Post Deployment Operations

Deactivating the USP Deployment

Caution It is recommended that you perform the checks identified in Pre-Deactivation/Post-Activation Health Check Summary, on page 6 before performing any deactivations. It is also recommended that you back up relevant data before proceeding. Refer to Backing Up Deployment Information for more information.

Execute the following command to deactivate the entire USP deployment:

`deactivate nsd` *`<nsd_name>`*

The output of this command is a transaction-id which can be used to monitor the deactivation progress using the following command

`show log` *`<transaction_id>`* **`| display xml`**

Example output for a successful USP deactivation:

Terminating the AutoDeploy VM

Terminating the AutoDeploy VM leverages the same *boot_uas.py* script used to instantiate the AutoDeploy VM.

Important

- Ensure that no changes have been made to this file since it was used to deploy AutoDeploy.
- Be sure to take a backup of the VM content if you are terminating the VM in order to upgrade with a new ISO.
- If AutoDeploy was deployed with HA support, this process terminates both VMs.

To terminate the AutoDeploy VM:

1. Log on to the Ultra M Manager Node.
2. Terminate the AutoDeploy VM.

   `./boot_uas.py --kvm --autodeploy --ha --delete-uas`

   Example command output:

   ```
   2018-01-24 16:30:23,821 - Removing old deployment 'AutoDeploy_instance_0', if it exists
   2018-01-24 16:30:24,176 - Removing old deployment 'AutoDeploy_instance_1', if it exists
   ```

3. View the status.

   `show uas`

   Example command output:

   ```
    Id    Name                                State
   ----------------------------------------------------
   ```

Terminating the AutoIT VM

Terminating the AutoIT VM leverages the same *boot_uas.py* script used to instantiate the AutoIT-VNF VM.

Important

- Ensure that no changes have been made to this file since it was used to deploy AutoIT.
- Be sure to take a backup of the VM content if you are terminating the VM in order to upgrade with a new ISO.
- If AutoIT was deployed with HA support, this process terminates both VMs.

To terminate the AutoIT VM:

1. Log on to the Ultra M Manager Node.
2. Terminate the AutoIT VM.

./boot_uas.py --kvm --autoit --ha --delete-uas

Example command output:

```
2018-01-24 16:25:23,734 - Removing old deployment 'AutoIT_instance_0', if it exists
2018-01-24 16:25:24,056 - Removing old deployment 'AutoIT_instance_1', if it exists
```

3. View the status.

   show uas

   Example command output:

```
 Id    Name                            State
--------------------------------------------------
```

Deploy and Undeploy the Card with the NCS CLI

To undeploy and redeploy the card (service or session function) using the NCS CLI:

1. Log on to the master UEM VM.
2. Access the NCS CLI.

   sudo -i

   ncs_cli -u admin -C

3. Undeploy or suspend the card.

   suspend-vnfci vnfid *<name>* **vdu** *<VDU>* **vnfci** *<VNFCI Instance>*

   For example:

   suspend-vnfci vnfid abc vdu sf vnfci sf1 success true

4. Verify the operational status of VNF, card, VDUs. Suspending card removes the card, e.g. from CF.

   In 6.2 and earlier releases:

   show vnf-state

```
vnf-state running
```

   In 6.3 and later releases:

   show vnfmproxy:vnfd *<vnfd_name>***vnf-state**

```
vnf-state running
```

   show card table

```
Slot         Card Type                                Oper State     SPOF  Attach
-----------  ---------------------------------------  -------------  ----  ------
 1: CFC      Control Function Virtual Card            Active         No
 2: CFC      Control Function Virtual Card            Standby        -
 4: FC       1-Port Service Function Virtual Card     Standby        -
```

   In 6.2 and earlier releases:

   show vdus

```
                                                    CONSTITUENT

[zk: 30.31.14.18(CONNECTED) 4] get /oper/vnfs/vnfd-deployment/vdus/vnf
{"state":"running","name":"vnfd-deployment"}

[zk: 30.31.14.18(CONNECTED) 6] get /oper/vnfs/vnfd-deployment/vdrs/sf2
[illegible]
```

5. Redeploy or resume the card by executing the following command:

resume-vnfci vnfid *<name>* **vdu** *<VDU>* **vnfci** *<VNFC Instance>*

Monitoring and Troubleshooting the Deployment

Pre-Deactivation/Post-Activation Health Check Summary

Table 1: Pre-deactivation/Post-activation Health Checks, on page 6 contains a summary of items to check/verify before performing a deactivation and/or after an activation.

Table 1: Pre-deactivation/Post-activation Health Checks

Item to Check	Notes
Checking OSP-D Server Health	Perform all identified checks.
Checking Controller Server Health	Perform all identified checks.
Checking OSD Compute Server Health	Perform all identified checks.
Viewing AutoVNF Operational Data	In particular, check the outputs of the following commands: • **show uas** • In releases prior to 6.0: **show autovnf-oper:vip-port** In 6.0 and later releases: **show vnfr** • In releases prior to 6.0: **show autovnf-oper:vnf-em** In 6.0 and later releases: **show vnfr** • In releases prior to 6.0: **show autovnf-oper:vnfm** In 6.0 and later releases: **show vnfr**
Viewing ESC Status	Perform all identified checks.
Viewing ESC Health	Perform all identified checks.
Viewing UEM Service Status	Perform all identified checks.
Viewing VNF Information through the Control Function	Perform all identified checks.

Checking OSP-D Server Health

Viewing Stack Status

Log on to the server on which OSP-D is running to view the stack status by executing the following command:

```
openstack stack list
```

Example output:

```
| ID                                   | Stack Name | Stack Status    | Creation Time
   | Updated Time |
+--------------------------------------+------------+-----------------+----------------------+--------------+
| db229d67-212d-4086-a266-e635b2902708 | tb3-ultram | CREATE_COMPLETE | 2017-06-20T02:31:31Z
 | None         |
+--------------------------------------+------------+-----------------+----------------------+--------------+
```

Note Prior to an update, the stack status may be "CREATE_COMPLETE" at the beginning of the update procedure. The stack status should read "UPDATE_COMPLETE" and list and update time at the successful completion of the update procedure.

Viewing the Bare Metal Node List

Log on to the server on which OSP-D is running to view the node list by executing the following command:

`openstack baremetal node list`

Example command output:

```
+--------------------------------------+------+--------------------------------------+-------------+--------------------+-------------+
| UUID                                 | Name | Instance UUID                        | Power
 State | Provisioning State | Maintenance |

Viewing the OpenStack Server List

Log on to the server on which OSP-D is running to ensure that stack components and verify they are active and running the same image by executing the following command:

`openstack server list`

Example command output:

```
+--------------------------------------+-------------------------+--------+-------------------
| ID                                   | Name                    | Status | Networks
          | Image Name                       |

Verifying Node Reachability

Log on to the server on which OSP-D is running to ensure the node reachability and availability by executing the following command:

```
for i in $(nova list| grep ACTIVE| awk '{print $12}' | sed 's\ctlplane=\\g'
 ) ; do ssh heat-admin@${i} uptime ; done
```

This command establishes an SSH session with each node and report the system uptime. Investigate any node that does not reply or has an unexpected uptime.

Example command output:

```
 14:47:10 up 18:15,  0 users,  load average: 0.01, 0.02, 0.05
 14:47:11 up 18:14,  0 users,  load average: 9.50, 9.15, 12.32
 14:47:11 up 18:14,  0 users,  load average: 9.41, 9.09, 12.26
 14:47:11 up 18:14,  0 users,  load average: 10.41, 10.28, 10.49
 14:47:12 up 18:15,  0 users,  load average: 0.00, 0.02, 0.05
 14:47:12 up 18:14,  0 users,  load average: 0.18, 0.06, 0.06
 14:47:12 up 18:15,  0 users,  load average: 0.00, 0.03, 0.05
 14:47:12 up 18:15,  0 users,  load average: 0.00, 0.01, 0.05
 14:47:13 up 18:14,  0 users,  load average: 0.02, 0.02, 0.05
 14:47:13 up 18:14,  0 users,  load average: 8.23, 8.66, 12.29
 14:47:13 up 18:14,  0 users,  load average: 8.76, 8.87, 12.14
 14:47:14 up 18:15,  0 users,  load average: 0.01, 0.04, 0.05
 14:47:14 up 18:15,  0 users,  load average: 9.30, 9.08, 10.12
 14:47:14 up 18:15,  0 users,  load average: 0.01, 0.06, 0.05
 14:47:14 up 18:14,  0 users,  load average: 8.31, 8.61, 11.96
```

```
14:47:15 up 18:14,  0 users,  load average: 17.08, 12.09, 11.06
14:47:15 up 17:09,  0 users,  load average: 1.64, 1.33, 1.10
14:47:15 up 17:04,  0 users,  load average: 1.02, 0.77, 0.79
14:47:16 up 16:58,  0 users,  load average: 0.55, 0.63, 0.72
14:47:16 up 23:46,  0 users,  load average: 2.68, 3.46, 3.89
14:47:16 up 1 day, 5 min,  0 users,  load average: 4.10, 4.27, 4.44
14:47:17 up 23:53,  0 users,  load average: 1.90, 2.32, 2.24
```

Verify NTP is running

To verify the operational status of NTP server:

1. Log on to the server on which OSP-D is running to ensure that NTP is running on all nodes in the cluster by executing the following command:

   for i in $(nova list| grep ACTIVE| awk '{print $12}' | sed 's\ctlplane=\\g') ; do ssh heat-admin@${i} systemctl status ntpd |grep Active; done

   This command establishes an SSH session with each node and lists the ntpd status.

   Example command output:

   ```
   Active: active (running) since Tue 2017-07-11 20:32:25 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:28 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:50 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:28 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:14 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:30 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:22 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:16 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:35 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:31 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:30 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:25 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:19 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:14 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:41 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 20:32:30 UTC; 18h ago
   Active: active (running) since Tue 2017-07-11 21:37:32 UTC; 17h ago
   Active: active (running) since Tue 2017-07-11 21:43:16 UTC; 17h ago
   Active: active (running) since Tue 2017-07-11 21:48:57 UTC; 17h ago
   Active: active (running) since Tue 2017-07-11 15:01:30 UTC; 23h ago
   Active: active (running) since Tue 2017-07-11 14:42:10 UTC; 24h ago
   Active: active (running) since Tue 2017-07-11 14:54:06 UTC; 23h ago
   ```

2. Verify that all the Overcloud nodes are synced to NTP server.

   for i in $(nova list | grep -i overc- | awk '{print $12}'| sed 's/ctlplane=//g') ; do (ssh -o StrictHostKeyChecking=no heat-admin@$i sudo ntpstat | grep NTP) ; done

   ```
   [stack@j19bxb-ospd ~]$ for i in $(nova list | grep -i overc- | awk '{print $12}'| sed
   's/ctlplane=//g') ; do (ssh -o StrictHostKeyChecking=no heat-admin@$i sudo ntpstat |
   grep NTP) ; done
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   synchronised to NTP server (10.84.96.130) at stratum 3
   ```

```
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
synchronised to NTP server (10.84.96.130) at stratum 3
```

3. Check the NTP status on the server on which OSP-D is running by executing the following command:

   systemctl status ntpd |grep Active

   Investigate any node that is not actively running NTP.

Checking OSP-D Server Health

Verifying VM and Other Service Status and Quotas

Log on to the server on which OSP-D is running to verify that Overcloud VMs are active and running by executing the following commands:

cd /home/stack
source *~/<stack_name>***rc-core**
nova list

Note Overcloud VM status can also be checked through the Horizon GUI.

Example command output:

```
+--------------------------------------+-----------------------+--------+------------+-------------+----------+

Checking Cinder Type

Log on to the server on which OSP-D is running to check the Cinder vilome type by executing the following commands:

```
cd /home/stack
source ~/<stack_name>rc-core
cinder type-list
```

Example command output:

```
+--------------------------------------+------+-------------+-----------+
| ID                                   | Name | Description | Is_Public |
+--------------------------------------+------+-------------+-----------+
| 208ef179-dfe4-4735-8a96-e7beee472944 | LUKS | -           | True      |
+--------------------------------------+------+-------------+-----------+
```

```
cinder type-show LUKS
```

Example command output:

```
+---------------------------------+--------------------------------------+
| Property                        | Value                                |

Checking Tenant Project Default Quotas

Log on to the server on which OSP-D is running to check default project quotas by executing the following commands:

nova quota-show

Example command output:

```
+-----------------------------+----------+
| Quota                       | Limit    |
+-----------------------------+----------+
| instances                   | 1000     |
| cores                       | 1000     |
| ram                         | 51200000 |
| metadata_items              | 128      |
| injected_files              | 100      |
| injected_file_content_bytes | 1024000  |
| injected_file_path_bytes    | 255      |
| key_pairs                   | 100      |
| server_groups               | 10       |
| server_group_members        | 10       |
+-----------------------------+----------+
```

openstack project list | grep core

Example command output:

```
| 271ab207a197465f9d166c2dc7304b18 | core |
```

nova quota-class-show 271ab207a197465f9d166c2dc7304b18

Example command output:

```
+-----------------------------+-------+
| Quota                       | Limit |
+-----------------------------+-------+
| instances                   | 10    |
| cores                       | 20    |
| ram                         | 51200 |
| floating_ips                | 10    |
| fixed_ips                   | -1    |
| metadata_items              | 128   |
| injected_files              | 5     |
| injected_file_content_bytes | 10240 |
| injected_file_path_bytes    | 255   |

```

Checking the Staging Network Configuration

Log on to the server on which OSP-D is running to check the staging network configuration by entering the following commands:

neutron subnet-show *<ext-mgmt-id>*

<ext-mgmt-id> is the ID for the external management interface as obtained through the **neutron subnet-list** command output.

Example output:

```
+-------------------+-------------------------------------------------------+
| Field             | Value                                                 |
+-------------------+-------------------------------------------------------+

Checking the Flavor List

Log on to the server on which OSP-D is running to check the flavor list and to by entering the following command:

nova flavor-list

Example command output:

```
+--------------------------------------+-------------------+-----------+------+-----------+------+-------+-------------+-----------+
| ID                                   | Name              | Memory_MB | Disk | Ephemeral
 | Swap | VCPUs | RXTX_Factor | Is_Public |
+--------------------------------------+-------------------+-----------+------+-----------+------+-------+-------------+-----------+
| eff0335b-3374-46c3-a3de-9f4b1ccaae04 | DNUCS002-AUTOIT-FLAVOR | 8192      | 80   | 0
     |      | 2     | 1.0         | True      |
+--------------------------------------+-------------------+-----------+------+-----------+------+-------+-------------+-----------+
```

Checking Host Aggregate and Availability Zone Configuration

Log on to the server on which OSP-D is running to check the host aggregate and availability zone configurations for the OSD Compute and for the AutoDeploy and AutoIT VMs.

Note It is assumed that the AutoDeploy and AutoIT VMs reside on the same OSD Compute node.

This is done by executing the following commands:

cd /home/stack
source *~/<stack_name>* **rc-core**
nova aggregate-list

Example command output:

```
+-----+-------------------+-------------------+
| Id  | Name              | Availability Zone |
+-----+-------------------+-------------------+
| 108 | LBUCS001-AUTOIT   | mgmt              |
```

```
| 147 | LBPGW101-EM-MGMT1 | -                 |
| 150 | LBPGW101-SERVICE1 | -                 |
| 153 | LBPGW101-CF-MGMT1 | -                 |
+-----+-------------------+-------------------+
```

nova aggregate-show LBUCS001-AUTOIT

```
+----+-------------+-------------------+-------------------------------+-------------------------------+
| Id  | Name           | Availability Zone | Hosts                             | Metadata
                          |
+----+-------------+-------------------+-------------------------------+-------------------------------+
| 108 | LBUCS001-AUTOIT | mgmt              | 'newtonoc-osd-compute-0.localdomain' |
'availability_zone=mgmt', 'mgmt=true' |
+----+-------------+-------------------+-------------------------------+-------------------------------+
```

Note This information can also be verified through the Horizon GUI. Login to Horizon as the user core and navigate to **Project** > **Compute** > **Instances**. Check each instance to verify that the status is Active and the power state is Running.

Correct any instance that does not meet these criteria before continuing.

Checking Controller Server Health

Note The commands in this section should be executed on any one of the Controller nodes and do not need to be repeated on the other Controller nodes unless an issue is observed.

Checking the Pacemaker Cluster Stack (PCS) Status

Log on to one of the Controller nodes and verify that the group of resources in the PCS cluster are active and in the expected state by executing the following command:

sudo pcs status

Example command output:

```
Cluster name: tripleo_cluster
Stack: corosync
Current DC: tb3-ultram-controller-0 (version 1.1.15-11.el7_3.4-e174ec8) - partition with
quorum
Last updated: Wed Jul 12 13:28:56 2017          Last change: Tue Jul 11 21:45:09 2017 by
root via crm_attribute on tb3-ultram-controller-0

tb3-ultram-controller-1
 my-ipmilan-for-controller-2    (stonith:fence_ipmilan):        Started
tb3-ultram-controller-0

Daemon Status:
  corosync: active/enabled
  pacemaker: active/enabled
  pcsd: active/enabled
```

From the output of this command, ensure that:

- All 3 controllers are listed as Online
- haproxy-clone is started on all 3 controllers
- galera-master lists all 3 controllers as Masters
- rabbitmq-clone is started on all 3 controllers
- redis-master lists one controller as master and the other 2 controllers as slaves
- openstack-cinder-volume is started on one node
- my-ipmilan/stonith is started on all 3 controllers
- Daemons corosync, pacemaker and pcsd are active and enabled

Note If the output displays any “Failed Actions”, execute the **sudo pcs resource cleanup** command and then re-execute the **sudo pcs status** command.

Checking Ceph Storage Status

Log on to the Controller node and verify the health of the Ceph storage from the Controller node by executing the following command:

`sudo ceph status`

Example command output:

```
cluster eb2bb192-b1c9-11e6-9205-525400330666
     health HEALTH_OK
     monmap e1: 3 mons at
{tb3-ultram-controller-0=11.118.0.10:6789/0,tb3-ultram-controller-1=11.118.0.11:6789/0,
tb3-ultram-controller-2=11.118.0.12:6789/0}
            election epoch 152, quorum 0,1,2
tb3-ultram-controller-0,tb3-ultram-controller-1,tb3-ultram-controller-2
```

```
    osdmap e158: 12 osds: 12 up, 12 in
           flags sortbitwise,require_jewel_osds
     pgmap v1417251: 704 pgs, 6 pools, 321 GB data, 110 kobjects
           961 GB used, 12431 GB / 13393 GB avail
                704 active+clean
client io 53755 B/s wr, 0 op/s rd, 7 op/s wr
```

From the output of this command, ensure that:

- health is listed as HEALTH_OK
- The correct number of monitors are listed in the monmap
- The correct number of OSDs are listed in the osdmap

Checking Controller Node Services

Log on to the Controller node and check the status of all services by executing the following command:

sudo systemctl list-units "openstack*" "neutron*" "openvswitch*"

Example command output:

```
UNIT                                        LOAD   ACTIVE SUB     DESCRIPTION
neutron-dhcp-agent.service                  loaded active running OpenStack Neutron DHCP
Agent
neutron-l3-agent.service                    loaded active running OpenStack Neutron Layer

 (swift) - Object Server
openstack-swift-proxy.service                loaded active running OpenStack Object Storage
 (swift) - Proxy Server
openvswitch.service                           loaded active exited  Open vSwitch

LOAD   = Reflects whether the unit definition was properly loaded.
ACTIVE = The high-level unit activation state, i.e. generalization of SUB.
SUB    = The low-level unit activation state, values depend on unit type.

43 loaded units listed. Pass --all to see loaded but inactive units, too.
To show all installed unit files use 'systemctl list-unit-files'.
```

Check the RabbitMQ Database Status

From each of the controller nodes, determine if the rabbitmq database is in a good state by executing the following command:

sudo rabbitmqctl eval 'rabbit_diagnostics:maybe_stuck().'

Example command output:

```
2017-07-20 01:58:02 There are 11020 processes.
2017-07-20 01:58:02 Investigated 0 processes this round, 5000ms to go.
2017-07-20 01:58:03 Investigated 0 processes this round, 4500ms to go.
2017-07-20 01:58:03 Investigated 0 processes this round, 4000ms to go.
2017-07-20 01:58:04 Investigated 0 processes this round, 3500ms to go.
2017-07-20 01:58:04 Investigated 0 processes this round, 3000ms to go.
2017-07-20 01:58:05 Investigated 0 processes this round, 2500ms to go.
2017-07-20 01:58:05 Investigated 0 processes this round, 2000ms to go.
2017-07-20 01:58:06 Investigated 0 processes this round, 1500ms to go.
2017-07-20 01:58:06 Investigated 0 processes this round, 1000ms to go.
2017-07-20 01:58:07 Investigated 0 processes this round, 500ms to go.
2017-07-20 01:58:07 Found 0 suspicious processes.
ok
```

If the database is healthy, the command returns “Found 0 suspicious processes.” If the database is not healthy, the command returns 1 or more suspicious processes. Contact your local support representative if suspicious processes are found.

Checking OSD Compute Server Health

Checking Ceph Status

Log on to the OSD Compute and check the Ceph storage status by executing the following command:

sudo ceph status

Example command output:

```
sudo ceph status
    cluster eb2bb192-b1c9-11e6-9205-525400330666
     health HEALTH_OK
     monmap e1: 3 mons at
{tb3-ultram-controller-0=11.118.0.10:6789/0,tb3-ultram-controller-1=11.118.0.11:6789/0,
tb3-ultram-controller-2=11.118.0.12:6789/0}
            election epoch 152, quorum 0,1,2
tb3-ultram-controller-0,tb3-ultram-controller-1,tb3-ultram-controller-2
     osdmap e158: 12 osds: 12 up, 12 in
            flags sortbitwise,require_jewel_osds
      pgmap v1417867: 704 pgs, 6 pools, 321 GB data, 110 kobjects
            961 GB used, 12431 GB / 13393 GB avail
                 704 active+clean
  client io 170 kB/s wr, 0 op/s rd, 24 op/s wr
```

Checking OSD Compute Node Services

Log on to each OSD Compute node and check the status of all services by executing the following command:

sudo systemctl list-units "openstack*" "neutron*" "openvswitch*"

Example command output:

```
UNIT                                 LOAD   ACTIVE SUB     DESCRIPTION
neutron-openvswitch-agent.service    loaded active running OpenStack Neutron Open vSwitch
Agent
neutron-ovs-cleanup.service          loaded active exited  OpenStack Neutron Open vSwitch
Cleanup Utility
neutron-sriov-nic-agent.service      loaded active running OpenStack Neutron SR-IOV NIC
Agent
openstack-nova-compute.service       loaded active running OpenStack Nova Compute Server
openvswitch.service                  loaded active exited  Open vSwitch

LOAD   = Reflects whether the unit definition was properly loaded.
ACTIVE = The high-level unit activation state, i.e. generalization of SUB.
SUB    = The low-level unit activation state, values depend on unit type.

6 loaded units listed. Pass --all to see loaded but inactive units, too.
To show all installed unit files use 'systemctl list-unit-files'.
```

Monitoring AutoDeploy Operations

This section identifies various commands that can be used to determine the status and health of AutoDeploy.

To use them, you must:

1. Log on to the AutoDeploy VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the root user.

```
sudo -i
```

Viewing AutoDeploy Logs

AutoDeploy logs are available on the AutoDeploy VM in the following directory:

/var/log/upstart/autodeploy.log

Important To access the command used to view logs, you must be logged in to the Confd CLI as the *admin* user on the AutoDeploy VM:

```
confd_cli -u admin -C
```

When prompted, you must enter the *admin* user password.

AutoDeploy Transaction Logs

Execute the following command to display AutoDeploy transaction logs:

show log *$TX-ID* **| display xml**

Example VIM-ORCH and VIM Activation Log:

```
2018-01-23 22:01:56,266 - Send Deployment notification for: autoit-instance
2018-01-23 22:08:36,876 - Deployment activate-ns-deployment: autoit initiated

```

Checking AutoDeploy Processes

Check the status of AutoDeploy VM by entering the following commands:

service autodeploy status

service uas-confd status

Determining the Running AutoDeploy Version

To display the version of the AutoDeploy software role that is currently operational:

show uas

Example output:

```
uas version               6.0.0
uas state                 active
uas external-connection-point 172.28.185.132
INSTANCE IP     STATE  ROLE
-------------------------------------
```

```
172.28.185.133  alive  CONFD-MASTER
172.28.185.134  alive  CONFD-SLAVE

NAME               LAST HEARTBEAT
----------------------------------------
AutoDeploy-MASTER  2018-01-24 21:29:54
USPCFMWorker       2018-01-24 21:29:45
USPCHBWorker       2018-01-24 21:29:45
USPCWorker         2018-01-24 21:29:45
```

Monitoring AutoIT Operations

This section identifies various commands that can be used to determine the status and health of AutoIT.

To use them, you must:

1. Log on to the AutoIT VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the *root* user.

   sudo -i

Viewing AutoIT Logs

AutoIT maintains logs containing information pertaining to UAS deployment and termination transactions. The *autoit.log* file is located in the following directory on the Ultra M Manager Node:

/var/log/cisco/usp/auto-it/autoit.log

Example Deployment Log:

tail -100f /var/log/cisco/usp/auto-it/autoit.log &^C

Viewing AutoIT Operational Data

View the AutoIT operational data by executing the following command:

show uas

Example show uas Command Output

```
uas version               6.0.0
uas state                 active
uas external-connection-point 172.28.185.132
INSTANCE IP     STATE  ROLE
-------------------------------------
172.28.185.133  alive  CONFD-MASTER
172.28.185.134  alive  CONFD-SLAVE

NAME           LAST HEARTBEAT
-------------------------------------
AutoIT-MASTER  2018-01-24 21:24:30
USPCFMWorker   2018-01-24 21:24:30
USPCHBWorker   2018-01-24 21:24:30
USPCWorker     2018-01-24 21:24:30
```

Important In case of standalone mode (non-HA) deployments, the *uas external-connection-point* information and *Instance IP* table are not applicable and are not displayed.

Checking AutoIT Processes

Verify that key processes are running on the AutoIT VM:

With Ubuntu 14.04:

service autoit status

Example output:

```
AutoIT is running.
```

Check ConfD.

service uas-confd status

With Ubuntu 16.04:

```
* autoit.service - Job that runs the autoit daemon
Loaded: loaded (/etc/systemd/system/autoit.service; static; vendor preset: enabled
Active: active (running) since Fri 2018-09-21 22:11:54 UTC; 1 weeks 0 days ago
Main PID: 1320 (autoit.sh)
CGroup: /system.slice/autoit.service
|-1320 /bin/sh /etc/cisco/autoit.sh start
|-1337 /bin/sh /etc/cisco/autoit.sh start

|-1352 /opt/cisco/usp/uas/autoit/autoit
`-1353 /opt/cisco/usp/uas/autoit/autoit
```

Monitoring AutoVNF Operations

This section identifies various commands that can be used to determine the status and health of AutoVNF.

To use them, you must:

1. Log on to the AutoVNF VM as *ubuntu*. Use the password that was created earlier for this user.
2. Become the root user.

   sudo -i

Viewing AutoVNF Logs

General AutoVNF Logs

AutoVNF logs are available on the AutoVNF VM in the following file:

/var/log/upstart/autovnf.log

To collect AutoVNF logs:

1. Navigate to the *scripts* directory.

   cd /opt/cisco/usp/uas/scripts

2. Launch the *collect-uas-logs.sh* script to collect the logs.

   sudo ./collect-uas-logs.sh

   Example log output:

   ```
   Creating log tarball uas-logs-2017-05-26_00.24.55_UTC.tar.bz2 ...
   uas-logs/
   uas-logs/autovnf/
   uas-logs/autovnf/autovnf_server.log

To extract the tarball, run: "tar jxf /tmp/uas-logs-2017-05-26_00.24.55_UTC.tar.bz2"
```

AutoVNF Transaction Logs

AutoVNF server and transaction logs are available on the Ultra M Manager Node in the following directory on the UAS VM:

/var/log/cisco-uas/autovnf

Inside this directory are transaction sub-directories, VNFD information and NETCONF traces are provided for the given transaction.

Example:

```
total 3568
drwxr-xr-x 4 root root    4096 May 25 23:31 ./
drwxr-xr-x 7 root root    4096 May 25 19:39 ../
drwxr-xr-x 2 root root    4096 May 25 23:31 579b4546-41a2-11e7-b3ab-fa163eccaffc/
drwxr-xr-x 2 root root    4096 May 25 23:29 a15bf26c-41a1-11e7-b3ab-fa163eccaffc/
-rw-r--r-- 1 root root 3632813 May 26 18:33 audit.log
-rw-r--r-- 1 root root       0 May 25 23:26 autovnf_server.log

cd a15bf26c-41a1-11e7-b3ab-fa163eccaffc
total 2568
drwxr-xr-x 2 root root    4096 May 25 23:29 ./
drwxr-xr-x 4 root root    4096 May 25 23:31 ../
-rw-r--r-- 1 root root 2614547 May 25 23:37 netconf_traces
-rw-r--r-- 1 root root       0 May 25 23:29 vnfd
```

AutoVNF Event Logs

Event logs provide useful information on UAS task progress. These logs are located in the *autovnf.log* file within the following directory on the UAS VM:

/var/log/upstart

Event logs are filed by transaction ID. To view transaction IDs:

1. Login to the ConfD CLI as the *admin* user.

   ```
   confd_cli -u admin -C
   ```

2. Enter the *admin* user password when prompted.
3. List the transactions.

   show transactions

   Example output:

```
TX ID                                  TX TYPE          DEPLOYMENT ID       TIMESTAMP
                      STATUS
-------------------------------------------------------------------------------------
562c18b0-4199-11e7-ad05-fa163ec6a7e4  vnf-deployment   vnfd2-deployment
2017-05-25T22:27:28.962293-00:00  deployment-success
abf51428-4198-11e7-ad05-fa163ec6a7e4  vnfm-deployment  ab-auto-test-vnfm2
2017-05-25T22:22:43.389059-00:00  deployment-success
```

   To view the logs associated with a specific transaction:

   show log *<transaction_id>* **| display xml**

   Example log pertaining to VNFM deployment:

```
<config xmlns="http://tail-f.com/ns/config/1.0">
  <logs xmlns="http://www.cisco.com/usp/nfv/usp-autovnf-oper">

Viewing AutoVNF Operational Data

AutoVNF maintains history information for all transactions, associated events, and related error/information logs in persistent storage. These logs are useful for monitoring deployment progress and for troubleshooting issues.

These logs can be retrieved at time using the "task-id" returned as well as by running ConfD "show" commands.

To access these commands, you must be logged in to the Confd CLI as the *admin* user on the AutoVNF VM:

```
confd_cli -u admin -C
```

When prompted, enter the *admin* user password.

Table 2: ConfD Log Descriptions, on page 49 provides a list of the available commands and describes the information in the output.

Table 2: ConfD Log Descriptions

ConfD Command	Purpose
In releases prior to 6.0: **show autovnf-oper:errors** In 6.0 and later releases: **show uas**	Displays a list of any deployment errors that may have occurred.
In releases prior to 6.0: **show autovnf-oper:logs | display xml** In 6.0 and later releases: **show log | display xml**	Displays log messages for AutoVNF transactions.
In releases prior to 6.0: **show autovnf-oper:network-catalog** In 6.0 and later releases: **show vnf-packager**	Displays information for the networks deployed with USP.
In releases prior to 6.0: **show autovnf-oper:transactions** In 6.0 and later releases: **show transaction**	Displays a list of transaction IDs that correspond to the USP deployment along with their execution date, time, and status.

ConfD Command	Purpose
In releases prior to 6.0: **show autovnf-oper:vdu-catalog** In 6.0 and later releases: **show vnfr**	Displays information pertaining to the virtual descriptor units (VDUs) used to deploy USP.
In releases prior to 6.0: **show autovnf-oper:vip-port** In 6.0 and later releases: **show vnfr**	Displays information port, network, and virtual IP addresses information.
In releases prior to 6.0: **show autovnf-oper:vnfm** In 6.0 and later releases: **show vnfr**	Displays information pertaining to the VNFM deployment and UEM VM deployment.
show confd-state	Displays information pertaining to confd-state on AutoVNF.
show confd-state ha	Displays information pertaining to HA specific confd-state on AutoVNF.
show log <*transaction_id*>	Displays detailed log information for a specific transaction ID.
show running-config	Displays the configuration running on the AutoVNF.
show uas	Displays information pertaining to the AutoVNF VM deployment.
In releases prior to 6.0: **show usp** In 6.0 and later releases: **show vnfr**	Displays information pertaining to the overall USP VM deployment.

NOTES:

- Log information can be saved out of ConfD to a file for later retrieval using one of the following commands:

  show log *transaction_id* **| save** *url*

  OR

  show autovnf-oper: *command* **| save** *url*

  Where *transaction_id* is a specific ID, *url* is a valid directory path, and *command* is one of the command operators identified in Table 2: ConfD Log Descriptions, on page 49.

Example show confd-state Command Output

show confd-state

```
confd-state version 6.3.1
confd-state epoll false
confd-state daemon-status started
confd-state ha mode master
confd-state ha node-id confd-master
confd-state ha connected-slave [ a2dd5178-afae-4b3a-8b2b-910216583501 ]

Example show uas Command Output

```
show uas
uas version              6.0.0
uas state                active
uas external-connection-point 50.50.50.67 INSTANCE
IP         STATE  ROLE
--------------------------------
10.2.3.6   alive  CONFD-MASTER
10.2.3.11  alive  CONFD-SLAVE
```

```
NAME                                        LAST HEARTBEAT
------------------------------------------------------------------
AutoVNF-MASTER                              2018-01-20 02:35:03
ESCHeartBeatMonitor-fremont-autovnf-vpc     2018-01-20 02:35:00
USPCFMWorker                                2018-01-20 02:34:51
USPCHBWorker                                2018-01-20 02:35:00
USPCWorker                                  2018-01-20 02:35:00
```

Important In this example, 10.2.3.6 is the confd-master and the active UAS VM.

Important In case of standalone mode (non-HA) deployments, the *uas external-connection-point* information and *Instance IP* table are not applicable and are not displayed.

Example output that shows the floating IP for AutoVNF:

```

The current version of AutoVNF software can also be seen through the USP UWS – AutoVNF User Interface under –

- the Site Overview screen (Service Deployment > Site) only if the AutoVNF configuration type is a record.
- the Auto-Vnf Configuration Overview screen only if the AutoVNF configuration type is a record.
- the UWS – AutoVNF dashboard.

UAS Log Collection

The UAS generates and consolidates a comprehensive set of UAS logs and VNF diagnostic information from StarOS device for troubleshooting purposes. The log collection includes logs from all components in a deployed UAS cluster, i.e. from AutoIT, AutoDeploy, AutoVNF, UEM, ESC and StarOS.

This section describes the following topics:

Feature Description

Automation of UAS log collection is facilitated through the use of ConfD CLI command **collect-logs**. When this command is executed, the logs from all or required components can be collected and copied to a common location.

Limitations

The following limitations exist with the UAS log collection feature.

- With the use of ConfD CLI approach, it is not possible to collect logs for AutoDeploy and AutoIT. To aggregate logs for these two components, use the standalone script.
- Direct collection of logs from CF, SF, UP instances is not supported. If VNFDs corresponding to these instances are invoked directly, appropriate error message will be recorded in the log file of AutoDeploy and AutoVNF.

Collecting the UAS Logs

The UAS logs can be collected using one of the following approaches:

- Via the ConfD CLI Command, on page 60
- Via the Standalone Script, on page 61

Via the ConfD CLI Command

UAS logs collection is automated through a remote procedure call (RPC) executed from the ConfD command line interface (CLI). The RPC “collect-logs” has been introduced to collect logs from the AutoVNF, ESC and UEM.

This command, on execution, fetches the logs from components under given NSD and VNFD levels in a deployed setup and creates a final consolidated tar ball comprising all logs.

Important When the ConfD CLI command is used, the log collection for AutoDeploy and AutoIT components is not supported.

This command can be invoked from ConfD CLI of AutoDeploy and AutoVNF.

Important The IP and credentials of instances are fetched from oper data of AutoDeploy/AutoVNF. So, the logs can be collected for instances whose VNFR is present in oper db.

To collect the UAS logs via ConfD CLI:

1. Login to the ConfD CLI as the *admin* user on the AutoDeploy VM or AutoVNF VM.

   ```
   confd_cli -u admin -C
   ```

2. Enter the *admin* user password when prompted.

3. Execute the following command:

   collect-logs nsd-id *<nsd id>*

   This command collects logs from all components present under given NSD and also from deploy-nsd if present.

   To collect logs by VNFD ID, use the following command:

   collect-logs nsd-id *<nsd id>* **vnfd** *vnfd id*

   This command collects logs from components specific to the given VNFD. Additionally, under given vnfd, corresponding AutoVNF logs of the given NSD will also be collected in case of RPC invoked from AutoDeploy (outside AutoVNF).

   For example, if VNFD of ESC, or UEM is invoked from AutoDeploy, the corresponding AutoVNF logs of given VNFD will also be collected, since log collection happens through respective AutoVNF in case of multiple AutoVNFs deployed through a single AutoDeploy.

   The vnf-diags from StarOS instances will be collected along with the UEM logs.

4. View the status of log collection using the AutoDeploy or AutoVNF logs under */var/log/upstart/* based on where it is invoked.

   If invoked from AutoDeploy, the RPC internally connects with AutoVNF and collects logs from UAS instances. The respective progress can be viewed from AutoVNF log.

5. Untar the *autocollect_logs.tgz* file to extract the collected logs.

   tar -zxvf autocollect_logs.tgz

   Note that the output consolidated tar ball *autocollect_logs.tgz* is created under */var/log/autocollect/* directory of the instance (AutoDeploy/AutoVNF) from where the log collection RPC was invoked.

Important Every time the log collection is triggered, the */var/log/autocollect* directory will be automatically cleaned and then new logs will be copied.

Example output:

```
vnf-logs/
vnf-logs/em/
vnf-logs/em/abc-vnf-vnf1-em-rmuruga-em1-1-em-logs-2018-08-09_06.41.25_UTC.tar.bz2
vnf-logs/em/abc-vnf-vnf1-em-rmuruga-em1-2-em-logs-2018-08-09_06.40.35_UTC.tar.bz2
vnf-logs/autovnf/
vnf-logs/autovnf/autoit-f-autovnf1-rmuruga-avf-2-uas-logs-2018-08-09_06.40.06_UTC.tar.bz2
vnf-logs/autovnf/autoit-f-autovnf1-rmuruga-avf-1-uas-logs-2018-08-09_06.40.49_UTC.tar.bz2
vnf-logs/esc/
vnf-logs/esc/esc_log_abc-vnf-vnf1-esc-rmuruga-esc-2_2018-08-09_06.40.15_UTC.tar.bz2
vnf-logs/esc/esc_log_abc-vnf-vnf1-esc-rmuruga-esc-1_2018-08-09_06.39.42_UTC.tar.bz2
```

Via the Standalone Script

The UAS uses a standalone script "*collect_all_uas_logs.py*" to generate and consolidate a comprehensive set of UAS logs and VNF diagnostic information from StarOS device for troubleshooting purposes.

Before using this script, you should be aware of the following:

- AutoVNF IP and SSH credentials (username and password)

- AutoVNF NETCONF login credentials
- Login credentials for UEM and ESC
- Login credentials for AutoIT and AutoDeploy

This script is available in the AutoIT, AutoDeploy and AutoVNF VMs in the */opt/cisco/usp/uas/scripts/* directory.

A sample yaml file (*sample_config.yaml*) is present in the same directory along with the script. The yaml file should be updated with proper IP and credential details.

Example configuration of *sample_config.yaml* file:

```
uas-cluster:
    autovnf:
    172.21.201.237:
      autovnf:
        login:
          user: ubuntu
          password: Cisco@123
        netconf:
          user: admin
          password: Cisco@123
.
.
.
```

Important You can exclude AutoDeploy or AutoIT for log collection by commenting out the phrase 'autodeploy' or 'autoit' using '#' in the yaml file.

For example:

```
#autodeploy:
```

To collect the UAS logs via the standalone script:

1. Log on to the AutoDeploy, AutoIT or AutoVNF VM using the user credentials specified during deployment.
2. Navigate to the *scripts* directory.

   cd /opt/cisco/usp/uas/scripts
3. Edit the *sample_config.yaml* file using a standard text editor to update the appropriate credential details and save it.
4. Launch the *collect_all_uas_logs.py* script to collect the logs.

   sudo ./collect_all_uas_logs.py - -cfgfile sample_config.yaml

   The script starts collecting the logs and the progress is displayed on the console. Upon completion, a final tar file *autocollect_logs.tgz* will be copied to */var/log/autocollect/* directory.

   Detailed logs are stored in a log file named *autocollect.log* under the */var/log/autocollect/* directory.

Note The logs directory will be cleared and re-created for every execution of the script.

Example output:

```
sudo ./collect_all_uas_logs.py --cfgfile sample_config.yaml
2018-07-26 08:52:57,273 - Uas-cluster present in config
2018-07-26 08:52:57,273 - ......Executing step 1 of 4......
2018-07-26 08:52:57,273 - Collecting logs from uas instances
2018-07-26 08:53:06,530 - Logs collected successfully from esc 48.48.48.24

2018-07-26 08:53:09,784 - Logs collected successfully from esc 48.48.48.16
2018-07-26 08:53:15,404 - Logs collected successfully from autovnf 38.38.38.26
2018-07-26 08:54:21,160 - Logs collected successfully from vnf-em 38.38.38.11
2018-07-26 08:54:24,829 - Logs collected successfully from vnf-em 38.38.38.27
2018-07-26 08:54:24,831 - Generating tar file for uas instance 10.225.202.93
2018-07-26 08:54:25,260 - Log collection completed for uas instance 10.225.202.93.
2018-07-26 08:54:25,261 - Auto-it present in config
2018-07-26 08:54:25,261 - ......Executing step 2 of 4......
2018-07-26 08:54:25,261 - Collecting logs from Autoit 10.225.202.77
2018-07-26 08:54:25,847 - Logs collected successfully for instance 10.225.202.77
2018-07-26 08:54:25,847 - Auto-deploy present in config
2018-07-26 08:54:25,848 - ......Executing step 3 of 4......
2018-07-26 08:54:25,848 - Collecting logs from Autodeploy 10.225.202.64
2018-07-26 08:54:26,454 - Logs collected successfully for instance 10.225.202.64
2018-07-26 08:54:26,454 - ......Executing step 4 of 4......
2018-07-26 08:54:26,454 - Generating consolidated final tar file
2018-07-26 08:54:26,499 - Log collection script completed. Please collect the tar file
'autocollect_logs.tgz' under /var/log/autocollect/
```

5. Extract the contents of *autocollect_logs.tgz* file using the following command:

   ```
   tar -zxvf autocollect_logs.tgz
   ```

   The following are the contents of the *autocollect_logs.tgz* tar file:

   - .bz2 files for each AutoDeploy and AutoIT logs
   - Two log files — *autocollect.log* for AutoDeploy logs and *autocollect-vnf_<autovnf ip>.log* for logs collected from AutoVNF and its instances.

   

   Important In case of failures of any UAS cluster nodes, check the *autocollect-vnf_<autovnf ip>.log* for the detailed error message.

   - *uas_logs_<autovnf ip>.tgz* — This file comprises tar bundles for the UAS cluster.

     When the *uas_logs_<autovnf ip>.tgz* tar file is extracted, a *vnf-logs* directory is created with individual sub-directories for *em* , *esc*, and *autovnf* for storing the corresponding collected tar file contents.

     If the VNF diagnostic log files are unavailable in the *diags* directory under *em*, you can use **vnf-collect-diags** RPC command from UEM VM to collect the logs. For information on collecting logs through the RPC, see the Collecting VNF Diagnostic Information, on page 64 section.

     The logs collected through the RPC are also stored in the *diags* directory under *em* directory.

6. Verify that files have been extracted.

   ```
   ls -lt
   ```

   Example output:

   ```
   total 2488
   ```

```
-rw-r--r-- 1 root root 1174824 Jul 26 08:54 uas_logs_10.225.202.93.tgz
-rw-r--r-- 1 root root   43113 Jul 26 08:54

-rw-r--r-- 1 root root 1266857 Jul 26 08:54 autocollect_logs.tgz
```

Collecting VNF Diagnostic Information

The VNF diagnostic information can also be collected through the use of **vnf-collect-diags** RPC command in UEM VM.

To collect the diagnostic information from StarOS device:

1. Log on to the master UEM VM.
2. Access the NCS CLI.

   sudo -i

   ncs_cli -u admin -C
3. Execute the following command to collect VNF diagnostic logs from StarOS device.

   vnf-collect-diags [correlator *<correlator id>* **vnfd** *<vnfd-id>* **]**

   This command collects the VNF diagnostic log files and makes it available in the */var/log/em/diags-<correlator id>* directory.
4. Check the per-VNF diagnostic collection status using the following command:

   show vnf-collect-diags-status

   Example output:

```
NAME                          STATUS
-----------------------------------------
xyz_autovnf-cups-c-abc  in-progress
```

Sample Logs

This section provides a few sample log files.

AutoDeploy Log:

```

2018-08-09 07:00:11,520 - Send Deployment notification for: abc-vnf-instance
```

Secure File Transfer

Feature Description

UAS provides **upload-file** RPC in ConfD to transfer a file or an image to the VNFC components under given NSD and VNFD levels in a deployed setup.

This command can be invoked from ConfD CLI of AutoDeploy and AutoVNF.

Important Though the **upload-file** command can be invoked from AutoDeploy and AutoVNF, it is highly important that the **nsd-id** must be specified as AutoVNF name only.

Limitations

The file transfer cannot be initiated to the components with following vnf-types — UEM, USP-UAS, ESC. That is, if **esc** is specified as **vnfd** in the **upload-file** command, then the file cannot be transferred to ESC.

How it Works

Perform the following procedure to transfer a file or an image to the VNFs.

1. Log on to AutoDeploy VM or AutoVNF VM as the default user, *ubuntu*.
2. Switch to the *root* user.

   ```
   sudo su
   ```

3. Enter the ConfD CLI.

```
confd_cli -C -u admin
```

4. Enter the *admin* user password when prompted.
5. Initiate the file transfer to the VNFs using the following command:

   For AutoDeploy:

   nsd:upload-file nsd-id *<nsd id>* **vnfd** *<vnfd name>* **source** *<path of the file>* **destination** *< path >*

   For AutoVNF:

   upload-file nsd-id *<nsd id>* **vnfd** *<vnfd name>* **source** *<path of the file>* **destination** *< path >*

   Notes:

   - The **nsd-id** must always be specified as AutoVNF name.
   - **vnfd** is an optional parameter in this configuration. This parameter must be alpha and/or numeric characters, and it accepts more than one value as an input. For example: [vpc1], [vpc1 vpc2 vpc3].
   - If **vnfd** is specified in the **upload-file** command and it is a valid VNFD, the file or image is transferred successfully. For the list of invalid or unsupportedVNFDs, see the Limitations, on page 66.
   - If **vnfd** is not specified in the **upload-file** command, then the file or image is transferred only to the valid VNFDs in the given NSD deployment.
   - If the command includes a single invalid VNFD, the file transfer will not be executed and an error indicating invalid argument in AutoDeploy is displayed. For the list of invalid or unsupportedVNFDs, see the Limitations, on page 66.

   Command example:

   ```
   nsd:upload-file nsd-id abc-autovnf vnfd [ vpc ] source
   /home/ubuntu/x.cfg destination /sftp
   ```

6. Monitor the progress of the file transfer operation.

   show transaction *<transaction-id>*

   transaction_id is the ID displayed as a result of the **upload-file** command executed in the previous step.

   Example command output:

   ```
   show transaction 15407
   TX ID     TX TYPE  DEPLOYMENT ID     TIMESTAMP                 STATUS  STATUS DETAIL
   15407 upload-file  vnf-autovnf 2018-10-29T05:43:47.666386-00:00  error    -
   ```

   Also, view the logs associated with a specific transaction.

   show log *<transaction-id>*

Monitoring File Transfer Operations

AutoDeploy and AutoVNF maintain logs for all transactions in persistent storage. The status/progress of file transfer can be viewed in AutoDeploy/AutoVNF logs archived under */var/log/upstart/* based on where it is invoked.

If invoked from AutoDeploy, then RPC internally connects with AutoVNF and performs the file transfer. The respective progress can be viewed through the AutoVNF logs.

To view the logs associated with a specific transaction:

show log *<transaction-id>*

Sample AutoDeploy Logs:

```

Monitoring VNFM Operations

Note The Cisco Elastic Services Controller (ESC) is the only VNFM supported in this release.

Viewing ESC Status

ESC status can be viewed from the ESC command line or by executing a REST API from AutoVNF.

Monitoring StatusThrough the ESC Command Line

Log on to the primary ESC VM and execute the following command from the command line:

```
escadm status
```

Example command output:

```
0 ESC status=0 ESC Master Healthy
```

Monitoring Status Through an AutoVNF API

Log on to the master AutoVNF VM and execute the following command:

```
curl -u admin:<password> -k https://<master_vnfm_address>:60000/esc/health
```

Example command output:

```
{"message": "ESC services are running.", "status_code": "2000"}
```

Status code and message display information about ESC health conditions as identified in Table 3: ESC Status Code Messages, on page 71. Status codes in the 2000s imply ESC is operational, 5000 status codes imply at least one of the ESC components is not in service.

Table 3: ESC Status Code Messages

Code	Message
2000	ESC services are running
2010	ESC services are running. ESC High-Availability node not reachable.
2020	ESC services are running. One or more VIM services (keystone, nova) not reachable.*
2030	ESC services are running. VIM credentials not provided.
2040	ESC services running. VIM is configured, ESC initializing connection to VIM.
2100	ESC services are running. ESC High-Availability node not reachable. One or more VIM services (nova) not reachable
5010	ESC service ESC_MANAGER not running.

Code	Message
5020	ESC service CONFD not running.
5030	ESC service MONA not running.
5040	ESC service VIM_MANAGER not running.
5090	More than one ESC service (confd, mona) not running.**

Viewing ESC Health

ESC health can be viewed by logging on to the primary ESC VM and executing the following command from the command line:

`health.sh`

Example command output:

```
esc ui is disabled -- skipping status check
esc_monitor start/running, process 840
esc_mona is up and running ...
vimmanager start/running, process 2807

vimmanager start/running, process 2807
esc_confd is started
tomcat6 (pid 2973) is running...                           [  OK  ]
postgresql-9.4 (pid  2726) is running...
ESC service is running...
Active VIM = OPENSTACK
ESC Operation Mode=OPERATION

/opt/cisco/esc/esc_database is a mountpoint
============== ESC HA (MASTER) with DRBD ==================
DRBD_ROLE_CHECK=0
MNT_ESC_DATABSE_CHECK=0
VIMMANAGER_RET=0
ESC_CHECK=0
STORAGE_CHECK=0
ESC_SERVICE_RET=0
MONA_RET=0
ESC_MONITOR_RET=0
=====================================
ESC HEALTH PASSED
```

Viewing ESC Logs

ESC logs are available on the VNFM VM in the following directory:

/var/log/esc/

Two levels of logs are available for ESC:

- ESC Logs, on page 73
- ESC YANG Logs, on page 74

Refer also to the ESC user documentation for additional information on monitoring and maintaining the software.

ESC Logs

To collect ESC logs:

1. Log on to the primary VNFM VM.
2. Navigate to the scripts directory.

   cd /opt/cisco/esc/esc-scripts
3. Launch the *collect-esc-logs.sh* script to collect the logs.

   sudo ./collect-esc-logs.sh

Example log output:

```
We trust you have received the usual lecture from the local System
Administrator. It usually boils down to these three things:

    #1) Respect the privacy of others.
    #2) Think before you type.
    #3) With great power comes great responsibility.

Warning: tar completed with status: 1

Tarball file:  /var/tmp/esc_log-2017-05-25_18.09.31_UTC.tar.bz2
Symbolic link: /tmp/esc_log-2017-05-25_18.09.31_UTC.tar.bz2

Suggestions:
 1. Transfer the tarball file from the esc vm
 2. Remove the tarball and symbolic link (to save ESC disk space):
     sudo rm /var/tmp/esc_log-2017-05-25_18.09.31_UTC.tar.bz2
     sudo rm /tmp/esc_log-2017-05-25_18.09.31_UTC.tar.bz2
 3. Command to list contents of tarball:
     tar jtvf esc_log-2017-05-25_18.09.31_UTC.tar.bz2
 4. Command to extract from the tarball:
     tar jxf esc_log-2017-05-25_18.09.31_UTC.tar.bz2
```

ESC YANG Logs

ESC YANG logs are stored in the following file:

/var/log/esc/yangesc.log

Monitoring VNF Operations

Viewing UEM Service Status

1. Log on to the master UEM VM as the user *ubuntu*.
2. Access the NCS CLI.

   /opt/cisco/usp/packages/nso/ncs-4.1.1/bin/ncs_cli -C -u admin
3. Check the NCS state.

   show ncs-state ha

   Example command output:

   ```
   ncs-state ha mode master
   ncs-state ha node-id 3-1501714180
   ncs-state ha connected-slave [ 4-1501714262 ]
   ```

4. Display the health of cluster.

   show ems

   Example command output:

```
EM            VNFM
ID  SLA  SCM  PROXY  VERSION
-----------------------------
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0
```

Important The UEM services will no longer run on the slave UEM to simplify troubleshooting, maintenance, and synchronization related issues.

Viewing UEM Logs

To collect UEM logs:

1. Navigate to the *scripts* directory.

   cd /opt/cisco/em-scripts

2. Launch the *collect-em-logs.sh* script to collect the logs.

   sudo ./collect-em-logs.sh

   Example log output:

```
Collecting Zookeeper nodes...
Traceback (most recent call last):
  File "/opt/cisco/em-scripts/zk_dump.py", line 2, in <module>
    from kazoo.client import KazooClient

To extract the tarball, run: "tar jxf /tmp/em-logs-2017-05-26_00.37.28_UTC.tar.bz2"
```

Viewing UEM Zookeeper Logs

The UEM maintains logs on the Zookeeper process. The logs are located in the following directories:

`/var/log/em/zookeeper/zookeeper.log`

`/var/log/em/zookeeper/zookeeper.out`

For logs from 3rd Zookeeper instance, check the following directories:

`/var/log/em/zookeeper/arbiter/zookeeper.log`

`/var/log/em/zookeeper/arbiter/zookeeper.out`

To collect the contents of UEM Zookeeper database, use the following command:

`sudo ./collect-em-logs.sh -add-zookeeper`

If "new -add-zookeeper" flag is specified, then by default, zookeeper data is collected in a single file named *zk_data*.

For a larger deployment, Zookeeper content can be collected in sub-folders. To collect the Zookeeper content in sub-folders, specify "-tree-output" flag as shown in the following command:

`sudo ./collect-em-logs.sh -add-zookeeper -tree-output`

When this command is executed, Zookeeper contents are collected under *zk_data* directory.

Viewing VNF Information through the Control Function

Information on the VNF deployment can be obtained by executing commands on the Control Function (CF) VNFC. To access the CF CLI:

1. Open an SSH connection to the IP address of the management interface associated with CF1.
2. Press **Enter** to bring up the log in prompt.
3. Enter the username and password.
4. At the Exec mode prompt, enter each of the following commands and observe the results to ensure that the VNF components have been properly deployed according to the desired configuration:

Command	Purpose
show card table	Displays all VM types (e.g. CF, SF, NF, and AF) that have been deployed.
show crash list	Displays software crash events records and associated dump files (minicore, NPU or kernel) for all crashes or a specified crash event. Verify that there are no new or unexpected crashes listed.

Command	Purpose
show emctrl vdu list	Displays card to VM mappings for the VNF. Each card should have a valid universally unique identifier (UUID).
show rct stats	Displays statistics associated with Recovery Control Task (RCT) events, including migrations, switchovers and shutdowns. RCT statistics are associated with card-to-card session recovery activities.
show session progress	Displays session progress information for the current context filtered by the options specified. Check for any active or new calls before proceeding with a deactivation.
show version verbose	Displays the software version that has been deployed.
show vdu summary	Displays general information pertaining to the virtual descriptor units (VDUs) that have been deployed.
In releases prior to 6.0: **show usf vdu all** In 6.0 and later releases: **show vnfr vdu all**	Displays detailed information for the VDUs that have been deployed for the USF VDU.
In releases prior to 6.0: **show usf vdu-group all** In 6.0 and later releases: **show vnfr vdu-group all**	Displays information for VDU groups pertaining to the USF VNF use case (if deployed).
In releases prior to 6.0: **show usf network-path all** In 6.0 and later releases: **show vnfr network-path all**	Displays network path information for USF VNF components (if deployed).
In releases prior to 6.0: **show usf service-function-chain all** In 6.0 and later releases: **show vnfr service-function-chain all**	Displays SFC information for the USF VNF (if deployed).

Monitoring and Recovering AutoVNF Through AutoIT

AutoIT provides the ability to monitor and auto-recover AutoVNF instances.

This functionality is enabled through configuration of the AutoVNF VNFC(s) at the time of deployment. Once enabled, AutoIT automatically monitors for faults/failures of the AutoVNF VNFC(s) for which the functionality is enabled. If a fault/failure is detected, AutoIT automatically attempts to auto-heal/recover (redeploy) the VNFC(s).

Important The Provisioning Network (floating) IP address is required to leverage the health monitoring functionality.

The following parameters must be configured at the VNFC-level:

Table 4: Health Check Descriptor Parameters

Parameter	Required	Type	Description
enabled	O	bool	Enable/Disable health monitoring.
probe-frequency	O	uint16	Health Check Frequency in seconds. UAS uses this as health probe time, meaning every polling interval UAS will invoke health check. Default value is 10 seconds.
probe-max-miss	O	uint16	Maximum number of health probe misses before VNFC instance is declared dead. Default value is 6.
recovery-type	O	choice string	Recovery type. It can be one of the following: • restart: Recovery only by restarting, move the VNFC instance to error after max retries • external: Recovery performed by external entity. No auto-recovery • restart-then-redeploy: Restart the VM on failure. After maximum retries, redeploy the failed VNFC instances. Default value is restart-then-redeploy.
retry-count	O	uint16	Number of retries to recover the VNFC Instance. Default value is set to restart-then-redeploy.
boot-time	O	uint16	Initial Bootup time for the VNFC. Default value is 300 seconds.
script	O	string	Script to check VNFC health, by default UAS ICMP script will be used.

The above parameters are configured at the VNFC-level within the VNF descriptor information that is part of the deployment network service descriptor (NSD) as shown in the following example configuration:

```
nsd <nsd_name>
…
 vnfd <autovnf_vnfd_name>
…
```

```
  vnfc <autovnf_vnfc_name>
   health-check enabled
   health-check probe-frequency 10
   health-check probe-max-miss 6
   health-check retry-count 6
   health-check recovery-type restart-then-redeploy
   health-check boot-time 300
…
```

Refer to the *Cisco Ultra Services Platform NETCONF API Guide* for more information on the use of these and other parameters related to VNF configuration and deployment.

In the event that automatic recovery is not possible, an API is available to manually recover the VNFC(s).

VNFC status can be viewed by executing the **show vnfr** command from AutoIT. Additional details can be found in the transaction logs for the deployment.

To manually recover a failed AutoVNF VNFC, execute the following command:

recover nsd-id *<nsd_name>* **vnfd** *<vnfd_name>*

Monitoring and Recovering VNFC Through AutoVNF

The UEM, CF, and SF VNFCs were autorecovered through the VNFM (ESC). In these situations, AutoVNF was not informed of these events. With this release, the AutoVNF monitors these VNFC VMs and can auto-recover them if required. Additionally, the AutoVNF can also monitor the VNFM (ESC) VMs and provide auto-recovery as needed.

This functionality is enabled through configuration of the VNFC(s) at the time of deployment. Once enabled, AutoVNF automatically monitors for faults/failures of the VNFCs for which the functionality is enabled. If a fault/failure is detected, AutoVNF automatically attempts to auto-heal/recover (redeploy) the VNFC(s).

Important The Provisioning Network (floating) IP address is required to leverage the health monitoring functionality.

This functionality is currently only supported for the following VNFCs:

- VNFM (ESC)
- UEM
- CF
- SF

Important Ultra M Manager sends fault notification when VMs are down and/or recovered.

The following parameters must be configured at the VNFC-level:

Table 5: Health Check Descriptor Parameters

Parameter	Required	Type	Description
enabled	O	bool	Enable/disable health monitoring.

Parameter	Required	Type	Description
probe-frequency	O	uint16	Health Check Frequency in seconds. UAS uses this as health probe time, meaning every polling interval UAS will invoke health check. Default value is 10 seconds.
probe-max-miss	O	uint16	Maximum number of health probe misses before VNFC instance is declared dead. Default value is 6.
recovery-type	O	choice string	Recovery type. It can be one of the following: • restart: Recovery only by restarting, move the VNFC instance to error after max retries • external: Recovery performed by external entity. No auto-recovery • restart-then-redeploy: Restart the VM on failure. After maximum retries, redeploy the failed VNFC instances. Default value is restart-then-redeploy.
retry-count	O	uint16	Number of retries to recover the VNFC Instance. Default value is set to restart-then-redeploy.
boot-time	O	uint16	Initial bootup time for the VNFC. Default value is 300 seconds.
script	O	string	Script to check VNFC health, by default UAS ICMP script will be used.

The above parameters are configured at the VNFC-level within the VNF descriptor information that is part of the deployment network service descriptor (NSD) as shown in the following example configuration:

```
nsd <nsd_name>
…
 vnfd <autovnf_vnfd_name>
…
  vnfc <vnfm_vnfc_name>
   health-check enabled
   health-check probe-frequency 10
   health-check probe-max-miss 6
   health-check retry-count 6
   health-check recovery-type restart-then-redeploy
   health-check boot-time 300
…
  vnfc <uem_vnfc_name>
   health-check enabled
   health-check probe-frequency 10
   health-check probe-max-miss 6
   health-check retry-count 6
   health-check recovery-type restart-then-redeploy
   health-check boot-time 300
…
  vnfc <cf_vnfc_name>
```

```
   health-check enabled
   health-check probe-frequency 10
   health-check probe-max-miss 6
   health-check retry-count 6
   health-check recovery-type restart-then-redeploy
   health-check boot-time 300
…
  vnfc <sf_vnfc_name>
   health-check enabled
   health-check probe-frequency 10
   health-check probe-max-miss 6
   health-check retry-count 6
   health-check recovery-type restart-then-redeploy
   health-check boot-time 300
…
```

Refer to the *Cisco Ultra Services Platform NETCONF API Guide* for more information on the use of these and other parameters related to VNF configuration and deployment.

In the event that automatic recovery is not possible, an API is available to manually recover the VNFC(s).

VNFC status can be viewed by executing the **show vnfr** command from AutoIT. Additional details can be found in the transaction logs for the deployment.

To manually recover a failed VNFC, execute the following command:

recover nsd-id *<nsd_name>* **vnfd** *<vnfd_name>*

Auto-Recovery of AutoDeploy and AutoIT Instances

The AutoIT and AutoDeploy provide the ability to auto-recover the AutoIT and AutoDeploy instances respectively when any of the instances are inactive. The auto-recovery procedure is facilitated by using the **boot_uas.py** script.

Important The auto-recovery mechanism works only in the HA mode.

To perform the auto-recovery of AutoDeploy instance, use the following script from a bare metal server:

./boot_uas.py --kvm --autodeploy --hostname *HOSTNAME* **--recover** *RECOVERY ID*

To perform the auto-recovery of AutoIT instance, use the following script from the bare metal server:

./boot_uas.py --kvm --autoit --hostname *HOSTNAME* **--recover** *RECOVERY ID*

The description of the options in the script is as follows:

Options	Description
--kvm	Specifies the recovery of the AutoDeploy or AutoIT instance from KVM (bare metal server). **Important** Recovery of the AutoDeploy and AutoIT instances in the OpenStack environment uses the same script but replacing the **kvm** option with **openstack** option in the script.

Options	Description
--autodeploy	Specifies the recovery of the AutoDeploy instances.
--autoit	Specifies the recovery of the AutoIT instances.
--hostname	Specifies the hostname of the instance to recover. Each of the AutoDeploy and AutoIT instances has one instance ID that is used to identify the instance to recover in the HA mode. So, setting this option is mandatory. To determine the hostname, follow these steps: **In the OpenStack environment:** **1.** Navigate to the */opt/cisco/uas-deployments* directory path. **2.** Use the **grep** command with the image name, which is used at the time of deployment of the AutoDeploy and AutoIT, to identify the deployment ID. For example : **grep -nr "64regression-image" *** **3.** Open the text file that corresponds to the identified deployment ID and check the value of the "name" key in the file. **Note** The value of the name key is the hostname. **In the KVM environment**: Use the hostname that was already configured during the deployment of AutoIT and AutoDeploy. Otherwise, log on to the AutoIT or AutoDeploy node and obtain the hostname from the active node.

Options	Description
--recover	**In the KVM environment:** Specifies the recovery value as an instance ID. Use this value to identify the unique deployment. **Note** The deployment ID for the AutoDeploy and AutoIT is available at the */var/cisco/AutoDeploy* and */var/cisco/AutoIT* directory paths, respectively. **In the OpenStack environment:** Specifies the recovery value as a deployment ID. Use this value to identify the unique deployment. **Note** The deployment ID for AutoDeploy and AutoIT is available at the */opt/cisco/uas-deployments* directory path. To identity the deployment ID, use the **grep** command with the image name, which is used at the time of deployment of the AutoDeploy and AutoIT. For example : **grep -nr "64regression-image" ***

Sample Output of Auto-Recovery Command

```
[root@tb2ano-rtp-baremetal abcefg]# virsh list --all
 Id    Name                           State

Troubleshooting Deactivation Process and Issues

NOTES:

- The deactivate process is idempotent and can be multiple times and without error. The system will retry to remove any resources that remain.
- If a deactivation fails (a transaction failure occurs), look at the logs on various UAS software components (AutoDeploy, AutoIT, and AutoVNF), VNFM (ESC), and UEM.
- If deactivation has failed, you must ensure that a clean up is performed either using automation tools or manually if necessary.
- Activation must not be reattempted until all of the previous artifacts have been removed.

Deactivation Fails Due to Communication Errors with AutoVNF

Problem Description

During the AutoVNF deactivation process, AutoDeply indicates that it is unable to deactivate the AutoVNF. This is observed through:

- AutoDeploy transaction log
- AutoDeploy upstart log

Possible Cause(s)

- AutoDeploy is not able to communicate with AutoVNF.

Action(s) to Take

- Check network connectivity between the AutoDeploy VM and the AutoVNF VIP.
- Check the management and orchestration network.
- Address any connectivity issues.

Next Steps

- Once connectivity issues are addressed, perform the deactivate procedure again.

Deactivation Fails Because AutoDeploy Generates an Exception

Problem Description

AutoDeploy generates an exception error during the deactivation process.

Possible Cause(s)

- Connectivity issues
- Configuration issues
- OpenStack/VIM specific issues
- Hardware issues

Action(s) to Take

1. Capture logs from */var/log/upstart/autodeploy.log* along with exception error message.
2. Log on to AutoIT and collect the logs from */var/log/upstart/autoit.log* along with the exception message, if any.
3. Log on to VIP of the active (master) AutoVNF VM and perform a cleanup by running the **deactivate** command from there.
   a. Log on to the AutoVNF VM as the default user, *ubuntu*.
   b. Switch to the root user.
      ```
      sudo su
      ```
   c. Enter the ConfD CLI.
      ```
      confd_cli -C -u admin
      ```
   d. Enter the *admin* user password when prompted.
   e. Deactivate the deployment.
      ```
      deactivate nsd-id <nsd_name>
      ```
4. Check the last transaction log to verify that the deactivation was successful. (Transactions are auto-sorted by timestamp, so it should be the last one in the list.)

   Example commands and outputs:

   ```
   show transactions
   ```

   ```
   TX ID              TX TYPE         ID          TIMESTAMP                          STATUS
               DETAIL
   ------------------------------------------------------------------------------------------------------------
   1500605583-055162  vnf-deployment  dep-5-5  2017-07-21T02:53:03.055205-00:00
   deployment-failed   -

   1500606127-221084  vnf-deployment  dep-5-5  2017-07-21T03:02:07.221114-00:00
   deployment-success  -
   ```

```
show log 1500606127-221084 | display xml
<config xmlns="http://tail-f.com/ns/config/1.0">
  <log xmlns="http://www.cisco.com/usp/nfv/usp-autovnf-oper">
    <tx-id>1500606127-221084</tx-id>
    <log>2017-07-21 03:02:07,276 - Notify deployment
2017-07-21 03:02:07,297 - Connection to VNFM (esc) at 172.16.181.107
2017-07-21 03:02:07,418 - NETConf Sessions (Transaction/Notifications) estabilished
…
```

5. Manually delete the AutoDeploy VM using the information in Terminating the AutoDeploy VM, on page 2.

Next Steps

- Open a support case providing all of the log information that was collected.

Deactivation Fails Because of AutoVNF-VNFM Communication Issues

Problem Description

During the AutoVNF deactivation process, AutoVNF indicates that it is unable to deactivate the VNFM. This is observed through:

- AutoVNF transaction log
- AutoVNF upstart log

Possible Cause(s)

- AutoVNF is not able to communicate with the VNFM.

Action(s) to Take

- Check network connectivity between the master AutoVNF VM and the VNFM VIP.
- Check the management and orchestration network.
- Address any connectivity issues.

Next Steps

- Once connectivity issues are addressed, perform the deactivate procedure again.

Deactivation Fails Because of Issue at VNFM

Problem Description

During the AutoVNF deactivation process, the VNFM returns an error. This is observed through:

- AutoVNF transaction log
- AutoVNF upstart log
- ESC logs

Possible Cause(s)

- ESC health is not good due to an issue or network connectivity.
- ESC is not able to communicate with the VIM.
- ESC has an internal error.
- AutoVNF is unable to create/delete OpenStack artifacts.

Action(s) to Take

1. Check */var/log/esc/yangesc.log* for any issues or error messages.
2. Run **health.sh** to determine the health of ESC.
3. Check network connectivity and address an issues. Retry the deactivation.
4. Check network connectivity with the VIM and address any issues. Retry the deactivation.
5. Determine if ESC has a deployment configuration. From the active ESC VM:

   ```
   /opt/cisco/esc/confd/bin/confd_cli -C
   show running-config
   ```

   If a configuration is present, most likely ESC is still retrying the deactivation, allow more time for the process to continue.

   If no configuration exists, check if there are deployment artifacts still on the VIM. Retry the deactivation.
6. Collect logs by running *collect_esc_log.sh* from both the active and standby ESC VMs.
7. Perform a manual cleanup.

Note Only artifacts which UAS created need to be removed. Any pre-created artifacts must remain in place.

   a. Login on to the VIM as tenant.
   b. Remove all VMs.
   c. Remove all VIP Ports.
   d. Remove all networks.
   e. Remove all flavors.
   f. Remove all volumes.
   g. Remove all images.
   h. Remove host-aggregate created as part of automation.

Next Steps

- Open a support case providing all of the log information that was collected.

Deactivation Fails Because AutoVNF Generates an Exception

Problem Description

AutoVNF generates an exception error during the deactivation process.

Possible Cause(s)

- Connectivity issues
- Configuration issues
- OpenStack/VIM specific issues
- Hardware issues

Action(s) to Take

1. Collect all logs from */var/log/cisco-uas*.
2. Perform a manual cleanup.

Note Only artifacts which UAS created need to be removed. Any pre-created artifacts can remain in place.

   a. Login on to the VIM as tenant.
   b. Remove all VMs.
   c. Remove all VIP Ports.
   d. Remove all networks.
   e. Remove all flavors.
   f. Remove all volumes.
   g. Remove all images.
   h. Remove host-aggregate created as part of automation.

Next Steps

- Open a support case providing all of the log information that was collected.

Troubleshooting UEM Issues

This section contains information on troubleshooting UEM issues.

UEM VM Stuck in a Boot Loop

Problem Description

Processes that normally run on the UEM VM are unable to start and the VM is stuck in a boot-loop.

Possible Cause(s)

There is an error with the Zookeeper database keeping the Zookeeper process and other UEM processes from starting. (No other UEM process can be started unless the Zookeeper process has started.)

Important Release 6.3 onwards, no UEM services will run on the slave UEM.

Action(s) to Take

1. Check the UEM Zookeeper logs. Refer to Viewing UEM Zookeeper Logs, on page 76.
2. Look for error messages similar to the following:

   ```
   [myid:4] - INFO  [main:FileSnap@83] - Reading snapshot
   /var/lib/zookeeper/data/version-2/snapshot.5000004ba
   [myid:4] - ERROR [main:QuorumPeer@557] - Unable to load database on disk
   java.io.EOFException
   ```

   If the above errors exist, proceed to the next step. If not, further debugging is required. Please contact your local support representative.
3. Rebuild the Zookeeper database.
   a. Check the health of Master and Slave EM instances. Execute the following commands on each instance.

   Master UEM VM:

   ```
   sudo -i
   ncs_cli -u admin -C
   admin connected from 127.0.0.1 using console on deploymentem-1

   show ems
   EM            VNFM
   ID  SLA  SCM  PROXY  VERSION
   ------------------------------
   3   UP   UP   UP     5.7.0
   6   UP   UP   UP     5.7.0

   exit
   ```

Important Only the master UEM status may be displayed in the above command because the slave UEM is in the boot loop.

```
show ncs-state ha
ncs-state ha mode master
ncs-state ha node-id 6-1506059686
ncs-state ha connected-slave [ 3-1506059622 ]
```

Slave UEM VM:

Important The slave UEM may not be accessible if it is experiencing the boot loop issue.

```
sudo -i
ncs_cli -u admin -C
```

```
admin connected from 127.0.0.1 using console on deploymentem-1
```

```
show ems
EM            VNFM
ID  SLA  SCM  PROXY  VERSION
------------------------------
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0
```

```
exit
```

```
show ncs-state ha
ncs-state ha mode slave
ncs-state ha node-id 3-1506059622
ncs-state ha master-node-id 6-1506059686
```

b. Log on to the node on which Zookeeper data is corrupted.

c. Enable the debug mode.

```
/opt/cisco/em-scripts/enable_debug_mode.sh
Disable EM reboot. Enable debug mode
```

d. Reboot the VM in order to enter the debug mode.

e. Remove the corrupted data.

```
cd /var/lib/zookeeper/data/
ls
myid  version-2  zookeeper_server.pid
```

```
mv version-2 version-2_old
```

Check for corrupted data in the arbiter directory as well.

```
cd /var/lib/zookeeper/arbiter/data
ls
myid  version-2  zookeeper_server.pid
```

```
mv version-2 version-2_old
```

Important This process removes the Zookeeper database by renaming it for additional debugging/recovery.

f. Reboot the node instance for it to reconcile and rebuild the Zookeeper database from a healthy UEM instance.

```
reboot
```

g. Log on to the UEM VM upon reboot.

h. Validate that the database has been successfully rebuilt on the previously failing UEM node.

```
sudo -i
ncs_cli -u admin -C
admin connected from 127.0.0.1 using console on vnfddeploymentem-0
```

```
show ems
EM            VNFM
ID  SLA  SCM  PROXY  VERSION
```

```
------------------------------
3   UP   UP   UP     5.7.0
6   UP   UP   UP     5.7.0
```

show ncs-state ha

```
ncs-state ha mode slave
ncs-state ha node-id 3-1506093933
ncs-state ha master-node-id 6-1506093930
```

exit

cd /var/lib/zookeeper/data/
ls

```
myid  version-2  version-2_old  zookeeper_server.pid
```

cat /var/log/em/zookeeper/zookeeper.log

```

<---SNIP--->
```

Also, check the logs in the */var/log/em/zookeeper/arbiter* directory.

i. Disable the UEM debug mode on the VM on which the Zookeeper database was rebuilt.

/opt/cisco/em-scripts/disable_debug_mode.sh

```
Disable debug mode
```

Next Steps

Open a support case providing all the log information that was collected.
