Feature Summary and Revision History

Summary Data

Applicable Product(s) or Functional Area	P-GW
Applicable Platform(s)	ASR 5500
Default Setting	Disabled - Configuration Required
Related Changes in This Release	Not Applicable
Related Documentation	<ul style="list-style-type: none">• <i>Command Line Interface Reference</i>• <i>P-GW Administration Guide</i>

Revision History

Revision Details	Release
First introduced.	21.22

Feature Description

The UE Overload Protection feature provides a mechanism to monitor resource utilization of system bandwidth, channel drop rate, SM CPU, SM memory and VPP CPU. When resources exceed configured threshold, certain identified UEs shall be impacted. For example, when system bandwidth resource, which is global, exceeds the configured threshold, the UEs across the system enabled for this feature shall be impacted. Remaining resources are considered as local to CPU complex.

Currently, P-GW supports managing or throttling of traffics and includes the following functions as part of the UE Overload protection functionality:

- Identification of subscriber impact to a P-GW
- Setting thresholds or conditions on the impact of subscriber to a P-GW
- Sending responses to these thresholds by throttling one or more subscribers who exceeded the threshold.

The UE Overload protection feature works only with VPP-enabled ASR 5500 with DPC2 card and other platforms. Threshold handling is applicable only for DPC2 cards (maximum of 6DPC2 cards) that does not include any Demux card. Now you can configure this feature through CLI globally: The following functions are supported:

- Configuration of UE Overload control profiles.
- Managed through PCRF– Enables or disables *ue overload protection* feature for each subscriber and based on the AVP received during the session establishment.
- Allows you to specify configuration actions when thresholds are met. You can adjust the APN-AMBR-DL and APN-AMBR-UL temporarily until the overload condition persists. UE Overload APN AMBR UL/DL values applied to the UEs are reverted to their original values in case of Session Manager restarts, Card migration, and ICSR.

Note If an UE session is under throttling, then APN-AMBR values get modified immediately if the new APN_AMBR values are lesser than the currently applied values. Otherwise, the values are not programmed in the fast path, instead, it gets applied once the threshold is relaxed.

- Allows you to receive periodic load condition (including VPP load) from Resource manager and provision to set up overload condition in Session Manager.
- **show status:** To optimize the system load the **show status** command is organized to show the recent status for up to 18 records and along with system-wide criteria. When the system criteria is met as a lower priority criteria, complex wide higher priority can still override for every complex level based on the complex level threshold crossing. You can view the following results through **show status**:
 - All "met" parameters, when a CPU complex is in throttled state due to one threshold parameter and if other threshold parameters meet on that same CPU complex.

All threshold parameters, if multiple threshold parameters are met within a given configured criteria.

The system bandwidth threshold, if met, is displayed as a separate row (last row) in the **show status**. The **Activation Time** for system bandwidth can be any one of the CPU complex activation times.

How it Works

In StarOS, all sessions are distributed across multiple Session Managers. Demux Manager acts as a central element of resource utilization collection at the CPU complex level. When the network traffic speed increases in conjunction with the deployment of 5G, P-GW allows subscribers to manage the performance of the network, such as high-speed downloads, User Equipment (UE) overload detection or recovery scenarios with the help of Demux Manager.

The UE Overload protection feature works on a detection algorithm, which is designed to work and targeted for the DPC2 card-based architecture. However, this algorithm works across different line cards. Following table explains the Overload detection algorithm steps.

Table 1: Workflow

Step	Description
1	Collects resource information at CPU complex level.
2	CLI defines the threshold of the resource utilization.
3	A programmable timer (time provided through CLI) runs the detection algorithm on its expiry and checks against the upper threshold for any of the resource utilizations has crossed the upper threshold limit: <ul style="list-style-type: none"> • If crossed, then scans for the offending users part of the instance of VPP thread or Session Manager and applies the temporary APN-AMBR-DL and APN-AMBR-UL threshold values. • Else, waits for the next cycle.
4	Checks recovery algorithm loop (with checks for resource utilization have gone below lower threshold value, which is configured through CLI. If the condition is crossed, then scans for the APN-AMBR-DL and APN-AMBR-UL instances and replaces with the original APN-AMBR-DL and APN-AMBR-UL values.
5	Records incidents in the counters to update statistics.
6	Applies timestamp when a criterion is met and used for checking the dampening expiry.

Limitations

The limitations are:

- Works only with VPP-enabled ASR 5500 whereby the load monitoring is performed on the DPC2 card.
- As the intent of this feature is to bring down the system load by throttling the user traffic through AMBR parameters, the operator should take care of enabling the sessions to be throttled.

- The operator must enter the actual name of the APNs at the time of entering the APN names in the list. This is because there is no validation on this list with respect to the APN names used in the system. For APN name, which is not available in the system, the error is not displayed during configuration. You can view the error through the **show config errors** command.

Configuring ue-overload-control-profile

UE Overload feature is applicable only to the new UE sessions that come up after the UE Overload configuration. When you enable the UE Overload configuration for a valid virtual APN(s) or base APN(s), you cannot modify any existing UE sessions to apply the feature.

Use the following commands to configure the ue- overload control profile settings on ASR5500:

```
configure
  context context_name
    ue-overload-control-profile name
  end
```

Notes:

- **ue-overload-control-profile:** Creates a new UE Overload Control Profile without prompting for confirmation.

Note Deletion of an UE Overload profile or an applied/active criteria or applied/active action profile or parameters results in relaxing of applied threshold(s) on a Card/CPU complex immediately.

Any modification of configuration takes effect only in the next *check-interval*.

Configuring ue-overload Criteria

Use the following commands to configure ue-overload criteria.

```
configure
  context context_name
    ue-overload-control-profile overload-criteria value priority priority_value

    system
      bandwidth-threshold value
      drop-rate-threshold value
    exit
    sessmgr
      cpu-threshold value
      memory-threshold value
    exit
    vpp
      cpu-threshold value
    exit
```

```

overload action name
exit
apn name
    overload-action name
    downlink-ambr value
    uplink-ambr value
    check-interval seconds
    dampen-interval seconds
exit

```

Notes:

- **overload-criteria:** Configures Overload criteria thresholds for system, sessmgr, vpp parameters along with criteria priority.
- **overload-action:** Configures overload action associated with this overload criteria.
- **sessmgr :** Configures Session Manager threshold for various overload criteria parameters.
- **system :** Configures System threshold for various overload criteria parameters.
- **vpp:** Configures VPP threshold for various overload criteria parameters.
- **apn:** Includes APN names to apply for this UE Overload control profile. APN is added in the UE Overload configuration in the following two ways:
 - **enable-by-default** – UE Overload feature is applicable to the UE sessions if the **UEOVERLOAD** field is enabled in the Service-Feature AVP or if **UEOVERLOAD** field or Service-Feature AVP is altogether missing.
 - **enable-by-gx** – UE Overload feature is applicable to the UE sessions only if the **UEOVERLOAD** field is enabled in the Service-Feature AVP.
- *check-interval:* Configures UE Overload parameters monitoring interval (in seconds). The default value is 30 seconds.
- **dampen-interval :** Configures minimum time defined for the system to be in the Overloaded State or Normal State (in seconds). The default value is 300 seconds.
- **default :** Restores default value assigned for following options.
 - **do :** Spawns an exec mode command which displays information to the administrator.
 - **end:** Exits configuration mode and returns to Exec Mode.
 - **exit:** Exits current configuration mode, returns to previous mode.
 - **no:** Enables or disables the following option:
 - **overload-criteria:** Configures Overload criteria thresholds for system, session manager, and VPP parameters along with criteria priority.

Monitoring and Troubleshooting

Show Commands and Outputs

This section provides information regarding show commands and their outputs for this feature.

show ue-overload-control-profile

The output of this command includes the following fields:

Field	Description
all	Displays all UE Overload Control Profiles.
full	Displays UE Overload Control profile in detail.
name-	Displays UE Overload Control Profile names.
Status	Displays the current status of an UE Overload Control profile.
APN List	Displays APN list that are configured under UE Overload Control profile.

show ue-overload-action

The output of this command includes the following fields:

Field	Description
ue-overload-action	Displays all UE overloaad action information or criteria and its statistics..
Statistics	Displays total collected information about criteria applied on UEs since its activation.

show ue-overload-control-profile name

The output of this command includes the following fields:

Field	Description
UE Overload Control Profile	
Profile Name	Displays name of the ue-overload control profile.
Status	Displays the current status of the ue-overload control profile.

show ue-overload-profile full all

The output of this command includes the following fields:

Field	Description
UE Overload Control Profiles	
UE Overload Control Profile Name	Displays name of the ue-overload control profile.
Overload-Criteria (s)	
Name	Displays name of the overload criteria.
Priority	Displays the priority of the ue-overload profile.
System	Displays System threshold for various overload criteria parameters.
Sessmgr	Displays Session Manager threshold for various overload criteria parameters. The percentage must be an integer between 0 to 100.
vpp	Displays a VPP CPU utilization threshold in percentage.
Bandwidth threshold	Displays a System bandwidth threshold in percentage.
drop-rate threshold	Displays System drop-rate in pps.
cpu threshold	Displays Session Manager CPU threshold in percentage.
memory threshold	Displays Session Manager memory threshold in percentage.
overload-action	Displays the associated UE Overload action profile.
APN (s)	
enable-by-default	Displays all the APNs enabled by default.
enable-by-gx	Displays all APNs enabled by Gx interface.
Check-interval: Displays check interval in seconds. check-interval must be an integer ranging from 15 through 300 seconds.	
Dampen-interval: Displays dampen interval in seconds. The dampen-interval must be an integer ranging from 30 through 3000 seconds.	

show ue-overload-action statistics full

To optimize the system load, the statistics entries are limited to seven records (six for the complex level and one for the system wide). System-Wide statistics entry is always shown as the last row.

The output of this command includes the following fields.

Field	Description
Profile-name:	Displays name of the UE overload profile.
Note	If an UE Overload profile is deleted or if association is removed from SAEGW service, then any statistics collected gets erased.

Field	Description
Criteria Name (Priority)	Displays Overload criteria name and priority. Note In a given criteria, if multiple thresholds are met along with System Bandwidth, then post relaxing the threshold, statistics are collected as part of the System Bandwidth entry.
Activation Time	The activation time of the overload criteria. Note For statistics collected post EGTPMGR recovery, the Activation Time is displayed as blank.
Activation Duration	The duration up to which the overload criteria was active. Note For statistics collected post EGTPMGR recovery, the Activation Duration is displayed as blank.
No.of Impacted UEs	Displays the number of UEs for which the temporary UL-AMBR values are applied.
Total UEs	Displays the total number of UEs on the Card/CPU complex Note If the Total UEs entries are less than the No.of Impacted UEs , some UE sessions might go down as the statistics are collected at the Card/CPU-complex when it comes out of threshold.
Card/CPU	The Card/CPU complex for which the particular criteria was active. If there is a system-wide overload action criteria, then it will display as SYSTEM . If no UE sessions were throttled on a Card/CPU-complex, then UE session entries are not shown in the statistics even though the Card/CPU complex exceeds any of the configured threshold parameters.

show configuration bulkstats
