Network Service Headers (NSH)

This chapter describes the following topics:

- Feature Summary and Revision History, on page 1
- Feature Description, on page 2
- How It Works, on page 2
- Configuring Support for NSH Framework, on page 4
- Show Commands and Outputs, on page 11

Feature Summary and Revision History

Summary Data

| Applicable Product(s) or Functional Area | • P-GW  
|                                          | • SAEGW  
| Applicable Platform(s)                  | • ASR 5500  
|                                          | • VPC-DI  
|                                          | • VPC-SI  
| Feature Default                         | Enabled - Always-on  
| Related Changes in This Release         | Not Applicable  
| Related Documentation                   | • Command Line Interface Reference  
|                                          | • P-GW Administration Guide  
|                                          | • SAEGW Administration Guide  

Feature Description

Network Services Headers (NSH), a new service chaining protocol, is added to the network traffic in a packet header to create a dedicated service plane that is independent of the underlying transport protocol. In general, NSH describes a sequence of service nodes that a packet is routed through before reaching the destination address. The NSH includes meta-data information about the packet and service chain in an IP packet. The NSH protocol addresses the growing requirement to deploy various services functions external to the gateway.

This feature introduces NSH protocol support for P-GW and SAEGW products and supports the following:

- Encoding and decoding of NSH format in the P-GW/SAEGW.
- Configurable parameters to be included for encoding in the variable header.
- NSH treatment for selective traffic based on configuration.
- Configuring the tag values for parameters present in the variable header.
- Selective configuration of policies for acting on the decode parameters received in the NSH.
- Configuring the intelligence of encoding the NSH information in every packet of a flow or only once per flow.
- NSH-based Traffic Identification with Traffic Steering.

Important

In this release, selective encryption of parameters is not supported.

How It Works

This section describes the working of NSH protocol support in Cisco's P-GW/SAEGW products.

- The Uplink Packet

For the uplink packet, P-GW/SAEGW adds the NSH, if the flow matches the specified criteria. NSH has a variable length context header also.

Following call flow shows the NSH protocol support in the Cisco PGW/SAEGW products for an uplink packet.
For an uplink packet, if the call flow matches the specified criteria, PGW or SAEGW adds the NSH header to the data packet. NSH header may have variable length context header, which can be encrypted if specified in the configuration.

• **The Downlink Packet**

For the downlink packet, P-GW/SAEGW processes and removes the NSH and applies policies based on the extracted NSH parameters.

Following call flow shows the NSH protocol support in the Cisco PGW/SAEGW products for a downlink packet.

For a downlink packet, PGW or SAEGW processes and removes NSH header. Then, PGW or SAEGW apply policies based on the extracted NSH parameters.

• Source and destination IP address for the outer IP packet is taken from the inner IP packet.

• By default, NSH encapsulated packets use the port number 6633.
Configuring Support for NSH Framework

This section covers configuration steps used in this feature for adding support for NSH framework.

Charging Action Association

Service chain is associated to charging action in the following way:

```
configure
  active-charging service service_name
  charging-action charging_action_name
  service-chain service_chain_name
end
```

Notes:

- **charging-action**: Defines charging action.
  - **charging_action_name**: Specifies name of the charging action. This is entered as an alphanumeric string of 1 through 64 characters.
- **service-chain**: Defines service chain association.
  - **service_chain_name**: Specifies name of the service chain. This is entered as an alphanumeric string of 1 through 64 characters.

Service Chain Association

A new CLI command `nsh-format` is added to the `service-chain` command for service-chain association.
configure
  service-chain <service_chain_name>
    nsh-format <nsh_format_name>
  end

Notes:
  • service-chain: Defines service chain association.
    service_chain_name: Specifies name of the service chain. This is entered as an alphanumeric string of 1 through 64 characters.
  • nsh-format: Associates NSH format with the service chain.

Service Scheme Association

A new CLI command nsh-response-received has been added to the trigger command to the ACS service scheme configuration mode.

configure
  active-charging service service_name
    service-scheme service_scheme_name
      [ no ] trigger { bearer-creation | flow-create | loc-update | nsh-response-received | sess-setup }
  end

Notes:
  • service-scheme: Enables the association of service-scheme based on subscriber class.
    service_scheme_name: Specifies name of the service scheme. This is entered as an alphanumeric string of 1 through 64 characters.
  • no: Disables the trigger action for the service-scheme.
  • trigger: Specifies the trigger action for service-scheme.
    bearer-creation: Triggers for every new bearer.
    flow-create: Triggers for every new flow.
    loc-update: Triggers whenever location changes of the subscriber.
    nsh-response-received: Triggers on NSH response packet.
    sess-setup: Triggers at session setup.

NSH Configuration Mode

The Network Service Header (NSH) configuration mode is a sub-mode of the Global Configuration mode. This NSH mode is used to encode or decode NSH.

Exec > Global Configuration> Network Service Entity - IP Configuration
confi gure
nsh
end

Entering the above command sequence results in the following prompt:

[local]host name(nsh)#

NSH Fields Configuration Mode

The NSH Fields configuration mode is a sub-mode of the NSH Configuration mode. This NSH Fields configuration mode is used to tag value to the NSH fields.

Exec > Global Configuration > Network Service Header > Network Service Header - Fields Configuration

confi gure
nsh
nsh-fields fields_name
end

Entering the above command sequence results in the following prompt:

[local]host name(nsh-nshfields)#

tag-value

This new CLI command is added to the NSH Fields configuration mode to associate a tag value to a NSH field.

confi gure
nsh
nsh-fields fields_name
tag-value tag_value { content-type | enterprise-id | imei | imsi | msisdn | rating-group | rulebase | tdf-app-id }
end

Notes:

• nsh-fields: Defines nsh fields tag values.
  fields_name: Specifies name of the nsh-field. This is entered as an alphanumeric string of 1 through 64 characters.
• tag-value: Associates a tag to a field.
  tag_value: Tag value for the NSH field.
• content-type: Specifies content type of payload.
• enterprise-id: Specifies the enterprise-ID to be sent in NSH context header.
• imei: Specifies imei of the subscriber.
• imsi: Specifies imsi of the subscriber.
• imisdn: Specifies imisdn of the subscriber.
• **rating-group**: Specifies rating-group applied for the traffic.
• **rulebase**: Specifies rule-base of the subscribers.
• **tdf-app-id**: Specifies tdf application id applied to the traffic

**NSH Format Configuration Mode**

The NSH Format Configuration mode is a sub-mode of the NSH Configuration mode. This NSH Format mode is used to encode or decode NSH.

Exec > Global Configuration> Network Service Header > Network Service Header - Format

```
configure
   nsh
      nsh-format format_name
      encode nsh-fields fields_name
   end
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(nsh-nshformat)#
```

**encode**

This new CLI command is added to the NSH Format configuration mode. This command defines the NSH encoding fields to be associated with the NSH format.

```
configure
   nsh
      nsh-format format_name
      encode nsh-fields fields_name
   end
```

**Notes:**

• **nsh-format**: Defines format in NSH header.
  
  `format_name`: Specifies name of the **NSH format**. This is entered as an alphanumeric string of 1 through 64 characters.

• **encode**: Associates nsh-fields for encoding.

• **nsh-fields**: Defines nsh fields tag value.
  
  `fields_name`: Specifies name of the fields. This is entered as an alphanumeric string of 1 through 64 characters.

**encoding-frequency**

This command defines frequency of encoding the NSH fields to be associated with the NSH format.

```
configure
   nsh
      nsh-format format_name
```

**Notes:**

• **format_name**: Specifies name of the **NSH format**. This is entered as an alphanumeric string of 1 through 64 characters.
encoding-frequency { always | once-per-flow } end

Notes:
- **encoding-frequency**: Defines frequency of encoding nsh-fields.
- **always**: Encodes nsh fields on every hit.
- **once-per-flow**: Encodes nsh fields once per flow.

decode

This command defines the NSH decoding fields to be associated with the NSH format.

```
configure
  nsh
    nsh-format format_name
    decode nsh-fields fields_name
  end
```

Notes:
- **nsh-format**: Defines format in NSH header.
  `format_name`: Specifies name of the NSH format. This is entered as an alphanumeric string of 1 through 64 characters.
- **decode**: Associates nsh-fields for decoding.
- **nsh-fields**: Defines nsh fields tag value.
  `fields_name`: Specifies name of the fields. This is entered as an alphanumeric string of 1 through 64 characters.

**Trigger Condition Configuration Mode Commands**

**content-type**

This command specifies the content type to be matched.

```
configure
  active-charging service service_name
    trigger-condition trigger_condition_name
    content-type { operator condition }
  end
```

Notes:
- **trigger-condition**: Defines ACS trigger conditions.
  `trigger_condition_name`: Specifies name of the trigger condition. This is entered as an alphanumeric string of 1 through 64 characters.
- **content-type**: Specifies the content type.
• **operator**: Specifies how to match. Operator must be one of the following:
  - `!`: not equals
  - `!contains`: not contains
  - `!ends-with`: not ends with
  - `!starts-with`: not starts with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with

• **condition**: Specifies the condition to match. Condition must be one of the following:
  - FALSE
  - TRUE

### tdf-app-id

This command specifies the identifier for application-based rules to be matched.

```
configure
  active-charging service service_name
  trigger-condition trigger_condition_name
    tdf-app-id { operator condition }
  end
```

**Notes:**

• **trigger-condition**: Defines ACS trigger conditions.

  **trigger_condition_name**: Specifies name of the trigger condition. This is entered as an alphanumeric string of 1 through 64 characters.

• **tdf-app-id**: Specifies the identifier for application based rules.

• **operator condition**: Specifies how to match. Operator must be one of the following:
  - `!`: not equals
  - `!contains`: not contains
  - `!ends-with`: not ends with
  - `!starts-with`: not starts with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
• **starts-with**: starts with

• **condition**: Specifies the condition to match. Condition must be one of the following:
  • FALSE
  • TRUE

### Sample Configuration for NSH Creation

The following is a sample configuration for this NSH service creation:

```bash
cfg
  nsh
    nsh-fields xyz
      tag-val 1 imei
      tag-val 2 imsi
    exit
    nsh-fields abc
      tag-val 4 content-type
    exit
    nsh-format format1
      encoding frequency always
      encode nsh-fields xyz
      decode nsh-fields abc
    exit
  exit
traffic-steering
appliance-group firewall
nsh-format format1
  ip address 1.2.3.4
#exit
#exit
service-chain sch1
  sfp direction uplink service-index 1 appliance firewall
#exit
exit
config
active-charging service ACS
  trigger-action ta1
  throttle-suppress
exit
trigger-condition tc1
  content-type contains text
exit
service-scheme schemel
  trigger nsh-response-received
    priority 1 trigger-condition tc1 trigger-action ta1
exit
exit
subs-class class1
  any-match = TRUE
exit
subscriber-base basel
  priority 1 subs-class class1 bind service-scheme schemel
exit
charging-action ca1
  service-chain xyz
exit
```
Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of the feature.

show nsh statistics

This command has been newly added in this release to display the nsh statistics. Following is the output when you execute this command:

```
Total Encap Successful : 0
Total Decap Successful : 0
Total Encap Failed : 0
  Memory Allocation : 0
  Config Error : 0
  Encryption Failed : 0
Total Decap Failed : 0
  Config Error : 0
  Base Header
    Invalid Length : 0
    Unsupported Version : 0
    Unsupported Next Protocol : 0
    Next Protocol Mismatch : 0
    Unsupported MD-Type : 0
  Context Header
    Unsupported MD-Class : 0
    Unsupported Type : 0
OAM Packets
  Received : 0
  Dropped : 0
Unknown Context Header Type : 0
```

show active-charging trigger-condition statistics

The output of this command includes the following field for this feature:

- NSH-Rsp-RevCd

This field displays the matching of trigger condition based on NSH response.
show active-charging trigger-condition statistics
