Cisco Catalyst 2.4 GHz and 5/6 GHz Dual-Band Polarization-Diverse Directional Patch Antenna (C-ANT9103=)

First Published: March 13, 2020
Last Updated: April 17, 2020

This document describes the Cisco Catalyst 2.4 GHz and 5/6 GHz Dual-Band Polarization-Diverse Directional Patch Antenna (C-ANT9103=), and provides electrical specifications and mounting instructions.

The antenna is an octal DART port polarization-diverse patch antenna that operates over the 2.4 GHz band and extended 5 GHz band (up to 7.125 GHz), and IoT. It has 8 RF paths and 16 digital lines. It also has an LED. The antenna ships with an articulating mount for use on flat surfaces and masts, and is adjustable in both horizontal and vertical planes.

The antenna is designed for use in indoor and outdoor environments with an approved Cisco Catalyst series access point that requires four dual-band and four 5/6 GHz antennas. The antenna also includes circuitry to enable self-identification of the antenna by the Cisco Catalyst Series access points.

The following information is provided in this document:

**Safety Precautions**

**Warning** Installation of this antenna near power lines is dangerous. For your safety, follow the installation directions.

Each year, hundreds of people are killed or injured when attempting to install an antenna. In many of these cases, the victim was aware of the danger of electrocution, but did not take adequate steps to avoid the hazard.

For your safety, and to help you achieve a good installation, read and follow these safety precautions. *They may save your life!*

- If you are installing an antenna for the first time, for your own safety as well as that of others, seek professional assistance. Your Cisco sales representative can explain which mounting method to use for the size and type of antenna you are about to install.

- Select your installation site with safety as well as performance in mind. Remember that electric power lines and phone lines look alike. For your safety, assume that any overhead line can kill you.

- Call your electric power company. Tell them your plans and ask them to come and look at your proposed installation. This is a small inconvenience considering your life is at stake.

- Plan your installation carefully and completely before you begin. Successful raising of a mast or tower is largely a matter of coordination. Each person should be assigned a specific task, and should know what to do and when to do it. One person should be in charge of the operation to issue instructions and watch for signs of trouble.

- When installing your antenna, remember:
  - *Do not* use a metal ladder.
  - *Do not* work on a wet or windy day.
  - *Do* dress properly—shoes with rubber soles and heels, rubber gloves, long sleeved shirt or jacket.

- If the assembly starts to drop, get away from it and let it fall. Remember, the antenna, mast, cable, and metal guy wires are all excellent conductors of electrical current. Even the slightest touch of any of these parts to a power line completes an electrical path through the antenna and the installer: *You!*

- If any part of the antenna system should come in contact with a power line, *don’t touch it or try to remove it yourself. Call your local power company.* They will remove it safely.

- If an accident occurs with the power lines, call for qualified emergency help immediately.

For a listing of all the warning statements and their translations, see *Translated Safety Warnings for Cisco Aironet Access Points* at:

Installation Notes

Antennas transmit and receive radio signals that are susceptible to RF obstructions and common sources of interference that can reduce throughput and the range of the device to which they are connected. Follow these guidelines to ensure the best possible performance:

- Install the antenna vertically and mount it with the cables pointing towards the ground.

- Keep the antenna away from metal obstructions such as heating and air-conditioning ducts, large ceiling trusses, building superstructures, and major power cabling runs. If necessary, use a rigid conduit to lower the antenna away from these obstructions.

- In an outdoor environment, connect the antenna to a lightning arrestor and ensure proper grounding.

- The density of the materials used in a building’s construction determines the number of walls the signal can pass through and still maintain adequate signal strength. Consider the following before choosing the location for your antenna:
  - Signals penetrate paper and vinyl walls with little change to signal strength.
  - Signals penetrate only one or two solid and precast concrete walls without degrading signal strength.
  - Signals penetrate three or four concrete and wood block walls without degrading signal strength.
  - Signals penetrate five or six walls constructed of drywall or wood without degrading signal strength.
  - Signals are likely to reflect off a thick metal wall and may not penetrate it at all.
  - Signals are likely to reflect off a chain link fence or wire mesh spaced between 1 and 1 1/2 inch. (2.5 and 3.8 cm). The fence acts as a harmonic reflector that blocks the signal.

- Install the antenna away from microwave ovens and 2 GHz cordless phones. These products can cause signal interference because they operate in the same frequency range as the device to which your antenna is connected.
Contents of the Antenna and Bracket Kit

Figure 1  Contents of the Antenna Bracket Kit

1  Cap plug. Four are included in the kit.
2  5/16-inch stainless steel flat washer. Four are included in the kit.
3  1/4-inch stainless steel split-lock washer. Four are included in the kit.
4  5/16-inch stainless steel split-lock washer. Two are included in the kit.
5  1/4-inch stainless steel flat washer. Two are included in the kit.
6  M8 stainless steel serrated washer. Two are included in the kit.
7  Mounting arm. One is included in the kit.
8  5/16-18 bolt. Two are included in the kit.
9  M5 x 0.8 bolt, 14.2 L. Four are included in the kit.
10  0.3125-18 nut. Two are included in the kit.
11  #8-18 stainless steel self tap screw. Four are included in the kit.
12  #6-8, 1 1/4-inch anchor. Four are included in the kit.
13  Worm gear clamp hose. Two are included in the kit.
14  Mounting flanges required for installation. Two are included in the kit.
Dimensions of the Antenna and Brackets

The dimensions noted in the following illustrations are all in mm, unless noted otherwise.

Figure 2  Dimensions of the Antenna with Brackets and Cables
Figure 3  Locations of Screw Holes and Pressure Vent at the Back of the Antenna
Figure 4  Locations of the Screw Holes on the Articulating Mount Flange
Installing the Antenna

You can install the antenna on a wall or ceiling (must be a flat surface), or on a pole with a minimum diameter of 2 inches (5.08 cm) and a maximum diameter of 5 inches (12.7 cm).

To install the antenna:

Step 1 Decide on a mounting location. See the “Deciding on a Mounting Location” section on page 13.

Step 2 Ensure that you have the requisite tools and fasteners ready. See the “Tools and Equipment Required” section on page 14.

Step 3 Proceed with mounting the antenna. When mounting the antenna, assemble the bracket hardware, connect the antenna and bracket to the mounting surface, and adjust the antenna orientation.

The mounting options available are:

a. Mounting on a Wall or Ceiling Using Articulating Bracket, page 15
b. Mounting Directly on a Wall Through Mounting Holes on the Antenna, page 21
c. Mounting on a Pole or Mast, page 22
d. Mounting on a Wall, Ceiling or Mast with AP Mounted Directly on Antenna, page 24

Step 4 (Optional) Paint the antenna. See the “Painting the Antenna” section on page 26.

Deciding on a Mounting Location

The antenna should be mounted clear of any obstructions to the side or front of the enclosure, which contains the radiating elements. Keep in mind that this antenna should be aimed at the intended coverage area. Therefore, you should mount the antenna such that the desired mechanical tilt is achieved. If possible, mount the antenna near the access point so that you can use the shortest possible connecting cables.

Caution For outdoor installations, install the antenna with cables exiting downward. This will help prevent water from accumulating around the cable exit points.
Tools and Equipment Required

⚠️ IMPORTANT SAFETY INSTRUCTIONS

Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Read the installation instructions before using, installing, or connecting the system to the power source. Use the statement number provided at the end of each warning statement to locate its translation in the translated safety warnings for this device.

SAVE THESE INSTRUCTIONS Statement 1071

⚠️ Warning Instructed person is someone who has been instructed and trained by a skilled person and takes the necessary precautions when working with equipment.

Skilled person/Qualified personnel is someone who have training or experience in the equipment technology and understand potential hazards when working with equipment. Statement 1089

⚠️ Warning Only skilled person should be allowed to install, replace, or service this equipment. Refer to Statement 1089 for description of skilled person. Statement 1090

⚠️ Warning To reduce the risk of electric shock, refer to national and local codes for proper installation and grounding of antennas. Statement 1052

Caution The fasteners and the mounting surface should be capable of maintaining a minimum pullout force of 150 pounds (68 kg) to support the weight of the antenna and bracket along with the potential wind loading on the antenna.

Caution The pole or mast must be rigid enough to hold the weight of the antenna along with the associated forces produced by wind loads. Also, the pole or mast must be structurally strong enough to withstand the clamping force of the hose clamps.

Before you start with mounting the antenna, go through the mounting procedure for each kind of installation and ensure that you have all tools and fasteners mentioned therein ready. The following is a general list of fasteners and tools which are not included in the antenna and brackets kit.

- To mount the antenna on a wall or ceiling, you need four mounting 4 mm or #8 screws or bolts and wall anchors.
- To mount the antenna on a pole or mast, you will need either or both of these supplies:
  - Slotted screwdriver to tighten the screws on the hose clamps
  - A 5/16 inch (8mm) socket or box wrench
- You may also need the following tools and equipment, which are not provided as part of the kit:
  - A drill and drill bit
  - A pencil
  - A small mallet or hammer, to hammer
Mounting on a Wall or Ceiling Using Articulating Bracket

**Note**  The fasteners and mounting surface should be capable of maintaining a minimum pullout force of 150 pounds (68 kg) to support the weight of the antenna along with the potential wind loading on the antenna.

**Step 1**  Determine the mounting location for the antenna.

**Step 2**  Attach the free articulating mount flange to the wall or ceiling using four 4mm or #8 screws and fasteners, through the holes on the bracket.

Use one of the two articulating mount flange brackets (see Figure 1) that is included in the mounting kit.

**Step 3**  Assemble the bracket hardware, as shown in Figure 5. Use a wrench to tighten the 1/4" x 20 x 1.25" screws on the brackets.

**Step 4**  Orient the antenna correctly so that the antenna cable exits downwards. Use a wrench to loosen or tighten the fasteners at the azimuth and elevation- adjustment pivots.

**Step 5**  Adjust the azimuth (side-to-side position) and elevation (up-and-down position) of the antenna. Loosen the adjustment pivot bolts slightly to allow for adjustment.

The azimuth angle can be adjusted ±60 degrees (Figure 8) and elevation can be adjusted ±60 degrees (Figure 9). Use the azimuth and elevation markings on the articulating mounting arm and the flange brackets as a guide. See Figure 7.

**Step 6**  After adjusting the antenna position, tighten the pivot bolts. Tighten all the bolts to not more than 30 lbf.in. (3.4 Nm).

**Step 7**  Connect the antenna’s 8-DART plug to the access point.

For the recommended cable type, see the “Recommended Cable” section on page 26.

Mounting on a Pole or Mast

Note The pole or mast must be rigid enough to hold the weight of an antenna along with the associated forces produced by wind loads. In addition, the mast must be structurally strong enough to withstand the clamping force of the hose clamps.

Step 1 Determine the mounting location for the antenna on the pole or mast.

Step 2 Position and mount the mounting flange bracket on to the pole or mast using the hose clamps provided in the kit. The hose clamps should pass through the slots on the free mounting flange bracket.

One of the two required articulating mount flange brackets come attached to the back of the antenna (see Figure 1). The other flange bracket, included in the kit, is the one used in this step.

Step 3 Tighten the hose clamps only to the extent that they can hold the flange bracket and the antenna in place until the antenna is positioned at its final position. Use a slotted screwdriver to tighten the screws on the hose clamps.

Step 4 Assemble the antenna and bracket to the flange bracket. See Figure 5.

Step 5 Position the antenna, mounting bracket, and hose clamps on the mast. See Figure 11 for reference.

Step 6 Tighten the hose clamps until the antenna is fully secure on the mast. Ensure that the antenna cannot rotate about the mast.

Step 7 After the antenna is secured on the mast, adjust the azimuth (side-to-side position) and elevation (up-and-down position) of the antenna. Loosen the adjustment pivot bolts slightly to allow for adjustment.

Azimuth angle can be adjusted ±60 degrees (Figure 8) and elevation can be adjusted ±60 degrees (Figure 9).

You can use the azimuth and elevation markings on the articulating mounting arm and the flange brackets as a guide. See Figure 7.

Step 8 After you adjust the antenna position, tighten the adjustment bolts. Tighten all the bolts to not more than 30 lbf.in. (3.4 Nm).

Step 9 Connect the antenna’s 8-DART plug to the access point.

For the recommended cable type, see the “Recommended Cable” section on page 26.
Figure 11  Antenna Bracket Hose Clamp Assembly for Pole Mounting

1. Articulating mount flange attached to the back of the antenna.
2. Articulating mount arm.
3. Articulating mount flange that is fastened to the pole or mast using hose clamps.
4. Worm-gear-type hose clamp (50–135mm) for mounting the assembly on a pole or mast.
5. Cables connecting the antenna to an access point.
Mounting on a Wall, Ceiling or Mast with AP Mounted Directly on Antenna

You can directly mount the Cisco Catalyst series C9130AX-E access point to the back of the C-ANT9103= antenna using the AIR-AP-BRACKET-9= bracket. See Figure 12.

- **Step 1**  Remove the rubber feet from each of the four shoulder screws on the access point.
- **Step 2**  Loosen and remove the four shoulder screws of the AP.
- **Step 3**  Fix the bracket to the AP using the four shoulder screws removed in Step 2. Tighten all the screws to 18-20 in-lbs (2.03-2.26 Nm).
- **Step 4**  Fasten the four 1\(\frac{1}{8}\) inch-L, 8-32 thread screws to fix the AP-bracket module to the back of the antenna. Tighten all the screws to 18-20 in-lbs (2.03-2.26 Nm).
- **Step 5**  Cover the four 1\(\frac{1}{8}\) inch-L, 8-32 thread screws using the caps.
- **Step 6**  Fix the cable to the bracket using zip ties.
- **Step 7**  Use the four 1\(\frac{1}{4}\)-20 thread serrated flange locknut to fix the AIR-AP-BRACKET-9= bracket to the adapter bracket. Tighten all the screws to 39-43 in-lbs (4.41-4.86Nm).
- **Step 8**  Connect the antenna’s octal DART plug to the access point.

Connecting the Antenna to the Access Point

The antenna has an 8-port DART plug which is connected to the octal DART port on the access point. The C-ANT9103= includes circuitry to enable self-identification of the antenna by the Cisco Catalyst series C9130AX-E access points. The C-ANT9103= antenna has a built-in EEPROM that can be read by the AP to automatically configure the antenna type, gain, and beamwidth in the wireless controller.

Recommended Cable

This antenna comes with a 2.5-ft long, bundled cable.

Painting the Antenna

Painting the antenna and the bracket does not affect its performance if you use standard exterior-grade, oil-based, or latex paint. Do not use metallic or metallic-flake paints, which will degrade antenna performance.

Note Before painting the antenna, cover the pressure-release vent on the rear, lower-left of the antenna with masking tape to prevent clogging. Ensure that you remove the tape afterwards.

We recommend that you use Krylon Fusion for Plastic or Rust-Oleum for Plastic (which might require a primer coat). For best results, follow the surface preparation suggestions from the paint manufacturer.
