System Installation Planning

This chapter provides an overview of the installation processes for IP telephony components. It describes the types of installations, provides an overview of components that are included in the release sets, and describes various installation strategies.

Note

Many of the IP telephony component names have changed as part of Cisco Unified Communications System releases. The latest product names are used in this document, even when referencing products from previous releases.

Cisco Unified Communications System Overview

The Cisco Unified Communications System is a full-featured business communications system built into an intelligent IP network. It enables voice, data, and video communications for businesses of all sizes. The Cisco Unified Communications System in this document is defined around commonly deployed business topology models in North America and European and Emerging Markets (EUEM). The Cisco Unified Communications System testing process validates the interoperability of voice products to ensure that they work together as an integrated system.

Cisco Unified Communications System provides an integrated system to meet a wide variety of customer needs. Cisco Unified Communications refers to the entire range of specific Cisco IP Communications products including all call control, conferencing, voicemail and messaging, customer contact, IP phone, video telephony, video conferencing, rich media clients, and voice application products. These products and applications are designed, developed, tested, documented, sold, and supported as an integrated system. Cisco Unified Communications System for enterprise is built upon IP telephony products that centers around the core call processing component, Cisco Unified Communications Manager. Cisco Unified Communications System for
midmarket is built upon IP telephony products that center around the call processing component, Cisco Business Edition.

Scope of this Installation Documentation

The installation procedures that are described in this document are intended to provide a high-level guide to installing the Cisco Unified Communications System. This document provides installation information from a system perspective and only for products that are part of Cisco Unified Communications System Release 9.0(1).

The Cisco Unified Communications IP telephony systems should meet the following basic characteristics and requirements:

- A deployment that is based on Cisco recommendations and guidelines for network design and architecture
- A new greenfield or a legacy system deployment, as described in the Installation Types, on page 3 section.
- An installation of Cisco Unified Communications System, not an upgrade from previous software versions. This topic only provides information related to installing components that are present in the Cisco Unified Communications System. See Release Set Versions for more information.

Note

If you have a legacy system with PBXs and other products that need to interoperate with the Cisco Unified Communications System, see Interoperability and Compatibility Portals, on page 11.

Due to the variety of options and complexity of procedures required to set up an IP telephony system completely, this document does not provide installation or configuration procedures for:

- Individual standalone components and features of the components

Note

Installation and configuration information for an individual component is available in the product level documentation set for that component.

- Third-party coresident applications, such as antivirus, security, server management, and remote access
- Additional third-party off-board applications such as operator console, and billing and accounting
- Server replacement (hardware installation) for components. For information on how to replace a single server or an entire cluster for Cisco Unified Communications Manager Release 9.0(1), see: http://www.cisco.com/en/US/docs/voice_ip_comm/cucm/install/8_6_1/cluster/clstr861.html

Refer to product-specific installation documents to perform the installation and configuration of the IP telephony products.

System Installation Overview

Installation Types

When installing and creating an IP telephony environment, consider the following deployment types:

• Greenfield deployment—A completely new installation of Cisco Unified Communications System, using no existing equipment.

• Legacy deployment—A new installation of Cisco Unified Communications System combined with existing legacy equipment, such as TDM PBXs and third-party adjuncts, which may require long-term co-existence and integration or eventual migration to new installation.

• Installed base (brownfield deployment)—An existing Cisco Unified Communications System, which requires an upgrade and migration from a previous system release to current system release. For more information about upgrading an existing installed base, see the upgrade chapters in this document.

Note
When performing upgrades, be aware of backward compatibility issues such as co-existence and interoperability with previous system release versions.
Release Sets

A release set is defined as the combination of products, components, and software versions that were tested to work together as an integrated Cisco Unified Communications System. A particular system release is also referred to as a release set.

Legacy Deployment and Installed Base Release Sets

If you are dealing with a legacy or brownfield deployment, be aware of interoperability issues between legacy and existing component versions and Cisco Unified Communications System Release 9.0(1) component versions.

You can verify a previous system release set by product release version in a summary matrix. Use the following links if you are unfamiliar with the versions of release sets deployed in IP telephony environments:

- Cisco Unified Communications System Release Summary Matrix for IP Telephony:
- IP Communications System Test Release:

Interoperability and Compatibility Portals, on page 11

Greenfield Deployment Release Set

If you are dealing with a greenfield deployment, be aware that certain features, applications, and components are part of Cisco Unified Communications System Release 9.0(1) family of products and have been tested and verified for interoperability and compatibility.

Based on your specific network design, you may choose to install all or some of these features, applications, and components.

For information about the Cisco Unified Communications System Release 9.0(1) IP telephony components and their software and firmware versions, see Release Set Versions.

System Installation Roadmap

The following table provides an overview of tasks that are performed during the installation of Cisco Unified Communications System.
### Component Installation Overview

The Cisco Unified Communications System IP telephony environment consists of these primary software components:

- **Call processing**—Unified Communications Manager, Unified Communications Manager Express, Unified SRST
- **Communications**—Cisco Emergency Responder, Cisco Unified Contact Center Express
- **Messaging**—Cisco Unity Connection, Cisco Unity Express
- **Instant Messaging and Presence**—Cisco Unified Communications Manager IM and Presence Service (formerly Cisco Unified Presence)
- **Conferencing**—Cisco Unified MeetingPlace, Cisco Unified Videoconferencing
- System Management—Cisco Unified Operations Manager, Cisco Unified Service Monitor, Cisco Unified Service Statistics Manager, Cisco Unified Provisioning Manager, LAN Management Solution
- Virtualization—VMware vSphere, VMware ESXi, VMware vCenter Server, Cisco UCS 2104XP Fabric Extender, Cisco UCS 6100 Series Fabric Interconnect, Cisco UCS 5108 Blade Server Chassis, Cisco UCS C-Series servers

In addition, the following Cisco hardware and software products are required for a complete IP telephony deployment:

- Cisco Unified IP Phones, Cisco IP Communicator, Cisco Unified Personal Communicator
- Cisco gateways, gatekeepers, Cisco Unified Border Element
- Cisco LAN/WAN infrastructure and components
- Cisco security components

The following table provides an overview of primary components in Cisco Unified Communications System Release 9.0(1) product family that can be installed and configured in IP telephony environments.

> Note

Cisco Unified Communications System IP telephony components listed in the following table are for enterprise business models. Not all these components are required for midmarket business models.

#### Table 2: System Installation Overview for Cisco Unified Communications System IP Telephony Components

<table>
<thead>
<tr>
<th>Component/Application/Feature</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Communications Infrastructure and Wireless Components</strong></td>
<td></td>
</tr>
<tr>
<td>Switches and routers</td>
<td>Cisco switches and routers provide switching and intelligent routing services that can deliver voice, video, data and Internet access, wireless, and other applications. They can also provide high-speed connectivity between users, applications, and communications systems.</td>
</tr>
<tr>
<td>Gateways and gatekeepers</td>
<td>Cisco gateways and gatekeepers are optimized for data, wireless, and IP communications. They support IP-to-IP connectivity between independent voice-over-IP (VoIP) networks and analog phone gateways using your existing phone equipment.</td>
</tr>
<tr>
<td>Firewall and security components</td>
<td>Security components include firewall and policy enforcement services, antivirus software, and domain and web server hardening. Firewall allows any port on the device to operate as a firewall port and integrates firewall security inside the network infrastructure. Policy enforcement services can protect networks from unauthorized access. These services combine with VPN services to enable businesses to securely extend their networks to business partners, remote sites, and mobile workers.</td>
</tr>
<tr>
<td>Component/Application/Feature</td>
<td>Purpose</td>
</tr>
<tr>
<td>-----------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Wireless components</td>
<td>Wireless components provide for secure, scalable, cost-effective WLANs with real-time access to instant messaging, email, and network resources.</td>
</tr>
<tr>
<td>System network management applications</td>
<td>These applications provide the means to monitor, manage, and troubleshoot the Cisco Unified Communications System. For example, Unified Operations Manager provides comprehensive monitoring and diagnostics for the entire system. It performs automatic discovery of the entire system and provides contextual diagnostics for rapid troubleshooting.</td>
</tr>
<tr>
<td><strong>Cisco Unified Communications Manager and Call Processing Components</strong></td>

<tr>
<td>Cisco Unified Communications Manager Services</td>
<td>There are a variety of services on the publisher, subscribers, and TFTP servers that are essential for call processing in the Unified Communications Manager cluster.</td>
</tr>
<tr>
<td>Cisco Unified Communications Manager Express</td>
<td>Cisco Unified Communications Manager Express provides call-processing functionality for small sized businesses</td>
</tr>
<tr>
<td>Cisco Unified IP Phones (SCCP and SIP)</td>
<td>Use methods such as auto-registration and Bulk Administration Tool (BAT) to install and configure Unified IP Phones and to add them to Unified Communications Manager database.</td>
</tr>
<tr>
<td>Virtualization Experience Clients</td>
<td>The Cisco Virtual Experience Infrastructure (VXI) system integrates virtualized data centers, networks, and endpoints with desktop virtualization services for comprehensive media, security, and performance acceleration.</td>
</tr>
<tr>
<td>Cisco TelePresence EX90</td>
<td>The Cisco TelePresence EX90 for the desktop is a video endpoint that provides a simple and efficient collaborative solution.</td>
</tr>
<tr>
<td>Install and configure Cisco IP Communicator</td>
<td>Cisco IP Communicator is a software-based application that delivers enhanced telephony support through desktop. It is designed to meet diverse customer needs by serving as a supplemental telephone when traveling, a telecommuting device, or as a primary desktop telephone.</td>
</tr>
<tr>
<td>Conferencing applications</td>
<td>Cisco Unified MeetingPlace provides intuitive interfaces for setting up, attending and managing meetings. Extensive voice, video using Cisco Unified Videoconferencing and web conferencing capabilities enable a range of meeting applications, including highly collaborative meetings, training sessions, and presentations.</td>
</tr>
<tr>
<td>Component/Application/Feature</td>
<td>Purpose</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Cisco Unified Communications Manager cluster (integration with switches, routers, gateways, gatekeepers, and Cisco Unified Communications Manager Telephony client)</td>
<td>Install the Unified Communications Manager Telephony client on the Cisco Unified Contact Center Express system to enable communication with Unified Communications Manager cluster.</td>
</tr>
<tr>
<td>Voice Mail and Unified Messaging components</td>
<td>These applications combine voice messaging, integrated messaging, speech recognition capabilities, and call-routing rules. The applications include Cisco Unity Connection, and Cisco Unity Express.</td>
</tr>
<tr>
<td>Presence application</td>
<td>Cisco Unified Communications Manager IM and Presence Service (formerly Cisco Unified Presence) links the various knowledge within each application to provide a ubiquitous and broad view of a defined user within the Cisco Unified Communications System.</td>
</tr>
<tr>
<td>Mobility components</td>
<td>Wireless and mobility components provide services that enable secure, scalable, methods to real-time access to instant messaging, email, and network resources. Some examples of these components are Cisco Unified Mobility Advantage, and Cisco Unified Mobile Communicator.</td>
</tr>
<tr>
<td>Cisco Unified Computing System</td>
<td>The Cisco Unified Computing System (UCS) is a data center platform that unites computing, networking, storage access, and virtualization into a cohesive system and integrates a low-latency, lossless 10 Gb Ethernet unified network fabric with enterprise-class, x86-architecture servers. It includes products such as blade servers, network adapters, blade server chassis, fabric interconnect and extenders and UCS Manager, which provides centralized management capabilities for the Cisco Unified Computing System.</td>

For installation information on Cisco Unified Communications System Release 9.0(1) for contact center components, see the following:

**System Installation Strategies**

This section describes the installation strategies that can be used for an IP telephony deployment. Details of individual components installations are not described unless additional information or clarification is required.

Installation of new networks in Cisco Unified Communications IP telephony environments (using new hardware) is supported via a flash-cut or a shrink-and-grow approach.

**Single-Stage Installation Using New Hardware (Greenfield Deployments)**

A completely new network is built using the components and software versions in the current Cisco Unified Communications System release set. The new system becomes operational when it is turned on after the required software is installed and initial configuration is completed.
Single-Stage Installation Using New Hardware (Legacy Deployments)

A new network using components and software versions in the current Cisco Unified Communications System release set is built alongside the legacy network. The new network is staged and configured to support the production environment.

All users should be migrated from the existing legacy network to the new network in a single installation window using a flash-cut installation process. Because interoperability with the legacy system is not required, components of the legacy system do not need to be upgraded. After all users are moved to the newly installed system, the legacy system is decommissioned.

Multistage Installation Using New Hardware (Legacy Deployments)

A new network using components and software versions in the current Cisco Unified Communications System release set is built alongside the legacy network. The new network is staged and configured to support the production environment.

This strategy uses either a flash-cut or shrink-and-grow installation process or a combination of both to:

- Deploy all the applications in one installation window (flash-cut) or in several installation windows (shrink-and-grow).
- Migrate all the users in one installation window (flash-cut) or in multiple installation windows (shrink-and-grow).

After all users have been moved to the newly installed system, the legacy system is decommissioned.

Multisite Phased Installation

For large enterprises with many sites, you can install one site at a time in multiple phases. Depending on whether it is a greenfield or legacy deployment, within each site, you can either employ the single-stage or multistage installation strategies described in this section.

Interoperability and Compatibility Portals

For information about support for legacy products and third-party product interoperability with Cisco IP telephony products, see the Cisco Interoperability Portal at:

http://www.cisco.com/go/interoperability

For detailed information about the compatibility with Unified Communications Manager and Cisco Unified Contact Center Express, see the following sites:
