Certificate Validation for Cloud Deployments

Webex Messenger and Webex Meetings Center present the following certificates to the client by default:

- CAS
- WAPI

Note Webex certificates are signed by a public Certificate Authority (CA). Cisco Jabber validates these certificates to establish secure connections with cloud-based services.

Cisco Jabber validates the following XMPP certificates received from Webex Messenger. If these certificates are not included in your operating system, you must provide them.

- VeriSign Class 3 Public Primary Certification Authority - G5 — This certificate is stored in the Trusted Root Certificate Authority
- VeriSign Class 3 Secure Server CA - G3 — This certificate validates the Webex Messenger server identity and is stored in the Intermediate Certificate Authority.
- AddTrust External CA Root
- GoDaddy Class 2 Certification Authority Root Certificate

For more information about root certificates for Cisco Jabber for Windows, see <https://www.identrust.co.uk/certificates/trustid/install-nes36.html>.

For more information about root certificates for Cisco Jabber for Mac, see <https://support.apple.com>.

Update Profile Photo URLs

In cloud-based deployments, Webex assigns unique URLs to profile photos when you add or import users. When Cisco Jabber resolves contact information, it retrieves the profile photo from Webex at the URL where the photo is hosted.

Profile photo URLs use HTTP Secure (`https://server_name/`) and present certificates to the client. If the server name in the URL is:

- A fully qualified domain name (FQDN) that contains the Webex domain — The client can validate the web server that is hosting the profile photo against the Webex certificate.
- An IP address — The client cannot validate the web server that is hosting the profile photo against the Webex certificate. In this case, the client prompts users to accept certificates whenever they look up contacts with an IP address in their profile photo URLs.

Important

- We recommend that you update all profile photo URLs that contain an IP address as the server name. Replace the IP address with the FQDN that contains the Webex domain to ensure that the client does not prompt users to accept certificates.
 - When you update a photo, the photo can take up to 24 hours to refresh in the client.
-

The following steps describe how to update profile photo URLs. Refer to the appropriate Webex documentation for detailed instructions.

Procedure

-
- Step 1** Export user contact data in CSV file format with the Webex Administration Tool.
 - Step 2** In the **userProfilePhotoURL** field, replace IP addresses with the Webex domain.
 - Step 3** Save the CSV file.
 - Step 4** Import the CSV file with the Webex Administration Tool.
