

# CVP Subdialog Start

For a Cisco CVP voice application invoked as a subdialog, the `CVP Subdialog Start` element must be used, which receives data from a calling application and creates corresponding element data or session data. The element should be placed at the entrance point of the application, immediately after the Start of Call element.

Data can be passed to the VoiceXML application either as HTTP parameters or VoiceXML parameters (using the `<param>` tag). In the first case (that is, as HTTP parameters), Cisco Unified CVP VoiceXML Server will automatically create session data using the name of the data received. In the second case (that is, as VoiceXML parameters), the `CVP Subdialog_Start` element must be configured appropriately in order for the data to be available as element or session data for the duration of the call session. For each data passed as a VoiceXML parameter, the *Parameter* setting must be configured with the same exact name as the data. The *Store As* setting can be configured to store the passed data either as session or element data. The *Enable Digits Bypass* setting is used to activate a VoiceXML workaround to ensure expected functionality for a particular TDM or analog phone. When this setting is set to *true*, a new setting named *Audio Filler URI* will be enabled in VoiceXML Studio and can be configured to set a reference to a silence wave file to be played in the digits field. For IP phones the *Enable Digits Bypass* setting should be set to *false*.

## Settings

Name (Label)	Type	Req'd	Single Setting Value	Substitution Allowed	Default	Notes
Parameter (Parameter)	string	No	false	true	None	Holds the name of a parameter passed as input to the subdialog. It must match the exact value specified in the VoiceXML page that calls the subdialog. This is a repeatable setting, so multiple values can be specified.
Where (Store As)	string	No	true	false	Session Data	Determines whether the parameter passed to the subdialog will be stored as element data or session data. By

						making it element data, the information will “belong” only to this element, and so there is no chance that these variables will overwrite any other variables.
enable_digits_bypass (Enable Digits Bypass)	boolean	Yes	true	true	false	Determines whether the digits field is used at the beginning of an application. By default this is disabled.
audio_filler_uri (Audio Filler URI)	string	No	true	true	<i>None</i>	Configures a URI for a silence wave file to be played in the above digits field.

## Exit States

Name	Notes
done	The element is successfully run.
