Configuring System Components

Command-line interface (CLI) commands are available to configure Cisco Unity Express system components. You enter some commands in EXEC mode and others in configuration mode.

This chapter describes how to configure the following basic Cisco Unity Express components:

- SIP parameters that Cisco Unity Express must communicate with Cisco Unified Communications Manager Express (Cisco Unified CME).
- JTAPI parameters that Cisco Unity Express must communicate with Cisco Unified Communications Manager.
- Other Cisco Unity Express system components such as Prompts, Scripts, Applications, Triggers, and so on.

All the procedures in this chapter can be implemented using either CLI commands or the graphical user interface (GUI) options. Use the CLI procedures for:

- Bulk provisioning
- Scripting
- Upgrading
- Troubleshooting systems

This chapter contains the following procedures for configuring Cisco Unity Express system components:

- Configuring SIP Call Control Parameters, page 2
  - Configuring the SIP Proxy Server Location for Cisco Unity Express, page 2
  - Configuring the Call Transfer Mode, page 4
  - Configuring DTMF Options, page 5
  - Configuring the MWI Notification Option, page 8
  - Configuring the MWI On and Off Extensions (Not Available in Cisco SRST Mode), page 12
  - Configuring Centralized Cisco Unity Express, page 14
  - Configuring FAX Support for Centralized Cisco Unity Express, page 19
  - Configuring NonSubscriber Distribution Lists for Centralized Cisco Unity Express, page 21
  - Configuring Cisco Unified CME SIP Options for RFC Compliance, page 21
- Configuring JTAPI Parameters (Cisco Unified Communications Manager Only), page 22
- Managing Scripts, page 26
- Managing Prompts, page 28
Configuring SIP Call Control Parameters

This section contains:

- Configuring the SIP Proxy Server Location for Cisco Unity Express, page 2
- Configuring the Call Transfer Mode, page 4
- Configuring DTMF Options, page 5
- Configuring the MWI Notification Option, page 8
- Configuring the MWI On and Off Extensions (Not Available in Cisco SRST Mode), page 12
- Configuring Cisco Unified CME SIP Options for RFC Compliance, page 21

Configuring the SIP Proxy Server Location for Cisco Unity Express

The Session Initiation Protocol (SIP) proxy server resides on the router where Cisco Unified CME is installed. Cisco Unified CME can be installed on a different router from where the Cisco Unity Express hardware and software is installed. The SIP proxy server location information must be configured properly to enable all communications between Cisco Unity Express and Cisco Unified CME. The SIP proxy server also enables the message waiting indicators (MWIs) to work with the Cisco Unity Express voice-mail application.

Required Data for This Procedure

The following information is required to configure the SIP proxy server:

- Hostname or IP address of the router where the SIP proxy server resides
- UDP port of the router where the SIP proxy server resides

SUMMARY STEPS

1. `config t`
2. `ccn subsystem sip`
3. `gateway address ip-address`
4. `gateway port port-number`
5. `end`
6. `show ccn subsystem sip`
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# config t</td>
<td></td>
</tr>
<tr>
<td>Step 2 ccn subsystem sip</td>
<td>Enters SIP configuration mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# ccn subsystem sip</td>
<td></td>
</tr>
<tr>
<td>Step 3 gateway address ip-address</td>
<td>Specifies the hostname or IP address of the router where the SIP proxy server resides.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-sip)# gateway address 10.100.6.9</td>
<td></td>
</tr>
<tr>
<td>Step 4 gateway port port-number</td>
<td>Specifies the UDP port number on which the SIP proxy server listens for incoming SIP messages. The default value is 5060.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-sip)# gateway port 5060</td>
<td>Note: We strongly recommend that you do not change this port number.</td>
</tr>
<tr>
<td>Step 5 end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-sip)# end</td>
<td></td>
</tr>
<tr>
<td>Step 6 show ccn subsystem sip</td>
<td>Displays the SIP subsystem parameters.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# show ccn subsystem sip</td>
<td></td>
</tr>
<tr>
<td>Step 7 copy running-config startup-config</td>
<td>Copies the configuration changes to the startup configuration.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following example illustrates the show ccn subsystem sip output, which displays the SIP gateway IP address and SIP port number:

se-10-0-0-0# show ccn subsystem sip

SIP Gateway: 10.100.6.9
SIP Port Number: 5060
DTMF Relay: sip-notify,sub-notify
MWI Notification: sub-notify
Transfer Mode: refer-consult
SIP RFC Compliance: Pre-RFC3261
Configuring the Call Transfer Mode

Cisco Unity Express permits configuration of attended and semiattended call transfer modes in addition to blind transfers.

SUMMARY STEPS

1. config t
2. ccn subsystem sip
3. transfer-mode {attended | semi-attended | blind refer | blind bye-also} 
4. end
5. show ccn subsystem sip

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# config t</td>
<td></td>
</tr>
</tbody>
</table>

| Step 2 ccn subsystem sip | Enters SIP configuration mode. |
| Example:                 |         |
| se-10-0-0-0(config)# ccn subsystem sip |         |

| Step 3 transfer-mode {attended | semi-attended | blind refer | blind bye-also} | Specifies the transfer mode. |
| Example:             |         |
| se-10-0-0-0(config-sip)# transfer-mode blind refer |         |

- **attended**—Transfers calls in attended mode using the REFER method. The transfer is completed when the destination extension answers the call.
- **semi-attended**—Transfers calls in semi-attended mode using the REFER method. The transfer is completed when the destination extension is ringing.
- **blind refer**—Transfers calls without consulting using the REFER method.
- **blind bye-also**—Transfers calls without consulting using the BYE/ALSO method. Cisco Unity Express uses this method if the remote end does not support REFER. This is the default value.
Chapter 5  Configuring System Components

Configuring SIP Call Control Parameters

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 4**
| `<end>` | Returns to privileged EXEC mode. |
| **Example:**
| `se-10-0-0-0(config-sip)# end` | |
| **Step 5**
| `show ccn subsystem sip` | Displays SIP configuration parameters. |
| **Example:**
| `se-10-0-0-0# show ccn subsystem sip` | |

### Examples

The following is example output of the `show ccn subsystem sip` command.

```
se-10-0-0-0# show ccn subsystem sip
SIP Gateway: 172.19.167.208
SIP Port Number: 5060
DTMF Relay: sip-notify rtp-nte
MWI Notification: outcall
Transfer Mode: blind (REFER)
SIP RFC Compliance: Pre-RFC3261
```

### Configuring DTMF Options

The listed options are available for handling incoming and outgoing DTMF signals for SIP calls from Cisco Unified CME and Cisco SRST mode.

Cisco Unity Express provides the following options for transferring DTMF signals for incoming and outgoing SIP calls.

- **rtp-nte**—Uses the media path to relay incoming and outgoing DTMF signals.
  
  To use the `rtp-nte` option, verify that the Cisco IOS SIP gateway is configured to use RTP-NTE for SIP calls, as shown in the following example:

  ```
  dial-peer voice 1000 voip
  destination-pattern 6700
  session protocol sipv2
  session target ipv4:10.100.9.6
  dtmf-relay rtp-nte
  codec g711ulaw
  no vad
  ```

- **sub-notify**—Uses Subscribe and Notify messages to relay incoming DTMF signals to Cisco Unity Express. This option is not available for outgoing DTMF signals from Cisco Unity Express.

- **info**—Uses the Info message to relay outgoing DTMF signals from Cisco Unity Express to the Cisco IOS SIP gateway. This option is not available for incoming DTMF signals to Cisco Unity Express.

- **sip-notify**—Uses Unsolicited-Notify messages for incoming and outgoing DTMF signals.
  
  To use the `sip-notify` option, verify that the Cisco IOS SIP gateway is configured to use Unsolicited NOTIFY for SIP calls, as shown in the following example:

  ```
  dial-peer voice 1 voip
  ```
destination-pattern 6700
session protocol sipv2
session target ipv4:10.100.9.6
dtmf-relay sip-notify
codec g711ulaw
no vad

You can configure more than one option for transferring DTMF signals. The order in which you configure the options determines their order of preference.

**Table 5-1** shows the various option combinations, the remote end capability, and the signaling option for incoming and outgoing DTMF signals.

Configuring SIP Call Control Parameters

Chapter 5 Configuring System Components

Steps

### Step 3

```
dtmf-relay \{rtp-nte | sub-notify | info | sip-notify\}
```

**Example:**
```
se-10-0-0-0(config-sip)# dtmf-relay sip-notify rtp-nte
```

**Purpose:** Specifies the DTMF signal handling option. Use a single `dtmf-relay` command to specify more than one DTMF option.
- **rtp-nte**—Uses the media path to relay incoming and outgoing DTMF signals.

**Note** Verify that the Cisco IOS gateway has a dial-peer configured to use `rtp-nte`.
- **sub-notify**—Uses Subscribe and Notify messages to relay for incoming DTMF signals to Cisco Unity Express.
- **info**—Uses the Info message to relay outgoing DTMF signals from Cisco Unity Express to the Cisco IOS SIP gateway.
- **sip-notify**—Uses Unsolicited-Notify messages to relay incoming and outgoing DTMF signals.

**Note** Verify that the Cisco IOS gateway has a dial-peer configured to use `sip-notify`.

### Step 4

```
end
```

**Example:**
```
se-10-0-0-0(config-sip)# end
```

**Purpose:** Returns to privileged EXEC mode.

### Step 5

```
show ccn subsystem sip
```

**Example:**
```
se-10-0-0-0# show ccn subsystem sip
```

**Purpose:** Displays SIP configuration parameters.

### Examples

The following example displays the output of the `show ccn subsystem sip` command.
```
se-10-0-0-0# show ccn subsystem sip
```

```
SIP Gateway: 172.19.167.208
SIP Port Number: 5060
DTMF Relay: sip-notify rtp-nte
MWI Notification: outcall
Transfer Mode: consult (REFER)
SIP RFC Compliance: Pre-RFC3261
```

### Configuring the MWI Notification Option

Cisco Unity Express expands MWI status update capability to include Cisco Unified Communications Manager and Cisco SRST mode. Three notification options are available:
- **Outcall Notification (Not Available in Cisco SRST Mode), page 9**
- **Sub-Notify Notification, page 9**
- **Unsolicited Notification, page 10**
From the GUI, select Voice Mail > Message Waiting Indicators > Settings to configure the MWI notification option.

**Outcall Notification (Not Available in Cisco SRST Mode)**

Only Cisco Unified CME can use the SIP outcall mechanism for generating MWI notifications. Outcall will not work in Cisco SRST mode.

*Note* If the MWI notification option is outcall, configure the MWI on and off extensions. See “Configuring the MWI On and Off Extensions (Not Available in Cisco SRST Mode)” on page 12.

The outcall option is available for backward compatibility. We recommend that you use either sub-notify or unsolicited for the MWI notification option.

To use the outcall option, Cisco Unified CME must configure two ephone-dns that are registered to receive MWI notifications as follows:

```
ephone-dn 30
  number 8000....
  mwi on
.
ephone-dn 31
  number 8001....
  mwi off
```

*Note* The number of dots in the above example must be equal to the extension length of the phones connected to Cisco Unified CME.

**Sub-Notify Notification**

Both Cisco Unified CME and Cisco Unified Communications Manager in SRST mode can use the sub-notify mechanism for generating MWI notifications. With this mechanism, the MWI notifications will reflect the accurate status of messages in a subscriber’s voice mailbox.

After an ephone-dn is configured with the sub-notify option, Cisco Unified CME sends a Subscribe message to Cisco Unity Express to register the phone for MWI notifications. When a new voice message arrives in the voice mailbox for the ephone-dn, Cisco Unity Express updates the MWI status. If Cisco Unity Express does not receive the Subscribe message for the ephone-dn, Cisco Unity Express will not update the MWI status when a new message arrives.

To use the sub-notify option, Cisco Unified CME must configure each ephone-dn that is registered to receive MWI notifications as follows:

For Cisco IOS Releases Prior to 12.3(11)T7

```
sip-ua
  mwi-server ipv4:10.100.9.6 transport udp port 5060
  number 2010
.
ephone-dn 35
  mwi sip
```
For Cisco IOS Releases 12.3(11)T7 and Later Releases

```
sip-ua
 .
   mwi-server ipv4:10.100.9.6 transport udp port 5060
      number 2010
 .
 ephone-dn 35
   mwi sip
```

For Cisco SRST Mode

```
sip-ua
 .
   mwi-server ipv4:10.100.9.6 transport udp port 5060
      number 2010
 .
call-manager-fallback.
   mwi relay
```

Note

The SIP server IP address used in these commands must be the IP address of Cisco Unity Express. In the examples shown above, this is 10.100.9.6.

Unsolicited Notification

Both Cisco Unified CME and Cisco Unified Communications Manager in SRST mode can use the unsolicited mechanism for generating MWI notifications. With this mechanism, the MWI notifications will reflect the accurate status of messages in a subscriber’s voice mailbox.

The unsolicited option does not require Cisco Unified CME to send a subscription request for each ephone-dn to Cisco Unity Express for MWI notifications. Cisco Unity Express sends Notify messages to Cisco Unified CME whenever the voice mailbox for any ephone-dn receives a new message. In this way, the MWI status reflects the current voice mailbox message status.

To use the unsolicited option, Cisco Unified CME must configure each ephone-dn that is registered to receive MWI notifications as follows:

For Cisco IOS Releases Prior to 12.3(11)T7

```
telephony-service
 .
   mwi sip-server 10.100.9.6 transport udp port 5060 unsolicited
      number 2010
 .
 ephone-dn 35
   mwi sip
```

For Cisco IOS Release 12.3(11)T7 and Later Releases

```
sip-ua
 .
   mwi-server ipv4:10.100.9.6 transport udp port 5060 unsolicited
      number 2010
 .
```
ephone-dn 35
mwip sip

For Cisco SRST Mode
sip-ua
  .
  .
mwi-server ipv4:10.100.9.6 transport udp port 5060 unsolicited
  number 2010
call-manager-fallback.
mwi relay

Note
The SIP server IP address used in these commands must be the IP address of Cisco Unity Express. In the examples shown above, this is 10.100.9.6.

SUMMARY STEPS

1. config t
2. ccn subsystem sip
3. mwi sip {outcall | sub-notify | unsolicited}
4. end
5. show ccn subsystem sip

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# config t</td>
<td></td>
</tr>
<tr>

</tr>
</tbody>
</table>
| Step 3 mwi sip {outcall | sub-notify | unsolicited} | Specifies the MWI notification methods for SIP calls. The default is *outcall*.
| **Example:** | |
| se-10-0-0-0(config-sip)# mwi sip sub-notify | |
Chapter 5      Configuring System Components

Configuring SIP Call Control Parameters

Examples

The following example displays the output of the `show ccn subsystem sip` command.

```
se-10-0-0-0# show ccn subsystem sip
SIP Gateway: 172.19.167.208
SIP Port Number: 5060
DTMF Relay: sip-notify, sub-notify
MWI Notification: sub-notify
Transfer Mode: consult (REFER)
```

Configuring the MWI On and Off Extensions (Not Available in Cisco SRST Mode)

Cisco Unity Express uses the MWI on and off extensions with the affected telephone extension to generate a SIP call to Cisco Unified CME, which changes the status of the telephone’s MWI light.

This configuration is required only if the MWI notification option is configured as `outcall`. (See the earlier section “Configuring the MWI Notification Option” on page 8.)

Prerequisites

Verify that the MWI on and off extensions are configured on Cisco Unified CME; otherwise, the MWI light will not work.

Required Data for This Procedure

The following information is required to configure the MWI on and off extensions:

- Extension number dedicated to the MWI on extension
- Extension number dedicated to the MWI off extension

SUMMARY STEPS

1. `config t`
2. `ccn application ciscomwiapplication`
3. `parameter strMWI_ON_DN on-extension`
4. `parameter strMWI_OFF_DN off-extension`
5. end
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command of Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# config t</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> ccn application ciscomwiapplication</td>
<td>Enters configuration mode for the MWI application.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config)# ccn application ciscomwiapplication</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> parameter strMWI_ON_DN on-extension</td>
<td>Assigns the on-extension value as the MWI on extension. Use the same on extension as configured on Cisco Unified CME.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-application)# parameter strMWI_ON_DN 8000</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> parameter strMWI_OFF_DN off-extension</td>
<td>Assigns the off-extension value as the MWI off extension. Use the same off extension as configured on Cisco Unified CME.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-application)# parameter strMWI_OFF_DN 8001</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-application)# end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>Copies the configuration changes to the startup configuration.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

Configuring the Inclusion of Envelope Information in SIP MWI Notifications

To determine whether envelope information is included in SIP MWI notifications, use the **mwi envelope-info** command.

Enabling the inclusion of envelope information in SIP MWI notifications does not effect whether Cisco Unity Express accepts MWI subscriptions that request envelope information. It only determines whether envelope information is not included in SIP MWI notifications and it effects only the content of MWI messages generated by Cisco Unity Express. Disabling the inclusion of envelope information does not terminate existing MWI subscriptions. After it is enabled, subsequent MWI notifications include envelope information for any existing MWI subscription that requested with envelope information.
Prerequisites

- Cisco Unity Express 3.2 or a later version
- The `mwi envelope-info` command is relevant only when the `mwi sip sub-notify` command is used. For more information about the `mwi sip sub-notify` command, see the earlier section “Configuring the MWI Notification Option” on page 8.

**SUMMARY STEPS**

1. config t
2. ccn subsystem sip
3. mwi envelope-info
4. end
5. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command of Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> config t</td>
<td>Enters configuration mode.</td>

</tbody>
</table>

**Configuring Centralized Cisco Unity Express**

Available in Cisco Unity Express 3.2 and later versions, the centralization feature enables the Cisco Unity Express NME or Cisco Unity Express SM-SRE-700-K9 to interoperate with up to ten Cisco Unified CME systems.
Note

The Cisco Unity Express AIM-CUE/AIM2-CUE, NM-CUE, NM-CUE-EC and ISM-SRE-300-K9 modules support only one Cisco Unified CME system.

Geographically dispersed Cisco Unified CME systems can be connected to Cisco Unity Express across a WAN link. Cisco Unity Express can be co-located with one of these Cisco Unified CME systems, although it is not required.

Figure 5-1 Centralized Cisco Unity Express Deployment Topology

To interconnect more than ten Cisco Unified CME systems, you can use Cisco Unified Messaging Gateway to interconnect multiple Cisco Unity, Cisco Unity Express, and third party messaging systems.

Note

Cisco Unity Express does not support importing and/or managing Cisco Unified CME Extension Mobility (EM) users, only ephone users.

To receive the greatest benefit from the centralization feature, you must configure a single central Cisco Unified CME gateway to manage the company’s dial-plan. This central Cisco Unified CME gateway is called the “local” site and is a predefined site on the system. The local site cannot be deleted. Cisco Unity Express uses one SIP gateway for all outgoing calls and faxes. This SIP gateway must be aware of the company’s dial-plan and be capable of routing calls from Cisco Unity Express to any Cisco Unified CME in the network. This gateway is configured independently of the sites, but by default, it routes to the Cisco Unified CME at the local site.
If you plan to use Outcall or Unsolicited Notify for MWI, the MWI relay must be enabled on the central (local) Cisco Unified CME and the other Cisco Unified CME routers must subscribe to this one. The central one will keep track of which numbers are defined where and pass on the MWI messages accordingly.

If you plan to use Subscribe-Notify for MWI, then the individual gateways must use Cisco Unity Express as their MWI server.

---

**Note**

Cisco Unity Express does not support automatic MWI synchronization if the WAN link between Cisco Unity Express and Cisco Unified CME is disrupted. You must manually synchronize the MWI if it is out of synch.

---

The commands listed in the following are not available when Cisco Unity Express is working in Cisco Unified Communications Manager mode.

The following instructions describe how to provision Cisco Unified CME sites:

- Defining a Cisco Unified CME Site (Site Provisioning), page 16
- Deleting a Cisco Unified CME Site, page 18

---

**Note**

The following procedures replace the following EXEC mode command found in Cisco Unity Express 3.1 and earlier versions, whose purpose was to provision the single Cisco Unified CME it supported: web admin cme hostname [hostname] username [username] password [password]. Although this command has not been deprecated, when you have multiple Cisco Unified CME systems, this command will apply only to the central (local) site.

---

**Defining a Cisco Unified CME Site (Site Provisioning)**

**Prerequisites**

Cisco Unity Express 3.2 or a later version

**SUMMARY STEPS**

1. `config t`
2. `site name [site-name | local ]`
3. `site-hostname hostname`
4. `description “text”`
5. `web username username password password`
6. `web credentials hidden username-password-hash`
7. `xml username username password password`
8. `xml credentials hidden username-password-hash`
9. `exit`
### Chapter 5 Configuring System Components

### Configuring SIP Call Control Parameters

10. **username** *username* site *site-name*  
11. end  
12. show site [site-name]  
13. show users site [site-name]

#### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>config t</strong></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0# config t</code></td>
</tr>
<tr>
<td><strong>Purpose</strong></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>**site name [site-name</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0(config)# site name local</code></td>
</tr>
</tbody>
</table>
| **Purpose** | Creates a Cisco Unified CME site:  
  *site-name*—The syntax for the site name is the same as the username, containing letters, numbers, hyphens, and/or dots, maximum 32 characters.  
  *local*—Name of the central site. |
| **Step 3** | **site-hostname hostname** |
| **Example:** | `se-10-0-0-0(config-site)# site-hostname 192.0.2.13` |
| **Purpose** | Sets the DNS hostname or IP address of the Cisco Unified CME site. |
| **Step 4** | **description “text”** |
| **Example:** | `se-10-0-0-0(config-site)# description “San Jose HQ”` |
| **Purpose** | Configures a description for the site:  
  *text*—Description for a specific site. The description can have a maximum of 64 characters and must be bracketed by quotes. |
| **Step 5** | **web username username password password** |
| **Example:** | `se-10-0-0-0(config-site)# web username admin password pass18` |
| **Purpose** | Configures the Web username and Web password for the site:  
  *username*—Web username for the site.  
  *password*—Web password for the site. |
| **Step 6** | **web credentials hidden username-password-hash** |
| **Example:** | `se-10-0-0-0(config-site)# web credentials hidden “GixGRq8cUmGIZd9c8oX9EnfGWYHfmPSd$ZZNgd+y9J3xlk2B35j0nfGWYHfmPSd$ZZNgd+y9J3xlk2B35j0nfGWYHfmPSd$ZZNgd+y9J3xlk2B35j0nfGWYHfmP”` |
| **Purpose** | Configures the hidden Web credentials for the site:  
  username-password-hash—Encrypted credentials for the Web username and password for the site. |
| **Step 7** | **xml username username password password** |
| **Example:** | `se-10-0-0-0(config-site)# xml username user42 password password42` |
| **Purpose** | Configures the XML username and Web password for the site:  
  *username*—Web username for the site.  
  *password*—Web password for the site. |
### Deleting a Cisco Unified CME Site

The following configuration mode command deletes a site. You cannot delete the local site.

```
no site name site-name
```

The syntax for the site name is the same as the username, containing letters, numbers, hyphens, and/or dots, maximum 32 characters.

### Example

The following example illustrates some of the configurations described above.

```
se-10-0-0-0# config t
Enter configuration commands, one per line. End with CNTL/Z.
se-10-0-0-0(config)# site name Montreal
se-10-0-0-0(config-site)# site-hostname 192.0.2.13
```
Configuring System Components

Chapter 5  Configuring System Components

Configuring SIP Call Control Parameters

```
se-10-0-0-0(config-site)# description HQ_Rue_St-Jacques

se-10-0-0-0#
```

Configuring FAX Support for Centralized Cisco Unity Express

Prerequisites

Cisco Unity Express 3.0 or a later version

SUMMARY STEPS

1. config t
2. fax gateway inbound address {ip-address | hostname}
3. fax print E164-number site sitename
4. end
5. show fax configuration
## DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>config t</td>
<td>Enters configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0# config t
```

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>fax gateway inbound address {ip-address</td>
<td>hostname}</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0(config)# fax gateway inbound address site8
```

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>fax print E164-number site sitename</td>
<td>Configures the site’s fax number used to print faxes:</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0(config)# fax print 555-0100 site site8
```

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0(config)# end
```

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show fax configuration</td>
<td>(Optional) Displays the fax configuration.</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0# show fax configuration
```

## Examples

The following example configures the inbound fax gateway IP address:
```
se-10-0-0-0# config t
se-10-0-0-0(config)# fax gateway inbound address 172.16.20.50
se-10-0-0-0(config)# end
```

The following example sets the site’s fax number to 555-0112:
```
se-10-0-0-0# config t
se-10-0-0-0(config)# fax print 555-0112 site site8
se-10-0-0-0(config)# end
```

The following is sample output for the `show fax configuration` command if only one site is configured:
```
se-10-0-0-0# show fax configuration
Outbound Fax Gateway: 172.16.50.38
Inbound Fax Gateway: aesopits.aesop.com
Fax Printing Number: 1111
```

The following is sample output for the `show fax configuration` command if more than one site is configured:
```
se-10-0-0-0# show fax configuration
```
Chapter 5  Configuring System Components

Configuring SIP Call Control Parameters

Outbound Fax Gateway: 172.16.50.38
Inbound Fax Gateway(s): 1.100.50.39, 1.100.60.98, 1.100.50.1

<table>
<thead>
<tr>
<th>Site</th>
<th>Fax Printing Number</th>
</tr>
</thead>

</tbody>
</table>

Configuring NonSubscriber Distribution Lists for Centralized Cisco Unity Express

To configure NonSubscriber Distribution Lists for Centralized Cisco Unity Express, see Configuring Public Distribution Lists, page 5.

Configuring Cisco Unified CME SIP Options for RFC Compliance

Cisco Unity Express provides the protocol command to ensure compatibility with all Cisco IOS releases. Cisco IOS Release 12.4(2)T and earlier releases are not RFC 3261 compliant. The lack of compliance causes the Cisco Unity Express software not to interoperate properly with those older Cisco IOS releases when sip-notify or sub-notify are used for DTMF.

Required Data for This Procedure

The release number of the Cisco IOS software running on your call control platform.

SUMMARY STEPS

1. config t
2. ccn subsystem sip
3. protocol {pre-rfc3261 | rfc3261}
4. end
5. show ccn subsystem sip

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command of Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0# config t</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command of Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2 ccn subsystem sip</td>
<td>Enters configuration mode for the SIP subsystem.</td>
</tr>
<tr>
<td>Example: se-10-0-0-0(config-sip)# ccn subsystem sip</td>
<td></td>
</tr>
</tbody>
</table>
## Configuring JTAPI Parameters (Cisco Unified Communications Manager Only)

Use this procedure to configure the parameters that Cisco Unity Express must communicate with Cisco Unified Communications Manager. These parameters include:

- Up to three Cisco Unified Communications Manager servers
- JTAPI user ID and password
- JTAPI CTI ports that are configured on Cisco Unified Communications Manager and that are associated with the Cisco Unified Communications Manager JTAPI user
- Optional separate CTI port to use for MWI

### Command of Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command(s)</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 3 | protocol (pre-rfc3261 | rfc3261) | Assigns the protocol type for RFC 3261 compatibility.  
- **pre-rfc3261**—Use this option if your call control platform uses a Cisco IOS release prior to 12.4(2)T. This is the default value.  
- **rfc3261**—Use this option if your call control platform uses Cisco IOS Release 12.4(2)T or a later release. |

**Example:**

```
se-10-0-0-0(config-sip)# protocol rfc3261
```

| Step 4 | end                           | Returns to privileged EXEC mode. |

**Example:**

```
se-10-0-0-0(config-sip)# end
```

| Step 5 | show ccn subsystem sip          | Displays the configured SIP subsystem parameters. |

**Example:**

```
se-10-0-0-0# show ccn subsystem sip
```

### Example

The following example sets the SIP option to RFC 3261 for call platforms using Cisco IOS Release 12.4(2)T or a later release.

```
se-10-0-0-0# config t
se-10-0-0-0(config)# ccn subsystem sip
se-10-0-0-0(config-sip)# protocol rfc3261
se-10-0-0-0(config-sip)# end
```

Following is example output of the `show ccn subsystem sip` command.

```
se-10-0-0-0# show ccn subsystem sip
SIP Gateway: 10.10.5.1
SIP Port Number: 5060
DTMF Relay: sip-notify,sub-notify
MWI Notification: sub-notify
Transfer Mode: refer-consult
SIP RFC Compliance: RFC3261
```
To configure CTI ports for MWI, the Cisco Unified Communications Manager must have a CTI port that is assigned the DN you specify when you configure the CTI port, and the DN must be under the control of Cisco Unity Express JTAPI application user.

If an MWI port is configured on Cisco Unity Express but the DN is not in service, or Cisco Unity Express cannot register the port, no notifications are generated. If no MWI port is configured, Cisco Unity Express uses one of the CTI ports configured with the `ctiports` command.

**Cisco Unified Communications Manager and Cisco Unity Express Version Compatibility**

Depending on the version, Cisco Unity Express can be configured to work with different versions of Cisco Unified Communications Manager. For more information see the Cisco Unity Express Compatibility Matrix.

The following scenarios apply when installing Cisco Unity Express with a different version of Cisco Unified Communications Manager, or upgrading the Cisco Unified Communications Manager version:

- By default, each version of Cisco Unity Express is set up to work with a specific version of Cisco Unified Communications Manager. Once you configure the IP Address or Hostname of the Cisco Unified Communications Manager, you must reload the Cisco Unity Express module for the configuration to take effect. After this reload, Cisco Unity Express automatically reloads again if the configured Cisco Unified Communications Manager version is different from the supported default version.

- If the Cisco Unified Communications Manager server being used by Cisco Unity Express is upgraded, Cisco Unity Express reloads and updates its system files to work with the new version of Cisco Unified Communications Manager. No further action from you is required.

**Prerequisites**

To use a separate CTI port for MWI, you must have 3.2 or later releases.

**Required Data for This Procedure**

The following information is required to configure the JTAPI parameters:

- IP address or hostname for the primary, secondary, and tertiary Cisco Unified Communications Manager servers

- JTAPI user ID and password from Cisco Unified Communications Manager. The password is case sensitive. These values must match the JTAPI user ID and password that were configured on Cisco Unified Communications Manager.

- List of CTI ports

- To use a separate CTI port for MWI, a list of DNs that are assigned on Cisco Unified Communications Manager and are under the control of Cisco Unity Express JTAPI application user.
### Configuring JTAPI Parameters (Cisco Unified Communications Manager Only)

**Note**
If you are using Cisco Unified Communications Manager 5.0 or a later version, verify that the AXL service is active. To do this, go to the Cisco Unified Communications Manager serviceability website, click on Tools > Service Activation. Look for Cisco AXL Web service.

### SUMMARY STEPS

1. `config t`
2. `ccn subsystem jtapi`
3. `ccm-manager address {primary-server-ip-address | primary-server-hostname} {secondary-server-ip-address | secondary-server-hostname} {tertiary-server-ip-address | tertiary-server-hostname}`
4. `ccm-manager username jtapi-user-id password jtapi-user-password`
5. `ctiport cti-port-number`
6. `mwiport dn-number`
7. `redirect-css cti-port {ccm-default | calling-party | redirecting-party}`
8. `redirect-css route-point {ccm-default | calling-party | redirecting-party}`
9. `end`
10. `show ccn subsystem jtapi`
11. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><code>config t</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0# config t</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters JTAPI configuration mode.</td>
</tr>
<tr>
<td><code>ccn subsystem jtapi</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0(config)# ccn subsystem jtapi</code></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Specifies up to three Cisco Unified Communications Manager servers. Enter the server IP addresses or hostnames on one command line or on separate command lines. If entered on separate lines, the servers are assigned in order as primary, secondary, and tertiary servers.</td>
</tr>
<tr>
<td>`ccm-manager address {primary-server-ip-address</td>
<td>primary-server-hostname} {secondary-server-ip-address</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0(config-jtapi)# ccm-manager address 10.100.10.120</code></td>
</tr>
<tr>
<td></td>
<td><code>se-10-0-0-0(config-jtapi)# ccm-manager address 10.100.10.120 10.120.10.120 10.130.10.120</code></td>
</tr>
</tbody>
</table>

**Note**  Restart the system for these changes to be effective.
### Configuring JTAPI Parameters (Cisco Unified Communications Manager Only)

**Step 4**

```
ccm-manager username jtapi-user-id password jtapi-user-password
```

**Example:**
```
se-10-0-0-0(config-jtapi)# ccm-manager username myjtapi
```

Specifies the JTAPI user ID and password. The password is case sensitive. These values must match the JTAPI user ID and password that were configured on Cisco Unified Communications Manager.

**Note**  
Restart the system for these changes to be effective.

**Step 5**

```
ctiport cti-port1 cti-port2 cti-port3 cti-port4...
```

**Example:**
```
se-10-0-0-0(config-jtapi)# ctiport 7008
se-10-0-0-0(config-jtapi)# ctiport 7009
se-10-0-0-0(config-jtapi)# ctiport 7010
se-10-0-0-0(config-jtapi)# ctiport 7011
se-10-0-0-0(config-jtapi)# ctiport 6001 6002 6003 6004 6005 6006 6007 6008
```

Specifies the JTAPI CTI ports that are configured on Cisco Unified Communications Manager and that are associated with the Cisco Unified Communications Manager JTAPI user.

Repeat this command to enter more than one port number or enter the ports on one line. You can specify up to the maximum number of ports supported for each module type. For information on the number of ports supported, see the *Release Notes for Cisco Unity Express*.

**Step 6**

```
mwiport dn-number
```

**Example:**
```
se-10-0-0-0(config-jtapi)# mwiport 44
```

(Optional) Configures a separate CTI port to use for MWI. The DN must be different from those used by any of the CTI ports (as configured using the `ctiport` command).

**Step 7**

```
redirect-css cti-port {ccm-default | calling-party | redirecting-party}
```

**Example:**
```
se-10-0-0-0(config-jtapi)# redirect-css cti-port redirecting-party
```

(Optional) Specifies the calling search space used to redirect calls from CTI ports to elsewhere.

- **ccm-default** — Redirect without Cisco Unity Express specifying a calling search space.
- **calling-party** — Use the original calling party’s calling search space to redirect.
- **redirecting-party** — Use the redirecting party’s calling search space to redirect.

**Step 8**

```
redirect-css route-point {ccm-default | calling-party | redirecting-party}
```

**Example:**
```
se-10-0-0-0(config-jtapi)# redirect-css cti-port calling-party
```

(Optional) Specifies the calling search space used to redirect calls from route points to CTI ports.

- **ccm-default** — Redirect without Cisco Unity Express specifying a calling search space.
- **calling-party** — Use the original calling party’s calling search space to redirect.
- **redirecting-party** — Use the redirecting party’s calling search space to redirect.

**Step 9**

```
end
```

**Example:**
```
se-10-0-0-0(config-jtapi)# end
```

Returns to privileged EXEC mode.
Managing Scripts

Cisco Unity Express provides you with building blocks (known as Steps) through its Cisco Unity Express Editor Software, which can be used to create customized call-flows for various applications such as auto-attendant or IVR applications. These call flows can be saved as AEF files (known as scripts).

Cisco Unity Express ships with some internal scripts, which are known as system scripts. These system scripts cannot be downloaded, modified or deleted. The number of custom scripts supported depends on the hardware module and the release. For more information, see the the Release Notes for Cisco Unity Express.

Customizing scripts involves the following procedures:

- Creating a Script File, page 26
- Uploading a Script File, page 27
- Displaying the List of Existing Scripts, page 27
- (Optional) Downloading a Script File, page 28
- (Optional) Deleting a Script File, page 28

Examples

Following is example output of the show ccn subsystem jtapi command:

```
se-10-0-0-0# show ccn subsystem jtapi
Cisco Call Manager: 10.100.10.120
CCM JTAPI Username: jtapiuser
CCM JTAPI Password: *****
Call Control Group 1 CTI ports: 7008,7009,7010,7011
Call Control Group 1 MWI port: 4210
CSS for redirects from route points: ccm-default
CSS for redirects from CTI ports: redirecting-party
```

Creating a Script File

To create a script file, use the Cisco Unity Express Editor software. See to the Cisco Unity Express Guide to Writing Auto-Attendant Scripts for guidelines and procedures for creating a script file.
The file cannot be larger than 256 KB. Starting with Cisco Unity Express 3.1, script files can also be created using Editor Express. Editor Express can be accessed using the GUI option System > Scripts > New.

**Note**
Cisco Unity Express Editor Express provides only a subset of the functionality that is available the Cisco Unity Express Script Editor. Use Cisco Unity Express Editor Express for simple call-flow customizations only.

After creating the script, use the GUI or Cisco Unity Express ccn copy command to upload the file to the Cisco Unity Express module. See the next section, "Uploading a Script File, page 27," for the upload procedure.

**Note**
If you create your script using Cisco Unity Express Editor Express, you do not need to upload because it is directly saved on the Cisco Unity Express module.

### Uploading a Script File

After creating the AEF file, upload the file using the ccn copy url command in Cisco Unity Express EXEC mode:

```
ccn copy url ftp://source-ip-address/script-filename.aef script script-filename.aef [username username password password]
```

**Example:**

```
se-10-0-0-0# ccn copy url ftp://10.100.10.123/AVTscript.aef script AVTscript.aef
se-10-0-0-0# ccn copy url http://www.server.com/AVTscript.aef script AVTscript.aef
```

This command is equivalent to using the GUI option Voice Mail > Scripts and selecting Upload.

An error message appears if you try to upload more than the maximum number of scripts allowed on your Cisco Unity Express module.

### Displaying the List of Existing Scripts

To display details of the script files existing on the module, use the following command in Cisco Unity Express EXEC mode:

```
show ccn scripts
```

**Example:**

```
se-10-0-0-0# show ccn scripts

Name: setmwi.aef
Script type: aa
Create Date: Wed May 30 19:49:05 PDT 2007
Last Modified Date: Wed May 30 19:49:05 PDT 2007
Length in Bytes: 27768

Name: xfermailbox.aef
Script type: aa
```
Managing Prompts

Cisco Unity Express supports customized prompt files. See the Release Notes for Cisco Unity Express for your release for the number of customized prompts supported on your hardware module.

Customizing prompts requires the following procedures:
- Recording a Prompt File, page 29 (required)
- Uploading a Prompt File, page 29 (required)
- Downloading a Prompt File, page 30 (optional)
- Renaming a Prompt File, page 30 (optional)
- Deleting a Prompt File, page 30 (optional)
- Rerecording a Prompt File, page 31 (optional)
Recording a Prompt File

Two methods are available to create prompt files:

- Create a wav file with the following format: G.711 u-law, 8 kHz, 8 bit, Mono. The file cannot be larger than 1 MB (about 2 minutes). After recording the wav file, use the GUI or Cisco Unity Express CLI `ccn copy url` command to copy or upload the file to the Cisco Unity Express module. See the next section, “Uploading a Prompt File,” for the upload procedure.

- Cisco Unity Express provides an in-built application called Administration via Telephone (AvT), which lets you record customized prompt files directly on the module using a telephone. For details on how to configure and use AvT, see the chapter Configuring the Administration via Telephone Application, page 1.

We recommend using the AvT on the TUI to record greetings and prompts because the AvT provides higher sound quality compared to .wav files recorded using other methods.

Uploading a Prompt File

After recording the .wav prompt file, upload the file using the `ccn copy url` command in Cisco Unity Express EXEC mode:

```
ccn copy url source-ip-address prompt prompt-filename [language xx_YY] [username name password password]
```

where `prompt-filename` is the file to be uploaded, `xx_YY` is the language of the prompt file, `name` is the FTP server login ID, and `password` is the FTP server password.

The optional language parameter lets you specify the language directory in which you want the prompt to be uploaded. An error message appears if the language specified in the command is not installed on the module. If the language parameter is omitted in this CLI command, the prompt is uploaded to the default system language directory.

Example:
```
se-10-0-0-0# ccn copy url ftp://10.100.10.123/AAprompt1.wav prompt AAprompt1.wav
se-10-0-0-0# ccn copy url http://www.server.com/AAgreeting.wav prompt AAgreeting.wav
```

This command is equivalent to using the GUI option Voice Mail > Prompts and selecting Upload.

An error message appears if you try to upload more than the maximum number of prompts allowed on your Cisco Unity Express module.

Displaying Existing Prompt File lists

To display details of the prompt files existing on the module, use the following command in Cisco Unity Express EXEC mode:

```
show ccn prompts [language xx_YY]
```

The optional language parameter lets you specify the language directory from which the prompts will be listed. If the language parameter is omitted in this CLI command, then prompts from all language directories are listed.
Managing Prompts

Example:
```
se-10-0-0-0# show ccn prompts
```

Name: AAWelcome.wav
Language: en_US
Last Modified Date: Tue May 29 22:41:44 PDT 2007
Length in Bytes: 15860

Name: AABusinessClosed.wav
Language: en_US
Last Modified Date: Tue May 29 22:41:44 PDT 2007
Length in Bytes: 26038

Name: AABusinessOpen.wav
Language: en_US
Last Modified Date: Tue May 29 22:41:44 PDT 2007
Length in Bytes: 1638

Name: AAHolidayPrompt.wav
Language: en_US
Last Modified Date: Tue May 29 22:41:44 PDT 2007
Length in Bytes: 24982

Downloading a Prompt File

Prompts can be copied from the Cisco Unity Express module and stored on another server or PC.

To copy or download a prompt file, use the `ccn copy prompt` command in Cisco Unity Express EXEC mode:

```
ccn copy prompt prompt-filename url ftp://destination-ip-address/prompt-filename [language xx_YY] [username name password password]
```

where `prompt-filename` is the file to be downloaded, `destination-ip-address` is the IP address of the FTP server, `xx_YY` is the language directory from which the prompt file is to be downloaded, `name` is the FTP server login ID, and `password` is the FTP server password.

Example:
```
se-10-0-0-0# ccn copy prompt AAprompt2.wav url ftp://10.100.10.123/AAprompt2.wav
```

Renaming a Prompt File

To rename a prompt file already existing on the Cisco Unity Express module, use the `ccn rename prompt` command in Cisco Unity Express EXEC mode:

```
ccn rename prompt old-name new-name [language xx_YY]
```

where `old-name` is the existing filename and `new-name` is the revised name, and `xx_YY` is the language directory in which the prompt to be renamed resides. If the language parameter is omitted in this CLI command, the system renames the prompt old-name from the default system language directory.

An error message appears if the prompt old-name does not exist in that language directory.

Example:
```
se-10-0-0-0# ccn rename prompt AAmyprompt.wav AAmyprompt2.wav
```

Deleting a Prompt File

To delete a prompt file from the Cisco Unity Express module, use the `ccn delete` command in Cisco Unity Express EXEC mode:
ccn delete prompt prompt-filename [language xx_YY]

where prompt-filename is the file to be deleted, and xx_YY is the language directory from which the prompt is to be deleted. If the language parameter is omitted from this CLI command, the system attempts to delete this prompt from the default system language directory.

An error message appears if the prompt prompt-filename does not exist in that language directory.

Example:
se-10-0-0-0# ccn delete prompt AAgreeting.wav

Rerecording a Prompt File

You can rerecord existing prompt files using the AvT application.

For details on how to rerecord prompts using AvT, see the “Configuring the Administration via Telephone Application” section on page 1.

Managing Applications

After you complete your pre-application tasks by uploading your scripts and prompts, you must create an application on the Cisco Unity Express module.

Cisco Unity Express supports two types of applications:
- Auto-Attendant Applications: This option is available with basic the Voice Mail license.
- Interactive Voice Response (IVR) Applications: IVR license must be purchased and installed in order to create IVR applications.

Cisco Unity Express ships with some internal applications, which are known as system applications. These system applications cannot be deleted.

The maximum number of custom Auto-Attendant applications that can be created on Cisco Unity Express is four, regardless of the hardware type. The maximum number of custom IVR applications that can be created differs depending on the hardware module. See the Release Notes for Cisco Unity Express for your release for the maximum number of custom IVR applications that can be created on your system.

This section describes the procedure for managing applications and contains the following sections:
- Creating and Modifying Applications, page 31 (required)
- Script Parameters for Applications, page 34
- Deleting an Application, page 35

Creating and Modifying Applications

Use the following procedure to create or modify an application.

Required Data for This Procedure

- Application name.
Managing Applications

- Script name for the application.
- Maxsessions value. See the “Sharing Ports Among Applications and Triggers” section on page 46.
- Name and value for each parameter that the script requires. These may vary, depending on the script that you have created.

**Note** For more information about creating scripts, see the *Cisco Unity Express Guide to Writing Scripts*.

**SUMMARY STEPS**

1. `config t`
2. `ccn application full-name [aa | ivr]`
3. `default [description | enabled | maxsessions | script | parameter name]`
4. `description “text”`
5. `maxsessions number`
6. `no [description | enabled | maxsessions | script | parameter name]`
7. `parameter name “value”`
8. `script name`
9. `enabled`
10. `end`
11. `show ccn application [aa | ivr]`
12. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><code>config t</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>se-10-0-0-0# config t</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Specifies the application to configure and enters application configuration mode. The full-name argument specifies the name of the application to configure. The optional parameter aa specifies that the application being configured is an Auto-Attendant application. The optional parameter ivr specifies that the application being configured is an IVR application. The default application type (when no optional parameter is specified) is Auto-Attendant.</td>
</tr>
<tr>
<td>`ccn application full-name [aa</td>
<td>ivr]`</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>se-10-0-0-0(config)# ccn application myscript aa</code></td>
<td></td>
</tr>
</tbody>
</table>
### Managing Applications

#### Step 3

**default [description | enabled | maxsessions | script | parameter name]**

Example:

```
se-10-0-0-0(config-application)# default maxsessions
```

(Optional) Resets the application configuration as follows:

- **description**—Sets the description to the name of the application.
- **enabled**—Enables the application.
- **maxsessions**—Sets the maxsessions value to the number of licensed ports for that application type.
- **script**—No effect.
- **parameter name**—Uses the script’s default value.

#### Step 4

**description "text"**

Example:

```
se-10-0-0-0(config-application)# description "my application"
```

(Optional) Enter a description of the application. Use quotes around the text.

#### Step 5

**maxsessions number**

Example:

```
se-10-0-0-0(config-application)# maxsessions 5
```

Specifies the number of callers who can access this application simultaneously.

#### Step 6

**no [description | enabled | maxsessions | script | parameter name]**

Example:

```
se-10-0-0-0(config-application)# no description
```

(Optional) Resets the application configuration as follows:

- **description**—Removes the description for this application.
- **enabled**—Disables the application.
- **maxsessions**—Sets the maxsessions value to zero.
- **script**—No effect.
- **parameter name**—No effect.

#### Step 7

**parameter name "value"**

Example:

```
se-10-0-0-0(config-application)# parameter MaxRetry "4"
se-10-0-0-0(config-application)# parameter WelcomePrompt "Welcome.wav"
```

Configures script parameters for the application. Each parameter must have a name and a value, which is written within quotes. For more details on Script Parameters, see the “Script Parameters for Applications” section on page 34.

#### Step 8

**script name**

Example:

```
se-10-0-0-0(config-application)# script myscript.aef
```

Specifies the name of the script that will be used by the application.

#### Step 9

**enabled**

Example:

```
se-10-0-0-0(config-application)# enabled
```

Allows the application to be accessible to the system.
### Managing Applications

#### Command or Action

<table>
<thead>
<tr>
<th>Step 10</th>
<th>end</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0(config-application)# end</code></td>
</tr>
</tbody>
</table>

**Purpose:** Returns to privileged EXEC mode.

| Step 11 | show ccn application [aa | ivr] |
|---------|---------------------------------|
| **Example:** | `se-10-0-0-0# show ccn application ivr` |

**Purpose:** Displays details of the specified type of application. If no application type is specified, all applications on the system are displayed.

<table>
<thead>
<tr>
<th>Step 12</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td><code>se-10-0-0-0# copy running-config startup-config</code></td>
</tr>
</tbody>
</table>

**Purpose:** Copies the configuration changes to the startup configuration.

---

### Examples

The following example illustrates the `show ccn application` output:

```
se-10-0-0-0# show ccn application
```

<table>
<thead>
<tr>
<th>Name:</th>
<th>myscript</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Application Type: aa</td>
</tr>
<tr>
<td>Script:</td>
<td>myscript.aef</td>
</tr>
<tr>
<td>ID number:</td>
<td>2</td>
</tr>
<tr>
<td>Enabled:</td>
<td>yes</td>
</tr>
<tr>
<td>Maximum number of sessions:</td>
<td>5</td>
</tr>
<tr>
<td>MaxRetry:</td>
<td>4</td>
</tr>
<tr>
<td>WelcomePrompt:</td>
<td>Welcome.wav</td>
</tr>
<tr>
<td><strong>se-10-0-0-0#</strong></td>
<td></td>
</tr>
</tbody>
</table>

---

### Script Parameters for Applications

While creating a script with Cisco Unity Express Script Editor, you can specify some script variables to be “parameters.” The value of these “parameters” can be easily modified using the Cisco Unity Express configuration commands, without the need to edit the script using the Cisco Unity Express Script Editor. This has two benefits:

- You can deploy the same script at multiple locations and still customize the script flow to some extent for that particular location without needing different scripts for different locations. For example, you can create a simple script which welcomes the caller by playing a prompt such as “Welcome to ABC stores,” and then transfers the caller to the operator. You can specify this welcome prompt and the operator extension as script parameters while creating the script. Then you can deploy the same script at multiple locations and change the welcome prompt and operator extension by using the Cisco Unity Express configuration commands.

- You can create multiple applications using the same script, but with different values for the script parameters, thereby allowing you to provide a different experience to the caller depending on the application being invoked.

To view a list of script parameters, create an application using that script, and then use the `show ccn application` command to display the list of parameters and their default values.

To change the value of these parameters, see Step 7 in Creating and Modifying Applications, page 31.
Deleting an Application

If you have an application that you do not want to keep, use this procedure to delete the application and any triggers associated with that application.

After you delete the application and triggers, the script associated with the application still remains installed on the Cisco Unity Express module.

The following system applications ship with Cisco Unity Express, and cannot be deleted:
- autoattendant
- ciscomwiapplication
- msgnotification
- promptmgmt (the AvT application)
- voicemail

Required Data for This Procedure

The following information is required to delete an application:
- Application name
- All trigger numbers or URL names associated with the application

SUMMARY STEPS

1. show ccn application
2. show ccn trigger
3. config t
4. no ccn trigger [sip | jtapi | http] phonenumber number
5. no ccn application name
6. exit
7. show ccn application
8. show ccn trigger
9. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>show ccn application</td>
<td>Displays the currently configured applications. Look for the name of the application you want to delete.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# show ccn application</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>show ccn trigger</td>
<td>Displays the currently configured triggers. Look for the telephone numbers associated with the application you want to delete.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# show ccn trigger</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

<table>
<thead>
<tr>
<th>Step 3</th>
<th>config t</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0# config t</td>
<td>Enters configuration mode.</td>
</tr>
</tbody>
</table>

| Step 4 | no ccn trigger [sip | jtapi | http] phonenum number |
|--------|-------------------------|
| **Example:**<br>se-10-0-0-0(config)# no ccn trigger sip phonenum number 7200 | Deletes a trigger associated with this application. Repeat this command for each trigger associated with the application. |

<table>
<thead>
<tr>
<th>Step 5</th>
<th>no ccn application name</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0(config)# no ccn application autoattendant</td>
<td>Deletes the application called name.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>exit</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0(config)# exit</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 7</th>
<th>show ccn application</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0# show ccn application</td>
<td>Displays the currently configured applications. Confirm that the deleted application is not shown.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 8</th>
<th>show ccn trigger</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0# show ccn trigger</td>
<td>Displays the triggers for each configured application. Confirm that the deleted triggers are not displayed.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 9</th>
<th>copy running-config startup-config</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong>&lt;br&gt;se-10-0-0-0# copy running-config startup-config</td>
<td>Copies the configuration changes to the startup configuration.</td>
</tr>
</tbody>
</table>

### Examples

The following is sample output from the `show ccn application` and `show ccn trigger` commands:

```
se-10-0-0-0# show ccn application

Name: voicemail
Description: voicemail
Script: voicebrowser.aef
ID number: 1
Enabled: yes
Maximum number of sessions: 8
logoutUri: http://localhost/voicemail/vxmlscripts/mbxLogout.jsp
url: http://localhost/voicemail/vxmlscripts/login.vxml

Name: autoattendant
Description: autoattendant
Script: aa.aef
ID number: 2
Enabled: yes
```

---

**Managing Applications**

Chapter 5  Configuring System Components
Chapter 5  Configuring System Components

Managing Applications

Maximum number of sessions: 8
MaxRetry: 3
operExt: 0
welcomePrompt: AAWelcome.wav
se-10-0-0-0#

Name: myapplication
Description: My AA application
Script: myscript.aef
ID number: 3
Enabled: yes
Maximum number of sessions: 8
MaxRetry: 3
operExt: 0
welcomePrompt: NewAAWelcome.wav
se-10-0-0-0#

The following configuration deletes the auto-attendant application and its trigger:

se-10-0-0-0# show ccn trigger

Name: 6500
Type: SIP
Application: voicemail
Locale: systemDefault
Idle Timeout: 5000
Enabled: yes
Maximum number of sessions: 3

Name: 6700
Type: SIP
Application: autoattendant
Locale: systemDefault
Idle Timeout: 5000
Enabled: yes
Maximum number of sessions: 8

Name: 7200
Type: SIP
Application: myapplication
Locale: systemDefault
Idle Timeout: 5000
Enabled: yes
Maximum number of sessions: 8

The following configuration deletes the auto-attendant application and its trigger:

se-10-0-0-0# config t
se-10-0-0-0(config)# no ccn trigger sip phonenumber 50170
se-10-0-0-0(config)# no ccn application myapplication
se-10-0-0-0(config)# exit

Now the output of the show commands looks similar to the following:

se-10-0-0-0# show ccn application

Name: voicemail
Description: voicemail
Script: voicebrowser.aef
ID number: 1
Enabled: yes
Maximum number of sessions: 8
logoutUri: http://localhost/voicemail/vxmlscripts/mbxLogout.jsp
url: http://localhost/voicemail/vxmlscripts/1
Managing Triggers

Triggers are incoming events that invoke application which in turn starts executing the script associated with that application. For example, the incoming event can be an incoming call or an incoming HTTP request.

After you have created and configured your application, you need to create a trigger on the Cisco Unity Express module to point to that application.

Cisco Unity Express supports three types of triggers:

- **SIP triggers**—Use this type of trigger to invoke applications in Cisco Unified CME and Cisco SRST mode. This type of trigger is identified by the phonenumber which is dialed to invoke the desired application.

- **JTAPI triggers**—Use this type of trigger to invoke applications in Cisco Unified Communications Manager mode. This type of trigger is identified by the phonenumber which is dialed to invoke the desired application.

- **HTTP triggers**—Use this type of trigger to invoke applications using an incoming HTTP request. Such a trigger is identified by the URL suffix of the incoming HTTP request. This type of trigger can only be used if an IVR license has been purchased and installed on the system.

Cisco Unity Express ships with some internal triggers, which are known as system triggers. These system triggers cannot be deleted.

This section describes the procedure for managing triggers and contains the following sections:
Configuring SIP Triggers for the Applications

Cisco Unity Express uses SIP to handle incoming calls in Cisco Unified CME and Cisco SRST mode. If you are deploying Cisco Unity Express in either of these modes, you must configure a SIP trigger for your application so that it can be invoked by incoming calls. This type of trigger is identified by the phone number which is dialed to invoke the desired application.

The telephone number that identifies your SIP trigger must match the dial-peer configured on the Cisco IOS SIP gateway. In order for Cisco Unity Express to be able to handle incoming calls on this phone number properly, you must configure the dial-peer on the Cisco IOS SIP gateway as follows:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# dial-peer voice 6000 voip
se-10-0-0-0(config)# destination-pattern 6...
se-10-0-0-0(config)# session protocol sipv2
se-10-0-0-0(config)# session target ipv4:1.100.50.125
se-10-0-0-0(config)# dtmf-relay sip-notify
se-10-0-0-0(config)# codec g711ulaw
se-10-0-0-0(config)# no vad
```

**Note**
Make sure that VAD is turned OFF on the dial-peer, it is configured to use g711ulaw codec and the session target is pointing to the Cisco Unity Express module.

Cisco Unity Express supports a maximum of 8 SIP triggers for all applications combined, regardless of the hardware type.

**Required Data for This Procedure**

The following information is required to configure the SIP triggers for applications:

- Telephone number that invokes the application. The number must be different for different applications. The `number` value must match one of the patterns configured in the `destination-pattern` field of the SIP dial peer pointing to Cisco Unity Express.

- Maximum number of callers that can access the trigger simultaneously. See “Sharing Ports Among Applications and Triggers” on page 46 for guidelines on assigning this value.

**SUMMARY STEPS**

1. `config t`
2. `ccn trigger sip phonenumber number`
3. `application application-name`
4. `enabled`
5. `maxsessions number`
6. `locale xx_YY`
7. `end`
8. `show ccn trigger`
9. `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>config t</strong>&lt;br&gt;Example:&lt;br&gt;<code>se-10-0-0-0(config)# config t</code>&lt;br&gt;Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>ccn trigger sip phonenumber number</code>&lt;br&gt;Example:&lt;br&gt;<code>se-10-0-0-0(config)# ccn trigger sip phonenumber 50150</code>&lt;br&gt;<code>se-10-0-0-0(config)# ccn trigger sip phonenumber 50160</code>&lt;br&gt;Specifies the telephone number that acts as the trigger to start the application on the Cisco Unity Express module and enters trigger configuration mode.&lt;br&gt;- <strong>number</strong>—The value should match one of the patterns configured in the <code>destination-pattern</code> field of the SIP dial peer pointing to Cisco Unity Express.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>application application-name</code>&lt;br&gt;Example:&lt;br&gt;<code>se-10-0-0-0(config-trigger)# application voicemail</code>&lt;br&gt;<code>se-10-0-0-0(config-trigger)# application autoattendant</code>&lt;br&gt;<code>se-10-0-0-0(config-trigger)# application promptmgmt</code>&lt;br&gt;Specifies the name of the application to invoke when a call is made to the trigger phone number.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>enabled</code>&lt;br&gt;Example:&lt;br&gt;<code>se-10-0-0-0(config-trigger)# enabled</code>&lt;br&gt;Enables the trigger.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>maxsessions number</code>&lt;br&gt;Example:&lt;br&gt;<code>se-10-0-0-0(config-trigger)# maxsessions 3</code>&lt;br&gt;<code>se-10-0-0-0(config-trigger)# maxsessions 6</code>&lt;br&gt;Specifies the maximum number of callers that this application can handle simultaneously. See the “Sharing Ports Among Applications and Triggers” section on page 46 for guidelines on assigning this value.</td>
</tr>
</tbody>
</table>

---

**Note**<br>Beginning with Cisco Unity Express 8.0, this number can be a combination of digits and wildcard characters. For more information, see the “Wild Card Trigger Patterns” section on page 42.
### Managing Triggers

**Examples**

The following sample configuration sets two triggers on the Cisco Unity Express module:

```plaintext
se-10-0-0-0# config t
se-10-0-0-0(config)# ccn trigger sip phonenum 50150
se-10-0-0-0(config-trigger)# application voicemail
se-10-0-0-0(config-trigger)# maxsessions 4
se-10-0-0-0(config-trigger)# enabled
se-10-0-0-0(config-trigger)# end
se-10-0-0-0(config)# ccn trigger sip phonenum 50160
se-10-0-0-0(config-trigger)# application autoattendant
se-10-0-0-0(config-trigger)# maxsessions 3
se-10-0-0-0(config-trigger)# enabled
se-10-0-0-0(config-trigger)# end
se-10-0-0-0#
```

The output of `show ccn trigger` looks similar to the following:

```plaintext
se-10-0-0-0# show ccn trigger

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Application</th>
<th>Locale</th>
<th>Idle Timeout</th>
<th>Enabled</th>
<th>Maximum number of sessions</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>voicemail</td>
<td>systemDefault</td>
<td>10000</td>
<td>yes</td>
<td></td>
</tr>
<tr>
<td>50150</td>
<td>SIP</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>4</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>50160</td>
<td>SIP</td>
<td>autoattendant</td>
</tr>
</tbody>
</table>
```

---

### Command or Action | Purpose
---|---
**Step 6**
locale xx_yy | (Optional) Specifies the trigger language. Any prompts being played out by an application invoked by this trigger will be played out in this language. Use this configuration only if you have more than one language installed on the system. The default for this configuration is to use the system default language as the trigger language.

Example:
```
se-10-0-0-0(config-trigger)# locale en_US
```

**Step 7**
end | Returns to privileged EXEC mode.

Example:
```
se-10-0-0-0(config-trigger)# end
```

**Step 8**
show ccn trigger | Displays the details of all configured triggers.

Example:
```
se-10-0-0-0(config-trigger)# show ccn trigger
```

**Step 9**
copy running-config startup-config | Copies the configuration changes to the startup configuration.

Example:
```
se-10-0-0-0(config-trigger)# copy running-config startup-config
```
Wild Card Trigger Patterns

Beginning with Cisco Unity Express 8.0, the trigger number can be a combination of digits and wildcard characters. Incoming calls targeted to a number that matches the pattern cause the associated script to be invoked. The script determines which number was dialed by inspecting the called number attribute associated with the call. Cisco Unity Express supports a limit of 32 characters in the trigger pattern. Wildcard patterns are supported for both SIP and JTAPI triggers.

Table 5-2 shows the trigger pattern wildcards and special characters supported in Cisco Unity Express 8.0.

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>The X wildcard matches any single digit in the range 0 through 9.</td>
<td>The trigger pattern 9XXX matches all numbers in the range 9000 through 9999. The trigger pattern 91X? matches all numbers in the range 910 through 91999999999999999999999999999999.</td>
</tr>
<tr>
<td>!</td>
<td>The exclamation point (!) wildcard matches one or more digits in the range 0 through 9.</td>
<td>The trigger pattern 91! matches all numbers in the range 910 through 91999999999999999999999999999999.</td>
</tr>
<tr>
<td>?</td>
<td>The question mark (?) wildcard matches zero or more occurrences of the preceding digit or wildcard value.</td>
<td>The trigger pattern 91X? matches all numbers in the range 91 through 91999999999999999999999999999999.</td>
</tr>
<tr>
<td>+</td>
<td>The plus sign (+) wildcard matches one or more occurrences of the preceding digit or wildcard value.</td>
<td>The trigger pattern 91X+ matches all numbers in the range 910 through 91999999999999999999999999999999.</td>
</tr>
<tr>
<td>[ ]</td>
<td>The square bracket ([ ]) characters enclose a range of values.</td>
<td>The trigger pattern 813510[012345] matches all numbers in the range 8135100 through 8135105. The trigger pattern 813510[0-5] matches all numbers in the range 8135100 through 8135105.</td>
</tr>
<tr>
<td>-</td>
<td>The hyphen (-) character, used with the square brackets, denotes a range of values.</td>
<td>The trigger pattern 813510[-] matches all numbers in the range 8135100 through 8135105.</td>
</tr>
<tr>
<td>^</td>
<td>The circumflex (^) character, used with the square brackets, negates a range of values. Ensure that it is the first character following the opening bracket ([). Each trigger pattern can have only one ^ character.</td>
<td>The trigger pattern 813510[^0-5] matches all numbers in the range 8135106 through 8135109.</td>
</tr>
</tbody>
</table>

Wildcard patterns are based on Cisco Unified Communications Manager route patterns. The rules for choosing between multiple wildcard patterns matching an incoming call are similar to those used by Cisco Unified Communications Manager. For each pattern that is a candidate match for the dial string, Cisco Unity Express calculates the number of other dial strings of the same length as the input dial string that would match each pattern, and then selects the pattern that has the fewest alternative dial string matches.
Configuring JTAPI Triggers for the Applications (Cisco Unified Communications Manager Only)

Cisco Unity Express uses JTAPI to handle incoming calls in Cisco Unified Communications Manager mode. If you are deploying Cisco Unity Express in Cisco Unified Communications Manager mode, you must configure a JTAPI trigger for your application so that it can be invoked by incoming calls. This type of trigger is identified by the phone number which is dialed to invoke the desired application.

The telephone number that identifies your JTAPI trigger must match the Route Point configured on the Cisco Unified Communications Manager.

Beginning in Cisco Unity Express 8.0, the trigger number can be a combination of digits and wildcard characters. See the “Wild Card Trigger Patterns” section on page 42.

**Note**

This Route Point must be associated with the JTAPI user configured on Cisco Unified Communications Manager. This same JTAPI user must also be configured on Cisco Unity Express module. See the “Configuring Triggers” section on page 1 for details on JTAPI user configuration.

Cisco Unity Express supports a maximum of 8 JTAPI triggers for all applications combined, regardless of the hardware type.

This configuration is required for only for Cisco Unified Communications Manager mode.

**Required Data for This Procedure**

The following information is required to configure the JTAPI triggers for applications:

- Telephone number that invokes the application. The number must be unique for each application.
- Number of seconds the system must wait for a caller response before it times out and drops the call.
- Language to use for the prompts. Cisco Unity Express supports many languages. Only one can be installed on the system. See the *Release Notes for Cisco Unity Express* for a list of available languages.
- Maximum number of callers that can access the trigger simultaneously. See the “Sharing Ports Among Applications and Triggers” section on page 46 for guidelines on assigning this value.

**SUMMARY STEPS**

1. `config t`
2. `ccn trigger jtapi phonenumber number`
3. `application application-name`
4. `enabled`
5. `maxsessions number`
6. `locale xx_yy`
7. `end`
8. `show ccn trigger`
9. `copy running-config startup-config`
## Managing Triggers

Chapter 5  Configuring System Components

Managing Triggers

Examples

The following sample configuration sets two triggers on the Cisco Unity Express module:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# ccn trigger jtapi phonenumber 6500
se-10-0-0-0(config-trigger)# application voicemail
se-10-0-0-0(config-trigger)# maxsessions 4
se-10-0-0-0(config-trigger)# enabled
se-10-0-0-0(config-trigger)# end
se-10-0-0-0(config)#
se-10-0-0-0(config)# ccn trigger jtapi phonenumber 6700
se-10-0-0-0(config-trigger)# application autoattendant
se-10-0-0-0(config-trigger)# maxsessions 8
se-10-0-0-0(config-trigger)# enabled
se-10-0-0-0(config-trigger)# end
se-10-0-0-0#
```

Output of the `show ccn trigger` command looks similar to the following:

```
se-10-0-0-0# show ccn trigger

Name:                         6500
Type:                         JTAPI
Application:                  voicemail
Locale:                       systemDefault
Idle Timeout:                 10000
Enabled:                      yes
Maximum number of sessions:   4

Name:                         6700
Type:                         JTAPI
Application:                  autoattendant
Locale:                       systemDefault
Idle Timeout:                 10000
Enabled:                      yes
Maximum number of sessions:   8
```

Step 8

**show ccn trigger**

Example:

```
se-10-0-0-0# show ccn trigger
```

Displays the details of all configured triggers.

Step 9

**copy running-config startup-config**

Example:

```
se-10-0-0-0# copy running-config startup-config
```

Copies the configuration changes to the startup configuration.

Configuring HTTP Triggers for the Applications

Cisco Unity Express can accept incoming HTTP requests to invoke an application using an HTTP trigger. For example, you can use it to initiate an IVR application notifying customers that their order has been filled and shipped. This type of trigger is identified by the URL suffix of the incoming HTTP request.
Managing Triggers

This type of trigger can only be used if an IVR license has been purchased and installed on the system. For details on how to configure and use HTTP triggers, see the *Cisco Unity Express Interactive Voice Response CLI Administrator Guide*.

**Configuring Multiple Triggers for an Application**

Your network may require multiple triggers for one or more Cisco Unity Express applications. For example, the following are some scenarios where multiple triggers for the same application are useful:

- **Multiple language support**—You have an auto-attendant application which you want to deploy in two different languages. One way to achieve this would be to have two different triggers (call-in numbers) pointing to the same application, but with different values for the *locale* parameter.

  For example, assume that you have call-in numbers 6700 and 6900 (both pointing to the same auto-attendant application), the locale for the trigger 6700 is configured to be *xx_XX*, and the locale for the trigger 6900 is configured to be *yy_YY*. If the callers dial 6700, they will hear the auto-attendant greetings in the language *xx_XX*. If the callers dial 6900, they will hear the auto-attendant greetings in the language *yy_YY*.

- **Different call treatment for internal and external callers**—You have an auto-attendant application, and you want to provide slightly different Menu options for internal and external callers. In other words, you want to provide an option to the internal callers to transfer to the inventory department, but you do not want to present this option to the external callers. One way to achieve this would be to have two different triggers (call-in numbers) pointing to the same application, and by making a branching decision in your script by checking the called number using the “Get Call Contact Info” step.

  Repeat the procedure described in the “Configuring SIP Triggers for the Applications” section on page 39 and the “Configuring JTAPI Triggers for the Applications (Cisco Unified Communications Manager Only)” section on page 43 (depending on your deployment mode) to create multiple triggers for an application.

**Sharing Ports Among Applications and Triggers**

**Accessing an Application**

The maximum number of callers that can access an application concurrently is determined by two parameters:

- The maxsessions value configured for the triggers invoking the application.
- The maxsessions value configured for the application itself.

If more calls than the trigger’s configured maxsession value are received, callers hear a busy tone. If more calls than the application’s configured maxsession value are received, Cisco Unity Express plays an error prompt to the callers.

The following example shows how the maxsessions values for applications and triggers play a role in how many active calls can be made to an application. In this example:

- Your module has 8 ports.
- You assigned the auto-attendant application a maxsessions value of 5.
- You configured 2 triggers both invoking the same auto-attendant application.
You configured one trigger with a maxsessions value of 2 and the other trigger with a maxsessions value of 4.

The maximum number of callers that can access the auto-attendant application simultaneously is five, not six. This is because although your system has a total of six sessions available for the two triggers, they both are accessing the same application, which allows only five concurrent sessions. The maxsessions value of the application acts as the gating factor in this case.

If you configure both triggers with a maxsessions value of 2, the maximum number of concurrent calls to the application is four, not five. This is because the system has a total of only four ports assigned to the two triggers. The maxsessions value assigned to the triggers acts as the factor in this example.

### Sharing Ports Among Different Applications

Cisco Unity Express supports multiple voice applications, and each of these applications need voice ports in order to execute. Consider the expected call traffic for each application when assigning the maxsessions for them. One application may have a higher call volume and therefore need more sessions than another, and at the same time you may want each application to have at least one session available for incoming calls. You should distribute the ports to your applications keeping in mind the usage of each application.

For example, your module has four ports and you configure the voice-mail application to have four maxsessions, and the auto-attendant application also to have four maxsessions. If four callers access voice-mail simultaneously, no ports is available for auto-attendant callers. Only when zero, one, two, or three callers access voice-mail simultaneously is at least one port available for auto-attendant.

As another example, you configure the voice-mail auto-attendant applications to have three maxsessions. At no time will one application use up all the ports. If voice-mail has three active calls, one caller can access auto-attendant. A second call to either voice-mail or auto-attendant is not successful.

### Configuring Holiday Lists

Cisco Unity Express permits configuration of holiday lists that can be used by an application to play a customizable greeting to callers when the company is closed for a holiday. The following sections describe how to configure and use Cisco Unity Express holiday lists:

- Overview of Holidays, page 47
- Using the Holiday Lists, page 48
- Configuring Year-Specific Holiday Lists, page 49
- Displaying the Holiday List, page 49
- Deleting Holidays from the List, page 51

### Overview of Holidays

You can configure:

- Year-specific holidays
- Fixed holidays
Year-Specific Holidays

- Cisco Unity Express supports up to three year-specific holiday lists for: the previous year, the current year, and the next year. If a year has no configured entries, the system handles that year as having no year-specific holidays.

  For example, if the current year is 2005 and you have not configured entries for 2006 (the next year), the system handles 2006 as having zero (0) holidays. You may configure holidays for 2005 and 2006 (the next year) but not for 2007.

- Each year-specific list can contain a maximum of 26 holidays.
- By default, all three year-specific holiday lists are empty.
- The administrator can delete entries from a previous year list but cannot add or modify that list in any other way.
- The system automatically deletes the previous year list at the beginning of the new calendar year.
- For example, the system will delete the 2004 holiday list on January 1, 2006.
- To copy holidays from one year to the next, use the GUI option Copy all to next year under System > Holiday Settings.

Fixed Holidays

- Fixed holidays are permanent holidays which apply to all years and do not need to be re-configured year after year (unlike year-specific holidays). If a holiday falls on the same date every year, those may be configured as fixed holidays.

  For example, if your business is always closed on January 1st for New Year celebrations, then you may configure January 1st as a fixed holiday.

- A maximum of 10 fixed holidays can be configured on the system.
- By default, there are no fixed holidays configured on the system.
- Fixed holidays may overlap with year-specific holidays. If you create a year-specific holiday that overlaps with a fixed holiday, a warning is issued. However, no warning is issued if you try to create a fixed holiday that overlaps with a year-specific holiday.

To configure holiday lists, use the graphical user interface (GUI) System > Holiday Settings option or the command-line interface (CLI) commands described in this section.

Using the Holiday Lists

The Cisco Unity Express Editor provides a step “Is Holiday” that checks the holidays configured on the system to determine whether the specified date is a holiday or not. The step takes as input the date to check against the holiday list. See the Cisco Unity Express Guide to Writing and Editing Scripts for more information on steps.

For example, you can use the “Is Holiday” step in your script to check if the current day is a holiday. If it is a holiday, you can play a customized greeting to the caller, such as “We are closed today. If this is an emergency, please call 1-222-555-0150 for assistance. Otherwise, please call back later.”
Configuring Holiday Lists

**Prerequisites**

Cisco Unity Express 3.0 or a later version

**Configuring Year-Specific Holiday Lists**

Use the following command in Cisco Unity Express configuration mode to configure a year-specific holiday list:

```
calendar holiday date yyyy mm dd [description holiday-description]
```

where `yyyy` is the 4-digit year, `mm` is the 2-digit month, `dd` is the 2-digit day, and `holiday-description` is an optional description of the holiday. If the description is more than one word, enclose the text in quotes (" ").

The valid values for `yyyy` are the current year or the next year. An error message appears if the year or date is out of range.

**Example:**

```
se-10-0-0-0# config t
se-10-0-0-0(config)# calendar holiday date 2005 05 30 description "Memorial Day"
se-10-0-0-0(config)# exit
se-10-0-0-0#
```

**Configuring the Fixed Holiday List**

Use the following command in Cisco Unity Express configuration mode to configure a fixed holiday:

```
calendar holiday fixed month day [description holiday-description]
```

where `month` is the 2-digit month, `day` is the 2-digit day, and `holiday-description` is an optional description of the holiday. If the description is more than one word, enclose the text in quotes (" ").

**Example:**

```
se-10-0-0-0# config t
se-10-0-0-0(config)# calendar holiday fixed 07 04 description "Independence Day"
se-10-0-0-0(config)# exit
se-10-0-0-0#
```

**Displaying the Holiday List**

Several CLI commands are available in Cisco Unity Express EXEC mode for displaying the holiday lists.

**Prerequisites**

Cisco Unity Express 3.0 or a later version
Displaying All Holiday Lists

The following command displays all the holiday lists configured on the system:

```
show calendar holiday [all]
```

This command displays the date and description for all holidays for all years. This display includes both year-specific holidays and fixed holidays. The output of this command appears similar to the following:

```
se-10-0-0-0-0# show calendar holiday

********************************************************************************
Year: 2004
********************************************************************************
September 04    Labor Day
November 25    Thanksgiving

********************************************************************************
Year: 2005
********************************************************************************
July 04    July 4th
September 05    Labor Day
November 24    Thanksgiving
December 25    Christmas
```

Displaying Holiday Lists for a Specific Year

The following command displays the holidays configured for a specific year:

```
show calendar holiday year yyyy
```

where `yyyy` is the 4-digit year. This command displays the date and description for all holidays configured for the specified year. This display includes both year-specific holidays and fixed holidays. If no holidays are configured for that year and the fixed holiday list is empty, the message “No holidays found for the specified year” appears. The output of this command appears similar to the following:

```
se-10-0-0-0-0# show calendar holiday year 2005

********************************************************************************
Year: 2005
********************************************************************************
July 04    July 4th
September 05    Labor Day
November 24    Thanksgiving
December 25    Christmas
```

Displaying Holiday Lists for a Specific Month

The following command displays the holidays configured for a specific month in a specified year:

```
show calendar holiday year yyyy month mm
```

where `yyyy` is the 4-digit year and `mm` is the 2-digit month. This command displays the date and description for all holidays configured for the specified month in the specified year. This display includes both year-specific holidays and fixed holidays. If no holidays are configured for that month and there are no holidays in that month, the message “No holidays found for the specified month” appears.

The output of this command appears similar to the following:
Deleting Holidays from the List

Several CLI commands are available in Cisco Unity Express configuration mode for deleting holidays from the list.

Prerequisites

Cisco Unity Express 3.0 or a later version

Deleting a Year-Specific Holiday from the Holiday List

The following command deletes a year-specific holiday:

```plaintext
no calendar holiday date yyyy mm dd
```

where `yyyy` is the 4-digit year, `mm` is the 2-digit month, and `dd` is the 2-digit day.

Example:

```plaintext
se-10-0-0-0# config t
se-10-0-0-0(config)# no calendar holiday date 2004 11 25
se-10-0-0-0(config)# end
```

Deleting Year-Specific Holidays from a Specific Month

Use this command with caution because this operation is irreversible and can cause the loss of the temporary holiday configuration for the entire month.

The following command deletes the year-specific holidays configured for a specific month in the specified year:

```plaintext
no calendar holiday year yyyy month mm
```

where `yyyy` is the 4-digit year and `mm` is the 2-digit month.

Example:

```plaintext
se-10-0-0-0# config t
se-10-0-0-0(config)# no calendar holiday year 2004 month 09
se-10-0-0-0(config)# end
```
Deleting Year-Specific Holidays for a Specific Year

<table>
<thead>
<tr>
<th>Caution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use this command with caution because this operation is irreversible and may cause the loss of the holiday configuration for the entire year.</td>
</tr>
</tbody>
</table>

The following command deletes all the year-specific holidays configured for the specified year:

```
no calendar holiday year yyyy
```

where yyyy is the 4-digit year.

**Example:**
```
se-10-0-0-0# config t
se-10-0-0-0(config)# no calendar holiday year 2004
se-10-0-0-0(config)# end
```

Deleting a Fixed Holiday from the Holiday List

The following command deletes a fixed holiday:

```
no calendar holiday fixed month day
```

where month fixed month day

**Example:**
```
se-10-0-0-0# config t
se-10-0-0-0(config)# no calendar holiday fixed 07 04
se-10-0-0-0(config)# exit
```

Configuring Business Hours

Cisco Unity Express provides support for business hour schedules that specify the hours when the business is open or closed during the week.

The following sections describe this feature, its configuration, and the procedures for using it:

- Overview of Business-Hours Schedules, page 53
- Using the Business-Hours Schedule, page 53
- Creating a Business-Hours Schedule, page 53
- Modifying Business-Hours Schedules, page 55
- Displaying Business-Hours Schedules, page 57
- Deleting a Business-Hours Schedule, page 58
Overview of Business-Hours Schedules

You can configure up to 4 weekly business-hours schedules. Each day is divided into 48 half-hour time slots. Each of these time slots can be configured to specify whether the business is open or closed during that time. Use the graphical user interface (GUI) System > Business Hours Settings option or the command-line interface (CLI) commands described in this section to configure these slots.

The Cisco Unity Express system ships with one default schedule called “systems chedule.” This schedule indicates the business is open 24 hours per day, 7 days per week. Use the GUI System > Business Hours Settings option or CLI commands to modify or delete this default schedule. This schedule counts toward the maximum limit of 4 business-hours schedules.

Using the Business-Hours Schedule

The Cisco Unity Express Editor provides a step “Business Hours” that checks whether the business is open or closed during a specified time slot. The step takes three parameters as input: a date, time and the name of a schedule configured on the system. See the Cisco Unity Express Guide to Writing and Editing Scripts for more information about steps.

For example, you can use the “Business Hours” step in your script to check whether the business is currently open or not. If it is closed, you can play a customized greeting to the caller, such as “You have reached us during our off-hours. If this is an emergency, please call 1-222-555-0150 for assistance. Otherwise, please call back later.”

Creating a Business-Hours Schedule

Follow this procedure to create a business-hours schedule.

Data Required for This Procedure

The following information is required to configure a business-hours schedule:

- Schedule name
  
  The maximum length of the name is 31 alphanumeric characters, including uppercase letters A to Z, lowercase letters a to z, digits 0 to 9, underscore (_), and dash (-). The first character of the name must be a letter.

  If a schedule with this name does not exist, the system will create it. By default, a newly created schedule is open, 24 hours per day, 7 days per week.

  If the schedule already exists, any changes will modify the schedule.

- Day of the week

- Starting and ending clock times when the business is open and closed

SUMMARY STEPS

1. config t
2. calendar biz-schedule schedule-name
3. closed day day-of-week from hh:mm to hh:mm
4. open day day-of-week from hh:mm to hh:mm
### Configuring Business Hours

#### Chapter 5  Configuring System Components

## 5. end

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><code>config t</code></td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td><code>se-10-0-0-0# config t</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 2**

- `calendar biz-schedule schedule-name`
- Specifies the name for the business-hours schedule and enters business configuration mode. The name must be one word.
- If a schedule with this name does not exist, the system creates it. If the schedule already exists, any changes modify the schedule. If the maximum number of schedules exists, the system displays an error message.

**Example:**

```
se-10-0-0-0(config)# calendar biz-schedule normal_hours
```

**Step 3**

- `closed day day-of-week from hh:mm to hh:mm`
- Enter the day of the week and the times when the business is closed for that day. Valid values for `day-of-week` are 1 to 7, where 1 represents Sunday, 2 is Monday, 3 is Tuesday, 4 is Wednesday, 5 is Thursday, 6 is Friday, and 7 is Saturday. Use the 24-hour clock format for `hh`. Valid `mm` values are 00 and 30 only.

**Example:**

```
se-10-0-0-0(config-business)# closed day 2 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 2 from 17:30 to 24:00
```

**Step 4**

- `open day day-of-week from hh:mm to hh:mm`
- Enter the day of the week and the times when the business is open for that day. Valid values for `day-of-week` are 1 to 7, where 1 represents Sunday, and so on. Use the 24-hour clock format for `hh`. Valid `mm` values are 00 and 30 only.

**Example:**

```
se-10-0-0-0(config-business)# open day 2 from 08:30 to 17:30
```

**Step 5**

Repeat Steps 3 and 4 for each day of the week that needs business hours scheduled.

**Step 6**

- `end`
- Returns to privileged EXEC mode.

**Example:**

```
se-10-0-0-0(config-business)# end
```
Examples

The following example configures a new business-hours schedule:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# calendar biz-schedule normal
Adding new schedule
se-10-0-0-0(config-business)# closed day 1 from 00:00 to 24:00
se-10-0-0-0(config-business)# closed day 2 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 2 from 17:30 to 24:00
se-10-0-0-0(config-business)# closed day 3 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 3 from 17:30 to 24:00
se-10-0-0-0(config-business)# closed day 4 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 4 from 17:30 to 24:00
se-10-0-0-0(config-business)# closed day 5 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 5 from 20:00 to 24:00
se-10-0-0-0(config-business)# closed day 6 from 00:00 to 08:30
se-10-0-0-0(config-business)# closed day 6 from 18:00 to 24:00
se-10-0-0-0(config-business)# closed day 7 from 00:00 to 09:00
se-10-0-0-0(config-business)# closed day 7 from 13:00 to 24:00
se-10-0-0-0(config-business)# end
```

Modifying Business-Hours Schedules

In Cisco Unity Express configuration mode, use the following command to access a business-hours schedule for modification:

```
calendar biz-schedule schedule-name
```

where `schedule-name` is the name of the business-hours schedule to modify. If a schedule with the specified business name does not exist, the system creates it.

The following example accesses the existing “normal” business-hours schedule:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# calendar biz-schedule normal
Modifying existing schedule
se-10-0-0-0(config-business)# open day 1 from 09:00 to 12:00
se-10-0-0-0(config-business)# end
se-10-0-0-0#
```

Only the hours specified using these commands are affected. The other time slots in the business-hours schedule are not modified.

Changing the Status of Open or Closed Hours

To modify an existing schedule, specify the open and closed hours for each day as needed.

Changing an Open Slot to a Closed Slot

Use either of the following configuration mode commands to change an open slot to a closed slot:

```
no open day day-of-week from hh:mm to hh:mm
closed day day-of-week from hh:mm to hh:mm
```

where `day-of-week` is the numeric day of the week (1 equals Sunday), `hh` are hours in the 24-hour clock format, and `mm` are minutes, either 00 or 30.
For example, use the **no open day 2 from 09:00 to 10:00** command if your business is open on Monday from 09:00 to 17:00; and use the **closed day 3 from 09:00 to 10:00** command if your business is closed Tuesday 9:00 a.m. to 10:00 a.m.

### Changing a Closed Slot to an Open Slot

Use either of the following commands to change a closed slot to an open slot:

- **no closed day day-of-week from hh:mm to hh:mm**
- **open day day-of-week from hh:mm to hh:mm**

where `day-of-week` is the numeric day of the week (1 equals Sunday), `hh` are hours in the 24-hour clock format, and `mm` are minutes, either 00 or 30.

For example, if Monday is closed from 00:00 to 10:00, then **no closed day 2 from 09:00 to 10:00** or **open day 2 from 09:00 to 10:00** opens the Monday time slot 9:00 a.m. to 10:00 a.m.

### Examples

The following output shows the “normal” business-hours schedule:

```
se-10-0-0-0# show calendar biz-schedule normal
```

```
****************************
Schedule: normal
Day                  Open Hours
-------------------------------
Sunday               None
Monday               08:30 to 17:30
Tuesday              08:30 to 17:30
Wednesday            08:30 to 17:30
Thursday             08:30 to 20:00
Friday               08:30 to 18:00
Saturday             09:00 to 13:00
```

The following commands modify the “normal” business hours by closing Monday hours from 8:30 to 9:30 and opening Saturday hours from 1:00 p.m. to 2:00 p.m.:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# calendar biz-schedule normal
se-10-0-0-0(config-business)# no open day 2 from 08:30 to 09:30
se-10-0-0-0(config-business)# no closed day 7 from 13:00 to 14:00
se-10-0-0-0(config-business)# end
```

The following output shows the changed schedule:

```
se-10-0-0-0# show calendar biz-schedule normal
```

```
****************************
Schedule: normal
Day                  Open Hours
-------------------------------
Sunday               None
Monday               09:30 to 17:30
Tuesday              08:30 to 17:30
Wednesday            08:30 to 17:30
Thursday             08:30 to 20:00
Friday               08:30 to 18:00
Saturday             09:00 to 14:00
```
Displaying Business-Hours Schedules

Several CLI commands are available in Cisco Unity Express EXEC mode for displaying the business-hours schedules.

Displaying a Specific Schedule

The following command displays a specific business-hours schedule:

```
show calendar biz-schedule schedule-name
```

where `schedule-name` is the name of the schedule. This command displays each day of the week and the open hours. The output of this command appears similar to the following.

```
se-10-0-0-0# show calendar biz-schedule normal

******************************
Schedule: normal
Day                 Open Hours
-------------------------------
Sunday              None
Monday              08:30 to 17:30
Tuesday             08:30 to 17:30
Wednesday           08:30 to 17:30
Thursday            08:30 to 20:00
Friday              08:30 to 18:00
Saturday            09:00 to 13:00

******************************
```

Displaying All Businesses Schedules

The following command displays all the configured business-hours schedules in the system:

```
show calendar biz-schedule [all]
```

This command displays the open hours for each day of the week for each schedule. The output of this command appears similar to the following:

```
sse-10-0-0-0# show calendar biz-schedule

******************************
Schedule: systemschedule
Day                 Open Hours
-------------------------------
Sunday              Open all day
Monday              Open all day
Tuesday             Open all day
Wednesday           Open all day
Thursday            Open all day
Friday              Open all day
Saturday            Open all day

******************************
Schedule: normal
Day                 Open Hours
-------------------------------
Sunday              None
Monday              08:30 to 17:30
Tuesday             08:30 to 17:30
Wednesday           08:30 to 17:30
```
Configuring System-Wide Fax Parameters

Starting in version 3.1 the convergence feature set to includes fax support. It allows both inbound and outbound faxing. Outbound faxing enables faxes to be printed to the fax machine.

This functionality requires T.37 fax support from the Cisco IOS gateways. Third-party fax servers are not supported.

After you complete the appropriate prerequisites (see below), you can configure the system level fax parameters as described below. This procedure also includes enabling a mailbox to receive faxes from a fax gateway.

To send and receive a fax on Cisco Unity Express, you must configure the inbound and outbound fax gateways. The inbound gateway is used for receiving a fax, and the outbound gateway is used for sending or printing a fax. You can use the same Cisco IOS gateway for both inbound and outbound faxing. Also, in order to print a fax received by Cisco Unity Express, the phone number of a fax machine must be configured.
Prerequisites

You must configure the Cisco IOS gateway for T.37 on-ramp and off-ramp fax support. See the “Configuring Your Cisco IOS Gateway for T.37 On-Ramp and Off-Ramp Fax Support” section on page 1 for more details.

To restrict specified extensions from using this feature, you must configure a restriction table as described in the “Configuring Restriction Tables” section on page 32.

Required Data for This Procedure

This procedure requires:

- IP address or hostname of the outbound fax gateway
- IP address or hostname for the inbound fax gateway
- Fax number used to print faxes

SUMMARY STEPS

1. `config t`
2. `fax gateway outbound address {hostname | ip-address}`
3. `fax gateway inbound address {hostname | ip-address}`
4. `fax print E.164`
5. `voice mailbox owner name`
6. `enable fax`
7. `end`
8. `show fax configuration`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>config t</code></td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>se-10-0-0-0# config t</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> `fax gateway outbound address {hostname</td>
<td>ip-address}`</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>se-10-0-0-0(config)# fax gateway outbound address 172.21.21.40</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> `fax gateway inbound address {hostname</td>
<td>ip-address}`</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>se-10-0-0-0(config)# fax gateway inbound address 172.21.21.40</code></td>
<td></td>
</tr>
</tbody>
</table>
Configuring SMTP Parameters

Cisco Unity Express supports various features which need to send outgoing e-mail messages. In order to send these e-mails, an external SMTP server is required.

This section describes how to configure an external SMTP server and its parameters on the Cisco Unity Express module. The SMTP server address can either be a hostname or IP address. To use a hostname, verify that the DNS server is configured.

---

### Command or Action

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 4 <strong>fax print</strong> E.164-number</td>
<td>Configures the system level fax number for printing the faxes.</td>
</tr>
<tr>
<td><strong>Example:</strong> se-10-0-0-0(config)# fax print 5550112</td>
<td></td>
</tr>
<tr>
<td>Step 5 <strong>voice mailbox owner</strong> name</td>
<td>Creates a mailbox for the specified user and enters mailbox configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> se-10-0-0-0(config)# voice mailbox owner owner22</td>
<td></td>
</tr>
<tr>
<td>Step 6 <strong>enable fax</strong></td>
<td>Enables the specified mailbox to receive faxes from a fax gateway.</td>
</tr>
<tr>
<td><strong>Example:</strong> se-10-0-0-0(config)# enable fax</td>
<td></td>
</tr>
<tr>
<td>Step 7 <strong>end</strong></td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> se-10-0-0-0(config)# end</td>
<td></td>
</tr>
<tr>
<td>Step 8 <strong>show fax configuration</strong></td>
<td>(Optional) Displays the configuration for the inbound fax gateway, outbound fax gateway, and the default fax number which is used for printing faxes.</td>
</tr>
<tr>
<td><strong>Example:</strong> se-10-0-0-0# show fax configuration</td>
<td></td>
</tr>
</tbody>
</table>

### Example

The following sample configuration configures the fax parameters on a Cisco Unity Express module:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# fax gateway inbound address 172.21.21.40
se-10-0-0-0(config)# fax gateway outbound address 172.21.21.40
se-10-0-0-0(config)# fax print 5550112
se-10-0-0-0(config)# voice mailbox owner owner22
se-10-0-0-0(config)# enable fax
se-10-0-0-0(config)# end
```

The output for `show fax configuration` is similar to the following:

```
se-10-0-0-0> show fax configuration

Inbound Fax Gateway: 172.21.21.40
Outbound Fax Gateway: 172.21.21.40
Fax Printing Number: 5550112
```

---

### Configuring SMTP Parameters

Cisco Unity Express supports various features which need to send outgoing e-mail messages. In order to send these e-mails, an external SMTP server is required.

This section describes how to configure an external SMTP server and its parameters on the Cisco Unity Express module. The SMTP server address can either be a hostname or IP address. To use a hostname, verify that the DNS server is configured.
If the SMTP server requires authentication, you must also provide the user ID and password of a valid user account on the SMTP server.

**Configuring an SMTP Server**

Use the following procedure to configure an SMTP server and its parameters in Cisco Unity Express configuration mode.

**Required Data for This Procedure**

- SMTP server hostname or IP address
- (Optional) SMTP port number
- SMTP authentication parameters (user ID and password, or credential string)

**SUMMARY STEPS**

1. `config t`
2. `smtp server address {hostname | ip-address} [port port] authentication {none | username userid password password | credentials credential-string}
3. `end`
4. `show smtp server`
## Configuring SMTP Parameters

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> config t</td>
<td>Enters configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# config t</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> smtp server address [hostname</td>
<td>ip-address] [port port] authentication [none</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-(config)# smtp server address 10.10.5.5 authentication none</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-(config)# smtp server address mainsmtp authentication username smtp123 password pwd123</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-(config)# smtp server address 172.16.1.1 authentication credentials 3CmyKjBFhzkjd8QxCVjv552jZsjjzh3bSd8ZZNgd+y9j3x1kZB35j0nfGwtyHfmsFs8ZZNgd</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> end</td>
<td>Returns to privileged EXEC mode.</td>
</tr>
<tr>
<td><strong>Step 4</strong> show smtp server</td>
<td>Displays the SMTP server settings.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# show smtp server</td>
<td></td>
</tr>
</tbody>
</table>

### Example

The following is sample output of the **show smtp server** command.

```
se-10-0-0-0# show smtp server

SMTP Server: 172.16.0.1
SMTP Port: 465
Authentication: Required
Username: cisco
Security: ssl
```

### Configuring SMTP Server Security

Beginning with Cisco Unity Express 8.6, you can configure the SMTP server security setting.
Prerequisite

Cisco Unity Express 8.6 or later versions

SUMMARY STEPS

1. `config t`
2. `smtp server security {ssl | starttls}`
3. `end`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>config t</code></td>
<td>Enters configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**

```
se-10-0-0-0# config t
```

| Step 2 `smtp server security {ssl | starttls}` | Configures the security settings for the SMTP server.                   |

**Example:**

```
se-10-0-0-0(config)# smtp server security ssl
```

If you configure this setting, you must configure the port number for the `smtp server address` command to the following:

- SSL—port 465
- STARTTLS—port 587

### Configuring Historical Reporting

Starting with Cisco Unity Express 3.0, information and statistics related to call and application events can be saved in a historical reporting database on the module. This historical data can later be used to generate various types of usage reports using the Cisco Unified Communications Express Historical Reporting Client.

Collection of historical data is disabled by default. You must enable it before the system starts saving these statistics in the reporting database. However, if an IVR license is purchased and installed on the module, the collection of historical data gets automatically enabled.

The number of days of historical data that can be stored depends on the Cisco Unity Express hardware. For more information, see the *Release Notes for Cisco Unity Express*. The historical reporting maintenance components consist of a database purging service that periodically removes any data older than this.

A special privilege is required for a user to be able to log in to the Cisco Unified Communications Express Historical Reporting Client software and view historical reports.

The following sections describe the procedures for configuring historical reporting parameters:

- Configuring the Local Historical Reporting Database, page 64
- Configuring the Database Purge Schedule, page 66
- Configuring the Database Capacity Threshold for a Purge, page 68
Configuring Historical Reporting

- Configuring the Database Threshold Capacity for Warning Notification, page 69
- Configuring the Purge Notification E-mail Addresses, page 71
- Manually Purging the Historical Reporting Database, page 72
- Exporting Historical Report Data to an External Server, page 74
- Assigning Historical Report Viewing Privileges to a Group, page 76

Configuring the Local Historical Reporting Database

Historical reporting data is stored in a local (internal) database. Use the `database local` command to configure storage of historical statistics on the local or internal database.

The `no` and `default` forms of this command have no effect.

Prerequisites

Cisco Unity Express 3.0 or a later version

SUMMARY STEPS

1. config t
2. ccn reporting historical
3. database local
4. description text
5. enabled
6. end
7. show ccn reporting historical

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>config t</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0# config t</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Enters historical reporting database configuration mode.</td>
</tr>
<tr>
<td>ccn reporting historical</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0(config)# ccn reporting historical</td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0(config-hrdm)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Configures local database to log historical statistics for reporting. This command is for future use.</td>
</tr>
<tr>
<td>database local</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>se-10-0-0-0(config-hrdm)# database local</td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action

#### Step 4

```bash
description word
```

**Example:**
```
se-10-0-0-0(config-hrdm)# description "Chicago office database"
```

(Optional) Sets the description for the historical reporting database. Use quotes around the text. The default value of the description is the hostname of the Cisco Unity Express system. The `no` and `default` forms of this command set the description value to the configured hostname of the system.

#### Step 5

```bash
enabled
```

**Example:**
```
se-10-0-0-0(config-hrdm)# enabled
```

Enables historical reporting. The collection of historical data is disabled by default. You must enable it before the system starts saving these statistics in the reporting database. However, if an IVR license is purchased and installed on the module, the collection of historical data is automatically enabled.

Use the `no` form of this command to disable the historical reporting database. If the historical reporting database is disabled, call-related events are not stored in the database. Use the `default` form of this command to enable the database.

#### Step 6

```bash
end
```

**Example:**
```
se-10-0-0-0(config-hrdm)# end
```

Saves and returns to privileged EXEC mode.

#### Step 7

```bash
show ccn reporting historical
```

**Example:**
```
se-10-0-0-0# show ccn reporting historical
```

Displays the historical reporting database parameters.

### Examples

Following is example output of the `show ccn reporting historical` command:
```
se-10-0-0-0# show ccn reporting historical

Database Information
---------------------
Enabled : Yes
Description: Chicago office database
DB Usage: 50%
Current Maintenance Status: idle

Purge Schedule
--------------
Daily Time: 4:00 AM
Data older than 365 days will be purged
Date of last completed purge:

Purge Capacity Configuration
-----------------------------
Email Address: abcd@domain.com
Warning Capacity: 65%
Purge Capacity: 75%
Oldest Days to purge: 7
```
Configuring the Database Purge Schedule

Use the `purge schedule` command in historical reporting database configuration mode to update the daily schedule for automatic purging of historical data.

A daily purge starts at the time of day specified (in hours:minutes 24-hour format). Stored data that is older than that specified in the `days-to-keep` value (in days) is purged from the database starting daily at the time specified.

The default purge schedule is set at 04:00.

**Note**
Because the purging of historical data on the module is resource-intensive, we recommend that the purge be scheduled to run during off-peak hours.

The default number of days is 90 for the AIM-CUE/AIM2-CUE and 365 for the NM-CUE-EC, NM-CUE, NME-CUE, ISM-SRE-300-K9, SM-SRE-700-K9, SM-SRE-710-K9, SM-SRE-900-K9, and SM-SRE-910-K9 modules. The maximum value you can specify for `days-to-keep` is summarized in Table 5-3. The `no` and `default` form of this command sets the purge scheduled time to 04:00, and the number of days to the default value for that particular system hardware module.

**Table 5-3 Maximum Days-to-Keep Value**

<table>
<thead>
<tr>
<th>Database</th>
<th>Storage Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>AIM-CUE/AIM2-CUE</td>
<td>90 days or database 90% full</td>
</tr>
<tr>

Purge Capacity: 75%
```
Configuring Historical Reporting

Configuring the Database Capacity Threshold for a Purge

Use the `purge purge-capacity` command in historical reporting database configuration mode to set the purge threshold as a percentage of the total database capacity and the number of days of historical data that is to be purged from the database.

When the database capacity reaches the configured threshold, historical data older than the configured `days-to-purge` value is removed from the database. The default purge capacity percentage is 90, and the `days-to-purge` default value is 7. The maximum purge capacity percentage value allowed is 90. The `no` and `default` form of this command sets the purge capacity percentage value to 90, and the number of `days-to-purge` to 7.

Prerequisites

Cisco Unity Express 3.0 or a later version

**SUMMARY STEPS**

1. `config t`
2. `ccn reporting historical`
3. `purge purge-capacity percentage percent days-to-purge days`
4. `end`
5. `show ccn reporting historical`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> config t</td>
<td>Enters global configuration mode.</td>
</tr>

<td></td>
</tr>
</tbody>
</table>
Configuring Historical Reporting

Examples

Following is example output of the `show ccn reporting historical` command:

```
se-10-0-0-0# show ccn reporting historical

Database Information
--------------------
Enabled : Yes
Description: Chicago office database
DB Usage: 50%
Current Maintenance Status: idle

Purge Schedule
-------------
Daily Time: 5:00 AM
Data older than 30 days will be purged
Date of last completed purge:

Purge Capacity Configuration
----------------------------
Email Address: abcd@domain.com
Warning Capacity: 65%
Purge Capacity: 75%
```

Configuring the Database Threshold Capacity for Warning Notification

Use the `purge warning-capacity` command to configure a percentage value of the total database capacity that, when reached, causes the system to send an e-mail message warning that the database capacity is approaching its limit. To configure the e-mail address to which this warning message gets sent, see the “Configuring the Purge Notification E-mail Addresses” section on page 71.

The default warning capacity percentage is 85. The maximum warning capacity percentage value allowed is 90. The `no` and `default` forms of this command set the warning capacity to 85%.

Prerequisites

Cisco Unity Express 3.0 or a later version

SUMMARY STEPS

1. `config t`

---

### Command or Action | Purpose
--- | ---
**Step 4** `end` | Saves and returns to privileged EXEC mode.
**Example:**
```
se-10-0-0-0(config-hrdm)# end
```
**Step 5** `show ccn reporting historical` | Displays the historical reporting database parameters.
**Example:**
```
se-10-0-0-0# show ccn reporting historical
```
Chapter 5  Configuring System Components

Configuring Historical Reporting

2. ccn reporting historical
3. purge warning-capacity percentage percent
4. end
5. show ccn reporting historical

DETAILED STEPS

<table>
<thead>
<tr>

</tbody>
</table>

Examples

Following is example output of the **show ccn reporting historical** command:

```
se-10-0-0-0# show ccn reporting historical

Database Information
----------------------
Enabled : Yes
Description: Chicago office database
DB Usage: 50%
Current Maintenance Status: idle

Purge Schedule
--------------
Daily Time: 5:00 AM
Data older than 30 days will be purged
Date of last completed purge: Fri Feb 10 22:00:00 EST
```
Purge Capacity Configuration
--------------------------------
Email Address: abcd@domain.com
Warning Capacity: 65%
Purge Capacity: 75%

Configuring the Purge Notification E-mail Addresses

Use the **purge notification** command to configure e-mail addresses of up to 255 characters in length, to which purge notification and warning messages are sent.

There is no default e-mail address. If an e-mail address is not configured, e-mail notifications are not sent.

If more than one e-mail address must be configured, enter the e-mail addresses separated by commas without spaces.

Use the **no** and **default** forms of this command to remove this configuration.

**Prerequisites**

Cisco Unity Express 3.0 or a later version

**SUMMARY STEPS**

1. **config t**
2. **ccn reporting historical**
3. **purge notification email address** `email-address`
4. **end**
5. **show ccn reporting historical**

**DETAILED STEPS**

Configuring Historical Reporting

Examples

Following is example output of the `show ccn reporting historical` command:

```
se-10-0-0-0# show ccn reporting historical

Database Information
-------------------
Enabled : Yes
Description: Chicago office database
DB Usage: 50%
Current Maintenance Status: idle

Purge Schedule
--------------
Daily Time: 5:00 AM
Data older than 30 days will be purged
Date of last completed purge: Fri Feb 10 22:00:00 EST

Purge Capacity Configuration
-----------------------------
Email Address: abcd@domain.com
Warning Capacity: 65%
Purge Capacity: 75%
```

Manually Purging the Historical Reporting Database

Use the `purge now` command to initiate a manual purge of the historical reporting database and remove historical data older than the specified `days-to-keep` number of days.

When the database is purged, historical data older than the specified `days-to-keep` value (in the range of 1–1000 days) is removed from the database. The `days-to-keep` value is required to initiate a manual purge.

Because the purging of historical data on the module is resource-intensive, we recommend that the manual purge be done during off-peak hours.

Prerequisites

Cisco Unity Express 3.0 or a later version
SUMMARY STEPS

1. `ccn reporting historical purge now days-to-keep days`
2. `show ccn reporting historical`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> <code>ccn reporting historical purge now days-to-keep days</code></td>
<td>Manually purges the historical reporting database and removes historical data older than the <code>days-to-keep</code> number of days.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>se-10-0-0-0(config)# ccn reporting historical purge now days-to-keep 30</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> <code>show ccn reporting historical</code></td>
<td>Displays the historical reporting database parameters.</td>
</tr>
<tr>
<td><strong>Example:</strong> <code>se-10-0-0-0# show ccn reporting historical</code></td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following example illustrates the output when the database is manually purged:

```
se-10-0-0-0# ccn reporting historical purge now days-to-keep 7
Historical Database Purge Initiated
-----------------------------------
Time: Fri Feb 10 04:00:00 EST
Data older than [ 7 ] days will be purged
```

The following example illustrates the `show ccn reporting historical` output:

```
se-10-0-0-0# show ccn reporting historical
Database Information
---------------------
Enabled : Yes
Description: Chicago office database
DB Usage: 50%
Current Maintenance Status: idle

Purge Schedule
---------------
Daily Time: 5:00 AM
Data older than 30 days will be purged
Date of last completed purge: Fri Feb 10 22:00:00 EST

Purge Capacity Configuration
-----------------------------
Email Address: abcd@domain.com
Warning Capacity: 65%
Purge Capacity: 75%
```
Exporting Historical Report Data to an External Server

You can export historical reporting call contact detailed records (CCDRs) to an external server from the Cisco Unity Express module for postprocessing. Use the `copy hrdb url` command to export ASCII comma separated values of the historical data to an external server as a flat file.

**Note**
We recommend that this command be executed during off peak hours or when the system is in a quiescent state.

**Prerequisites**
Cisco Unity Express 3.0 or a later version

**SUMMARY STEPS**
1. `copy hrdb url url`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 <code>copy hrdb url url</code></td>
<td>Copies and uploads the historical reporting data in ASCII comma separated value format from the module to the specified URL.</td>
</tr>
</tbody>
</table>

**Example:**
```
se-10-0-0-0# copy hrdb url ftp://1.2.3.4/hr.txt
```

**Examples**
The following are output examples of ASCII files formatted as comma separated values (CSVs) that are uploaded to the external server:

```
1,0,0,1,2,3,-1,1001,2,-1,16904,2007-05-30 13:19:34.032,2007-05-30 13:19:41.357,-240,6666,6666,15000000001,2,voicemail,7,C3E380E8-E0811DC-8295BE88-935E7691@192.1.1.110,,,,,,,,,,
2,0,0,1,2,3,-1,1001,2,-1,16912,2007-05-30 13:19:44.197,2007-05-30 13:19:47.194,-240,6666,6666,15000000002,2,voicemail,2,CAEC0AEE-E0811DC-8299BE88-935E7691@192.1.1.110,,,,,,,,,,
3,0,0,1,2,3,-1,1001,2,-1,16902,2007-05-30 13:19:55.992,2007-05-30 13:19:59.575,-240,6666,6666,15000000003,2,voicemail,3,D1F49256-E0811DC-829DBE88-935E7691@192.1.1.110,,,,,,,,,,
```

Call contact detailed records (CCDRs) column fields described in Table 5-4 are listed sequentially in the ASCII CSV files:

You can define the custom variables 1 through 10 to suit your needs.
### Table 5-4  Call Contact Detailed Records (CCDRs) Descriptions

Assigning Historical Report Viewing Privileges to a Group

A special privilege is required for a user to be able to log in to the Cisco Unified Communications Manager Express Historical Reporting Client software and view historical reports. The name of the privilege required for this purpose is ViewHistoricalReports. All members of the group, which has this privilege, are able to view historical reports. See the “Configuring Privileges” section on page 11 for details on assigning privileges.

Prerequisites

Cisco Unity Express 3.0 or a later version

SUMMARY STEPS

1. `config t`
2. `groupname name privilege ViewHistoricalReports`
3. end
4. show groupname privileges

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>config t</td>
</tr>
<tr>
<td>Example:</td>
<td>se-10-0-0-0# config t</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>groupname name privilege ViewHistoricalReports</td>
</tr>
<tr>
<td>Example:</td>
<td>se-10-0-0-0(config)# groupname myGroup privilege ViewHistoricalReports</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>end</td>
</tr>
<tr>
<td>Example:</td>
<td>se-10-0-0-0(config)# end</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>show groupname privileges</td>
</tr>
<tr>
<td>Example:</td>
<td>se-10-0-0-0# show ccn groupname</td>
</tr>
</tbody>
</table>

Examples

An example of the sequence of commands for assigning historical report viewing privilege is as follows:

```
se-10-0-0-0# config t
se-10-0-0-0(config)# groupname myGroup privilege ViewHistoricalReports
se-10-0-0-0(config)# end
se-10-0-0-0# show groups privileges
```

Banner Support

This section describes how to configure a system wide login banner that is displayed to all users when they log in to the CLI or GUI and prompts the user for credentials.

The login banner may contain only plain text (no special formatting) and cannot be larger than 1944 characters (24 lines, with 80 characters each, plus a new line character). The same banner text is displayed whether the user logs in to the CLI or GUI and whether the banner is configured using the CLI or GUI.

For the CLI, the login banner is displayed only when the console login is configured to challenge the user for credentials before connecting to the CUE console. If a console session is resumed, no banner is displayed. A user can be resumed a console session when they disconnect from the console with telnet without first using the `exit` or `end` command to log off.
Use the `banner login` command to configure the login banner. This command requires a delimiter character that signals the end of banner content input. The delimiter character can be any printable character except ? and “. You cannot use the delimiter character in the banner content. Otherwise, the banner input is ended prematurely.

The `banner login` command is a multi-line command and can accept more than one line for the banner-content. You can include the following tokens in the banner-content to represent system settings.

<table>
<thead>
<tr>
<th>token</th>
<th>Information displayed in the banner</th>
</tr>
</thead>
<tbody>
<tr>
<td>$(hostname)</td>
<td>Displays the hostname for the module.</td>
</tr>
<tr>
<td>$(domain)</td>
<td>Displays the domain for the module.</td>
</tr>
</tbody>
</table>

If you enter a banner that exceeds the allowed length, the command stops accepting input, truncates the message at the maximum length, outputs an error message, and returns to global configuration.

You can configure the login banner from either the CLI or the GUI to prompt the user for credentials. You can also disable the login banner so that users are not prompted to enter credentials.

## Defining a Login Banner

### Prerequisites

Cisco Unity Express 3.2 or a later version

### SUMMARY STEPS

1. `config t`
2. `banner login delimiter-char banner-content delimiter-char`
3. `end`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td><code>config t</code></td>
<td>Enters configuration mode.</td>
</tr>
</tbody>
</table>

Example:

```
se-10-0-0-0# config t
```
### Command or Action

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| 2    | `banner login delimiter-char banner-content` <br> `delimiter-char` | Configures the login banner:  
`delimiter-character`—Character that indicates the beginning and end of the banner text. <br>`banner-content`—Text content of the banner. |
|      | **Example:**<br>se-10-0-0-0(config)# banner login `%` <br>Enter TEXT message. End with the character '%'. <br>Welcome to $(hostname) % | |
| 3    | `end` | Returns to privileged EXEC mode. |
|      | **Example:**<br>se-10-0-0-0(config)# end | |

### Examples

The following example configures the banner login to “Welcome to hostname:”

```
se-10-0-0-0# config t
se-10-0-0-0 (config)# banner login %
Enter TEXT message. End with the character '%'.
Welcome to $(hostname) %
se-10-0-0-0 (config)# exit
```

The following example configures the banner login to “Welcome to hostname.somewhere.com, enjoy:”

```
se-10-0-0-0# config t
se-10-0-0-0 (config)# ip domain-name somewhere.com
se-10-0-0-0 (config)# banner login @
Enter TEXT message. End with the character '@'.
Welcome to $(hostname).$(domain), enjoy!
@
se-10-0-0-0 (config)# exit
```

The following example configures the banner login to:

```
-----------------------------------
You have entered a restricted area.
Unauthorized access is prohibited.
c-----------------------------------
```

```
se-10-0-0-0# config t
se-10-0-0-0 (config)# banner login 1
Enter TEXT message. End with the character '1'.
c-----------------------------------
You have entered a restricted area.
Unauthorized access is prohibited.
c-----------------------------------
1
se-10-0-0-0 (config)# exit
```
