, then these are the only two rows associated with I.)

For example, two rows exist even for an interface which has no others stacked on top or below it:

- ifStackStatus.0.x=active
- ifStackStatus.x.0=active

 ::= { ifMIBObjects 2 }

ifStackEntry OBJECT-TYPE
SYNTAX IfStackEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
Information on a particular relationship between two sub-layers, specifying that one sub-layer runs on 'top' of the other sub-layer. Each sub-layer corresponds to a conceptual row in the ifTable.
INDEX { ifStackHigherLayer, ifStackLowerLayer }
 ::= { ifStackTable 1 }

IfStackEntry ::= SEQUENCE { ifStackHigherLayer InterfaceIndexOrZero, ifStackLowerLayer InterfaceIndexOrZero, ifStackStatus RowStatus }
ifStackHigherLayer OBJECT-TYPE
SYNTAX InterfaceIndexOrZero
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The value of ifIndex corresponding to the higher sub-layer of the relationship, i.e., the sub-layer which runs on 'top' of the sub-layer identified by the corresponding instance of ifStackLowerLayer. If there is no higher sub-layer (below the internetwork layer), then this object has the value 0.
::= { ifStackEntry 1 }

ifStackLowerLayer OBJECT-TYPE
SYNTAX InterfaceIndexOrZero
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
The value of ifIndex corresponding to the lower sub-layer of the relationship, i.e., the sub-layer which runs 'below' the sub-layer identified by the corresponding instance of ifStackHigherLayer. If there is no lower sub-layer, then this object has the value 0.
::= { ifStackEntry 2 }

ifStackStatus OBJECT-TYPE
SYNTAX RowStatus
MAX-ACCESS read-create
STATUS current
DESCRIPTION
The status of the relationship between two sub-layers. Changing the value of this object from 'active' to 'notInService' or 'destroy' will likely have consequences up and down the interface stack. Thus, write access to this object is likely to be inappropriate for some types of interfaces, and many implementations will choose not to support write-access for any type of interface.
::= { ifStackEntry 3 }
**ifStackLastChange** OBJECT-TYPE
SYNTAX TimeTicks
MAX-ACCESS read-only
STATUS current
DESCRIPTION
The value of sysUpTime at the time of the last change of the (whole) interface stack. A change of the interface stack is defined to be any creation, deletion, or change in value of any instance of ifStackStatus. If the interface stack has been unchanged since the last re-initialization of the local network management subsystem, then this object contains a zero value.

::= { ifMIBObjects 6 }

---

**Generic Receive Address table**

This group of objects is mandatory for all types of interfaces which can receive packets/frames addressed to more than one address. This table replaces the ifExtnsRcvAddr table. The main difference is that this table makes use of the RowStatus textual convention, while ifExtnsRcvAddr did not.

**ifRcvAddressTable** OBJECT-TYPE
SYNTAX Sequence of IfRcvAddressEntry
MAX-ACCESS not-accessible
STATUS current
DESCRIPTION
This table contains an entry for each address (broadcast, multicast, or uni-cast) for which the system will receive packets/frames on a particular interface, except as follows:

- For an interface operating in promiscuous mode, entries are only required for those addresses for which the system would receive frames were it not operating in promiscuous mode.
- For 802.5 functional addresses, only one entry is required, for the address which has the functional address bit ANDed with the bit mask of all functional addresses for which the interface will accept frames.

A system is normally able to use any unicast address which corresponds to an entry in this table as a source address.

::= { ifMIBObjects 4 }
ifRcvAddressEntry OBJECT-TYPE
   SYNTAX IfRcvAddressEntry
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   A list of objects identifying an address for which the system will accept packets/frames on the particular
   interface identified by the index value ifIndex.
   INDEX { ifIndex, ifRcvAddressAddress }
   ::= { ifRcvAddressTable 1 }
   IfRcvAddressEntry ::= SEQUENCE { ifRcvAddressAddress PhysAddress, ifRcvAddressStatusRowStatus, ifRcvAddressType INTEGER }

ifRcvAddressAddress OBJECT-TYPE
   SYNTAX PhysAddress
   MAX-ACCESS not-accessible
   STATUS current
   DESCRIPTION
   An address for which the system will accept packets/frames on this entry's interface.
   ::= { ifRcvAddressEntry 1 }

ifRcvAddressStatus OBJECT-TYPE
   SYNTAX RowStatus
   MAX-ACCESS read-create
   STATUS current
   DESCRIPTION
   This object is used to create and delete rows in the ifRcvAddressTable.
   ::= { ifRcvAddressEntry 2 }
ifRcvAddressType OBJECT-TYPE
   SYNTAX INTEGER {other(1), volatile(2), nonVolatile(3) }
   MAX-ACCESS read-create
   STATUS current
   DESCRIPTION
   This object has the value nonVolatile(3) for those entries in the table which are valid and will not be deleted by the next restart of the managed system. Entries having the value volatile(2) are valid and exist, but have not been saved, so that will not exist after the next restart of the managed system. Entries having the value other(1) are valid and exist but are not classified as to whether they will continue to exist after the next restart.
   DEFVAL { volatile }
   ::= { ifRcvAddressEntry 3 }

Definition of interface-related traps

linkDown NOTIFICATION-TYPE
   OBJECTS { ifIndex, ifAdminStatus, ifOperStatus }
   STATUS current
   DESCRIPTION
   A linkDown trap signifies that the SNMP entity, acting in an agent role, has detected that the ifOperStatus object for one of its communication links is about to enter the down state from some other state (but not from the notPresent state). This other state is indicated by the included value of ifOperStatus.
   ::= { snmpTraps 3 }

linkUp NOTIFICATION-TYPE
   OBJECTS { ifIndex, ifAdminStatus, ifOperStatus }
   STATUS current
   DESCRIPTION
   A linkUp trap signifies that the SNMP entity, acting in an agent role, has detected that the ifOperStatus object for one of its communication links left the down state and transitioned into some other state (but not into the notPresent state). This other state is indicated by the included value of ifOperStatus.
   ::= { snmpTraps 4 }

IF-MIB conformance information

ifConformance OBJECT IDENTIFIER
   ::= { ifMIB 2 }
ifGroups OBJECT IDENTIFIER
   ::= { ifConformance 1 }

ifCompliances OBJECT IDENTIFIER
   ::= { ifConformance 2 }

**IF-MIB compliance statements**

ifCompliance3 MODULE-COMPLIANCE
   STATUS current
   DESCRIPTION
   The compliance statement for SNMP entities which have network interfaces.
   MODULE -- this module
   MANDATORY-GROUPS { ifGeneralInformationGroup, linkUpDownNotificationsGroup }
   The groups:
   - ifFixedLengthGroup
   - ifHCFixedLengthGroup
   - ifPacketGroup
   - ifHCPacketGroup
   - ifVHCPacketGroup

Mutually exclusive; at most one of these groups is implemented for a particular interface. When any of these
groups is implemented for a particular interface, then ifCounterDiscontinuityGroup must also be implemented
for that interface.

GROUP ifFixedLengthGroup
   DESCRIPTION
   This group is mandatory for those network interfaces which are character-oriented or transmit data in
   fixed-length transmission units, and for which the value of the corresponding instance of ifSpeed is less than
   or equal to 20,000,000 bits/second.

GROUP ifHCFixedLengthGroup
   DESCRIPTION
   This group is mandatory for those network interfaces which are character-oriented or transmit data in
   fixed-length transmission units, and for which the value of the corresponding instance of ifSpeed is greater
   than 20,000,000 bits/second.

GROUP ifPacketGroup
   DESCRIPTION
   This group is mandatory for those network interfaces which are packet-oriented, and for which the value of
   the corresponding instance of ifSpeed is less than or equal to 20,000,000 bits/second.
GROUP ifHCPacketGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are packet-oriented and for which the value of the corresponding instance of ifSpeed is greater than 20,000,000 bits/second but less than or equal to 650,000,000 bits/second.

GROUP ifVHCPacketGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are packet-oriented and for which the value of the corresponding instance of ifSpeed is greater than 650,000,000 bits/second.

GROUP ifCounterDiscontinuityGroup
DESCRIPTION
This group is mandatory for those network interfaces that are required to maintain counters (i.e., those for which one of the ifFixedLengthGroup, ifHCFixedLengthGroup, ifPacketGroup, ifHCPacketGroup, or ifVHCPacketGroup is mandatory).

GROUP ifRevAddressGroup
DESCRIPTION
The applicability of this group MUST be defined by the media-specific MIBs. Media-specific MIBs must define the exact meaning, use, and semantics of the addresses in this group.

OBJECT ifLinkUpDownTrapEnable
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifPromiscuousMode
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifAdminStatus
SYNTAX INTEGER { up(1), down(2) }
MIN-ACCESS read-only
DESCRIPTION
Write access is not required, nor is support for the value testing(3).

OBJECT ifAlias
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

::={ifCompliances 3}
IF-MIB units of conformance

ifGeneralInformationGroupOBJECT-GROUP

OBJECTS { ifIndex, ifDescr, ifType, ifSpeed, ifPhysAddress, ifAdminStatus, ifOperStatus, ifLastChange, ifLinkUpDownTrapEnable, ifConnectorPresent, ifHighSpeed, ifName, ifNumber, ifAlias, ifTableLastChange }

STATUS current

DESCRIPTION
A collection of objects providing information applicable to all network interfaces.
::= { ifGroups 10 }

---

Note
The following five groups are mutually exclusive; at most one of these groups is implemented for any interface.

- ifFixedLengthGroupOBJECT-GROUP

OBJECTS { ifInOctets, ifOutOctets, ifInUnknownProtos, ifInErrors, ifOutErrors }

STATUS current

DESCRIPTION
A collection of objects providing information specific to non-high speed (non-high speed interfaces transmit and receive at speeds less than or equal to 20,000,000 bits/second) character-oriented or fixed-length-transmission network interfaces.
::= { ifGroups 2 }

ifHCFixedLengthGroupOBJECT-GROUP

OBJECTS { ifHCInOctets, ifHCOutOctets, ifInOctets, ifOutOctets, ifInUnknownProtos, ifInErrors, ifOutErrors }

STATUS current

DESCRIPTION
A collection of objects providing information specific to high speed (greater than 20,000,000 bits/second) character-oriented or fixed-length-transmission network interfaces.
::= { ifGroups 3 }
ifPacketGroupOBJECT-GROUP

OBJECTS { ifInOctets, ifOutOctets, ifInUnknownProtos, ifInErrors, ifOutErrors, ifMtu, ifInUcastPkts,
ifInMulticastPkts, ifInBroadcastPkts, ifInDiscards, ifOutUcastPkts, ifOutMulticastPkts,
ifOutBroadcastPkts, ifOutDiscards, ifPromiscuousMode }

STATUS current

DESCRIPTION
A collection of objects providing information specific to non-high speed (non-high speed interfaces
transmit and receive at speeds less than or equal to 20,000,000 bits/second) packet-oriented network
interfaces.

::= { ifGroups 4 }

ifHCPacketGroupOBJECT-GROUP

OBJECTS { ifHCInOctets, ifHCOutOctets, ifInOctets, ifOutOctets, ifInUnknownProtos, ifInErrors,
ifOutErrors, ifMtu, ifInUcastPkts, ifInMulticastPkts, ifInBroadcastPkts, ifInDiscards, ifOutUcastPkts,
ifOutMulticastPkts, ifOutBroadcastPkts, ifOutDiscards, ifPromiscuousMode }

STATUS current

DESCRIPTION
A collection of objects providing information specific to high speed (greater than 20,000,000 bits/second
but less than or equal to 650,000,000 bits/second) packet-oriented network interfaces.

::= { ifGroups 5 }

ifVHCPacketGroupOBJECT-GROUP

OBJECTS { ifHCInUcastPkts, ifHCInMulticastPkts, ifHCInBroadcastPkts, ifHCOutUcastPkts,
ifHCOutMulticastPkts, ifHCOutBroadcastPkts, ifHCOcitcOctets, ifHCOutOctets, ifInOctets, ifOutOctets,
ifInUnknownProtos, ifInErrors, ifOutErrors, ifMtu, ifInUcastPkts, ifInMulticastPkts, ifInBroadcastPkts,
ifInDiscards, ifOutUcastPkts, ifOutMulticastPkts, ifOutBroadcastPkts, ifOutDiscards,
ifPromiscuousMode }

STATUS current

DESCRIPTION
A collection of objects providing information specific to higher speed (greater than 650,000,000
bits/second) packet-oriented network interfaces.

::= { ifGroups 6 }

ifRcvAddressGroupOBJECT-GROUP

OBJECTS { ifRcvAddressStatus, ifRcvAddressType }

STATUS current

DESCRIPTION
A collection of objects providing information on the multiple addresses which an interface receives.

::= { ifGroups 7 }
ifStackGroup2 OBJECT-GROUP
  OBJECTS { ifStackStatus, ifStackLastChange }
  STATUS current
  DESCRIPTION
  A collection of objects providing information on the layering of MIB-II interfaces.
  ::= { ifGroups 11 }

ifCounterDiscontinuityGroup OBJECT-GROUP
  OBJECTS { ifCounterDiscontinuityTime }
  STATUS current
  DESCRIPTION
  A collection of objects providing information specific to interface counter discontinuities.
  ::= { ifGroups 13 }

linkUpDownNotificationsGroup NOTIFICATION-GROUP
  NOTIFICATIONS { linkUp, linkDown }
  STATUS current
  DESCRIPTION
  The notifications which indicate specific changes in the value of ifOperStatus.
  ::= { ifGroups 14 }

IF-MIB deprecated definitions - objects

Interface test table
  This group of objects is optional and deprecated. However, a media-specific MIB may make implementation of this group mandatory. This table replaces the ifExtnsTestTable.
ifTestTable OBJECT-TYPE
SYNTAX SEQUENCE OF IfTestEntry
MAX-ACCESS not-accessible
STATUS deprecated
DESCRIPTION
This table contains one entry per interface. It defines objects which allow a network manager to instruct an agent to test an interface for various faults. Tests for an interface are defined in the media-specific MIB for that interface. After invoking a test, the object ifTestResult can be read to determine the outcome. If an agent cannot perform the test, ifTestResult is set to so indicate. The object ifTestCode can be used to provide further test-specific or interface-specific (or even enterprise-specific) information concerning the outcome of the test. Only one test can be in progress on each interface at any one time. If one test is in progress when another test is invoked, the second test is rejected. Some agents may reject a test when a prior test is active on another interface.

Before starting a test, a manager-station must first obtain 'ownership' of the entry in the ifTestTable for the interface to be tested. This is accomplished with the ifTestId and ifTestStatus objects as follows:

```c
try_again:
    get (ifTestId, ifTestStatus)
    while (ifTestStatus != notInUse)
        /*
        * Loop while a test is running or some other
        * manager is configuring a test.
        */
        short delay
        get (ifTestId, ifTestStatus)
    }
    /*
    * Is not being used right now -- let's compete
    * to see who gets it.
    */
    lock_value = ifTestId
    if ( set(ifTestId = lock_value, ifTestStatus = inUse,
              ifTestOwner = 'my-IP-address') == FAILURE )
        /*
        * Another manager got the ifTestEntry -- go
        * try again
        */
        goto try_again;
    /*
    * I have the lock
```
set up any test parameters.

/*

* This starts the test

*/

set(ifTestType = test_to_run);

Wait for test completion by polling ifTestResult when test completes, agent sets ifTestResult agent also sets ifTestStatus = 'notInUse' retrieve any additional test results, and ifTestId if (ifTestId == lock_value+1) results are valid.

A manager station first retrieves the value of the appropriate ifTestId and ifTestStatus objects, periodically repeating the retrieval if necessary, until the value of ifTestStatus is 'notInUse'. The manager station then tries to set the same ifTestId object to the value it just retrieved, the same ifTestStatus object to 'inUse', and the corresponding ifTestOwner object to a value indicating itself. If the set operation succeeds then the manager has obtained ownership of the ifTestEntry, and the value of the ifTestId object is incremented by the agent (per the semantics of TestAndIncr). Failure of the set operation indicates that some other manager has obtained ownership of the ifTestEntry.

Once ownership is obtained, any test parameters can be setup, and then the test is initiated by setting ifTestType. On completion of the test, the agent sets ifTestStatus to 'notInUse'. Once this occurs, the manager can retrieve the results. In the (rare) event that the invocation of tests by two network managers were to overlap, then there would be a possibility that the first test's results might be overwritten by the second test's results prior to the first results being read. This unlikely circumstance can be detected by a network manager retrieving ifTestId at the same time as retrieving the test results, and ensuring that the results are for the desired request.

If ifTestType is not set within an abnormally long period of time after ownership is obtained, the agent should time-out the manager, and reset the value of the ifTestStatus object back to 'notInUse'. It is suggested that this time-out period be 5 minutes.

In general, a management station must not retransmit a request to invoke a test for which it does not receive a response; instead, it properly inspects an agent's MIB to determine if the invocation was successful. Only if the invocation was unsuccessful, is the invocation request retransmitted.

Some tests may require the interface to be taken off-line in order to execute them, or may even require the agent to reboot after completion of the test. In these circumstances, communication with the management station invoking the test may be lost until after completion of the test. An agent is not required to support such tests. However, if such tests are supported, then the agent should make every effort to transmit a response to the request which invoked the test prior to losing communication. When the agent is restored to normal service, the results of the test are properly made available in the appropriate objects.

Note that this requires that the ifIndex value assigned to an interface must be unchanged even if the test causes a reboot. An agent must reject any test for which it cannot, perhaps due to resource constraints, make available at least the minimum amount of information after that test completes.

::= { ifMIBObjects 3 }
ifTestEntry OBJECT-TYPE
   SYNTAX IfTestEntry
   MAX-ACCESS not-accessible
   STATUS deprecated
   DESCRIPTION
   An entry containing objects for invoking tests on an interface.
   AUGMENTS { ifEntry }
   ::= { ifTestTable 1 }
   IfTestEntry ::= 
   SEQUENCE { ifTestIdTestAndIncr, ifTestStatus INTEGER, ifTestType AutonomousType, ifTestResult INTEGER, ifTestCode OBJECT IDENTIFIER, ifTestOwnerOwnerString }

ifTestId OBJECT-TYPE
   SYNTAX TestAndIncr
   MAX-ACCESS read-write
   STATUS deprecated
   DESCRIPTION
   This object identifies the current invocation of the interface's test.
   ::= { ifTestEntry 1 }

ifTestStatus OBJECT-TYPE
   SYNTAX INTEGER { notInUse(1), inUse(2) }
   MAX-ACCESS read-write
   STATUS deprecated
   DESCRIPTION
   This object indicates whether or not some manager currently has the necessary 'ownership' required to invoke a test on this interface. A write to this object is only successful when it changes its value from 'notInUse(1)' to 'inUse(2)'. After completion of a test, the agent resets the value back to 'notInUse(1)'.
   ::= { ifTestEntry 2 }
ifTestType OBJECT-TYPE
SYNTAX AutonomousType
MAX-ACCESS read-write
STATUS deprecated
DESCRIPTION
A control variable used to start and stop operator-initiated interface tests. Most OBJECT IDENTIFIER values assigned to tests are defined elsewhere, in association with specific types of interface. However, this document assigns a value for a full-duplex loopback test, and defines the special meanings of the subject identifier:
noTest OBJECT IDENTIFIER ::= { 0 0 }
When the value noTest is written to this object, no action is taken unless a test is in progress, in which case the test is aborted. Writing any other value to this object is only valid when no test is currently in progress, in which case the indicated test is initiated.
When read, this object always returns the most recent value that ifTestType was set to. If it has not been set since the last initialization of the network management subsystem on the agent, a value of noTest is returned.
 ::= { ifTestEntry 3 }

ifTestResult OBJECT-TYPE
SYNTAX INTEGER { none(1), -- no test yet requested success(2), inProgress(3), notSupported(4), unAbleToRun(5), -- due to state of system aborted(6), failed(7) }
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION
This object contains the result of the most recently requested test, or the value none(1) if no tests have been requested since the last reset. Note that this facility provides no provision for saving the results of one test when starting another, as could be required if used by multiple managers concurrently.
 ::= { ifTestEntry 4 }

ifTestCode OBJECT-TYPE
SYNTAX OBJECT IDENTIFIER
MAX-ACCESS read-only
STATUS deprecated
DESCRIPTION
This object contains a code which contains more specific information on the test result, for example an error-code after a failed test. Error codes and other values this object may take are specific to the type of interface and/or test. The value may have the semantics of either the AutonomousType or InstancePointer textual conventions as defined in RFC 2579. The identifier is testCodeUnknown OBJECT IDENTIFIER ::= { 0 0 } and defined for use if no additional result code is available.
 ::= { ifTestEntry 5 }
ifTestOwner OBJECT-TYPE
SYNTAX OwnerString
MAX-ACCESS read-write
STATUS deprecated
DESCRIPTION
The entity which currently has the 'ownership' required to invoke a test on this interface.
::= {ifTestEntry 6 }

IF-MIB deprecated definitions - groups

ifGeneralGroup OBJECT-GROUP
OBJECTS { ifDescr, ifType, ifSpeed, ifPhysAddress, ifAdminStatus, ifOperStatus, ifLastChange,
ifLinkUpDownTrapEnable, ifConnectorPresent, ifHighSpeed, ifName }
STATUS deprecated
DESCRIPTION
A collection of objects deprecated in favour of ifGeneralInformationGroup.
::= { ifGroups 1 }

ifTestGroup OBJECT-GROUP
OBJECTS { ifTestId, ifTestStatus, ifTestType, ifTestResult, ifTestCode, ifTestOwner }
STATUS deprecated
DESCRIPTION
A collection of objects providing the ability to invoke tests on an interface.
::= { ifGroups 8 }

ifStackGroup OBJECT-GROUP
OBJECTS { ifStackStatus }
STATUS deprecated
DESCRIPTION
The previous collection of objects providing information on the layering of MIB-II interfaces.
::= { ifGroups 9 }
ifOldObjectsGroup OBJECT-GROUP
OBJECTS { ifInNUcastPkts, ifOutNUcastPkts, ifOutQLen, ifSpecific }
STATUS deprecated
DESCRIPTION
The collection of objects deprecated from the original MIB-II interfaces group.
 ::= { ifGroups 12 }
IF-MIB deprecated definitions - compliance

ifCompliance MODULE-COMPLIANCE
STATUS deprecated
DESCRIPTION
A compliance statement defined in a previous version of this MIB module, for SNMP entities which have network interfaces.

MODULE -- this module
MANDATORY-GROUPS { ifGeneralGroup, ifStackGroup }

GROUP ifFixedLengthGroup
DESCRIPTION
This group is mandatory for all network interfaces which are character-oriented or transmit data in fixed-length transmission units.

GROUP ifHCFixedLengthGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are character-oriented or transmit data in fixed-length transmission units, and for which the value of the corresponding instance of ifSpeed is greater than 20,000,000 bits/second.

GROUP ifPacketGroup
DESCRIPTION
This group is mandatory for all network interfaces which are packet-oriented.

GROUP ifHCPacketGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are packet-oriented and for which the value of the corresponding instance of ifSpeed is greater than 650,000,000 bits/second.

GROUP ifTestGroup
DESCRIPTION
This group is optional. Media-specific MIBs which require interface tests are strongly encouraged to use this group for invoking tests and reporting results. A medium specific MIB which has mandatory tests may make implementation of this group mandatory.

GROUP ifRcvAddressGroup
DESCRIPTION
The applicability of this group MUST be defined by the media-specific MIBs. Media-specific MIBs must define the exact meaning, use, and semantics of the addresses in this group.

OBJECT ifLinkUpDownTrapEnable
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifPromiscuousMode
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifStackStatus
SYNTAX INTEGER { active(1) } -- subset of RowStatus
MIN-ACCESS read-only

DESCRIPTION
Write access is not required, and only one of the six enumerated values for the RowStatus textual convention need be supported, specifically: active(1).

OBJECT ifAdminStatus
SYNTAX INTEGER { up(1), down(2) }
MIN-ACCESS read-only

DESCRIPTION
Write access is not required, nor is support for the value testing(3).

::= { ifCompliances 1 }
ifCompliance2 MODULE-COMPLIANCE
STATUS deprecated

DESCRIPTION
A compliance statement defined in a previous version of this MIB module, for SNMP entities which have network interfaces.

MODULE -- this module
MANDATORY-GROUPS { ifGeneralInformationGroup, ifStackGroup2, ifCounterDiscontinuityGroup }

GROUP ifFixedLengthGroup
DESCRIPTION
This group is mandatory for all network interfaces which are character-oriented or transmit data in fixed-length transmission units.

GROUP ifHCFixedLengthGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are character-oriented or transmit data in fixed-length transmission units, and for which the value of the corresponding instance of ifSpeed is greater than 20,000,000 bits/second.

GROUP ifPacketGroup
DESCRIPTION
This group is mandatory for all network interfaces which are packet-oriented.

GROUP ifHCPacketGroup
DESCRIPTION
This group is mandatory only for those network interfaces which are packet-oriented and for which the value of the corresponding instance of ifSpeed is greater than 650,000,000 bits/second.

GROUP ifRevAddressGroup
DESCRIPTION
The applicability of this group MUST be defined by the media-specific MIBs. Media-specific MIBs must define the exact meaning, use, and semantics of the addresses in this group.

OBJECT ifLinkUpDownTrapEnable
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifPromiscuousMode
MIN-ACCESS read-only
DESCRIPTION
Write access is not required.

OBJECT ifStackStatus
SYNTAX INTEGER { active(1) } -- subset of RowStatus
MIN-ACCESS read-only
DESCRIPTION
Write access is not required, and only one of the six enumerated values for the RowStatus textual convention need be supported, specifically: active(1).

OBJECT ifAdminStatus
SYNTAX INTEGER { up(1), down(2) }
MIN-ACCESS read-only

DESCRIPTION
Write access is not required, nor is support for the value testing(3).

OBJECT ifAlias
MIN-ACCESS read-only

DESCRIPTION
Write access is not required.

::= { ifCompliances 2 }
Vendor-specific Management Information Base

This chapter describes the vendor-specific Management Information Base (MIB) text documents that Cisco Unified Communications Manager (Cisco Unified CM) supports and that are used with Simple Network Management Protocol (SNMP).

- Vendor-specific Management Information Base, page 1025
- Supported servers - Cisco Unified CM releases, page 1025
- IBM MIBs, page 1049
- Hewlett Packard MIBs, page 1052
- Intel MIBs, page 1058

Vendor-specific Management Information Base

The MIBs described in this chapter exist on various Cisco Media Convergence Servers (MCS), depending on vendor and model number. To query these MIBS, you can use the standard MIB browsers provided by the vendor. Go to the following URLs:

Supported servers - Cisco Unified CM releases

This section lists the supported server models and unsupported server models by MIB and by Cisco Unified CM Release.

This will result in mandatory memory and hard drive upgrades, if older supported servers are desired for use with the new software versions.

Cisco Unified CM release 8.0(1) inapplicable MIBs

IBM-SYSTEM-POWER MIB does not apply to the following IBM server models:

- MCS-7815-I1-IPC1
- MCS-7815-I2-IPC1
- MCS-7815-I3-IPC1
- MCS-7816-I3-IPC1
• MCS-7816-I4-IPC1
• MCS-7825I-3.0-IPC1
• MCS-7825-I1-IPC1
• MCS-7825-I2-IPC1
• MCS-7825-I3-IPC1
• MCS-7825-I4-IPC1
• MCS-7828-I3-IPC1

IBM-SYSTEM-RAID MIB does not apply to the following IBM server models:
• MCS-7815-I1-IPC1
• MCS-7815-I2-IPC1
• MCS-7815-I3-IPC1
• MCS-7816-I3-IPC1
• MCS-7816-I4-IPC1
• MCS-7825-I4-IPC1
• MCS-7828-I4-IPC1

IBM-SYSTEM-STORAGE-MIB does not apply to the following IBM server models:
• MCS-7815-I1-IPC1
• MCS-7815-I2-IPC1
• MCS-7815-I3-IPC1
• MCS-7816-I3-IPC1
• MCS-7816-I4-IPC1
• MCS-7825I-3.0-IPC1
• MCS-7825-I1-IPC1
• MCS-7825-I2-IPC1
• MCS-7825-I3-IPC1
• MCS-7828-I3-IPC1

</tr>
</thead>
<tbody>
<tr>
<td>Logical Drive</td>
<td>CPQIDA-MIB1.3.6.1.4.1.232.3.23.1.1.4</td>
<td>cpqDaLogDrvStatus Clearing Value = 2</td>
<td>The logical drive can be in one of the following states:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Ok (2) Indicates that the logical drive is in normal operation mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Failed (3) Indicates that more physical drives have failed than the fault tolerance mode of the logical drive can handle without data loss.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Unconfigured (4) Indicates that the logical drive is not configured.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Recovering (5) Indicates that the logical drive is using Interim Recovery Mode. In Interim Recovery Mode, at least one physical drive has failed, but the logical drive's fault tolerance mode lets the drive continue to operate with no data loss.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Ready Rebuild (6) Indicates that the logical drive is ready for Automatic Data Recovery. The physical drive that failed has been replaced, but the logical drive is still operating in Interim Recovery Mode.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Rebuilding (7) Indicates that the logical drive is currently doing Automatic Data Recovery. During Automatic Data Recovery, fault tolerance algorithms restore data to the replacement drive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Wrong Drive (8) Indicates that the wrong physical drive was replaced after a physical drive failure.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Bad Connect (9) Indicates that a physical drive is not responding.</td>
</tr>
</tbody>
</table>
### HP hardware status messages

<table>
<thead>
<tr>
<th>MCS-78xx Status</th>
<th>MIB and OID</th>
<th>MIB Object Name and Clearing Value</th>
<th>Object Response</th>
</tr>
</thead>
</table>
| Physical Drive1 | CPQIDA-MIB1.3.6.1.4.1.232.25.1.1.6 | cpqDaPhyDrv Status Clearing Value = 2 | • The following values are valid for the physical drive status:  
  • other (1) Indicates that the instrument agent does not recognize the drive. You may need to upgrade your instrument agent and/or driver software.  
  • ok (2) Indicates the drive is functioning properly.  
  • failed (3) Indicates that the drive is no longer operating and should be replaced.  
  • predictiveFailure(4) Indicates that the drive has a predictive failure error and should be replaced. |
| System Fan      | CPQHLTH-MIB1.3.6.1.4.1.232.6.2.6.4 | cpqHeThermalSystemFan Status Clearing Value = 2 | This value will be one of the following:  
  • other(1) Fan status detection is not supported by this system or driver.  
  • ok(2) The fan is operating properly.  
  • degraded(2) A redundant fan is not operating properly.  
  • failed(4) A non-redundant fan is not operating properly. |
| CPU Fan         | CPQHLTH-MIB1.3.6.1.4.1.232.6.2.6.5 | cpqHeThermalCpuFan Status Clearing Value = 2 | This value will be one of the following:  
  • other(1) Fan status detection is not supported by this system or driver.  
  • ok(2) The fan is operating properly.  
  • degraded(2) A redundant fan is not operating properly.  
  • failed(4) A non-redundant fan is not operating properly. |
