## Deactivating the USP Deployment

### Caution

It is recommended that you perform the checks identified in [Pre-Deactivation/Post-Activation Health Check Summary, on page 6](#) before performing any deactivations. It is also recommended that you back up relevant data before proceeding. Refer to [Backing Up Deployment Information](#) for more information.

Execute the following command to deactivate the entire USP deployment:

```
deactivate nsd <nsd_name>
```

The output of this command is a transaction-id which can be used to monitor the deactivation progress using the following command

```
show log <transaction_id> | display xml
```

Example output for a successful USP deactivation:

## Terminating the AutoDeploy VM

Terminating the AutoDeploy VM leverages the same *boot\_uas.py* script used to instantiate the AutoDeploy VM.

### Important

- Ensure that no changes have been made to this file since it was used to deploy AutoDeploy.
- Be sure to take a backup of the VM content if you are terminating the VM in order to upgrade with a new ISO.
- If AutoDeploy was deployed with HA support, this process terminates both VMs.

To terminate the AutoDeploy VM:

1. Log on to the Ultra M Manager Node.
2. Terminate the AutoDeploy VM.

```
./boot_uas.py --kvm --autodeploy --ha --delete-uas
```

Example command output:

```
2018-01-24 16:30:23,821 - Removing old deployment 'AutoDeploy_instance_0', if it exists
2018-01-24 16:30:24,176 - Removing old deployment 'AutoDeploy_instance_1', if it exists
```

3. View the status.

```
show uas
```

Example command output:

```
Id      Name                               State
-----
```

## Terminating the AutoIT VM

Terminating the AutoIT VM leverages the same *boot\_uas.py* script used to instantiate the AutoIT-VNF VM.

### Important

- Ensure that no changes have been made to this file since it was used to deploy AutoIT.
- Be sure to take a backup of the VM content if you are terminating the VM in order to upgrade with a new ISO.
- If AutoIT was deployed with HA support, this process terminates both VMs.

To terminate the AutoIT VM:

1. Log on to the Ultra M Manager Node.
2. Terminate the AutoIT VM.

```
./boot_uas.py --kvm --autoit --ha --delete-uas
```

Example command output:

```
2018-01-24 16:25:23,734 - Removing old deployment 'AutoIT_instance_0', if it exists
2018-01-24 16:25:24,056 - Removing old deployment 'AutoIT_instance_1', if it exists
```

3. View the status.

```
show uas
```

Example command output:

```
Id      Name                               State
-----
```

## Deploy and Undeploy the Card with the NCS CLI

To undeploy and redeploy the card (service or session function) using the NCS CLI:

1. Log on to the master UEM VM.
2. Access the NCS CLI.

```
sudo -i
ncs_cli -u admin -C
```

3. Undeploy or suspend the card.

```
suspend-vnfci vnfid <name> vdu <VDU> vnfci <VNFCI Instance>
```

For example:

```
suspend-vnfci vnfid abc vdu sf vnfci sfl success true
```

4. Verify the operational status of VNF, card, VDUs. Suspending card removes the card, e.g. from CF.

In 6.2 and earlier releases:

```
show vnf-state
```

```
vnf-state running
```

In 6.3 and later releases:

```
show vnfproxy:vnfd <vnfd_name>vnf-state
```

```
vnf-state running
```

```
show card table
```

Slot	Card Type	Oper State	SPOF	Attach
1: CFC	Control Function Virtual Card	Active	No	
2: CFC	Control Function Virtual Card	Standby	-	
4: FC	1-Port Service Function Virtual Card	Standby	-	

In 6.2 and earlier releases:

```
show vodus
```

ID	CARD	TYPE	ID	DEVICE	MEMORY		CONSTITUENT		IS	INITIALIZED	VIM
					CPU	UTILS	STORAGE	ELEMENT			
ID				NAME	GROUP	BYTES	GROUP	GROUP	INFRA		
cf	control-function		cf1	scm-cf-nc	scm-cf-nc	ugp			true	true

```

## 5. Redeploy or resume the card by executing the following command:

```
resume-vnfc vnfid <name> vdu <VDU> vnfc <VNFC Instance>
```

# Monitoring and Troubleshooting the Deployment

## Pre-Deactivation/Post-Activation Health Check Summary

Table 1: Pre-deactivation/Post-activation Health Checks, on page 6 contains a summary of items to check/verify before performing a deactivation and/or after an activation.

**Table 1: Pre-deactivation/Post-activation Health Checks**

Item to Check	Notes
Checking OSP-D Server Health	Perform all identified checks.
Checking Controller Server Health	Perform all identified checks.
Checking OSD Compute Server Health	Perform all identified checks.
Viewing AutoVNF Operational Data	In particular, check the outputs of the following commands: <ul style="list-style-type: none"> <li>• <b>show uas</b></li> <li>• In releases prior to 6.0: <b>show autovnf-oper:vip-port</b> In 6.0 and later releases: <b>show vnfr</b></li> <li>• In releases prior to 6.0: <b>show autovnf-oper:vnf-em</b> In 6.0 and later releases: <b>show vnfr</b></li> <li>• In releases prior to 6.0: <b>show autovnf-oper:vnfm</b> In 6.0 and later releases: <b>show vnfr</b></li> </ul>
Viewing ESC Status	Perform all identified checks.
Viewing ESC Health	Perform all identified checks.
Viewing UEM Service Status	Perform all identified checks.
Viewing VNF Information through the Control Function	Perform all identified checks.

## Checking OSP-D Server Health

### Viewing Stack Status

Log on to the server on which OSP-D is running to view the stack status by executing the following command:

```
openstack stack list
```

Example output:

ID	Stack Name	Stack Status	Creation Time
db229d67-212d-4086-a266-e635b2902708	tb3-ultram	CREATE_COMPLETE	2017-06-20T02:31:31Z

**Note** Prior to an update, the stack status may be “CREATE\_COMPLETE” at the beginning of the update procedure. The stack status should read “UPDATE\_COMPLETE” and list and update time at the successful completion of the update procedure.

## Viewing the Bare Metal Node List

Log on to the server on which OSP-D is running to view the node list by executing the following command:

```
openstack baremetal node list
```

**Example command output:**

UUID	Name	Instance UUID	Power State	Provisioning State	Maintenance
6725bb18-2895-4a8a-86ad-96b00cc9df4d	None	bc903f51-8483-4522-bcd7-ac396ac626b1	power on	active	False

```

## Verifying Node Reachability

Log on to the server on which OSP-D is running to ensure the node reachability and availability by executing the following command:

```
for i in $(nova list | grep ACTIVE | awk '{print $12}' | sed 's\ctlplane=\g') ; do ssh heat-admin@${i} uptime ; done
```

This command establishes an SSH session with each node and report the system uptime. Investigate any node that does not reply or has an unexpected uptime.

**Example command output:**

```
14:47:10 up 18:15, 0 users, load average: 0.01, 0.02, 0.05
14:47:11 up 18:14, 0 users, load average: 9.50, 9.15, 12.32
14:47:11 up 18:14, 0 users, load average: 9.41, 9.09, 12.26
14:47:11 up 18:14, 0 users, load average: 10.41, 10.28, 10.49
14:47:12 up 18:15, 0 users, load average: 0.00, 0.02, 0.05

14:47:16 up 1 day, 5 min,  0 users,  load average:  4.10,  4.27,  4.44
14:47:17 up 23:53,  0 users,  load average:  1.90,  2.32,  2.24

```

## Verify NTP is running

To verify the operational status of NTP server:

1. Log on to the server on which OSP-D is running to ensure that NTP is running on all nodes in the cluster by executing the following command:

```

for i in $(nova list | grep ACTIVE | awk '{print $12}' | sed
's/ctlplane=\\g' ) ; do ssh heat-admin@${i} systemctl status ntpd |grep
Active; done

```

This command establishes an SSH session with each node and lists the ntpd status.

### Example command output:

```

Active: active (running) since Tue 2017-07-11 20:32:25 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:28 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:50 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:28 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:14 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:30 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:22 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:16 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:35 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:31 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:30 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:25 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:19 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:14 UTC; 18h ago
Active: active (running) since Tue 2017-07-11 20:32:41 UTC; 18h ago

Active: active (running) since Tue 2017-07-11 21:37:32 UTC; 17h ago
Active: active (running) since Tue 2017-07-11 21:43:16 UTC; 17h ago
Active: active (running) since Tue 2017-07-11 21:48:57 UTC; 17h ago
Active: active (running) since Tue 2017-07-11 15:01:30 UTC; 23h ago
Active: active (running) since Tue 2017-07-11 14:42:10 UTC; 24h ago
Active: active (running) since Tue 2017-07-11 14:54:06 UTC; 23h ago

```

2. Verify that all the OpenStack nodes are synced to NTP server.

```

for i in $(nova list | grep -i overc- | awk '{print $12}' | sed
's/ctlplane=//g') ; do (ssh -o StrictHostKeyChecking=no heat-admin@${i}
sudo ntpstat | grep NTP) ; done

```

```

[stack@j19bxb-ospd ~]$ for i in $(nova list | grep -i overc- | awk '{print $12}' | sed
's/ctlplane=//g') ; do (ssh -o StrictHostKeyChecking=no heat-admin@${i} sudo ntpstat |
grep NTP) ; done
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3

synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
```

3. Check the NTP status on the server on which OSP-D is running by executing the following command:

```
systemctl status ntpd |grep Active
```

Investigate any node that is not actively running NTP.

## Checking OSP-D Server Health

### Verifying VM and Other Service Status and Quotas

Log on to the server on which OSP-D is running to verify that Overcloud VMs are active and running by executing the following commands:

```
cd /home/stack
source ~/<stack_name>rc-core
nova list
```

**Note** Overcloud VM status can also be checked through the Horizon GUI.

#### Example command output:

```

+-----+-----+-----+-----+-----+
| ID                                     | Name                                     |

## Checking Cinder Type

Log on to the server on which OSP-D is running to check the Cinder volume type by executing the following commands:

```

cd /home/stack
source ~/<stack_name>rc-core
cinder type-list

```

**Example command output:**

```

+-----+-----+-----+-----+
| ID                | Name | Description | Is_Public |
+-----+-----+-----+-----+
| 208ef179-dfe4-4735-8a96-e7beee472944 | LUKS | -           | True      |
+-----+-----+-----+-----+

```

```

cinder type-show LUKS

```

**Example command output:**

```

+-----+-----+-----+-----+
| Property          | Value
+-----+-----+-----+-----+
| description       | None
| extra_specs      | {}
| id                | bf855b0f-8b3f-42bf-9497-05013b4ddad9 |
+-----+-----+-----+-----+

```

```

| is_public          | True          |
| name              | LUKS         |
| os-volume-type-access:is_public | True        |
| qos_specs_id      | None         |
+-----+-----+

```

## Checking Core Project (Tenant) and User Core

Log on to the server on which OSP-D is running to check the core projects and users by executing the following commands:

```

cd /home/stack
source ~/<stack_name> rc-core
openstack project list

```

**Example command output:**

```

+-----+-----+
| ID              | Name        |
+-----+-----+
| 271ab207a197465f9d166c2dc7304b18 | core       |
| 52547e0fca994cd682aa733b941d0f68 | service   |
| 9543ad9db4dd422ea5aedf04756d3682 | admin     |
+-----+-----+

```

```
openstack project show core
```

**Example command output:**

```

+-----+-----+
| Field          | Value      |
+-----+-----+
| description    | core tenant |
| enabled       | True      |

```

## Checking Nova/Neutron Security Groups

Log on to the server on which OSP-D is running to check Nova and Neutron security groups by executing the following commands:

**nova secgroup-list**

### Example command output:

WARNING: Command secgroup-list is deprecated and will be removed after Nova 15.0.0 is released. Use python-neutronclient or python-openstackclient instead.

```

+-----+-----+-----+
| Id                | Name    | Description                |
+-----+-----+-----+
| ce308d67-7645-43c1-a83e-89d3871141a2 | default | Default security group |
+-----+-----+-----+

```

**neutron security-group-list**

### Example command output:

```

+-----+-----+-----+

## Checking Tenant Project Default Quotas

Log on to the server on which OSP-D is running to check default project quotas by executing the following commands:

```
nova quota-show
```

**Example command output:**

```

+-----+-----+
| Quota                | Limit |
+-----+-----+
| instances             | 1000  |
| cores                 | 1000  |
| ram                   | 5120000 |
| metadata_items       | 128   |
| injected_files        | 100   |
| injected_file_content_bytes | 1024000 |
| injected_file_path_bytes | 255   |
| key_pairs             | 100   |
| server_groups         | 10    |
| server_group_members | 10    |
+-----+-----+

```

```
openstack project list | grep core
```

**Example command output:**

```
| 271ab207a197465f9d166c2dc7304b18 | core |
```

```
nova quota-class-show 271ab207a197465f9d166c2dc7304b18
```

**Example command output:**

```

+-----+-----+
| Quota                | Limit |
+-----+-----+
| instances             | 10    |
| cores                 | 20    |
| ram                   | 51200 |

```

## Checking the External Network Using the core-project-id

Log on to the server on which OSP-D is running to check the external network configuration by entering the following commands:

```
neutron net-list
```

**Example command output:**

```

+-----+-----+-----+
| id | name |
| subnets |
+-----+-----+-----+
| 1236bd98-5389-42f9-bac8-433997525549 | LBUCS001-AUTOIT-MGMT |
| c63451f2-7e44-432e-94fc-167f6a31e4aa | 172.16.182.0/24 |
| 1c46790f-cab5-4b1d-afc7-a637fe2dbe08 | LBUCS001-EXTERNAL-MGMT |

| 1c70a9ab-212e-4884-b7d5-4749c44a87b6 | LBPGW101-DI-INTERNAL1 |
| e619b02e-84e0-48d9-9096-f16adc84f1cc | HA network tenant 271ab207a197465f9d166c2dc7304b18 |
| cefd5f5f-0c97-4027-b385-ca1a57f2cfac | 169.254.192.0/18 |
+-----+-----+-----+

```

```
neutron net-show 1c46790f-cab5-4b1d-afc7-a637fe2dbe08
```

**Example command output:**

```

+-----+-----+
| Field | Value |
+-----+-----+
| admin_state_up | True |
| availability_zone_hints | |
| availability_zones | |
| created_at | 2017-06-05T07:18:59Z |
| description | |
| id | 1c46790f-cab5-4b1d-afc7-a637fe2dbe08 |
| ipv4_address_scope | |
| ipv6_address_scope | |
| is_default | False |
| mtu | 1500 |
| name | LBUCS001-EXTERNAL-MGMT |
| port_security_enabled | True |
| project_id | 271ab207a197465f9d166c2dc7304b18 |
| provider:network_type | vlan |
+-----+-----+

```

```

| provider:physical_network | datacentre |
| provider:segmentation_id | 101 |
| qos_policy_id | |
| revision_number | 6 |
| router:external | True |
| shared | False |
| status | ACTIVE |
| subnets | a23a740e-3ad0-4fb1-8526-3353dfd0010f |
| tags | |
| tenant_id | 271ab207a197465f9d166c2dc7304b18 |
| updated_at | 2017-06-05T07:22:51Z |
+-----+-----+

```

Note down the **provider:segmentation\_id**. In this example, 101 is the vlan for the external interface.

### neutron subnet-list

#### Example command output:

```

+-----+-----+-----+-----+
| id | allocation_pools | name | cidr |
+-----+-----+-----+-----+

## Checking the Staging Network Configuration

Log on to the server on which OSP-D is running to check the staging network configuration by entering the following commands:

```
neutron subnet-show <ext-mgmt-id>
```

<ext-mgmt-id> is the ID for the external management interface as obtained through the **neutron subnet-list** command output.

### Example output:

```
+-----+-----+
| Field          | Value                                                                 |
+-----+-----+
| allocation_pools | {"start": "10.169.127.168", "end": "10.169.127.190"} |
| cidr            | 10.169.127.160/27 |

## Checking the DI-Internal and Service Network Configurations

Log on to the server on which OSP-D is running to check the DI-internal and service network configuration by entering the following commands:

```
neutron net-list
```

**Example command output:**

```

+-----+-----+-----+-----+
| id                | name                |
| subnets          |                     |
+-----+-----+-----+-----+
| 1236bd98-5389-42f9-bac8-433997525549 | LBUCS001-AUTOIT-MGMT |
| c63451f2-7e44-432e-94fc-167f6a31e4aa | 172.16.182.0/24      |

## Checking the Flavor List

Log on to the server on which OSP-D is running to check the flavor list and to by entering the following command:

```
nova flavor-list
```

**Example command output:**

ID	Name	Memory_MB	Disk	Ephemeral
eff0335b-3374-46c3-a3de-9f4b1ccea04	DNUCS002-AUTOIT-FLAVOR	8192	80	0

## Checking Host Aggregate and Availability Zone Configuration

Log on to the server on which OSP-D is running to check the host aggregate and availability zone configurations for the OSD Compute and for the AutoDeploy and AutoIT VMs.

**Note** It is assumed that the AutoDeploy and AutoIT VMs reside on the same OSD Compute node.

This is done by executing the following commands:

```
cd /home/stack  
source ~/<stack_name>rc-core  
nova aggregate-list
```

**Example command output:**

Id	Name	Availability Zone
108	LBUCS001-AUTOIT	mgmt

```
| 147 | LBPGW101-EM-MGMT1 | - |
| 150 | LBPGW101-SERVICE1 | - |
| 153 | LBPGW101-CF-MGMT1 | - |
+-----+-----+-----+
```

#### **nova aggregate-show LBUCS001-AUTOIT**

```
+-----+-----+-----+-----+-----+
| Id | Name | Availability Zone | Hosts | Metadata |
+-----+-----+-----+-----+-----+
| 108 | LBUCS001-AUTOIT | mgmt | 'newtonoc-osd-compute-0.localdomain' | 'availability_zone=mgmt', 'mgmt=true' |
+-----+-----+-----+-----+-----+
```

**Note** This information can also be verified through the Horizon GUI. Login to Horizon as the user core and navigate to **Project > Compute > Instances**. Check each instance to verify that the status is Active and the power state is Running.

Correct any instance that does not meet these criteria before continuing.

## Checking Controller Server Health

**Note** The commands in this section should be executed on any one of the Controller nodes and do not need to be repeated on the other Controller nodes unless an issue is observed.

## Checking the Pacemaker Cluster Stack (PCS) Status

Log on to one of the Controller nodes and verify that the group of resources in the PCS cluster are active and in the expected state by executing the following command:

```
sudo pcs status
```

#### **Example command output:**

```
Cluster name: tripleo_cluster
Stack: corosync
Current DC: tb3-ultram-controller-0 (version 1.1.15-11.e17_3.4-e174ec8) - partition with quorum
Last updated: Wed Jul 12 13:28:56 2017 Last change: Tue Jul 11 21:45:09 2017 by root via crm_attribute on tb3-ultram-controller-0
```

```
3 nodes and 22 resources configured
```

```
Online: [ tb3-ultram-controller-0 tb3-ultram-controller-1 tb3-ultram-controller-2 ]
```

```
Full list of resources:
```

```
ip-192.200.0.104 (ocf::heartbeat:IPaddr2): Started tb3-ultram-controller-1
ip-10.84.123.6 (ocf::heartbeat:IPaddr2): Started tb3-ultram-controller-0
ip-11.119.0.42 (ocf::heartbeat:IPaddr2): Started tb3-ultram-controller-0
Clone Set: haproxy-clone [haproxy]
Started: [ tb3-ultram-controller-0 tb3-ultram-controller-1 tb3-ultram-controller-2 ]
Master/Slave Set: galera-master [galera]
```

```

Masters: [ tb3-ultram-controller-0 tb3-ultram-controller-1 tb3-ultram-controller-2 ]
ip-11.120.0.47 (ocf::heartbeat:IPAddr2):      Started tb3-ultram-controller-1
ip-11.118.0.49 (ocf::heartbeat:IPAddr2):      Started tb3-ultram-controller-0
Clone Set: rabbitmq-clone [rabbitmq]
  Started: [ tb3-ultram-controller-0 tb3-ultram-controller-1 tb3-ultram-controller-2 ]
ip-11.120.0.48 (ocf::heartbeat:IPAddr2):      Started tb3-ultram-controller-1
Master/Slave Set: redis-master [redis]
  Masters: [ tb3-ultram-controller-0 ]
  Slaves: [ tb3-ultram-controller-1 tb3-ultram-controller-2 ]
openstack-cinder-volume      (systemd:openstack-cinder-volume):      Started
tb3-ultram-controller-0
my-ipmilan-for-controller-0  (stonith:fence_ipmilan):      Started
tb3-ultram-controller-0
my-ipmilan-for-controller-1  (stonith:fence_ipmilan):      Started
tb3-ultram-controller-1
my-ipmilan-for-controller-2  (stonith:fence_ipmilan):      Started
tb3-ultram-controller-0

Daemon Status:
corosync: active/enabled
pacemaker: active/enabled
pcsd: active/enabled

```

From the output of this command, ensure that:

- All 3 controllers are listed as Online
- haproxy-clone is started on all 3 controllers
- galera-master lists all 3 controllers as Masters
- rabbitmq-clone is started on all 3 controllers
- redis-master lists one controller as master and the other 2 controllers as slaves
- openstack-cinder-volume is started on one node
- my-ipmilan/stonith is started on all 3 controllers
- Daemons corosync, pacemaker and pcsd are active and enabled

---

**Note** If the output displays any “Failed Actions”, execute the **sudo pcs resource cleanup** command and then re-execute the **sudo pcs status** command.

---

## Checking Ceph Storage Status

Log on to the Controller node and verify the health of the Ceph storage from the Controller node by executing the following command:

```
sudo ceph status
```

### Example command output:

```

cluster eb2bb192-b1c9-11e6-9205-525400330666
  health HEALTH_OK
  monmap e1: 3 mons at
{tb3-ultram-controller-0=11.118.0.10:6789/0,tb3-ultram-controller-1=11.118.0.11:6789/0,
tb3-ultram-controller-2=11.118.0.12:6789/0}
  election epoch 152, quorum 0,1,2
tb3-ultram-controller-0,tb3-ultram-controller-1,tb3-ultram-controller-2

```

```

osdmap e158: 12 osds: 12 up, 12 in
      flags sortbitwise,require_jewel_osds
pgmap v1417251: 704 pgs, 6 pools, 321 GB data, 110 kobjects
      961 GB used, 12431 GB / 13393 GB avail
      704 active+clean
client io 53755 B/s wr, 0 op/s rd, 7 op/s wr

```

From the output of this command, ensure that:

- health is listed as HEALTH\_OK
- The correct number of monitors are listed in the monmap
- The correct number of OSDs are listed in the osdmap

## Checking Controller Node Services

Log on to the Controller node and check the status of all services by executing the following command:

```
sudo systemctl list-units "openstack*" "neutron*" "openvswitch"
```

**Example command output:**

UNIT	LOAD	ACTIVE	SUB	DESCRIPTION
neutron-dhcp-agent.service Agent	loaded	active	running	OpenStack Neutron DHCP
neutron-l3-agent.service 3 Agent	loaded	active	running	OpenStack Neutron Layer
neutron-metadata-agent.service Agent	loaded	active	running	OpenStack Neutron Metadata

openstack-swift-object.service loaded active running OpenStack Object Storage
(swift) - Object Server
openstack-swift-proxy.service loaded active running OpenStack Object Storage
(swift) - Proxy Server
openvswitch.service loaded active exited Open vSwitch

```

LOAD = Reflects whether the unit definition was properly loaded.

ACTIVE = The high-level unit activation state, i.e. generalization of SUB.

SUB = The low-level unit activation state, values depend on unit type.

43 loaded units listed. Pass --all to see loaded but inactive units, too.

To show all installed unit files use 'systemctl list-unit-files'.

## Check the RabbitMQ Database Status

From each of the controller nodes, determine if the rabbitmq database is in a good state by executing the following command:

```
sudo rabbitmqctl eval 'rabbit_diagnostics:maybe_stuck().'
```

### Example command output:

```

2017-07-20 01:58:02 There are 11020 processes.
2017-07-20 01:58:02 Investigated 0 processes this round, 5000ms to go.
2017-07-20 01:58:03 Investigated 0 processes this round, 4500ms to go.
2017-07-20 01:58:03 Investigated 0 processes this round, 4000ms to go.
2017-07-20 01:58:04 Investigated 0 processes this round, 3500ms to go.
2017-07-20 01:58:04 Investigated 0 processes this round, 3000ms to go.
2017-07-20 01:58:05 Investigated 0 processes this round, 2500ms to go.
2017-07-20 01:58:05 Investigated 0 processes this round, 2000ms to go.
2017-07-20 01:58:06 Investigated 0 processes this round, 1500ms to go.
2017-07-20 01:58:06 Investigated 0 processes this round, 1000ms to go.
2017-07-20 01:58:07 Investigated 0 processes this round, 500ms to go.
2017-07-20 01:58:07 Found 0 suspicious processes.
ok

```

If the database is healthy, the command returns “Found 0 suspicious processes.” If the database is not healthy, the command returns 1 or more suspicious processes. Contact your local support representative if suspicious processes are found.

## Checking OSD Compute Server Health

### Checking Ceph Status

Log on to the OSD Compute and check the Ceph storage status by executing the following command:

```
sudo ceph status
```

#### Example command output:

```
sudo ceph status
  cluster eb2bb192-b1c9-11e6-9205-525400330666
  health HEALTH_OK
  monmap e1: 3 mons at
{tb3-ultram-controller-0=11.118.0.10:6789/0,tb3-ultram-controller-1=11.118.0.11:6789/0,
tb3-ultram-controller-2=11.118.0.12:6789/0}
  election epoch 152, quorum 0,1,2
tb3-ultram-controller-0,tb3-ultram-controller-1,tb3-ultram-controller-2
  osdmap e158: 12 osds: 12 up, 12 in
  flags sortbitwise,require_jewel_osds
  pgmap v1417867: 704 pgs, 6 pools, 321 GB data, 110 kobjects
  961 GB used, 12431 GB / 13393 GB avail
  704 active+clean
  client io 170 kB/s wr, 0 op/s rd, 24 op/s wr
```

### Checking OSD Compute Node Services

Log on to each OSD Compute node and check the status of all services by executing the following command:

```
sudo systemctl list-units "openstack*" "neutron*" "openvswitch"
```

#### Example command output:

UNIT	LOAD	ACTIVE	SUB	DESCRIPTION
neutron-openvswitch-agent.service	loaded	active	running	OpenStack Neutron Open vSwitch Agent
neutron-ovs-cleanup.service	loaded	active	exited	OpenStack Neutron Open vSwitch Cleanup Utility
neutron-sriov-nic-agent.service	loaded	active	running	OpenStack Neutron SR-IOV NIC Agent
openstack-nova-compute.service	loaded	active	running	OpenStack Nova Compute Server
openvswitch.service	loaded	active	exited	Open vSwitch

LOAD = Reflects whether the unit definition was properly loaded.

ACTIVE = The high-level unit activation state, i.e. generalization of SUB.

SUB = The low-level unit activation state, values depend on unit type.

6 loaded units listed. Pass --all to see loaded but inactive units, too.

To show all installed unit files use 'systemctl list-unit-files'.

## Monitoring AutoDeploy Operations

This section identifies various commands that can be used to determine the status and health of AutoDeploy.

To use them, you must:

1. Log on to the AutoDeploy VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the root user.

```
sudo -i
```

## Viewing AutoDeploy Logs

AutoDeploy logs are available on the AutoDeploy VM in the following directory:

```
/var/log/upstart/autodeploy.log
```

**Important** To access the command used to view logs, you must be logged in to the Confd CLI as the *admin* user on the AutoDeploy VM:

```
confd_cli -u admin -C
```

When prompted, you must enter the *admin* user password.

## AutoDeploy Transaction Logs

Execute the following command to display AutoDeploy transaction logs:

```
show log $TX-ID | display xml
```

### Example VIM-ORCH and VIM Activation Log:

```
2018-01-23 22:01:56,266 - Send Deployment notification for: autoit-instance
2018-01-23 22:08:36,876 - Deployment activate-ns-deployment: autoit initiated
2018-01-23 22:08:36,919 - Send Deployment notification for: autoit-instance
2018-01-23 22:08:36,951 - Deployment activate-ns-deployment: autoit initiated
2018-01-23 22:08:37,004 - Send Deployment notification for: autoit-deploy
2018-01-23 22:08:37,029 - Image '/var/cisco/isos/rhel-server-7.3-x86_64-dvd.iso' exists
2018-01-23 22:08:37,134 - Send Deployment notification for: autoit-instance
2018-01-23 22:08:37,165 - Deployment activate-ns-deployment: autoit started
2018-01-23 22:08:37,181 - Adding NSR: autoit-instance
2018-01-23 22:08:37,215 - Start pipeline of 1 tasks
2018-01-23 22:08:37,257 - Scheduling Task: autoit
2018-01-23 22:08:37,269 - Waiting for all workers to finish the transactions

```

## Checking AutoDeploy Processes

Check the status of AutoDeploy VM by entering the following commands:

```
service autodeploy status
```

```
service uas-confd status
```

## Determining the Running AutoDeploy Version

To display the version of the AutoDeploy software role that is currently operational:

```
show uas
```

**Example output:**

```

uas version                6.0.0
uas state                   active
uas external-connection-point 172.28.185.132
INSTANCE IP      STATE  ROLE
-----

```

```
172.28.185.133 alive CONF-D-MASTER
172.28.185.134 alive CONF-D-SLAVE
```

NAME	LAST HEARTBEAT
AutoDeploy-MASTER	2018-01-24 21:29:54
USPCFMWorker	2018-01-24 21:29:45
USPCHBWorker	2018-01-24 21:29:45
USPCWorker	2018-01-24 21:29:45

## Monitoring AutoIT Operations

This section identifies various commands that can be used to determine the status and health of AutoIT.

To use them, you must:

1. Log on to the AutoIT VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the *root* user.

```
sudo -i
```

## Viewing AutoIT Logs

AutoIT maintains logs containing information pertaining to UAS deployment and termination transactions. The *autoit.log* file is located in the following directory on the Ultra M Manager Node:

```
/var/log/cisco/usp/auto-it/autoit.log
```

### Example Deployment Log:

```
tail -100f /var/log/cisco/usp/auto-it/autoit.log &^C
```

```

## Viewing AutoIT Operational Data

View the AutoIT operational data by executing the following command:

```
show uas
```

### Example show uas Command Output

```

uas version                6.0.0
uas state                   active
uas external-connection-point 172.28.185.132
INSTANCE IP      STATE  ROLE
-----
172.28.185.133  alive  CONFD-MASTER
172.28.185.134  alive  CONFD-SLAVE

NAME                LAST HEARTBEAT
-----
AutoIT-MASTER      2018-01-24 21:24:30
USPCFMWorker        2018-01-24 21:24:30
USPCHBWorker        2018-01-24 21:24:30
USPCWorker          2018-01-24 21:24:30

```

### Important

In case of standalone mode (non-HA) deployments, the *uas external-connection-point* information and *Instance IP* table are not applicable and are not displayed.

## Checking AutoIT Processes

Verify that key processes are running on the AutoIT VM:

With Ubuntu 14.04:

```
service autoit status
```

### Example output:

```
AutoIT is running.
```

Check ConfD.

```
service uas-confd status
```

With Ubuntu 16.04:

```
* autoit.service - Job that runs the autoit daemon
Loaded: loaded (/etc/systemd/system/autoit.service; static; vendor preset: enabled)
Active: active (running) since Fri 2018-09-21 22:11:54 UTC; 1 weeks 0 days ago
Main PID: 1320 (autoit.sh)

## Monitoring AutoVNF Operations

This section identifies various commands that can be used to determine the status and health of AutoVNF.

To use them, you must:

1. Log on to the AutoVNF VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the root user.

```
sudo -i
```

## Viewing AutoVNF Logs

### General AutoVNF Logs

AutoVNF logs are available on the AutoVNF VM in the following file:

```
/var/log/upstart/autovnf.log
```

To collect AutoVNF logs:

1. Navigate to the *scripts* directory.

```
cd /opt/cisco/usp/uas/scripts
```

2. Launch the *collect-uas-logs.sh* script to collect the logs.

```
sudo ./collect-uas-logs.sh
```

#### Example log output:

```
Creating log tarball uas-logs-2017-05-26_00.24.55_UTC.tar.bz2 ...
uas-logs/
uas-logs/autovnf/
uas-logs/autovnf/autovnf_server.log

uas-logs/upstart/ensemble.log

===== Tarball available at: /tmp/uas-logs-2017-05-26_00.24.55.UTC.tar.bz2
=====

To extract the tarball, run: "tar jxf /tmp/uas-logs-2017-05-26_00.24.55.UTC.tar.bz2"

```

## AutoVNF Transaction Logs

AutoVNF server and transaction logs are available on the Ultra M Manager Node in the following directory on the UAS VM:

```
/var/log/cisco-uas/autovnf
```

Inside this directory are transaction sub-directories, VNFD information and NETCONF traces are provided for the given transaction.

### Example:

```

total 3568
drwxr-xr-x 4 root root    4096 May 25 23:31 ./
drwxr-xr-x 7 root root    4096 May 25 19:39 ../
drwxr-xr-x 2 root root    4096 May 25 23:31 579b4546-41a2-11e7-b3ab-fa163eccaffc/
drwxr-xr-x 2 root root    4096 May 25 23:29 a15bf26c-41a1-11e7-b3ab-fa163eccaffc/
-rw-r--r-- 1 root root 3632813 May 26 18:33 audit.log
-rw-r--r-- 1 root root      0 May 25 23:26 autovnf_server.log

cd a15bf26c-41a1-11e7-b3ab-fa163eccaffc
total 2568
drwxr-xr-x 2 root root    4096 May 25 23:29 ./
drwxr-xr-x 4 root root    4096 May 25 23:31 ../
-rw-r--r-- 1 root root 2614547 May 25 23:37 netconf_traces
-rw-r--r-- 1 root root      0 May 25 23:29 vnfd

```

## AutoVNF Event Logs

Event logs provide useful information on UAS task progress. These logs are located in the *autovnf.log* file within the following directory on the UAS VM:

```
/var/log/upstart
```

Event logs are filed by transaction ID. To view transaction IDs:

1. Log in to the ConfD CLI as the *admin* user.

```
confd_cli -u admin -C
```

2. Enter the *admin* user password when prompted.
3. List the transactions.

#### show transactions

#### Example output:

TX ID	STATUS	TX TYPE	DEPLOYMENT ID	TIMESTAMP
562c18b0-4199-11e7-ad05-fa163ec6a7e4		vnf-deployment	vnfd2-deployment	
2017-05-25T22:27:28.962293-00:00		deployment-success		
abf51428-4198-11e7-ad05-fa163ec6a7e4		vnfm-deployment	ab-auto-test-vnfm2	
2017-05-25T22:22:43.389059-00:00		deployment-success		

To view the logs associated with a specific transaction:

#### show log <transaction\_id> | display xml

#### Example log pertaining to VNFM deployment:

```
<config xmlns="http://tail-f.com/ns/config/1.0">

## Viewing AutoVNF Operational Data

AutoVNF maintains history information for all transactions, associated events, and related error/information logs in persistent storage. These logs are useful for monitoring deployment progress and for troubleshooting issues.

These logs can be retrieved at time using the “task-id” returned as well as by running ConfD “show” commands.

To access these commands, you must be logged in to the ConfD CLI as the *admin* user on the AutoVNF VM:

```
confd_cli -u admin -C
```

When prompted, enter the *admin* user password.

[Table 2: ConfD Log Descriptions, on page 49](#) provides a list of the available commands and describes the information in the output.

**Table 2: ConfD Log Descriptions**

ConfD Command	Purpose
In releases prior to 6.0: <b>show autovnf-oper:errors</b> In 6.0 and later releases: <b>show uas</b>	Displays a list of any deployment errors that may have occurred.
In releases prior to 6.0: <b>show autovnf-oper:logs   display xml</b> In 6.0 and later releases: <b>show log   display xml</b>	Displays log messages for AutoVNF transactions.
In releases prior to 6.0: <b>show autovnf-oper:network-catalog</b> In 6.0 and later releases: <b>show vnf-packager</b>	Displays information for the networks deployed with USP.
In releases prior to 6.0: <b>show autovnf-oper:transactions</b> In 6.0 and later releases: <b>show transaction</b>	Displays a list of transaction IDs that correspond to the USP deployment along with their execution date, time, and status.

ConfD Command	Purpose
In releases prior to 6.0: <b>show autovnf-oper:vdu-catalog</b>  In 6.0 and later releases: <b>show vnfr</b>	Displays information pertaining to the virtual descriptor units (VDUs) used to deploy USP.
In releases prior to 6.0: <b>show autovnf-oper:vip-port</b>  In 6.0 and later releases: <b>show vnfr</b>	Displays information port, network, and virtual IP addresses information.
In releases prior to 6.0: <b>show autovnf-oper:vnfm</b>  In 6.0 and later releases: <b>show vnfr</b>	Displays information pertaining to the VNFM deployment and UEM VM deployment.
<b>show confd-state</b>	Displays information pertaining to confd-state on AutoVNF.
<b>show confd-state ha</b>	Displays information pertaining to HA specific confd-state on AutoVNF.
<b>show log &lt;transaction_id&gt;</b>	Displays detailed log information for a specific transaction ID.
<b>show running-config</b>	Displays the configuration running on the AutoVNF.
<b>show uas</b>	Displays information pertaining to the AutoVNF VM deployment.
In releases prior to 6.0: <b>show usp</b>  In 6.0 and later releases: <b>show vnfr</b>	Displays information pertaining to the overall USP VM deployment.

**NOTES:**

- Log information can be saved out of ConfD to a file for later retrieval using one of the following commands:

```
show log transaction_id | save url
```

OR

```
show autovnf-oper: command | save url
```

Where *transaction\_id* is a specific ID, *url* is a valid directory path, and *command* is one of the command operators identified in [Table 2: ConfD Log Descriptions, on page 49](#).

## Example show confd-state Command Output

### show confd-state

```

10.2.3.11 alive  CONFD-SLAVE

```

NAME	LAST HEARTBEAT
AutoVNF-MASTER	2018-01-20 02:35:03
ESCHearBeatMonitor-fremont-autovnf-vpc	2018-01-20 02:35:00
USPCFMWorker	2018-01-20 02:34:51
USPCHBWorker	2018-01-20 02:35:00
USPCWorker	2018-01-20 02:35:00

**Important**

In this example, 10.2.3.6 is the confd-master and the active UAS VM.

**Important**

In case of standalone mode (non-HA) deployments, the *uas external-connection-point* information and *Instance IP* table are not applicable and are not displayed.

Example output that shows the floating IP for AutoVNF:

```
-SNIP-
nsd autoit

## UAS Log Collection

The UAS generates and consolidates a comprehensive set of UAS logs and VNF diagnostic information from StarOS device for troubleshooting purposes. The log collection includes logs from all components in a deployed UAS cluster, i.e. from AutoIT, AutoDeploy, AutoVNF, UEM, ESC and StarOS.

This section describes the following topics:

- [Feature Description, on page 60](#)
- [Limitations, on page 60](#)
- [Collecting the UAS Logs, on page 60](#)
  - [Via the ConfD CLI Command, on page 60](#)
  - [Via the Standalone Script, on page 61](#)
- [Collecting VNF Diagnostic Information, on page 64](#)
- [Sample Logs, on page 64](#)

## Feature Description

Automation of UAS log collection is facilitated through the use of ConfD CLI command **collect-logs**. When this command is executed, the logs from all or required components can be collected and copied to a common location.

## Limitations

The following limitations exist with the UAS log collection feature.

- With the use of ConfD CLI approach, it is not possible to collect logs for AutoDeploy and AutoIT. To aggregate logs for these two components, use the standalone script.
- Direct collection of logs from CF, SF, UP instances is not supported. If VNFDs corresponding to these instances are invoked directly, appropriate error message will be recorded in the log file of AutoDeploy and AutoVNF.

## Collecting the UAS Logs

The UAS logs can be collected using one of the following approaches:

- [Via the ConfD CLI Command, on page 60](#)
- [Via the Standalone Script, on page 61](#)

### Via the ConfD CLI Command

UAS logs collection is automated through a remote procedure call (RPC) executed from the ConfD command line interface (CLI). The RPC “collect-logs” has been introduced to collect logs from the AutoVNF, ESC and UEM.

This command, on execution, fetches the logs from components under given NSD and VNFD levels in a deployed setup and creates a final consolidated tar ball comprising all logs.

#### Important

When the ConfD CLI command is used, the log collection for AutoDeploy and AutoIT components is not supported.

This command can be invoked from ConfD CLI of AutoDeploy and AutoVNF.

#### Important

The IP and credentials of instances are fetched from oper data of AutoDeploy/AutoVNF. So, the logs can be collected for instances whose VNFR is present in oper db.

To collect the UAS logs via ConfD CLI:

1. Login to the ConfD CLI as the *admin* user on the AutoDeploy VM or AutoVNF VM.

```
confd_cli -u admin -C
```

2. Enter the *admin* user password when prompted.

- Execute the following command:

```
collect-logs nsd-id <nsd id>
```

This command collects logs from all components present under given NSD and also from deploy-nsd if present.

To collect logs by VNFD ID, use the following command:

```
collect-logs nsd-id <nsd id> vnfd vnf id
```

This command collects logs from components specific to the given VNFD. Additionally, under given vnf, corresponding AutoVNF logs of the given NSD will also be collected in case of RPC invoked from AutoDeploy (outside AutoVNF).

For example, if VNFD of ESC, or UEM is invoked from AutoDeploy, the corresponding AutoVNF logs of given VNFD will also be collected, since log collection happens through respective AutoVNF in case of multiple AutoVNFs deployed through a single AutoDeploy.

The vnf-diags from StarOS instances will be collected along with the UEM logs.

- View the status of log collection using the AutoDeploy or AutoVNF logs under `/var/log/upstart/` based on where it is invoked.

If invoked from AutoDeploy, the RPC internally connects with AutoVNF and collects logs from UAS instances. The respective progress can be viewed from AutoVNF log.

- Untar the `autocollect_logs.tgz` file to extract the collected logs.

```
tar -zxvf autocollect_logs.tgz
```

Note that the output consolidated tar ball `autocollect_logs.tgz` is created under `/var/log/autocollect/` directory of the instance (AutoDeploy/AutoVNF) from where the log collection RPC was invoked.

### Important

Every time the log collection is triggered, the `/var/log/autocollect` directory will be automatically cleaned and then new logs will be copied.

Example output:

```
vnf-logs/
vnf-logs/em/
vnf-logs/em/abc-vnf-vnf1-em-rmuruga-em1-1-em-logs-2018-08-09_06.41.25.UTC.tar.bz2
vnf-logs/em/abc-vnf-vnf1-em-rmuruga-em1-2-em-logs-2018-08-09_06.40.35.UTC.tar.bz2

vnf-logs/esc/
vnf-logs/esc/esc_log_abc-vnf-vnf1-esc-rmuruga-esc-2_2018-08-09_06.40.15.UTC.tar.bz2
vnf-logs/esc/esc_log_abc-vnf-vnf1-esc-rmuruga-esc-1_2018-08-09_06.39.42.UTC.tar.bz2
```

## Via the Standalone Script

The UAS uses a standalone script "`collect_all_uas_logs.py`" to generate and consolidate a comprehensive set of UAS logs and VNF diagnostic information from StarOS device for troubleshooting purposes.

Before using this script, you should be aware of the following:

- AutoVNF IP and SSH credentials (username and password)

- AutoVNF NETCONF login credentials
- Login credentials for UEM and ESC
- Login credentials for AutoIT and AutoDeploy

This script is available in the AutoIT, AutoDeploy and AutoVNF VMs in the `/opt/cisco/usp/uas/scripts/` directory.

A sample yaml file (`sample_config.yaml`) is present in the same directory along with the script. The yaml file should be updated with proper IP and credential details.

Example configuration of `sample_config.yaml` file:

```
uas-cluster:
  autovnf:
    172.21.201.237:
      autovnf:
        login:
          user: ubuntu
          password: Cisco@123
        netconf:
          user: admin
          password: Cisco@123
  .
  .
  .
```

---

### Important

You can exclude AutoDeploy or AutoIT for log collection by commenting out the phrase ‘autodeploy’ or ‘autoit’ using ‘#’ in the yaml file.

For example:

```
#autodeploy:
```

---

To collect the UAS logs via the standalone script:

1. Log on to the AutoDeploy, AutoIT or AutoVNF VM using the user credentials specified during deployment.
2. Navigate to the `scripts` directory.

```
cd /opt/cisco/usp/uas/scripts
```

3. Edit the `sample_config.yaml` file using a standard text editor to update the appropriate credential details and save it.
4. Launch the `collect_all_uas_logs.py` script to collect the logs.

```
sudo ./collect_all_uas_logs.py - -cfgfile sample_config.yaml
```

The script starts collecting the logs and the progress is displayed on the console. Upon completion, a final tar file `autocollect_logs.tgz` will be copied to `/var/log/autocollect/` directory.

Detailed logs are stored in a log file named `autocollect.log` under the `/var/log/autocollect/` directory.

---

### Note

The logs directory will be cleared and re-created for every execution of the script.

---

Example output:

```
sudo ./collect_all_uas_logs.py --cfgfile sample_config.yaml
2018-07-26 08:52:57,273 - Uas-cluster present in config
2018-07-26 08:52:57,273 - .....Executing step 1 of 4.....
2018-07-26 08:52:57,273 - Collecting logs from uas instances
2018-07-26 08:53:06,530 - Logs collected successfully from esc 48.48.48.24

2018-07-26 08:54:25,848 - Collecting logs from Autodeploy 10.225.202.64
2018-07-26 08:54:26,454 - Logs collected successfully for instance 10.225.202.64
2018-07-26 08:54:26,454 - .....Executing step 4 of 4.....
2018-07-26 08:54:26,454 - Generating consolidated final tar file
2018-07-26 08:54:26,499 - Log collection script completed. Please collect the tar file
'autocollect_logs.tgz' under /var/log/autocollect/
```

5. Extract the contents of *autocollect\_logs.tgz* file using the following command:

```
tar -zxvf autocollect_logs.tgz
```

The following are the contents of the *autocollect\_logs.tgz* tar file:

- .bz2 files for each AutoDeploy and AutoIT logs
- Two log files — *autocollect.log* for AutoDeploy logs and *autocollect-vnf\_<autovnf ip>.log* for logs collected from AutoVNF and its instances.

---

**Important** In case of failures of any UAS cluster nodes, check the *autocollect-vnf\_<autovnf ip>.log* for the detailed error message.

---

- *uas\_logs\_<autovnf ip>.tgz* — This file comprises tar bundles for the UAS cluster.

When the *uas\_logs\_<autovnf ip>.tgz* tar file is extracted, a *vnf-logs* directory is created with individual sub-directories for *em*, *esc*, and *autovnf* for storing the corresponding collected tar file contents.

If the VNF diagnostic log files are unavailable in the *diags* directory under *em*, you can use **vnf-collect-diags** RPC command from UEM VM to collect the logs. For information on collecting logs through the RPC, see the [Collecting VNF Diagnostic Information, on page 64](#) section.

The logs collected through the RPC are also stored in the *diags* directory under *em* directory.

6. Verify that files have been extracted.

```
ls -lt
```

Example output:

```
total 2488
```

```
-rw-r--r-- 1 root root 1174824 Jul 26 08:54 uas_logs_10.225.202.93.tgz
-rw-r--r-- 1 root root 43113 Jul 26 08:54
auto-it-5571-cups-1-uas-logs-2018-07-26_08.54.25.UTC.tar.bz2
-rw-r--r-- 1 root root 3197 Jul 26 08:54 autocollect-vnf_10.225.202.93.log
-rw-r--r-- 1 root root 47104 Jul 26 08:54
auto-deploy-5571-cups-1-uas-logs-2018-07-26_08.54.26.UTC.tar.bz2
-rw-r--r-- 1 root root 3488 Jul 26 08:54 autocollect.log
-rw-r--r-- 1 root root 1266857 Jul 26 08:54 autocollect_logs.tgz
```

## Collecting VNF Diagnostic Information

The VNF diagnostic information can also be collected through the use of **vnf-collect-diags** RPC command in UEM VM.

To collect the diagnostic information from StarOS device:

1. Log on to the master UEM VM.
2. Access the NCS CLI.

```
sudo -i
ncs_cli -u admin -C
```

3. Execute the following command to collect VNF diagnostic logs from StarOS device.

```
vnf-collect-diags [ correlator <correlator id> vnfd <vnfd-id> ]
```

This command collects the VNF diagnostic log files and makes it available in the `/var/log/em/diags-<correlator id>` directory.

4. Check the per-VNF diagnostic collection status using the following command:

```
show vnf-collect-diags-status
```

Example output:

```
NAME                                STATUS
-----
xyz_autovnf-cups-c-abc  in-progress
```

## Sample Logs

This section provides a few sample log files.

### AutoDeploy Log:

```
2018-08-09 06:40:10,385 - Deployment uas-log-collection: autoit initiated

2018-08-09 07:00:11,520 - Send Deployment notification for: abc-vnf-instance

```

# Secure File Transfer

## Feature Description

UAS provides **upload-file** RPC in ConfD to transfer a file or an image to the VNFC components under given NSD and VNFD levels in a deployed setup.

This command can be invoked from ConfD CLI of AutoDeploy and AutoVNF.

### Important

Though the **upload-file** command can be invoked from AutoDeploy and AutoVNF, it is highly important that the **nsd-id** must be specified as AutoVNF name only.

## Limitations

The file transfer cannot be initiated to the components with following vnf-types — UEM, USP-UAS, ESC. That is, if **esc** is specified as **vnfd** in the **upload-file** command, then the file cannot be transferred to ESC.

## How it Works

Perform the following procedure to transfer a file or an image to the VNFs.

1. Log on to AutoDeploy VM or AutoVNF VM as the default user, *ubuntu*.
2. Switch to the *root* user.

```
sudo su
```
3. Enter the ConfD CLI.

```
confd_cli -C -u admin
```

4. Enter the *admin* user password when prompted.
5. Initiate the file transfer to the VNFs using the following command:

For AutoDeploy:

```
nsd:upload-file nsd-id <nsd id> vnfd <vnfd name> source <path of the file>
destination < path >
```

For AutoVNF:

```
upload-file nsd-id <nsd id> vnfd <vnfd name> source <path of the file>
destination < path >
```

Notes:

- The **nsd-id** must always be specified as AutoVNF name.
- **vnfd** is an optional parameter in this configuration. This parameter must be alpha and/or numeric characters, and it accepts more than one value as an input. For example: [ vpc1 ], [ vpc1 vpc2 vpc3 ].
- If **vnfd** is specified in the **upload-file** command and it is a valid VNFD, the file or image is transferred successfully. For the list of invalid or unsupportedVNFDs, see the [Limitations, on page 66](#).
- If **vnfd** is not specified in the **upload-file** command, then the file or image is transferred only to the valid VNFDs in the given NSD deployment.
- If the command includes a single invalid VNFD, the file transfer will not be executed and an error indicating invalid argument in AutoDeploy is displayed. For the list of invalid or unsupportedVNFDs, see the [Limitations, on page 66](#).

Command example:

```
nsd:upload-file nsd-id abc-autovnf vnfd [ vpc ] source
/home/ubuntu/x.cfg destination /sftp
```

6. Monitor the progress of the file transfer operation.

```
show transaction <transaction-id>
```

*transaction\_id* is the ID displayed as a result of the **upload-file** command executed in the previous step.

Example command output:

```
show transaction 15407
TX ID      TX TYPE  DEPLOYMENT ID      TIMESTAMP                      STATUS  STATUS  DETAIL
15407 upload-file  vnf-autovnf 2018-10-29T05:43:47.666386-00:00 error  -
```

Also, view the logs associated with a specific transaction.

```
show log <transaction-id>
```

## Monitoring File Transfer Operations

AutoDeploy and AutoVNF maintain logs for all transactions in persistent storage. The status/progress of file transfer can be viewed in AutoDeploy/AutoVNF logs archived under */var/log/upstart/* based on where it is invoked.

If invoked from AutoDeploy, then RPC internally connects with AutoVNF and performs the file transfer. The respective progress can be viewed through the AutoVNF logs.

To view the logs associated with a specific transaction:

```
show log <transaction-id>
```

### Sample AutoDeploy Logs:

```
2018-10-26 16:12:30,156 - allowed-address-pair: 90.90.90.0/24 on eth0
2018-10-26 16:12:30,163 - Adding pre-created network: suneduvv-orch into catalog

```

# Monitoring VNFM Operations

**Note** The Cisco Elastic Services Controller (ESC) is the only VNFM supported in this release.

## Viewing ESC Status

ESC status can be viewed from the ESC command line or by executing a REST API from AutoVNF.

### Monitoring Status Through the ESC Command Line

Log on to the primary ESC VM and execute the following command from the command line:

```
escadm status
```

**Example command output:**

```
0 ESC status=0 ESC Master Healthy
```

### Monitoring Status Through an AutoVNF API

Log on to the master AutoVNF VM and execute the following command:

```
curl -u admin:<password> -k https://<master_vnfm_address>:60000/esc/health
```

**Example command output:**

```
{"message": "ESC services are running.", "status_code": "2000"}
```

Status code and message display information about ESC health conditions as identified in [Table 3: ESC Status Code Messages, on page 71](#). Status codes in the 2000s imply ESC is operational, 5000 status codes imply at least one of the ESC components is not in service.

**Table 3: ESC Status Code Messages**

Code	Message
2000	ESC services are running
2010	ESC services are running. ESC High-Availability node not reachable.
2020	ESC services are running. One or more VIM services (keystone, nova) not reachable.*
2030	ESC services are running. VIM credentials not provided.
2040	ESC services running. VIM is configured, ESC initializing connection to VIM.
2100	ESC services are running. ESC High-Availability node not reachable. One or more VIM services ( nova ) not reachable
5010	ESC service ESC_MANAGER not running.

Code	Message
5020	ESC service CONFD not running.
5030	ESC service MONA not running.
5040	ESC service VIM_MANAGER not running.
5090	More than one ESC service (confd, mona) not running.**

## Viewing ESC Health

ESC health can be viewed by logging on to the primary ESC VM and executing the following command from the command line:

**health.sh**

**Example command output:**

```

esc ui is disabled -- skipping status check
esc_monitor start/running, process 840
esc_mona is up and running ...
vimmanager start/running, process 2807

vimmanager start/running, process 2807
esc_confid is started
tomcat6 (pid 2973) is running... [ OK ]
postgresql-9.4 (pid 2726) is running...
ESC service is running...
Active VIM = OPENSTACK
ESC Operation Mode=OPERATION

/opt/cisco/esc/esc_database is a mountpoint
===== ESC_HA (MASTER) with DRBD =====
DRBD_ROLE_CHECK=0
MNT_ESC_DATABASE_CHECK=0
VIMMANAGER_RET=0
ESC_CHECK=0
STORAGE_CHECK=0
ESC_SERVICE_RET=0
MONA_RET=0
ESC_MONITOR_RET=0
=====
ESC HEALTH PASSED

```

## Viewing ESC Logs

ESC logs are available on the VNF VM in the following directory:

*/var/log/esc/*

Two levels of logs are available for ESC:

- [ESC Logs, on page 73](#)
- [ESC YANG Logs, on page 74](#)

Refer also to the ESC user documentation for additional information on monitoring and maintaining the software.

## ESC Logs

To collect ESC logs:

1. Log on to the primary VNF VM.
2. Navigate to the scripts directory.  
**cd /opt/cisco/esc/esc-scripts**
3. Launch the *collect-esc-logs.sh* script to collect the logs.  
**sudo ./collect-esc-logs.sh**

### Example log output:

We trust you have received the usual lecture from the local System Administrator. It usually boils down to these three things:

```
#1) Respect the privacy of others.
#2) Think before you type.
#3) With great power comes great responsibility.
```

```
[sudo] password for admin: Creating log tarball:

Warning: tar completed with status: 1

Tarball file: /var/tmp/esc_log-2017-05-25_18.09.31.UTC.tar.bz2
Symbolic link: /tmp/esc_log-2017-05-25_18.09.31.UTC.tar.bz2

Suggestions:
1. Transfer the tarball file from the esc vm
2. Remove the tarball and symbolic link (to save ESC disk space):
   sudo rm /var/tmp/esc_log-2017-05-25_18.09.31.UTC.tar.bz2
   sudo rm /tmp/esc_log-2017-05-25_18.09.31.UTC.tar.bz2
3. Command to list contents of tarball:
   tar jtvf esc_log-2017-05-25_18.09.31.UTC.tar.bz2
4. Command to extract from the tarball:
   tar jxf esc_log-2017-05-25_18.09.31.UTC.tar.bz2

```

## ESC YANG Logs

ESC YANG logs are stored in the following file:

```
/var/log/esc/yangesc.log
```

# Monitoring VNF Operations

## Viewing UEM Service Status

1. Log on to the master UEM VM as the user *ubuntu*.
2. Access the NCS CLI.  
*/opt/cisco/usp/packages/nso/ncs-4.1.1/bin/ncs\_cli -C -u admin*
3. Check the NCS state.

```
show ncs-state ha
```

**Example command output:**

```
ncs-state ha mode master
ncs-state ha node-id 3-1501714180
ncs-state ha connected-slave [ 4-1501714262 ]
```

4. Display the health of cluster.

```
show ems
```

**Example command output:**

EM ID	SLA	SCM	VNFM PROXY	VERSION
3	UP	UP	UP	5.7.0
6	UP	UP	UP	5.7.0

**Important**

The UEM services will no longer run on the slave UEM to simplify troubleshooting, maintenance, and synchronization related issues.

## Viewing UEM Logs

To collect UEM logs:

1. Navigate to the *scripts* directory.

```
cd /opt/cisco/em-scripts
```

2. Launch the *collect-em-logs.sh* script to collect the logs.

```
sudo ./collect-em-logs.sh
```

**Example log output:**

```
Collecting Zookeeper nodes...

===== Tarball available at: /tmp/em-logs-2017-05-26_00.37.28.UTC.tar.bz2
=====

To extract the tarball, run: "tar jxf /tmp/em-logs-2017-05-26_00.37.28.UTC.tar.bz2"

```

## Viewing UEM Zookeeper Logs

The UEM maintains logs on the Zookeeper process. The logs are located in the following directories:

```

/var/log/em/zookeeper/zookeeper.log
/var/log/em/zookeeper/zookeeper.out

```

For logs from 3rd Zookeeper instance, check the following directories:

```

/var/log/em/zookeeper/arbiter/zookeeper.log
/var/log/em/zookeeper/arbiter/zookeeper.out

```

To collect the contents of UEM Zookeeper database, use the following command:

```
sudo ./collect-em-logs.sh -add-zookeeper
```

If "new -add-zookeeper" flag is specified, then by default, zookeeper data is collected in a single file named *zk\_data*.

For a larger deployment, Zookeeper content can be collected in sub-folders. To collect the Zookeeper content in sub-folders, specify "-tree-output" flag as shown in the following command:

```
sudo ./collect-em-logs.sh -add-zookeeper -tree-output
```

When this command is executed, Zookeeper contents are collected under *zk\_data* directory.

## Viewing VNF Information through the Control Function

Information on the VNF deployment can be obtained by executing commands on the Control Function (CF) VNFC. To access the CF CLI:

1. Open an SSH connection to the IP address of the management interface associated with CF1.
2. Press **Enter** to bring up the log in prompt.
3. Enter the username and password.
4. At the Exec mode prompt, enter each of the following commands and observe the results to ensure that the VNF components have been properly deployed according to the desired configuration:

Command	Purpose
<b>show card table</b>	Displays all VM types (e.g. CF, SF, NF, and AF) that have been deployed.
<b>show crash list</b>	Displays software crash events records and associated dump files (minicore, NPU or kernel) for all crashes or a specified crash event. Verify that there are no new or unexpected crashes listed.

Command	Purpose
<b>show emetrl vdu list</b>	Displays card to VM mappings for the VNF. Each card should have a valid universally unique identifier (UUID).
<b>show rct stats</b>	Displays statistics associated with Recovery Control Task (RCT) events, including migrations, switchovers and shutdowns. RCT statistics are associated with card-to-card session recovery activities.
<b>show session progress</b>	Displays session progress information for the current context filtered by the options specified. Check for any active or new calls before proceeding with a deactivation.
<b>show version verbose</b>	Displays the software version that has been deployed.
<b>show vdu summary</b>	Displays general information pertaining to the virtual descriptor units (VDUs) that have been deployed.
In releases prior to 6.0: <b>show usf vdu all</b> In 6.0 and later releases: <b>show vnfr vdu all</b>	Displays detailed information for the VDUs that have been deployed for the USF VDU.
In releases prior to 6.0: <b>show usf vdu-group all</b> In 6.0 and later releases: <b>show vnfr vdu-group all</b>	Displays information for VDU groups pertaining to the USF VNF use case (if deployed).
In releases prior to 6.0: <b>show usf network-path all</b> In 6.0 and later releases: <b>show vnfr network-path all</b>	Displays network path information for USF VNF components (if deployed).
In releases prior to 6.0: <b>show usf service-function-chain all</b> In 6.0 and later releases: <b>show vnfr service-function-chain all</b>	Displays SFC information for the USF VNF (if deployed).

## Monitoring and Recovering AutoVNF Through AutoIT

AutoIT provides the ability to monitor and auto-recover AutoVNF instances.

This functionality is enabled through configuration of the AutoVNF VNFC(s) at the time of deployment. Once enabled, AutoIT automatically monitors for faults/failures of the AutoVNF VNFC(s) for which the functionality is enabled. If a fault/failure is detected, AutoIT automatically attempts to auto-heal/recover (redeploy) the VNFC(s).

**Important** The Provisioning Network (floating) IP address is required to leverage the health monitoring functionality.

The following parameters must be configured at the VNFC-level:

**Table 4: Health Check Descriptor Parameters**

Parameter	Required	Type	Description
enabled	O	bool	Enable/Disable health monitoring.
probe-frequency	O	uint16	Health Check Frequency in seconds. UAS uses this as health probe time, meaning every polling interval UAS will invoke health check. Default value is 10 seconds.
probe-max-miss	O	uint16	Maximum number of health probe misses before VNFC instance is declared dead. Default value is 6.
recovery-type	O	choice string	Recovery type. It can be one of the following: <ul style="list-style-type: none"> <li>• restart: Recovery only by restarting, move the VNFC instance to error after max retries</li> <li>• external: Recovery performed by external entity. No auto-recovery</li> <li>• restart-then-redeploy: Restart the VM on failure. After maximum retries, redeploy the failed VNFC instances.</li> </ul> Default value is restart-then-redeploy.
retry-count	O	uint16	Number of retries to recover the VNFC Instance. Default value is set to restart-then-redeploy.
boot-time	O	uint16	Initial Bootup time for the VNFC. Default value is 300 seconds.
script	O	string	Script to check VNFC health, by default UAS ICMP script will be used.

The above parameters are configured at the VNFC-level within the VNF descriptor information that is part of the deployment network service descriptor (NSD) as shown in the following example configuration:

```
nsd <nsd_name>
...
  vnfd <autovnf_vnfd_name>
...
```

```
vnfc <autovnf_vnfc_name>
  health-check enabled
  health-check probe-frequency 10
  health-check probe-max-miss 6
  health-check retry-count 6
  health-check recovery-type restart-then-redeploy
  health-check boot-time 300
...
```

Refer to the *Cisco Ultra Services Platform NETCONF API Guide* for more information on the use of these and other parameters related to VNF configuration and deployment.

In the event that automatic recovery is not possible, an API is available to manually recover the VNFC(s).

VNFC status can be viewed by executing the **show vnfr** command from AutoIT. Additional details can be found in the transaction logs for the deployment.

To manually recover a failed AutoVNF VNFC, execute the following command:

```
recover nsd-id <nsd_name> vnfd <vnfd_name>
```

## Monitoring and Recovering VNFC Through AutoVNF

The UEM, CF, and SF VNFCs were autorecovered through the VNFM (ESC). In these situations, AutoVNF was not informed of these events. With this release, the AutoVNF monitors these VNFC VMs and can auto-recover them if required. Additionally, the AutoVNF can also monitor the VNFM (ESC) VMs and provide auto-recovery as needed.

This functionality is enabled through configuration of the VNFC(s) at the time of deployment. Once enabled, AutoVNF automatically monitors for faults/failures of the VNFCs for which the functionality is enabled. If a fault/failure is detected, AutoVNF automatically attempts to auto-heal/recover (redeploy) the VNFC(s).

### Important

The Provisioning Network (floating) IP address is required to leverage the health monitoring functionality.

This functionality is currently only supported for the following VNFCs:

- VNFM (ESC)
- UEM
- CF
- SF

### Important

Ultra M Manager sends fault notification when VMs are down and/or recovered.

The following parameters must be configured at the VNFC-level:

**Table 5: Health Check Descriptor Parameters**

Parameter	Required	Type	Description
enabled	O	bool	Enable/disable health monitoring.

Parameter	Required	Type	Description
probe-frequency	O	uint16	Health Check Frequency in seconds. UAS uses this as health probe time, meaning every polling interval UAS will invoke health check. Default value is 10 seconds.
probe-max-miss	O	uint16	Maximum number of health probe misses before VNFC instance is declared dead. Default value is 6.
recovery-type	O	choice string	Recovery type. It can be one of the following: <ul style="list-style-type: none"> <li>• restart: Recovery only by restarting, move the VNFC instance to error after max retries</li> <li>• external: Recovery performed by external entity. No auto-recovery</li> <li>• restart-then-redeploy: Restart the VM on failure. After maximum retries, redeploy the failed VNFC instances.</li> </ul> Default value is restart-then-redeploy.
retry-count	O	uint16	Number of retries to recover the VNFC Instance. Default value is set to restart-then-redeploy.
boot-time	O	uint16	Initial bootup time for the VNFC. Default value is 300 seconds.
script	O	string	Script to check VNFC health, by default UAS ICMP script will be used.

The above parameters are configured at the VNFC-level within the VNF descriptor information that is part of the deployment network service descriptor (NSD) as shown in the following example configuration:

```
nsd <nsd_name>
...
vnfd <autovnf_vnfd_name>
...
vnfc <vnfm_vnfc_name>
health-check enabled
health-check probe-frequency 10
health-check probe-max-miss 6
health-check retry-count 6
health-check recovery-type restart-then-redeploy
health-check boot-time 300
...
vnfc <uem_vnfc_name>
health-check enabled
health-check probe-frequency 10
health-check probe-max-miss 6
health-check retry-count 6
health-check recovery-type restart-then-redeploy
health-check boot-time 300
...
vnfc <cf_vnfc_name>
```

```

health-check enabled
health-check probe-frequency 10
health-check probe-max-miss 6
health-check retry-count 6
health-check recovery-type restart-then-redeploy
health-check boot-time 300
...
vnfc <sf_vnfc_name>
health-check enabled
health-check probe-frequency 10
health-check probe-max-miss 6
health-check retry-count 6
health-check recovery-type restart-then-redeploy
health-check boot-time 300
...

```

Refer to the *Cisco Ultra Services Platform NETCONF API Guide* for more information on the use of these and other parameters related to VNF configuration and deployment.

In the event that automatic recovery is not possible, an API is available to manually recover the VNFC(s).

VNFC status can be viewed by executing the **show vnfr** command from AutoIT. Additional details can be found in the transaction logs for the deployment.

To manually recover a failed VNFC, execute the following command:

```
recover nsd-id <nsd_name> vnfd <vnfd_name>
```

## Troubleshooting Deactivation Process and Issues

### NOTES:

- The deactivate process is idempotent and can be multiple times and without error. The system will retry to remove any resources that remain.
- If a deactivation fails (a transaction failure occurs), look at the logs on various UAS software components (AutoDeploy, AutoIT, and AutoVNF), VNFM (ESC), and UEM.
- If deactivation has failed, you must ensure that a clean up is performed either using automation tools or manually if necessary.
- Activation must not be reattempted until all of the previous artifacts have been removed.

## Deactivation Fails Due to Communication Errors with AutoVNF

### Problem Description

During the AutoVNF deactivation process, AutoDeploy indicates that it is unable to deactivate the AutoVNF. This is observed through:

- AutoDeploy transaction log
- AutoDeploy upstart log

### Possible Cause(s)

- AutoDeploy is not able to communicate with AutoVNF.

**Action(s) to Take**

- Check network connectivity between the AutoDeploy VM and the AutoVNF VIP.
- Check the management and orchestration network.
- Address any connectivity issues.

**Next Steps**

- Once connectivity issues are addressed, perform the deactivate procedure again.

## Deactivation Fails Because AutoDeploy Generates an Exception

**Problem Description**

AutoDeploy generates an exception error during the deactivation process.

**Possible Cause(s)**

- Connectivity issues
- Configuration issues
- OpenStack/VIM specific issues
- Hardware issues

**Action(s) to Take**

1. Capture logs from `/var/log/upstart/autodeploy.log` along with exception error message.
2. Log on to AutoIT and collect the logs from `/var/log/upstart/autoit.log` along with the exception message, if any.
3. Log on to VIP of the active (master) AutoVNF VM and perform a cleanup by running the **deactivate** command from there.
  - a. Log on to the AutoVNF VM as the default user, `ubuntu`.
  - b. Switch to the root user.
 

```
sudo su
```
  - c. Enter the ConfD CLI.
 

```
confd_cli -C -u admin
```
  - d. Enter the `admin` user password when prompted.
  - e. Deactivate the deployment.
 

```
deactivate nsd-id <nsd_name>
```
4. Check the last transaction log to verify that the deactivation was successful. (Transactions are auto-sorted by timestamp, so it should be the last one in the list.)

**Example commands and outputs:**

```
show transactions
```

TX ID	TX TYPE	ID	TIMESTAMP	STATUS
DETAIL				
1500605583-055162 deployment-failed	vnf-deployment -	dep-5-5	2017-07-21T02:53:03.055205-00:00	
1500606090-581863 deployment-success	vnf-deployment -	dep-5-5	2017-07-21T03:01:30.581892-00:00	
1500606127-221084 deployment-success	vnf-deployment -	dep-5-5	2017-07-21T03:02:07.221114-00:00	

```

show log 1500606127-221084 | display xml
<config xmlns="http://tail-f.com/ns/config/1.0">
  <log xmlns="http://www.cisco.com/usp/nfv/usp-autovnf-oper">
    <tx-id>1500606127-221084</tx-id>
    <log>2017-07-21 03:02:07,276 - Notify deployment
2017-07-21 03:02:07,297 - Connection to VNFM (esc) at 172.16.181.107
2017-07-21 03:02:07,418 - NETConf Sessions (Transaction/Notifications) established
...

```

- Manually delete the AutoDeploy VM using the information in [Terminating the AutoDeploy VM, on page 2](#).

#### Next Steps

- Open a support case providing all of the log information that was collected.

## Deactivation Fails Because of AutoVNF-VNFM Communication Issues

### Problem Description

During the AutoVNF deactivation process, AutoVNF indicates that it is unable to deactivate the VNFM. This is observed through:

- AutoVNF transaction log
- AutoVNF upstart log

### Possible Cause(s)

- AutoVNF is not able to communicate with the VNFM.

### Action(s) to Take

- Check network connectivity between the master AutoVNF VM and the VNFM VIP.
- Check the management and orchestration network.
- Address any connectivity issues.

### Next Steps

- Once connectivity issues are addressed, perform the deactivate procedure again.

## Deactivation Fails Because of Issue at VNFM

### Problem Description

During the AutoVNF deactivation process, the VNFM returns an error. This is observed through:

- AutoVNF transaction log
- AutoVNF upstart log
- ESC logs

#### Possible Cause(s)

- ESC health is not good due to an issue or network connectivity.
- ESC is not able to communicate with the VIM.
- ESC has an internal error.
- AutoVNF is unable to create/delete OpenStack artifacts.

#### Action(s) to Take

1. Check `/var/log/esc/yangesc.log` for any issues or error messages.
2. Run `health.sh` to determine the health of ESC.
3. Check network connectivity and address an issues. Retry the deactivation.
4. Check network connectivity with the VIM and address any issues. Retry the deactivation.
5. Determine if ESC has a deployment configuration. From the active ESC VM:

```
/opt/cisco/esc/confd/bin/confd_cli -C
show running-config
```

If a configuration is present, most likely ESC is still retrying the deactivation, allow more time for the process to continue.

If no configuration exists, check if there are deployment artifacts still on the VIM. Retry the deactivation.

6. Collect logs by running `collect_esc_log.sh` from both the active and standby ESC VMs.
7. Perform a manual cleanup.

---

**Note** Only artifacts which UAS created need to be removed. Any pre-created artifacts must remain in place.

---

- a. Login on to the VIM as tenant.
- b. Remove all VMs.
- c. Remove all VIP Ports.
- d. Remove all networks.
- e. Remove all flavors.
- f. Remove all volumes.
- g. Remove all images.
- h. Remove host-aggregate created as part of automation.

### Next Steps

- Open a support case providing all of the log information that was collected.

## Deactivation Fails Because AutoVNF Generates an Exception

### Problem Description

AutoVNF generates an exception error during the deactivation process.

### Possible Cause(s)

- Connectivity issues
- Configuration issues
- OpenStack/VIM specific issues
- Hardware issues

### Action(s) to Take

1. Collect all logs from */var/log/cisco-uas*.
2. Perform a manual cleanup.

---

**Note** Only artifacts which UAS created need to be removed. Any pre-created artifacts can remain in place.

---

- a. Login on to the VIM as tenant.
- b. Remove all VMs.
- c. Remove all VIP Ports.
- d. Remove all networks.
- e. Remove all flavors.
- f. Remove all volumes.
- g. Remove all images.
- h. Remove host-aggregate created as part of automation.

### Next Steps

- Open a support case providing all of the log information that was collected.

## Troubleshooting UEM Issues

This section contains information on troubleshooting UEM issues.

## UEM VM Stuck in a Boot Loop

### Problem Description

Processes that normally run on the UEM VM are unable to start and the VM is stuck in a boot-loop.

### Possible Cause(s)

There is an error with the Zookeeper database keeping the Zookeeper process and other UEM processes from starting. (No other UEM process can be started unless the Zookeeper process has started.)

---

**Important** Release 6.3 onwards, no UEM services will run on the slave UEM.

---

### Action(s) to Take

1. Check the UEM Zookeeper logs. Refer to [Viewing UEM Zookeeper Logs, on page 76](#).
2. Look for error messages similar to the following:

```
[myid:4] - INFO [main:FileSnap@83] - Reading snapshot
/var/lib/zookeeper/data/version-2/snapshot.5000004ba
[myid:4] - ERROR [main:QuorumPeer@557] - Unable to load database on disk
java.io.EOFException
```

If the above errors exist, proceed to the next step. If not, further debugging is required. Please contact your local support representative.

3. Rebuild the Zookeeper database.
  - a. Check the health of Master and Slave EM instances. Execute the following commands on each instance.

#### Master UEM VM:

```
sudo -i
ncs_cli -u admin -C
admin connected from 127.0.0.1 using console on deploymentem-1
```

#### show ems

```
EM          VNFM
ID  SLA  SCM  PROXY  VERSION
-----
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0
```

```
exit
```

---

**Important** Only the master UEM status may be displayed in the above command because the slave UEM is in the boot loop.

---

#### show ncs-state ha

```
ncs-state ha mode master
ncs-state ha node-id 6-1506059686
ncs-state ha connected-slave [ 3-1506059622 ]
```

#### Slave UEM VM:

**Important** The slave UEM may not be accessible if it is experiencing the boot loop issue.

```

sudo -i
ncs_cli -u admin -C
admin connected from 127.0.0.1 using console on deploymentem-1

show ems
EM          VNFM
ID  SLA  SCM  PROXY  VERSION
-----
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0

exit

show ncs-state ha
ncs-state ha mode slave
ncs-state ha node-id 3-1506059622
ncs-state ha master-node-id 6-1506059686

```

- b. Log on to the node on which Zookeeper data is corrupted.
- c. Enable the debug mode.

```

/opt/cisco/em-scripts/enable_debug_mode.sh
Disable EM reboot. Enable debug mode

```

- d. Reboot the VM in order to enter the debug mode.
- e. Remove the corrupted data.

```

cd /var/lib/zookeeper/data/
ls
myid  version-2  zookeeper_server.pid

```

```

mv version-2 version-2_old

```

Check for corrupted data in the arbiter directory as well.

```

cd /var/lib/zookeeper/arbiter/data
ls
myid  version-2  zookeeper_server.pid

```

```

mv version-2 version-2_old

```

**Important** This process removes the Zookeeper database by renaming it for additional debugging/recovery.

- f. Reboot the node instance for it to reconcile and rebuild the Zookeeper database from a healthy UEM instance.

```

reboot

```

- g. Log on to the UEM VM upon reboot.
- h. Validate that the database has been successfully rebuilt on the previously failing UEM node.

```
sudo -i
ncs_cli -u admin -C
admin connected from 127.0.0.1 using console on vnfddeploymentem-0
```

**show ems**

```
EM          VNF
ID  SLA  SCM  PROXY  VERSION
-----
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0
```

**show ncs-state ha**

```
ncs-state ha mode slave
ncs-state ha node-id 3-1506093933
ncs-state ha master-node-id 6-1506093930
```

**exit**

```
cd /var/lib/zookeeper/data/
```

**ls**

```
myid version-2 version-2_old zookeeper_server.pid
```

**cat /var/log/em/zookeeper/zookeeper.log**

```
