

# IGMP Profile Configuration Mode Commands

---

## Command Modes

The Internet Group Management Protocol (IGMP) Profile Configuration Mode is used to create and manage the IGMP parameters for an Ethernet interface.

Exec > Global Configuration > Context Configuration > IGMP Profile Configuration

**configure > context *context\_name* > ip igmp profile *profile\_name***

Entering the above command sequence results in the following prompt:

[*context\_name*]host\_*name*(config-igmp-profile-<*profile\_name*>) #

---

**Important**

Available commands or keywords/variables vary based on platform type, product version, and installed license(s).

- [default ip igmp, on page 2](#)
- [end, on page 3](#)
- [exit, on page 4](#)
- [ip igmp query, on page 5](#)
- [ip igmp require router-alert, on page 6](#)
- [ip igmp robustness, on page 7](#)
- [ip igmp unsolicited-report-interval, on page 8](#)
- [ip igmp version, on page 9](#)

**default ip igmp**

# default ip igmp

Configures default IGMP parameters.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context context_name &gt; ip igmp profile profile_name</b>
	Entering the above command sequence results in the following prompt: [context_name] host_name(config-igmp-profile-<profile_name>) #
<b>Syntax Description</b>	<b>default ip igmp { query   require   robustness   unsolicited-report-interval   version }</b>
<b>Usage Guidelines</b>	Specify the IGMP parameters for the default profile. Refer to the remaining command description in this chapter for additional information.

## Example

To apply enable echo mode on this interface, use the following command:

```
bfid echo
```

## end

Exits the current configuration mode and returns to the Exec mode.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Syntax Description</b>	<b>end</b>
<b>Usage Guidelines</b>	Use this command to return to the Exec mode.

**exit**

## exit

Exits the current mode and returns to the parent configuration mode.

**Product** All

**Privilege** Security Administrator, Administrator

**Syntax Description** **exit**

**Usage Guidelines** Use this command to return to the parent configuration mode.

# ip igmp query

Configures the maximum response time for IGMP queries.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context context_name &gt; ip igmp profile profile_name</b> Entering the above command sequence results in the following prompt: [context_name]host_name(config-igmp-profile-<profile_name>) #
<b>Syntax Description</b>	<b>ip igmp query max-response-time seconds</b>  <b>max-response-time seconds</b> Specify the maximum number of seconds that the system will wait for an IGMP response as an integer from 1 through 25.
<b>Usage Guidelines</b>	Specify the maximum response time for IGMP queries.

## Example

```
ip igmp query max-response-time 10
```

**ip igmp require router-alert**

# ip igmp require router-alert

Sets the router alert flag to ON in IP IGMP packets.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context <i>context_name</i> &gt; ip igmp profile <i>profile_name</i></b>
	Entering the above command sequence results in the following prompt: <i>[context_name] host_name(config-igmp-profile-&lt;profile_name&gt;) #</i>

**Syntax Description** [ no ] ip igmp require router-alert

**no**

Sets the router alert flag to OFF in IP IGMP packets.

**Usage Guidelines** Sets the router alert flag to ON in IP IGMP packets.

## Example

```
ip igmp require router-alert
```

# ip igmp robustness

Sets the Robustness value in IP IGMP packets. The Robustness variable allows tuning for the expected packet loss on a subnet. If a subnet is expected to be lossy, the Robustness variable may be increased. IGMP is robust to packet losses. The Robustness variable should not be set to 1 (one).

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context context_name &gt; ip igmp profile profile_name</b>
	Entering the above command sequence results in the following prompt: [context_name]host_name(config-igmp-profile-<profile_name>) #
<b>Syntax Description</b>	<b>ip igmp robustness value</b>  <b>value</b> Sets the robustness value as an integer from 1 through 10. Default: 2
<b>Usage Guidelines</b>	Sets the robustness value in IP IGMP packets.
<b>Example</b>	<b>ip igmp robustness 7</b>

**ip igmp unsolicited-report-interval**

# ip igmp unsolicited-report-interval

Sets the Unsolicited Report Interval which is the time between repetitions of a host's initial report of membership in a group.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context context_name &gt; ip igmp profile profile_name</b> Entering the above command sequence results in the following prompt: <code>[context_name]host_name(config-igmp-profile-&lt;profile_name&gt;)#</code>
<b>Syntax Description</b>	<b>ip igmp unsolicited-report-interval seconds</b>  <b>seconds</b> Specifies the number of seconds between repetitions of a host's initial report of membership in a group as an integer from 1 through 25. Default: 10
<b>Usage Guidelines</b>	Set the Unsolicited Report Interval which is the time between repetitions of a host's initial report of membership in a group.

## Example

```
ip igmp unsolicited-report-interval 15
```

# ip igmp version

Sets the IGMP version to be supported by this interface.

<b>Product</b>	All
<b>Privilege</b>	Security Administrator, Administrator
<b>Command Modes</b>	Exec > Global Configuration > Context Configuration > IGMP Profile Configuration <b>configure &gt; context context_name &gt; ip igmp profile profile_name</b> Entering the above command sequence results in the following prompt: [context_name]host_name(config-igmp-profile-<profile_name>) #
<b>Syntax Description</b>	<b>ip igmp version { v1   v2   v3 }</b>
	<b>v1   v2   v3</b> Specifies the IGMP Version number: <ul style="list-style-type: none"><li>• <b>v1:</b> Version 1, RFC 1112</li><li>• <b>v2:</b> Version 2, RFC 2236</li><li>• <b>v3:</b> Version 3, RFC 4604</li></ul>
<b>Usage Guidelines</b>	Set the IGMP version to be supported by this interface.

## Example

```
ip igmp version v2
```

ip igmp version
