THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If the equipment causes interference to radio or television reception, which can be determined by turning the equipment off and on, users are encouraged to try to correct the interference by using one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

Modifications to this product not authorized by Cisco could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB’s public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

Overview

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Administration Guide provides the information you need to understand, install, configure, and manage the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G on your network. This guide is intended to be used to administer phones running with Cisco Unified Communications Manager Release 4.3 and later.

Audience

Network engineers, system administrators, and telecom engineers should review this guide to learn the steps that are required to set up Cisco Unified IP Phones. The tasks described in this document involve configuring network settings that are not intended for phone users. The tasks in this manual require a familiarity with Cisco Unified Communications Manager.

Organization

This guide is organized as follows:
<table>
<thead>
<tr>
<th>Chapter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Unified Wireless IP Phone, on page 1</td>
<td>Provides a conceptual overview and description of the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G and provides an overview of the tasks required prior to installation</td>
</tr>
<tr>
<td>VoIP Wireless Network, on page 23</td>
<td>Describes how the IP Phone interacts with other key IP telephony and wireless network protocols and components</td>
</tr>
<tr>
<td>Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Setup, on page 47</td>
<td>Describes how to properly and safely install and configure the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G on your network</td>
</tr>
<tr>
<td>Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Web Pages, on page 67</td>
<td>Describes how to use the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G web pages for initial phone configuration and to update configuration files for the wireless IP phone</td>
</tr>
<tr>
<td>Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Settings, on page 115</td>
<td>Describes how to configure network profiles and phone settings, by using the Settings menu on the wireless IP phone</td>
</tr>
<tr>
<td>Wavelink Avalanche Server, on page 133</td>
<td>Describes how to use the Configuration Utility on the Wavelink Avalanche server for updating the phone configuration</td>
</tr>
<tr>
<td>Features, Templates, Services, and Users, on page 147</td>
<td>Provides an overview of procedures for configuring telephony features and adding users to Cisco Unified Communications Manager</td>
</tr>
<tr>
<td>Security, Device, Model, Status, and Call Statistics Information, on page 175</td>
<td>Explains how to view phone security, device, and network information and network and call statistics from the wireless IP phone</td>
</tr>
<tr>
<td>Remote Monitoring, on page 195</td>
<td>Explains how to obtain status information about the phone using the phone web page</td>
</tr>
<tr>
<td>Troubleshooting, on page 209</td>
<td>Provides tips for troubleshooting the wireless IP phone</td>
</tr>
<tr>
<td>Internal Support Website, on page 231</td>
<td>Provides suggestions for setting up a website for providing users with important information about their wireless IP phone</td>
</tr>
<tr>
<td>International User Support, on page 235</td>
<td>Provides information about setting up phones in non-English environments</td>
</tr>
<tr>
<td>Technical Specifications, on page 237</td>
<td>Provides technical specifications of the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G</td>
</tr>
<tr>
<td>Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Deployment Overview, on page 241</td>
<td>Provides a detailed checklist for deploying the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G</td>
</tr>

SAVE THESE INSTRUCTIONS
Phone Overview

The Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G provides wireless voice communication over an IP network. As with traditional analog telephones, you can place and receive phone calls and access features such as hold, transfer, and speed dial. In addition, because the phone connects to your wireless local area network (WLAN), you can place and receive phone calls from anywhere in your wireless environment.

For information about the phones and accessories, see the following documents:

- Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide
- Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Accessory Guide

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

This section describes the phone components.

Cisco Unified Wireless IP Phone 7925G and 7926G

The Cisco Unified Wireless IP Phone 7925G and 7926G are 802.11 dual-band wireless devices that provide comprehensive voice communications in conjunction with Cisco Unified Communications Manager and with Cisco Aironet 802.11b/g and Cisco Aironet 802.11a access points (APs) in a private business communications network.
The phone is a qualified Bluetooth wireless device (Qualified Device ID [QDID] B014396). The phone provides voice communication over the same wireless LAN that your computer uses, allowing you to place and receive phone calls, put calls on hold, transfer calls, make conference calls, and so on.

The following figure shows the Cisco Unified Wireless IP Phone 7925G. The Cisco Unified Wireless IP Phone 7926G looks similar.

![Cisco Unified Wireless IP Phone 7925G and 7926G](image)

This phone model, like other network devices, must be configured and managed. This phone encodes G.711a, G.711u, G.729a, G.729ab, and G.722/ilBC codecs, and decodes G.711a, G711b, G.711u, G.729, G729a, G729b, and G729ab codecs. The phone also supports uncompressed wideband (16 bits, 16 kHz) audio.

The Cisco Unified Wireless IP Phone 7925G and 7926G is hearing aid compatible (HAC) but do not have any TTY features. They have a centered “dot” or “nib” on the 5 key that is a tactile identifier.

The physical characteristics include:

- Resistance to damage from dropping the phone
- Tolerance of antibacterial and alcohol-based wipes
- Latex- and lead-free
- Resistance against liquid splashes
- Dust resistance
- Shockproof and vibration-proof
- USB 1.1 interface

In addition to basic call-handling features, your phone can provide enhanced productivity features that extend your call-handling capabilities.

Depending on the configuration, your phone supports:

- Use of Bluetooth wireless headsets, including certain hands-free call features
Wireless access to your phone number and the corporate directory

- A local phone book that can store up to 200 contacts and speed-dial hot keys that can be assigned to phone book contacts
- Access to network data, XML applications, and web-based services
- Online customizing of phone features and services from your User Options web pages
- An online help system that displays information on the phone screen

The Cisco Unified Wireless IP Phone 7926G contains a bar code scanner.

Cisco Unified Wireless IP Phone 7925G-EX

Your Cisco Unified Wireless IP Phone 7925G-EX is an Atmospheres Explosibles (ATEX) Zone 2/Class 22 and Canadian Standards Association (CSA) Division 2/Class 1 certified full-feature telephone. The phone is certified for use in potentially explosive environments in the gas, oil, and chemical production fields as well as dust-filled environments. The phone has Ingress Protection 64 (IP 64) level protection, indicating dust-tight equipment that is protected against splashing water. The phone has an industry-standard yellow styling that offers fast recognition in emergency situations.

The phone is a qualified Bluetooth wireless device (Qualified Device ID [QDID] B014396). The phone provides voice communication over the same wireless LAN that your computer uses, allowing you to place and receive phone calls, put calls on hold, transfer calls, make conference calls, and so on.

The following figures show the Cisco Unified Wireless IP Phone 7925G-EX.

This phone model, like other network devices, must be configured and managed. This phone encodes G.711a, G.711u, G.729a, G.729ab, and G.722/iLBC codecs, and decodes G.711a, G711b, G.711u, G.729, G729a, G729b, and G729ab codecs. The phone also supports uncompressed wideband (16 bits, 16 kHz) audio.
The Cisco Unified Wireless IP Phone 7925G-EX is hearing aid compatible (HAC) but does not have any TTY features. It also has a centered “dot” or “nib” on the 5 key that is a tactile identifier.

The physical characteristics include:

- Atmospheres Explosibles (ATEX) Zone 2/Class 22 certification prevents ignition of surrounding gas vapors by the phone.
- Canadian Standards Association (CSA) Division 2/Class 1 certification provides access to mobile collaborative communications.
- Industry-standard yellow styling offers fast recognition in emergency situations.
- Ingress Protection 64 (IP 64) level protection, indicating dust-tight equipment which is protected against splashing water.
- The large 2-inch color (176 x 220 pixels) display makes viewing easy.
- Resistance to damage from dropping the phone.
- Tolerance of antibacterial and alcohol-based wipes.
- Latex- and lead-free.
- Shockproof and vibration-proof.
- USB 1.1 interface.

**Note**

ATEX Zone 2 certification: Zone 2 is defined as an area in which an explosive gas atmosphere is not likely to occur in normal operation and if it does occur, is likely to do so only infrequently and will exist for a short period only (for example, less than 10 hours per year).

**Note**

CSA Class 1 Division II certification: Class 1 is a location where a quantity of flammable gas or vapor sufficient to produce an explosive or ignitable mixture may be present in the air. Division II is a location where a classified hazard does not normally exist but is possible under abnormal conditions.

In addition to basic call-handling features, your phone can provide enhanced productivity features that extend your call-handling capabilities.

Depending on the configuration, your phone supports:

- Use of Bluetooth wireless headsets, including certain hands-free call features
- Wireless access to your phone number and the corporate directory
- A local phone book that can store up to 200 contacts and speed-dial hot keys that can be assigned to phone book contacts
- Access to network data, XML applications, and web-based services
- Online customizing of phone features and services from your User Options web pages
Buttons and Hardware

The following figure shows the Cisco Unified Wireless IP Phone 7926G. The Cisco Unified Wireless IP Phone 7925G and 7925G-EX are similar in appearance to the Cisco Unified Wireless IP Phone 7926G. The following table describes the functions of the keys on the phones.

<table>
<thead>
<tr>
<th></th>
<th>Indicator light (LED)</th>
<th>Provides these indications:</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
<td>• Solid red: Phone is connected to AC power source and battery is charging.</td>
</tr>
<tr>
<td></td>
<td></td>

**Cisco Unified Wireless IP Phone 7925G Desktop Charger Overview**

The Cisco Unified Wireless IP Phone 7925G Desktop Charger provides the following features:

- Charges the docked phone battery from line power
- Contains a speakerphone, with the volume controlled by the phone volume buttons
- Supports Bluetooth through the speakerphone
- Displays status information using the Power/Bluetooth Status LED and Battery LED
- Contains an additional port at the back of the station for charging a spare battery
- Works on line power or from the spare battery for the phone
The following figure shows the Cisco Unified Wireless IP Phone 7925G docked in the Cisco Unified Wireless IP Phone 7925G Desktop Charger.

*Figure 1: Cisco Unified Wireless IP Phone 7925G docked in the charger*

The Cisco Unified Wireless IP Phone 7925G Desktop Charger supports the following phones:

- Cisco Unified Wireless IP Phone 7925G
- Cisco Unified Wireless IP Phone 7925G-EX
- Cisco Unified Wireless IP Phone 7926G

The two LEDs on the Cisco Unified Wireless IP Phone 7925G Desktop Charger change color, as described in the following table.
The charger is not plugged into line power. Solid Unlit Power/Bluetooth Status

The charger is plugged into line power. Green Solid

Bluetooth is connecting or disconnecting from the charger. Blue Flashing slowly

The charger is connected to the phone using Bluetooth. Solid

No spare battery is installed. Unlit Solid Battery

The spare battery is charging. Red Solid

The spare battery is fully charged. Green Solid

The station is powered by the spare battery with adequate charge. Amber-yellow Solid

The station is powered by the spare battery, but the battery is low. Flashing

The station is powered by the spare battery, but the battery is rapidly depleting. Flashing and dimming slowly

The spare battery charges only when the Cisco Unified Wireless IP Phone 7925G Desktop Charger is plugged into line power.

The Cisco Unified Wireless IP Phone 7925G Desktop Charger supports Bluetooth Version 2.1 + Extended Data Rate (EDR) using Hands-free Version 1.5.

The following figure shows the location of the Control button. The Control button is used when pairing the charger with the phone.

Bluetooth Technology

The Cisco Unified Wireless IP Phones are full-feature telephones and a qualified Bluetooth wireless devices (Qualified Device ID [QDID] B014396) and provide voice communication over the same wireless LAN that your computer uses. In addition to basic call-handling features, your phone operates with Bluetooth wireless headsets, including certain hands-free call features.

Bluetooth devices operate in the unlicensed Industrial Scientific Medicine (ISM) band of 2.4 GHz, which is the same as the 802.11b/g band. This unlicensed band in most countries includes the frequency range from 2400 to 2483.5 MHz. Bluetooth enables low bandwidth wireless connections within a range of 10 meters. The best performance is in the 1 to 2 meter range. Synchronous voice channels are provided by using circuit switching and asynchronous data channels are provided by using packet switching.

Bluetooth uses integrated Adaptive Frequency Hopping (AFH) to avoid interference. Every 625 microseconds (1/1,000,000 of a second) the channel changes or hops to another frequency within the 2402 to 2480 MHz range. This equals 1600 hops every second.

The phones contain a Bluetooth module and 802.11 WLAN module. This coexistence greatly reduces and avoids radio interference between the Bluetooth and 802.11b/g radio.

Bluetooth devices fit into three different power classes, as shown in the following table.

<table>
<thead>
<tr>
<th>Class</th>
<th>Maximum permitted transmit power (mW, dBm)</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class 1</td>
<td>100 mW, 20 dBm</td>
<td>Up to 100 meters</td>
</tr>
</tbody>
</table>
### Bluetooth Class 2.0 with Extended Data Rate (EDR)

Bluetooth Class 2.0 with Extended Data Rate (EDR) is a short-range wireless technology that is supported by the wireless IP phones. The phones support the Hands-Free Profile Version 1.5. Because of potential interference issues, we recommend that you:

- Use 802.11a that operates in the 5 GHz band.
- Reduce the proximity of other 802.11b/g devices, Bluetooth devices, microwave ovens, and large metal objects.
- Use the phone on the same side of the body as the Bluetooth-enabled headset.

#### Caution

Use CSA or ATEX qualified Bluetooth accessories with the Cisco Unified Wireless IP Phone 7925G-EX in hazardous environments.

For information about pairing headsets, see [Headset Usage](#) on page 60.

For more information about Bluetooth and hands-free profiles, see [http://www.bluetooth.com](http://www.bluetooth.com).

## Hands-Free Profile

Your phone supports certain features of the Hands-free Profile, which is a standard set of features that enable users of handsfree devices (such as Bluetooth wireless headsets) to perform certain tasks without having to handle the phone. For example, instead of pressing **Redial** on your phone, you can redial a number from your Bluetooth wireless headset according to instructions from the headset manufacturer.

#### Caution

Use CSA or ATEX qualified Bluetooth accessories with the Cisco Unified IP Phone 7925G-EX in hazardous environments.

These hands-free features apply to Bluetooth wireless headsets used with your Cisco Unified Wireless IP Phone:

- **Redial**
  - Re-calls the last number dialed.

- **Reject incoming call**
  - Uses the iDivert option to direct the call to voicemail.

### Range and Maximum Permitted Transmit Power

<table>
<thead>
<tr>
<th>Class</th>
<th>Maximum permitted transmit power (mW, dBm)</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class 2</td>
<td>2.5 mW, 4 dBm</td>
<td>Up to 10 meters</td>
</tr>
<tr>
<td>Class 3</td>
<td>1 mW, 0 dBm</td>
<td>Up to 1 meter</td>
</tr>
</tbody>
</table>
Three-way calling

When there is an active call and another incoming call or call on hold, you may choose to handle the calls in one of these ways:

- End the active call and answer or resume a waiting call.
- Put the active call on hold and answer or resume a waiting call.

Note

Hands-free devices may differ in how features are activated. Hands-free device manufacturers may also use different terms when referring to the same feature.

For more information on using hands-free features, see the documentation provided by the device manufacturer.

Feature Support

The Cisco Unified Wireless IP Phone functions much like traditional IP phones allowing you to place and receive telephone calls while connected to the wireless LAN. In addition to traditional phone features, the Cisco Unified Wireless IP Phone includes features that enable you to administer and monitor the phone as a network device.

Caution

This product is not a medical device and may use an unlicensed frequency band that is susceptible to interference from other devices or equipment.

Feature Overview

The Cisco Unified Wireless IP Phone provides traditional telephony functionality, such as call forward and call transfer, call pickup, redial, speed dial, conference calls, and voice message system access, as well as these features:

- Bluetooth Class 2 technology for headsets that support Bluetooth
- Six-line appearance
- Adjustable ring and volume levels
- Adjustable display brightness and time outs
- Autodetection of headset and autoanswer from the headset
- Wireless web access to your phone number and the corporate directory
- Access to network data, XML applications, and web-based services
- Online customizing of phone features and services from the User Options web pages
- An online help system that displays information on the phone screen
Telephony Features

You can use Cisco Unified Communications Manager Administration to set up phone registration criteria and calling search spaces, to configure corporate directories and services, and to modify phone button templates. See Telephony Features Available, on page 148 and Cisco Unified Communications Manager Administration Guide for additional information.

For more information about the Cisco Unified Communications Manager Administration, see Cisco Unified Communications Manager documentation suite at http://www.cisco.com/en/US/products/sw/voicesw/ps556/tsd_products_support_series_home.html.

You can also use the context-sensitive help available within the application for guidance.

Network Settings

As with other network devices, you must configure wireless IP phones to access Cisco Unified Communications Manager and the rest of the IP network using the wireless LAN. There are two methods for configuring network settings such as DHCP, TFTP, and for configuring wireless settings for the phone.

- Cisco Unified Wireless IP Phone web pages
- Network Profiles menu on the Cisco Unified Wireless IP Phone

You access the configuration web pages by using a browser from your PC. You configure network settings on the phone itself.

Because the Cisco Unified Wireless IP Phone is a network device, you can obtain detailed status information about it. This information can assist you in troubleshooting problems that users might encounter when using their IP phones.

Information for End Users

If you are a system administrator, you are the primary source of information for Cisco Unified Wireless IP Phone users in your network or company. To ensure that you distribute the most current feature and procedural information, familiarize yourself with Cisco Unified Wireless IP Phone documentation. Make sure you visit the Cisco Unified IP Phone web site:

From this site, you can view additional phone documentation.
In addition to providing documentation, it is important to inform users about available Cisco Unified Wireless IP Phone features (including features specific to your company or network) and about how to access and customize those features, if appropriate.

## Security Features

Implementing security in a wireless network protects against data tampering to Cisco Unified Communications Manager data, call signaling, and media stream. It also reduces the chances for identity theft. To reduce the threats, the Cisco wireless LAN (WLAN) provides options for user authentication with servers and for encrypting communications streams between phones and network devices.

For information about supported security options for the Cisco Unified Wireless IP Phone, see Authentication Methods, on page 39.

For information about security features supported by Cisco Unified Communications Manager and Cisco Unified Wireless IP Phones, see Supported Security Features, on page 15.

Supported Security Features

The following table provides an overview of the security features that the Cisco Unified Wireless IP Phone supports. For more information about these features and about Cisco Unified Communications Manager and Cisco Unified IP Phone security, see *Cisco Unified Communications Manager Security Guide*.

For information about current security settings on a phone, choose SETTINGS > System Configuration > Security. For more information, see Display Security Configuration Screen, on page 175.

---

**Note**

Most security features are available only if a certificate trust list (CTL) is installed on the phone. For more information about the CTL, see “Configuring the Cisco CTL Client” chapter in the *Cisco Unified Communications Manager Security Guide*.

---

### Table 3: Security Features Description

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image authentication</td>
<td>Prevents tampering with the firmware image before it is loaded on a phone by using signed binary files (with the extension.sbn). Tampering with the image causes a phone to fail the authentication process and reject the new image.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>Customer-site certificate installation</td>
<td>Authenticates each Cisco Unified IP Phone by using a unique certificate. Phones include a manufacturing installed certificate (MIC), but for additional security, you can specify in Cisco Unified Communications Manager Administration that a certificate be installed by using the Certificate Authority Proxy Function (CAPF). Alternatively, you can install a locally significant certificate (LSC) from the Security Configuration menu on the phone. See Set Up Phone Security Certificate, on page 130 for more information.</td>
</tr>
<tr>
<td>Device authentication</td>
<td>Occurs between the Cisco Unified Communications Manager server and the phone when each entity accepts the certificate of the other entity. Determines whether a secure connection between the phone and a Cisco Unified Communications Manager should occur, and, if necessary, creates a secure signaling path between the entities using TLS protocol. Cisco Unified Communications Manager will not register phones unless authenticated by the Cisco Unified Communications Manager.</td>
</tr>
<tr>
<td>File authentication</td>
<td>Validates digitally signed files that the phone downloads. The phone validates the signature to make sure that file tampering did not occur after the file creation. Files that fail authentication are not written to Flash memory on the phone. The phone rejects such files without further processing.</td>
</tr>
<tr>
<td>Signaling Authentication</td>
<td>Uses the TLS protocol to validate that no tampering has occurred to signaling packets during transmission.</td>
</tr>
<tr>
<td>Manufacturing installed certificate</td>
<td>Each Cisco Unified IP Phone contains a unique manufacturing installed certificate (MIC), which is used for device authentication. The MIC is a permanent unique proof of identity for the phone, and allows Cisco Unified Communications Manager to authenticate the phone.</td>
</tr>
<tr>
<td>Secure Cisco Unified SRST reference</td>
<td>After you configure a Cisco Unified Survivable Remote Site Telephony (SRST) reference for security and then reset the dependent devices in Cisco Unified Communications Manager Administration, the TFTP server adds the SRST certificate to the phone cnf.xml file and sends the file to the phone. A secure phone then uses a TLS connection to interact with the SRST-enabled router.</td>
</tr>
<tr>
<td>Media encryption</td>
<td>Uses SRTP to ensure that the media streams between supported devices prove secure and that only the intended device receives and reads the data. Includes creating a media master key pair for the devices, delivering the keys to the devices, and securing the delivery of the keys while the keys are in transport.</td>
</tr>
<tr>
<td>Signaling encryption by using TLS</td>
<td>Ensures that all SCCP signaling messages that are sent between the device and the Cisco Unified Communications Manager server are encrypted.</td>
</tr>
<tr>
<td>Feature</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CAPF (Certificate Authority Proxy Function)</td>
<td>Implements parts of the certificate generation procedure that are too processing-intensive for the phone, and it interacts with the phone for key generation and certificate installation. The CAPF can be configured to request certificates from customer-specified certificate authorities on behalf of the phone, or it can be configured to generate certificates locally.</td>
</tr>
<tr>
<td>Security profiles</td>
<td>Defines whether the phone is nonsecure, authenticated, or encrypted. See Security Profiles, on page 17 for more information.</td>
</tr>
<tr>
<td>Encrypted configuration files</td>
<td>Lets you ensure the privacy of phone configuration files.</td>
</tr>
<tr>
<td>Optional disabling of the web server functionality for a phone</td>
<td>You can prevent access to a phone web page, which displays a variety of operational statistics for the phone.</td>
</tr>
<tr>
<td>Phone hardening</td>
<td>Additional security options, which you control from Cisco Unified Communications Manager Administration:</td>
</tr>
<tr>
<td></td>
<td>• Disabling Gratuitous ARP (GARP)</td>
</tr>
<tr>
<td></td>
<td>• Disabling access to the Setting menus</td>
</tr>
<tr>
<td></td>
<td>• Disabling access to web pages for a phone</td>
</tr>
<tr>
<td>Note</td>
<td>You can view current settings for the GARP Enabled and Web Access options by looking at the phone’s Device Information menu. For more information, see Display Security Configuration Screen, on page 175.</td>
</tr>
</tbody>
</table>

- Authenticated, Encrypted, and Protected Phone Calls, on page 18
- Device Information, on page 179
- Security Restrictions, on page 19

**Security Profiles**

A security profile defines whether the phone is nonsecure, authenticated, encrypted, or protected. Every Cisco Unified IP Phone that is supported by Cisco Unified Communications Manager Administration has a security profile. For information about configuring the security profile and applying the profile to the phone, see *Cisco Unified Communications Manager Security Guide*.

**Note**

To view the security mode that is set for the phone, from the phone screen, choose SETTINGS > Device Information > Security > Security Mode.

- Device Information, on page 179
- Security Restrictions, on page 19

Authenticated, Encrypted, and Protected Phone Calls

When security is implemented for a phone, you can identify authenticated or encrypted phone calls by icons on the screen on the phone. You can also determine that the connected phone is secure and protected if a security tone plays at the beginning of the call.

In an authenticated call, all devices participating in the establishment of the call authenticate using Cisco Unified Communications Manager. When an in-progress call is authenticated, the call progress icon to the right of the call duration timer in the phone screen changes to this icon: 📞.

In an encrypted call, all devices participating in the establishment of the call are authenticated by Cisco Unified Communications Manager. In addition, call signaling and media streams are encrypted. An encrypted call offers a high level of security, providing integrity and privacy to the call. When an in-progress call is being encrypted, the call progress icon to the right of the call duration timer in the phone screen changes to this icon: 📞.

If the call is routed through non-IP call legs (for example, the PSTN) the call may be nonsecure even though it is encrypted within the IP network and has a lock icon associated with it.

In a protected call, a security tone plays at the beginning of a call to indicate that the other connected phone is also receiving and transmitting encrypted audio. If your call is connected to a nonprotected phone, the security tone does not play.

Protected calling is supported for connections between two phones only. Some features, such as conference calls, shared lines, Extension Mobility, and Join Across Lines, are not available when protected calling is configured. Protected calls are not authenticated.

Protected Calls Identification

A protected call is established when your phone and the phone on the other end are configured for protected calling. The other phone can be in the same Cisco IP network or on a network outside the IP network. Protected calls can only be made between two phones. Conference calls and other multiple-line calls are not supported.

The system establishes a protected call using this process:

1. A user initiates the call from a protected phone (protected security mode).
2. The phone displays the icon (encrypted) on the phone screen. This icon indicates that the phone is configured for secure (encrypted) calls, but the icon does not mean that the other connected phone is also protected.

3. A security tone plays if the call is connected to another protected phone, indicating that both ends of the conversation are encrypted and protected. If the call is connected to a nonprotected phone, the secure tone does not play.

Note

Protected calling is supported for conversations between two phones. Some features, such as conference calls, shared lines, Extension Mobility, and Join Across Lines, are not available when protected calling is configured.

Related Topics

- Security Profiles, on page 17
- Security Restrictions, on page 19

Security Restrictions

When using a phone that is not configured for encryption, the user cannot barge into an encrypted call. When barge fails in this case, a reorder (fast busy) tone plays on the barge initiator phone.

If the phone is configured for encryption, the user can barge into an authenticated or nonsecure call from the encrypted phone. After the barge occurs, Cisco Unified Communications Manager classifies the call as nonsecure.

If the phone is configured for encryption, the user can barge into an encrypted call, and the phone indicates that the call is encrypted.

A user can barge into an authenticated call, even if the phone that is used to barge is nonsecure. The authentication icon continues to display on the authenticated phones in the call, even if the initiator’s phone does not support security.

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Deployment

When deploying a new IP telephony system, system administrators and network administrators must complete several tasks to prepare the network for IP telephony service. For information and a checklist for setting up and configuring a complete Cisco IP telephony network, see the "System Configuration Overview” chapter in the Cisco Unified Communications Manager System Guide.

After you have set up the IP telephony system and configured system-wide features in Cisco Unified Communications Manager Administration, you can add IP phones to the system. To add Cisco Wireless IP Phones to the IP network, system administrators should conduct a site survey to determine strategic locations for access points (APs) to ensure good wireless voice coverage. For detailed information about a voice over WLAN deployment, see the Cisco Unified Wireless IP phone 7925 and 7926 Series Deployment Guide at
Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Setup in Cisco Unified Communications Manager

To add phones to the Cisco Unified Communications Manager Administration, you can use:

- Autoregistration
- Cisco Unified Communications Manager Administration
- Bulk Administration Tool (BAT)
- BAT and the Tool for Auto-Registered Phones Support (TAPS)

For general information about configuring phones in Cisco Unified Communications Manager, see the "Cisco Unified IP Phone" chapter in the Cisco Unified Communications Manager System Guide.

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Installation

After you have added the phones to the Cisco Unified Communications Manager Administration, you can complete the phone installation. You can install the phone or the user can install the phone. The Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Installation Guide provides directions for assembling the phone and accessories and charging the battery.

Before using the phone to connect to the wireless LAN, you need to configure a network profile for the phone. You can use the phone web pages to set up the network profile and other phone settings, or you can configure the network profile using the menus on the phone.

If you use autoregistration that is part of Cisco Unified Communications Manager Administration, you need to update the specific configuration information for the phone such as associating the phone with a user, changing the softkey template, or changing the directory number (DN).

Note Before you install a phone, even if it is new, upgrade the phone to the current firmware image. For information about upgrading, see the readme file for your phone which is located at: http://www.cisco.com/cgi-bin/tablebuild.pl/ip-7900ser-crypto.

VoIP Wireless Network Overview

This chapter provides an overview of the interaction between the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G and other key components of a VoIP network in a wireless local area network (WLAN) environment.

Wireless LAN

With the introduction of wireless communication, wireless IP phones can provide voice communication within the corporate WLAN. The Cisco Unified Wireless IP Phone depends upon and interacts with wireless access points (APs) and key Cisco IP telephony components, including Cisco Unified Communications Manager Administration, to provide wireless voice communication.

In a traditional LAN, IP phones and computers use cables to transmit messages and data packets. Cisco Unified WLAN delivers security, scalability, reliability, ease of deployment, and management similar to wired LANs. It includes RF capabilities that enable real-time access to core business applications and provides proven enterprise-class secure connectivity. The WLAN is an integrated end-to-end solution that uses wireless IP phones and APs, network infrastructure, network management, and mobility services.
The following figure shows a typical WLAN topology that enables the wireless transmission of voice for wireless IP telephony.

*Figure 2: WLAN with Cisco Unified Wireless IP Phones*

When a wireless IP phone powers up, it searches for and becomes associated with an AP. As users move from one location to another, the wireless IP phone roams out of range of one AP into the range of another AP. The wireless IP phone builds and maintains a list of eligible APs and reconnects to an AP in that list. See AP Association, on page 34 for more information.

The AP uses its connection to the wired network to transmit data and voice packets to and from the switches and routers. Voice signaling transmits to the Cisco Unified Communications Manager server for call processing and routing. APs are critical components in a WLAN because they provide the wireless links or "hot spots" to the network.

Each AP has a wired connection to an Ethernet switch, such as a Cisco Catalyst 3750 Series, that is configured on a LAN. The switch provides access to gateways and the Cisco Unified Communications Manager server to support wireless IP telephony.

For more information on WLANs, APs (including supported models), antennas, and wireless IP telephony, see Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide at http://www.cisco.com/en/US/products/hw/phones/ps379/products_implementation_design_guides_list.html.

### WLAN Standards and Technologies

This section describes WLAN standards and technologies.

#### 802.11 Standards for WLAN Communications

Wireless LANs must follow the Institute of Electrical and Electronics Engineers (IEEE) 802.11 standards that define the protocols that govern all Ethernet-based wireless traffic. The Cisco Unified Wireless IP Phone supports the following standards:
802.11a
Uses the 5 GHz band that provides more channels and improved data rates by using Orthogonal Frequency Division Multiplexing (OFDM) technology. Dynamic Frequency Selection (DFS) and Transmit Power Control (TPC) supports this standard.

802.11b
Specifies the radio frequency (RF) of 2.4 GHz for both transmitting and receiving data at lower data rates (1, 2, 5.5, 11 Mbps). Commonly called the Wi-Fi standard.

802.11d
Enables APs to communicate available radio channels and acceptable power levels. The Cisco Unified Wireless IP Phone always gives precedence to 802.11d to determine which channels and powers to use. If the information is unavailable, then the phone reverts to the locally configured regulatory domain.

802.11e
Supports Quality of Service (QoS).

802.11g
Uses the same unlicensed 2.4 GHz band as 802.11b, but extends the data rates to provide greater performance by using OFDM technology. OFDM is a physical-layer encoding technology for transmitting signals using RF.

802.11h
Supports the 5 GHz spectrum and transmit power management.

802.11i
Specifies security standards.

Radio Frequency Ranges

WLAN communications use the following RF ranges:

2.4 GHz
Does not require licensing. To reduce interference within this bandwidth, WLANs transmit on non-overlapping channels, which are typically limited to three channels, although Japan uses four channels.

Many devices operate in the 2.4 GHz bandwidth, including cordless phones and microwave ovens, and these devices can interfere with wireless communications. Interference does not destroy the signal, but can reduce the transmission speed from 11 Mbps to 1 Mbps. RF interference can affect voice quality over the wireless network.

5 GHz
Divided into several sections called Unlicensed National Information Infrastructure (UNII) bands and each section has four channels. The channels are spaced at 20 MHz to provide non-overlapping channels and more channels than 802.11b or 802.11g.
For more information, see the *Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide*. The following tables show the frequency band ranges and operating channels by regulatory domain for each of the phones.

Wireless Modulation Technologies

Wireless communications use the following modulation technologies for signaling:

**Direct-Sequence Spread Spectrum (DSSS)**

Prevents interference by spreading the signal over the frequency range or bandwidth. DSSS technology multiplexes chunks of data over several frequencies so that multiple devices can communicate without interference. Each device has a special code that identifies the data packets for the device and all other data packets are ignored. Cisco wireless 802.11b/g products use DSSS technology to support multiple devices on the WLAN.

**Orthogonal Frequency Division Multiplexing (OFDM)**

Transmits signals by using RF. OFDM is a physical-layer encoding technology that breaks one high-speed data carrier into several lower-speed carriers to transmit in parallel across the RF spectrum. When used with 802.11g and 802.11a, OFDM can support data rates as high as 54 Mbps.

The following table provides a comparison of data rates, number of channels, and modulation technologies by standard.

**Table 8: Data Rates, Number of Channels, and Modulation Technologies by IEEE Standard**

**AP, Channel, and Domain Relationships**

APs transmit and receive RF signals over channels within the 2.4 GHz or 5 GHz frequency band. To provide a stable wireless environment and reduce channel interference, you must specify nonoverlapping channels for each AP. The recommended 2.4 GHz channels to be used are 1, 6, and 11.

Regulatory domains determine the number of channels that wireless communications can use within the frequency band. Radio Frequency Ranges, on page 25 list the frequency ranges, operating channels, and
product numbers for the regulatory domains. The Cisco Unified Wireless IP Phone uses the fourth domain for all other regions in the world. Wireless LANs in the rest of the world use 802.11d to identify band ranges and channels.

In a non-controller-based wireless network, Cisco recommends that you statically configure channels for each AP. If your wireless network uses a controller, use the Auto-RF feature with minimal voice disruption. Some channels may need to be statically configured if there is an intermittent interferer, to avoid disruptions in that area.

The AP coverage area depends on the type of antenna and transmission power. The AP coverage range is from 500 to 1000 feet with effective isotropic radiated power (EIRP) output. To provide effective coverage, APs need a range overlap of approximately 20 percent to allow uninterrupted connections as phone users roam from one AP to another.

Wireless networks use a service set identifier (SSID). The SSID differentiates one WLAN from another, so all APs and all devices attempting to connect to a specific WLAN must use the same SSID. The SSID groups user devices and associates the group with the APs.

**WLANs and Roaming**

Wireless IP phones provide communication mobility to users within the WLAN environment. Unlike cellular phones that have a broad coverage, the coverage area for the wireless IP phone is smaller; therefore, phone users frequently roam from one AP to another. To understand some of the limitations of roaming with wireless IP phones, these examples provide information about the WLAN environment.

**Pre-call Roaming**

A wireless IP phone user powers up the phone in the office, and the phone associates with the nearby AP. The user leaves the building, moves to another building, and then places a call. The phone associates with a different AP in order to place the call from the new location. If the associated AP is within the same Layer 2 VLAN, the IP address remains the same for the phone. But, if the roaming phone crosses a Layer 3 boundary with DHCP enabled and Layer 3 mobility is not enabled, the phone recognizes that it is no longer in the same subnet. The phone must request a new IP address before it can connect to the network and place the call. If Layer 3 mobility is enabled, the phone does not need to reconnect to the network.

If a user leaves the WLAN coverage area and then comes back into the same WLAN area, the phone must reconnect to the network. Pressing a key on the phone causes the phone to perform immediate scans to find and connect to the network.
Mid-call Roaming

A wireless IP phone user is actively engaged in a call and moves from one building to another. The roaming event occurs when the phone moves into the range of a different AP, and then the phone authenticates and associates with the new AP. The previous AP hands the call over to the new AP while maintaining continuous audio connection without user intervention. As long as the APs are in the same Layer 2 subnet, the wireless IP phone keeps the same IP address and the call continues. As a wireless IP phone roams between APs, it must reauthenticate with each new AP. See Authentication Methods, on page 39 for information about authentication.

If the user is roaming across Layer 2 boundaries, then Layer 3 mobility must be enabled to have seamless roaming, and to preserve an existing call.

If the wireless IP phone user moves from an AP that covers IP Subnet A to an AP that covers IP Subnet B without Layer 3 mobility enabled, the phone no longer has an IP address or gateway that is valid within the new subnet and the call can disconnect.

Layer 3 Roaming

Layer 3 roaming is available with Cisco autonomous and unified deployments. With unified deployments, Layer 3 roaming can be performed using intercontroller roaming or, if AP groups are used, to enable Layer 3 roaming.

Layer 3 roaming with Cisco Unified Access Points is accomplished by controllers that use dynamic interface tunneling and requires Layer 3 mobility to be enabled. Clients that roam across controllers and VLANS can keep their IP address when using the same SSID.

Fast and Secure Roaming

Cisco Centralized Key Management (CCKM) enables authenticated client devices to roam securely from one AP to another without any perceptible delay during reassociation. With the support of the CCKM protocol, the wireless IP phone negotiates the handoff from one AP to another easily. During the roaming process, the phone scans for the nearby APs, determines which AP can provide the best service, and then reassociates with the new AP. When implementing stronger authentication methods, such as WPA2 and EAP, the number of information exchanges increases and causes more delay during roaming. To avoid delays, use CCKM.

CCKM, a centralized key management protocol, provides a cache of session credentials on the Cisco Unified Wireless LAN Controller or a Wireless Domain Server (WDS). As the phone roams from one AP to the next, CCKM compresses the number of message exchanges during roaming by providing a master key stored on the WDS for the AP to use. The reassociation exchange is reduced to two messages, thereby reducing the off-network or audio gap time.

For details about CCKM, see the "Cisco Fast Secure Roaming Application Note" at:

Note

In dual-band WLANs, it is possible to roam between 2.4 GHz bands (802.11b/g) and 5 GHz bands (802.11a). The phone moves out of range of one AP using one band and into the range of another that has the same SSID but is using a different band.

Bluetooth Wireless Technology

Bluetooth enables low-bandwidth wireless connections within a range of 30 feet (10 meters). The best performance is in the 3- to 6-foot (1- to 2-meter) range. Bluetooth wireless technology operates in the 2.4 GHz band, which is the same as the 802.11b/g band. Because of potential interference issues, we recommend that you:

• Use 802.11a, which operates in the 5 GHz band
• Reduce the proximity to other 802.11b/g devices, Bluetooth devices, microwave ovens, and large metal objects

VoIP Wireless Network Components

The wireless IP phone must interact with several network components in the WLAN to successfully place and receive calls.

Network Protocols

Cisco Unified Wireless IP Phones support several network protocols for voice communication. The following table describes the network protocols that the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G supports.

Table 9: Supported Network Protocols

### Cisco Unified Wireless AP Interactions

Wireless IP phones use the same APs as wireless data devices. However, voice traffic over a WLAN requires different equipment configurations and layouts than a WLAN that is used exclusively for data traffic. Data transmission can tolerate a higher level of RF noise, packet loss, and channel contention than voice transmission. Packet loss during voice transmission can cause choppy or broken audio and make the phone call inaudible.

Wireless IP Phones users are mobile and often roam across a campus or between floors in a building while connected to a call. In contrast, data users remain in one place or occasionally move to another location. The ability to roam while maintaining a call is one of the advantages of wireless voice, so RF coverage needs to include stairwells, elevators, quiet corners outside conference rooms, passageways and so on.

To ensure good voice quality and optimal RF signal coverage, you must perform a site survey. The site survey determines the AP platform and antenna type, AP placement, channel assignments and transmit power levels that are required for the deployment.

After you deploy and use wireless voice, you should continue to perform postinstallation site surveys. When you add a group of new users, install more equipment, or stack large amounts of inventory, you are changing the wireless environment. A postinstallation survey verifies that the AP coverage remains adequate for optimal voice communications.

### AP Association

At startup, the Cisco Unified Wireless IP Phone scans for APs with SSIDs and encryption types that it recognizes. The phone builds and maintains a list of eligible APs and uses the following variables to determine the best AP.
Received Signal Strength Indicator (RSSI)

Signal strength of available APs within the RF coverage area. The phone attempts to associate with the AP with the highest RSSI value.

Traffic Specification (TSpec)

Calculation of call limits and WLAN load balancing. The TSpec value of each voice stream allows the system to allocate bandwidth to voice devices on a first-come, first-served basis.

The wireless IP phone associates with the AP with the highest RSSI and lowest channel usage values (QBSS) that have matching SSID and encryption types. To ensure that voice traffic is handled properly, you must configure the correct QoS in the AP. For configuration information, see Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide.

Voice QoS in Wireless Networks, on page 35

Voice QoS in Wireless Networks

Voice traffic on the Wireless LAN, like data traffic, is susceptible to delay, jitter, and packet loss. These issues do not impact the data end user, but have serious implications for a voice call. To ensure that voice traffic receives timely and reliable treatment with low delay and low jitter, you must use Quality of Service (QoS), and use separate virtual LANs (VLANs) for voice and data. By isolating the voice traffic onto a separate VLAN, you can use QoS to provide priority treatment for voice packets when traveling across the network. Also, use a separate VLAN for data traffic, not the default native VLAN that is typically used for all network devices.

You typically need at least three VLANs on the network switches and the APs that support voice connections on the WLAN. These VLANs are:

Voice VLAN

Voice traffic to and from the wireless IP phone

Data VLAN

Data traffic to and from the wireless PC

Native VLAN

Data traffic to and from other wireless infrastructure devices

Assign an SSID to the voice VLAN and a different SSID to the data VLAN. If you configure a separate management VLAN in the WLAN, do not associate an SSID with the management VLAN.

By separating the phones into a voice VLAN and marking voice packets with higher QoS, you can ensure that voice traffic gets priority treatment over data traffic, resulting in lower packet delay and fewer lost packets.
Unlike wired networks with dedicated bandwidths, wireless LANs consider traffic direction when implementing QoS. Traffic is classified as upstream or downstream from the point of view of the AP as shown in the following figure.

**Figure 3: Voice traffic in a wireless network**

Beginning with Cisco IOS release 12.2(11)JA, Cisco Aironet APs support the contention-based channel access mechanism called Enhanced Distributed Coordination Function (EDCF). The EDCF-type of QoS has up to eight queues for downstream (toward the 802.11b/g clients) QoS. You can allocate the queues based on these options:

- Differentiated Services Code Point (DSCP) settings for the packets
- Layer 2 or Layer 3 access lists
- VLANs for specific traffic

Different traffic types are sent to different priority queues. The following are the queues:

- **Best Effort (BE)** = 0, 3
- **Background (BK)** = 1, 2
- **Video (VI)** = 4, 5
- **Video (VO)** = 6, 7

Call Control (SCCP) is sent on UP4 (VI) and voice is sent as UP6 (VO).

Although 802.11b/g EDCF does not guarantee that voice traffic is protected from data traffic, you should get the best statistical results by using this queuing model.

---

**Note**

The Cisco Unified Wireless IP Phone marks the call control packets with a DSCP value of 24 and voice packets with DSCP value of 46.

To improve reliability of voice transmissions in a nondeterministic environment, the Cisco Unified Wireless IP Phone supports the IEEE 802.11e industry standard and is Wi-Fi Multimedia (WMM) capable. WMM enables differentiated services for voice, video, best effort data and other traffic. However, in order for these differentiated services to provide sufficient QoS for voice packets, only a certain amount of voice bandwidth can be serviced or admitted on a channel at one time. If the network can handle “N” voice calls with reserved bandwidth, when the amount of voice traffic is increased beyond this limit (to N+1 calls), the quality of all calls suffers.

To help address the problems of VoIP stability and roaming, an initial Call Admission Control (CAC) scheme is required. With CAC, QoS is maintained in a network overload scenario by ensuring that the number of active voice calls does not exceed the configured limits on the AP. The Cisco Unified Wireless IP Phone can integrate layer 2 TSpec admission control with layer 3 Cisco Unified Communications Manager admission
control (RSVP). During times of network congestion, calling or called parties receive a Network Busy message. The system maintains a small bandwidth reserve so that wireless phone clients can roam into a neighboring AP, even when the AP is at full capacity. After the AP reaches the voice bandwidth limit, the next call is load-balanced to a neighboring AP without affecting the quality of the existing calls on the channel.

Implementing QoS in the connected Ethernet switch is highly desirable to maintain good voice quality. The COS and DSCP values that the Cisco Unified Wireless IP Phone sets do not need to be modified. To configure QoS correctly on the AP, see *Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide*.

---

**Cisco Unified Communications Manager Interactions**

Cisco Unified Communications Manager is the call control component in the network that handles and routes calls for the wireless IP phones. Cisco Unified Communications Manager manages the components of the IP telephony system—the phones, access gateways, and the resources—for such features as call conferencing and route planning. When deploying the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, you must use Cisco Unified Communications Manager Release 4.3 and later, and SCCP.

Before Cisco Unified Communications Manager can recognize a phone, the phone must register with Cisco Unified Communications Manager and be configured in the database.

You can find more information about configuring Cisco Unified Communications Manager to work with the IP phones and IP devices in the *Cisco Unified Communications Manager Administration Guide* and *Cisco Unified Communications Manager System Guide*.

**Related Topics**
- Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Deployment, on page 19
- Phone Configuration Files and Profile Files, on page 37

---

**Phone Configuration Files and Profile Files**

Phone configuration files define parameters for connecting to Cisco Unified Communications Manager and are stored on the TFTP server. In general, any time you make a change in Cisco Unified Communications Manager Administration that requires the phone to reset, the phone configuration file changes automatically.

Configuration files also contain information about the correct image load for the phone. If this image load differs from the one currently loaded on a phone, the phone contacts the TFTP server to request the new image file.

The phone first requests the configuration file `SEPxxxxxxxxxx.cnf.xml`, where each `xx` is the two-digit lowercase hexadecimal representation of each integer in the MAC address. If the phone cannot find this file, it requests the configuration file `XMLDefault.cnf.xml`.

After the phone obtains the `*.cnf.xml` files, it requests a phone-specific profile file. If a phone cannot find this profile file, it requests the appropriate common profile file.

After the phone finds one of the profile files, or if it cannot find a profile file, it continues with its startup process.
Dynamic Host Configuration Protocol Server Interactions

Dynamic Host Configuration Protocol (DHCP) is a communications protocol that lets network administrators manage and automate the assignment of IP addresses in a network. When an IP device is added to the network, it must have a unique IP address. Without DHCP, the IP address must be entered manually at each device. DHCP allocates IP addresses dynamically and reuses IP addresses when devices no longer need them.

If DHCP is enabled in the network, the Cisco Unified Wireless IP Phone uses the DHCP scope settings in the DHCP server to perform the phone provisioning bootup process. You must configure the settings of the DHCP server in the Cisco Unified Communications Manager network.

The DHCP scope settings include the following:

- TFTP servers
- DNS server IP address (optional unless using host names)
- Pool and range of the subnet mask, IP address, and gateway

The priority of the DHCP settings for the TFTP server is unique to the Cisco Unified Wireless IP Phone, as shown in the following table.

<table>
<thead>
<tr>
<th>Priority</th>
<th>DHCP Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>

### Voice Communication Security in WLANs

Because all WLAN devices that are within range can receive all other WLAN traffic, securing voice communications is critical in WLANs. To ensure that voice traffic is not manipulated or intercepted by intruders, the Cisco Unified Wireless IP Phone and Cisco Aironet APs are supported in the Cisco SAFE Security architecture. For more information about security in networks, see [http://www.cisco.com/en/US/netsol/ns744/networking_solutions_program_home.html](http://www.cisco.com/en/US/netsol/ns744/networking_solutions_program_home.html).

### Authentication Methods

The Cisco Wireless IP telephony solution provides wireless network security that prevents unauthorized logins and compromised communications by using the following authentication methods:

#### Open Authentication

Any wireless device can request authentication in an open system. The AP that receives the request may grant authentication to any requestor or only to requestors on a list of users. Communication between the wireless device and AP could be nonencrypted.

#### Open Authentication with WEP

This is similar to Open Authentication in the preceding bullet, except with improved security. Communication between the wireless device and AP use Wired Equivalent Privacy (WEP) keys to provide security.

#### Shared Key Authentication

The AP sends an unencrypted challenge text string to any device attempting to communicate with the AP. The device that requests authentication uses a preconfigured WEP key to encrypt the challenge text and sends the encrypted challenge text back to the AP. If the challenge text is encrypted correctly, the AP allows the requesting device to authenticate. A device can authenticate only if its WEP key matches the WEP key on the APs.

Shared key authentication can be less secure than open authentication with WEP because someone can monitor the challenges. An intruder can calculate the WEP key by comparing the unencrypted and encrypted challenge text strings.
Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST) Authentication

This client server security architecture encrypts EAP transactions within a Transport Level Security (TLS) tunnel between the AP and the RADIUS server such as the Cisco Access Control Server (ACS).

The TLS tunnel uses Protected Access Credentials (PAC) for authentication between the client (phone) and the RADIUS server. The server sends an Authority ID (AID) to the client (phone), which in turn selects the appropriate PAC. The client (phone) returns a PAC-Opaque to the RADIUS server. The server decrypts the PAC with its master-key. The server and client now have the PAC key and a TLS tunnel is created. EAP-FAST supports automatic PAC provisioning, but you must enable it on the RADIUS server.

**Note**

In the Cisco ACS, by default, the PAC expires in one week. If the phone has an expired PAC, authentication with the RADIUS server takes longer while the phone gets a new PAC. To avoid the PAC provisioning delays, set the PAC expiration period to 90 days or longer on the ACS or RADIUS server.

Extended Authentication Protocol Transport Level Security (EAP-TLS) Authentication

EAP-TLS/RFC 2716 uses the TLS protocol (RFC 2246), which is the latest IETF version of the SSL security protocol. TLS provides a way to use certificates for both user and server authentication, and for dynamic session key generation.

Microsoft Windows XP provides support for 802.1x, allowing EAP authentication protocols (including EAP-TLS) to be used for authentication. The authentication used in EAP-TLS is mutual: the server authenticates the user and the user authenticates the server. Mutual authentication is required in a WLAN. EAP-TLS provides excellent security but requires client certificate management.

EAP-TLS uses Public Key Infrastructure (PKI) with the following conditions:

- A Wireless LAN client (user machine) requires a valid certificate to authenticate to the WLAN network.
- An authentication server (typically a RADIUS server) requires a server certificate to validate its identity to the clients.
- A Certificate Authority (CA) server infrastructure issues certificates to the authentication server and the clients.

Protected Extensible Authentication Protocol (PEAP) Authentication

PEAP uses server-side public key certificates to authenticate clients by creating an encrypted SSL/TLS tunnel between the client and the authentication server. This functionality is disabled by default and you enable it using Cisco Unified Communications Manager Administration.

The Cisco Unified Wireless IP Phone can optionally validate the server certificate during the authentication over an 802.11 wireless link.

Lightweight Extensible Authentication Protocol (LEAP)

Cisco proprietary password-based mutual authentication scheme between the client (phone) and a RADIUS server. Cisco Unified Wireless IP Phones can use LEAP for authentication with the wireless network.
Auto (AKM)

Selects the 802.11 Authentication mechanism automatically from the configuration information exhibited by the AP. Supports WPA/WPA2-PSK or LEAP with 802.1x+WEP or WPA/WPA2.

This section describes the following concepts:

- Authenticated Key Management, on page 41
- Encryption Methods, on page 41

Authenticated Key Management

The following authentication schemes use the RADIUS server to manage authentication keys:

Wi-Fi Protected Access (WPA)

Uses information on a RADIUS server to generate unique keys for authentication. Because these keys are generated at the centralized RADIUS server and are not saved on the phone or AP, WPA provides more security than WPA Pre-Shared Key (WPA PSK). WPA2 provides more security than WPA.

Cisco Centralized Key Management (CCKM)

Uses information on a RADIUS server and a wireless domain server (WDS) to manage and authenticate keys. The WDS creates a cache of security credentials for CCKM-enabled client devices for fast and secure reauthentication.

With WPA and CCKM, encryption keys are not entered on the phone, but are automatically derived between the AP and phone. The EAP username and password that are used for authentication must be entered on each phone.

Authenticated key management supports WPA/WPA2-PSK and WPA/WPA2/802.1x+WEP utilizing LEAP for the EAP type. CCKM can optionally be used with WPA/WPA2/802.1x+WEP mode.

Encryption Methods

To ensure that voice traffic is secure, the Cisco Unified Wireless IP Phone supports WEP, TKIP, and Advanced Encryption Standards (AES) for encryption. When using these mechanisms for encryption, both the signaling Skinny Client Control Protocol (SCCP) packets and voice Real-Time Transport Protocol (RTP) packets are encrypted between the AP and the wireless IP phone.

WEP

When using WEP in the wireless network, authentication happens at the AP by using open or shared-key authentication. The WEP key that is set up on the phone must match the WEP key that is configured at the AP for successful connections. The Cisco Unified Wireless IP Phone supports WEP keys that use 40-bit encryption or a 128-bit encryption and remain static on the phone and AP.

EAP and CCKM authentication can use WEP keys for encryption. The RADIUS server manages the WEP key and passes a unique key to the AP after authentication for encrypting all voice packets; consequently, these WEP keys can change with each authentication.
Temporal Key Integrity Protocol (TKIP)

WPA uses TKIP encryption that has several improvements over WEP. TKIP provides per-packet key ciphering and longer initialization vectors (IVs) that strengthen encryption. In addition, a message integrity check (MIC) ensures that encrypted packets are not being altered. TKIP removes the predictability of WEP that helps intruders decipher the WEP key.

AES

An encryption method used for WPA2 authentication. This national standard for encryption uses a symmetrical algorithm that has the same key for encryption and decryption. AES uses Cipher Blocking Chain (CBC) encryption of 128 bits in size, supporting key sizes of 128, 192, and 256 bits, as a minimum.

AP Authentication and Encryption Options

Authentication and encryption schemes are set up within the wireless LAN. VLANS are configured in the network and on the APs and specify different combinations of authentication and encryption. An SSID is associated with a VLAN and its particular authentication and encryption scheme. In order for wireless client devices to authenticate successfully, you must configure the same SSIDs with their authentication and encryption schemes on the APs and on the Cisco Unified Wireless IP Phone.

Some authentication schemes require specific types of encryption. With Open authentication, you can use static WEP for encryption for added security. But if you are using Shared Key authentication, you must set static WEP for encryption, and you must configure a WEP key on the phone.

When using Authenticated Key Management (AKM) for the Cisco Unified Wireless IP Phone, you have several choices for both authentication and encryption setup on the APs with different SSIDs. When the phone attempts to authenticate, it chooses the AP that advertises the authentication and encryption scheme that the phone can support. Auto (AKM) mode can authenticate by using WPA, WPA2, WPA Pre-shared key, or CCKM.

Note

- When using WPA Pre-shared key or WPA2 Pre-shared key, the pre-shared key must be statically set on the phone. These keys must match the keys configured on the AP.
- When using Auto (AKM), encryption options are automatically configured for WPA, WPA2, WPA Pre-shared key, WPA2 Pre-shared key, or CCKM.
- In AKM mode, the phone will authenticate with LEAP if it is configured with WPA, WPA2, or CCKM key management.
- The Cisco Unified Wireless IP Phone does not support auto-EAP negotiation; to use EAP-FAST mode, you must specify it.
- If AKM and 802.1x are used, the authentication method is LEAP.
- The Cisco Unified Wireless IP Phone uses network EAP for 802.1x but you can enable open EAP.

The following table provides a list of authentication and encryption schemes configured on the Cisco Aironet APs supported by the Cisco Unified Wireless IP Phone. The table shows the network configuration option for the phone that corresponds to the AP configuration.

Site Survey Verification

Before the initial deployment of wireless phones in the WLAN, perform a site survey to verify that the APs are providing adequate coverage and that wireless phones can roam from one AP to another with no audio problems. After the initial deployment, it is a good practice to perform site surveys at regular intervals to ensure continued coverage and roaming.

From the Cisco Unified Wireless IP Phone, you can use the Neighbor List utility or Site Survey utility from the SETTINGS > Status menu.

The Neighbor List utility provides information about the current AP and the closest neighbors tracked by the phone.

The Site Survey utility produces a report, written as a temporary HTML file, upon termination of the survey. This Site Survey Report is accessible from the phone web page to view or send to Cisco TAC for troubleshooting purposes.

The following topics provide information about performing the site survey.

Verify Wireless Voice Network

When you perform a site survey verification and encounter problems, see Troubleshooting, on page 209 for assistance with finding the cause of the problem.
Perform these tasks to verify wireless voice network operation.

**Procedure**

**Step 1** Check that the wireless IP phone associates with all APs in the WLAN.

**Step 2** Check that the wireless IP phone authenticates with all APs in the WLAN.

**Step 3** Check that the wireless IP phone registers with Cisco Unified Communications Manager.

**Step 4** Check that the wireless IP phone can make stationary phone calls with good quality audio.

**Step 5** Check that the wireless IP phone can make roaming phone calls with good quality audio and no disconnections.

**Step 6** Check that the wireless IP phone can place multiple calls, especially in areas designated for high density use.

**Step 7** After phones are installed, request that users report any problems when using their wireless IP phones.

**Related Topics**

- Display Neighbor List, on page 45
- Perform Site Survey, on page 46

**Display Neighbor List**

The Neighbor List utility displays a list of the current AP and the closest neighbors tracked by the phone. The phone typically does not scan while it is idle, so often there is only one entry, which is the currently associated AP, in the list.

To use the Neighbor List utility, follow these steps:

**Procedure**

**Step 1** Configure the Cisco Unified Wireless IP Phone with the same SSID and encryption/authentication settings as the APs.

**Step 2** Power on the phone so that it associates with the WLAN.

**Step 3** Choose **SETTINGS > Status > Neighbor List**.

The phone displays the current AP and the closest neighbors. For example:

SSID: abcd

<table>
<thead>
<tr>
<th>Channel</th>
<th>AP Name</th>
<th>RSSI</th>
<th>Channel Utilization (CU)</th>
</tr>
</thead>
<tbody>
<tr>
<td>36</td>
<td>ap1</td>
<td>-59</td>
<td>10</td>
</tr>
<tr>
<td>149</td>
<td>ap2</td>
<td>-65</td>
<td>2</td>
</tr>
<tr>
<td>52</td>
<td>ap3</td>
<td>-70</td>
<td>15</td>
</tr>
</tbody>
</table>

**Step 4** To see more information about an AP, scroll to the desired line and press **Details**. The following example gives details for a specific AP:
AP Name: ap1
SSID: voice
Channel: 36
BSSID: 00:13:1a:16:cf:d0
RSSI: -59
CU: 10

Step 5 To verify the ability to roam between APs, walk through all areas where phones are used and take readings. Approach areas from different directions to assure successful roaming conditions.

Step 6 Adjust AP and antenna placement and AP power settings to provide adequate coverage overlap.

Perform Site Survey

Use the Site Survey utility to actively and passively scan the wireless medium across all channels and to locate APs that belong to the Basic Service Set (BSS). The results of the scans can help to identify areas of low coverage, if any, and to determine whether the APs are configured consistently as recommended in the Cisco deployment guidelines.

When you start the Site Survey utility, the phone disassociates from the current AP and remains disassociated for the duration of the operation.

⚠️ Caution During Site Survey, both active and passive scans are performed at a rapid rate. These scans will result in the phone battery life depleting faster than normal and might cause disruption to the wireless medium.

To use the Site Survey utility, follow these steps.

Procedure

Step 1 Configure the Cisco Unified Wireless IP Phone with the same SSID and encryption/authentication settings as the APs.

Step 2 Power on the phone so that it associates with the WLAN.

Step 3 Choose SETTINGs > Status > Site Survey.

The phone displays a list of APs within range that have the same SSID and security settings as the phone. To see more information about an AP, scroll to the desired line and press Details.

Step 4 To verify the ability to roam between APs, walk through all areas where phones are used and take readings. Approach areas from different directions to assure successful roaming conditions.

Step 5 Adjust AP and antenna placement and AP power settings to provide approximately 20 percent coverage overlap.

Step 6 When you terminate the site survey, a report is generated for you to view from the phone web page.

Verify Wireless Voice Network, on page 44
Site Survey Report, on page 110
Before You Begin

Before installing a Cisco Unified Wireless IP Phone, review the requirements in the following sections.

Network Requirements

For the Cisco Unified Wireless IP Phone to successfully operate as a Cisco Unified IP Phone endpoint, your network must support these requirements:

• Voice over Wireless LAN
  • Cisco Aironet Access Points (APs) configured to support Voice over WLAN (VoWLAN)
  • Controllers and switches configured to support VoWLAN
  • Security implemented for authenticating wireless voice devices and users

  **Note**
  You must verify that your wireless network is configured properly for voice service.

• VoIP Network
  • Cisco routers and gateways configured for VoIP
Either Cisco Unified Communications Manager Release 4.3 or later, or Cisco Unified Communications Manager Express Release 4.3 or later

IP network configured to support DHCP or manual assignment of IP address, gateway, and subnet mask

Cisco Unified Communications Manager Phone Addition Methods

Before installing the wireless IP phone, you must choose a method for adding phones to the Cisco Unified Communications Manager database. Some methods require entering the MAC address of the phone. The following table provides an overview of these methods.

<table>
<thead>
<tr>
<th>Method</th>

<tr>
<td>Cisco Unified Communications Manager</td>
<td>Yes</td>
<td>Requires phones to be added individually</td>
</tr>
<tr>
<td>Administration only</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The following sections describe methods for adding phones.

Autoregistration Phone Addition

Use autoregistration to enter phones into the Cisco Unified Communications Manager database without first gathering MAC addresses from the phones. When autoregistration is enabled, Cisco Unified Communications Manager automatically assigns the next available sequential directory number (DN) to new phones during the initial phone startup process.
After registering the phones, you can modify settings, such as the DN and device pools, by using Cisco Unified Communications Manager Administration.

Autoregistration is disabled by default in Cisco Unified Communications Manager Administration. You must enable and properly configure autoregistration before connecting any Cisco Unified IP Phone to the network. For information about enabling and configuring autoregistration, see Cisco Unified Communications Manager Administration Guide.

**Autoregistration and TAPS Phone Addition**

Use autoregistration and TAPS to add phones to the Cisco Unified Communications Manager database. Add the phones first by using BAT to the Cisco Unified Communications Manager database with dummy MAC addresses. Then use TAPS to update MAC addresses and download predefined configurations for the phones.

To implement TAPS, dial a TAPS DN and follow voice prompts. When the process is complete, the phone has downloaded its DN and other settings. The correct MAC address for the phone is updated in Cisco Unified Communications Manager Administration.

You must enable autoregistration in Cisco Unified Communications Manager Administration for TAPS to function.

For Cisco Unified Communications Manager Release 5.0 or earlier, see Bulk Administration Tool User Guide for Cisco Unified Communications Manager for detailed instructions about BAT and TAPS. For Cisco Unified Communications Manager Release 6.0 or later, see Cisco Unified Communications Manager Bulk Administration Guide.

**BAT Phone Addition**

Add a group of phones to the Cisco Unified Communications Manager database by using BAT. This tool performs batch operations, including registration, on multiple phones. You need the MAC addresses for each phone before you use BAT.

The following table describes how to determine the MAC address of the wireless IP phone.

| **Table 14: Determine the MAC Address of the Phone** |
|---------------------------------|----------------------------------|
| **Method**                      | **For more information**         |
| Choose **SETTINGS > Model Information > MAC Address** and look at the MAC Address field. | See View Model Information Screen, on page 184 |
| Remove the battery and look on the back of the phone. | See Install or Remove Phone Battery, on page 55 |
BAT is included in Cisco Unified Communications Manager 5.0 or later, but it is a plug-in for earlier releases.

For detailed instructions about using BAT, see the following documents:

- For Cisco Unified Communications Manager Release 5.0 and earlier, see *Bulk Administration Tool User Guide for Cisco Unified Communications Manager*.
- For Cisco Unified Communications Manager Release 6.0 and later, see *Cisco Unified Communications Manager Bulk Administration Guide*.

When using BAT to add a Cisco Unified Wireless IP Phone, use the default setting for the phone load. The phone load name includes symbols (-, _, .) and BAT does not permit symbols in an entry.

**Cisco Unified Communications Manager Administration Phone Addition**

Add phones individually by using Cisco Unified Communications Manager Administration. To do so, obtain the MAC address for each phone before you begin. See *Cisco Unified Communications Manager Phone Addition Methods*, on page 48 for instructions.

Perform one of the following after collecting the MAC addresses:

- Cisco Unified Communications Manager Release 5.0 or later: Choose **Device > Phone** and click **Add New**.
- Cisco Unified Communications Manager Release 4.x: Choose **Device > Add a New Device**.

For additional instructions and conceptual information about Cisco Unified Communications Manager, see the *Cisco Unified Communications Manager Administration Guide* and *Cisco Unified Communications Manager System Guide*.

**Device Support**

**Safety Information**

Review the following warnings before installing the Cisco Unified Wireless IP Phone. To see translations of these warnings, see the Regulatory Compliance and Safety Information for the Cisco Unified Wireless IP Phone 7920 Series and Peripherals document that accompanied the device.
Warning: This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device. Statement 1071

Warning: Read the installation instructions before connecting the system to the power source. Statement 1004

Warning: This equipment will not be able to access emergency services during a power outage because of reliance on utility power for normal operation. Alternative arrangements should be made for access to emergency services. Access to emergency services can be affected by any call-barring function of this equipment.

Warning: Do not use the Cisco Unified Wireless IP Phone 7925G and 7926G in hazardous environments such as areas where high levels of explosive gas may be present. Check with the site safety engineer before using any type of wireless device in such an environment.

Warning: The plug-socket combination for the battery charger must be accessible at all times, because it serves as the main disconnecting device. Statement 1019

Warning: The battery charger requires short-circuit (overcurrent) protection to be provided as part of the building installation. Install only in accordance with national and local wiring regulations. Statement 1045

Warning: The power supply must be placed indoors. Statement 331

Warning: Ultimate disposal of this product should be handled according to all national laws and regulations. Statement 1040

Warning: Telephone receivers produce a magnetic field that can attract small magnetic objects such as pins and staples. To avoid the possibility of injury, do not place the handset where such objects may be picked up.

Warning: The battery charger used with Cisco Unified IP Wireless Phone 7925G-EX is not ATEX or CSA certified and as such it should not be charged in hazardous environment.
Use CSA or ATEX qualified Bluetooth accessories with the Cisco Unified IP Wireless Phone 7925G-EX in hazardous environments.

Battery Safety Notices

These battery safety notices apply to the batteries that are approved by the Cisco Unified Wireless IP Phone manufacturer.

Warning
There is the danger of explosion if the battery is replaced incorrectly. Replace the battery only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the manufacturer’s instructions. Statement 1015

Warning
Ultimate disposal of this product should be handled according to all national laws and regulations. Statement 1040

Warning
Do not dispose of the battery pack in fire or water. The battery may explode if placed in a fire.

Caution
The battery pack is intended for use only with this device.

Caution
Do not disassemble, crush, puncture, or incinerate the battery pack.

Caution
To avoid risk of fire, burns, or damage to your battery pack, do not allow a metal object to touch the battery contacts.

Caution
Handle a damaged or leaking battery with extreme care. If you come in contact with the electrolyte, wash the exposed area with soap and water. If the electrolyte has come in contact with the eye, flush the eye with water for 15 minutes and seek medical attention.

Caution
Do not charge the battery pack if the ambient temperature exceeds 104 degrees Fahrenheit (40 degrees Celsius).

Caution
Do not expose the battery pack to high storage temperatures (above 140 degrees Fahrenheit, 60 degrees Celsius).
When discarding a battery pack, contact your local waste disposal provider regarding local restrictions on the disposal or recycling of batteries.

To obtain a battery, contact your local dealer. Use only the batteries that have a Cisco part number.

**Standard battery**

CP-BATT-7925G-STD

**Extended use battery**

CP-BATT-7925G-EXT

Use only the Cisco power supply that is compatible with your phone. To order your power supply, contact your local dealer and refer to the list of Cisco part numbers.

The battery and power supply are not provided with your phone. To order the battery and power supply, contact your local dealer.
Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Installation

After setting up the wireless network to support voice communications and configuring the wireless IP phones in Cisco Unified Communications Manager, you are ready to install the phones. The following sections contain installation information.

Phone Power

The Cisco Unified Wireless IP Phone uses a battery for power. The following table lists the types of batteries available for the wireless IP phone and the maximum talk and standby times.

Table 15: Batteries Available for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

<table>
<thead>
<tr>
<th>Type</th>
<th>Technology</th>
<th>Talk time</th>
<th>Standby time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard</td>
<td>Lithium ion (Li-ion)</td>
<td>Up to 9.5 hrs</td>
<td>Up to 180 hrs</td>
</tr>
<tr>
<td>Extended</td>
<td>Li-ion</td>
<td>Up to 13 hrs</td>
<td>Up to 240 hrs</td>
</tr>
</tbody>
</table>

Use U-APSD for talk-time power save mode. Also 5 GHz talk time is reduced up to 30 minutes for a standard battery and up to 2 hours for an extended battery. Use of 802.11b/g and a Bluetooth headset can reduce the talk time by 40 to 50 percent. To extend talk-time battery life, the Cisco Unified Wireless IP Phone can use PS-POLL power save methods. The Cisco Unified Wireless IP Phone uses either U-APSD or PS-POLL when in idle (no active phone call).

When an AP supports the Cisco Compatible Extensions (CCX) proxy ARP information element, the idle battery life is optimized. If the AP does not support CCX or proxy ARP is not enabled, then the idle battery life is up to 50 percent less.

The following table shows the charging time for the two types of batteries. You can stop charging the battery when the battery is fully charged. Lithium ion batteries can be partially charged without shortening the battery life. Batteries should handle up to 4000 recharges.

Note

Battery life varies because of environmental factors and Bluetooth use.

Table 16: Battery Charging Time

<table>
<thead>
<tr>
<th>Battery type</th>
<th>Power supply connected to phone</th>
<th>Phone connected to PC and USB cable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard</td>
<td>2 hours</td>
<td>5 hours</td>
</tr>
<tr>
<td>Extended</td>
<td>3 hours</td>
<td>7 hours</td>
</tr>
</tbody>
</table>
Install or Remove Phone Battery

To install the battery in the wireless IP phone, follow these steps.

Procedure

**Step 1** Remove the cover on the back of the phone as shown in the following figure.

*Figure 4: Remove Cover to Install the Battery*

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Locking catch</td>
</tr>
<tr>
<td>2</td>
<td>Battery cover</td>
</tr>
</tbody>
</table>
Step 2  To install the battery, insert the battery catches in the corresponding slots at the bottom of the Cisco Unified Wireless IP Phone. Ensure that the metal contacts on the battery and the phone are facing each other.

Step 3  Press the battery to the body of the phone until it locks into place. See the following figure.

**Figure 5: Install the Battery**

<table>
<thead>
<tr>
<th></th>
<th>Battery insertion slots</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Battery</td>
</tr>
</tbody>
</table>
Step 4  To remove the battery, press up on the locking catch, then lift and remove the battery.

**Figure 6: Replace the Back Cover**

<p>| | |</p>

</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cover insertion slots</td>
</tr>
<tr>
<td>2</td>
<td>Cover</td>
</tr>
</tbody>
</table>

**Note**  The MAC address for each Cisco Unified Wireless IP Phone appears on a printed label on the back of the phone underneath the battery.
Charge Phone Battery Using Power Supply

Use the following figure and steps to charge the phone battery quickly.

*Figure 7: Charge the Phone Battery*

![Figure 7: Charge the Phone Battery]

**Procedure**

**Step 1** Lift the mini-USB port cover on the bottom of phone.

**Step 2** Swing the port cover to one side.

**Step 3** Insert the AC power supply mini-USB connector in the port.

**Step 4** Insert the AC plug adapter in the slot on the power supply.

**Step 5** Insert the AC power supply in a wall outlet.

The indicator light indicates the charging status:

**Red**

Battery charging in process.

**Green**

Battery charging is complete.

**Note** You can use the phone while the battery is being charged. For charging times, see Phone Power, on page 54.
Charge Phone Battery Using USB Cable and PC

The following figure shows how to connect your phone to a PC to charge the phone battery.

*Figure 8: Charge the phone battery using the USB cable and PC*

**Procedure**

**Step 1** Insert the phone connector on the USB cable into the phone.

**Step 2** Insert the USB A-type connector into the USB port on your PC.

**Step 3** Monitor the indicator light after the phone briefly displays *USB Connected* on the status line.

**Step 4** If you see the *Found New Hardware Wizard* popup message, stop the wizard from opening when connecting to USB port, using the following steps:

a) Click *Next* to use the wizard dialog box.

b) In the Update New Software dialog, click *No, not this time*, and click *Next*.

c) Click *Install the Software automatically (Recommended)* and click *Next*.

d) After a few moments, the Cannot Install This Hardware dialog displays. Click *Don't prompt me again to install this software*.

e) Click *Finish* to close the dialog box.

**Note** While the battery is charging, the indicator light is red. When the battery is fully charged, the indicator light turns green. Charging times are longer when you use this method and are described in *Phone Power*, on page 54.

Wireless LAN Settings for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

Before the phone can connect to the WLAN, you must configure the network profile for the phone with the WLAN settings. You can use one of the following methods for setting up the network profiles.

**WLAN Settings from Cisco Unified Wireless IP Phone Web Pages**

You can access the Cisco Unified Wireless IP Phone web pages to set up the WLAN settings in the network profile. For a new phone with the factory default settings, you must use the USB cable to connect the phone to your PC.

**Related Topics**

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Web Pages, on page 67

**WLAN Settings from Network Profile Menu on Phone**

You can use the Settings menu on the phone and access the Network Profiles menu to set up the network configuration and the WLAN configuration.

**Related Topics**

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Settings, on page 115

**Headset Usage**

Although Cisco performs some internal testing of third-party wired and Bluetooth wireless headsets for use with the wireless phone, Cisco does not certify or support products from headset or handset vendors. Because of the inherent environmental and hardware inconsistencies in the locations where phones are deployed, there is not a single "best" solution that is optimal for all environments. Cisco recommends that customers test the headsets that work best in their environment before deploying a large number of units in their network.

**Caution**

Use CSA or ATEX qualified Bluetooth accessories with the Cisco Unified Wireless IP Phone 7925G-EX in hazardous environments.

Cisco recommends the use of good quality external devices, like headsets that are screened against unwanted radio frequency (RF) and audio frequency (AF) signals. Depending on the quality of these devices and their proximity to other devices such as cell phones and two-way radios, some audio noise may still occur.

The primary reason that a particular headset would be inappropriate for the phone is the potential for an audible hum. This hum can be heard by either the remote party or by both the remote party and the phone user. Some humming or buzzing sounds can be caused by a range of outside sources; for example, electric lights, being near electric motors or large PC monitors. In some instances, the mechanics or electronics of various headsets can cause remote parties to hear an echo of their own voice when they speak to phone users.

**Related Topics**

External Device Use, on page 62
Connect Headsets

You can use the headset with all of the features on the Cisco Unified Wireless IP Phone, including the Volume and Mute buttons. Use the phone buttons to adjust the ear piece volume and to mute the speech path from the headset microphone.

Procedure

Step 1 To connect a headset to the Cisco Unified Wireless IP Phone, lift the headset port cover on the right side of the phone.

Step 2 Plug the headset into the headset port.

Bluetooth Wireless Headsets

The Cisco Unified Wireless IP Phone supports Bluetooth Class 2 technology with Hands-Free Profile Version 1.5 when the headsets support Bluetooth. Bluetooth enables low bandwidth wireless connections within a range of 33 feet (10 meters). The best performance is in the 3 to 6 foot (1 to 2 meter) range.

Because of potential interference issues, Cisco recommends that you:

- Reduce the proximity of other 802.11b/g devices, Bluetooth devices, microwave ovens, and large metal objects.
- Use the Cisco Unified Wireless IP Phone on the same side of the body as the Bluetooth-enabled headset.

Using Bluetooth wireless headsets will likely increase battery power consumption on your phone and might result in reducing battery life.

For a Bluetooth wireless headset to work, it does not need to be within direct line-of-sight of the phone, but some barriers, such as walls or doors, and interference from other electronic devices, can affect the connection.

Headset Pairing

The Cisco Unified Wireless IP Phone pairs with headsets using a shared key authentication and encryption method. The authentication process can require a personal identification number (PIN) specific to the headset, commonly “0000.” The Cisco Unified Wireless IP Phone can be paired with more than one headset at a time. Pairing is typically performed once for each headset.

After a device has been paired, its Bluetooth connection remains as long as both devices (phone and headset) are enabled and within range of each other. The connection reestablishes itself automatically if either of the devices powers down then powers up. The green-dotted Bluetooth icon indicates whether a device is connected.

Note

The Cisco Unified Wireless IP Phone can be connected to only one Bluetooth-enabled headset at a time. Further, the Cisco Unified Wireless IP Phone only supports communication with Bluetooth wireless technology-enabled devices qualified by the Bluetooth Special Interest Group (SIG).

When headsets are more than 10 meters away from Cisco Unified Wireless IP Phone, Bluetooth drops the connection after a 15 to 20 second timeout. If the paired headset comes back into range of the Cisco Unified Wireless IP Phone and the phone is not connected to another Bluetooth headset, then the in-range Bluetooth
headset automatically reconnects. For certain phone types that operate in power-save modes, the user may have to “wake up” the headset by tapping on its operational button to initiate the reconnect.

---

**Note**
Users should read the headset user guide for more information about pairing and connecting the headsets.

---

### Audio Quality

Beyond the physical, mechanical, and technical performance, the audio portion of a headset must sound good to you (the user) and to the party on the far end. Sound is subjective and Cisco cannot guarantee the performance of any headsets, but some of the headsets on the sites listed below have been reported to perform well on Cisco Unified IP Phones.

Nevertheless, it is ultimately the customer's responsibility to test this equipment in their own environment to determine suitable performance.

For information about wired and Bluetooth wireless headsets for your phone, see the *Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Accessory Guide* and these web sites:

- [http://www.plantronics.com](http://www.plantronics.com)
- [http://www.jabra.com](http://www.jabra.com)
- [http://www.jawbone.com](http://www.jawbone.com)

### External Device Use

Cisco recommends the use of good quality external devices, such as speakers, microphones, and headsets that are shielded (screened) against unwanted radio frequency (RF) and audio frequency (AF) signals.

Depending on the quality of these devices and their proximity to other devices, such as mobile phones or two-way radios, some audio noise may still occur. In these cases, Cisco recommends that you take one or more of the following actions:

- Move the external device away from the source of the RF or AF signals.
- Route the external device cables away from the source of the RF or AF signals.
- Use shielded cables for the external device, or use cables with a better shield and connector.
- Shorten the length of the external device cable.
- Apply ferrites or other such devices on the cables for the external device.

Cisco cannot guarantee the performance of the system because Cisco has no control over the quality of external devices, cables, and connectors. The system performs adequately when suitable devices are attached with good quality cables and connectors.

---

**Caution**

In European Union countries, use only external headsets that are fully compliant with the EMC Directive [89/336/EC].
Bulk Provisioning

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Startup

After charging the battery and configuring the wireless IP phone, you are ready to power on the phone and connect to the WLAN.

To power on the Cisco Unified Wireless IP Phone, press and hold the Power On button until the phone begins its startup process by cycling through these steps:

1. The phone displays the Cisco Systems screen.
2. The phone screen displays these messages as the phone starts up:
   - Locating Network Services
   - Configuring IP
   - Network Up
   - Configuring Unified CMList
   - Registering
3. The following information displays on the main phone screen:
   - Current time and date
   - Primary directory number
   - Main screen icons for four menus and Help
   - Your current options on status line
   - Softkey labels (Messages and Options)

When the phone passes through these stages with no errors, the phone has started up properly. Now the phone is in standby mode and is ready to place or receive calls.

The signal icon in the upper left corner shows the strength of the signal between the wireless access point and the phone. The phone must have an adequate signal to successfully place or receive calls. If the signal icon displays only one bar, the weak signal can cause problems with phone performance.

Related Topics

Phone Startup Process, on page 64
Startup and Connectivity Problems, on page 209
Active and Standby Phone Modes

The following sections describe the available modes when the Cisco Unified Wireless IP Phone is powered on.

Active Mode

The phone is in active mode when there is an active RTP stream. When the phone is performing one of these actions, it is consuming power:

- Connected to an active call
- Scanning for channels
- Sending CDP packets
- Sending keepalive messages
- Reregistering with Cisco Unified Communications Manager

Related Topics
- Phone Power, on page 54

Standby Mode

The phone can enter standby mode if none of the events from the Active Mode list are currently active. The phone awakes from standby mode in response to these events:

- Pressing keys on the keypad
- Roaming between APs
- Power cycling the phone
- Losing network connectivity
- Losing RF connectivity
- Transmitting scheduled CDP or keepalive packets

Related Topics
- Phone Startup Process, on page 64
- Startup and Connectivity Problems, on page 209

Phone Startup Process

When connecting to the wireless VoIP network, the Cisco Unified Wireless IP Phone goes through a standard startup process, as described in the following list. Depending on your specific network configuration, not all of these steps may occur on your wireless IP phone.
1 Powering on the phone. The Cisco Unified Wireless IP Phone has nonvolatile flash memory in which it stores firmware images and user-defined preferences. At startup, the phone runs a bootstrap loader that loads a phone image stored in Flash memory. Using this image, the phone initializes its software and hardware.

For more information, see Phone Power, on page 54 and Startup and Connectivity Problems, on page 209.

2 Scanning for an access point. The Cisco Unified Wireless IP Phone scans the RF coverage area with its radio. The phone searches its network profiles and scans for access points that have a matching SSID and authentication type. The phone associates with the access point with the highest RSSI that matches with its network profile.

For more information, see Cisco Unified Wireless AP Interactions, on page 34 and Startup and Connectivity Problems, on page 209.

3 Authenticating with access point. The Cisco Unified Wireless IP Phone begins the authenticating process.

- If set for Open, then any device can authenticate to the access point. For added security, static WEP encryption might optionally be used.
- If set to Shared Key, the phone encrypts the challenge text using the WEP key and the access point must verify that the WEP key was used to encrypt the challenge text before network access is available.
- If set for LEAP, EAP-FAST, or PEAP, the username and password are authenticated by the RADIUS server before network access is available.
- If set for EAP-TLS, the phone requires one or more of the following certificates:
  - a client certificate and the RADIUS root certificate
  - the CA certificate
- If set for Auto (AKM), the phone looks for an access point with one of the following key management options enabled:
  - WPA, WPA2, or CCKM
    The username and password are authenticated by the RADIUS server before network access is available.
  - WPA-Pre-shared key, WPA2-Pre-shared key
    The phone authenticates with the access point using the pre-shared key.

For more information, see Authentication Methods, on page 39.

4 Configuring IP network. If the wireless IP phone is using DHCP to obtain an IP address, the phone queries the DHCP server to obtain one. If you are not using DHCP in your network, you must assign a static IP address to each phone locally.

In addition to assigning an IP address, the DHCP server directs the wireless IP phone to a TFTP server. If the phone has a statically defined IP address, you must configure the TFTP server IP address locally on the phone; the phone then contacts the TFTP server directly.

For more information, see:

- DHCP Settings, on page 121
5. Downloading Load ID. The wireless IP phone checks to verify that the proper firmware is installed or if new firmware is available to download.

Cisco Unified Communications Manager informs devices using .cnf or .cnf.xml format configuration files of their load ID. Devices using .xml format configuration files receive the load ID in the configuration file.

For more information, see Phone Configuration Files and Profile Files, on page 37.

6. Downloading configuration file. The TFTP server has configuration files and profile files. A configuration file includes parameters for connecting to Cisco Unified Communications Manager and information about which image load a phone should be running. A profile file contains various parameters and values for phone and network settings.

For more information, see:
- Set Alternate TFTP Server, on page 122
- Phone Configuration Files and Profile Files, on page 37
- Startup and Connectivity Problems, on page 209

7. Connecting to Cisco Unified Communications Manager.

The configuration file defines how the Cisco Unified IP Phone communicates with Cisco Unified Communications Manager. After obtaining the file from the TFTP server, the phone attempts to make a TCP connection to the highest priority Cisco Unified Communications Manager on the list.

For more information, see:
- Cisco Unified Communications Manager Interactions, on page 37
- Startup and Connectivity Problems, on page 209

8. Registering to Cisco Unified Communications Manager.

If the phone was manually added to the database, Cisco Unified Communications Manager identifies and registers the phone. If the phone was not manually added to the database and autoregistration is enabled in Cisco Unified Communications Manager, the phone attempts to autoregister itself in the Cisco Unified Communications Manager database.

For more information, see:
- Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Deployment, on page 19
- Add Users to Cisco Unified Communications Manager, on page 171

Web Pages Overview

This chapter describes how to set up your PC to configure a Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G by using a USB connector and how to remotely access a configured phone over the WLAN. It contains the following sections:

PC Setup for Phone Setup

To set up new phones, use your PC and USB connection to enter the initial configuration for the wireless network settings and network profiles. To save time during initial deployment, you can create a standard network profile template and export it to several phones.

Before you can configure phones by using the USB connection, you must install drivers and set up the USB ports on the phone and PC.

Your PC must have one of the following operating systems:

- Windows 2000 32 bit
Install USB Drivers

To install the drivers on your PC, perform the following steps.

**Procedure**

**Step 1** Log in to Cisco.com.

**Step 2** Download the installation package and read me file for the USB drivers from this location: http://www.cisco.com/cgi-bin/tablebuild.pl/ip-7900ser-crypto

**Note** Before proceeding, review the read me file for specific instructions for your PC operating system.

**Step 3** Double-click on the USB installation file (listed in the read me file) to start the installation program.

**Step 4** Follow the prompts in the InstallShield Wizard.

**Note** If you receive a Hardware Installation warning message stating that the software has not passed Microsoft Windows Logo testing, click **Continue**.

**Step 5** When you see the Finished screen, the installation is complete. Close the wizard.

**Step 6** Plug the USB cable into the USB port on the PC and into the USB connector on the phone. The Found New Hardware Wizard dialog box opens.

**Step 7** To update the new software, click the button next to **Yes, this time only** and click **Next**.

**Step 8** Click the button next to **Install the Software automatically (Recommended)**. After 2 to 3 minutes, the software installs and a message appears on the task bar stating **Found New Hardware - Software installed and ready to use**.

**Step 9** Click **Finish** when the installation completes. The phone briefly displays **USB Connected** on the status line.

---

Set Up USB LAN on PC

To configure the USB LAN connection on your PC, follow these steps:
Procedure

Step 1
To set up the USB LAN connection, access the Network Connections window on your PC.

Step 2
Locate and double-click the new LAN connection to open the Local Area Connection Status window, and then click Properties.

Step 3
Scroll to the Internet Protocol (TCP/IP) section and click Properties.

Step 4
In the Internet Protocol (TCP/IP) Properties window, choose Use the following IP address.

Step 5
In the IP address field, enter a static IP address for the PC: 192.168.1.xxx, where xxx is 1-99 or 101-254.

Example:
192.168.1.11

Note
• By default, the Cisco Unified Wireless IP Phone is configured with 192.168.1.100 so you cannot use this IP address for the PC.
• Make sure to use an IP address that is not in use on any other interface on the PC.

Step 6
Enter the subnet mask 255.255.255.0

Step 7
Click OK to make the changes.

Access Phone Configuration Web Page, on page 71
Home Web Page Summary Information, on page 73

Access Phone Web Page

After setting up the USB interface on the PC, you are ready to use the USB cable connection to the phone to access the phone web pages.

To access the phone web pages, follow these steps:

Procedure

Step 1
Open a Windows browser.

Step 2
In the address field, enter https://192.168.1.100 to locate the wireless IP phone web page.

Note
When the Security Alert dialog box displays a notice to accept the Trust Certificate, click Yes or Always to accept the application.

The Summary web page for the phone displays. See Home Web Page Summary Information, on page 73 for details about this web page.

Step 3
When prompted, enter your username and password.
Default username: admin
Default password: Cisco
Remote Phone Updates

You might have to update settings on a Cisco Unified Wireless IP Phone that is already configured and in use. You can use the wireless LAN to remotely access and configure these phones.

Use the following sections for information about remotely updating phones.

Set Privileges for Phone Web Page

To make changes to the phone by using the web page, you must use Cisco Unified Communications Manager Administration to enable Web Access and Phone Book Web Access.
To allow configuration privileges, follow these steps.

**Procedure**

**Step 1** Log in to Cisco Unified Communications Manager Administration.

**Step 2** Search for the phone by choosing Device > Phone and enter search information such as the DN.

**Note** The administrator password for web access can also be changed using the Product Specific Configuration page of the Cisco Unified Communications Manager Administration.

**Step 3** Click on the DN of the phone that you want to set the privileges.

**Step 4** Open the Phone Configuration window, scroll down to Product Specific Configuration Layout, and enable these privileges:

- a) In the Web Access field, select Full from the drop-down menu.
- b) In the Phone Book Web Access field, select Allow Admin.

**Step 5** Click Save to make the change.

**Step 6** You must reset the phone to enable configuration privileges on the web pages for this phone.

### Access Phone Configuration Web Page

You can access the web page for any Cisco Unified Wireless IP Phone that is connected to the WLAN. Be sure the phone is powered on, connected, and registered to a Cisco Unified Communications Manager server.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>If a wireless IP phone was previously registered to Cisco Unified CallManager Administration Release 4.x, and you try to register to Cisco Unified Communications Manager Administration Release 5.0 or later, the Phone Configuration web page password might be set to Cisco.</td>
</tr>
</tbody>
</table>

To access the web page for the Cisco Unified Wireless IP Phone follow these steps.

**Procedure**

**Step 1** Log in to the Cisco Unified Communications Manager Administration.

**Step 2** Go to Device > Phone.

**Step 3** Click Find. All of the phones display. If the phone is registered with a Cisco Unified Communications Manager Administration, the IP address displays. The phone IP address is linked to the Home web page.

**Step 4** Click on the Description field in the Phone Configuration window of Cisco Unified Communications Manager Administration. The Device Information section displays.

**Step 5** Go to the Web Access field in the Product Specific Configuration Layout and change the parameter to Full. This parameter gives you full access to all of the web pages.

**Step 6** Choose one of the following methods:

- a) From the Phone Configuration window, click on the linked IP address. The Home web page displays. There are two sections displayed on the Home web page: setup menus (left) and summary information (right). **Home Web Page Menu**, on page 72 describes the available Home web...
page menus, from which you can configure network profiles, USB settings, trace settings, Wavelink settings, and certificates. Home Web Page Summary Information, on page 73 describes the phone summary information.

b) Or if you already know the IP address, you can open a web browser and enter the following URL. The IP_address variable is the IP address of the Cisco Unified IP Phone:

https://<IP_address>/index.html

**Step 7** If the Security Alert dialog box displays a notice to accept the Trust Certificate, click Yes or Always to accept the application.

**Step 8** Log in to the Home web page with the default username: admin and enter the default password: Cisco. You may need to log into additional windows to configure other options.

**Step 9** Make changes to configurable pages as needed.

**Step 10** Return to the Phone Configuration page in Cisco Unified Communications Manager Administration and set the Web Access field back to Read Only or Disabled.

**Step 11** Reset the phone from Cisco Unified Communications Manager to disable full access to the web pages. Be sure to change the Web Access privileges and reset the phone to prevent users from making configuration changes on the phone web pages.

### Home Web Page Menu

The following table describes the menu entries in the home web page.

## Network Profiles

You can configure up to four profiles for a phone to take advantage of WLAN environments. You can add names to the profiles and enable one or more of the profiles for the phone to use. The Network Profiles section of the web page displays the following information about each phone:

**Profile**

- Displays a list of four configurable profiles.

Set Up Wireless Settings in Network Profile

You must configure wireless settings in a profile to enable the phone to access the wireless network. To configure the wireless settings, see Network Profile Settings, on page 75 and follow these steps.

Procedure

**Step 1** Choose the network profile that you want to configure.

**Step 2** To give the profile a recognizable name, in the Profile Name field, enter a name up to 63 characters and numbers in length.

**Step 3** To identify the SSID that the phone uses to associate with access points, in the SSID field, enter an SSID that is already configured in the WLAN.

**Note** The SSID is case sensitive; you must enter it exactly as configured in the network.

**Step 4** To conserve battery power, in the Call Power Save Mode, choose the type (U-APSD or PS-Poll) and option that is being used in the WLAN.

**Step 5** Choose the signal mode or priority of signal modes in the 802.11 Mode field that is used by your WLAN.

Wireless LAN Security

The Cisco Unified Wireless IP Phone supports many types of authentication. Authentication methods might require a specific encryption method or you can choose between several encryption methods. When configuring a network profile, you can choose one of these authentication methods:

**Open**

Provides access to all access points without WEP Key authentication or encryption.
Open plus WEP

Provides access to all access points and authentication through the use of one or more WEP Keys at the local access point.

Shared Key plus WEP

Provides shared key authentication through the use of WEP Keys at the local access point.

LEAP

Exchanges a username and cryptographically secure password with a RADIUS server for authentication in the network. LEAP is a Cisco proprietary version of EAP.

EAP-FAST

Exchanges a username and password with a RADIUS server for authentication in the network.

EAP-TLS

Uses a dynamic session-based WEP key derived from the client adapter and RADIUS server to encrypt data and a client certificate for authentication. It uses PKI to secure communication to the RADIUS authentication server.

PEAP (MSCHAP V2)

Performs mutual authentication, but does not require a client certificate on the phone. This method uses name and password authentication based on Microsoft MSCHAP V2 authentication.

With Firmware Release 1.4(7), server validation cannot be configured from the phone web page. Server validation is automatically enabled after a server certificate has been uploaded.

Auto (AKM)

Automatic authenticated key management in which the phone selects the AP and type of key management scheme, which includes WPA, WPA2, WPA-Pre-shared key (PSK), WPA2-PSK, or CCKM (which uses a wireless domain server [WDS]).

When set to AKM mode, the phone uses LEAP for 802.1x type authentication methods (non-PSK such as WPA, WPA2, or CCKM). AKM mode supports only authenticated key-management types (WPA, WPA2, WPA-PSK, WPA2-PSK, CCKM).

The type of authentication and encryption schemes that you use with your WLAN determine how you set up the authentication, security, and encryption options in the network profiles for the Cisco Unified Wireless IP Phones. The following table provides a list of supported authentication and encryption schemes that you can configure on the Cisco Unified Wireless IP Phone.

<table>
<thead>
<tr>
<th>Authentication mode</th>
<th>Wireless encryption</th>
<th>Wireless security credentials</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>None</td>
<td>None: access to all APs</td>
</tr>
</tbody>
</table>
## Set Up Authentication Mode

To select the Authentication Mode for this profile, follow these steps:

### Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose the network profile that you want to configure.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Choose the authentication mode.</td>
</tr>
</tbody>
</table>

### Note

### Authentication mode | Wireless encryption | Wireless security credentials |
<table>
<thead>

<td>Uses TKIP</td>
<td>Requires Passphrase</td>
</tr>
<tr>
<td>Auto (AKM) with WPA2 Pre-Shared Key</td>
<td>Uses AES</td>
<td>Requires Passphrase</td>
</tr>
</tbody>
</table>
Step 3  Click Save to make the change.

---

**Wireless Security Credentials**

When your network uses EAP-FAST, EAP-TLS, PEAP, or WPA2, CCKM for user authentication, you must configure both the username and password if required on the Access Control Server (ACS) and the phone.

**Note**

If you use domains within your network, you must enter the username with the domain name, in the format: `domain\username`.

**Set Up Username and Password**

To enter or change the username or password for the network profile, you must use the same username and the same password string that are configured in the RADIUS server. The maximum length of the username or password entry is 32 characters.

To set up the username and password in Wireless Security Credentials, follow these steps:

**Procedure**

**Step 1** Choose the network profile.

**Step 2** In the Username field, enter the network username for this profile.

**Step 3** In the Password field, enter the network password string for this profile.

**Step 4** Click Save to make the change.

---

**Pre-Shared Key Setup**

When using Auto (AKM) for WPA Pre-shared key or WPA2 Pre-shared key authentication, you must configure a Passphrase/Pre-shared key in the Wireless Security Credentials area.

**Pre-Shared Key Formats**

The Cisco Unified Wireless IP Phone supports ASCII and hexadecimal formats. You must use one of these formats when setting up a WPA Pre-shared key:

**Hexadecimal**

For hexadecimal keys, you enter 64 hex digits (0-9 and A-F); for example, AB123456789CD01234567890EFAB123456789CD01234567890EF3456789C
ASCII

For ASCII keys, you enter a character string that uses 0-9, A-Z (upper and lower case), including symbols and is from 8 to 63 characters in length; for example, GREG12356789ZXYW

Set Up PSK

To set up a PSK in the Wireless Credentials area, follow these steps:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose the network profile that uses Auto (AKM) to enable the WPA Pre-shared key or WPA2 Pre-shared key.</td>
</tr>
<tr>
<td>2</td>
<td>In the Key Type area, choose one of these character formats:</td>
</tr>
<tr>
<td></td>
<td>• Hex</td>
</tr>
<tr>
<td></td>
<td>• ASCII</td>
</tr>
<tr>
<td>3</td>
<td>Enter an ASCII string or hexadecimal digits in the Passphrase/Pre-shared key field.</td>
</tr>
<tr>
<td>4</td>
<td>Click Save to make the change.</td>
</tr>
</tbody>
</table>

Wireless Encryption

If your wireless network uses WEP encryption, and you set the Authentication Mode as Open + WEP or Shared Key + WEP, you must enter an ASCII or hexadecimal WEP Key.

The WEP Keys for the phone must match the WEP Keys assigned to the access point. Cisco Unified Wireless IP Phone and Cisco Aironet Access Points support both 40-bit and 128-bit encryption keys.

WEP Key Formats

You must use one of these formats when setting up a WEP key:

Hexadecimal

For hexadecimal keys, you use one of the following key sizes:

40-bit

You enter a 10-digit encryption key string that uses the hex digits (0-9 and A-F); for example, ABCD123456.

128-bit

You enter a 26-digit encryption key string that uses the hex digits (0-9 and A-F); for example, AB123456789CD01234567890EF.
ASCII

For ASCII keys, you enter a character string that uses 0-9, A-Z (upper and lower case), and all symbols, with one of the following key sizes:

40-bit

You enter a 5-character string; for example, GREG5.

128-bit

You enter a 13-character string; for example, GREGSSECRET13.

Set Up WEP Keys

To set up WEP keys, follow these steps.

Procedure

Step 1 Choose the network profile that uses Open+WEP or Shared+WEP.

Step 2 In the Key Type area, choose one of these character formats:

- Hex
- ASCII

Step 3 For Encryption Key 1, click Transmit Key.

Step 4 In the Key Size area, choose one of these character string lengths:

- 40
- 128

Step 5 In the Encryption Key field, enter the appropriate key string based on the selected Key Type and Key Size.

See WEP Key Formats, on page 84.

Step 6 Click Save to make the change.

- Set Up Advanced Profile Settings, on page 94

EAP-TLS Authentication Certificates

EAP-TLS is a certificate-based authentication that requires a trust relationship between two or more entities. Each entity has a certificate proving its identity and is signed by a trusted authority. These certificates are exchanged and verified during EAP-TLS authentication.
The EAP-TLS certificate-based authentication requires that the internal clock on the Cisco Unified Wireless IP Phone be set correctly. Use the phone web page to set the clock on the phone before using EAP-TLS authentication.

To use EAP-TLS, both the Cisco Unified Wireless IP Phone and the Cisco Secure Access Control Server (ACS) must have certificates installed and configured properly. If your wireless network uses EAP-TLS for authentication, you can use the Manufacturing Installed Certificate (MIC) or a user installed certificate for authentication on the phone.

**Manufacturing Installed Certificate**

Cisco has included a Manufacturing Installed Certificate (MIC) in the phone at the factory.

During EAP-TLS authentication, the ACS server needs to verify the trust of the phone and the phone needs to verify the trust of the ACS server.

To verify the MIC, the Manufacturing Root Certificate and Manufacturing Certificate Authority (CA) Certificate must be exported from a Cisco Unified Wireless IP Phone and installed on the Cisco ACS server. These two certificates are part of the trusted certificate chain used to verify the MIC by the Cisco ACS server.

To verify the Cisco ACS certificate, a trusted subordinate certificate (if any) and root certificate (created from a CA) on the Cisco ACS server must be exported and installed on the phone. These certificates are part of the trusted certificate chain used to verify the trust of the certificate from the ACS server.

**User-Installed Certificate**

To use a user-installed certificate, a Certificate Signing Request (CSR) is generated on the phone, sent to the CA for approval, and the approved certificate installed on the Cisco Unified Wireless IP Phone.

During EAP-TLS authentication, the ACS server verifies the trust of the phone and the phone verifies the trust of the ACS server.

To verify the authenticity of the user-installed certificate, you must install a trusted subordinate certificate (if any) and root certificate from the CA that approved the user certificate on the Cisco ACS server. These certificates are part of the trusted certificate chain used to verify the trust of the user installed certificate.

To verify the Cisco ACS certificate, you export a trusted subordinate certificate (if any) and root certificate (created from a CA) on the Cisco ACS server and the exported certificates are installed on the phone. These certificates are part of the trusted certificate chain used to verify the trust of the certificate from the ACS server.

**Install EAP-TLS Authentication Certificates**

To install authentication certificates for EAP-TLS, perform the following steps.

**Procedure**

- **Step 1** From the phone web page, set the Cisco Unified Communications Manager date and time on the phone.
- **Step 2** If using the Manufacturing Installed Certificate (MIC):
  - a) From the phone web page, export the CA root certificate and manufacturing CA certificate.
b) From Internet Explorer, install certificates on the Cisco ACS server and edit the trust list.
c) From Microsoft Certificate Services, export the CA certificate from the ACS server and import it to the
phone.
For more information, see:

- Export and Install Certificates on ACS, on page 88
- Export CA certificate from ACS using Microsoft Certificate Services, on page 88

Step 3 If using a user installed certificate, from phone web page:
a) Generate the Certificate Signing Request (CSR).
b) Send the CSR to CA to sign.
c) Import the certificate.
d) Install certificate on the Cisco ACS server and edit the trust list.
e) Download the CA certificate from the ACS server and import it into the phone.
For more information, see Request and Import User-Installed Certificate, on page 89.

Step 4 Using the ACS configuration tool, set up the user account.
For more information, see:

- Set Up ACS User Account and Install Certificate, on page 90
- User Guide for Cisco Secure ACS for Windows

Set Date and Time

EAP-TLS uses certificate-based authentication that requires the internal clock on the Cisco Unified Wireless
IP Phone to be set correctly. The date and time on the phone might change when it is registered to Cisco Unified
Communications Manager.

Note

If a new server authentication certificate is being requested and the local time is behind the Greenwich
Mean Time (GMT), the authentication certificate validation might fail. Cisco recommends that you set
the local date and time ahead of the GMT.

To set the phone to the correct local date and time, follow these steps.

Procedure

Step 1 Select Date & Time from the left navigation pane.
Step 2 If the setting in the Current Phone Date & Time field is different from the Local Date & Time field, click Set
Phone to Local Date & Time.
Step 3 Click Phone Restart, and then click OK.
Export and Install Certificates on ACS

To use the MIC, export the Manufacturing Root Certificate and Manufacturing CA Certificate and install it on the Cisco ACS server.

To export the manufacturing root certificate and manufacturing CA certificate to the ACS server, follow these steps.

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>From the phone web page, choose <strong>Certificates</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click <strong>Export</strong> next to the Manufacturing Root Certificate.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Save the certificate and copy it to the ACS server.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Repeat Steps 1 and 2 for the Manufacturing CA certificate.</td>
</tr>
<tr>
<td>Step 5</td>
<td>From the ACS Server System Configuration page, enter the file path for each certificate and install the certificates.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For more information about using the ACS configuration tool, see the ACS online help or the <strong>User Guide for Cisco Secure ACS for Windows</strong>.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Use the Edit the Certificate Trust List (CTL) page to add the certificates to be trusted by ACS.</td>
</tr>
</tbody>
</table>

ACS Certificate Export Methods

Depending on the type of certificate you export from the ACS, use one of the following methods:

- To export the CA certificate from the ACS server that signed the user-installed certificate or ACS certificate, see **Export CA certificate from ACS using Microsoft Certificate Services**, on page 88.
- To export the CA certificate from the ACS server that uses a self-signed certificate, see **Export CA Certificate from ACS Using Internet Explorer**, on page 89.

Export CA certificate from ACS using Microsoft Certificate Services

Use this method to export the CA certificate from the ACS server that signed the user-installed certificate or ACS certificate.

To export the CA certificate using the Microsoft Certificate Services web page, follow these steps.

**Procedure**

| Step 1 | From the Microsoft Certificate Services web page, select **Download a CA certificate, certificate chain or CRL**. |
| Step 2 | At the next page, highlight the current CA certificate in the text box, choose DER under Encoding Method, then click **Download CA certificate**. |
| Step 3 | Save the CA certificate. |
Export CA Certificate from ACS Using Internet Explorer

Use this method to export the CA certificate from the ACS server that uses a self-signed certificate.

To export certificates from the ACS server using Internet Explorer, follow these steps.

**Procedure**

**Step 1** From Internet Explorer, choose **Tools > Internet Options**, then click the Content tab.

**Step 2** Under Certificates, click **Certificates**, then click the Trusted Root Certification Authorities tab.

**Step 3** Highlight the root certificate and click **Export**. The Certificate Export Wizard appears.

**Step 4** Click **Next**.

**Step 5** At the next window, select **DER encoded binary X.509 (.CER)**, and click **Next**.

**Step 6** Specify a name for the certificate and click **Next**.

**Step 7** Save the CA certificate to be installed on the phone.

Request and Import User-Installed Certificate

To request and install the certificate on the phone, follow these steps.

**Procedure**

**Step 1** From the phone web page, choose the network profile using EAP-TLS, and select **User Installed** in the EAP-TLS Certificate field.

**Step 2** Click **Certificates**.

On the User Certificate Installation page, the Common Name field should match the user name in the ACS server.

**Note** You can edit the Common Name field if you wish. Make sure that it matches the username in the ACS server. See Set Up ACS User Account and Install Certificate, on page 90.

**Step 3** Enter the information to be displayed on the certificate, and click **Submit** to generate the Certificate Signing Request (CSR).

**Step 4** In the next screen, select and copy the entire contents of the text box (the encoded CSR text). Send this data to the CA administrator for signing.

Send the CSR text by e-mail or another method determined by your CA administrator. The following steps describe the basic CSR approval process on the CA web page.
Step 5 From the Microsoft Certificate Services Request a Certificate page, select Advanced certificate request to initiate the signing request.

Step 6 At the Advanced Certificate Request page, select Submit a certificate request by using a base-64-encoded PKCS CMC.

Step 7 Copy the certificate data from the Cisco Unified Wireless IP Phone and paste it in the Saved Request text box, then click Submit.

Step 8 After the CSR is approved, the certificate must be exported in a DER encoded format and sent to the original requestor.

Step 9 Return to the phone web page and choose Certificates to import the signed certificate.

Step 10 On the Certificates page, locate the User Installed certificate line, and click Import.

Step 11 Browse to the certificate on your PC to import to the phone.

Install Authentication Server Root Certificate

To install the Authentication Server Root Certificate on the phone, follow these steps.

Procedure

Step 1 Export the Authentication Server Root Certificate from the ACS. See ACS Certificate Export Methods, on page 88.

Step 2 Go to the phone web page and choose Certificates.

Step 3 Click Import next to the Authentication Server Root certificate.

Step 4 Restart the phone.

Set Up ACS User Account and Install Certificate

To set up the user account name and install the MIC root certificate for the phone on the ACS, follow these steps.

Note

For more information about using the ACS configuration tool, see the ACS online help or the User Guide for Cisco Secure ACS for Windows.

Procedure

Step 1 From the ACS configuration tool User Setup page, create a phone user account name if it is not already set up. Typically, the user name includes the phone MAC address at the end (for example, CP-7925G-SEPxxxxxxxxxxxx). No password is necessary for EAP-TLS.

Note Make sure the user name matches the Common Name field in the User Certificate Installation page. See Request and Import User-Installed Certificate, on page 89.
Step 2  On the System Configuration page, in the EAP-TLS section, enable these fields:

- Allow EAP-TLS
- Certificate CN comparison

Step 3  On the ACS Certification Authority Setup page, add the Manufacturing Root Certificate and Manufacturing CA Certificate to the ACS server.

Step 4  Enable both the Manufacturing Root Certificate and Manufacturing CA Certificate in the ACS Certificate Trust List.

PEAP Setup

Protected Extensible Authentication Protocol (PEAP) uses server-side public key certificates to authenticate clients by creating an encrypted SSL/TLS tunnel between the client and the authentication server.

Note  Server validation can be enabled by importing the authentication server certificate.

Before You Begin

Before you configure PEAP authentication for the phone, make sure these Cisco Secure ACS requirements are met:

- The ACS root certificate must be installed.
- The Allow EAP-MSCHAPv2 setting must be enabled.
- User account and password must be configured.
- For password authentication, you can use the local ACS database or an external one (such as Windows or LDAP).

Enable PEAP Authentication

With Firmware Release 1.4(7), the Cisco Unified Wireless IP Phone sends a download request to the TFTP server for the server certificate (WLANRootCA.cer) so the server certificate can be installed automatically. The server certificate must have a SHA-1 signature and DER encoding. Any preexisting server certificates are removed automatically. The phone restarts after the certificate is installed. After the certificate is installed, Server Validation is enabled automatically and cannot be configured when the phone is set to use PEAP authentication.

Procedure

Step 1  From the phone configuration web page, choose PEAP as the authentication mode.

Step 2  Enter a user name and password.
IP Network Settings

The Cisco Unified IP Phones enable DHCP, by default, to automatically assign IP addresses to devices when you connect them to the network. If you do not use DHCP in your network, then you must disable DHCP and manually enter network configuration information.

When DHCP is disabled in the network, you must configure the following settings in the Static Settings menu:

- IP address
- Subnet mask
- Default Router
- DNS server 1 and 2
- TFTP server 1

Use these guidelines when manually configuring the IP settings:

- Ensure the TFTP server has an IP address.
- Ensure the default router IP address is on the same subnet as the host IP address.

Related Topics

Dynamic Host Configuration Protocol Server Interactions, on page 38

Enable DHCP

To enable the use of DHCP in the Network Profile, follow these steps:

Procedure

Step 1 Choose the network profile that you want to configure.
Step 2 Under the IP Network Configuration area, choose the option Obtain IP address and DNS servers automatically.
Step 3 Click Save to make the change.

Disable DHCP

To disable the use of DHCP in the Network Profile, follow these steps:
Procedure

Step 1. Choose the network profile that you want to configure.

Step 2. Under the IP Network Configuration area, choose Use the following IP addresses and DNS servers.

Step 3. Enter the required IP addresses. See Network Configuration Fields When DHCP Not in Use, on page 93 for descriptions of these fields.

Step 4. Click Save to make the change.

Network Configuration Fields When DHCP Not in Use

When DHCP is not in use, the fields listed in the following table need to be statically configured.

Table 21: Network Configuration fields

<table>
<thead>
<tr>
<th>Static setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP Address</td>
<td>IP address of the phone</td>
</tr>
<tr>
<td>Subnet Mask</td>
<td>Subnet mask used by the phone</td>
</tr>
<tr>
<td>Default Router 1</td>
<td>Primary gateway used by the phone</td>
</tr>
<tr>
<td>DNS Server 1</td>
<td>Primary DNS server used by the phone</td>
</tr>
<tr>
<td>DNS Server 2</td>
<td>Optional backup DNS server used by the phone</td>
</tr>
<tr>
<td>TFTP Server 1</td>
<td>Primary TFTP server used by the phone</td>
</tr>
<tr>
<td>TFTP Server 2</td>
<td>Optional backup TFTP server used by the phone</td>
</tr>
<tr>
<td>Domain Name</td>
<td>Name of the DNS in which the phone resides</td>
</tr>
</tbody>
</table>

Set Up Alternate TFTP Server

If you use DHCP to direct the phones to a TFTP server, you can also assign an alternative TFTP server to some phones instead of the one assigned by DHCP.

Note

If you disable DHCP, then you must use these steps to set up the TFTP server for the phone.

To assign an alternate TFTP server to a phone, follow these steps:
Procedure

Step 1 Choose the network profile that you want to configure.
Step 2 In the TFTP area, choose the option Use the following TFTP servers.
Step 3 You must enter the required IP addresses. See Network Configuration Fields When DHCP Not in Use, on page 93 for descriptions of these fields.
Step 4 Click Save to make the change.

Set Up Advanced Profile Settings

The Network Profiles in the Settings menu enable the settings for QoS, bandwidth, and power. The Traffic Specification (TSPEC) parameters are used to advertise information about generated traffic for Call Admission Control (CAC) to the AP. The parameters are:

**Minimum PHY rate**

Lowest rate that outbound traffic is expected to use before the phone roams to another AP.

**Surplus Bandwidth Allowance**

Fractional number that specifies the excess allocation of time and bandwidth above application rates required to transport a MAC service data unit (MSDU) in a TSPEC frame.

---

**Note**

If your wireless LAN has access points that use 802.11b and you plan to use Call Admission Control (CAC) with TSPEC, then you need to modify the PHY rate to a supported rate for your 802.11b access points.

To make changes to the advanced settings, follow these steps:

Procedure

Step 1 Choose the network profile that you want to configure.
Step 2 Click the Advanced Profile link at the top of the page.
Step 3 In the TSPEC Setting area, Cisco recommends that you keep the minimum PHY rate at 12 Mbps.
   **Note** If you are using 802.11b APs and plan to use Call Admission Control (CAC) with TSPEC, then set the PHY Rate to a rate that the APs support such as 11 Mbps.
Step 4 In the Surplus Bandwidth field, enter the appropriate values.
Step 5 In the 802.11G Power Settings area, check only the channels that are used in your WLAN, so that the phone scans for only those channels.
In the Max Tx Power field, keep the default value.
Step 6 In the 802.11A Power Settings area, check only the channels that are used in your WLAN, so that the phone scans for only those channels.
In the Max Tx Power field, keep the default value.
Caution  You must check at least one channel after using Clear All, to enable the phone to access the WLAN.

Step 7  Click Save to make the change.

IP Network Settings, on page 92
Set Up Alternate TFTP Server, on page 93

Set Up USB Settings on PC

To use the USB cable from your PC to a phone, you must configure the USB settings to work with the USB port on the PC. The phone has a default USB IP address of 192.168.1.100. You can change the USB port configuration on the phone in these ways:

- To obtain the IP address automatically, by getting an IP address from the PC that has DHCP set up.
- To use the IP address and subnet mask assigned in this area.

To display the USB Settings area, access the web page for the phone as described in Access Phone Web Page, on page 69, and then click the USB Settings hyperlink.

To change the USB port settings for the phone, follow these steps:

Procedure

Step 1  On the phone web page, choose the USB Settings hyperlink.

Step 2  Choose one of the following options:

- Obtain IP address automatically
- Use the following IP address

Step 3  To change the static IP address, in the IP Address field, enter a new IP address that is not assigned on the subnet.

Step 4  To change the subnet for the new IP address, in the Subnet Mask field, enter the appropriate subnet mask.

Step 5  Click Save to make the change.
Set Up Trace Settings

You can use the Trace Settings area on the web page to configure how the phone creates and saves trace files (often used in troubleshooting). Because trace files are stored in the memory of the phone, you can control the number of files and the data that you want to collect. Trace Settings Fields, on page 98 describes these configurable items.

**Note**

When preserving trace logs, choose only the logs that need to be saved after the phone is powered off and powered on to avoid using up phone memory.

To display the Trace Settings area, access the web page for the phone as described in the Access Phone Web Page, on page 69, and then click the Trace Settings hyperlink under Setup. For information about the fields, see Trace Settings Fields, on page 98.

**Note**

- When set to False, the trace logs are lost when the phone is powered off.
- When the phone is powered off, then powered back on, the Preserve Logs field is reset to False, the default value.

There are various levels of tracing available that provide different levels of messaging:

- Emergency
- Alert
- Critical
- Error
- Warning
- Notice
- Info
- Debug

To change the trace settings for the phone, follow these steps:
**Procedure**

**Step 1**  On the phone web page, choose the **Trace Settings** hyperlink.

**Step 2**  In the Number of Files field, choose the number of trace files to save, from 2 to 10.

**Step 3**  In the Remote Syslog Server area, check the box to enable a server to collect the trace files.

**Step 4**  If you enabled the syslog server, you must complete these fields:

- **IP Address**
  - Enter server IP address.

- **Port**
  - Enter a port number (514, 1024-65535).

**Step 5**  In the Module Trace Level area, check only the modules for which you want data:

- Kernel
- Wireless LAN Driver
- Wireless LAN Manager
- Configuration
- Call Control
- Network Services
- Security Subsystem
- User Interface
- Audio System
- System
- Java
- Bluetooth

**Step 6**  In the Advanced Trace Settings area, in the Preserve Logs field, choose one of the following:

- **True**
  - Save the trace logs to flash memory on the phone.

- **False**
  - Save the trace logs to RAM.

**Step 7**  Click **Save** to make the changes.

### Set Up Wavelink Settings

The Cisco Unified Wireless IP Phone supports the use of the Wavelink Avalanche server to configure the phone, which can be set up as a Wavelink Avalanche client device. Configuration Utility for Wavelink Avalanche can be installed on the Wavelink Avalanche server to configure a single phone or multiple phones with common settings. For more information, see [Wavelink Avalanche Server](onpage133).

You can use the phone web page to assign attributes to the phone that can be used to distinguish it from other mobile devices connected to the Wavelink server. These attributes can be used as search criteria for locating phones on the Wavelink server. For example, the predefined ModelName parameter with a value of CP7925G identifies a device as a Cisco Unified Wireless IP Phone 7925G or Cisco Unified Wireless IP Phone 7925G-EX, while CP7926 identifies a device as a Cisco Unified Wireless IP Phone 7926G.

By default, the parameters are configured as follows:

- ModelName = CP7925 or CP7926
- EnablerVer = 3.11-01

**Note**

For more information about using the Wavelink Avalanche server, see [Wavelink Server IP Address Setup](onpage134).

To configure Wavelink parameters using the phone web page, follow these steps:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preserve Logs</td>
<td>True: Save trace logs after powering off the phone</td>
</tr>
<tr>
<td></td>
<td>False: Delete trace logs</td>
</tr>
<tr>
<td>Reset Trace Settings upon</td>
<td>You can enable debugging by configuring various settings on the Trace</td>
</tr>
<tr>
<td>Reboot</td>
<td>Configuration. These options determine how trace settings are handled</td>
</tr>
<tr>
<td></td>
<td>when you reboot:</td>
</tr>
<tr>
<td></td>
<td>• Yes: Default value. Settings will be reset to the default values upon</td>
</tr>
<tr>
<td></td>
<td>reboot.</td>
</tr>
<tr>
<td></td>
<td>• No: Trace settings will not reset upon reboot.</td>
</tr>
</tbody>
</table>
**Procedure**

**Step 1** From the phone web page, choose **Wavelink Settings**.

**Step 2** In the Wavelink Custom Parameters section, enter values for each parameter in the Name and Value fields. You can define up to four pairs of custom parameters.

**Note** Do not use spaces in the Name field.

---

**Phone Book Setup**

Cisco Unified Wireless IP Phone users can store up to 100 contacts in the Phone Book on the phone. As the administrator, you can configure the Phone Book for these phones from the phone web page.

**Note** Before you can access the Phone Book from the phone web page, you must enable the Phone Book Web Access privilege in Cisco Unified Communications Manager Administration.

**Related Topics**

Set Privileges for Phone Web Page, on page 70

---

**Import and Export Contacts**

To import contact information from a file, follow these steps.

**Procedure**

**Step 1** From the phone web page, choose **Phone Book > Import/Export** from the left pane.

**Step 2** At the Phone Book Import & Export page, do one of the following:

- To import a file, browse to it on your PC. Choose one of the following options, and click **Import**:
  - Delete all current contacts before importing
  - Delete only the current contacts that have the same IDs
  - Merge current contacts with imported data

- To export a file, click **Export**. A file with your contact information displays. Save this file to your PC or another storage device.
Import and Export CSV Phone Contacts

When you export or import phone contact records using the Comma Separated Values (CSV) format, you can view, edit, or create records with third-party software such as Microsoft Excel and Microsoft Outlook. After editing or creating records, you can transfer them to the Cisco Unified Wireless IP Phone.

Note

The Cisco Unified Wireless IP Phone 7920G CSV files can be imported into the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G.

Each record contains fields separated by commas. The supported field names are as follows:

• First Name
• Last Name
• Company
• Business Street
• Business City
• Business State
• Business Postal Code
• Business Country
• Home Phone
• Home Speed Dial
• Business Phone
• Business Speed Dial
• Mobile Phone
• Mobile Speed Dial
• Business Fax
• Fax Speed Dial
• Other Phone
• Other Speed Dial (Speed Dial for Other/FAX Phone)
• Primary Phone (must match one of above phone numbers)
• E-mail Address

The following field names generated by the Cisco Unified Wireless IP Phone do not map to Microsoft Outlook by default:

• Nickname
• IM Address
• Unique Identifier (UUID)
Because the importing file may not have the UUID field generated by the Cisco Unified Wireless IP Phone, the import procedure includes the option for the user to use name fields as a way to match the importing record with the existing phone book records on the phone. Deleting or merging matching records is supported.

The First-name and Last-name fields must be matched with the following criteria:

- Use the First-Name and Last-Name to match if one of them is valid.
- Use the Company-Name field if other name fields are empty.

Microsoft Outlook 2003 does not support exporting or importing of Unicode characters. Because Microsoft Outlook 2003 uses the native international language characters when displaying the contacts list, it does not export these characters in the CSV file format. The Cisco Unified Wireless IP Phone uses the UTF-8 to encode the international character sets and Microsoft Outlook 2003 can import or export these characters; however, Microsoft Outlook 2003 may not properly display these characters.

Perform the following steps to import or export the phone book records into a file using CSV format.

**Procedure**

1. Access the web page of the Cisco Unified Wireless IP Phone.
2. Select the **PHONE BOOK** menu.
3. To import, click the **Import** option.
4. Specify how old and duplicated contact records are processed.
5. Click **Create File of Type**.
6. Click **Comma Separated Values (CSV) format**.
7. To export, click the **Export** option. 
   **Note** If a Security Alert window displays, click **Yes**.
8. Click **Open**, **Save**, or **Cancel**.
9. Click **Save** and specify the filename and location.
10. Click **Save** again.
11. Click **Import** after all options are specified.
12. Check the Status web page because it displays the number of valid records that were processed. Because the import function duplicates UUIDs and names, the total number of created contacts on the phone may be less than the total number of records processed.

---

**Search Phone Book**

You can search for contacts in the Phone Book by first name, last name, nickname, or company name.

To perform a search, follow these steps:
**Procedure**

**Step 1** From the phone web page, choose **Phone Book** from the left pane.
**Step 2** At the Phone Book page, enter a search string in the text box and click **Search**. The contact records containing a match will be displayed.

---

**Phone Book Actions**

You can update the information for Phone Book from the phone web page.

**Note** When you enter phone numbers, the web page stores and displays only numeric characters and the symbols # and *.

---

**Add Contact**

To add a contact to the Phone Book, follow these steps.

**Procedure**

**Step 1** From the phone web page, choose **Phone Book** from the left pane.
**Step 2** At the Phone Book page, click **New**. The Phone Book (New Contact) page appears.
**Step 3** Enter information for this contact. If you wish to assign speed dials, see **Assign Speed-Dial Hot Key to Contact Number**, on page 104.
**Step 4** When finished, click **Save**.

---

**Delete Contacts**

To delete contacts from the Phone Book, follow these steps.

**Procedure**

**Step 1** From the phone web page, choose **Phone Book** from the left pane.
**Step 2** At the Phone Book page, select the contacts to delete, and click **Delete**.
**Step 3** To delete all contacts, click **DeleteAll**.
Edit Contact Information

To edit information for a contact, follow these steps:

**Procedure**

**Step 1** From the phone web page, choose **Phone Book** from the left pane.

**Step 2** At the Phone Book page, select a contact. The Phone Book (Edit Contact) page appears.

**Step 3** Change or enter information for this contact. If you wish to assign speed dials, see Assign Speed-Dial Hot Key to Contact Number, on page 104.

**Step 4** When finished, click **Save**.

Assign Speed-Dial Hot Key to Contact Number

You can assign a speed-dial hot key to any contact phone number in the Phone Book.

To assign a speed-dial hot key to a contact number, follow these steps.

**Procedure**

**Step 1** From the phone web page, add a new contact or select a contact record to edit. For more information, see **Add Contact**, on page 103 or **Edit Contact Information**, on page 104.

**Step 2** At the Phone Book (Edit Contact) page or the Phone Book (New Contact) page, click the speed dial icon next to the phone number you wish to assign.

**Step 3** At the Phone Book (Speed Dial List) window, click an unassigned speed dial. The speed dial you selected is assigned to the contact number, and the speed dial code number appears next to the contact number.

**Step 4** Click **Save**.

**Step 5** To change a speed dial assignment, click the speed dial icon again and repeat Step 3.

System Settings

In addition to phone settings, the phone web page includes areas for system management.

**Related Topics**
- Remote Monitoring, on page 195
- Set Date and Time, on page 87
Trace Logs

You can use the Trace Logs area on the web page to view and manage trace files. System trace logs appear in a list on this page. You define how many messages are saved in the Trace Settings area.

To view a trace log, click on the Message.<n> link. The trace log appears in ASCII text. You can save the text file in a directory or on a disk to send to Cisco TAC for troubleshooting purposes.

To download a trace log, click Download. All the trace logs on the phone are then collected into a file named SEP<MAC-ADDRESS-OF-PHONE>_LOGS.tar.gz for a downloading and saving.

---

Note

Trace logs are erased when the phone is powered off.

---

To display the Trace Logs area, access the web page for the phone as described in the PC Setup for Phone Setup, on page 67, and click the Trace Logs hyperlink.

Related Topics

Backup Settings Area

You can use the Backup Settings area on the web page to export the phone configuration. You must set up an encryption key that encrypts the phone settings to keep them secure. When you export a configuration, all the settings in the network profiles, phone settings, USB settings, and trace are copied. None of the statistics or information fields are copied from the web pages.

---

Note

To import a file to a phone, you must enter the same encryption key that was used to export the file.

---

To display the Backup Settings area, access the web page for the phone as described in the Access Phone Configuration Web Page, on page 71, and click the Backup Settings hyperlink. The following table describes the items in this area.

Table 23: Backup Settings area items

<table>
<thead>
<tr>
<th>Item</th>

</table>

**Network Profile Templates**

At initial phone deployment, you can create a typical network profile and export the phone settings to a location that you specify, such as a folder on your PC or your network. Then, you can import the network profile template to several phones to save time.

**Create Phone Configuration Template**

To create a phone configuration template, follow these steps.

**Procedure**

1. **Step 1** Connect the USB cable to the phone and access the phone web page using the instructions on Access Phone Web Page, on page 69.
2. **Step 2** On the phone web page, choose the **Network Profiles** hyperlink and configure the Network Profile settings for your template configuration.
   *Note* You can leave the Username and Password fields blank so they can be configured individually.
3. **Step 3** Next, configure the USB Settings and Trace Settings for your template configuration.
4. **Step 4** Choose the **Backup Settings** hyperlink to access the export and import settings.
5. **Step 5** In the Export Configuration area, enter an encryption key from 8 to 20 characters long. Record this key because you must enter this key to import the configuration template on other phones.
6. **Step 6** Click **Export**. The File Download dialog box appears.
7. **Step 7** Click **Save**.
8. **Step 8** Give your configuration a new file name, such as `7925template.cfg`.
9. **Step 9** Choose a location on your PC or on the network for the file and click **Save**.

**Encrypted Configuration File Contents**

The encrypted configuration file contains these settings:
• Profile Name
• SSID
• Single Access Point
• Call Power Save Mode
• 802.11 Mode
• WLAN Security
• Authentication Method
• User name
• Password
• Passphrase
• Encryption keys
• Use DHCP to get IP address and DNS servers
• Static Settings (if configured)
  ◦ IP Address
  ◦ Subnet Mask
  ◦ Default Router
  ◦ Primary DNS Server
  ◦ Secondary DNS Server

• Use DHCP to get TFTP Server
• Static TFTP Settings (if configured)
  ◦ TFTP Server 1
  ◦ TFTP Server 2

Advanced Network Profile Settings
• Minimum PHY rate
• Surplus Bandwidth
• 802.11G Power Settings (checked ones)
• 802.11A Power Settings (checked ones)

USB Settings (use one of these)
• Obtain IP address from server
• Static settings (if configured)
  ◦ IP address
  ◦ Subnet Mask
Trace Settings

- Number of Files
- Syslog Server (enabled/disabled)
  - IP address
  - Port
- Modules and error level for collection
- Preserving Logs (true/false)

Import Configuration Template

To import a phone configuration template, follow these steps.

Procedure

**Step 1** Connect the USB cable to an unconfigured phone and access the phone web page using the instructions on Access Phone Web Page, on page 69.

**Step 2** On the phone web page, choose the Backup Settings hyperlink.

**Step 3** In the Import Configuration area of the page, enter the Encryption Key.

**Note** You must enter the same key that you used to export the configuration template.

**Step 4** Use the Browse button to locate the configuration template and click Open. The configuration file downloads to the phone.

**Step 5** You can use the web pages to add missing configuration items such as the username and password or make other changes at this time.

Related Topics

- System Settings, on page 104

- Upgrade Phone Firmware, on page 108
- Administration Password Changes, on page 109

Upgrade Phone Firmware

You can use the Phone Upgrade area on the web page to upgrade firmware files on the phones by using the USB connection or by using the WLAN.
Procedure

Step 1
To display the Phone Upgrade area, access the web page for the phone as described in the Access Phone Configuration Web Page, on page 71, and click the Phone Upgrade hyperlink.

Step 2
To upgrade the phone software, enter the phone software TAR (firmware filename) or use the Browse button to locate the firmware file on the network.

Related Topics

- Trace Logs, on page 105
- Backup Settings Area, on page 105
- Administration Password Changes, on page 109

Administration Password Changes

The method you use to change an administration password depends on the communications server being used in your system.

Administration Passwords and Cisco Unified CallManager Release 4.x

If you are running Cisco Unified CallManager Release 4.x, you can use the Change Password area on the web page to change the administration password for the phone web pages.

To change the password on the web page, you must first enter the old password. Enter the new password and then reenter the new password to confirm the change.

To display the Change Password area, access the web page for the phone as described in the Access Phone Configuration Web Page, on page 71, and click the Change Password hyperlink in the System submenu.

Administration Passwords and Cisco Unified Communications Manager Release 5.0 or Later

If you are running Cisco Unified Communications Manager Release 5.0 or later, you must set the password in Cisco Unified Communications Manager Administration on the Phone Configuration page. The password that you set in Cisco Unified Communications Manager takes precedence over the password that you set on the web pages.

⚠️ Caution
When setting the Administration Password in the Product Specific Configuration section in Cisco Unified Communications Manager Release 5.0 Administration, you must enable TFTP encryption. Otherwise, the password appears in readable text in the phone configuration file and can be viewed from any host that has access to TFTP server.

Site Survey Report

Before the Site Survey Report is generated for viewing from the phone web page, you must first run the Site Survey utility from the phone. For more information, see Perform Site Survey, on page 46.

To view the report, go to the phone web page and choose Site Survey from the left pane. An HTML report in the form of a neighbor table of Access Points (AP) displays.

You can also run the Neighbor List utility from the phone to display a list of current APs on the phone. However, this utility will not generate the Site Survey Report that you can access from the phone web page. See also Display Neighbor List, on page 45.

The neighbor table provides a matrix of APs observed during the site survey. Depending on the extent of the survey, not all observed APs will be considered a best AP or an immediate neighbor.

The Site Survey Report stores information about each AP until it reaches a limit of 256 APs. For each AP, up to ten neighbors are tracked.

The following table shows the information shown in the site survey report.

Table 24: Site Survey Report Neighbor Table

<table>
<thead>
<tr>
<th>Information</th>
<th>Description or indicator</th>
</tr>
</thead>
<tbody>
<tr>
<td>Report title</td>
<td>The Service Set Identifier (SSID) used during Site Survey is displayed in the report title.</td>
</tr>
<tr>
<td>Best AP</td>
<td>Information displayed in cell with yellow background and where the row heading matches the column heading (for example, 64%-60/-43):</td>
</tr>
<tr>
<td></td>
<td>• Percentage of time it is the best AP.</td>
</tr>
<tr>
<td></td>
<td>• Received Signal Strength Indicator (RSSI) range during the time it is the best AP.</td>
</tr>
<tr>
<td>Note</td>
<td>A low number (below -65) may indicate insufficient overlap between the best AP and its neighbors.</td>
</tr>
</tbody>
</table>
Information may be displayed in the following way:

- Pink background: If AP is on the same channel as the best AP.

  **Note** Being on the same channel as the best AP might indicate a problem with the channel re-use pattern, particularly if the percentage of time the AP is an immediate neighbor is relatively high compared with other immediate neighbors.

- Asterisk (*): Not an immediate neighbor.

Information displayed in cell (for example, 27%-61/-39):

- Percentage of time the AP is the immediate neighbor of the best AP.
- RSSI range during the time the AP is the immediate neighbor.

The following table lists the information that is provided in the AP details report.

**Table 25: AP Details Report**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP</td>
<td>Name of the AP if it is CCX-compliant; otherwise, the MAC address is displayed here.</td>

Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Settings

- Access Settings Menu, page 115
- Network Profile Settings, page 116
- Phone Settings Menu, page 127
- Set Up Phone Security Certificate, page 130
- Change USB Port Setup, page 131

Access Settings Menu

You can view and change many network configuration options and phone settings for the Cisco Unified Wireless IP Phone by using the Settings menu.

Note

You can control whether a Cisco Unified Wireless IP Phone has access to the Settings menu from the Cisco Unified Communications Manager Administration Phone Configuration page. Use the Settings Access field in the Product Specific Configuration section of the phone configuration page. For more information, see Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162.

To access the Settings menu, follow these steps:

Procedure

Step 1

Press \( \downarrow \) on the Navigation button for (Settings).

Step 2

Use these menu options to view or change settings:

- Phone Settings
- Network Profiles
These options are configurable; other options are display only.

**Step 3** To select the item that you want to configure or view, perform one of these actions:

- Use the **Navigation** button to scroll to the item and then press the **Select** button.
- Use the keypad to enter the number that corresponds to the item.

**Step 4** If a menu option is locked **🔒**, press ****# on the keypad to unlock the option.

When the menu is unlocked, **🔒** displays.

---

**Network Profile Settings**

On the Cisco Unified Wireless IP Phone, you can configure four network profiles for a specific WLAN. Users who travel between company locations can have separate network profiles for each WLAN location. You can set up profiles with the local SSID, WLAN settings, and authentication information for each location.

**Note** You can control whether a Cisco Unified Wireless IP Phone has access to the Network Profiles menu from the Cisco Unified Communications Manager Administration Phone Configuration page. Use the Settings Access field in the Product Specific Configuration section of the phone configuration page.

The following sections provide information about configuring network profiles.

**Related Topics**
- Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162

**Access Network Profile Menu**

To view or configure the Network Profile menu on a Cisco Unified Wireless IP Phone, follow these steps.
Procedure

Step 1 Choose SETTINGS > Network Profiles.

Step 2 To select the profile name that you want to configure, perform one of these actions:

- Use the Navigation button to scroll to the item and then press the Select button.
- Use the keypad to enter the number that corresponds to the item.

The Network Config list is locked.

Step 3 To unlock the network settings in the profile, press * #.

The option unlocks, and displays.

Step 4 To display the profile settings, press View.

Step 5 Scroll to and select one of these menu options:

- Profile Name
- Network Configuration
- WLAN Configuration

Step 6 Make changes to the settings. For more information, see Network Settings, on page 119.

Step 7 To save changes to settings in the Profile menu, press Save.

Step 8 To use the modified profile, scroll to the profile name and press Select. The ✓ appears beside the enabled profiles. You can enable up to four profiles.

Change Profile Name

You can change the default name of the network profile to one that is more meaningful to the user, such as "Headquarters" or "Branch office." You can change the name before or after you make changes to the network profile.

To rename the profile, follow these steps.
Procedure

**Step 1** Choose SETTINGS > Network Profiles.

**Step 2** To select the profile name that you want to change, use the Navigation button to scroll to the item and then press the View button.

**Step 3** Enter **##** to unlock the profile.

**Step 4** Select Profile Name.

**Step 5** Press the softkey to delete each character from right to left. Then enter the new profile name. For information on input restrictions, see Network Profile Data Input Guidelines, on page 118.

**Step 6** Press Options > Save to complete the name change.

Network Profile Data Input Guidelines

When you edit the Network Profile, you can enter characters, numbers, and special characters from the phone keypad. Use the numeric keys on the keypad to enter the number or the assigned characters. Each press moves to another character choice. Use the following guidelines when entering values:

**Enter characters**

Press the numeric key to move to the desired character (lowercase, then uppercase).

**Enter numbers**

Press the numeric key to enter the number.

**Delete the last character**

Press << to delete the last character or number in the string.

**Enter a space**

Press * to enter a space between characters.

**Enter a dot**

Press + to enter a dot between numbers.

**Enter special characters and symbols**

Press one of the following keys to display and enter these characters:

* Press 0 to enter * - / = \ : ;

* Press 1 to enter a space + , . ' " | ~

* Press 2 to enter # ? ( ) { }{

* Press 3 to enter ! @ <> $ % ^ &
Save an entry

Press Options > Save.

Cancel editing mode

Press Options > Cancel as needed to return to the menu option or main screen.

</tr>
</tbody>
</table>
DHCP Settings

The Cisco Unified IP Phones enable DHCP, by default, to automatically assign IP addresses to devices when you connect them to the network. If you do not use DHCP in your network, then you must disable DHCP and manually enter the network configuration information.

Use these guidelines when manually configuring the IP settings:

- Ensure the TFTP server has an IP address.
- Ensure the default router IP address is on the same subnet as the host IP address.

Note

When DHCP is enabled, you cannot configure IP settings, but you can configure an alternate TFTP server.

Disable DHCP

To disable DHCP on the phone and manually configure IP settings, follow these steps:

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose SETTINGS &gt; Network Profiles.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Scroll to the profile name that you want to configure and press the View softkey.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter **# to unlock the profile and press Edit.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Select Network Configuration. Press View.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Scroll to DHCP Enabled and press No.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Scroll to IP Address and press Select.</td>
</tr>
<tr>
<td>Step 7</td>
<td>In the New IP Address field, enter the static IP address for the phone.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Press Options &gt; Validate to save the entry or press Options &gt; Cancel.</td>
</tr>
<tr>
<td>Step 9</td>
<td>After you disable DHCP, you must enter the other required static fields. See Static Settings with Disabled DHCP, on page 122 for descriptions of these fields.</td>
</tr>
</tbody>
</table>

For information about entering values, see Network Profile Data Input Guidelines, on page 118.
Static Settings with Disabled DHCP

<tr>
<td>Alternate TFTP server</td>
<td>Identifies the TFTP server that the phone uses to obtain configuration files.</td>
</tr>
<tr>
<td>TFTPServer 1</td>
<td>Identifies the second TFTP server that the phone can use to obtain configuration files.</td>
</tr>
</tbody>
</table>

Set Alternate TFTP Server

If you use DHCP to direct the phones to a TFTP server, you can also assign an alternative TFTP server to some phones instead of the one assigned by DHCP. To assign an alternate TFTP server to a phone, follow these steps:

Procedure

Step 1 Choose SETTINGS > Network Profiles.
Step 2 To select the profile name that you want to configure, scroll to the item and press the View button.
Step 3 Enter **# to unlock the profile and press Edit.
Step 4 Select Network Configuration.
Step 5 Scroll to Alternate TFTP and press Yes.
Step 6 Scroll to TFTPServer 1 and press Select.
Step 7 In the New TFTPServer 1 field, enter the IP address for the server.
See Static Settings with Disabled DHCP, on page 122 for descriptions of these fields.
For information about entering values, see Network Profile Data Input Guidelines, on page 118.

**Step 8** Press Options > Validate to save the entry or press Options > Cancel.

---

### Change Cisco Discovery Protocol Settings

Some network devices do not use Cisco Discovery Protocol (CDP).

To change whether the phone transmits CDP packets and settings associated with CDP, follow these steps in Cisco Unified Communications Manager Administration:

**Procedure**

**Step 1** Choose Device > Phone.
**Step 2** Click Find and locate the phone in the displayed list.
**Step 3** Scroll to Device Information.
**Step 4** Scroll to Cisco Discovery Protocol (CDP).
**Step 5** Click Enabled from the drop-down menu.
**Step 6** Click Save and Reset, if prompted.

---

### Erase Network Profile Configuration

You can erase the network profile configuration and return to the default settings.

To erase the configuration, follow these steps:

**Procedure**

**Step 1** Choose SETTINGS > Network Profiles.
**Step 2** To select the profile name that you want to configure, scroll to the item and press the View button.
**Step 3** Enter **#** to unlock the profile and press Edit.
**Step 4** Select Network Configuration.
**Step 5** Scroll to Erase Configuration and press Yes to erase or No.

---

Phone Settings Menu

The Phone Settings menu enables configuration of individual phones with ringtones or volume levels, display settings, keypad settings, and home page settings.

**Note**

You can control whether a Cisco Unified Wireless IP Phone has access to the Phone Settings menu from the CiscoUnified Communications Manager Administration Phone Configuration page. Use the Settings Access field in the Product Specific Configuration section of the phone configuration page.

**Related Topics**

- Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162

Set Up Phone Settings

To access the Phone Settings menu options on a Cisco Unified Wireless IP Phone, follow these steps.

**Procedure**

1. Choose SETTINGS > Phone Settings.
2. Press the number for the setting that you want to configure or scroll to the setting and press the Select button.
3. Press the number for the setting category or scroll to the setting and press the Select button.
4. Press the number for the setting that you want to change or scroll to the setting and press the Select button.
   For descriptions of the settings, see Phone Settings Fields, on page 128. For specific instructions to change these settings, see "Configure Phone Settings" in the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide.
Phone Settings Fields

The following table describes the fields in the Phone Settings page.

*Table 29: Configurable Settings for the Phone Sounds, Display, and Keypad*

Set Up Phone Security Certificate

Security features establish and maintain authenticated communication streams between the phone and the Cisco Unified Communications Manager server, and digitally sign files before they are delivered.

A Locally Significant Certificate (LSC) installs on phones after you perform the necessary tasks associated with the Certificate Authority Proxy Function (CAPF). You can use Cisco Unified Communications Manager Administration to configure an LSC, as described in the *Cisco Unified Communications Manager Security Guide*.

Alternatively, you can initiate the installation of an LSC from the Security Configuration menu on the phone. This menu also lets you update or remove an LSC.

Before you do so, ensure that the appropriate Cisco Unified Communications Manager and the CAPF security configurations are complete:

- The CTL file must have a CAPF certificate.
- The CAPF certificate must exist in the /usr/local/cm/.security/certs folder in every server in the cluster.
- The CAPF is running and configured.

For more information on certificates, see *Cisco Unified Communications Manager Security Guide*. For more information about the security features, see *Security Features*, on page 14.

Depending on how you have configured the CAPF, this procedure installs an LSC, updates an existing LSC, or removes an existing LSC.

To configure an LSC on the phone, perform the following steps.

### Phone setting | Description
--- | ---
Device List | Displays the list of Bluetooth devices available to the phone.

### Diagnostics

| Phone setting | Description |
--- | --- |
Keypad | Performs a diagnostic routine to check a button on the keypad. |
Audio | Causes the phone to ring to check the speaker. |
WLAN | Checks the WLAN. |
Scanner (Cisco Unified Wireless IP Phone 7926G only) | Checks the bar code scanner. |

### Related Topics

- [Access Settings Menu](#), on page 115
- [Network Profile Settings](#), on page 116
- [Set Up Phone Security Certificate](#), on page 130
- [Phone Settings Menu](#), on page 127
**Procedure**

**Step 1**
Obtain the CAPF authentication string that was set when the CAPF was configured.

**Step 2**
Choose SETTINGS > System Configuration > Security.

**Step 3**
Press * * # to unlock the option.

**Step 4**
Scroll to LSC and press Update. The phone prompts for an authentication string.

**Step 5**
Enter the authentication string and press Submit. The phone begins to install, update, or remove the LSC, depending on how the CAPF was configured. During the procedure, a series of messages appears in the LSC option field in the Security Configuration menu so that you can monitor progress. When the procedure completes successfully, the phone will display Installed or Not Installed.

The LSC install, update, or removal process can take a long time to complete. You can stop the process at any time by pressing Stop from the Security Configuration menu. Settings must be unlocked before you can press this softkey.

When the phone successfully completes the installation procedure, it displays Success. If the phone displays Failed, the authorization string may be incorrect or the phone may not be enabled for upgrading. See the error messages generated by the CAPF and take appropriate actions.

**Step 6**
To verify that an LSC is installed on the phone, choose SETTINGS > System Configuration > Security. The LSC displays Installed.

## Change USB Port Setup

When using the USB cable to configure a phone, you might need to change the USB configuration. The phone has a default USB IP address of 192.168.1.100 that you can use with the USB connection to the PC. If you need to change the USB port configuration, these options are available:

- Obtain the IP address automatically, by getting an IP address from the PC with DHCP set up.
- Use the IP address and subnet mask assigned in your area.

To view or configure the USB port configuration on a Cisco Unified Wireless IP Phone, follow these steps:

**Procedure**

**Step 1**
Choose SETTINGS > System Configuration > USB.

**Step 2**
To open the menu, press the Select button.

**Step 3**
Press * * # to unlock the menu.

**Step 4**
To configure DHCP, press Select and choose one of these options:
To obtain an IP address automatically from the PC, choose **Enable**, then press **Save**. You have completed the USB configuration.

To use a static IP address, choose **Disable**, then press **Save**.

**Note** If you disabled DHCP, you must enter an IP address and a subnet mask by performing Steps 5 through 12.

**Note** Do not perform the following steps if DHCP is enabled.

**Step 5** To change the static IP address, scroll to **IP Address**, and press **Select**.

**Step 6** Enter a new IP address that is not assigned on the subnet.

**Step 7** To save the changes, press **Options > Save**.

**Step 8** To change the subnet for the new IP address, scroll to **Subnet Mask** and press **Select**.

**Step 9** Enter the appropriate subnet address.

**Step 10** To save the changes, press **Save**.

Wavelink Avalanche Server

- Wavelink Avalanche Server Overview, page 133
- Before You Begin, page 133
- Best Practices, page 134
- Wavelink Server IP Address Setup, page 134
- Set Up and Use CU, page 135
- Install CU File, page 137
- Update Configuration Files, page 137
- Update Phone, page 144

Wavelink Avalanche Server Overview

This chapter describes the Wavelink Avalanche Management Console and how to use it to configure the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G. The Configuration Utility (CU) for Wavelink Avalanche can be installed on the Wavelink Avalanche Management Console and used to configure a single phone or multiple phones with common settings.

Note
Not all features can be configured using Wavelink. Some features can only be configured from Cisco Unified Communications Manager Administration.

Before You Begin

Before you can use the Wavelink Avalanche Management Console to configure phones, ensure that you have the necessary components and follow the best practices during your setup.

The following components are required for configuring the phone using the Wavelink Avalanche server:

- Wavelink Avalanche software:
Best Practices

This section describes the best practices recommended for setting up and using the CU on the Wavelink Avalanche server.

- Ensure that the phone is registered to Cisco Unified Communications Manager.
- Try out this process with one or two phones before deploying to many phones.
- Set up a VLAN that has access only to the Wavelink server.
- Configure DHCP Option 149 with the Wavelink server IP address. If you do not configure this option, see Set Up Wavelink Server Address from Phone, on page 134.
- Configure a Cisco Access Point to use a default SSID of "cisco" with open authentication and no encryption.

Wavelink Server IP Address Setup

If you did not configure DHCP Option 149 with the Wavelink server IP address, you must manually assign it.

Note

Do not perform this task if you previously configured the Wavelink server address using DHCP Option 149.

The following sections describe the methods to assign the Wavelink server on the phone.

Set Up Wavelink Server Address from Phone

To assign the Wavelink server from the phone, follow these steps.
Procedure

Step 1  Turn on the phone.
Step 2  Verify that the phone is installed with the required firmware version and is registered to Cisco Unified Communications Manager.
Step 3  Choose SETTINGS > System Configuration > Wavelink.
Step 4  To unlock the phone, press **#**.
Step 5  In the Alternate Wavelink Server option, choose Yes.
Step 6  Enter the IP address of the Wavelink server, and press Save.

Set Up Wavelink Server Address from Phone Web Page

To assign the Wavelink server using the phone web page, follow these steps.

Procedure

Step 1  From the phone web page, choose Wavelink Settings from the left pane. Under Wavelink Settings, make sure that the server is enabled.
Step 2  Click Use the following Server and enter the IP address of the server.
Step 3  Click Save.

Set Up and Use CU

This section describes the tasks for configuring and using the CU from the Wavelink Management Console.

Note The CU is labeled as 7921G but the CU works for all 792X phones.

To set up and use the CU from the Wavelink Management Console, perform the following tasks.

Procedure

Step 1  Assign attributes for the phone. For more information, see Phone Attributes Setup, on page 136.
Step 2  Install the CU on Wavelink. For more information, see Install CU File, on page 137.
Step 3  Update the configuration files. For more information, see Update Configuration Files, on page 137.
Step 4  Update the phones. For more information, see Phone Attributes Setup, on page 136.
Phone Attributes Setup

You can assign attributes on the Cisco Unified Wireless IP Phone that can be used to distinguish it from other mobile devices connected to the Wavelink server. These attributes can be used as search criteria for locating phones on the Wavelink server. For example, the predefined ModelName field of CP7925G is used to identify a device as the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G.

To assign attributes, use the Wavelink Management Console, the phone UI, or the phone web page:

- If you use the Wavelink Management Console, choose the Add Properties option from the Client Settings option (for a single phone) or the Edit Device Properties option (for a mobile device group). For more information, see the Wavelink Avalanche server documentation.
- If you assign attributes from the phone or phone web page, use the following sections to define values for the CustomName and CustomValue fields.

Define CustomName and CustomValue on Phone

To define the CustomName and CustomValue fields from the phone, follow these steps:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>On the main phone screen, choose SETTINGS &gt; System Configuration &gt; Wavelink.</td>
</tr>
<tr>
<td>2</td>
<td>Unlock the phone by pressing **#.</td>
</tr>
<tr>
<td>3</td>
<td>Scroll to a CustomName, enter an attribute name (for example, “User”), and click <strong>Save</strong>.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Only alphanumeric characters are allowed in the CustomName field.</td>
</tr>
<tr>
<td>4</td>
<td>Scroll to CustomValue and enter a value for the corresponding CustomName (for example, “Admin”), and click <strong>Save</strong>.</td>
</tr>
<tr>
<td></td>
<td>You can define up to four pairs of custom parameters.</td>
</tr>
</tbody>
</table>

Define Custom Parameters from Phone Web Page

To define customer parameters from the phone web page, follow these steps:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>From the phone web page, choose Wavelink Settings.</td>
</tr>
<tr>
<td>2</td>
<td>In the Wavelink Custom Parameters section, enter values in the Name and Value fields. You can define up to four pairs of custom parameters.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Do not use spaces in the Name field.</td>
</tr>
</tbody>
</table>
Install CU File

The CU file is provided by Cisco in the .ava file format.

---

**Note**

Install the CU on the Wavelink Avalanche Management Console.

For more information, see the Wavelink Avalanche Management Console documentation.

To install the phone CU, follow these steps.

**Procedure**

**Step 1** Launch the Wavelink Avalanche Management Console and connect to the agent.

**Step 2** Choose **Software Management** > **Install Software Package**.

**Step 3** Browse to the location of the .ava file containing the CU and select it.

**Step 4** Click **New** and enter the software collection name under which the phone configuration files will be added.

**Step 5** Follow the instructions on the wizard to complete the installation.

**Step 6** When the installation completes, expand the software collection name on the left pane. The phone CU file name 7925CU appears with a red "x" (disabled) next to it.

**Step 7** Right-click **7925CU** and choose **Enable Package**.

**Note** The installation is complete. The following additional steps are optional. They configure the selection criteria so you can easily apply changes to a device group.

**Step 8** Right-click the software collection (containing the phone CU) and choose **Settings**.

**Step 9** Click the button at right of the Selection Criteria box to launch the Selection Criteria wizard.

**Step 10** Select an item from the Source Properties list on the left, and enter a value in the Selection Expression text box.

**Step 11** Repeat the previous step for each property and value you wish to include. When finished, click **Compile**, and then click **Test Expression**.

**Step 12** Review the list displayed under Matching Clients to ensure the selection criteria have been met.

**Step 13** Click **Apply**, then click **OK**.

---

Update Configuration Files

You can update a phone configuration file using the CU installed on a Wavelink Avalanche Management Console.

The following table lists the configuration file settings.
Table 30: Configuration File Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>For more information, see...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Profile Settings</td>
<td>Profile Settings Fields, on page 138</td>
</tr>
<tr>
<td>WLAN Settings</td>
<td></td>
</tr>
<tr>
<td>Network Settings</td>
<td></td>
</tr>
<tr>
<td>USB Settings</td>

</tr>
<tr>
<td>Trace Settings</td>
<td>Trace Settings Fields, on page 143</td>
</tr>
<tr>
<td>Wavelink Settings</td>
<td>Wavelink Settings Fields, on page 144</td>
</tr>
</tbody>
</table>

To update settings in the phone configuration file, follow these steps:

**Procedure**

**Step 1** Right click 7925CU (in a folder under Software Collections) to launch the CU.

**Step 2** From the left pane, choose the settings you wish to configure:

- Profile Settings
- USB Settings
- Trace Settings
- Wavelink Settings

**Step 3** From the settings page, select or enter information for those settings.

**Step 4** Click Apply.

**Profile Settings Fields**

The following table lists the fields in the Profile Settings screen.

USB Settings Field

You can change the IP address of the USB port on your phone by choosing one of the following options in the DHCP Enabled field:

Yes
Obtains an IP address automatically.

No
You can specify the IP address and subnet mask on this page.

Related Topics
Set Up USB Settings on PC, on page 95

Trace Settings Fields

You can configure trace settings to determine how the phone creates and saves trace files. The following table describes the trace settings.

Table 32: Trace Settings

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Files</td>
<td>Choose the number of trace files that the phone saves, from 2 to 10 files.</td>
</tr>
<tr>
<td>Enable Remote Syslog</td>
<td>Set up a remote server to store trace logs. If enabled, enter remote address and remote port.</td>
</tr>
<tr>
<td>Remote IP Address</td>
<td>Enter remote IP address if Enable Remote Syslog is enabled.</td>
</tr>
<tr>
<td>Remote Port</td>
<td>Enter a port number if Enable Remote Syslog is enabled. Valid values are: 514 and 1024 to 65535.</td>

<td>Assign up to four attribute names to the phone to be used as selection criteria.</td>
</tr>
<tr>
<td>Custom Value 1-4</td>
<td>Define the values for each Custom Name to be used as selection criteria.</td>
</tr>
</tbody>
</table>

### Update Phone

When you have completed the phone configuration changes, you must export the configuration file from the phone CU to Wavelink, and then update the phone.

**Note**

The CU does not perform a complete validation of the phone configuration. If the configuration file contains an invalid setting, the phone may reject the configuration and send an error message to the syslog.

To update the phone with the updated configuration file, perform the following steps.
Procedure

**Step 1**  From the CU, select the configuration file, and then choose **Export to Wavelink**.

**Step 2**  At the Success window, click **OK**. A message indicating the file transfer is complete appears at the bottom of the window.

**Step 3**  To update a mobile device group, select it from the left pane, and choose **Update Now (Disallow User Override)**.

**Step 4**  To update a single device, expand a mobile device group or software collection from the left pane, right-click on the device listed in the right pane, and do one of the following actions:

  - Choose **Update Now**.
  
  - Choose **Client Settings**. In the Avalanche Client Controls window, check the **Force package sync during Update Now** check box, and click **Update Now**.
CHAPTER 7

Features, Templates, Services, and Users

Features, Templates, Services, and Users Overview

This chapter provides an overview of the feature configuration and setup, softkey template modification, services setup, and user assignment in Cisco Unified Communications Manager Administration. Cisco Unified Communications Manager documentation provides detailed instructions for these procedures.

For suggestions about providing users with information for using the phone and features, see Internal Support Website, on page 231. For information about setting up phones in non-English environments, see International User Support, on page 235.
Cisco Unified Wireless IP Phones Setup in Cisco Unified Communications Manager

To provide telephony call routing and call-control features for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, you must use Cisco Unified Communications Manager Administration. For instructions about adding these devices, see the “Cisco Unified IP Phone Configuration” chapter in the Cisco Unified Communications Manager Administration Guide.

Telephony Features Available

The following table describes supported telephony features that you can configure using Cisco Unified Communications Manager Administration for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G. The table provides references to documentation that contains configuration procedures and feature information.

For information about using the features on the phone, see Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide for Cisco Unified Communications Manager.

---

**Note**
Cisco Unified Communications Manager Administration also provides several service parameters that you can use to configure various telephony functions. For more information about service parameters and the functions that they control, you can use the I or ? button on the Cisco Unified Communications Manager configuration page.

Table 34: Telephony Features for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Configuration Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 GHz Channel Support for Thailand</td>
<td>Enables the wireless phones to use the 5 GHz channel in Thailand.</td>
<td>For more information, see Radio Frequency Ranges, on page 25.</td>
</tr>
<tr>
<td>7926G J2ME Memory Increase</td>
<td>Increases the amount of Java MIDP memory available for the Cisco Unified Wireless IP Phone 7926G.</td>
<td>No configuration required.</td>
</tr>
<tr>
<td>792x USB Driver Support for Microsoft Windows 7</td>
<td>Enables USB driver support for Microsoft Windows 7.</td>
<td>No configuration required.</td>
</tr>

<td>Feature</td>
<td>Description</td>
<td>Configuration Reference</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Abbreviated Dialing</td>
<td>Allows users to speed dial a phone number by entering an assigned code (1-99) on the phone keypad. Users assign the codes from the User Options web pages.</td>
<td>For more information, see: • <em>Cisco Unified Communications Manager Administration Guide</em>, &quot;Cisco Unified IP Phone Configuration&quot; chapter • <em>Cisco Unified Communications Manager System Guide</em>, &quot;Cisco Unified IP Phone&quot; chapter</td>
</tr>
<tr>
<td>Auto Answer</td>
<td>Connects incoming calls automatically after a ring or two to the speakerphone or headset if attached.</td>
<td>For more information, see the <em>Cisco Unified Communications Manager Administration Guide</em>: • For Cisco Unified Communications Manager Release 5.0 or later, see the &quot;Configuring Directory Numbers&quot; chapter • For Cisco Unified Communications Manager Release 4.x, see the &quot;Phone Configuration&quot; chapter</td>
</tr>
<tr>
<td>Auto-pickup</td>
<td>Allows a user to use one-touch pickup functionality for call pickup, group call pickup, and other group call pickup.</td>
<td>For more information, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, &quot;Call Pickup Group Configuration&quot; chapter.</td>
</tr>
<tr>
<td>Barge</td>
<td>Allows a user to join a non-private call on a shared phone line. Barge features include cBarge, Barge, and Single Button Barge. • cBarge adds a user to a call and converts it into a conference, allowing the user and other parties to access conference features. • Barge adds a user to a call but does not convert the call into a conference. • Single Button Barge enables users to Barge or cBarge into a remote-in-use call on a shared line. The phones support Barge in two conference modes: • Built-in conference bridge at the target device (the phone that is being barged). This mode uses the <strong>Barge</strong> softkey. • Shared conference bridge. This mode uses the <strong>cBarge</strong> softkey. <strong>Note</strong> The Barge and Privacy features work together.</td>
<td>For more information, see: • <em>Cisco Unified Communications Manager Administration Guide</em>, &quot;Device Pool Configuration&quot; chapter • <em>Cisco Unified Communications Manager System Guide</em>, &quot;Cisco Unified IP Phones&quot; chapter • <em>Cisco Unified Communications Manager Features and Services Guide</em>, &quot;Barge and Privacy&quot; chapter</td>

<tr>
<td>Client matter codes (CMC)</td>
<td>Enables a user to specify that a call relates to a specific client matter.</td>
<td>For more information, see the <em>Cisco Unified Communications Manager Features and Services Guide</em>, &quot;Client Matter Codes and Forced Authorization Codes&quot; chapter.</td>
</tr>
</tbody>
</table>
| Conference | Allows a user to talk simultaneously with multiple parties by calling each participant individually. Conference features include Conference, Join, cBarge, and Meet-Me. Allows a noninitiator in a standard (ad hoc) conference to add or remove participants; also allows any conference participant to join together two standard conferences on the same line. The Service parameter, AdvanceAdhocConference, (disabled by default in Cisco Unified Communications Manager Administration) allows you to enable these features. **Note** Be sure to inform your users if these features are activated. | For more information, see:  
  - *Cisco Unified Communications Manager System Guide*, "Cisco Unified IP Phones" chapter  
  - *Cisco Unified Communications Manager System Guide* "Conference Bridges" chapter |
| Configurable call forward display | Allows you to specify information that appears on a phone when a call is forwarded. This information can include the caller name, caller number, redirected number, and original dialed number. | For more information, see:  
  - *Cisco Unified Communications Manager 5.0 or later*—*Cisco Unified Communications Manager Administration Guide*, "Directory Number Configuration" chapter  
  - *Cisco Unified Communications Manager 4.x*—*Cisco Unified Communications Manager Administration Guide*, "Cisco Unified IP Phone Configuration" chapter  
  - *Cisco Unified Communications Manager System Guide*, "Cisco Unified IP Phones" chapter |
<p>| Direct transfer | Allows a user to connect two calls to each other (without remaining on the line). | For more information, see <em>Cisco Unified Communications Manager System Guide</em>, &quot;Cisco Unified IP Phones&quot; chapter. |</p>
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Configuration Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Directed Call Park</td>
<td>Allows a user to transfer an active call to an available directed call park number that the user dials or speed dials. After pressing Transfer, the user dials the directed call park number to store the call. Call Park BLF speed dial enables access to the directed call park number and indicates that the directed call park number is available or unavailable. <strong>Note</strong> If you implement Directed Call Park, avoid configuring the Park softkey. This prevents users from confusing the two Call Park features.</td>
<td>For more information, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, “Call Park and Directed Call Park” chapter.</td>
</tr>
<tr>
<td>Do Not Disturb (DND)–Reject</td>
<td>Enables a user to temporarily stop incoming calls when it is activated. If no call forwarding features are activated, calls to this station are routed to a busy signal or voice mail when DND–Reject is active. Otherwise, all incoming calls are routed to a preassigned call forwarding busy target.</td>
<td>For more information, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, “Do Not Disturb” chapter.</td>
</tr>
<tr>
<td>Dock Icon Support for Cisco Unified Wireless IP Phone 7925G Desktop Charger</td>
<td>An icon displays on the phone screen when the phone is docked in the desktop charger. The phone must be already paired with the desktop charger.</td>
<td>No configuration required.</td>
</tr>
<tr>

<td>Description</td>
<td>Configuration Reference</td>
</tr>
<tr>
<td>------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| DND              | When DND is turned on, no audible rings occur during the ringing-in state of a call or no audible or visual notifications of any type occur. You can configure the phone to have a softkey template with a DND softkey or a phone-button template. | For more information, see:  
  - *Cisco Unified Communications Manager Features and Services Guide*, "Do Not Disturb" chapter  
  - *Cisco Unified Communications Manager Administration Guide* |
<p>| Note             | DND is available in Cisco Unified Communications Manager 6.0 or later.        |                                           |
|                  | The following DND parameters are configurable in Cisco Unified Communications Manager Administration: |                                           |
| <strong>DND</strong>          | This check box allows you to enable DND on a per-phone basis. Use <em>Cisco Unified Communications Manager Administration</em> &gt; Device &gt; Phone &gt; Phone Configuration. |                                           |
| <strong>DND Option</strong>   | Choose &quot;Call Reject&quot; (to turn off all audible and visual notifications), or &quot;Ringer Off&quot; (to turn off only the ringer). DND Option appears on both the Common Phone Profile window and the Phone Configuration window (Phone Configuration window value takes precedence). |                                           |
| <strong>DND Incoming Call Alert</strong> | Choose the type of alert to play, if any, on a phone for incoming calls when DND is active. This parameter is located on both the Common Phone Profile window and the Phone Configuration window (Phone Configuration window value takes precedence). |                                           |
| <strong>BLF Status Depicts DND</strong> | Enables DND status to override busy/idle state. |                                           |
| EU Regulatory Compliance | Enables the WLAN firmware to meet the 2015 European compliance regulations. | No configuration required. |</p>

</tr>
<tr>
<td>Fast Dial Service</td>
<td>Allows a user to enter a Fast Dial code to place a call. Fast Dial codes can be assigned to phone numbers or Personal Address Book entries.</td>
<td>For more information, see <em>Cisco Unified Communications Manager System Guide</em>, “Cisco Unified IP Phone Services” chapter.</td>
</tr>
<tr>
<td>Forced authorization codes (FAC)</td>
<td>Controls the types of calls that certain users can place.</td>
<td>For more information, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, “Client Matter Codes and Forced Authorization Codes” chapter.</td>
</tr>
<tr>
<td>Group call pickup</td>
<td>Allows a user to answer a call ringing on a phone in another group by using a group pickup code.</td>
<td>For more information, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, “Call Pickup Group Configuration” chapter.</td>
</tr>
<tr>
<td>Hold</td>
<td>Allows users to move connected calls from an active state to a held state.</td>
<td>Requires no configuration, unless you want to use music on hold.</td>
</tr>
<tr>
<td>Hold Reversion</td>
<td>Limits the amount of time that a call can be on hold before reverting back to the phone that put the call on hold and alerting the user. Reverting calls are distinguished from incoming calls by a single ring (or beep, depending on the new call indicator setting for the line). This notification repeats at intervals if the call is not resumed. A call that triggers Hold Reversion displays a brief message on the status line. You can configure call focus priority to favor incoming or reverting calls.</td>
<td>For more information about configuring this feature, see <em>Cisco Unified Communications Manager Features and Services Guide</em>, “Hold Reversion” chapter.</td>

Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

Each Cisco Unified IP Phone has special configuration fields in Cisco Unified Communications Manager Administration that are available by phone model. The following product-specific configuration fields are available for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G.

Table 35: Product-Specific Fields

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disable Speakerphone</td>
<td>True or False</td>
<td>Turns off the speakerphone capability of the handset.</td>
</tr>
<tr>
<td>Gratuitous ARP</td>
<td>Enable or disable</td>
<td>Enables or disables the ability for the phone to learn MAC addresses from Gratuitous ARP. This capability is required to monitor or record voice streams.</td>
</tr>
<tr>
<td>Settings Access</td>
<td>Enabled, Disabled, and Restricted</td>
<td>Enables, disables, or restricts access to local configuration settings in the Settings menus. With restricted access, only the Phone Settings menu is accessible. With disabled access, the Settings menu does not display any options.</td>
</tr>
<tr>
<td>Web Access</td>
<td>Read Only, Full, Disabled</td>
<td>Determines the level of access to the web pages for the phone. Provides Disabled, Read only, and Full access to a phone’s web pages through a web browser.</td>
</tr>
<tr>
<td>Profile 1–4</td>
<td>Unlocked or locked</td>
<td>Locks or unlocks the network profiles. If locked, the phone user cannot modify the network profile.</td>
</tr>
<tr>
<td>Load Server</td>
<td>IP address or hostname for the server</td>
<td>Identifies the alternate server that the phone uses to obtain firmware loads and upgrades.</td>
</tr>
<tr>
<td>Special Numbers</td>
<td>up to 16 digits in length</td>
<td>Identifies special phone numbers that do not require unlocking the keypad to call, such as 911 or an emergency number</td>
</tr>
<tr>
<td>Application URL</td>
<td>maximum length is 256 characters</td>
<td>Specifies the URL that the phone uses to contact application services.</td>
</tr>
<tr>
<td>“Send” Key Action</td>
<td>Enable or Disable</td>
<td>When enabled, pressing the green button causes the phone to go off-hook. When disabled, pressing the green button causes the phone to display the list of recently dialed numbers (for last number redial).</td>
</tr>
<tr>
<td>Phone Book Web Access</td>
<td>Enabled or Disabled</td>
<td>Controls the access of the local phone book so that it can be accessed by using the web page for the phone. This parameter works with the Web Access parameter. When Web Access is disabled, the local phone book is not accessible.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Options</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------------</td>
<td>--------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unlock-Settings Sequence (<strong>#</strong>)</td>
<td>Enabled or Disabled</td>
<td>Specifies the unlock settings as **#. If this parameter is enabled, the phone cannot be unlocked using any other key sequence. The user does not have write-access to the phone Settings menu if this parameter is enabled unless the sequence is entered on the phone.</td>
</tr>
<tr>
<td>Application Button Activation Timer</td>
<td>Time in seconds</td>
<td>Specifies the amount of time to hold down the Application button to activate the application.</td>
</tr>
<tr>
<td>Application Button Priority</td>
<td>Low, Medium, High</td>
<td>Indicates the priority of the Application button relative to the other phone tasks.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Low</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specifies that the Application button works only when the phone is idle and on the main screen.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Medium</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specifies that the button takes precedence over all tasks except when the keypad is locked.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>High</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Specifies that the button takes precedence over all tasks on the phone.</td>
</tr>
<tr>
<td>Out-of-Range Alert</td>
<td></td>
<td>Controls the frequency of audible alerts when the phone is out of range of an AP. The phone does not play audible alerts when the parameter value is “disabled.” The phone can beep one time or regularly at 10, 30, or 60 second intervals. When the phone is within range of an AP, the alert stops.</td>
</tr>
<tr>
<td>Scan Mode</td>
<td>Auto, Single AP, Continuous</td>
<td>Controls the scanning by the phone.</td>
</tr>
<tr>
<td></td>
<td>Default: Auto</td>
<td><strong>Auto</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Phone scans when it is in a call or when the received strength signal indicator (RSSI) is low.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Single AP</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Phone never scans except when the basic service set (BSS) is lost.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Continuous</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Phone scans continuously even when it is not in a call.</td>
</tr>
<tr>
<td>Restricted Data Rates</td>
<td>Enable or disable</td>
<td>Enables or disables the restriction of the upstream and downstream PHY rates according to CCX V4 Traffic Stream Rate Set IE (S54.2.6).</td>
</tr>
<tr>
<td>Power Off When Charging</td>
<td>Enable or disable</td>
<td>Indicates whether the phone powers off when it is connected to a charger or placed in a charging station.</td>
</tr>
<tr>
<td></td>
<td>Default: disabled</td>
<td></td>
</tr>
<tr>
<td><strong>Parameter</strong></td>
<td><strong>Options</strong></td>
<td><strong>Description</strong></td>
</tr>
<tr>
<td>---------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Cisco Discovery Protocol</td>
<td>Enable or disable Default: enabled</td>
<td>Enables or disables the Cisco Discovery Protocol on the phone.</td>
</tr>
</tbody>
</table>
| Advertise G.722 Codec     | Use System Default, Disabled, Enabled Default: Use System Default            | Indicates whether the phone advertises the G.722 codec to the Cisco Unified Communications Manager. Codec negotiation involves two steps:
1. The phone must advertise the supported codec to the Cisco Unified Communications Manager (not all endpoints support the same set of codecs).
2. When the Cisco Unified Communications Manager gets the list of supported codecs from all phones involved in the call attempt, it chooses a commonly supported codec based on various factors, including the region pair setting.
Valid values are:
- **Use System Default**
  Defers to the setting specified in the enterprise parameter Advertise G.722 Codec.
- **Disabled**
  Does not advertise G.722 to the Cisco Unified Communications Manager.
- **Enabled**
  Advertises G.722 to the Cisco Unified Communications Manager.
<p>| Home Screen               | Main Phone Screen or Line View Default: Main Phone Screen                    | Enables one of two views on the phone: Main Phone Screen or Line View.          |
| FIPS Mode                 | Enable or disable Default: disabled                                            | Enables or disables the Federal Information Processing Standards (FIPS) mode on the phone. |
| Auto Line Select          | Enable or disable Default: disabled                                            | Enables or disables the Auto Line Select feature on the phone. If enabled, the phone shifts the call focus to incoming calls on all lines. If disabled, the phone shifts only the call focus to incoming calls on the currently used line. |
| Bluetooth                 | Enable or disable Default: enabled                                            | Enables or disables the Bluetooth option on the phone. If disabled, the user cannot enable Bluetooth on the phone. |
| File System Verification  | Enable or disable Default: disabled                                            | Enables the phone to perform a file system integrity check as part of the firmware upgrade process. This parameter is used to troubleshoot file system issues. Enabling this feature may affect phone performance. |</p>
<table>

<td>Default: Enabled</td>
<td>Indicates whether the Java on the phone is enabled or disabled.</td>
</tr>
</tbody>
</table>

### Set Up Product-Specific Options

To configure product-specific options, follow these steps.

**Procedure**

1. **Step 1** From Cisco Unified Communications Manager Administration, choose **Device > Phone**.
2. **Step 2** Perform one of the following actions:
   - For Cisco Unified Communications Manager 4.x or earlier, click **Add a Phone**.
   - For Cisco Unified Communications Manager 5.0 and later, click **Add Phone**.
3. **Step 3** Choose **Phone Type > Cisco7925**.
4. **Step 4** In the Phone Configuration page, locate the **Product Specific Configuration** area.
5. **Step 5** Make changes to the settings as needed. See **Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G**, on page 162 for a description of the fields.
   - **Note** For detailed information about these settings, click the I or ? button for Product Specific Configuration Help.
6. **Step 6** Check the **Override Common Settings** check box to override higher level configuration settings for that feature.
7. **Step 7** Reset the phone to make the changes take effect.

### Disable Java

You can disable Java on the phones if you do not deploy Java applications. Disabling Java frees up phone memory for other tasks. By default, Java is enabled.
Procedure

Step 1  In Cisco Unified Communications Manager Administration, select Device > Phone.
Step 2  Find the phone to be changed.
Step 3  Set the Java field to Enabled or Disabled.
Step 4  Click Save.

Softkey Templates

Administrators can change the order of softkeys for the Cisco Unified Wireless IP Phone by using Cisco Unified Communications Manager Administration. Unlike other Cisco Unified IP Phones that have buttons for some functions, the Cisco Unified Wireless IP Phone has two nonconfigurable softkeys that are set for:

- Message
- Options

When you configure a softkey template for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, you can configure the Cisco Unified Communications Manager softkeys and their sequence in the Options menu only. The order of softkeys in the softkey template corresponds to the phone softkey list in the Options menu. When you set up the softkey template for users that prefer to have a particular softkey appear during a connected call, place the desired softkey in the first position for the Connected phone state.

Standard and Nonstandard Softkey Templates

The standard softkey template displays the Hold softkey when a call is connected. Some users want the Transfer softkey to appear for a connected call instead of Hold.

To change the softkey that displays, you set up a nonstandard softkey template that places Transfer in the first position for the Connected state. You assign this nonstandard softkey template to the Cisco Unified Wireless IP Phone assigned to users that want these softkeys.

Note  To ensure that users hear the voice-messaging greeting when they are transferred to the voice message system, you must set up a softkey template with Transfer as the first softkey for a connected call.

Softkey Template Setup

Use the procedures in the online Help topic, “Adding Non-Standard Softkey Templates” to change the softkeys and their sequence. Softkey templates support up to 16 softkeys for applications. For more information about softkey templates, see the “Softkey Templates” chapter in the Cisco Unified Communications Manager System Guide.
To configure softkey templates, select **Device > Device Settings > Softkey Template** from Cisco Unified Communications Manager Administration. You can modify a standard softkey template by making a copy of it, giving it a new name, and making updates to that copied softkey template. You can also modify a nonstandard softkey template.

To assign a softkey template to a phone, use the Softkey Template field in the Cisco Unified Communications Manager Administration Phone Configuration page. For more information, see the “Softkey Template Configuration” chapter in the *Cisco Unified Communications Manager Administration Guide* and the *Cisco Unified Communications Manager System Guide*.

**Related Topics**

- Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162
- Services Menu, on page 167
- Corporate and Personal Directories, on page 170
- Add Users to Cisco Unified Communications Manager, on page 171

## Phone Button Templates

Phone button templates let you assign lines and features to positions in the Line View. Ideally, you modify templates before registering phones on the network. In this way, you can access customized phone button template options from Cisco Unified Communications Manager during registration.

To modify a phone button template, choose **Device > Device Settings > Phone Button Template** from Cisco Unified Communications Manager Administration. To assign a phone button template to a phone, use the Phone Button Template field in the Cisco Unified Communications Manager Administration Phone Configuration page. For more information about modifying phone button templates, see the "Cisco Unified IP Phones" chapter in the *Cisco Unified Communications Manager System Guide* for your release.

The Cisco Unified Wireless IP Phone can have up to six lines and up to 24 connected calls. The default button template uses position 1 for lines and assigns positions 2 through 6 as speed dial. You can assign the following features to button positions:

- Service URL
- Privacy
- Speed dial

Use softkey features in the Options menu to access other phone features, such as call park, call forward, redial, hold, resume, and conferencing.

## Services Menu

The Services menu on the Cisco Unified Wireless IP Phone gives users access to Cisco Unified IP Phone Services. These services are XML applications or Java MIDlets that enable the display of interactive content with text and graphics on the phone. Examples of services include Push to Talk, directories, stock quotes, and weather reports. Some services, such as Push to Talk, can use the configurable Applications button that is located on the side of the phone.
To create customized XML applications for your site, see the Cisco Unified IP Phone Service Application Development Notes.

Before a user can access any service, two important tasks must be completed:

- The system administrator must use Cisco Unified Communications Manager Administration to configure available services.
- The user must subscribe to services using the Cisco Unified IP Phone User Options application. This web-based application provides a graphical user interface (GUI) for limited end-user configuration of IP Phone applications.

**Note**

For information about extension mobility services for users, see the "Cisco Extension Mobility" chapter in the Cisco Unified Communications Manager Features and Services Guide.

**Related Topics**

- Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162
- Softkey Templates, on page 166
- Corporate and Personal Directories, on page 170
- Add Users to Cisco Unified Communications Manager, on page 171
- Custom Phone Rings Creation, on page 174

**Set Up IP Phone Services**

To set up IP Phone services, follow these steps.

**Procedure**

**Step 1**
Before you set up services, gather the URLs for the sites you want to set up and verify that users can access those sites from your corporate IP telephony network.

**Step 2**
Perform one of the following actions:

- To set up these services in Cisco Unified Communications Manager Administration for Release 4.x, choose **Feature > Cisco IP Phone Services**.
- To set up these services in Cisco Unified Communications Manager Administration for Release 5.0 or later, choose **Device > Device Settings > Phone Services**.

For more information about phone services, see the "Cisco Unified IP Phone Services" chapter in the Cisco Unified Communications Manager System Guide.

**Step 3**
After you configure these services, verify that your users have access to the Cisco Unified Communications Manager User Options web-based application, from which they can select and subscribe to configured services. See **User Phone Features and Services**, on page 233 for a summary of the information that you must provide to end users.
Java MIDlet Support

The Cisco Unified Wireless IP Phone supports the use of Java MIDlets offered by Cisco vendors and third-party developers. Running Java MIDlet applications directly on the phone allows more sophisticated application capabilities than with existing XML services, such as animated graphics, custom user interface objects, advanced network connectivity, and persistent local storage. Because Java MIDlets are an industry standard, developers can use standard Java development tools for building applications.

Cisco Unified Communications Manager IP Phone Service provisioning and subscription interfaces allow explicit provisioning of IP Phone Services using the phone configuration file. This explicit provisioning system allows Java MIDlet applications to be installed and managed on the phone. When a new service is added in the configuration, the phone downloads and installs it. When a service is removed, the phone uninstalls it.

For more information on Java MIDlets, see the Java MIDlet Developers Guide for Cisco Unified IP Phones and the Cisco IP Phone Services MIDlet Software Development Kit.

Java MIDlet Startup

You can enable a Java MIDlet to automatically launch when a phone powers on.

For a MIDlet to automatically launch, the phone must subscribe to the MIDlet application. If the phone is not subscribed to the MIDlet, the automatic launch fails.

To configure a MIDlet to automatically launch, you configure the Idle URL field in the Phone Configuration window of the Cisco Unified Communications Manager Administration with URL to the MIDlet in the following format:

<~MIDlet URL> -minimize

Note
The -minimize must have a space before the hyphen, and there must be no space after the hyphen.

The Idle URL Timer field is not used by the launched URL.

When the phone powers on and registers with the Cisco Unified Communication Manager, the MIDlet automatically launches and minimizes to the background. The user can close the MIDlet manually while the phone is powered on. After the MIDlet is closed, the user can manually launch the MIDlet at a later time or turn the phone off and on to restart the MIDlet.

For more information, see the Cisco Unified Communications Manager Administration Guide and the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide.

Example

To automatically launch the WifiScanner MIDlet, configure the Idle URL field with the following information:

http://<ip address>/MIDlets/WifiScanner.jad -minimize

where <ip address> is the IP address of the server that stores the MIDlet.
Corporate and Personal Directories

The Directory menu on the Cisco Unified Wireless IP Phone gives users access to several directories. These directories can include:

**Corporate Directory**

Allows a user to look up phone numbers for coworkers. To support this feature, you must configure corporate directories.

**Personal Directory**

Allows a user to store a set of personal numbers. To support this feature, you must provide the user with software to configure the personal directory.

**Corporate Directory**

Cisco Unified Communications Manager uses a Lightweight Directory Access Protocol (LDAP) directory to store authentication and authorization information about users of Cisco Unified Communications Manager applications that interact with Cisco Unified Communications Manager. Authentication establishes the users' rights to access the system. Authorization identifies the telephony resources that a user is permitted to use, such as a specific telephone extension.

To install and set up these features, see the *Cisco Unified Communications Manager Administration Guide*, "LDAP System Configuration", "LDAP Directory Configuration", and "LDAP Authentication Configuration" chapters. That manual guides you through the configuration process for integrating Cisco Unified Communications Manager with Microsoft Active Directory, Sun ONE Directory, Netscape Directory, and iPlanet Directory Server.

After you configure the LDAP directory, users can use the Corporate Directory service on the Cisco Unified Wireless IP Phone to look up users in the corporate directory.

**Personal Directory**

Personal Directory consists of the following features:

- Personal Address Book (PAB)
- Personal Fast Dials (Fast Dials)
- Address Book Synchronization Tool (TABSynch)

Users can configure personal directory entries on the Cisco Unified IP Phone. To configure a personal directory, users must have access to the following:

**User Options web pages**

Make sure that users know how to access their User Options web pages. For details, see *User Phone Features and Services*, on page 233.
Obtain Cisco Unified IP Phone Address Book Synchronizer Application

To obtain the installer, follow these steps.

**Procedure**

<table>
<thead>
<tr>

<td>When the file download dialog box displays, click Save.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Send the TabSyncInstall.exe file to all users who require this application.</td>
</tr>
</tbody>
</table>

Add Users to Cisco Unified Communications Manager

Adding users to Cisco Unified Communications Manager Administration allows you to display and maintain information about users and allows each user to perform the following actions:

- Access the corporate directory and other customized directories from a Cisco Unified IP Phone
- Create a personal directory
- Set up speed dial and call forwarding numbers
- Subscribe to services that are accessible from a Cisco Unified IP Phone

You can add users to Cisco Unified Communications Manager using one of these methods:

- To add users individually from Cisco Unified Communications Manager Administration for Release 5.0 or later, choose User Management > End User > Add New.
  
  See "Adding a New User" chapter in Cisco Unified Communications Manager Administration Guide for more information about adding users. See Cisco Unified Communications Manager System Guide for details about user information.

- To add users individually from Cisco Unified Communications Manager Administration for Release 4.x, choose User > Add a New User.

  See "Adding a New User" chapter in Cisco Unified Communications Manager Administration Guide for more information about adding users. See Cisco Unified Communications Manager System Guide for details about user information.

- To add users in batches, use the Bulk Administration Tool. This method also enables you to set an identical default password for all users.
For detailed information, see *Bulk Administration Tool User Guide* (Cisco Unified Communications Manager Release 4.3 or later) or *Cisco Unified Communications Manager Bulk Administration Guide* (Cisco Unified Communications Manager Release 5.0 or later).

**Related Topics**

- Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162
- Softkey Templates, on page 166
- Corporate and Personal Directories, on page 170
- Add Users to Cisco Unified Communications Manager, on page 171
- Custom Phone Rings Creation, on page 174

## User Options Web Pages Management

From the User Options web page, users can customize and control several phone features and settings. For detailed information about the User Options web pages, see *Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide*.

## Set Up User Access to User Options Web Pages

Before a user can access the User Options web pages, you must use Cisco Unified Communications Manager Administration to add the user to a standard Cisco Unified Communications Manager end-user group and associate appropriate phones with the user.

**Note**

You can use Cisco Unified Communications Manager Administration to control user access to the phone web pages. For information about setting Web Access for users, see *Product-Specific Fields for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G, on page 162*.

To set up user access, do the following.

**Procedure**

**Step 1** For Cisco Unified Communications Manager Administration for release 5.x and later:

a) From **User Management > User Group**, choose **User Management > End User**.

b) Add the username.

c) Add the phone.

d) Associate the phone to the user.

e) Add the user to a user group.

**Step 2** For Cisco Unified Communications Manager Administration for Release 4.x, see *Cisco Unified Communications Manager Administration Guide*, "End User Configuration" section.
Customize User Options Web Page Display

Most options that are on the User Options web pages appear by default. However, you must set the following options using Enterprise Parameters Configuration settings in Cisco Unified Communications Manager Administration:

- Show Ring Settings
- Show Line Text Label Settings
- Show Call Forwarding

Note

The settings apply to all User Options web pages at your site.

To specify the options that appear on the User Options web pages, follow these steps.

Procedure

Step 1
From Cisco Unified Communications Manager Administration, choose System > Enterprise Parameters. The Enterprise Parameters Configuration window displays.

Step 2
In the CCMUser Parameters area, specify whether a parameter appears on the User Options web pages by choosing one of these values from the Parameter Value drop-down list box for the parameter:

- **True**
  - Option displays on the User Options web pages (default).
- **False**
  - Option does not display on the User Options web pages.
- **Show All Settings**
  - All call forward settings display on the User Options web pages (default).
- **Hide All Settings**
  - No call forward settings display on the User Options web pages.
- **Show Only Call Forward All**
  - Only Call Forward All Calls displays on the User Options web pages.
Custom Phone Rings Creation

You can customize the phone ring types available at your site by using a set of phone ring sounds provided by Cisco Unified Communications Manager or by creating your own pulse code modulation (PCM) files and editing the RingList.xml file. See the "Custom Phone Rings" chapter in the Cisco Unified Communications Manager Features and Services Guide for more information about customized ringtones.

Security, Device, Model, Status, and Call Statistics Information

Security, Device, Model, Status, and Call Statistics Information Overview

This chapter describes how to use the Settings menus on the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G to view the Security Configuration menu, Device Information menu, Model Information menu, Status menu, and the Call Statistics screen.

Related Topics
- Remote Monitoring, on page 195
- Troubleshooting, on page 209

Display Security Configuration Screen

To view the Security Configuration screen on the Cisco Unified Wireless IP Phone and see information about the security settings, follow these steps.

Procedure

Step 1 Choose SETTINGS > System Configuration > Security.

Step 2 Use the Navigation button to scroll through the items on the Security Configuration screen.

</tr>
</tbody>
</table>
CTL File Screen

The CTL File screen contains these options:

**CTL File**

Displays the MD5 hash of the certificate trust list (CTL) file that is installed in the phone, and provides access to the CTL File menu. If no CTL file is installed on the phone, this field displays Not Installed. If security is configured for the phone, the CTL file installs automatically when the phone reboots or resets. For more information about this file, see "Configuring the Cisco CTL Client" chapter in *Cisco Unified Communications Manager Security Guide*.

- A locked padlock icon in this option indicates that the CTL file is locked.
- An unlocked padlock icon indicates that the CTL file is unlocked.

**CAPF Server**

IP address of the CAPF server used by the phone. Also displays a certificate icon if a certificate is installed for this server.

**Communications Manager/TFTP Server**

IP address of a Cisco Unified Communications Manager and TFTP server used by the phone. Also displays a certificate icon if a certificate is installed for this server.

If neither the primary TFTP server (TFTP Server 1) nor the backup TFTP server (TFTP Server 2) is listed in the CTL file, you must unlock the CTL file before you can save changes that you make to the TFTP Server 1 option or to the TFTP Server 2 option on the Network Configuration menu. For information about changing these options, see DHCP Settings, on page 121.

</tbody>
</table>
When the wireless IP phone is connected to a Cisco Unified Communications Manager Release 5.0 or later, you can have multiple security profiles assigned to a phone. When the phone has more than one security profile using different secure Cisco Unified Communications Manager clusters, you must delete the CTL file from the current profile before enabling another profile. For more information, see Security Profiles, on page 17.

**Lock and Unlock CTL File**

To lock and unlock the CTL file, follow these steps:

**Procedure**

**Step 1** If a CTL file is installed on the phone, choose **Settings > System Configuration > Security > CTL File**.

**Step 2** Scroll to the CTL File menu and press **Select**.

**Step 3** Press **##** to unlock options on the CTL File menu.

**Step 4** If you decide not to continue, press **##** again to lock options on this menu.

**Step 5** Scroll to the CTL option that you want to change and press **Erase**.
After you make the change, the CTL file locks automatically.

**Step 6** To exit the CTL File screen, press **Exit**.

**Trust List Screen**

The Trust List screen displays information about all of the servers that the phone trusts.

The Trust List screen contains these options:

**CAPF Server**

IP address of the CAPF used by the phone. Also displays a certificate icon if a certificate is installed for this server.

**Communications Manager/TFTP Server**

IP address of a Cisco Unified Communications Manager and TFTP server used by the phone. Also displays a certificate icon if a certificate is installed for this server.

**SRST Router**

IP address of the trusted SRST router that is available to the phone, if such a device has been configured in Cisco Unified Communications Manager Administration. Also displays a certificate icon if a certificate is installed for this server.
Access Trust List Screen

To access the Trust List screen on a phone with a CTL file,

Procedure

**Step 1**
Choosing Settings > Security Configuration > Trust List.

**Step 2**
To exit the Trust List screen, press the Exit softkey.

View Status Messages Screen
You can use the Settings menu and Status menu to view status messages for the Cisco Unified Wireless IP Phone. The Status Messages screen displays up to 10 of the most recent status messages that the phone has generated.

You can access this screen at any time, even if the phone has not finished starting up. Network Statistics Fields, on page 189 describes the status messages that might appear. This table also includes actions you can take to address indicated errors.

To view status messages, follow these steps:

Procedure

---

**Step 1** Choose Settings > Status.
**Step 2** Select Status Messages. The list of the status messages displays.
**Step 3** To erase the messages, press Clear.
**Step 4** To exit the screen, press Back.
---

<tbody>
<tr>
<td>Bad MIC on phone</td>
<td>The manufacturing installed certificate (MIC) that is used for security features is corrupted.</td>
<td>For information about how to manage the MIC for your phone, see the &quot;Using the Certificate Authority Proxy Function&quot; chapter in Cisco Unified Communications Manager Security Guide.</td>
</tr>
</tbody>
</table>
| CFG file not found   | Neither the name-based configuration file nor default configuration file were not found on the TFTP Server. | The configuration file for a phone is created when the phone is added to the Cisco Unified Communications Manager database. If the phone has not been added to the Cisco Unified Communications Manager database, the TFTP server generates a CFG File Not Found response.  
  • Phone is not registered with Cisco Unified Communications Manager. 
  You must manually add the phone to Cisco Unified Communications Manager if you are not allowing phones to autoregister. See Cisco Unified Communications Manager Phone Addition Methods, on page 48 for details.  
  • If you are using DHCP, verify that the DHCP server is pointing to the correct TFTP server.  
  • If you are using static IP addresses, check configuration of the TFTP server. See IP Network Settings, on page 92 for details on assigning a TFTP server. |
| CTL Installed        | A certificate trust list (CTL) file is installed in the phone.              | None. This message is informational only.  
For more information about the CTL file, see Cisco Unified Communications Manager Security Guide. |
| CTL update failed    | The phone could not update its certificate trust list (CTL) file.           | Problem with the CTL file on the TFTP server.  
For more information, see Cisco Unified Communications Manager Security Guide. |
| Duplicate IP         | Another device is using the IP address assigned to the phone.              | • If the phone has a static IP address, verify that you have not assigned a duplicate IP address. See IP Network Settings, on page 92 section for details.  
• If you are using DHCP, check the DHCP server configuration. |
<p>| LCS operation failed | The locally significant certificate (LSC) that is used for the security features did not install properly. | For information about how to manage the LSC for your phone, see the &quot;Using the Certificate Authority Proxy Function&quot; chapter in Cisco Unified Communications Manager Security Guide. |</p>
<table>
<thead>
<tr>
<th>Status message</th>
<th>Description</th>
<th>Possible explanation and action</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCS operation complete</td>
<td>The LCS was updated successfully on the phone.</td>
<td>For information about how to manage the LSC for your phone, see the “Using the Certificate Authority Proxy Function” chapter in Cisco Unified Communications Manager Security Guide.</td>
</tr>
<tr>
<td>TFTP Error</td>
<td>The phone does not recognize an error code provided by the TFTP server.</td>
<td>Contact the Cisco TAC.</td>
</tr>
</tbody>
</table>
| TFTP server not authorized      | The specified TFTP server could not be found in the phone CTL. | • The DHCP server is not configured properly and is not providing the correct TFTP server address. In this case, update the TFTP server configuration to specify the correct TFTP server.  
• If the phone is using a static IP address, the phone may be configured with the wrong TFTP server address. In this case, enter the correct TFTP server address in the Network Configuration menu on the phone.  
• If the TFTP server address is correct, there may be a problem with the CTL file. In this case, run the CTL client and update the CTL file, making sure that the proper TFTP servers are included in this file. |
| TFTP timeout                   | TFTP server did not respond.                    | • Network is busy: The errors should resolve themselves when the network load reduces.          
• No network connectivity between the TFTP server and the phone: Verify the network connections.  
• TFTP server is down: Check configuration of TFTP server. |

### View Configuration File Name

You can use the Settings menu and Status menu to determine the name of the configuration file for the Cisco Unified Wireless IP Phone.

To locate the configuration file name, follow these steps:

**Procedure**

1. **Step 1** Choose SETTINGS > Status.
2. **Step 2** Select Status Messages.  
The phone displays the name of the configuration file in the following format:  
SEPmacaddress.cnf.xml or SEPMacaddress.cnf.xml.enc.sgn.
3. **Step 3** To exit the screen, press Back.
Related Topics

</table>
Call Statistics

You can access the Call Statistics screen on the phone to display counters, statistics, and voice quality metrics in these ways:

**During the call**

You can view the call information by pressing the **Select** button twice rapidly.

**After the call**

You can view the call information captured during the last call by displaying the Call Statistics screen.

---

**Note**

You can remotely view the call statistics information using a web browser to access the Streaming Statistics web page. For more information about remote monitoring, see Remote Monitoring, on page 195

A single call can have multiple voice streams, but data is captured for only the last voice stream. A voice stream is a packet stream between two endpoints. If one endpoint is put on hold, the voice stream stops even though the call is still connected. When the call resumes, a new voice packet stream begins, and the new call data overwrites the former call data.

**Related Topics**

- View Status Messages Screen, on page 186

</table>
### Field | Description
---|---
MOS LQK | Score that is an objective estimate of the mean opinion score (MOS) for listening quality (LQK) that rates from 5 (excellent) to 1 (bad). This score is based on audible concealment events due to frame loss in the preceding 8-second interval of the voice stream. For more information, see Voice Quality Monitoring, on page 221.

*Note* The MOS LQK score can vary based on the type of codec that the Cisco Unified IP Phone uses.

Avg MOS LQK | Average MOS LQK score observed for the entire voice stream.

Min MOS LQK | Lowest MOS LQK score observed from start of the voice stream.

Max MOS LQK | Baseline or highest MOS LQK score observed from start of the voice stream.

These codecs provide the following maximum MOS LQK score under normal conditions with no frame loss:

- G.711 gives 4.5
- G.729 A /AB gives 3.7

MOS LQK Version | Version of the Cisco proprietary algorithm used to calculate MOS LQK scores.

CumConcealRatio | Total number of concealment frames divided by total number of speech frames received from start of the voice stream.

IntConcealRatio | Ratio of concealment frames to speech frames in preceding 3-second interval of active speech. If using voice activity detection (VAD), a longer interval might be required to accumulate 3 seconds of active speech.

MaxConcealRatio | Highest interval concealment ratio from start of the voice stream.

Conceal Secs | Number of seconds that have concealment events (lost frames) from the start of the voice stream (includes severely concealed seconds).

SevConcealSecs | Number of seconds that have more than 5 percent concealment events (lost frames) from the start of the voice stream.

DSCP | Information about outbound and inbound previous and current frames.

### Firmware Versions

You can verify the firmware versions that are used on the Cisco Unified Wireless IP Phone by viewing the Firmware Info screen. The firmware version name is in this format:

Product_Name-Model-Protocol.Version Number.Filetype
An example of a firmware release for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G is cmterm-7925-sccp.X-0-0.cop.sgn.

Access Web Page for Phone

To access the web page for a Cisco Unified Wireless IP Phone, perform the following steps.

Procedure

Step 1  Obtain the IP address of the Cisco Unified Wireless IP Phone using one of these methods:

- Search for the phone in Cisco Unified Communications Manager by choosing Devices > Phones. Phones that are registered with Cisco Unified Communications Manager display the IP address on the Find and List Phones web page and at the top of the Phone Configuration web page.

- On the Cisco Unified Wireless IP Phone, press SETTINGS > Device Information > Network and then scroll to the IP Address option.

Step 2  Open a web browser and enter the following URL:

https://<IP_address>

where IP_address is the IP address of the Cisco Unified Wireless IP Phone

Note
Step 3 If the Security Alert dialog box displays a notice to accept the Trust Certificate, click Yes or Always to accept the application.

Step 4 Log in to the web pages with username admin and enter the password Cisco for the phone web pages.

**Cisco Unified IP Phone Web Page Information**

The web pages for a Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G includes these items for monitoring the phone:

- Wireless LAN Statistics: Provides information about the wireless LAN configuration.
- Network Statistics: Provides information about network traffic.
- Stream Statistics: Provides information about voice quality items.

**Related Topics**

Startup and Connectivity Problems

After installing a Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G in your network and adding it to Cisco Unified Communications Manager Administration, the phone should start up as described in the Phone Startup Process, on page 64. If the phone does not start up properly, see the following sections for troubleshooting information.

Incomplete Startup Process

Problem
The phone does not start up and information does not display on the phone.

Cause
When an IP Phone connects to the wireless network, the phone should go through its normal startup process and the phone screen should display information.

If the phone does not complete the startup process, the cause might be due to low RF signal strength, network outages, a dead battery in the phone, or the phone might not be functional.
Solution

To determine whether the phone is functional, follow these suggestions to systematically eliminate potential problems.

1 Verify that the wired network is accessible by placing calls to and from other wired Cisco Unified IP Phones.

2 Verify that the wireless network is accessible:
   • Power on another previously functional Cisco Unified Wireless IP Phone to verify that the access point is active.
   • Power on the Cisco Unified Wireless IP Phone that will not start up and move to a different access point location that is known to be good.

3 Verify that the phone is receiving power:
   • If the message Low Battery appears on the phone screen, the battery might be dead.
   • Insert a new or fully charged battery in the wireless IP phone that will not start up.
   • If you are using the battery, try plugging in the external power supply instead.

4 If the phone does not power up successfully, and never shows the Main screen, try using Recovery Mode:
   • Press both the Push to Talk button and the Speaker button, and then press the Power button.
   • The phone goes into recovery mode and checks the integrity of the firmware files.
   • If an error message appears indicating recovery required, then plug the USB cable into the phone and a PC. See Set Up USB LAN on PC, on page 68.
   • Using a browser, access the web page for the phone. See Access Phone Web Page, on page 69 for instructions.
   • Go to the Phone Recovery section on the web page and upload a new Phone Software TAR file.

If, after you attempt these solutions, the phone still does not start up, contact a Cisco technical support representative for additional assistance.

No Association to Cisco Aironet Access Points

After power on, if a phone continues to cycle through messages displaying on the phone screen, the phone is not associating with the access point properly. The phone cannot successfully start up unless it associates and authenticates with an access point.

The wireless phone must first authenticate and associate with an access point before it can obtain an IP address. The phone follows this start up process with the access point:

1 Scans for an access point
2 Associates with an access point
3 Authenticates using a preconfigured authentication method (using the configured security mode setting)
4 Obtains an IP address
Access Point Settings Mismatch

**Problem**
A configuration mismatch exists between the phone and the AP.

**Solution**
- Check the SSID settings on the access point and on the phone to be sure the SSIDs match.
- Check the authentication type settings on the access point and on the phone to be sure authentication and encryption settings match.

If the **No Service - IP Config Failed** message displays, DHCP failed because the encryption between the access point and phone do not match.

- If using static WEP, check the WEP key on the phone to be sure it matches the WEP key on the access point. Reenter the WEP key on the phone to be sure it is correct.

If open authentication is set, the phone is able to associate to an access point even if the WEP keys are incorrect or mismatched.

Authentication Failed, No AP Found

**Problem**
Authentication returns the **No AP found** message.

**Solution**
- Check whether the correct authentication method and related encryption settings are enabled on the access point.
- Check that the correct SSID is entered on the phone.
- Check that the correct username and password are configured when using LEAP, EAP-FAST, PEAP, or Auto (AKM) authentication.
- If you are using a WPA Pre-shared key or WPA2 Pre-shared Key, check that you have the correct passphrase configured.
- You might need to enter the username on the phone in the domain\username format when authenticating with a Windows domain.
**EAP Authentication Failed Message**

**Problem**
Authentication returns the EAP authentication failed message.

**Solution**
- If you are using EAP, you might need to enter the EAP username on the phone in the domain\username format when authenticating with a Windows domain.
- Check that the correct EAP username and password are entered on phone.

**AP Error - Cannot Support All Requested Capabilities**

**Problem**
Authentication returned the AP Error - Cannot support all requested capabilities message.

**Solution**
On the access point, check that CKIP/CMIC is not enabled for the voice VLAN SSID. The wireless phone does not support these features.

**Phone Does Not Register with Cisco Unified Communications Manager**

If a phone proceeds past the first stage (authenticating with access point) and continues to cycle through the messages displaying on the phone screen, the phone is not starting up properly. The phone cannot successfully start up until it connects to the LAN and registers with a Cisco Unified Communications Manager server. The following sections can assist you in determining the reason that the phone is unable to start up properly.

**Cisco Unified Communications Manager Phone Registration Rejected**

**Problem**
The error message Registration Rejected displays.

**Cause**
A Cisco Unified Wireless IP Phone can register with a Cisco Unified Communications Manager server only if the phone has been added to the server or if autoregistration is enabled.

**Solution**
Review the information and procedures in Add Users to Cisco Unified Communications Manager, on page 171 to ensure that the phone has been added to the Cisco Unified Communications Manager database. Verify that the phone is in the Cisco Unified Communications Manager database, using **Device > Phone > Find**.
from Cisco Unified Communications Manager Administration to search for the phone based on its MAC Address. To determine the MAC address of a phone, see Device Information, on page 179.

If the phone is already entered in the Cisco Unified Communications Manager database, its configuration file may be damaged. See Configuration File Corruption, on page 215 for assistance.

**Phone Cannot Connect to TFTP Server or to Cisco Unified Communications Manager**

**Problem**
If the network is down between the phone and either the TFTP server or Cisco Unified Communications Manager, the phone cannot start up properly.

**Solution**
Ensure that the network is currently running.

**TFTP Server Settings**

**Problem**
The TFTP server setting on the phone is incorrect.

**Cause**
The Cisco Unified Wireless IP Phone uses the TFTP server setting to identify the primary TFTP server to use. If the TFTP server does not respond to the request, then the Communications Manager1 (CM1) shows as TFTP_AS_CM if the phone has not registered with Cisco Unified Communications Manager before.

If the phone has previously registered with Cisco Unified Communications Manager, the Cisco Unified Communications Manager list information is cached in memory. If TFTP fails, you must power cycle the phone to connect to the TFTP server.

The phone tries to create a TCP connection to the TFTP IP address and then to the gateway. If Cisco Unified Communications Manager service is not running on the TFTP server, or if SRST is not running on the gateway, the wireless IP phone may continually cycle while attempting to contact the identified TFTP server.

The Cisco Unified Wireless IP Phone does not cache the IP information passed from the DHCP server, so the TFTP request must be sent and responded to every time the phone power cycles.

**Solution**
If you have assigned a static IP address to the phone, you must manually enter this setting. See IP Network Settings, on page 92.

If you are using DHCP, the phone obtains the address for the TFTP server from the DHCP server. Check the IP address configured in the DHCP server.

You can also enable the phone to use a static TFTP server. Such a setting is particularly useful if the phone was recently moved from one location to another.
For information about determining and changing TFTP server settings, see IP Network Settings, on page 92 or View Configuration File Name, on page 188.

IP Addressing and Routing

Problem
The IP addressing and routing fields may not be correctly configured.

Solution
Verify the IP addressing for the Cisco Unified Wireless IP Phone. If you are using DHCP, the DHCP server should provide these values. If you have assigned a static IP address to the phone, you must enter these values manually.

Note
When the wireless IP phone loses the RF signal (goes out of the coverage area), the phone will not release the DHCP server unless it reaches the timeout state.

Check for these problems:

• DHCP Server: If you have assigned a static IP address to the phone, you do not need to enter a value for the DHCP Server option. If you are using a DHCP server, and the wireless IP phone gets a response from the DHCP server, the information is automatically configured. See Troubleshooting Switch Port Problems, available at this URL: http://www.cisco.com/en/US/products/hw/switches/ps708/products_tech_note09186a008015bfd6.shtml.

• IP Address, Subnet Mask, Primary Gateway: If you have assigned a static IP address to the phone, you must configure settings for these options. See IP Network Settings, on page 92.

If you are using DHCP, check the IP addresses distributed by your DHCP server. Be aware of DHCP conflicts and duplicate IP addresses. See Understanding and Troubleshooting DHCP in Catalyst Switch or Enterprise Networks, available at this URL: http://www.cisco.com/en/US/tech/tk648/tk361/technologies_tech_note09186a00800f0804.shtml.

For information about determining and changing IP addressing, see IP Network Settings, on page 92.

DNS Settings

Problem
The phone has incorrect DNS server information.

Solution
If you are using DNS to refer to Cisco Unified Communications Manager, you must ensure that you have specified a DNS server. You should also verify that there is a CNAME entry in the DNS server for the Cisco Unified Communications Manager system.

You must also ensure that DNS is configured to do reverse look-ups. The default setting on Windows 2000 is to perform forward-only look-ups.

For information about determining and changing DNS settings, see IP Network Settings, on page 92.
Cisco Unified Communications Manager and TFTP Service Status

**Problem**

If the Cisco Unified Communications Manager or TFTP services are not running, phones might not be able to start up properly. However, in such situations, it is likely that you are experiencing a system-wide failure and that other phones and devices are unable to start up properly.

**Cause**

The wireless phone attempts to open a TCP connection to all the Cisco Unified Communications Manager servers that are part of the assigned Cisco Unified Communications Manager group.

**Solution**

If the Cisco Unified Communications Manager service is not running, all devices on the network that rely on it to make phone calls will be affected. If the TFTP service is not running, many devices will not be able to start up successfully.

For more information, see the Cisco Unified Communications Manager documentation.

Configuration File Corruption

**Problem**

If you continue to have problems with a particular phone that other suggestions in this chapter do not resolve, the configuration file might be corrupted.

**Solution**

Create a new phone configuration file. See Create New Configuration File, on page 228.

Cisco Unified Wireless IP Phone Resets Unexpectedly

If users report that their phones are resetting during calls or resetting while idle on their desk, you should investigate the cause. If the network connection and Cisco Unified Communications Manager connection are stable, a Cisco Unified Wireless IP Phone should not reset on its own.

Typically, a phone resets if it has problems connecting to the access point and LAN or to Cisco Unified Communications Manager. The following sections can help you identify the cause of a phone resetting in your network.

Phone Resets Due to Access Point Setup

**Problem**

The AP may not be configured correctly.
Solution
Verify that the wireless configuration is correct. For example, check if the particular access point or switch to which the phone is connected is down.

Related Topics
Site Survey Verification, on page 44

Intermittent Network Outages

Problem
Your network may be experiencing intermittent outages.

Solution
Intermittent network outages affect data and voice traffic differently. Your network might be experiencing intermittent outages without detection. If so, data traffic can resend lost packets and verify that packets are received and transmitted. However, voice traffic cannot recapture lost packets. Rather than retransmitting a lost network connection, the phone resets and attempts to reconnect to the network. Contact the system administrator for information on known problems in the voice network.

DHCP Settings Errors

Problem
The DHCP settings may be incorrect.

Solution
Try the following actions:

• Verify that you have properly configured the phone to use DHCP. See Verify DHCP Setup, on page 229.
• Verify that the DHCP server is set up properly.
• Verify the DHCP lease duration. Cisco recommends that you set the lease duration to 8 days.

Voice VLAN Setup Errors

Problem
If the Cisco Unified Wireless IP Phone appears to reset during heavy network usage (for example, following extensive web surfing on a computer connected to same access point and switch as phone), it is likely that you do not have a voice VLAN or the appropriate QoS settings configured.
Solution

By isolating the wireless phones on a separate auxiliary VLAN, you can use QoS to prioritize the voice traffic over data traffic and improve the voice quality. See Voice QoS in Wireless Networks, on page 35 for details.

Phones Have Not Been Intentionally Reset

Problem

If you are not the only administrator with access to Cisco Unified Communications Manager, you should verify that no one else has intentionally reset the phones.

Solution

You can check if a Cisco Unified IP Phone received a command from Cisco Unified Communications Manager to reset by pressing Applications on the phone and choosing Administrator Settings > Status > Network Statistics.

- If the Restart Cause field displays Reset-Reset, the phone received a Reset/Reset from Cisco Unified Communications Manager Administration.
- If the Restart Cause field displays Reset-Restart, the phone reset because it received a Reset/Restar from Cisco Unified Communications Manager Administration.

DNS or Other Connectivity Errors

Problem

The phone reset continues and you suspect DNS or other connectivity issues.

Solution

If the phone continues to reset, eliminate DNS or other connectivity errors. See Determine DNS or Connectivity Issues, on page 229.

Audio Problems

When users report that active phone calls have poor voice quality that includes choppy audio, static or gaps in audio, or no audio, use the information in this section to identify the cause of the problem.

Related Topics

Roaming and Voice Quality or Lost Connection Problems, on page 219

One-Way Audio or No Speech Path

Problem

One or more people on a call do not hear any audio.
Solution

Use the following list to identify possible causes for the problem:

• Check the access point to see if the transmit power setting matches the transmit power setting on the phone. One-way audio is common when the access point power setting is greater than that of the phone. The phone firmware supports dynamic transmit power control (DTPC). The phone uses the transmit power that the access point advertises upon association.

Note

With DTPC, if Client Transmit Power is set in the access point, the phone automatically uses the same client power setting. If the access point is set for the maximum setting (Max), the access point uses the Transmit Power setting on the phone.

• Check that the access point is enabled for ARP caching. When the phone is in power save mode or scanning, the access point can respond to the wireless IP phone only when ARP caching is enabled.

• Check your gateway and IP routing for voice problems.

• Check if a firewall or NAT is in the path of the RTP packets. If so, you can use Cisco IOS and PIXNAT to modify the connections so that two-way audio is possible.

• Check that the Data Rate setting for the phone and the access point are the same. These settings should match or the phone should be set for Auto.

• Check the phone hardware to be sure the speaker is functioning properly.

• Check the volume settings in the Phone Settings menu.

• Check that the speaker is functioning properly. Adjust the speaker volume setting and call the phone to check the speaker.

Related Topics

Site Survey Verification, on page 44

Ring Volume is Too Low

Problem

User complains that the ringer on the phone is not loud enough.

Solution

To see if the ring volume is set correctly on the phone, choose Settings > Phone Settings > Sound Settings > Volumes. Scroll up for the highest volume.

You can also press the Volume button on the side of the phone and the volume setting appears on the phone screen.
Phone Does Not Ring

Problem
User complains that phone does not ring.

Solution
Check the phone settings:

• To see if the phone is set to ring, choose Settings > Phone Settings > Sound Settings > Alert Pattern, and check that a ring setting is selected.

• To see if a ringtone has been set for the phone, choose Settings > Phone Settings > Ring Tone. If none is set, add a ringtone for the phone.

• To see if the speaker is functioning properly, adjust the ring volume settings to the highest level. Enable keypad tones or call the phone to check the speaker.

Roaming and Voice Quality or Lost Connection Problems

If users report that when they are engaged in an active phone call and walking from one location to another (roaming), the voice quality deteriorates or the connection is lost, use the information in this section to identify the cause of the problem.

Related Topics
Audio Problems, on page 217

Voice Quality Deteriorates While Roaming

Problem
User complains that the voice quality deteriorates while roaming.

Solution

• Check the RSSI on the destination access point to see if the signal strength is adequate. The next access point should have an RSSI value of -67 dBm or greater.

• Check the site survey to determine if the channel overlap is adequate for the phone and the access point to hand off the call to the next access point before the signal is lost from the previous access point.

• Check to see if noise or interference in the coverage area is too great.

• Check that signal to noise ratio (SNR) levels are 25 dB or higher for acceptable voice quality.
Voice Conversation Delays While Roaming

**Problem**
User complains of delays in the voice conversation while roaming.

**Solution**
- Use the Site Survey Utility to see if there is another acceptable access point as a roaming option. The next access point should have a signal of -67 dBm to roam successfully.
- Check the Cisco Catalyst 45xx switch. If Cisco Catalyst 45xx series switches are being used as the main Layer 3 switches in the network, ensure that the supervisor blades are a minimum SUP2+ or later version. The wireless phone (or any wireless client) experiences roaming delays when an earlier version (SUP 1 or SUP2) blade is used.

Phone Loses Cisco Unified Communications Manager Connection While Roaming

**Problem**
User complains that the call gets dropped while roaming.

**Solution**
Check for the following configuration or connectivity issues between the phone and the access point:
- The RF signal strength might be weak. Use the Site Survey Tool and check the RSSI value for the next access point.
- The next access point might not have connectivity to Cisco Unified Communications Manager.
- There might be an authentication type mismatch between the phone and the next access point.
- The access point might be in a different subnet from the previous access point. The Cisco Unified Wireless IP Phone is capable of Layer 2 roaming only. Layer 3 roaming requires WLSM that uses GRE. For more information, see WLANs and Roaming, on page 30.
- If using EAP-FAST, LEAP, or Auto (AKM) authentication, the access point might be using filters to block TCP ports. The RADIUS server uses port 1812 for authentication and 1813 for accounting.

Phone Does not Roam Back to Preferred Band

**Problem**
The phone does not roam back to the preferred wireless band.
Solution
For troubleshooting information, see the Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide.

Voice Quality Monitoring

To measure the voice quality of calls that are sent and received within the network, Cisco IP Phones use the following statistical metrics that are based on concealment events. The DSP plays concealment frames to mask frame loss in the voice packet stream.

Concealment Ratio metrics
Shows the ratio of concealment frames over total speech frames. An interval conceal ratio is calculated every 3 seconds.

Concealed Second metrics
Shows the number of seconds in which the DSP plays concealment frames due to lost frames. A severely "concealed second" is a second in which the DSP plays more than 5 percent concealment frames.

MOS-LQK metrics
Uses a numeric score to estimate the relative voice listening quality. The phone calculates the mean opinion score (MOS) for listening quality (LQK) based audible concealment events due to frame loss in the preceding 8 seconds, and includes perceptual weighting factors such as codec type and frame size.

MOS LQK scores are produced by a Cisco proprietary algorithm, Cisco Voice Transmission Quality (CVTQ) index. Depending on the MOS LQK version number, these scores might be compliant with the International Telecommunications Union (ITU) standard P.564. This standard defines evaluation methods and performance accuracy targets that predict listening quality scores based on observation of actual network impairment.

Note
Concealment ratio and concealment seconds are primary measurements based on frame loss while MOS LQK scores project a "human-weighted" version of the same information on a scale from 5 (excellent) to 1 (bad) for measuring listening quality.

Listening quality scores (MOS LQK) relate to the clarity or sound of the received voice signal. Conversational quality scores (MOS CQ such as G.107) include impairment factors, such as delay, that degrade the natural flow of conversation.

For information about configuring voice quality metrics for phones, see the phone metrics sections in the Cisco Unified Communications Manager documents.

You can access voice quality metrics on the phone or remotely by using Streaming Statistics.

Related Topics
Remote Monitoring, on page 195
Voice Quality Metrics

To use the metrics for monitoring voice quality, note the typical scores under normal conditions of zero packet loss and use the metrics as a baseline for comparison.

It is important to distinguish significant changes from random changes in metrics. Significant changes are scores that change about 0.2 MOS or greater and persist in calls that last longer than 30 seconds. Conceal Ratio changes should indicate greater than 3 percent frame loss.

MOS LQK scores can vary based on the codec that the phone uses. The following codecs provide these MOS LQK scores under normal conditions with zero frame loss:

- G.711 and G.722 codecs have maximum scores of 4.5
- G.729A/AB codec has a maximum score of 3.8

A Conceal Ratio of zero indicates that the IP network is delivering frames and packets on time with no loss.

Voice Quality Troubleshooting Tips

When you observe significant and persistent changes to metrics, use the following table for general troubleshooting information.

Table 49: Changes to Voice Quality Metrics

<table>
<thead>
<tr>
<th>Metric change</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>MOS LQK scores decrease significantly</td>
<td>Network impairment from packet loss or high jitter:</td>
</tr>
<tr>
<td></td>
<td>• Average MOS LQK decreases could indicate widespread and uniform impairment.</td>
</tr>
<tr>
<td></td>
<td>• Individual MOS LQK decreases indicate bursty impairment.</td>
</tr>
<tr>
<td></td>
<td>Cross-check with Conceal Ratio and Conceal Seconds for evidence of packet loss and jitter.</td>
</tr>
<tr>
<td>MOS LQK scores decrease significantly</td>
<td>• Check to see if the phone is using a different codec than expected (Sender Codec and Rcvr Codec).</td>
</tr>
<tr>
<td></td>
<td>• Check to see if the MOS LQK version changed after a firmware upgrade.</td>
</tr>
<tr>
<td>Conceal Ratio and Conceal Seconds increase significantly</td>
<td>• Network impairment from packet loss or high jitter.</td>
</tr>
<tr>
<td>Metric change</td>
<td>Condition</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Conceal Ratio is near or at zero, but the voice quality is poor</td>
<td>• Noise or distortion in the audio channel such as echo or audio levels.</td>
</tr>
<tr>
<td></td>
<td>• Tandem calls that undergo multiple encode/decode such as calls to a cellular network or calling card network.</td>
</tr>
<tr>
<td></td>
<td>• Acoustic problems coming from a speakerphone, hands-free cellular phone or wireless headset.</td>
</tr>
<tr>
<td></td>
<td>Check packet transmit (TxCnt) and packet receive (RxCnt) counters to verify that voice packets are flowing.</td>
</tr>
</tbody>
</table>

**Note**

Voice quality metrics do not account for noise or distortion, only frame loss.

---

**Common Phone Status Messages**

The following sections describe the common status messages that display on the phone screen.

**Network Busy Message**

**Problem**
The phone is unable to complete a call. The phone displays the **Network Busy** message.

**Cause**
The WLAN is not able to allocate bandwidth for the phone to complete the call.

**Solution**
Wait a few minutes and try the call again. If the problem persists, the WLAN might be congested. Consider increasing the WLAN bandwidth.

**Leaving Service Area Message**

**Problem**
The phone is unable to place or receive calls. The no signal icon displays on the phone screen. The phone displays the **Leaving Service Area** message.

**Cause**
The phone cannot detect any access point (AP) beacons.
**Locating Network Services Message**

**Problem**
The phone is searching for an AP and the phone displays the Locating Network Services message.

**Cause**
The phone is searching all beacons and scanning for a channel and SSID to use.

**Solution**
Wait for the phone to complete the searching and scanning process. Depending on the signal strength of the available WLAN, this process can take a few minutes.

**Authentication Failed Message**

**Problem**
The phone is unable to access the WLAN, and the main phone screen is not active. The phone displays the Authentication Failed message.

**Cause**
The authentication server does not accept the security credentials.

**Solution**
Verify that the security mode and credentials are correct by viewing the Network profile. For information about accessing and changing Network profiles, see Access Network Profile Menu, on page 116.

**Configuring IP Message**

**Problem**
The main phone screen is not active and the phone displays the Configuring IP message.

**Cause**
The phone is attempting to obtain network parameters such as its IP address, or the IP address of the gateway or router from the DHCP server.
Solution
Wait a few minutes for the phone to obtain the network parameters.
If the phone unable to retrieve the IP address, check that the DHCP server is up and running.

Configuring CM List Message

Problem
The main phone screen is not active and the phone displays the Configuring CM List message.

Cause
The phone is downloading its configuration files from the TFTP server.

Solution
Wait a few minutes for the phone to download all of its configuration files.

General Troubleshooting Information

The following table provides general troubleshooting information for the wireless IP phone.

Table 50: Cisco Unified Wireless IP Phone Troubleshooting Tips

<table>
<thead>
<tr>
<th>Summary</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phone is resetting</td>
<td>The phone resets when it loses contact with the Cisco Unified Communications Manager software. This lost connection can be due to any network connectivity disruption, including access point problems, switch outages, and switch reboots. See Cisco Unified Wireless IP Phone Resets Unexpectedly, on page 215.</td>
</tr>
<tr>
<td>Time on phone is incorrect</td>
<td>Sometimes the time or date on the phone is incorrect. The Cisco Unified Wireless IP Phone gets its time and date when it registers with Cisco Unified Communications Manager. Power cycle the phone to reset the time or date. The time shows in either 12 hour or 24 hour format.</td>
</tr>
<tr>
<td>Phone firmware downgrades</td>
<td>After applying a Cisco Unified Communications Manager upgrade or patch, that is older than the current Cisco Unified Wireless IP Phone firmware, the phones could automatically downgrade to the load contained in the patch. Check the Cisco Unified Wireless IP Phone default image in the TFTP folder to fix this problem.</td>
</tr>
</tbody>
</table>
An unstable RF environment can cause the phone to remain in active mode because it is constantly seeking an AP. This reduces the battery life considerably. When leaving an area of coverage, shut down the phone. Higher phone transmit power can affect battery life.

To maximize idle time on the phone and conserve battery life, you need to optimize the registration time so the phone can go into power save mode more often.

The phone does not have a DHCP IP address, is unable to register to Cisco Unified Communications Manager, and shows a Configuring IP or Registering message.

Verify the following:

1. The Cisco Unified Communications Manager service is running on the Cisco Unified Communications Manager server.
2. Both phones are registered to the same Cisco Unified Communications Manager.
3. Audio server debug and capture logs are enabled for both phones. If needed, enable Java debug.

Call statistics display does not show iLBC as the receiver/sender codec.

1. Check the following using the Cisco Unified Communications Manager administration pages:
   • Both phones are in the iLBC device pool.
   • The iLBC device pool is configured with the iLBC region.
   • The iLBC region is configured with the iLBC codec.

2. Capture a sniffer trace between the phone and Cisco Unified Communications Manager and verify that SCCP messages, OpenReceiveChannel, and StationMediaTransmit messages have media payload type value equal to 86. If so, the problem is with the phone; otherwise the problem is with the Cisco Unified Communications Manager configuration.

3. Enable audio server debug and capture logs from both phones. If needed, enable Java debug.

For additional troubleshooting information, see the Cisco Unified Communications Manager Troubleshooting Guide.

Log Information for Troubleshooting

The following sections can help you gather troubleshooting information.

Related Topics
- Startup and Connectivity Problems, on page 209
- Roaming and Voice Quality or Lost Connection Problems, on page 219
- Reset Phone to Factory Defaults, on page 228

System Log Server

To gather information about problems with the wired network that can cause roaming delays or no connectivity, set up a system log server. Enable “syslog” on the network switches and access points that are logged to the system log server. Also enable Network Time Protocol (NTP) so that all access points and switches use the same times.

For information about setting up a system log server, see Set Up Trace Settings, on page 96.

Phone Trace Logs

When you are experiencing problems registering with Cisco Unified Communications Manager, or call connections, you can use the Trace Logs function to trace the path of a packet from the phone to Cisco Unified Communications Manager. The result shows the number of hops and the IP address of each hop to reach the Cisco Unified Communications Manager server. You can use this information to check connectivity between the phone, Cisco Unified Communications Manager servers and gateways during a call.

To download trace logs, click Download Logs from the Trace Logs page.

Related Topics
- Trace Logs, on page 105

Prevent Internet Explorer Error when Downloading Trace Logs

Depending on your settings, Internet Explorer might display an error when you download a trace log from the Trace Logs page.

To prevent this error from displaying, follow these steps.

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>From Internet Explorer, choose Tools &gt; Internet Options.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>In the Internet Options window, click the Advanced tab.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Under the Security section, enable Do not save encrypted pages to disk, and click OK.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Exit all Internet Explorer sessions.</td>
</tr>
</tbody>
</table>
Reset Phone to Factory Defaults

You can clear all locally stored configuration options in a phone from the Phone Settings menu. When you use the restore to factory default option, all user-defined entries in Network Profiles, Phone Settings, and Call History are erased.

To erase the local configuration, follow these steps.

Procedure

**Step 1** Choose SETTINGS > Phone Settings.

**Step 2** Press **2** on the keypad.

The phone briefly displays Start factory reset now?

**Step 3** Perform one of the following actions:

- Press Yes to delete all settings. The phone cycles through normal startup procedures.
- Press No to cancel the reset.

**Step 4** Press SETTINGS > Network Profiles to reconfigure the network settings for your WLAN.

**Caution** Erasing the local configuration removes network profiles that are set up for the Cisco Unified Wireless IP Phone to access the WLAN. You must reconfigure the network settings after performing the reset to enable the phone to access the WLAN.

Related Topics

- Roaming and Voice Quality or Lost Connection Problems, on page 219
- Common Phone Status Messages, on page 223

Troubleshooting Procedures

Use the procedures in this section to resolve problems.

Create New Configuration File

**Note** When you remove a phone from the Cisco Unified Communications Manager database, its configuration file is deleted from the Cisco Unified Communications Manager TFTP server. The directory number (DN) remains in the Cisco Unified Communications Manager database as an unassigned DN. You can assign these DNs to other devices or delete them from the Cisco Unified Communications Manager database. You can use the Route Plan Report to view and delete unassigned reference numbers. See Cisco Unified Communications Manager Administration Guide for more information.
To create a new configuration file, follow these steps:

**Procedure**

**Step 1** From Cisco Unified Communications Manager, select **Device > Phone > Find** to locate the phone that is not working properly.

**Step 2** Choose **Delete** to remove the phone from the Cisco Unified Communications Manager database.

**Step 3** Add the phone back to the Cisco Unified Communications Manager database. See **Add Users to Cisco Unified Communications Manager**, on page 171 for details.

**Step 4** Power cycle the phone.

**Related Topics**

- **Startup and Connectivity Problems**, on page 209

- **Common Phone Status Messages**, on page 223

---

**Verify DHCP Setup**

To determine if the phone has been properly configured to use DHCP, follow these steps.

**Procedure**

**Step 1** Verify that you have properly configured the phone to use DHCP. See **DHCP Settings**, on page 121 for details.

**Step 2** Verify that the DHCP server has been set up properly.

**Step 3** Verify the DHCP lease duration. Your local policy determines this setting. Cisco Unified IP Phones send messages with request type 151 to renew their DHCP address leases. If the DHCP server expects messages with request type 150, the lease is denied, forcing the phone to restart and request a new IP address from the DHCP server.

---

**Determine DNS or Connectivity Issues**

To eliminate DNS or other connectivity errors, follow these steps.

**Procedure**

**Step 1** Reset the phone to factory defaults. See **Reset Phone to Factory Defaults**, on page 228 for details.

**Step 2** Modify DHCP and IP settings:

a) Disable DHCP. See **DHCP Settings**, on page 121 for details.
b) Assign static IP values to the phone. See DHCP Settings, on page 121 for details. Use the same default router setting used for other functioning Cisco Unified IP Phones.

c) Assign a TFTP server. See Set Alternate TFTP Server, on page 122 for details. Use the same TFTP server used for other functioning Cisco Unified IP Phones.

Step 3  From Cisco Unified Communications Manager, choose System > Server and verify that the server is referred to by its IP address and not by its hostname.

Note  Cisco recommends that you configure only IP addresses and not hostnames to eliminate the DNS resolution in the phone registration process.

Step 4  From Cisco Unified Communications Manager, select Device > Phone and verify that you have assigned the correct MAC address to this Cisco Unified IP Phone.

To determine the MAC address of a phone, see Device Information, on page 179.

Step 5  Power cycle the phone.
Internal Support Website Overview

If you are a system administrator, you are likely the primary source of information for Cisco Unified IP Phone users in your network or company. It is important to provide current and thorough information to end users.

To successfully use some features on the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G (such as speed dial numbers and voice messaging system options), users must receive information from you or your network team or be able to contact you for assistance.

Cisco recommends that you create a web page on your internal support site that provides end users with important information about their new Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G.

Cisco Unified Wireless IP Phone Operations

Users need to know that their Cisco Unified Wireless IP Phone operates more like a cell phone than like their desktop phone. Small wireless phones with an antenna allow users to move around a facility while staying connected to a call. These phones, like cell phones, can approach the edge of the RF signal range and experience static or poor voice quality. At times, the user might encounter areas where there is no signal and lose the call entirely. The following is a list of calling locations and situations in which wireless phones might experience audio problems:

- Stairwells, elevators, rooms with metal equipment such as file cabinets, or heavy machinery
- Break rooms with microwave ovens, or labs with equipment that emits RF signals within the same ranges
• Conference rooms or other congested areas where many people are using wireless devices
• Parking garages and outdoor areas where access points are not located or are out of range

⚠️ Caution
This product is not a medical device and may use an unlicensed frequency band that is susceptible to interference from other devices or equipment.

The Cisco Unified Wireless IP Phone has many of the same phone features as the IP phone desktop models, such as Mute, access to voice messaging, and directories. The phone has a limited number of buttons because of its size. As a consequence, the wireless IP phone differs from the desktop IP phone as follows:

• No line buttons: You must enter the phone number from the keypad and press Send. You can press the Phone icon from the main screen to use other lines on your phone.
• Only two softkeys: You must press the Options softkey to see the list of softkey features.
• You do not hear a dial tone.

Phone Care and Maintenance

Users need to know how to protect and clean their phone. These guidelines provide information about using accessories and cleaning the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G:

• Use only chargers, batteries, and accessories that are approved by the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G manufacturer. Use of unapproved chargers, batteries, and accessories might be dangerous.
• Do not adhere a clip to the back of the phone or insert a clip between the phone and battery cover because it can damage the battery.
• When disconnecting the power cord of any accessory, grasp and pull the plug. Do not pull the cord.
• Keep accessories out of reach of young children.
• Clean the phone with any moist wipe.

⚠️ Note
Using unapproved accessories, not protecting the phone from moisture or contaminants, and hard impacts can invalidate the one-year hardware warranty.

For a list of available accessories and their descriptions, see the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Accessory Guide at this URL:
Help System on Phone

This Cisco Unified Wireless IP Phone provides access to a comprehensive online help system. To view the main help menu on a phone, from the main screen, press the **Select** button in the center of the **Navigation** button. Wait for several seconds for this menu to appear.

Cisco Unified Wireless IP Phone Manuals

You should provide end users with access to user documentation for the Cisco Unified Wireless IP Phones. This documentation includes detailed user instructions for key phone features.

There are several Cisco Unified IP Phone models available, so to assist users in finding the appropriate documentation on the Cisco website, Cisco recommends that you provide links to the current documentation. If you do not want to or cannot send users to the Cisco website, Cisco suggests that you download the PDF files and provide them to end users on your website.

Related Topics

- Related Documentation, on page xvii

User Phone Features and Services

End users can perform a variety of activities using the Cisco Unified Communications Manager User Options web page. Cisco Unified Wireless IP Phone users can set up speed dial and call forwarding numbers. Keep in mind that configuring settings on a phone using a website might be new for your end users. You need to provide as much information as possible to ensure that they can successfully access and use the User Options web page.

Make sure to provide end users with the following information about the User Options web page:

- The URL required to access the application. This URL is:
  
  https://server_name:port_number/ccmuser

  where **server_name** is the host on which the web server is installed and **port_number** is the port address.

- A user ID and default password for accessing the application.

  These settings correspond to the values you entered when you added the user to Cisco Unified Communications Manager (see Add Users to Cisco Unified Communications Manager, on page 171).

- A description of a web-based, graphical user interface application and how to access it with a web browser.

- An overview of tasks that users can accomplish by using the web page.

User Voice Messaging System Access

Cisco Unified Communications Manager provides the flexibility to integrate with many different voice messaging systems, including the Cisco Unity voice messaging system. Because you can integrate with many different systems, you must provide users with detailed information about how to use your specific system.

You should provide this information to each user:

- How to access the voice messaging system account.
- The initial password for accessing the voice messaging system.
  Make sure that you have configured a default voice messaging system password for all users.
- How the phone indicates that messages are waiting.
  Make sure that you have used Cisco Unified Communications Manager to set up a message waiting indicator (MWI) method.

For information about setting up the MWI method and the interface to the voice messaging system in Cisco Unified Communications Manager, see the documentation for your system at this URL:

If you are using a Cisco Unity voice messaging system, see the Cisco Unity documentation for your system for configuring voice messaging and the initial passwords at this URL:

See the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide for information about accessing the voice messaging system from the phone.
International User Support

• International User Support Overview, page 235
• Unified Communications Manager Endpoints Locale Installer, page 235

International User Support Overview

Translated and localized versions of the Cisco Unified IP Phones are available in several languages. If you are supporting Cisco Unified IP Phones in a non-English environment, see the following section to ensure that the phones are set up properly for your users.

Before you deploy the wireless IP phones, download the locale installer for the firmware releases and configure the languages in Cisco Unified Communications Manager.

You can obtain translated documentation for the Cisco Unified IP Phones at this URL:

Unified Communications Manager Endpoints Locale Installer

By default, Cisco IP Phones are set up for the English (United States) locale. To use the Cisco IP Phones in other locales, you must install the locale-specific version of the Unified Communications Manager Endpoints Locale Installer on every Cisco Unified Communications Manager server in the cluster. The Locale Installer installs the latest translated text for the phone user interface and country-specific phone tones on your system so that they are available for the Cisco IP Phones.

To access the Locale Installer required for a release, access http://software.cisco.com/download/navigator.html?mdfid=286037605&flowid=46245, navigate to your phone model, and select the Unified Communications Manager Endpoints Locale Installer link.

For more information, see the documentation for your particular Cisco Unified Communications Manager release.

Note

The latest Locale Installer may not be immediately available; continue to check the website for updates.

Technical Specifications

Phone Behavior During Times of Network Congestion

Anything that degrades network performance can affect Cisco IP Phone voice and video quality, and in some cases, can cause a call to drop. Sources of network degradation can include, but are not limited to, the following activities:

- Administrative tasks, such as an internal port scan or security scan
- Attacks that occur on your network, such as a Denial of Service attack

Wireless Network Setup

QoS Policies Setup

For information about QoS policies, see Cisco Unified Wireless IP Phone 7925 and 7926 Series Deployment Guide.

Cisco Unified Communications Manager Setup for Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G

The following steps provide an overview and checklist of configuration tasks for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G in Cisco Unified Communications Manager Administration. The steps presents a suggested order to guide you through the phone configuration process. Some tasks are optional, depending on your system and user needs. For detailed procedures and information, see the sources in the steps.
**Procedure**

**Step 1** Gather the following information about the phone:
- Phone model
- MAC address
- Name or user ID of phone user
- Device pool
- Partition, calling search space, and location information
- Number of lines and associated directory numbers (DNs) to assign to the phone
- Cisco Unified Communications Manager user to associate with the phone
- Phone usage information that affects softkey template, phone features, IP Phone services, or phone applications

This step provides a list of configuration requirements for setting up phones and identifies preliminary configuration that you need to perform before configuring individual phones, such as phone button templates or softkey templates.

For more information, see
- *Cisco Unified Communications Manager System Guide*, "Cisco Unified IP Phone" chapter
- *Telephony Features Available*, on page 148

**Step 2** Customize phone button templates (if required) to change the number of line buttons, speed-dial buttons, Service URL buttons, or to add a Privacy button to meet user needs.

For more information, see
- *Cisco Unified Communications Manager Administration Guide*, "Phone Button Template Configuration" chapter
- *Phone Button Templates*, on page 167

**Step 3** Add and configure the phone by completing the required fields in the Phone Configuration window. Required fields are indicated by an asterisk (*) next to the field name; for example, MAC address and device pool.

This step adds the device with its default settings to the Cisco Unified Communications Manager database.

For more information, see
- *Cisco Unified Communications Manager Administration Guide*, "Cisco Unified IP Phone Configuration" chapter
- "*" Button Help in the Phone Configuration window

**Step 4** Add and configure directory numbers (lines) on the phone by completing the required fields in the Directory Number Configuration window. Required fields are indicated by an asterisk (*) next to the field name; for example, directory number and presence group.

This step adds primary and secondary directory numbers and features associated with directory numbers to the phone.
For more information, see

- *Cisco Unified Communications Manager Administration Guide*, "Directory Number Configuration" chapter, "Creating a Cisco Unity Voice Mailbox" section

- *Telephony Features Available*, on page 148

**Step 5**
Customize softkey templates. This step adds, deletes, or changes the order of softkey features that display on the user's phone to meet feature usage needs.

For more information, see

- *Cisco Unified Communications Manager Administration Guide*, "Softkey Template Configuration" chapter

- *Softkey Templates*, on page 166

**Step 6**
Assign line view speed-dial numbers. This step adds line view speed-dial numbers.

**Note**
Configuring and using line view speed-dial numbers are different from speed-dial hot keys that are set up using the Phone Book feature and stored locally on the wireless IP phone.

**Note**
Users can change line view speed-dial settings on their phones by using Cisco Unified CM User Options.

For more information, see

- *Cisco Unified Communications Manager Administration Guide*, "Cisco Unified IP Phone Configuration" chapter, "Configuring Speed-Dial Buttons" section

- *Telephony Features Available*, on page 148

**Step 7**
Configure Cisco Unified IP Phone services and assign services (optional). This step provides IP Phone services.

**Note**
Users can add or change services on their phones by using the Cisco Unified CM User Options.

For more information, see

- *Cisco Unified Communications Manager Administration Guide*, "Cisco Unified IP Phone Services Configuration" chapter

- *Services Menu*, on page 167

**Step 8**
Add user information by configuring required fields. Required fields are indicated by an asterisk (*); for example, User ID and last name.

**Note**
Assign a password (for User Options web pages) and PIN (for Extension Mobility and Personal Directory)

This step adds user information to the global directory for Cisco Unified Communications Manager.

For more information, see

- *Cisco Unified Communications Manager Administration Guide*, "End User Configuration" chapter

- *Add Users to Cisco Unified Communications Manager*, on page 171
Step 9  Associate a user to a user group. This step assigns to users a common list of roles and permissions that apply to all users in a user group. Administrators can manage user groups, roles, and permissions to control the level of access (and, therefore, the level of security) for system users.

**Note**  Applicable to Cisco Unified Communications Manager Administration Release 5.x and later.

For more information, see the *Cisco Unified Communications Manager Administration Guide*:

- “End User Configuration” chapter, “End User Configuration settings” section
- “User Group Configuration” chapter, “Adding Users to a User Group” section

Step 10  Associate a user with a phone. This step is optional if you do not want users to have access to User Options. This step provides users with control over their phone such as forwarding calls or adding line view speed-dial numbers or services.

**Note**  Some phones, such as those used by multiple users, do not have an associated user.

For more information, see *Cisco Unified Communications Manager Administration Guide*, “End User Configuration” chapter, "Associating Devices to a User" section.

---

**Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Installation**

The following steps provide an overview and checklist of installation tasks for the Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G. The steps presents a suggested order to guide you through the phone installation. Some tasks are optional, depending on your system and user needs. For detailed procedures and information, see the sources in the steps.

**Procedure**

**Step 1**  Assemble the phone components and charge the battery.

For more information, see *Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G Installation*, on page 20.

**Step 2**  Configure the network profile by using the USB cable and the phone web page.

For more information, see *Access Web Page for Phone*, on page 195.

**Step 3**  Configure the phone settings by using the Settings menu on the phone.

For more information, see *Phone Settings Menu*, on page 127.

**Step 4**  Power on the phone and monitor the phone startup process.

For more information, see:

- *Phone Startup Process*, on page 64
- *Startup and Connectivity Problems*, on page 209

**Step 5**  Make calls with the wireless IP phone.
For more information, see:

- *Cisco Unified Wireless IP Phone 7925G, 7925G-EX, and 7926G User Guide*
- *Roaming and Voice Quality or Lost Connection Problems*, on page 219

**Step 6** Provide information to end users about how to use their phones and how to configure their phone options. For more information, see *Internal Support Website*, on page 231.
