

ACL Configuration Mode Commands

	The Access Control List Configuration Mode is used to create and manage IP-based, user access privileges.
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	configure > context <i>context_name</i> > ip access-list <i>acl_name</i>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
(f	
Important	The commands or keywords/variables that are available are dependent on platform type, product version, and installed license(s).
	deny/permit (by source IP address masking), on page 2

- redirect nexthop (by IP packets), on page 105
- redirect nexthop (by TCP/UDP packets), on page 108

deny/permit (by source IP address masking)

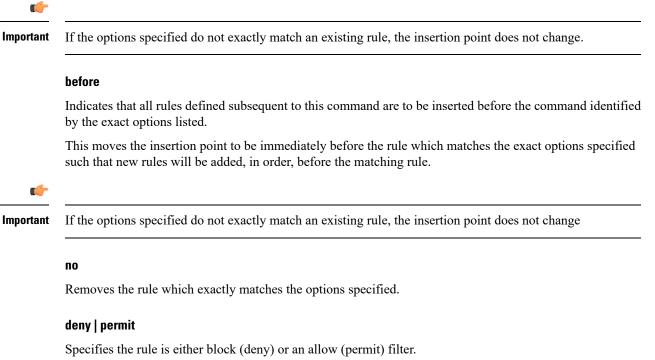

Filters subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>{ deny permit } [log] source_address source_wildcard after { deny permit } [log] source_address source_wildcard before { deny permit } [log] source_address source_wildcard no { deny permit } [log] source_address source_wildcard</pre>

after

Indicates that all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

• deny: Indicates the rule, when matched, drops the corresponding packets.

• permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

Important The logging option is not supported for ACLs applied on SPIO or local contexts.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

	must be identical.
	• One-bits in this parameter mean that the corresponding bits configured for the <i>source_address</i> parameter must be ignored.
(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
Usage Guidelines	Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rules as it does not require a rule for each source and destination pair.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .

• Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter

Example

The following command defines two rules with the second logging filtered packets:

permit 1.2.3.0 0.0.0.31 deny log 1.2.4.0 0.0.0.15

The following sets the insertion point before the first rule defined above:

```
before permit 1.2.3.0 0.0.0.31
```

The following command sets the insertion point after the second rule defined above:

after deny log 1.2.4.0 0.0.0.15

The following deletes the first rule defined above:

no permit 1.2.3.0 0.0.0.31

deny/permit (any)

Filters subscriber sessions based on any packet received. This command is also sets the access control list insertion point.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>

Entering the above command sequence results in the following prompt:

```
[context name]host name(config-acl)#
```

no { deny | permit } [log] any

```
Syntax Description { deny | permit } [ log ] any
after { deny | permit } [ log ] any
before { deny | permit } [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- deny: Indicates the rule, when matched, drops the corresponding packets.
- permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.

Indicates all packets which match the filter are to be logged.

Important

The logging option is not supported for ACLs applied on SPIO or local contexts.

I

	any
	Indicates all packets will match the filter regardless of source and/or destination.
Usage Guidelines	Define a catch all rule to place at the end of the list of rules.
Important	It is suggested that any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.
	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
	Example
	The following commands define two rules with the second logging filtered packets:
	permit any deny log any
	The following sets the insertion point before the first rule defined above:
	before permit any
	The following command sets the insertion point after the second rule defined above:
	after deny log any
	The following deletes the first rule defined above:
	no permit any

deny/permit (by host IP address)

Filters subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>{ deny permit } [log] host source_host_address after { deny permit } [log] host source_host_address before { deny permit } [log] host source_host_address no { deny permit } [log] host source host address</pre>

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

٩

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

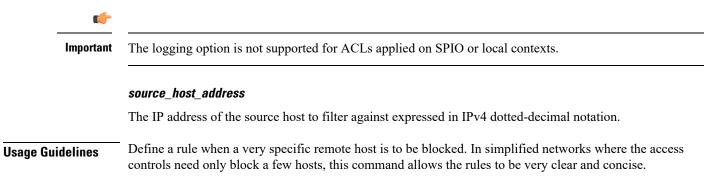

Specifies the rule is either block (deny) or an allow (permit) filter.

- deny: Indicates the rule, when matched, drops the corresponding packets.
- permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.

Indicates that all packets which match the filter are to be logged.

C-

Important

The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following commands define two rules with the second logging filtered packets:

```
permit host 10.2.3.4
deny log host 10.2.3.5
```

The following sets the insertion point before the first rule defined above:

```
before permit host 10.2.3.4
```

The following command sets the insertion point after the second rule defined above:

after deny log host 10.2.3.5

The following deletes the first rule defined above:

```
no permit host 10.2.3.4
```

deny/permit (by source ICMP packets)

Filters subscriber sessions based on the internet control message protocol (ICMP) packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>{ deny permit } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]] after { deny permit } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]] before { deny permit } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]] no { deny permit } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]]</pre>

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

٩

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

6

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- deny: Indicates the rule, when matched, drops the corresponding packets.
- permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

Important The logging option is not supported for ACLs applied on SPIO or local contexts.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

	(
Important	Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
		icmp_type
		Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.
		icmp_code
		Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.
Usage Gui	delines	Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk.
		The IP filtering allows flexible controls for pairs of individual hosts or groups by IP masking which allows the filtering of entire subnets if necessary.
	¢	
Important	Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
		Example
		The following commands define two rules with the second logging filtered packets:
		permit icmp host 10.2.3.4 any 168 deny log icmp 10.2.3.0 0.0.0.31 host 10.2.4.16 168 11
		The following sets the insertion point before the first rule defined above:
		before permit icmp host 10.2.3.4 any 168
		The following command sets the insertion point after the second rule defined above:
		after deny log icmp 10.2.3.0 0.0.0.31 host 10.2.4.16 168 11
		The following deletes the first rule defined above:
		no permit icmp host 10.2.3.4 any 168

deny/permit (by IP packets)

Filters subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product

All

Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>{ deny permit } [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] after { deny permit } [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] before { deny permit } [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] before { deny permit } [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] no { deny permit } [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num]</pre>
	after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

```
C)
```

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

C)

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- deny: Indicates the rule, when matched, drops the corresponding packets.
- permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.

Indicates all packets which match the filter are to be logged.

Important The logging option is not supported for ACLs applied on SPIO or local contexts.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

C/

Important

rtant The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet filtering is to be applied to IP packet fragments only.

protocol num

Indicates that the packet filtering is to be applied to a specific protocol number.

num can be an integer ranging from 0 to 255.

(
Important	This keyword is not applicable to a SPIO interface. Instead, you must specify the type of protocol packets for which you want to deny/permit processing on a SPIO. For example, deny icmp , deny tcp , or deny udp .
Usage Guidelines	Block IP packets when the source and destination are of interest.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .

Example

The following commands define two rules with the second logging filtered packets:

```
permit ip host 10.2.3.4 any fragment
deny log ip 10.2.3.0 0.0.0.31 host 10.2.4.16
```

The following sets the insertion point before the first rule defined above:

before permit ip host 10.2.3.4 any fragment

The following command sets the insertion point after the second rule defined above:

after deny log ip 10.2.3.0 0.0.0.31 host 10.2.4.16

The following deletes the first rule defined above:

no permit ip host 10.2.3.4 any fragment

deny/permit (by TCP/UDP packets)

Filters subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>{ deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port range start_port end_port] } after { deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port range start_port end_port] } before { deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port end_port] } before { deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port range start_port end_port] } no { deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port neq dest_port range start_port end_port] } no { deny permit } [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq source_port] } { { dest_address dest_wildcard any host dest_host_address } } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } } } } } } } } } } } } } } } } } }</pre>

} [eq dest_port | gt dest_port | lt dest_port | neq dest_port | range start_port
end port] }

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

C)

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

deny | permit

Specifies the rule is either block (deny) or an allow (permit) filter.

- deny: Indicates the rule, when matched, drops the corresponding packets.
- permit: Indicates the rule, when matched, allows the corresponding packets.

log

Default: Packets are not logged.

Indicates all packets which match the filter are to be logged.

Important The logging option is not supported for ACLs applied on SPIO or local contexts.

tcp | udp

Specifies the filter is to be applied to IP based transmission control protocol or the user datagram protocol.

• tcp: Filter applies to TPC packets.

• udp: Filter applies to UDP packets.

source_address

The IP address(es) from which the packet originated. IP addresses must be entered in IPv4 dotted-decimal format.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important

ant The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered.

source_port must be an integer from 0 through 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

C)

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be an integer from 0 through 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.

dest_port must be an integer from 0 through 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

neq dest_port

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

range start_port end_port

Specifies a range of ports to be matched.

start_port must be an integer from 0 through 65535, and must be less than the end_port value.

end_port must be an integer from 0 through 65535, and must be greater than the start_port value.

is option is supported in PDIF Release 8.3.
ock IP packets when the source and destination are of interest but for only a limited set of ports.
e maximum number of rules that can be configured per ACL varies depending on how the ACL is to be ed. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
e

Example

The following commands define four rules with the second and fourth rules logging filtered packets:

permit tcp host 10.2.3.4 any deny log udp 10.2.3.0 0.0.0.31 host 10.2.4.16 permit tcp host 10.2.3.64 gt 1023 any deny log udp 10.2.3.0 0.0.0.31 10.2.4.127 0.0.0.127

The following sets the insertion point before the first rule defined above:

before permit tcp host 10.2.3.4 any

The following command sets the insertion point after the second rule defined above:

after deny log udp 10.2.3.0 0.0.0.31 host 10.2.4.16

The following deletes the third rule defined above:

no permit tcp host 10.2.3.64 gt 1023 any

description

Allows you to enter descriptive text for this configuration.

I

Product	- All
Privilege	Security Administrator, Administrator
Syntax Description	description text no description
	no
	Clears the description for this configuration.
	text
	Enter descriptive text as an alphanumeric string of 1 to 100 characters.
	If you include spaces between words in the description, you must enclose the text within double quotation marks (" "), for example, "AAA BBBB".
Usage Guidelines	The description should provide useful information about this configuration.
ond	

end

	Exits the current configuration mode and returns to the Exec mode.
Product	All
Privilege	Security Administrator, Administrator
Syntax Description	end
Usage Guidelines	Use this command to return to the Exec mode.

exit

Exits the current mode and returns to the parent configuration mode.

Product	All
Privilege	Security Administrator, Administrator
Syntax Description	exit
Usage Guidelines	Use this command to return to the parent configuration mode.

readdress server

Alters the destination address and port number in TCP or UDP packet headers to redirect packets to a different server.

L

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration configure > context context_name > ip access-list acl_name
	Entering the above command sequence results in the following prompt: [context_name]host_name(config-acl) #
Syntax Description	<pre>readdress server redirect_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq] dest_port gt dest_port lt dest_port neq dest_port] } after readdress server redirect_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq] dest_port gt dest_port lt dest_port neq dest_port] } before readdress server redirect_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq] dest_port gt dest_port lt dest_port neq dest_port] } no readdress server redirect_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { dest_address dest_wildcard any host dest_host_address [port port_no] { top udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { dest_address dest_wildcard any host dest_host_address } [eq] dest_port gt dest_port lt dest_port neq dest_port] }</pre>

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

C)

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

redirect_address

The IP address to which the IP packets are redirected. TCP or UDP packet headers are rewritten to contain the new destination address. This must be an IPv4 address specified in dotted-decimal notation.

port port_no

The number of the port at the redirect address where the packets are sent. TCP or UDP packet headers are rewritten to contain the new destination port number.

tcp | udp

Specifies the redirect is to be applied to the IP based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TCP packets.
- **udp**: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be an integer from 0 through 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

• Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

 One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.

G

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be an integer from 0 through 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer 0 through 65535.

neq dest_port

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.

dest_port must be an integer 0 through 65535.

Usage Guidelines Use this command to define a rule that redirects packets to a different destination address. The TCP and UDP packet headers are modified with the new destination address and destination port.

(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
¢	
Important	Prior to Release 8.3, for packets received from the packet data network destined for a subscriber's UE, the system applied logic to reset the source address of a packet to the original destination address of the input

Prior to Release 8.3, for packets received from the packet data network destined for a subscriber's UE, the system applied logic to reset the source address of a packet to the original destination address of the input packet before applying the outbound access control list (ACL). In Release 8.3 and higher, the system reverses the order and applies the outbound ACL before resetting the source address. This change impacts all current readdress server rules in inbound IPv4 ACLs.

Important

After Release 8.3, for every readdress server rule in an inbound IPv4 ACL, you must add a permit rule to an outbound ACL that explicitly permits packets from the readdress rule's redirect address and port number. If the permit rule is omitted, the system will reject all packets destined for the subscriber's UE from the readdress rule's redirect address and port number.

Example

The following command defines a rule that redirects packets to the server at 192.168.10.4, UDP packets coming from any host with a destination of any host are matched:

```
readdress server 192.168.10.4 udp any any
```

The following sets the insertion point before the rule defined above:

before readdress server 192.168.10.4 udp any any

The following command sets the insertion point after the first rule defined above:

after readdress server 192.168.10.4 udp any any

The following deletes the rule defined above:

no readdress server 192.168.10.4 udp any any

redirect context (by IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect context context_id [log] source_address source_wildcard after redirect context context_id [log] source_address source_wildcard before redirect context context_id [log] source_address source_wildcard no redirect context context_id [log] source_address source_wildcard</pre>
	after
	Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

(

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
Usage Guidelines	Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of redirect rules as it does not require a rule for each source and destination pair.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

redirect context 23 198.162.22.0 0.0.0.31

The following sets the insertion point before the rule defined above:

before redirect context 23 198.162.22.0 0.0.0.31

The following command sets the insertion point after the first rule defined above:

after redirect context 23 198.162.22.0 0.0.0.31

The following deletes the first rule defined above:

no redirect context 23 198.162.22.0 0.0.0.31

redirect context (any)

Redirects subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>

Entering the above command sequence results in the following prompt:

```
[context name]host name(config-acl)#
```

```
Syntax Description redirect context context_id [ log ] any
```

```
after redirect context context_id [ log ] any
before redirect context context_id [ log ] any
no redirect context context id [ log ] any
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

C)

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

C)

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage Guidelines Det

Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

(
Important	Any rule which is added as a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule that redirects packets to the context with the context ID of 23 and any source IP:
	redirect context 23 any
	The following sets the insertion point before the rule defined above:
	before redirect context 23 any
	The following command sets the insertion point after the first rule defined above:
	after redirect context 23 any
	The following deletes the first rule defined above:
	no redirect context 23 any
redirect co	ontext (by host IP address)

Redirects subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect context context_id [log] host source_ipv4_address after redirect context context_id [log] host source_ipv4_address</pre>

before redirect context context_id [log] host source_ipv4_address
no redirect context context_id [log] host source_ipv4_address

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

C)

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_ipv4_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage Guidelines Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

L

(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23 and a host IP address of 192.168.200.11:

redirect context 23 host 192.168.200.11

The following sets the insertion point before the rule defined above:

before redirect context 23 host 192.168.200.11

The following command sets the insertion point after first the rule defined above:

after redirect context 23 host 192.168.200.11

The following deletes the first rule defined above:

no redirect context 23 host 192.168.200.11

redirect context (by source ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect context context_id [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]] after redirect context context_id [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest host address } [icmp type [icmp code]]</pre>
	before redirect context context_id [log] icmp { source_address source_wildcard

```
| any | host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ icmp_type [ icmp_code ] ]
no redirect context context_id [ log ] icmp { source_address source_wildcard |
any | host source_host_address } { dest_address dest_wildcard | any | host
dest_host_address } [ icmp_type [ icmp_code ] ]
```

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

G

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

```
C)
```

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

```
()
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
	icmp_type
	Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.
	icmp_code
	Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.
Usage Guidelines	Define a rule to block ICMP packets which can be used for address resolution and possibly be a security risk.
	The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.
1	
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

redirect context 23 icmp host 192.168.100.25

The following sets the insertion point before the rule defined above:

before redirect context 23 icmp host 192.168.100.25

The following command sets the insertion point after the first rule defined above:

after redirect context 23 icmp host 192.168.100.25

The following deletes the first rule defined above:

no redirect context 23 icmp host 192.168.100.25

redirect context (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect context context_id [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] after redirect context context_id [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] before redirect context context_id [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] before redirect context context_id [log] ip { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [fragment] [protocol num] no redirect context context_id [log] ip { source_address source_wildcard any</pre>
	This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.
1	
Important	If the options specified do not exactly match an existing rule, the insertion point does not change.
	before
	Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
	This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
(
Important	If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

C)

Important

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

¢

Important

tant The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol num

Indicates that the packet filtering is to be applied to a specific protocol number.

num can be an integer ranging from 0 to 255.

Usage Guidelines

Block IP packets when the source and destination are of interest.

C C

Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

6

Important Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

redirect context 23 ip host 198.162.100.25 any fragment

The following sets the insertion point before the rule defined above:

before redirect context 23 ip host 198.162.100.25 any fragment

The following command sets the insertion point after the first rule defined above:

after redirect context 23 ip host 198.162.100.25 any fragment

The following deletes the first rule defined above:

no redirect context 23 ip host 198.162.100.25 any fragment

redirect context (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect context context_id [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port] }</pre>
	<pre>after redirect context context_id [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port] }</pre>
	<pre>before redirect context context_id [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port] } no redirect context context_id [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port</pre>

| lt source_port | neq source_port] } { { dest_address dest_wildcard | any | host
 dest_host_address } [eq dest_port | gt dest_port | lt dest_port | neq dest_port]
}

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

```
Ċ
```

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

9

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TPC packets.
- udp: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

G

Important

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered.

source_port must be an integer from 0 through 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered.

source_port must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

C)

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be an integer from 0 through 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be an integer from 0 through 65535.

neq dest_port

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.

	dest_port must be an integer from 0 through 65535.
Usage Guidelines	Block IP packets when the source and destination are of interest but for only a limited set of ports.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule that redirects packets to the context with the context ID of 23, and UDP packets coming from any host are matched:
	redirect context 23 udp any
	The following sets the insertion point before the rule defined above:
	before redirect context 23 udp any
	The following command sets the insertion point after the first rule defined above:
	after redirect context 23 udp any
	The following deletes the rule defined above:
	no redirect context 23 udp any

redirect css delivery-sequence

This is a restricted command. In 9.0 and later releases, this command is obsoleted.

redirect css service (any)

Redirects subscriber sessions based on any packet received (Content Service Steering). This command is also used to set the access control list insertion point.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:

	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] any after redirect css service service_name [log] any before redirect css service service_name [log] any no redirect css service service_name [log] any</pre>
	after
	Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.
	This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.
6	
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.
	before
	Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.
	This moves the insertion point to be immediately before the rule definitions which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.
6	
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.
	no
	Removes the rule definition which exactly matches the options specified.
	css service service_name
	The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the show active-charging all command to display the names of all configured charging services.
	service_name must be an alphanumeric string from 1 through 15 characters.
	log
	Default: packets are not logged.
	Indicates all packets which match the redirect are to be logged.
	any
	Indicates all packate will match the redirect recordless of source and/or destination

Indicates all packets will match the redirect regardless of source and/or destination.

Usage Guidelines Define a catch all rule definitions to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

(
Important	Any rule definition which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.
4	
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule definition that redirects packets to the charging service with the name <i>chgsvc1</i> and any source IP:
	redirect css service chgsvc1 any
	The following sets the insertion point before the rule definition above:
	before redirect service chgsvc1 any
	The following command sets the insertion point after the first rule definitions above:
	after redirect service chgsvc1 any

The following deletes the first rule definition above:

```
no redirect service chgsvc1 any
```

redirect css service (by host IP address)

Redirecst subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:

dest_address dest_wildcard } [ icmp type [ icmp_code ]
```

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

G

Important

t The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

• Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.

• One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

```
(†
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage Guidelines

Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.

The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

```
¢
```

Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

a 👉

Important Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming from the host with the IP address *198.162.100.25*:

redirect css service chgsvc1 icmp host 192.168.200.11

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 icmp host 192.168.200.11

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 icmp host 192.168.200.11

The following deletes the first rule definition above:

no redirect css service chgsvc1 icmp host 192.168.200.11

redirect css service (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network (Content Service Steering).

(
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition that exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest host address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest wildcard

This option is used in conjunction with the dest_address option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

9

Important

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage Guidelines

Block IP packets when the source and destination are of interest.

a 🌈

Important

The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

C)

Important Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule definition that redirects packets to the charging service named chgsvc1, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

redirect css service chgsvc1 ip host 192.168.100.25 any fragment

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 ip host 192.168.100.25 any fragment The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvcl ip host 192.168.100.25 any fragment The following deletes the first rule definition above:

no redirect css service chgsvc1 ip host 192.168.100.25 any fragment

redirect css service (by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] source_address source_wildcard after redirect css service service_name [log] source_address source_wildcard before redirect css service service_name [log] source_address source_wildcard no redirect css service service_name [log] source_address source_wildcard</pre>
	after
	Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
	This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.
(
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.
	hafara

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

C)

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
Usage Guidelines	Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.

Important

The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 10.2.3.0 0.0.0.31
```

redirect css service (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } after redirect css service service_name [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port neq dest_port range start_dest_port end_source_port] } { dest_address dest_wildcard any host dest_host_address } [eq source_port] } before redirect css service service_name [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port] gt source_port] lt source_port neq source_port range start_source_port end_source_port] \$ { dest_address dest_wildcard any host dest_host_address } [eq dest_port] \$ { dest_address dest_wildcard any host dest_host_address } [eq dest_port] \$ no redirect css service service_name [log] { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port] \$ source_wildcard any host source_host_address } [eq source_port] \$ source_wildcard any host source_host_address } [eq source_port] \$ source_wildcard any host source_host_address } [eq source_port] \$ source_wildcard any host source_host_address } [eq source_port] \$ source_wildcard any host dest_host_address } [eq dest_port] \$ source_wildcard any host dest_host_address } [eq dest_port] \$ { dest_address dest_wildcard any host dest_host_address } [eq dest_port] \$ { dest_address dest_wildcard any host dest_host_address } [eq de</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

C)

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP-based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TPC packets.
- udp: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

C)

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

range start_source_port end_source_port

Specifies that all source TCP ports within a specific range are to be filtered.

start_source_port is the initial port in the range and *end_source_port* is the final port in the range.

Both start_source_port and end_source_port can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the dest_address parameter must be ignored.

C-

Important

nt The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered.

dest_port must be configured to an integer value from 0 to 65535. neg *dest port* Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. dest_port must be configured to an integer value from 0 to 65535. range start_dest_port end_dest_port Specifies that all destination TCP ports within a specific range are to be filtered. start_dest_port is the initial port in the range and end_dest_port is the final port in the range. Both start_dest_port and end_dest_port can be configured to an integer value from 0 to 65535. Block IP packets when the source and destination are of interest but for only a limited set of ports. **Usage Guidelines** Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide. Important Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context. Example The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched: redirect css service chgsvc1 udp any The following sets the insertion point before the rule definition above: before redirect css service chgsvc1 udp any The following command sets the insertion point after the first rule definition above: after redirect css service chgsvc1 udp any The following command deletes the rule definition above: no redirect css service chgsvc1 udp any

redirect css service (for downlink, any)

Redirects subscriber sessions based on any packet received in the downlink (from the Mobile Node) direction (Content Service Steering). This command is also used to set the access control list insertion point.

Product

All

I

Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] downlink any after redirect css service service_name [log] downlink any before redirect css service service_name [log] downlink any no redirect css service service_name [log] downlink any</pre>

Syntax Description	<pre>redirect css service service_name [log] downlink host source_host_address before redirect css service service_name [log] downlink host source_host_address</pre>
	<pre>after redirect css service service_name [log] downlink host source_host_address no redirect css service service_name [log] downlink host source_host_address</pre>
	after
	Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.
	This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.
(
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.
	before
	Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.
	This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.
(
Important	If the options specified do not exactly match an existing rule definition, the insertion point does not change.
	no
	Removes the rule definition which exactly matches the options specified.
	css service service_name
	The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the show active-charging service all command to display the names of all configured charging services.
	service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

	log
	Default: packets are not logged.
	Indicates all packets which match the redirect are to be logged.
	host
	Specifies that the rule definition applies to a specific host as determined by its IP address.
	source_host_address
	The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.
Jsage Guidelines	Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be
	used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.
(
Important	Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule definition that redirects packets to the charging service with the name <i>chgsvc1and</i> a host IP address of <i>192.168.200.11</i> :
	redirect css service chgsvcl downlink host 192.168.200.11
	The following sets the insertion point before the rule definition above:
	before redirect css service chgsvc1 downlink host 192.168.200.11
	The following command sets the insertion point after the first rule definition above:
	after redirect css service chgsvc1 downlink host 192.168.200.11
	The following deletes the first rule definition above:
	no redirect css service chgsvc1 downlink host 192.168.200.11

redirect css service (for downlink, by ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

	after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

```
G
```

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

```
C)
```

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

C)

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

```
¢
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage Guidelines Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.

The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

C)

Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

C(†

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets coming in the downlink (from the Mobile Node) direction from the host with the IP address 192.168.100.25:

redirect css service chgsvc1 downlink icmp host 192.168.100.25

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 downlink icmp host 192.168.100.25

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 downlink icmp host 192.168.100.25

The following deletes the first rule definition above:

no redirect css service chgsvc1 downlink icmp host 192.168.100.25

redirect css service (for downlink, by IP packets)

Redirects subscriber sessions based on the internet protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] downlink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] after redirect css service service_name [log] downlink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] before redirect css service service_name [log] downlink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] before redirect css service service_name [log] downlink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] no redirect css service service_name [log] downlink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment]</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

(

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

	fragment
	Indicates packet redirection is to be applied to IP packet fragments only.
Usage Guidelines	Block IP packets when the source and destination are of interest.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule definition that redirects packets to the charging service named <i>chgsvc1</i> , and downlink IP packets coming from the host with the IP address <i>198.162.100.25</i> , and fragmented packets for any destination are matched:

redirect css service chgsvc1 downlink ip host 198.162.100.25 any fragment

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 downlink ip host 198.162.100.25 any fragment

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvcl downlink ip host 198.162.100.25 any fragment

The following deletes the first rule definition above:

no redirect css service chgsvc1 downlink ip host 198.162.100.25 any fragment

redirect css service (for downlink, by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source in the downlink (from the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>

Entering the above command sequence results in the following prompt:

[context name]host name(config-acl)#

Syntax Description

redirect css service service_name [log] downlink source_address source_wildcard
after redirect css service service_name [log] downlink source_address
source_wildcard
before redirect css service service_name [log] downlink source_address
source_wildcard
no redirect css service service name [log] downlink source address source wildcard

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
Usage Guidelines	Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
	Example
	The following command defines a rule definition to redirect packets to a charging service named <i>chgsvc1</i> :

redirect css service chgsvc1 downlink 10.2.3.0 0.0.0.31

redirect css service (for downlink, by TCP/UDP packets)

Redirects subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the downlink (from the Mobile Node) direction (Content Service Steering).

Product

All

Privilege	Security Administrator, Administrator
Command Modes	 Exec > Global Configuration > Context Configuration > ACL Configuration configure > context context_name > ip access-list acl_name Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } after redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port] lt dest_port neq source_port range start_dest_port end_dest_port] } after redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } before redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port] lt source_port neq source_port range start_source_port gt source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port range start_source_port gt source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } no redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard any host source_host_address } [eq source_port gt source_port] f { dest_address dest_wildcard any host dest_host_address } [eq dest_port]] no redirect css service service_name [log] downlink { tcp udp } { { source_address source_wildcard</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

¢

Important

t If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

downlink

Apply this rule definition only to packets in the downlink (from the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TPC packets.
- udp: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

Important

The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

range start_source_port end_source_port

Specifies that all source TCP ports within a specific range are to be filtered. *start_source_port* is the initial port in the range and *end_source_port* is the final port in the range. Both *start_source_port* and *end_source_port* can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

```
(
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

neq *dest_port*

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

range start_dest_port end_dest_port

Specifies that all destination TCP ports within a specific range are to be filtered. *start_dest_port* is the initial port in the range and *end_dest_port* is the final port in the range.

	Both <i>start_dest_port</i> and <i>end_dest_port</i> can be configured to an integer value from 0 to 65535.
Usage Guidelines	Block IP packets when the source and destination are of interest but for only a limited set of ports.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
de forma de la compactación de l	
Important	Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule definition that redirects packets to the charging service named <i>chgsvc1</i> , and UDP packets coming from any host are matched:
	redirect css service chgsvc1 downlink udp any
	The following sets the insertion point before the rule definition above:
	before redirect css service chgsvc1 downlink udp any
	The following command sets the insertion point after the first rule definition above:
	after redirect css service chgsvc1 downlink udp any
	The following deletes the rule definition above:

```
no redirect css service chgsvc1 downlink udp any
```

redirect css service (for uplink, any)

Redirects subscriber sessions based on any packet received in the uplink (to the Mobile Node) direction (Content Service Steering). This command is also used to set the access control list insertion point.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] uplink any after redirect css service service_name [log] uplink any before redirect css service service_name [log] uplink any no redirect css service service name [log] uplink any</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

C)

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

0

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

Usage Guidelines Define a catch all rule definition to place at the end of the list of rule definitions to provide explicit handling of rule definitions which do not fit any other criteria.

(
Important	It is suggested that any rule definition which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rule definitions is adequate or needs modification to ensure proper security.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule definition that redirects packets to the charging service with the name <i>chgsvc1</i> and any source IP:

```
redirect css service chgsvc1 uplink any
```

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 uplink any

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 uplink any

The following deletes the first rule definition above:

no redirect css service chgsvc1 uplink any

redirect css service (for uplink, by host IP address)

Redirects subscriber sessions based on the targeted host IP address in the uplink (to the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#

Syntax Description redirect css service service_name [log] uplink host source_host_address after redirect css service service_name [log] uplink host source_host_address before redirect css service service name [log] uplink host source host address

no redirect css service service name [log] uplink host source host address

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

after

Indicates all rule definitions defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

•

Important If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage Guidelines

Define a rule definition when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rule definitions to be very clear and concise.

 Important
 The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

 Important
 Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers

Example

facilitated by a specific context.

The following command defines a rule definition that redirects packets to the charging service with the name *chgsvc1* and a host IP address of *192.168.200.11*:

redirect css service chgsvc1 uplink host 192.168.200.11

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 uplink host 192.168.200.11

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 uplink host 192.168.200.11

The following deletes the first rule definition above:

no redirect css service chgsvc1 uplink host 192.168.200.11

redirect css service (for uplink, by ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>

Entering the above command sequence results in the following prompt:

[context name]host name(config-acl)#

Syntax Description redirect css service service_name [log] uplink icmp { any | host

source_host_address | source_address source_wildcard } { any | host dest_host_address
| dest_address dest_wildcard } [icmp_type [icmp_code]
after redirect css service service_name [log] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host dest_host_address
| dest_address dest_wildcard } [icmp_type [icmp_code]
before redirect css service service_name [log] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host dest_host_address
| dest_address dest_wildcard } [icmp_type [icmp_code]
before redirect css service service_name [log] uplink icmp { any | host
source_host_address dest_wildcard } [icmp_type [icmp_code]
no redirect css service service_name [log] uplink icmp { any | host
source_host_address | source_address source_wildcard } { any | host
dest_address dest_wildcard } [icmp_type [icmp_code]

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

```
C)
```

Important

t If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important

t The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

```
C)
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

icmp_type

Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.

icmp_code

Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.

Usage Guidelines Define a rule definition to block ICMP packets which can be used for address resolution and possibly be a security risk.

The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.

C)

Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Important Also note that "redirect" rule definitions are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

C(†

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and ICMP packets in the uplink (to the Mobile Node) direction from the host with the IP address *198.162.100.25*:

redirect css service chgsvc1 uplink icmp host 192.168.100.25

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 uplink icmp host 192.168.100.25

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 uplink icmp host 192.168.100.25

The following deletes the first rule definition above:

no redirect css service chgsvc1 uplink icmp host 192.168.100.25

redirect css service (for uplink, by IP packets)

Redirects subscriber sessions based on the internet protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] uplink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] after redirect css service service_name [log] uplink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] before redirect css service service_name [log] uplink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] before redirect css service service_name [log] uplink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment] no redirect css service service_name [log] uplink ip { any host source_host_address source_address source_wildcard } { any host dest_host_address dest_address dest_wildcard } [fragment]</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

Important

C)

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

Ċ

Important

If the options specified do not exactly match an existing rule definition, the insertion point does not change.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

Usage Guidelines Block IP packets when the source and destination are of interest.

C)

Important

The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and uplink IP packets going to the host with the IP address *198.162.100.25*, and fragmented packets for any destination are matched:

redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment

The following command deletes the first rule definition above:

no redirect css service chgsvc1 uplink ip host 198.162.100.25 any fragment

redirect css service (for uplink, by source IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source in the uplink (to the Mobile Node) direction (Content Service Steering).

Product	- All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] uplink source_address source_wildcard after redirect css service service_name [log] uplink source_address source_wildcard before redirect css service service_name [log] uplink source_address source_wildcard no redirect css service service name [log] uplink source address source wildcard</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the filter are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be ignored.

Usage Guidelines	Define a rule definition when any packet from the IP addresses which fall into the group of addresses matching the IP address masking. This allows the reduction of filtering rule definitions as it does not require a rule definition for each source and destination pair.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .

Example

The following command defines a rule definition to redirect packets to a charging service named *chgsvc1*:

```
redirect css service chgsvc1 uplink 10.2.3.0 0.0.0.31
```

redirect css service (for uplink, by TCP/UDP packets)

Redirects subscriber sessions to a charging service based on the transmission control protocol/user datagram protocol packets in the uplink (to the Mobile Node) direction (Content Service Steering).

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect css service service_name [log] uplink { tcp udp } { { source_address source_wildcard any source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } after redirect css service service_name [log] uplink { tcp udp } { { source_address source_wildcard any source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any source_host_address } [eq dest_port gt source_port lt dest_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] } { gt dest_port lt dest_port neq dest_port range start_dest_port end_dest_port] } { { dest_address dest_wildcard any source_host_address } [eq source_port gt source_address source_wildcard any source_host_address } [eq source_port gt source_address source_wildcard any source_host_address } [eq source_port gt source_address source_wildcard any source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any source_host_address } [eq source_port gt source_port lt source_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any source_host_address } [eq dest_port gt source_port lt dest_port neq source_port range start_source_port end_source_port] } { { dest_address dest_wildcard any host dest_host_address } [eq dest_port] } { { dest_port lt dest_port neq dest_port ra</pre>

after

Indicates all rule definitions subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule definition which matches the exact options specified such that new rule definitions will be added, in order, after the matching rule definition.

before

Indicates all rule definitions subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule definition which matches the exact options specified such that new rule definitions will be added, in order, before the matching rule definition.

no

Removes the rule definition which exactly matches the options specified.

css service service_name

The name of the active charging service to which packets are to be redirected. At the executive mode prompt, use the **show active-charging service all** command to display the names of all configured charging services.

service_name must be an alphanumeric string from 1 through 15 characters.

uplink

Apply this rule definition only to packets in the uplink (to the Mobile Node) direction.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TPC packets.
- udp: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

any

Specifies that the rule definition applies to all packets.

host

Specifies that the rule definition applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be configured to an integer value from 0 to 65535.

range start_source_port end_source_port

Specifies that all source TCP ports within a specific range are to be filtered.

start_source_port is the initial port in the range and end_source_port is the final port in the range.

Both start_source_port and end_source_port can be configured to an integer value from 0 to 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

eq dest_port

Specifies a single, specific destination TCP port number to be filtered.

dest_port must be configured to an integer value from 0 to 65535.

gt dest_port

Specifies that all destination TCP port numbers greater than the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

It dest_port

Specifies that all destination TCP port numbers less than the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

neq dest_port

Specifies that all destination TCP port numbers not equal to the one specified are to be filtered. *dest_port* must be configured to an integer value from 0 to 65535.

range start_dest_port end_dest_port

Specifies that all destination TCP ports within a specific range are to be filtered. *start_dest_port* is the initial port in the range and *end_dest_port* is the final port in the range. Both *start_dest_port* and *end_dest_port* can be configured to an integer value from 0 to 65535.

Usage Guidelines Block IP packets when the source and destination are of interest but for only a limited set of ports.

C-

Important The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

Example

The following command defines a rule definition that redirects packets to the charging service named *chgsvc1*, and UDP packets coming from any host are matched:

redirect css service chgsvc1 uplink udp any

The following sets the insertion point before the rule definition above:

before redirect css service chgsvc1 uplink udp any

The following command sets the insertion point after the first rule definition above:

after redirect css service chgsvc1 uplink udp any

The following deletes the rule definition above:

no redirect css service chgsvc1 uplink udp any

redirect nexthop (by IP address masking)

Redirects subscriber sessions based on the IP address mask sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:

Syntax Description	<pre>redirect nexthop nexthop_addr { context context_id interface interface_name } [log] source_address source_wildcard after redirect nexthop nexthop_addr { context context_id interface interface_name } [log] source_address source_wildcard before redirect nexthop nexthop_addr { context context_id interface interface_name } [log] source_address source_wildcard no redirect nexthop nexthop_addr { context context_id interface interface_name } [log] source_address source_wildcard</pre>

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

٩

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface interface_name

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

```
Important
                       The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed
                       masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and
                       0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
                       Define a rule when any packet from the IP addresses which fall into the group of addresses matching the IP
Usage Guidelines
                       address masking. This allows the reduction of redirect rules as it does not require a rule for each source and
                       destination pair.
                 C)
           Important
                       The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be
                       used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.
                 6
           Important
                       Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated
                       by a specific context.
```

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and the source IP and wildcard of 192.168.22.0 and 0.0.0.31:

redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31

The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 198.162.22.0 0.0.0.31

redirect nexthop (any)

Redirects subscriber sessions based on any packet received. This command is also used to set the access control list insertion point.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect nexthop nexthop_addr { context context_id interface interface_name } [log] any after redirect nexthop nexthop_addr { context context_id interface interface_name } [log] any before redirect nexthop nexthop_addr { context context_id interface interface_name } [log] any no redirect nexthop nexthop_addr { context context_id interface interface_name } [log] any</pre>
	after
	Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.
	This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.
(
Important	If the options specified do not exactly match an existing rule, the insertion point does not change.
	before
	Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.
	This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.
(
Important	If the options specified do not exactly match an existing rule, the insertion point does not change.
	no
	Removes the rule which exactly matches the options specified.

ACL Configuration Mode Commands

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface interface_name

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

any

Indicates all packets will match the redirect regardless of source and/or destination.

 Usage Guidelines
 Define a catch all rule to place at the end of the list of rules to provide explicit handling of rules which do not fit any other criteria.

 Important
 Any rule which is added to be a catch all should also have the log option specified. The logged packets may be used to determine if the current list of rules is adequate or needs modification to ensure proper security.

 Important
 Important

 Important
 The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the Engineering Rules appendix in the System Administration Guide.

 Important
 Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and any source IP:

```
redirect nexthop 192.168.10.4 context 23 any
```

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 any

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 any

The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 any

redirect nexthop (by host IP address)

Redirects subscriber sessions based on the targeted host IP address sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect nexthop nexthop_addr { context context_id interface interface_name } [log] host source_ipv4_address after redirect nexthop nexthop_addr { context context_id interface interface_name } [log] host source_ipv4_address before redirect nexthop nexthop_addr { context context_id interface interface_name } [log] host source_ipv4_address no redirect nexthop nexthop_addr { context context_id interface interface_name } [log] host source_ipv4_address</pre>
	after
	Indicates all rules defined subsequent to this command are to be inserted after the command identified by the

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

¢

Important

If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop *nexthop_addr*

The directly connected IP address to which the IP packets are forwarded.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface interface_name

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 to 79 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_ipv4_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

Usage Guidelines Define a rule when a very specific remote host is to be blocked. In simplified networks where the access controls need only block a few hosts, this command allows the rules to be very clear and concise.

6

Important

The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the *Engineering Rules* appendix in the *System Administration Guide*.

6

Important

Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

L

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23 and a host IP address of 192.168.200.11:

redirect nexthop 192.168.10.4 context 23 host 192.168.200.11

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 host 192.168.200.11

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 host 192.168.200.11

The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 host 192.168.200.11

redirect nexthop (by source ICMP packets)

Redirects subscriber sessions based on the internet control message protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator
Command Modes	Exec > Global Configuration > Context Configuration > ACL Configuration
	<pre>configure > context context_name > ip access-list acl_name</pre>
	Entering the above command sequence results in the following prompt:
	[context_name]host_name(config-acl)#
Syntax Description	<pre>redirect nexthop nexthop_addr { context context_id interface interface_name } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]]</pre>
	<pre>after redirect nexthop nexthop_addr { context context_id interface interface_name</pre>
	<pre>before redirect nexthop nexthop_addr { context context_id interface interface_name } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]] no redirect nexthop nexthop_addr { context context_id interface interface_name } [log] icmp { source_address source_wildcard any host source_host_address } { dest_address dest_wildcard any host dest_host_address } [icmp_type [icmp_code]]</pre>

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to be immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

C)

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop nexthop_addr

The directly connected IP address to which the IP packets are forwarded.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface interface_name

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

```
()
```

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
	icmp_type
	Specifies that all ICMP packets of a particular type are to be filtered. The type can be an integer value between 0 and 255.
	icmp_code
	Specifies that all ICMP packets of a particular code are to be filtered. The type can be an integer value between 0 and 255.
Usage Guidelines	Define a rule to block ICMP packets which can be used for address resolution and possible be a security risk.
	The IP redirecting allows flexible controls for pairs of individual hosts or groups by IP masking which allows the redirecting of entire subnets if necessary.
1	
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and ICMP packets coming from the host with the IP address 198.162.100.25:

redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25

The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 icmp host 192.168.100.25

redirect nexthop (by IP packets)

Redirects subscriber sessions based on the internet protocol packets sent by the source to the mobile node or the network.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

Important

rtant The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

fragment

Indicates packet redirection is to be applied to IP packet fragments only.

protocol num

Indicates that the packet filtering is to be applied to a specific protocol number.

num can be an integer ranging from 0 to 255.

Usage Guidelines Block IP packets when the source and destination are of interest.

(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated

Example

The following command defines a rule that redirects packets to the next hop host at 192.168.10.4, the context with the context ID of 23, and IP packets coming from the host with the IP address 198.162.100.25, and fragmented packets for any destination are matched:

redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any
fragment

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any fragment

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any fragment

The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 ip host 192.168.100.25 any fragment

redirect nexthop (by TCP/UDP packets)

Redirects subscriber sessions based on the transmission control protocol/user datagram protocol packets sent by the source to the mobile node or the network.

Product	All
Privilege	Security Administrator, Administrator

after

Indicates all rules defined subsequent to this command are to be inserted after the command identified by the exact options listed.

This moves the insertion point to immediately after the rule which matches the exact options specified such that new rules will be added, in order, after the matching rule.

Important

nt If the options specified do not exactly match an existing rule, the insertion point does not change.

before

Indicates all rules defined subsequent to this command are to be inserted before the command identified by the exact options listed.

This moves the insertion point to be immediately before the rule which matches the exact options specified such that new rules will be added, in order, before the matching rule.

Important If the options specified do not exactly match an existing rule, the insertion point does not change.

no

Removes the rule which exactly matches the options specified.

nexthop nexthop_addr

The directly connected IP address to which the IP packets are forwarded.

context context_id

The context identification number of the context to which packets are redirected. At the executive mode prompt, use the **show context all** command to display context names and context IDs.

interface interface_name

The name of the logical interface to which the packets should be redirected. *interface_name* must be an alphanumeric string from 1 through 79 characters.

log

Default: packets are not logged.

Indicates all packets which match the redirect are to be logged.

tcp | udp

Specifies the redirect is to be applied to IP based transmission control protocol or the user datagram protocol.

- tcp: Redirect applies to TPC packets.
- udp: Redirect applies to UDP packets.

source_address

The IP address(es) from which the packet originated.

This option is used to filter all packets from a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this option. The range can then be configured using the *source_wildcard* parameter.

source_wildcard

This option is used in conjunction with the *source_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *source_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the source_address parameter must be ignored.

C)

Important The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is **not** acceptable since the one-bits are not contiguous.

any

Specifies that the rule applies to all packets.

host

Specifies that the rule applies to a specific host as determined by its IP address.

source_host_address

The IP address of the source host to filter against expressed in IPv4 dotted-decimal notation.

dest_host_address

The IP address of the destination host to filter against expressed in IPv4 dotted-decimal notation.

eq source_port

Specifies a single, specific source TCP port number to be filtered. *source_port* must be an integer from 0 through 65535.

gt source_port

Specifies that all source TCP port numbers greater than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

It source_port

Specifies that all source TCP port numbers less than the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

neq source_port

Specifies that all source TCP port numbers not equal to the one specified are to be filtered. *source_port* must be an integer from 0 through 65535.

dest_address

The IP address(es) to which the packet is to be sent.

This option is used to filter all packets to a specific IP address or a group of IP addresses.

When specifying a group of addresses, the initial address is configured using this parameter. The range can then be configured using the *dest_wildcard* parameter.

dest_wildcard

This option is used in conjunction with the *dest_address* option to specify a group of addresses for which packets are to be filtered.

The mask must be entered as a complement:

- Zero-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be identical.
- One-bits in this parameter mean that the corresponding bits configured for the *dest_address* parameter must be ignored.

(
Important	The mask must contain a contiguous set of one-bits from the least significant bit (LSB). Therefore, allowed masks are 0, 1, 3, 7, 15, 31, 63, 127, and 255. For example, acceptable wildcards are 0.0.0.3, 0.0.0.255, and 0.0.15.255. A wildcard of 0.0.7.15 is not acceptable since the one-bits are not contiguous.
	eq <i>dest_port</i>
	Specifies a single, specific destination TCP port number to be filtered.
	dest_port must be an integer from 0 through 65535.
	gt <i>dest_port</i>
	Specifies that all destination TCP port numbers greater than the one specified are to be filtered.
	dest_port must be an integer from 0 through 65535.
	It dest_port
	Specifies that all destination TCP port numbers less than the one specified are to be filtered.
	dest_port must be an integer from 0 through 65535.
	neq <i>dest_port</i>
	Specifies that all destination TCP port numbers not equal to the one specified are to be filtered.
	dest_port must be an integer from 0 through 65535.
Usage Guidelines	Block IP packets when the source and destination are of interest but for only a limited set of ports.
(
Important	The maximum number of rules that can be configured per ACL varies depending on how the ACL is to be used. For more information, refer to the <i>Engineering Rules</i> appendix in the <i>System Administration Guide</i> .
(fr	
Important	Also note that "redirect" rules are ignored for ACLs applied to specific subscribers or all subscribers facilitated by a specific context.
	Example
	The following command defines a rule that redirects packets to the next hop host at 192.168.10.4,

the context with the context ID of 23, and UDP packets coming from any host are matched:

redirect nexthop 192.168.10.4 context 23 udp any

The following sets the insertion point before the rule defined above:

before redirect nexthop 192.168.10.4 context 23 udp any

The following command sets the insertion point after the first rule defined above:

after redirect nexthop 192.168.10.4 context 23 udp any The following deletes the first rule defined above:

no redirect nexthop 192.168.10.4 context 23 udp any
