Precision Queue API

Precision queues help direct incoming callers to appropriate agents, as they match specific agent attributes with caller requirements. If a precision queue requires an agent who lives in Boston and who speaks fluent Spanish, then an agent with the attributes **Boston = True** and **Spanish = True** is a good match.

Use the Precision Queue API to list the precision queues currently defined in the database, define new precision queues, and view, edit, and delete existing precision queues.

**URL**

https://<server>/unifiedconfig/config/precisionqueue

**Operations**

- **create**: Creates one precision queue.
- **delete**: Marks one precision queue for deletion, but does not permanently delete it. Deleting a precision queue that is referenced dynamically in a script is allowed. No new calls are queued against it, but the precision queue remains operational until calls are no longer in the queue.
- **get**: Returns one precision queue, using the URL
  https://<server>/unifiedconfig/config/precisionqueue/<id>.
- **Query parameters:**
  - `agentcount`: Use this query parameter to have the agent count parameter included in the response; for example, `agentcount=true`.
  - `attributes`: Use this query parameter to have the attribute parameter included in the response; for example, `attributes=true`.
  - `skillgroups`: Use this query parameter to augment the returned precision queue attributes with an id listing of all of the skillgroups that are associated with the precision queue; for example, `skillgroups=true`.
- **list**: Retrieves a list of precision queues. Query parameters described above for the get operation are also allowed for list.
- **update**: Updates one precision queue.
Parameters

Precision queue parameters:

- refURL: The refURL of the precision queue. See Shared Parameters.
- name: The name of the precision queue. See Shared Parameters.
- changeStamp: See Shared Parameters.
- description: See Shared Parameters.
- mediaRoutingDomain: A reference to the media routing domain (Media Routing Domain API) including the name and refURL. See References.
  - Defaults to Cisco_Voice MRD if this parameter is not provided.
  - This reference cannot be updated.
- bucketInterval: A reference to a bucket interval (Bucket Interval API), including the refURL and name. See References.
- agentCount: Returns agent count for the precision queue. Returned only when using the agentcount query parameter.
- agentOrdering: Determines the order in which agents receive calls from this queue.
  - 1: LAA (Agent availability time)
  - 2: Most skilled agent
  - 3: Least skilled agent
- id: The database id of the precision queue. Read-only field. Used in scripting.
- attributes: A collection of attribute names (attribute1, attribute2, and so on) indicating all of the attributes used in this precision queue. Returned only when the query parameter attributes=true.
- serviceLevelThreshold: Maximum time in seconds that a caller should wait before being connected with an agent.
- serviceLevelType: This value indicates how the system calculates the service level.
  - 1: Ignore abandoned calls.
  - 2: Abandoned call has negative impact.
  - 3: Abandoned call has positive impact.
- skillgroups: A collection of skill groups associated with this precision queue, including the id of each skill group. Returned only when the query parameter skillgroups=true.
- steps: Required. A collection of steps for this precision queue. You can have 1-10 steps. Returned only for get operation. See the Step parameters below.

Step parameters:

- waitTime: Time in seconds to wait before proceeding to the next step.
- considerIf: A Consider If expression which must be met to execute a particular step. Items used in the expression are case sensitive. You cannot add an expression to the last step.
• terms: Required. A collection of terms for this step. Each step can have 1-10 terms. See the Term parameters below.

Term parameters:
• attribute: A reference to the attribute (Attribute API), including the refURL, name, description, and dataType. Multiple unique attributes can be used across all terms in a precision queue.

• parenCount: Denotes a parenthesis before or after this term. A value of 1 means a parenthesis before the current term, and a value of -1 means a parenthesis after the current term. The sum of all parenCount for all terms in a step must be equal to zero, meaning that all parenthesis in the expression are matched. For example, a step to check for agents that have (sales > 7 or expertSales = true) and english = true requires 3 terms with the parenCount set to 1 on the first term, -1 on the second term, and 0 on the last term.

• termRelation: Indicates the relationship of this term to the preceding term, using the following values:
  * 0: None. Valid only on the first term in a step.
  * 1: AND
  * 2: OR

• attributeRelation: Indicates what kind of comparison is done on the attribute, using the following values:
  * 1: Equal
  * 2: Not equal
  * 3: Less than
  * 4: Less than or equal
  * 5: Greater than
  * 6: Greater than or equal

• value1: The value that the attribute is tested against. For boolean attributes, this value must be true/false. For proficiency attributes, this value must be 1-10.

Search and Sort Values
The following table shows the parameters that are searched and the parameters that are sortable.

<table>
<thead>
<tr>
<th>Search parameters</th>
<th>Sort parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>• name</td>
<td>• name (default)</td>
</tr>
<tr>
<td>• description</td>
<td>• description</td>
</tr>
</tbody>
</table>

See Search and Sort.

Example Get Response
<pre>
