## Preface

- About this Guide: xlvii
  - Conventions Used: xlvii
  - Supported Documents and Resources: xlix
    - Related Common Documentation: xlix
    - Related Product Documentation: xlix
  - Obtaining Documentation: 1
  - Contacting Customer Support: 1

## Chapter 1

PDN Gateway Overview: 1

- Product Description: 1
  - Qualified Platforms: 4
  - Licenses: 4
- Network Deployment(s): 4
  - PDN Gateway in the E-UTRAN/EPC Network: 4
    - Supported Logical Network Interfaces (Reference Points): 6
  - PDN Gateway Supporting eHRPD to E-UTRAN/EPC Connectivity: 11
    - Supported Logical Network Interfaces (Reference Points): 13
- Features and Functionality - Base Software: 17
  - 3GPP R9 Volume Charging Over Gx: 17
  - 3GPP Release 12 Cause Code IE Support: 18
  - AAA Server Groups: 18
  - ANSI T1.276 Compliance: 19
  - APN Support: 19
  - Assume Positive for Gy-based Quota Tracking: 20
  - Asynchronous Core Transfer Support for egtpinmgr: 20
  - Availability of SSID Information in Gx, Gy, Gz, and LI Interface: 21
Contents

Mobile IP Registration Revocation 44
MTU Size PCO 45
Multiple PDN Support 45
Node Functionality GTP Echo 46
Non-Optimized e-HRPD to Native LTE (E-UTRAN) Mobility Handover 46
Online/Offline Charging 47
  Online Charging 47
  Offline Charging 48
Optimization for egtpinmgr Recovery 49
P-CSCF Recovery 49
Peer GTP Node Profile Configuration Support 49
PMIPv6 Heartbeat 49
Proxy Mobile IPv6 (S2a) 50
QoS Bearer Management 50
RADIUS Support 51
Removal of Private Extension-based Overcharging Feature 53
S-GW Restoration Support 56
Source IP Address Validation 57
SRVCC PS-to-CS Handover Indication Support 57
Subscriber Level Trace 57
  3GPP Tracing to Intercept Random Subscriber 58
Support for One Million S1-U Peers on the S-GW 59
TCP Window Size 60
Threshold Crossing Alerts (TCA) Support 61
Transaction Rate KPIs - Session Events Per Second 61
UE Time Zone Reporting 62
User Location Change Reporting Support 63
3GPP ULI Reporting Support Enhanced 63
  Feature Change 64
Virtual APN Support 65
Features and Functionality - Inline Service Support 65
Content Filtering 66
  Integrated Adult Content Filter 66
  ICAP Interface 66
Contents

Header Enrichment: Header Insertion and Encryption 67
IPNE Service Support 68
Network Address Translation (NAT) 68
NAT64 Support 69
Peer-to-Peer Detection 69
Personal Stateful Firewall 70
Features and Functionality - Optional Enhanced Feature Software 71
3GPP R13 Emergency Call Support on the ePDG and P-GW 71
AAA and Prefix Delegation DHCP Correlation 71
APN Backoff Timer Support 71
Bulkstats for GTP-C Messages by ARP Value 72
Common Gateway Access Support 73
Dynamic RADIUS Extensions (Change of Authorization) 73
Expanded Prioritization for VoLTE/Emergency Calls 74
ePDG Selection Using PCO 74
GRE Protocol Interface Support 75
GTP-based S2a Interface Support 75
GTP-based S2b Interface Support 76
Voice Over WiFi Support 76
GTP Throttling 76
Bypass Rate Limit Function 77
HSS and PCRF Based P-CSCF Restoration Support 78
Inter-Chassis Session Recovery 78
IP Security (IPSec) Encryption 79
IPv6 Prefix Delegation from the RADIUS Server and the Local Pool 80
L2TP LAC Support 80
Lawful Intercept 81
Layer 2 Traffic Management (VLANs) 81
Local Policy Decision Engine 81
Modify Bearer Response using controlled parameters 82
MPLS Forwarding with LDP 82
NEMO Service Supported 82
NEMO Support in GGSN 83
Network Provided Location Information for IMS 83
CHAPTER 2

PDN Gateway Configuration 113

Configuring the System as a Standalone eGTP P-GW 113
Information Required 113
  Required Local Context Configuration Information 114
  Required P-GW Context Configuration Information 114
  Required PDN Context Configuration Information 116
  Required AAA Context Configuration Information 118
How This Configuration Works 122
eGTP P-GW Configuration 124
  Initial Configuration 125
  P-GW Service Configuration 129
  P-GW PDN Context Configuration 129
  Active Charging Service Configuration 130
  Policy Configuration 132
  Verifying and Saving the Configuration 134
DHCP Service Configuration 134
  DHCP Service Creation 135
  DHCP Server Parameter Configuration 135
  DHCP Service Configuration Verification 136
DHCPv6 Service Configuration 136
  DHCPv6 Service Creation 137
  DHCPv6 Server Parameter Configuration 137
  DHCPv6 Client Parameter Configuration 138
  DHCPv6 Profile Configuration 138
  Associate DHCPv6 Configuration 140
  DHCPv6 Service Configuration Verification 140
Configuring the System as a Standalone PMIP P-GW in an LTE-SAE Network 141
Information Required 141
  Required Local Context Configuration Information 141
  Required P-GW Context Configuration Information 142
Contents

P-MIP P-GW (LTE) Configuration 152
Initial Configuration 153
P-GW Service Configuration 156
P-GW PDN Context Configuration 157
Active Charging Service Configuration 157
AAA and Policy Configuration 159
Verifying and Saving the Configuration 161

Configuring the System as a Standalone PMIP P-GW Supporting an eHRPD Network 161

Information Required 161
Required Local Context Configuration Information 162
Required P-GW Context Configuration Information 162
Required PDN Context Configuration Information 164
Required AAA Context Configuration Information 166

How This Configuration Works 170

P-MIP P-GW (eHRPD) Configuration 172
Initial Configuration 173
P-GW Service Configuration 176
P-GW PDN Context Configuration 177
Active Charging Service Configuration 177
AAA and Policy Configuration 178
Verifying and Saving the Configuration 181

Configuring Optional Features on the P-GW 181

Configuring ACL-based Node-to-Node IP Security on the S5 Interface 181
Creating and Configuring a Crypto Access Control List 181
Creating and Configuring an IPSec Transform Set 181
Creating and Configuring an IKEv2 Transform Set 182
Creating and Configuring a Crypto Map 183
Configuring APN as Emergency 183
Configuring Common Gateway Access Support 184
Diameter Endpoint Configuration 184
AAA Group Configuration 185
CHAPTER 3  Monitoring the Service  203

Authorization over S6b Configuration  185
DNS Client Configuration  185
Duplicate Call Accept Configuration  186
Common Gateway Access Support Configuration Verification  186
Configuring Dynamic Node-to-Node IP Security on the S5 Interface  186
  Creating and Configuring an IPSec Transform Set  186
  Creating and Configuring an IKEv2 Transform Set  187
  Creating and Configuring a Crypto Template  188
  Binding the S5 IP Address to the Crypto Template  188
Configuring Guard Timer on Create Session Request Processing  188
  Configuring Session Timeout  189
Configuring the GTP Echo Timer  189
  Default GTP Echo Timer Configuration  189
  Dynamic GTP Echo Timer Configuration  191
Configuring GTP Offline Accounting on the P-GW  193
Configuring GTP Throttling Feature  194
  Configuring the Outgoing Control Message Throttling  194
  Configuring the Incoming Control Message Throttling  194
Configuring Local QoS Policy  195
  Creating and Configuring a Local QoS Policy  195
  Binding a Local QoS Policy  196
  Verifying Local QoS Policy  197
Configuring X.509 Certificate-based Peer Authentication  197
Configuring RFL Bypass Feature  198
  Configuring the Throttling Override Policy Mode  198
  Configuring the RLF Bypass Feature  198
Auto Correction of VoLTE Sessions  199
  Feature Information  199
  Feature Description  199
  How It Works  200
  Configuring the Auto Correction of VoLTE Sessions Feature  200
Monitoring and Troubleshooting  200
Monitoring System Status and Performance 203
  Including the IMSI/IMEI in System Event Logs of Type Error and Critical 206
    Configuring the P-GW to Include the IMSI/IMEI in System Event Logs of Type Error and Critical 209
  Clearing Statistics and Counters 209

CHAPTER 4  3GPP Changes to the Gx Interface 211
  Feature Information 211
  Feature Changes 212
  Limitations 212

CHAPTER 5  5G Non Standalone 213
  Feature Summary and Revision History 213
  Feature Description 214

CHAPTER 6  APN-Backoff Timer Support 217
  Feature Description 217
    Functionality 217
      GTP-C Overload Feature and the M2M License 218
    Licensing 218
  Configuring APN Backoff Timer Support on the P-GW/SAEGW 219
    Configuring LAPI Behavior 219
    Configuring the APN Backoff Timer and Jitter Values 219
    Verifying the Configuration 220
  Monitoring the Feature 220
    Bulk Statistics 220
      APN Schema 220
      P-GW Schema 220
      SAEGW Schema 221
    Show Command Output 221
      show apn name 221
      show apn statistics 221
      show configuration apn name 221
      show pgw-service statistics 221
show session disconnect-reasons 221

CHAPTER 7

Backup and Recovery of Key KPI Statistics 223
  Feature Description 223
  How It Works 223
  Architecture 224
  Limitations 225
  Configuring Backup Statistics Feature 225
    Configuration 225
    Verifying the Backup Statistics Feature Configuration 226

CHAPTER 8

Bulkstats for Average Data Rate per IPPOOL 227
  Feature Summary and Revision History 227
  Feature Description 227
  Monitoring and Troubleshooting 228
    Bulk Statistics 228
      Datarate-IPPool Schema 228
    Show Commands and/or Outputs 228
      show bulkstats schemas 228
      show bulkstats data 228
      show subscribers data-rate ip-pool <pool_name> 229

CHAPTER 9

Bulkstats for GTP-C Messages by ARP Value 231
  Feature Description 231
    Limitations 232
    Licensing 232
    Performance Indicator Changes 232
      S-GW Ingress S4 Interface 232
      S-GW Ingress S11 Interface 233
      S-GW Egress GTP-based S5/S8 Interface 234
      P-GW Ingress GTP-based S5/S8 Interface 235
        cleargtpc 235
        P-GW eGTP-C S5/S8 Schema 236
        eGTP-C Schema 236
CHAPTER 11 CoA, RADIUS DM, and Session Redirection (Hotlining) 267

RADIUS Change of Authorization and Disconnect Message 267

CoA Overview 267
DM Overview 268
License Requirements 268
Enabling CoA and DM 268

Enabling CoA and DM 268
CoA and DM Attributes 269
CoA and DM Error-Cause Attribute 270
Viewing CoA and DM Statistics 271

Session Redirection (Hotlining) 272

Overview 272
License Requirements 272

Operation 272
ACL Rule 272
Redirecting Subscriber Sessions 273
Session Limits On Redirection 273
Stopping Redirection 273
Handling IP Fragments 273
Recovery 273
AAA Accounting 274

Viewing the Redirected Session Entries for a Subscriber 274

CHAPTER 12 Collision Handling on the P-GW/SAEGW/S-GW 277

Feature Description 277

Relationships to Other Features 277
How It Works 277

Collision Handling 277
Example Collision Handling Scenarios 278

Limitations 279
Standards Compliance 280
Configuring Collision Handling 280

Configuring DBcmd Message Behavior 280
Verifying the Configuration 280
Monitoring the Collision Handling Feature 280
Collision Handling Show Command(s) and/or Outputs 281
  show configuration 281
  show egtp-service all 281
  show egtp statistics verbose 281

CHAPTER 13

Diamproxy Peer Connection Status Audit 283
  Feature Summary and Revision History 283
  Feature Description 283
  How It Works 284
  Configuring Diamproxy Peer Connection Status Audit 284
    Enabling Connection Status Audit Interval 284
    Verifying the Diamproxy Peer Connection Status Audit 285

CHAPTER 14

Direct Tunnel for 4G (LTE) Networks 287
  Direct Tunnel for 4G Networks - Feature Description 287
  How It Works 290
    DT Establishment Logic 290
    Establishment of Direct Tunnel 291
      Direct Tunnel Activation for Primary PDP Context 292
      Direct Tunnel Activation for UE Initiated Secondary PDP Context 292
      RAB Release with Direct Tunnel 293
      Iu Release with Direct Tunnel 294
      Service Request with Direct Tunnel 295
      Downlink Data Notification with Direct Tunnel when UE in Connected State 296
      Downlink Data Notification with Direct Tunnel when UE in Idle State 296
      Intra SGSN Routing Area Update without SGW Change 297
      Routing Area Update with S-GW Change 302
      Intra SRNS with S-GW Change 307
      Intra SRNS without S-GW Change 307
      New SRNS with S-GW Change and Direct Data Transfer 310
      New SRNS with S-GW Change and Indirect Data Transfer 310
      Old SRNS with Direct Data Transfer 313
Old SRNS with Indirect Data Transfer 314
Network Initiated Secondary PDP Context Activation 317
PGW Init Modification when UE is Idle 317
Limitations 318
Standards Compliance 319
Configuring Support for Direct Tunnel 319
Configuring Direct Tunnel on an S4-SGSN 319
Enabling Setup of GTP-U Direct Tunnel 319
Enabling Direct Tunnel to RNCs 320
Restricting Direct Tunnels 320
Verifying the Call-Control Profile Configuration 321
Verifying the RNC Configuration 321
Configuring S12 Direct Tunnel Support on the S-GW 321
Monitoring and Troubleshooting Direct Tunnel 322
show subscribers sgsn-only 322
show gmm-sm statistics sm-only 323
Direct Tunnel Bulk Statistics 323

CHAPTER 15

Dynamic Guaranteed Bit Rate 325
Feature Summary and Revision History 325
Feature Description 326
How It Works 326
Limitations and Restrictions 327
Configuring Dedicated GBR Bearer 328
trigger 328
committed-data-rate 329
step-up 329
step-down 329
Sample Configuration 330

CHAPTER 16
ePDG Selection Using PCO 331
Feature Description 331
How it Works 331
Limitations 332
Configuring ePDG Selection Using PCO 332

Verifying the Configuration 332

Monitoring and Troubleshooting ePDG Selection Using PCO Feature 332

Show Commands for ePDG Selection Using PCO Feature 332

Show Commands for ePDG Selection Using PCO Feature

show apn apn_name 332
show config 333
show configuration verbose 333
show pgw-service statistics name 333
show saegw-service statistics name function pgw 333

CHAPTER 17

Embed IMSI into Session Id 335

Feature Summary and Revision History 335

Feature Description 336

How It Works 336

Limitations 336

Configuring Diameter Accounting Interim Interval 337

Monitoring and Troubleshooting 338

Show Commands and Outputs 338

Show Commands and Outputs

show configuration 338
show configuration [ verbose ] 338

CHAPTER 18

Enabling S6b for IMS APN 339

Feature Summary and Revision History 339

Feature Changes 340

Configuring Commands for Enabling S6b for IMS APN 340

Show Commands and Outputs 341

Show Commands and Outputs

show apn name 341
show config apn intershat 341

CHAPTER 19

Emergency Call Support on the ePDG and P-GW 343

Feature Description 343

How it Works 344

Configuring AAA Failure Handling for s2b Emergency Calls 348
CHAPTER 20

Expanded Prioritization for VoLTE/Emergency Calls

Feature Description
Relationships to Other Features
Licensing

How It Works

Configuring Expanded Prioritization for VoLTE/Emergency Calls
Configuring eMPS Profile and its Associated Attributes
Associating an eMPS Profile with P-GW Service
Associating an eMPS Profile with S-GW Service

Monitoring and Troubleshooting the Expanded Prioritization for VoLTE/Emergency Calls
Show Command(s) and/or Outputs
Bulkstats for Expanded Prioritization for VoLTE/Emergency Calls

CHAPTER 21

Extended QCI Options

Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters

Feature Description

Configuring ARP Granularity for QCI Level Counters
Create a Stats Profile
Enable the Collection of Packet Drop Statistics
Enable the Collection of QCI/ARP Level Statistics
Associate a Stats Profile with an APN
Verify the Configuration

Monitoring Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters
Bulk Statistics
Show Commands

DSCP Marking Based on Both QCI and ARP Values

Feature Description
Relationships to Other Features
Licensing

How It Works

Configuring DSCP Marking Based on Both QCI and ARP Values
Configuring QCI-QoS Mapping
Associating QCI-QoS Mapping Configuration
Standalone P-GW Call Flows  437
SAEGW GTP-based S2b Call Flows  449
Standards Compliance  463
How the S2a Architecture Works  463
Standalone P-GW and SAEGW Architecture for S2a Interface Support  463
Limitations on S2a Interface Support on the P-GW and SAEGW  465
Standalone P-GW S2a Call Flows  465
SAEGW S2a Call Flows  471
Configuring the GTP-based S2b Interface on the P-GW and SAEGW  477
Configuring GTP-based S2b Interface Support  477
Verifying the Configuration  478
Monitoring the GTP-based S2b Interface Feature  478
GTP-based S2b Interface Show Commands  478
  show pgw-service statistics all  478
  show subscribers epdg-address  479
  show subscribers saegw-only epdg-address  479
  show subscribers saegw-only interface-type S2bGTP  479
  show subscribers summary pgw-address  479
  show subscribers pgw-only full all  479
  show subscribers pgw-only epdg-address  479
  show subscribers summary epdg-address  479
  show subscribers summary interface-type S2bGTP  479
  show subscribers saegw-only full all  479
  show saegw-service statistics all function pgw  480
Monitoring the GTP-based S2a Interface Feature  480
GTP-based S2a Interface Show Commands  480
  show pgw-service statistics all  480
  show saegw-service statistics all  480
  show saegw-service statistics all function-pgw  481
  show session-subsystem facility sessmgr service-type pgw-ingress  481
  show subscribers pgw-only full all  481

  show subscribers summary interface-type S2aGTP  481
CHAPTER 25

3GPP R12 GTP-C Load and Overload Control Support on the P-GW, SAEGW, and S-GW

Feature Description 483

Relationships to Other Features 484

How It Works 484

Creating and Configuring a 3GPP R12 GTP-C Load Control Profile 485

Configuration Overview 485

Creating the GTPP R12 Load Control Profile 485

Configuring the 3GPP R12 Load Control Profile Weightage Settings 486

Configuring the 3GPP R12 Load Control Profile Inclusion Frequency 486

Configuring the 3GPP R12 Load Control Threshold 487

Configuring 3GPP R12 Load Control Information Handling 487

Configuring 3GPP R12 Load Control Information Publishing 487

Configuring the 3GPP R12 GTP-C Polling Parameter Interval 488

Associating the 3GPP R12 Load Control Profile with a P-GW, SAEGW, or S-GW Service 488

Verifying the 3GPP R12 Load Control Configuration 489

Saving the Configuration 490

Creating and Configuring a 3GPP R12 GTP-C Overload Control Profile 490

Configuration Overview 490

Creating the GTPP R12 Overload Control Profile 490

Configuring 3GPP R12 Overload Control Weightage Settings 491

Configuring the 3GPP R12 Overload Control Inclusion Frequency 491

Configuring the 3GPP R12 Overload Control Validity Period 492

Configuring 3GPP R12 Overload Control Tolerance Limits 492

Configuring 3GPP R12 Overload Control Throttling Behavior 493

Configuring 3GPP R12 Overload Control Message Prioritization 494

Configuring 3GPP R12 Overload Control Self-Protection Behavior 494

Configuring 3GPP R12 Overload Control Information Handling 495

Configuring 3GPP R12 Overload Control Information Publishing 495

Configuring the 3GPP R12 GTP-C Polling Parameter Interval 495

Associating the 3GPP R12 Overload Control Configuration with a P-GW, SAEGW, or S-GW Service 496

Verifying the 3GPP R12 Overload Control Configuration 497
Saving the 3GPP R12 Overload Control Configuration 497
Monitoring and Troubleshooting the 3GPP R12 GTP-C Load and Overload Control Feature 497

Support ADC Rules over Gx Interface 578
  Limitations 579
  Configuring ADC Rules over Gx 579
  GoR Name Support in TDF-Application-Identifier 580
  ADC Mute Customization 581

Support for TAI and ECGI Change Reporting 584
  Feature Description 584
  How it Works 585
  Monitoring and Troubleshooting the TAI and ECGI Change Reporting Feature 586

Location Based Local-Policy Rule Enforcement 586
  Feature Description 587
  How it Works 587
  Configuring Location Based Local Policy Rule Enforcement Feature 589
  Monitoring and Troubleshooting the Location Based LP Rule Enforcement Feature 591

Gx Support for GTP based S2a/S2b 592

Gx-based Virtual APN Selection 592
  Feature Description 592
  Configuring Gx based Virtual APN Selection Feature 593
  Monitoring and Troubleshooting the Gx based Virtual APN Selection 593

Graceful Handling of RAR from Different Peers 594

NetLoc Feature Enhancement 595
  Feature Description 595
  Command Changes 599
  Performance Indicator Changes 599

RAN-NAS Cause Code Feature Enhancement 600
  Feature Description 600
  Command Changes 604

Session Disconnect During Diamproxy-Session ID Mismatch 604
  Feature Description 604
  Configuring System to Delete Diamproxy-Session ID Mismatched Sessions 605
  Monitoring and Troubleshooting the Mismatched Session Deletion Feature 606

Support for Negotiating Mission Critical QCIs 606
  Feature Description 607
  Configuring DPCA for Negotiating Mission Critical QCIs 607
Monitoring and Troubleshooting the Mission Critical QCI 608

HSS and PCRF-based P-CSCF Restoration Support for WLAN 608
   Feature Description 609
   Configuring the HSS/PCRF-based P-CSCF Restoration 610
   Monitoring and Troubleshooting the HSS/PCRF-based P-CSCF Restoration 611

Loop Prevention for Dynamic Rules 613
   Feature Information 613
   Feature Description 614
   How It Works 614
   Configuring Loop Prevention for Dynamic Rules 614
   Monitoring and Troubleshooting 615

Separation of Accounting Interim Interval Timer for RADIUS and Diameter Rf 616
   Feature Information 616
   Feature Description 616
   How It Works 617
   Configuring Diameter Accounting Interim Interval 618
   Monitoring and Troubleshooting 618

Enhancement to OCS Failure Reporting for Gy 619
   Feature Information 619
   Feature Description 620

Support Added for RAN/NAS Cause Code for S5/S8 and S2b Interfaces 620
   Feature Information 620
   Feature Description 621
   Command Changes 625

CHAPTER 27

Gx Support for eMPS 627
   Feature Summary and Revision History 627
   Feature Description 628
      Relationships to Other Features 629
   How It Works 629
      Limitations 630
   Configuring Gx Support for eMPS 630
      Configuring eMPS Profile 630
      Enabling Gx Prioritization for eMPS Sessions 630
Enabling GTP Prioritization for eMPS Sessions under GTP Load Overload Throttling 631
Verifying the Gx Support for eMPS Configuration 632
Monitoring and Troubleshooting the Gx Support for eMPS 632
show ims-authorization policy-control statistics 632

CHAPTER 28  Gy Interface Support 633

Introduction 633
License Requirements 634
Supported Standards 635
Features and Terminology 635
Charging Scenarios 635
Session Charging with Reservation 635
Basic Operations 636
Re-authorization 636
Threshold based Re-authorization Triggers 637
Termination Action 637
Diameter Base Protocol 637
Diameter Credit Control Application 638
Quota Behavior 638
Supported AVPs 650
Unsupported AVPs 654
PLMN and Time Zone Reporting 659
Interworking between Session-based Gy and Event-based Gy 660
OCS Unreachable Failure Handling Feature 660
Enhancement to OCS Failure Reporting for Gy 662
Feature Description 662
Backpressure Handling 662
Gy Backpressure Enhancement 663
Gy Support for GTP based S2a/S2b 663
Generating OOC/ROC with Changing Association between Rule and RG 664
Static Rulebase for CCR 664
CC based Selective Gy Session Control 664
Feature Description 664
Configuring CC based Selective Gy Session Control 665
CHAPTER 29

Gy Failure Handling Enhancement 679

Feature Summary and Revision History 679
Feature Description 680
How It Works 680
Configuring Gy Failure Handling 681
Monitoring and Troubleshooting the Gy Failure Handling 681

About this Guide

This preface describes the *P-GW Administration Guide*, how it is organized, and its document conventions. Packet Data Network Gateway (P-GW) is a StarOS application that runs on Cisco® ASR 5500 and virtualized platforms.

- Conventions Used, on page xlvii
- Supported Documents and Resources, on page xlix
- Contacting Customer Support, on page 1

Conventions Used

The following tables describe the conventions used throughout this documentation.

<table>
<thead>
<tr>
<th>Notice Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information Note</td>
<td>Provides information about important features or instructions.</td>
</tr>
<tr>
<td>Caution</td>
<td>Alerts you of potential damage to a program, device, or system.</td>
</tr>
<tr>
<td>Warning</td>
<td>Alerts you of potential personal injury or fatality. May also alert you of potential electrical hazards.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Typeface Conventions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text represented as a <em>screen display</em></td>
<td>This typeface represents displays that appear on your terminal screen, for example: Login:</td>
</tr>
<tr>
<td>Text represented as <strong>commands</strong></td>
<td>This typeface represents commands that you enter, for example: show ip access-list This document always gives the full form of a command in lowercase letters. Commands are not case sensitive.</td>
</tr>
</tbody>
</table>
### Typeface Conventions

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text represented as a command variable</td>
<td>This typeface represents a variable that is part of a command, for example:</td>
</tr>
<tr>
<td></td>
<td>show card slot_number</td>
</tr>
<tr>
<td></td>
<td>slot_number is a variable representing the desired chassis slot number.</td>
</tr>
<tr>
<td>Text represented as menu or sub-menu names</td>
<td>This typeface represents menus and sub-menus that you access within a software application, for example:</td>
</tr>
<tr>
<td></td>
<td>Click the File menu, then click New</td>
</tr>
</tbody>
</table>

### Command Syntax Conventions

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>{ keyword or variable }</td>
<td>Required keyword options and variables are those components that are required to be entered as part of the command syntax.</td>
</tr>
<tr>
<td></td>
<td>Required keyword options and variables are surrounded by grouped braces {}. For example:</td>
</tr>
<tr>
<td></td>
<td>sctp-max-data-chunks { limit max_chunks</td>
</tr>
<tr>
<td></td>
<td>If a keyword or variable is not enclosed in braces or brackets, it is mandatory. For example:</td>
</tr>
<tr>
<td></td>
<td>smtp trap link-status</td>
</tr>
<tr>
<td>[ keyword or variable ]</td>
<td>Optional keywords or variables, or those that a user may or may not choose to use, are surrounded by brackets.</td>
</tr>
<tr>
<td></td>
<td>Some commands support multiple options. These are documented within braces or brackets by separating each option with a vertical bar.</td>
</tr>
<tr>
<td></td>
<td>These options can be used in conjunction with required or optional keywords or variables. For example:</td>
</tr>
<tr>
<td></td>
<td>action activate-flow-detection { initiation</td>
</tr>
<tr>
<td></td>
<td>or</td>
</tr>
<tr>
<td></td>
<td>ip address [ count number_of_packets</td>
</tr>
</tbody>
</table>
Supported Documents and Resources

Related Common Documentation

The most up-to-date information for this product is available in the product Release Notes provided with each product release.

The following common documents are available:

- AAA Interface Administration Guide and Reference
- Command Line Interface Reference
- GTPP Interface Administration Guide and Reference
- Installation Guide (platform dependent)
- Release Change Reference
- SNMP MIB Reference
- Statistics and Counters Reference
- System Administration Guide (platform dependent)
- Thresholding Configuration Guide

Related Product Documentation

The following product documents are also available and work in conjunction with the P-GW:

- ADC Administration Guide
- ECS Administration Guide
- ePDG Administration Guide
- GGSN Administration Guide
- HSGW Administration Guide
- IPsec Reference
- MME Administration Guide
- NAT Administration Guide
- PSF Administration Guide
- SAEGW Administration Guide
- SaMOG Administration Guide
- S-GW Administration Guide
Obtaining Documentation

The most current Cisco documentation is available on the following website:
http://www.cisco.com/cisco/web/psa/default.html

Use the following path selections to access the P-GW documentation:
Products > Wireless > Mobile Internet > Network Functions > Cisco PGW Packet Data Network Gateway

Contacting Customer Support

Use the information in this section to contact customer support.

Refer to the support area of http://www.cisco.com for up-to-date product documentation or to submit a service request. A valid username and password are required to access this site. Please contact your Cisco sales or service representative for additional information.
PDN Gateway Overview

The Cisco® Packet Data Network (PDN) Gateway (P-GW) is a critical network function for the 4G mobile core network, known as the evolved packet core (EPC). The P-GW acts as the interface between the 3GPP2 Long Term Evolution-System Architecture Evolution (LTE-SAE) network and other packet data networks, such as the Internet, SIP-based IP Multimedia Subsystem (IMS) networks, and evolved High Rate Packet Data (eHRPD) wireless data networks.

This overview provides general information about the P-GW including:

- Product Description, on page 1
- Network Deployment(s), on page 4
- Features and Functionality - Base Software, on page 17
- Features and Functionality - Inline Service Support, on page 65
- Features and Functionality - Optional Enhanced Feature Software, on page 71
- How the PDN Gateway Works, on page 94
- Supported Standards, on page 106

Product Description

The P-GW is the node that terminates the SGi interface towards the PDN. If a UE is accessing multiple PDNs, there may be more than one P-GW for that UE. The P-GW provides connectivity to the UE to external packet data networks by being the point of exit and entry of traffic for the UE. A UE may have simultaneous connectivity with more than one P-GW for accessing multiple PDNs. The P-GW performs policy enforcement, packet filtering for each user, charging support, lawful interception and packet screening.
Figure 1: P-GW in the Basic E-UTRAN/EPC Network
Another key role of the P-GW is to act as the anchor for mobility between 3GPP and non-3GPP technologies such as WiMAX and 3GPP2 (CDMA 1X and EvDO).

P-GW functions include:

- Mobility anchor for mobility between 3GPP access systems and non-3GPP access systems. This is sometimes referred to as the SAE Anchor function.
- Policy enforcement (gating and rate enforcement)
- Per-user based packet filtering (deep packet inspection)
- Charging support
- Lawful Interception
- UE IP address allocation
- Packet screening
- Transport level packet marking in the downlink;
- Down link rate enforcement based on Aggregate Maximum Bit Rate (AMBR)

The following are additional P-GW functions when supporting non-3GPP access (eHRPD):

- P-GW includes the function of a Local Mobility Anchor (LMA) according to draft-ietf-netlmm-proxymip6, if PMIP-based S5 or S8 is used.
• The P-GW includes the function of a DSMIPv6 Home Agent, as described in draft-ietf-mip6-nemo-v4traversal, if S2c is used.

**Qualified Platforms**

P-GW is a StarOS application that runs on Cisco ASR 5500 and virtualized platforms. For additional platform information, refer to the appropriate System Administration Guide and/or contact your Cisco account representative.

**Licenses**

The P-GW is a licensed Cisco product. Separate session and feature licenses may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

**Network Deployment(s)**

This section describes the supported interfaces and the deployment scenarios of a PDN Gateway.

**PDN Gateway in the E-UTRAN/EPC Network**

The following figure displays the specific network interfaces supported by the P-GW. Refer to Supported Logical Network Interfaces (Reference Points), on page 13 for detailed information about each interface.
Figure 3: Supported P-GW Interfaces in the E-UTRAN/EPC Network

The following figure displays a sample network deployment of a P-GW, including all of the interface connections with other 3GPP Evolved-UTRAN/Evolved Packet Core network devices.
Figure 4: P-GW in the E-UTRAN/EPC Network

Supported Logical Network Interfaces (Reference Points)

The P-GW provides the following logical network interfaces in support of E-UTRAN/EPC network:

S2b Interface

The S2b interface reference point defined between the non-trusted non-3GPP ePDG (Evolved Packet Data Gateway) and the P-GW uses PMIPv6 (Proxy Mobile IP version 6) for providing access to the EPC. GTPv2-C is the signaling protocol used on the S2b. The S2b interface is based on 3GPP TS 29.274.

The S2b interface runs PMIPv6 protocol to establish WLAN UE sessions with the P-GW. It also supports the transport of P-CSCF attributes and DNS attributes in PBU (Proxy-MIP Binding Update) and PBA (Proxy-MIP Binding Acknowledgement) messages as part of the P-CSCF discovery performed by the WLAN UEs.

When the P-CSCF Address information is missing, P-CSCF Discovery is initiated upon S4-SGSN to LTE (and vice versa) handoff. If the P-CSCF Address information is already available, there is no need to explicitly trigger another P-CSCF Discovery upon S4-SGSN to LTE (and vice versa) handoff.
S5/S8 Interface

This reference point provides tunneling and management between the S-GW and the P-GW, as defined in 3GPP TS 23.401 and TS 23.402. The S8 interface is an inter-PLMN reference point between the S-GW and the P-GW used during roaming scenarios. The S5 interface is used between an S-GW and P-GW located within the same administrative domain (non-roaming). It is used for S-GW relocation due to UE mobility and if the S-GW needs to connect to a non-collocated P-GW for the required PDN connectivity.

Supported protocols

- Transport Layer: UDP, TCP
- Tunneling:
  - GTP: GTPv2-C (signaling channel), GTPv1-U (bearer channel)
  - PMIPv6: GRE or IP-in-IP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

S6b Interface

This reference point, between a P-GW and a 3GPP AAA server/proxy, is used for mobility-related authentication. It may also be used to retrieve and request parameters related to mobility and to retrieve static QoS profiles for UEs (for non-3GPP access) in the event that dynamic PCC is not supported.

From Release 12.2 onwards, the S6b interface has been enhanced to pass on the UE assigned IPv6 address (IPv6 prefix and IPv6 interface ID) to the AAA server. S6b interface also has support for Framed-IPv6-Pool,
Framed IP Pool, and served party IP address AVPs based IP allocation. With this support, based on the Pool name and APN name received from AAA server, the selection of a particular IP pool from the configuration is made for assigning the IP address.

The S6b interface on the P-GW or GGSN can be manually disabled to stop all message traffic to the 3GPP AAA during overload conditions. When the interface is disabled, the system uses locally configured APN-specific parameters including: Framed-Pool, Framed-IPv6-Pool, Idle-Timeout, Charging-Gateway-Function-Host, Server-Name (P-CSCF FQDN). This manual method is used when the HSS/3GPP AAA is in overload condition to allow the application to recover and mitigate the impact to subscribers.

Release 12.3 onwards, the IPv6 address reporting through Authorization-Authentication-Request (AAR) towards the S6b interface is no longer a default feature. It is now configurable through the CLI.

Another enhancement on S6b interface support is the new S6b retry-and-continue functionality that creates an automatic trigger in the GGSN and P-GW to use the locally configured APN profile upon receipt of any uniquely defined Diameter error code on the S6b interface for an Authorization-Authentication-Request (AA-R) only. This procedure would be utilized in cases where a protocol, transient, or permanent error code is returned from the both the primary and secondary AAA to the GGSN or P-GW. In case of retry-and-continue functionality, P-GW should query from DNS server if it is configured in APN. S6b failure handling continues the data call. This behavior is only applicable to the aaa-custom15 Diameter dictionary.

StarOS Release 17 and onwards, P-GW supports receiving AVP "Restoration-Priority-Indicator" from AAA server over the S6b interface to distinguish between VoLTE enabled IMS PDN connections and non-VoLTE enabled IMS PDN connections. KPIs are also provided based on the AVP value.

---

Important

The S6b interface can be disabled via the CLI in the event of a long-term AAA outage.

**Supported protocols:**

- **Transport Layer:** TCP, SCTP
- **Network Layer:** IPv4, IPv6
- **Data Link Layer:** ARP
- **Physical Layer:** Ethernet

---

**SGi Interface**

This reference point provides connectivity between the P-GW and a packet data network (3GPP TS 23.401). This interface can provide access to a variety of network types including an external public or private PDN and/or an internal IMS service provisioning network.

**Supported protocols:**
• Transport Layer: TCP, UDP
• Network Layer: IPv4, IPv6
• Data Link Layer: ARP
• Physical Layer: Ethernet

Gx Interface

This signalling interface supports the transfer of policy control and charging rules information (QoS) between the Policy and Charging Enforcement Function (PCEF) on the P-GW and a Policy and Charging Rules Function (PCRF) server (3GPP TS 23.401).

Supported protocols:
• Transport Layer: TCP, SCTP
• Network Layer: IPv4, IPv6
• Data Link Layer: ARP
• Physical Layer: Ethernet

For more information on the Gx interface, refer to Dynamic Policy Charging Control (Gx Reference Interface), on page 30.

Gy Interface

The Gy reference interface enables online accounting functions on the P-GW in accordance with 3GPP Release 8 and Release 9 specifications.

Supported protocols:
• Transport Layer: TCP, SCTP
• Network Layer: IPv4, IPv6
• Data Link Layer: ARP
• Physical Layer: Ethernet
Gz Interface

The Gz reference interface enables offline accounting functions on the P-GW. The P-GW collects charging information for each mobile subscriber UE pertaining to the radio network usage.

**Supported protocols:**
- Transport Layer: TCP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

Gn/Gp Interface

This reference point provides tunneling and management between the P-GW and the SGSN during handovers between the EPS and 3GPP 2G and/or 3G networks (3GPP TS 29.060). For more information on the Gn/Gp interface, refer to *Gn/Gp Handoff Support, on page 37.*

**Supported protocols**
- Transport Layer: UDP, TCP
- Tunneling: GTP: GTP-C (signaling channel)
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet
Rf Interface

The Rf interface enables offline accounting functions on the P-GW in accordance with 3GPP Release 8 and Release 9 specifications. The P-GW collects charging information for each mobile subscriber UE pertaining to the radio network usage.

**Supported protocols:**

- Transport Layer: TCP, SCTP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

**PDN Gateway Supporting eHRPD to E-UTRAN/EPC Connectivity**

The following figure displays the specific network interfaces supported by the P-GW in an eHRPD network. Refer to **Supported Logical Network Interfaces (Reference Points), on page 6** for detailed information about each interface.
The following figure displays a sample network deployment of a P-GW in an eHRPD Network, including all of the interface connections with other 3GPP Evolved-UTRAN/Evolved Packet Core network devices.
Supported Logical Network Interfaces (Reference Points)

The P-GW provides the following logical network interfaces in support of eHRPD to E-UTRAN/EPC connectivity:

**S5/S8 Interface**

This reference point provides tunneling and management between the S-GW and the P-GW, as defined in 3GPP TS 23.401. The S8 interface is an inter-PLMN reference point between the S-GW and the P-GW used during roaming scenarios. The S5 interface is used between an S-GW and P-GW located within the same administrative domain (non-roaming). It is used for S-GW relocation due to UE mobility and if the S-GW needs to connect to a non-collocated P-GW for the required PDN connectivity.

**Supported protocols:**

- Transport Layer: UDP, TCP
- Tunneling:
  - GTP: IPv4 or IPv6 GTP-C (signaling channel) and GTP-U (bearer channel)
  - PMIPv6: IPv6 GRE or IP-in-IP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
S2a Interface

This reference point supports the bearer interface by providing signaling and mobility support between a trusted non-3GPP access point (HSGW) and the PDN Gateway. It is based on Proxy Mobile IP but also supports Client Mobile IPv4 FA mode which allows connectivity to trusted non-3GPP IP access points that do not support PMIP.

**Supported protocols:**

- Transport Layer: UDP, TCP
- Tunneling: GRE IPv6
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

---

S6b Interface

This reference point, between a P-GW and a 3GPP AAA server/proxy, is used for mobility-related authentication. It may also be used to retrieve and request parameters related to mobility and to retrieve static QoS profiles for UEs (for non-3GPP access) in the event that dynamic PCC is not supported.

From Release 12.2 onwards, the S6b interface has been enhanced to pass on the UE assigned IPv6 address (IPv6 prefix and IPv6 interface ID) to the AAA server. S6b interface also has support for Framed-IPv6-Pool, Framed IP Pool, and served party IP address AVPs based IP allocation. With this support, based on the Pool...
name and APN name received from AAA server, the selection of a particular IP pool from the configuration is made for assigning the IP address.

The S6b interface on the P-GW or GGSN can be manually disabled to stop all message traffic to the 3GPP AAA during overload conditions. When the interface is disabled, the system uses locally configured APN-specific parameters including: Framed-Pool, Framed-IPv6-Pool, Idle-Timeout, Charging-Gateway-Function-Host, Server-Name (P-CSCF FQDN). This manual method is used when the HSS/3GPP AAA is in overload condition to allow the application to recover and mitigate the impact to subscribers

Release 12.3 onwards, the IPv6 address reporting through Authorization-Authentication-Request (AAR) towards the S6b interface is no longer a default feature. It is now configurable through the CLI.

Another enhancement on S6b interface support is the new S6b retry-and-continue functionality that creates an automatic trigger in the GGSN and P-GW to use the locally configured APN profile upon receipt of any uniquely defined Diameter error code on the S6b interface for an Authorization-Authentication-Request (AA-R) only. This procedure would be utilized in cases where a protocol, transient, or permanent error code is returned from the both the primary and secondary AAA to the GGSN or P-GW. In case of retry-and-continue functionality, P-GW should query from DNS server if it is configured in APN. S6b failure handling continues the data call. This behavior is only applicable to the aaa-custom15 Diameter dictionary.

The S6b interface can be disabled via the CLI in the event of a long-term AAA outage.

**Supported protocols:**

- Transport Layer: TCP, SCTP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

---

**SGi Interface**

This reference point provides connectivity between the P-GW and a packet data network. This interface can provide access to a variety of network types including an external public or private PDN and/or an internal IMS service provisioning network.

**Supported protocols:**

- Transport Layer: TCP, UDP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
• Physical Layer: Ethernet

Gx Interface

This signalling interface supports the transfer of policy control and charging rules information (QoS) between the Policy and Charging Enforcement Function (PCEF) on the P-GW and a Policy and Charging Rules Function (PCRF) server (3GPP TS 23.401).

Supported protocols:
• Transport Layer: TCP, SCTP
• Network Layer: IPv4, IPv6
• Data Link Layer: ARP
• Physical Layer: Ethernet

For more information on the Gx interface, refer to Dynamic Policy Charging Control (Gx Reference Interface), on page 30.

Rf Interface

The Rf reference interface enables offline accounting functions on the P-GW in accordance with 3GPP Release 8 and Release 9 specifications. The P-GW collects charging information for each mobile subscriber UE pertaining to the radio network usage.

Supported protocols:
• Transport Layer: TCP
• Network Layer: IPv4, IPv6
• Data Link Layer: ARP
• Physical Layer: Ethernet
Gy Interface

The Gy reference interface enables online accounting functions on the P-GW in accordance with 3GPP Release 8 and Release 9 specifications.

**Supported protocols:**
- Transport Layer: TCP
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet

For more information on the Gy interface and online accounting, refer to Gy Interface Support, on page 36.

### Features and Functionality - Base Software

This section describes the features and functions supported by default in the base software for the P-GW service and do not require any additional licenses to implement the functionality.

**Important**

To configure the basic service and functionality on the system for the P-GW service, refer to the configuration examples provided in this guide.

### 3GPP R9 Volume Charging Over Gx

Also known as accumulated usage tracking over Gx, this 3GPP R9 enhancement provides a subset of the volume and charging control functions defined in TS 29.212 based on usage quotas between a P-GW and PCRF. The quotas can be assigned to the default bearer or any of the dedicated bearers for the PDN connection.
This feature enables volume reporting over Gx, which entails usage monitoring and reporting of the accumulated usage of network resources on an IP-CAN session or service data flow basis. PCRF subscribes to the usage monitoring at session level or at flow level by providing the necessary information to PCEF. PCEF in turn reports the usage to the PCRF when the conditions are met. Based on the total network usage in real-time, the PCRF will have the information to enforce dynamic policy decisions.

When usage monitoring is enabled, the PCEF can monitor the usage volume for the IP-CAN session, or applicable service data flows, and report accumulated usage to the PCRF based on any of the following conditions:

- When a usage threshold is reached,
- When all PCC rules for which usage monitoring is enabled for a particular usage monitoring key are removed or deactivated,
- When usage monitoring is explicitly disabled by the PCRF,
- When an IP CAN session is terminated or,
- When requested by the PCRF.

Accumulated volume reporting can be measured by total volume, the uplink volume, or the downlink volume as requested by the PCRF. When receiving the reported usage from the PCEF, the PCRF deducts the value of the usage report from the total allowed usage for that IP-CAN session, usage monitoring key, or both as applicable.

### 3GPP Release 12 Cause Code IE Support

When an E-RAB or a data session is dropped, an operator may need to get detailed RAN and/or NAS release cause code information as well as ULI information from the access network to be included in P-GW and S-GW CDRs for call performance analysis, user QoE analysis and proper billing reconciliation. The operator may also need to retrieve the above information at the P-CSCF for IMS sessions.

"Per E-RAB Cause" was received in an E-RAB Release command and a E-RAB Release Indication messages over S1. However RAN and NAS causes were not forwarded to the P-GW and the S-GW and they were not provided by the P-GW to the PCRF.

A "RAN/NAS Release Cause" information element (IE), which indicates AS and/or NAS causes, has been added to the Session Deletion Request and Delete Bearer Command. The "RAN/NAS Release Cause" provided by the MME is transmitted transparently by the S-GW to the P-GW (if there is signaling towards the P-GW) for further propagation towards the PCRF.

For backward compatibility, the S-GW can still receive the cause code from the CC IE in the S4/S11 messages and/or receive the cause code from some customers' private extension.

### AAA Server Groups

Value-added feature to enable VPN service provisioning for enterprise or MVNO customers. Enables each corporate customer to maintain its own AAA servers with its own unique configurable parameters and custom dictionaries.

This feature provides support for up to 800 AAA server groups and 800 NAS IP addresses that can be provisioned within a single context or across the entire chassis. A total of 128 servers can be assigned to an individual server group. Up to 1,600 accounting, authentication and/or mediation servers are supported per chassis.
As AAA applications do not support the indirectly connected hosts, configure only the directly connected host.

**ANSI T1.276 Compliance**

ANSI T1.276 specifies security measures for Network Elements (NE). In particular it specifies guidelines for password strength, storage, and maintenance security measures.

ANSI T1.276 specifies several measures for password security. These measures include:

- Password strength guidelines
- Password storage guidelines for network elements
- Password maintenance, e.g. periodic forced password changes

These measures are applicable to the ASR 5500 and an element management system since both require password authentication. A subset of these guidelines where applicable to each platform will be implemented. A known subset of guidelines, such as certificate authentication, are not applicable to either product. Furthermore, the platforms support a variety of authentication methods such as RADIUS and SSH which are dependent on external elements. ANSI T1.276 compliance in such cases will be the domain of the external element. ANSI T1.276 guidelines will only be implemented for locally configured operators.

**APN Support**

The P-GW’s Access Point Name (APN) support offers several benefits:

- Extensive parameter configuration flexibility for the APN.
- Creation of subscriber tiers for individual subscribers or sets of subscribers within the APN.
- Virtual APNs to allow differentiated services within a single APN.

In StarOS v12.x and earlier, up to 1024 APNs can be configured in the P-GW. In StarOS v14.0 and later, up to 2048 APNs can be configured in the P-GW. An APN may be configured for any type of PDP context, i.e., PPP, IPv4, IPv6 or both IPv4 and IPv6. Many dozens of parameters may be configured independently for each APN.

Here are a few highlights of what may be configured:

- **Accounting**: RADIUS, GTPP or none. Server group to use. Charging characteristics. Interface with mediation servers.
- **Authentication**: Protocol, such as, CHAP or PAP or none. Default username/password. Server group to use. Limit for number of PDP contexts.
- **Enhanced Charging**: Name of rulebase to use, which holds the enhanced charging configuration (e.g., eG-CDR variations, charging rules, prepaid/postpaid options, etc.).
- **IP**: Method for IP address allocation (e.g., local allocation by P-GW, Mobile IP, DHCP, etc.). IP address ranges, with or without overlapping ranges across APNs.
• **Tunneling**: PPP may be tunneled with L2TP. IPv4 may be tunneled with GRE, IP-in-IP or L2TP. Load-balancing across multiple tunnels. IPv6 is tunneled in IPv4. Additional tunneling techniques, such as, IPsec and VLAN tagging may be selected by the APN, but are configured in the P-GW independently from the APN.

• **QoS**: IPv4 header ToS handling. Traffic rate limits for different 3GPP traffic classes. Mapping of R98 QoS attributes to work around particular handset defections. Dynamic QoS renegotiation (described elsewhere).

After an APN is determined by the P-GW, the subscriber may be authenticated/authorized with an AAA server. The P-GW allows the AAA server to return VSAs (Vendor Specific Attributes) that override any/all of the APN configuration. This allows different subscriber tier profiles to be configured in the AAA server, and passed to the P-GW during subscriber authentication/authorization.

---

**Important**

For more information on APN configuration, refer to the *PDN Gateway Configuration* chapter this guide.

### Assume Positive for Gy-based Quota Tracking

In the current implementation, the PCEF uses a Diameter based Gy interface to interact with the OCS and obtain quota for each subscriber’s data session. Now, the PCEF can retry the OCS after a configured amount of quota has been utilized or after a configured amount of time. The quota value would be part of the deca-service configuration, and would apply to all subscribers using this deca-service. The temporary quota will be specified in volume (MB) and/or time (minutes) to allow for enforcement of both quota tracking mechanisms, individually or simultaneously.

When a user consumes the interim total quota or time configured for use during failure handling scenarios, the PCEF shall retry the OCS server to determine if functionality has been restored. In the event that services have been restored, quota assignment and tracking will proceed as per standard usage reporting procedures. Data used during the outage will be reported to the OCS. In the event that the OCS services have not been restored, the PCEF should reallocate with the configured amount of quota and time assigned to the user. The PCEF should report all accumulated used data back to OCS when OCS is back online. If multiple retries and interim allocations occur, the PCEF shall report quota used during all allocation intervals.

When the Gy interface is unavailable, the P-GW shall enter "assume positive" mode. Unique treatment is provided to each subscriber type. Each functional application shall be assigned unique temporary quota volume amounts and time periods based on a command-level AVP from the PCRF on the Gx interface. In addition, a configurable option has been added to disable assume positive functionality for a subscriber group identified by a command-level AVP sent on the Gx interface by the PCRF.

### Asynchronous Core Transfer Support for egtpinmnr

Asynchronous core transfer support for egtpinmnr has been added to optimize outage time during an egtpinmnr restart.

Previously, when the egtpinmnr restarted, the recovery process began only after a core dump file was created and transferred. However, the time taken to transfer the core file was significant. The outage time during an egtpinmnr restart was equal to the egtpinmnr recovery time plus the core file transfer time.

Support for Asynchronous Core Transfer has been added to include the egtpinmnr during the recovery process. Now, recovery begins when the egtpinmnr process crashes without waiting for the kernel to complete a core
dump file transfer and release its resources. As a result, the outage time during an egtpinmgr restart is equal to the egtpinmgr recovery time only.

With this enhancement, outage time during an egtpinmgr restart is reduced. The outage time consists only of the time required to recover the egtpinmgr. The time taken to create and transfer the core file no longer contributes to the outage time.

## Availability of SSID Information in Gx, Gy, Gz, and LI Interface

On the S2a interface P-GW receives the identity of the Wifi access point in the TWAN-IDENTIFIER attribute in the CREATE SESSION REQUEST message. This information consists of AP MAC address, SSID, and CIVIC Address (which may contain information like AP Group name).

For location tracking and location based policy purpose, the above information needs to be propagated to the Policy Server (Gx), Quota Server(Gy), Charging Gateway(Gz) and LI Server. This new feature enhances the P-GW to propagate the AP SSID, BSSID and Civic Address on all these interfaces whenever received on the S2a interface.

### Gx Interface

On the Gx interface this information is sent to PCRF in CCR-I/CCR-U and CCR-T messages in TWAN IDENTIFIER attribute. The standard Gx dictionary configuration is sufficient for this.

### Gy Interface

On the Gy interface this information is sent to quota server in CCR-I/CCR-U and CCR-T messages in a Cisco Vendor specific attribute named "Civic-Addr" whenever dcca_custom33 dictionary is configured for this interface.

### Gz Interface

On the Gz interface this information is sent to charging gateway in the CDR (Charging Data Records) in TWANUserLocationInformation attribute whenever custom53 dictionary is configured on this interface.

### LI Interface

On the LI interface the information is sent to the LI server in the IRI events in "twan_identifier" field. No specific dictionary change is needed for this.

---

**Important**

The PGW receives this SSID/BSSID/Civic Address information on s2a interface from a Trusted WLAN network (via SaMOG). If Cisco SaMOG is used then the functionality of sending this information from SaMOG to PGW can be controlled via a configuration (refer the SaMOG functionality for this). This feature will lead to 3-4% increase in baseline AAAmgr memory usage.

## Backup and Recovery of Key KPI Statistics

Before the Backup and Recovery of Key KPI Statistics feature was implemented, statistics were not backed up and could not be recovered after a SessMgr task restart. Due to this limitation, monitoring the KPI was a problem as the GGSN, P-GW, SAEGW, and S-GW would lose statistical information whenever task restarts occurred.
KPI calculation involves taking a delta between counter values from two time intervals and then determines the percentage of successful processing of a particular procedure in that time interval. When a SessMgr crashes and then recovers, the GGSN, P-GW, SAEGW, and S-GW lose the counter values - they are reset to zero. So, the KPI calculation in the next interval will result in negative values for that interval. This results in a dip in the graphs plotted using the KPI values, making it difficult for operations team to get a consistent view of the network performance to determine if there is a genuine issue or not.

This feature makes it possible to perform reliable KPI calculations even if a SessMgr restart occurs.

---

**Important**

For more information on Backup and Recovery of Key KPI Statistics, refer to the *Backup and Recovery of Key KPI Statistics* chapter in this guide.

---

### Bit Rate Mapping Across Gx and GTP-based Interfaces

This feature provides more consistent behavior and ensures correct bandwidth is allocated for bearers. Bit rate granularity provided by different interfaces was not aligned in 3GPP specifications. For example, the PCRF provided bits per second on the Gx and the GTP utilized kilobits per second. Due to the conversion of bps to kbps, there were scenarios where the rounding off could have resulted in the incorrect allocation of MBR/GBR values.

With this feature, a bitrate value sent on GTP interface will be rounded up if the conversion from bps (received from Gx) to kbps results in a fractional value. However, the enforcement of bitrate value (AMBR, MBR, GBR) values will remain the same. Once the value (in kbps) that is sent towards the Access side, it needs to be rounded up.

This feature (rounding up the bitrate in kbps) will be enabled by default. However, a CLI command under P-GW service, `[no] egtp bitrates-rounded-down-kbps`, controls the behavior of rounding-up. The CLI command enables/disables the old behavior of rounding down. By default, this CLI command is configured to use rounded-up bitrate values. Depending on how the CLI is configured, either rounded-up (Ceil) or rounded-down bitrate value will be sent on GTP interface towards the Access side. If the CLI command is enabled, then it will result in the old behavior. In addition, `show subscribers pgw-only full all` shows the APN-AMBR in terms of bps. Previously, `show subscribers pgw-only full all` used to show in terms of kbps.

CR - C4-132189 - is defined for TS 29.274 for GTP conversion by P-GW.

### Bulk Statistics Support

The system's support for bulk statistics allows operators to choose to view not only statistics that are of importance to them, but also to configure the format in which it is presented. This simplifies the post-processing of statistical data since it can be formatted to be parsed by external, back-end processors.

When used in conjunction with an element management system (EMS), the data can be parsed, archived, and graphed. The system can be configured to collect bulk statistics (performance data) and send them to a collection server (called a receiver). Bulk statistics are statistics that are collected in a group. The individual statistics are grouped by schema. Following is a list of supported schemas for P-GW:

- **APN**: Provides Access Point Name statistics
- **APN Expansion**: Provides more granular GTP-C statistics on a per-APN and per-QCI level
• **Card**: Provides card-level statistics
• **Context**: Provides context service statistics
• **Diameter-acct**: Provides Diameter Accounting statistics
• **Diameter-auth**: Provides Diameter Authentication statistics
• **ECS**: Provides Enhanced Charging Service statistics
• **eGTP-C**: Provides Evolved GPRS Tunneling Protocol - Control message statistics
• **FA**: Provides FA service statistics
• **GTPC**: Provides GPRS Tunneling Protocol - Control message statistics
• **GTPP**: Provides GPRS Tunneling Protocol - Prime message statistics
• **GTPU**: Provides GPRS Tunneling Protocol - User message statistics
• **HA**: Provides HA service statistics
• **IMSA**: Provides IMS Authorization service statistics
• **IP Pool**: Provides IP pool statistics
• **LMA**: Provides Local Mobility Anchor service statistics
• **P-GW**: Provides P-GW node-level service statistics
• **P-GW eGTP-C S2a**: Provides eGTP-C S2a interface statistics.
• **P-GW eGTP-C S2b**: Provides eGTP-C S2b interface statistics.
• **P-GW eGTP-C S5/S8**: Provides eGTP-C S5/S8 interface statistics.
• **Port**: Provides port-level statistics
• **PPP**: Provides Point-to-Point Protocol statistics
• **RADIUS**: Provides per-RADIUS server statistics
• **System**: Provides system-level statistics

The system supports the configuration of up to 4 sets (primary/secondary) of receivers. Each set can be configured with to collect specific sets of statistics from the various schemas. Statistics can be pulled manually from the system or sent at configured intervals. The bulk statistics are stored on the receiver(s) in files.

The format of the bulk statistic data files can be configured by the user. Users can specify the format of the file name, file headers, and/or footers to include information such as the date, system host name, system uptime, the IP address of the system generating the statistics (available for only for headers and footers), and/or the time that the file was generated.

When an EMS is used as the receiver, it is capable of further processing the statistics data through XML parsing, archiving, and graphing.

The Bulk Statistics Server component of an EMS parses collected statistics and stores the information in the PostgreSQL database. If XML file generation and transfer is required, this element generates the XML output and can send it to a Northbound NMS or an alternate bulk statistics server for further processing.
Additionally, if archiving of the collected statistics is desired, the Bulk Statistics server writes the files to an alternative directory on the server. A specific directory can be configured by the administrative user or the default directory can be used. Regardless, the directory can be on a local file system or on an NFS-mounted file system on an EMS server.

Important

For more information on bulk statistic configuration, refer to the Configuring and Maintaining Bulk Statistics chapter in the System Administration Guide.

Congestion Control

The congestion control feature allows you to set policies and thresholds and specify how the system reacts when faced with a heavy load condition.

Congestion control monitors the system for conditions that could potentially degrade performance when the system is under heavy load. Typically, these conditions are temporary (for example, high CPU or memory utilization) and are quickly resolved. However, continuous or large numbers of these conditions within a specific time interval may have an impact the system's ability to service subscriber sessions. Congestion control helps identify such conditions and invokes policies for addressing the situation.

Congestion control operation is based on configuring the following:

- **Congestion Condition Thresholds**: Thresholds dictate the conditions for which congestion control is enabled and establishes limits for defining the state of the system (congested or clear). These thresholds function in a way similar to operation thresholds that are configured for the system as described in the Thresholding Configuration Guide. The primary difference is that when congestion thresholds are reached, a service congestion policy and an SNMP trap, starCongestion, are generated.

  A threshold tolerance dictates the percentage under the configured threshold that must be reached in order for the condition to be cleared. An SNMP trap, starCongestionClear, is then triggered.

- **Port Utilization Thresholds**: If you set a port utilization threshold, when the average utilization of all ports in the system reaches the specified threshold, congestion control is enabled.

  - **Port-specific Thresholds**: If you set port-specific thresholds, when any individual port-specific threshold is reached, congestion control is enabled system-wide.

- **Service Congestion Policies**: Congestion policies are configurable for each service. These policies dictate how services respond when the system detects that a congestion condition threshold has been crossed.

Important

For more information on congestion control, refer to the Congestion Control chapter in the System Administration Guide.

Default and Dedicated EPC Bearers

Provides a foundation for contributing towards improved Quality of User Experience (QoE) by enabling deterministic end-to-end forwarding and scheduling treatments for different services or classes of applications.
pursuant to their requirements for committed bandwidth resources, jitter and delay. In this way, each application receives the service treatment that users expect.

In the StarOS 9.0 release and later, the Cisco EPC core platforms support one or more EPS bearers (default plus dedicated). An EPS bearer is a logical aggregate of one or more Service Data Flows (SDFs), running between a UE and a P-GW in the case of a GTP-based S5/S8 interface, and between a UE and HSGW (HRPD Serving Gateway) in case of a PMIP-based S2a interface. In networks where GTP is used as the S5/S8 protocol, the EPS bearer constitutes a concatenation of a radio bearer, S1-U bearer and an S5/S8 bearer anchored on the P-GW. In cases where PMIPv6 is used the EPS bearer is concatenated between the UE and HSGW with IP connectivity between the HSGW and P-GW.

---

The P-GW supports GTP-based S5/S8 and PMIPv6 S2a capabilities, with no commercial support for PMIPv6 S5/S8.

An EPS bearer uniquely identifies traffic flows that receive a common QoS treatment between a UE and P-GW in the GTP-based S5/S8 design, and between a UE and HSGW in the PMIPv6 S2a approach. If different QoS scheduling priorities are required between Service Data Flows, they should be assigned to separate EPS bearers. Packet filters are signalled in the NAS procedures and associated with a unique packet filter identifier on a per-PDN connection basis.

One EPS bearer is established when the UE connects to a PDN, and that remains established throughout the lifetime of the PDN connection to provide the UE with always-on IP connectivity to that PDN. That bearer is referred to as the default bearer. A PDN connection represents a traffic flow aggregate between a mobile access terminal and an external Packet Data Network (PDN) such as an IMS network, a walled garden application cloud or a back-end enterprise network. Any additional EPS bearer that is established to the same PDN is referred to as a dedicated bearer. The EPS bearer Traffic Flow Template (TFT) is the set of all 5-tuple packet filters associated with a given EPS bearer. The EPC core elements assign a separate bearer ID for each established EPS bearer. At a given time a UE may have multiple PDN connections on one or more P-GWs.

**DHCP Support**

The P-GW supports dynamic IP address assignment to subscriber IP PDN contexts using the Dynamic Host Control Protocol (DHCP), as defined by the following standards:

- RFC 2131, Dynamic Host Configuration Protocol
- RFC 2132, DHCP Options and BOOTP Vendor Extensions

The method by which IP addresses are assigned to a PDN context is configured on an APN-by-APN basis. Each APN template dictates whether it will support static or dynamic addresses. Dynamically assigned IP addresses for subscriber PDN contexts can be assigned through the use of DHCP.

The P-GW acts as a DHCP server toward the UE and a DHCP client toward the external DHCP server. The DHCP server function and DHCP client function on the P-GW are completely independent of each other; one can exist without the other.

DHCP supports both IPv4 and IPv6 addresses.

The P-GW does not support DHCP-relay.

**Deferred IPv4 Address Allocation**
Apart from obtaining IP addresses during initial access signalling, a UE can indicate via PCO options that it prefers to obtain IP address and related configuration via DHCP after default bearer has been established. This is also known as Deferred Address Allocation.

IPv4 addresses are becoming an increasingly scarce resource. Since 4G networks like LTE are always on, scarce resources such as IPv4 addresses cannot/should not be monopolized by UEs when they are in an ECM-IDLE state.

PDN-type IPv4v6 allows a dual stack implementing. The P-GW allocates an IPv6 address only by default for an IPv4v6 PDN type. The UE defers the allocation of IPv4 addresses based upon its needs, and relinquishes any IPv4 addresses to the global pool once it is done. The P-GW may employ any IPv4 address scheme (local pool or external DHCP server) when providing an IPv4 address on demand.

Support for Option 26 in DHCP

While fetching IPv4 address for the UE, P-GW acts as an independent DHCP server and client at the same time. It acts as a DHCP server towards the UE and as DHCP client towards the external DHCP server. In earlier release, support for exchange of certain DHCP options between the UE and the external DHCP server through the P-GW was added. This included support for relaying certain external DHCP server provided options (1, 3, 6, 28, and 43) to the UE along with the IPv4 address when deferred address allocation was configured with IP-Addralloc Proxy mode.

This feature adds support for Option 26 received in DHCP OFFER message from the DHCP server.

P-GW preserved the exchanged DHCP option 26 between the UE and the external DHCP server. P-GW relays this option for any future message exchanges between the UE and the external DHCP server. The external DHCP server component of the P-GW reserves and maintains the external DHCP server provided DHCP option so that when the UE renews or rebinds the DHCP lease, P-GW responds with the preserved value.

This feature introduces a behavior change with respect to renewal request. Earlier, when the ASR5500 was configured in DHCP proxy mode and when the DHCP server did not respond to a renewal request, a retransmission at time T2 (.85 * lease time) did not include both of the configured DHCP servers. DHCP lease got expired after retries exhaustion in the RENEW state.

With this feature, suppose the number of retransmission is configured as 2, then in RENEW state maximum 2 retries are done for the DHCP request messages. If no response is received from the DHCP server and state is changed to REBIND then also DHCP request messages is retried 2 times.

**Old Behavior:** Earlier, for lower values of "number of retransmission" (example >= 2), DHCP request message was not retried in the REBIND state.

**New Behavior:** Now, DHCP request message is retried for the number of times it is configured in both RENEW and REBIND state.

DHCPv6 Support

The Dynamic Host Configuration Protocol (DHCP) for IPv6 enables the DHCP servers to pass the configuration parameters, such as IPv6 network addresses to IPv6 nodes. It offers the capability of allocating the reusable network addresses and additional configuration functionality automatically.

The DHCPv6 support does not just feature the address allocation, but also fulfills the requirements of Network Layer IP parameters. Apart from these canonical usage modes, DHCPv6's Prefix-Delegation (DHCP-PD) has also been standardized by 3GPP (Rel 10) for "network-behind-ue" scenarios.
P-GW manages IPv6 prefix life-cycle just like it manages IPv4 addresses, thus it is responsible for allocation, renew, and release of these prefixes during the lifetime of a session. IPv6 Prefix is mainly for the UE’s session attached to P-GW, where as delegated prefix is for network/devices behind UE. For IPv6 prefixes, P-GW may be obtained from either local-pool, AAA (RADIUS/DIAMETER) or external DHCPv6 servers based on respective configuration. For Delegated IPv6 Prefix allocation, P-GW obtained it from external DHCPv6 servers based on configuration.

**Unicast Address Support Feature:** The IPv6 prefix delegation for the requested UE is either allocated locally or from an external DHCPv6 server by P-GW, GGSN, SAEGW based on configuration at these nodes. These DHCP messages are sent to the external DHCPv6 server using multicast address as destination address. In networks where there are large number of P-GW servers, but less number of DHCP servers, the DHCPv6 messages with multicast address have to travel through the entire network, increasing load on the network. The Unicast address support feature enables the operator to send all DHCPv6 messages on unicast address towards external server using configured address of DHCPv6 server in a DHCP service. This feature is CLI controlled and the operator needs to configure a CLI to support for client unicast operation to the DHCP Server.

DHCPv6 support for P-GW covers the following requirements:

- RFC 3315, Dynamic Host Configuration Protocol for IPv6 (Basic DHCPv6)
- RFC 3633, prefix delegation mechanism

For more information on DHCPv6 service configuration, refer to the **DHCPv6 Configuration** section of the **PDN Gateway Configuration** chapter.

### Direct Tunnel Support

When Gn/Gp interworking with pre-release SGSNs is enabled, the GGSN service on the P-GW supports direct tunnel functionality.

Direct tunnel improves the user experience (e.g. expedited web page delivery, reduced round trip delay for conversational services, etc.) by eliminating SGSN tunnel "switching" latency from the user plane. An additional advantage of direct tunnel from an operational and capital expenditure perspective is that direct tunnel optimizes the usage of user plane resources by removing the requirement for user plane processing on the SGSN.

The direct tunnel architecture allows the establishment of a direct user plane tunnel between the RAN and the GGSN, bypassing the SGSN. The SGSN continues to handle the control plane signalling and typically makes the decision to establish direct tunnel at PDP Context Activation. A direct tunnel is achieved at PDP context activation by the SGSN establishing a user plane (GTP-U) tunnel directly between RNC and GGSN (using an Update PDP Context Request toward the GGSN).

A major consequence of deploying direct tunnel is that it produces a significant increase in control plane load on both the SGSN and GGSN components of the packet core. It is therefore of paramount importance to a wireless operator to ensure that the deployed GGSNs are capable of handling the additional control plane loads introduced of part of direct tunnel deployment. The Cisco GGSN and SGSN offer massive control plane transaction capabilities, ensuring system control plane capacity will not be a capacity limiting factor once direct tunnel is deployed.
For more information on direct tunnel support, refer to the *Direct Tunnel for 4G (LTE) Networks* chapter in this guide.

**DNS Support for IPv4/IPv6 PDP Contexts**

This feature adds functionality in P-GW for PDN type IPv4v6. in StarOS Release 15.0. Previously, if an MS requested an IPv4 DNS address, P-GW did not send the IPv4 DNS address.

MS may request for DNS server IPv4 or IPv6 addresses using the Protocol Configurations Options IE (as a container or as part of IPCP protocol configuration request) in PDP Context Activation procedure for PDP Type IPv4, IPv6, or IPv4v6. In that case, the P-GW may return the IP address of one or more DNS servers in the PCO IE in the PDP Context Activation Response message. The DNS address(es) shall be coded in the PCO as specified in 3GPP TS 24.008.

For PDP Type IPv4v6, if MS requested DNS server IPv4 address, it did not return anIPv4 address. Support is now added to respond with address requested by MS.

AAA server may also provide DNS Server IPAddress in Access-Accept Auth Response. In such cases, AAA provided DNS server IPs takes priority over the one configured under APN.

When DNS server address is requested in PCO configuration, the following preference would be followed:

1. DNS values received from RADIUS Server.
2. DNS values locally configured with APN.
3. DNS values configured at context level with `ip name-servers` CLI.

**Domain Based Flow Definitions**

This solution provides improved flexibility and granularity in obtaining geographically correct exact IP entries of the servers by snooping DNS responses.

Currently, it is possible to configure L7 rules to filter based on domain (m.google.com). Sometimes multiple servers may serve a domain, each with its own IP address. Using an IP-rule instead of an http rule will result in multiple IP-rules; one IP-rule for each server "behind" the domain, and it might get cumbersome to maintain a list of IP addresses for domain-based filters.

In this solution, you can create ruledefs specifying hostnames (domain names) and parts of hostnames (domain names). Upon the definition of the hostnames/domain names or parts of them, the P-GW will monitor all the DNS responses sent towards the UE and will snoop only the DNS response, which has q-name or a-name as specified in the rules, and identify all the IP addresses resulted from the DNS responses. DNS snooping will be done on live traffic for every subscriber.

**DSCP Marking**

Provides support for more granular configuration of DSCP marking.

For Interactive Traffic class, the P-GW supports per-gateway service and per-APN configurable DSCP marking for Uplink and Downlink direction based on Allocation/Retention Priority in addition to the current priorities.

The following matrix may be used to determine the Diffserv markings used based on the configured traffic class and Allocation/Retention Priority:
Table 1: Default DSCP Value Matrix

<table>
<thead>
<tr>
<th>Allocation Priority</th>
<th>1</th>
<th>2</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Handling Priority</td>
<td>ef</td>
<td>ef</td>
<td>ef</td>
</tr>
<tr>
<td>1</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
<tr>
<td>2</td>
<td>af21</td>
<td>af21</td>
<td>af21</td>
</tr>
</tbody>
</table>

In addition, the P-GW allows configuration of diameter packets and GTP-C/GTP-U echo with DSCP values.

RAT-Type based DSCP Marking

Operators can perform DSCP marking on gateways such as P-GW, SAE-GW and GGSN, based on RAT-Type. It allows the operator to configure different QoS services and to optimize traffic based on the RAT-type: EUTRAN, GERAN and UTRAN.

RAT-Type based DSCP marking includes the following:

- Support for all QCI and ARP values.
- Support for Standard and non-Standard QCIs.
- If a particular RAT-Type is not configured, the DSCP marking functionality is applied to all RAT-Type.
- Applicable for Virtual APNs.
- During Inter-RAT hand-offs, DSCP marking is based on the RAT-Type of the current hand-off.
- DSCP marking per RAT-Type is only applicable for user data traffic and not for control traffic (GTP-C packets).

Important

Backward compatibility is maintained for existing DSCP marking and IP-ToS functionalities.

GTP-U on per APN Basis

This feature provides the flexibility to have a different DSCP marking table on per APN basis so that traffic on each of the APNs can be marked differently, depending on the needs of the APN.

The S-GW/P-GW supports configurable DSCP marking of the outer header of a GTP-U tunnel packet based on a QCI/THP table for the S5/S8 and Gn/Gp interfaces. This feature allows configuring DSCP marking table on a per APN basis.

Previously, DSCP marking table was configured on P-GW service level. As part of this requirement, CLI was added to associate the qos-qci-mapping table in APN.
The P-GW does not support non-standard QCI values unless a valid license key is installed.

QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.

From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128–254. For more information, see Non-standard QCI Support, on page 84.

In order to be backward compatible with older configurations, if a DSCP marking table is associated with P-GW service and not with the APN, then the one in P-GW service will be used. If table is associated in both P-GW service and APN, then the one on APN will take precedence.

**Dynamic GTP Echo Timer**

The Dynamic GTP Echo Timer enables the eGTP and GTP-U services to better manage GTP paths during network congestion. As opposed to the default echo timer, which uses fixed intervals and retransmission timers, the dynamic echo timer adds a calculated round trip timer (RTT) that is generated once a full request/response procedure has completed. A multiplier can be added to the calculation for additional support during congestion periods.

For more information, refer to the Configuring the GTP Echo Timer section located in the Configuring Optional Features on the P-GW section of the PDN Gateway Configuration chapter.

**Dynamic Policy Charging Control (Gx Reference Interface)**

Dynamic policy and charging control provides a primary building block toward the realization of IMS multimedia applications. In contrast to statically provisioned architectures, the dynamic policy framework provides a centralized service control layer with global awareness of all access-side network elements. The centralized policy decision elements simplify the process of provisioning global policies to multiple access gateways. Dynamic policy is especially useful in an Always-On deployment model as the usage paradigm transitions from a short lived to a lengthier online session in which the volume of data consumed can be extensive. Under these conditions dynamic policy management enables dynamic just in-time resource allocation to more efficiently protect the capacity and resources of the network.

Dynamic Policy Control represents the ability to dynamically authorize and control services and application flows between a Policy Charging Enforcement Function (PCEF) on the P-GW and the PCRF. Policy control enables a centralized and decoupled service control architecture to regulate the way in which services are provisioned and allocated at the bearer resource layer.

The StarOS 9.0 release included enhancements to conform with 3GPP TS 29.212 and 29.230 functions. The Gx reference interface uses Diameter transport and IPv6 addressing. The subscriber is identified to the PCRF at session establishment using IMSI based NAI s within the Subscription-ID AVP. Additionally the IMEI within the Equipment-Info AVP is used to identify the subscriber access terminal to the policy server. The Gx reference interface supports the following capabilities:

- Authorize the bearer establishment for a packet flow
- Dynamic L3/L4 transfer of service data flow filters within PCC rules for selection and policy enforcement of downlink/uplink IP CAN bearers
• Support static pre-provisioned L7 rulebase name attribute as trigger for activating Inline Services such as Peer-to-Peer Detection
• Authorize the modification of a service data flow
• Revoke the authorization of a packet flow
• Provision PCC rules for service data flows mapped to default or dedicated EPS bearers
• Support P-GW initiated event triggers based on change of access network gateway or IP CAN
• Provide the ability to set or modify APN-AMBR for a default EPS bearer
• Create or modify QoS service priority by including QCI values in PCC rules transmitted from PCRF to PCEF functions

Enhanced Charging Service (ECS)

The Enhanced Charging Service provides an integrated in-line service for inspecting subscriber data packets and generating detail records to enable billing based on usage and traffic patterns. Other features include:

• Content Analysis Support, on page 33
• Content Service Steering, on page 34
• Support for Multiple Detail Record Types, on page 34
• Diameter Credit Control Application, on page 35
• Accept TCP Connections from DCCA Server, on page 35
• Gy Interface Support, on page 36

The Enhanced Charging Service (ECS) is an in-line service feature that is integrated within the system. ECS enhances the mobile carrier's ability to provide flexible, differentiated, and detailed billing to subscribers by using Layer 3 through Layer 7 deep packet inspection with the ability to integrate with back-end billing mediation systems.

ECS interacts with active mediation systems to provide full real-time prepaid and active charging capabilities. Here the active mediation system provides the rating and charging function for different applications.

In addition, ECS also includes extensive record generation capabilities for post-paid charging with in-depth understanding of the user session. Refer to Support for Multiple Detail Record Types, on page 34 for more information.

The major components include:

• Service Steering: Directs subscriber traffic into the ECS subsystem. Service Steering is used to direct selective subscriber traffic flows via an Access Control List (ACL). It is used for other redirection applications as well for both internal and external services and servers.

• Protocol Analyzer: The software stack responsible for analyzing the individual protocol fields and states during packet inspection. It performs two types of packet inspection:
  • Shallow Packet Inspection: inspection of the layer 3 (IP header) and layer 4 (e.g. UDP or TCP header) information.
  • Deep Packet Inspection: inspection of layer 7 and 7+ information. Deep packet inspection functionality includes:
    • Detection of URI (Uniform Resource Identifier) information at level 7 (e.g., HTTP, WTP, RTSP Uniform Resource Locators (URLs)).
• Identification of true destination in the case of terminating proxies, where shallow packet inspection would only reveal the destination IP address / port number of a terminating proxy.

• De-encapsulation of upper layer protocol headers, such as MMS-over-WTP, WSP-over-UDP, and IP-over GPRS.

• Verification that traffic actually conforms to the protocol the layer 4 port number suggests.

• **Rule Definitions**: User-defined expressions, based on protocol fields and/or protocol-states, which define what actions to take when specific field values are true. Expressions may contain a number of operator types (string, =, >, etc.) based on the data type of the operand. Each Ruledef configuration is consisting of multiple expressions applicable to any of the fields or states supported by the respective analyzers.

• **Rule Bases**: a collection of rule definitions and their associated billing policy. The rule base determines the action to be taken when a rule is matched. It is possible to define a rule definition with different actions.

**Mediation and Charging Methods**

To provide maximum flexibility when integrating with billing mediation systems, ECS supports a full range of charging and authorization interfaces.

• **Pre-paid**: In a pre-paid environment, the subscribers pay for service prior to use. While the subscriber is using the service, credit is deducted from subscriber's account until it is exhausted or call ends. The pre-paid accounting server is responsible for authorizing network nodes (GGSNs) to grant access to the user, as well as grant quotas for either time connected or volume used. It is up to the network node to track the quota use, and when these use quotas run low, the network node sends a request to the pre-paid server for more quota.

If the user has not used up the purchased credit, the server grants quota and if no credit is available to the subscriber the call will be disconnected. ECS and DCCA manage this functionality by providing the ability to setup quotas for different services.

Pre-paid quota in ECS is implemented using DIAMETER Credit Control Application (DCCA). DCCA supports the implementation of real-time credit control for a variety of services, such as networks access, messaging services, and download services.

In addition to being a general solution for real-time cost and credit control, DCCA includes these features:

• **Real-time Rate Service Information** - DCCA can verify when end subscribers' accounts are exhausted or expired; or deny additional chargeable events.

• **Support for Multiple Services** - DCCA supports the usage of multiple services within one subscriber session. Multiple Service support includes; 1) ability to identify and process the service or group of services that are subject to different cost structures 2) independent credit control of multiple services in a single credit control sub-session.

Refer to Diameter Credit Control Application, on page 35 Diameter Credit Control Application for more information.

• **Post-paid**: In a post-paid environment, the subscribers pay after use of the service. A AAA server is responsible for authorizing network nodes (GGSNs) to grant access to the user and a CDR system generates G-CDRs/eG-CDRs/EDRs/UDRs or Comma Separated Values (CSVs) for billing information on pre-defined intervals of volume or per time.
Support for the Enhanced Charging Service requires a service license; the ECS license is included in the P-GW session use license. For more information on ECS, refer to the *ECS Administration Guide*.

**Content Analysis Support**

The Enhanced Charging Service is capable of performing content analysis on packets of many different protocols at different layers of the OSI model.

The ECS content analyzers are able to inspect and maintain state across various protocols at all layers of the OSI stack. ECS system supports, inspects, and analyzes the following protocols:

- IP
- TCP
- UDP
- DNS
- FTP
- TFTP
- SMTP
- POP3
- HTTP
- ICMP
- WAP: WTP and WSP
- Real-Time Streaming: RTP and RTSP
- MMS
- SIP and SDP
- File analysis: examination of downloaded file characteristics (e.g. file size, chunks transferred, etc.) from file transfer protocols such as HTTP and FTP.

Traffic analyzers in enhanced charging subsystem are based on configured rules. Rules used for Traffic analysis analyze packet flows and form usage records. Usage records are created per content type and forwarded to a pre-paid server or to a mediation/billing system. A traffic analyzer performs shallow (Layer 3 and Layer 4) and deep (above Layer 4) packet inspection of the IP packet flows.

The Traffic Analyzer function is able to do a shallow (layer 3 and layer 4) and deep (above layer 4) packet inspection of IP Packet Flows.

It is able to correlate all layer 3 packets (and bytes) with higher layer trigger criteria (e.g. URL detected in a HTTP header) and it is also perform stateful packet inspection to complex protocols like FTP, RTSP, SIP that dynamically open ports for the data path and by this way, user plane payload is differentiated into "categories".
In release 20.0 and higher Trusted StarOS builds, the FTP option is no longer available.

The Traffic Analyzer works on the application level as well and performs event based charging without the interference of the service platforms.

This functionality is available for use with the Enhanced Charging Service which requires a session-use license. For more information on ECS, refer to the *ECS Administration Guide*.

**Content Service Steering**

Content Service Steering (CSS) directs selective subscriber traffic into the ECS subsystem (In-line services internal to the system) based on the content of the data presented by mobile subscribers.

CSS uses Access Control Lists (ACLs) to redirect selective subscriber traffic flows. ACLs control the flow of packets into and out of the system. ACLs consist of "rules" (ACL rules) or filters that control the action taken on packets matching the filter criteria.

ACLs are configurable on a per-context basis and applies to a subscriber through either a subscriber profile or an APN profile in the destination context.

For more information on CSS, refer to the *Content Service Steering* chapter of the *System Administration Guide*.

For more information on ACLs, refer to the *IP Access Control Lists* chapter of the *System Administration Guide*.

**Support for Multiple Detail Record Types**

To meet the requirements of standard solutions and at the same time, provide flexible and detailed information on service usage, the Enhanced Charging Service (ECS) provides the following type of usage records:

- **Event Detail Records (EDRs)**
- **Usage Detail Records (UDRs)**

ECS provides for the generation of charging data files, which can be periodically retrieved from the system and used as input to a billing mediation system for post-processing. These files are provided in a standard format, so that the impact on the existing billing/mediation system is minimal and at the same time, these records contain all the information required for billing based on the content.

GTP-P accounting in ECS allows the collection of counters for different types of data traffic into detail records. The following types of detail records are supported:

- **Event Detail Records (EDRs)**: An alternative to standard G-CDRs when the information provided by the G-CDRs is not sufficient to do the content billing. EDRs are generated according to explicit action...
statements in rule commands that are user-configurable. The EDRs are generated in comma separated values (CSV) format, generated as defined in traffic analysis rules.

- **User Detail Records (UDRs):** Contain accounting information related to a specific mobile subscriber. The fields to be reported in them are user-configurable and are generated on any trigger of time threshold, volume threshold, handoffs, and call termination. The UDRs are generated in comma separated values (CSV) format, generated as defined in traffic analysis rules.

---

**Important**

This functionality is available for use with the Enhanced Charging Service which requires a session-use license. For more information on ECS, refer to the *ECS Administration Guide*.

---

**Diameter Credit Control Application**

Provides a pre-paid billing mechanism for real-time cost and credit control based on the following standards:

- RFC 3588, Diameter Base Protocol, September 2003
- RFC 4006, Diameter Credit-Control Application, August 2005

The Diameter Credit Control Application (DCCA) is used to implement real-time credit-control for a variety of end user services such as network access, Session Initiation Protocol (SIP) services, messaging services, download services etc.

Used in conjunction with ECS, the DCCA interface uses a mechanism to allow the user to be informed of the charges to be levied for a requested service. In addition, there are services such as gaming and advertising that may credit as well as debit from a user account.

DCCA also supports the following:

- **Real-time Rate Service Information:** The ability to verify when end subscribers' accounts are exhausted or expired; or deny additional chargeable events.

- **Support for Multiple Services:** The usage of multiple services within one subscriber session is supported. Multiple Service support includes:
  - The ability to identify and process the service or group of services that are subject to different cost structures.
  - Independent credit control of multiple services in a single credit control sub-session.

---

**Important**

This functionality is available for use with the Enhanced Charging Service, which requires a session-use license. For more information on ECS, refer to the *ECS Administration Guide*.

---

**Accept TCP Connections from DCCA Server**

This feature allows for peer Diameter Credit Control Application servers to initiate a connection the NGME. This feature allows peer diameter nodes to connect to the NGME on TCP port 3868 when the diameter server is incapable of receiving diameter incoming diameter requests.
Gy Interface Support

The Gy interface enables the wireless operator to implement a standardized interface for real time content based charging with differentiated rates for time based and volume based charging.

As it is based on a quota mechanism, the Gy interface enables the wireless operator to spare expensive Prepaid System resources.

As it enables time-, volume-, and event-based charging models, the Gy interface flexibly enables the operator to implement charging models tailored to their service strategies.

The Gy interface provides a standardized Diameter interface for real time content based charging of data services. It is based on the 3GPP standards and relies on quota allocation.

It provides an online charging interface that works with the ECS deep packet inspection feature. With Gy, customer traffic can be gated and billed in an "online" or "prepaid" style. Both time- and volume-based charging models are supported. In all of these models, differentiated rates can be applied to different services based on shallow or deep packet inspection.

Gy is a Diameter interface. As such, it is implemented atop, and inherits features from, the Diameter Base Protocol. The system supports the applicable Base network and application features, including directly connected, relayed or proxied DCCA servers using TLS or plaintext TCP.

In the simplest possible installation, the system exchanges Gy Diameter messages over Diameter TCP links between itself and one "prepay" server. For a more robust installation, multiple servers would be used. These servers may optionally share or mirror a single quota database so as to support Gy session failover from one server to the other. For a more scalable installation, a layer of proxies or other Diameter agents can be introduced to provide features such as multi-path message routing or message and session redirection features.

The Cisco implementation is based on the following standards:

- RFC 4006 generic DCCA, including:
  - CCR Initial, Update, and Final signaling
  - ASR and RAR asynchronous DCCA server messages
  - Time, Total-Octets, and Service-Specific-Units quota management
  - Multiple independent quotas using Multiple-Services-Credit-Control
  - Rating-Group for quota-to-traffic association
  - CC-Failure-Handling and CC-Session-Failover features
  - Final-Unit-Action TERMINATE behavior
  - Tariff-Time-Change feature.

- 3GPP TS 32.299 online mode "Gy" DCCA, including:
  - Final-Unit-Action REDIRECT behavior
• Quota-Holding-Time: This defines a user traffic idle time, on a per category basis, after which the usage is returned and no new quota is explicitly requested.

• Quota-Thresholds: These AVPs define a low value watermark at which new quota will be sought before the quota is entirely gone; the intent is to limit interruption of user traffic. These AVPs exist for all quota flavors, for example "Time-Quota-Threshold".

• Trigger-Type: This AVP defines a set of events which will induce a re-authentication of the current session and its quota categories.

**Framed-Route Attribute Support**

The Framed-Route attribute provides routing information to be configured for the user on the network access server (NAS). The Framed-Route information is returned to the RADIUS server in the Access-Accept message. Mobile Router enables a router to create a PDN Session which the P-GW authorizes using RADIUS server. The RADIUS server authenticates this router and includes a Framed-Route attribute in the access-accept response packet. Framed-Route attribute also specifies the subnet routing information to be installed in the P-GW for the "mobile router." If the P-GW receives a packet with a destination address matching the Framed-Route, the packet is forwarded to the mobile router through the associated PDN Session. For more information, see Routing Behind the Mobile Station on an APN chapter.

**Gn/Gp Handoff Support**

Integrated support of this feature requires that a valid session use license key be installed for both P-GW and GGSN. Contact your local Sales or Support representative for information on how to obtain a license. In LTE deployments, smooth handover support is required between 3G/2G and LTE networks, and Evolved Packet Core (EPC) is designed to be a common packet core for different access technologies. P-GW supports handovers as user equipment (UE) moves across different access technologies.

Cisco's P-GW supports inter-technology mobility handover between 4G and 3G/2G access. Interworking is supported between the 4G and 2G/3G SGSNs, which provide only Gn and Gp interfaces but no S3, S4 or S5/S8 interfaces. These Gn/Gp SGSNs provide no functionality introduced specifically for the evolved packet system (EPS) or for interoperation with the E-UTRAN. These handovers are supported only with a GTP-based S5/S8 and P-GW supports handoffs between GTPv2 based S5/S8 and GTPv1 based Gn/Gp tunneled connections. In this scenario, the P-GW works as an IP anchor for the EPC.

---

**Important**

To support the seamless handover of a session between GGSN and P-GW, the two independent services must be co-located on the same node and configured within the same context for optimum interoperation.

**Important**

For more information on Gn/GP handoffs, refer to [Gn/Gp Interface](#), on page 10.
GTP-C Path Failure Enhancements and Improved Debugging Tools

In StarOS release 20.0, enhancements have been added to optimize GTP-C path failure functionality, and to improve the debug capability of the system for GTP-C path failure problems. These features will help Operators and Engineers to debug different aspects of the system that will help in identifying the root cause of GTP-C path failures in the network. These enhancements affect path failure detection via the s5, s8, s2b, and s2a interfaces.

The following enhancements are added as part of this feature:

- The node can be configured so that it does not detect a path failure if a low restart counter is received due to incorrect or spurious messages. This prevents call loss. The option to disable path failure due to Echo Request/Response and Control Message Request/Response messages is also available so that call loss is prevented in the event of a false path failure detection.

- More granularity has been added to GTP-C path failure statistics so that the root cause of issues in the network can be diagnosed more quickly.

- A path failure history for the last five path failures per peer is available to assist in debugging path failures in the network.

- Seamless path failure handling is implemented so that call loss is avoided during redundancy events.

Support to Avoid False Path Failure Detection

Several enhancements have been made to facilitate the node's ability to avoid false path failure detection:

- The software has been enhanced to avoid path failure detection due to spurious/incorrect messages from a peer. These messages can cause a large burst in network traffic due to the number of service deactivations and activations, resulting in network congestion. The `gtpc` command in eGTP-C Service Configuration Mode has been enhanced to resolve this issue. The `max-remote-restart-counter-change` keyword has been added to ensure false path failure detections are not detected as GTP-C path failures. For example, if the `max-remote-restart-counter-change` is set to 10 and the current peer restart counter is 251, eGTP will detect a peer restart only if the new restart counter is 252 through 255 or 0 through 5. Similarly, if the stored restart counter is 1, eGTP will detect a peer restart only if the new restart counter is 2 through 11.

- Also as part of this enhancement, new keywords have been added to the `path-failure detection-policy` command in eGTP-C Service Configuration Mode to enable or disable path failure detection.

- The `show egtp-service all` command in Exec Mode has been enhanced to indicate whether Echo Request/Echo Response Restart Counter Change and Control Message Restart Counter Change are enabled/disabled on the node.

Improved GTP-C Path Failure Statistics

Several improvements have been made to improve the quality of the GTP-C path failures so that operators/engineers can more quickly identify the cause of the failure.

- The output of the `show egtpc statistics path-failure-reasons` has been enhanced to show the number and type of control message restart counter changes at the demuxmgr and sessmgr. This command output has also been enhanced to track the number of path failures detected that were ignored at the eGTP-C layer.
The `show egtpc peers path-failure-history` command output has been added to provide detailed information on the last five path failures per peer.

The output of the `show egtp-service all name` and `show configuration` commands has been enhanced to show the current configuration settings specific to path GTP-C path failure detection policy.

**IMS Emergency Bearer Handling**

With this support, a UE is able to connect to an emergency PDN and make Enhanced 911 (E911) calls while providing the required location information to the Public Safety Access Point (PSAP).

E911 is a telecommunications-based system that is designed to link people who are experiencing an emergency with the public resources that can help. This feature supports E911-based calls across the LTE and IMS networks. In a voice over LTE scenario, the subscriber attaches to a dedicated packet data network (PDN) called EPDN (Emergency PDN) in order to establish a voice over IP connection to the PSAP. Signaling either happens on the default emergency bearer, or signaling and RTP media flow over separate dedicated emergency bearers. Additionally, different than normal PDN attachment that relies on AAA and PCRF components for call establishment, the EPDN attributes are configured locally on the P-GW, which eliminates the potential for emergency call failure if either of these systems is not available.

Emergency bearer services are provided to support IMS emergency sessions. Emergency bearer services are functionalities provided by the serving network when the network is configured to support emergency services. Emergency bearer services are provided to normally attached UEs and to UEs that are in a limited service state (depending on local service regulations, policies, and restrictions). Receiving emergency services in limited service state does not require a subscription.

The standard (refer to 3GPP TS 23.401) has identified four behaviors that are supported:

- Valid UEs only
- Authenticated UEs only
- MSI required, authentication optional
- All UEs

To request emergency services, the UE has the following two options:

- UEs that are in a limited service state (due to attach reject from the network, or since no SIM is present), initiate an ATTACH indicating that the ATTACH is for receiving emergency bearer services. After a successful attach, the services that the network provides the UE is solely in the context of Emergency Bearer Services.

- UEs that camp normally on a cell initiates a normal ATTACH if it requires emergency services. Normal attached UEs initiated a UE Requested PDN Connectivity procedure to request Emergency Bearer Services.

**IP Access Control Lists**

IP access control lists allow you to set up rules that control the flow of packets into and out of the system based on a variety of IP packet parameters. IP access lists, or access control lists (ACLs) as they are commonly referred to, are used to control the flow of packets into and out of the system. They are configured on a per-context basis and consist of "rules" (ACL
rules) or filters that control the action taken on packets that match the filter criteria. Once configured, an ACL can be applied to any of the following:

- An individual interface
- All traffic facilitated by a context (known as a policy ACL)
- An individual subscriber
- All subscriber sessions facilitated by a specific context

For more information on IP access control lists, refer to the IP Access Control Lists chapter in the System Administration Guide.

**IP Address Hold Timers**

Also known as address quarantining, this subscriber-level CLI introduces an address hold timer to temporarily buffer a previously assigned IP address from an IP address pool to prevent it from being recycled and reassigned to a new subscriber session. It is especially useful during inter-RAT handovers that sometimes lead to temporary loss of the mobile data session.

This feature provides a higher quality user experience for location-based services where the remote host server needs to reach the mobile device.

Currently, the P-GW only supports an address hold timer with IPv4 addresses.

**IPv6 and IPv4 Capabilities**

Enables increased address efficiency and relieves pressures caused by rapidly approaching IPv4 address exhaustion problem.

The P-GW offers the following IPv6 capabilities:

**Native IPv6 and IPv6/IPv4 transport**

- Support for any combination of IPv4, IPv6 or dual stack IPv4/IPv6 address assignment from dynamic or static address pools on the P-GW.
- Support for mobility packets wrapped with UDP and IPv4 headers.
- Support for native IPv6/IPv4 transport and service addresses on PMIPv6 S2a interface. Note that transport on GTP S5/S8 connections in this release is IPv4 based.
- Support for IPv6 transport for outbound traffic over the SGi reference interface to external Packet Data Networks.
- Support for downlink IPv4 data packets received from the SGi forwarded/redirected to a configured next-hop address if the subscriber session does not exist in the P-GW. If the next-hop is not ARP resolvable, then the packet will be dropped. The appropriate interface stats will be updated with the packets forward/dropped counts.
**Important**

The `unconnected-address next-system ip address` keyword must be enabled to support the downlink IPv4 data packets forwarding/redirection.

**IPv6 Connections to Attached Elements**

IPv6 transport and interfaces are supported on all of the following connections:

- Diameter Gx policy signaling interface
- Diameter Gy online charging reference interface
- S6b authentication interface to external 3GPP AAA server
- Diameter Rf offline charging interface
- Lawful Intercept (X1, X2 interfaces)

**Routing and Miscellaneous Features**

- OSPFv3
- MP-BGP v6 extensions
- IPv6 flows (Supported on all Diameter QoS and Charging interfaces as well as Inline Services (e.g. ECS)

**IPv6 MTU Option Support in RA Message**

In RFC-4861 there is a provision to send the Maximum Transmission Unit (MTU) in Router Advertisement (RA) messages. Prior to StarOS release 20.0, the Cisco P-GW did not support the IPv6 MTU option in RA messages. In StarOS release 20.0 the P-GW now supports the sending of the IPv6 MTU option in RAs for IPv6 and IPv4v6 PDN types towards the UE. As a result, the UE can now send uplink data packets based on the configured MTU and perform data fragmentation at the source, if required. This feature also reduces the number of ICMPv6 *Packet Too Big* error messages in the customer’s network.

The MTU size is configurable via the Command Line Interface (CLI) on the GGSN and P-GW.

**Supported Functionality**

To support the IPv6 MTU Option in RA Message feature, the P-GW/GGSN supports the following functionality and behavior:

- The `ipv6 initial-router-advt option mtu` command in *APN Configuration Mode* is available to enable/disable this feature per APN. By default, this feature is enabled for all APNs.
  - For the P-GW and SAEGW, the session manager sends the MTU value that is configured via the CLI command `data-tunnel mtu 1280-2000` in *APN Configuration Mode*.
  - For the GGSN, the RADIUS-returned value in the Framed-MTU Attribute Value Pair (AVP) takes precedence over the value configured via the `ppp mtu 100-2000` CLI command in *APN Configuration Mode*.

- For the GGSN, if the RADIUS-returned MTU value is less than the minimum IPv6 MTU, then the minimum IPv6 MTU value of 1280 is sent in the IPv6 MTU option field in RA messages.
• For the GGSN, if the **ppp mtu 100-2000** CLI command is configured with an MTU value of less than 1280, then the minimum IPv6 MTU value is sent in the IPv6 MTU option field in RA messages.

• When no MTU value comes from the RADIUS server and both the above mentioned CLI commands are not configured, the default value of 1500 is used for the MTU.

• Support for the MTU option in RA messages is available in the GGSN/P-GW/SAEGW.

• This feature is supported on the P-GW independent of interfaces such as s2a/s2b/s5/s8.

• The MTU option in RA messages is supported for both IPv6 and IPv4v6 PDN types.

• The MTU option in RA messages is available in the output of the **monitor protocol** command.

• The same MTU value is sent by the gateway in initial and periodic RA messages for a call line.

• The behavior of sending the IPv6 MTU option in RA for a PDN call is persistent across session recovery and ICSR switchover.

• Existing MTU related data path behavior for the GGSN/P-GW/SAEGW is not changed.

**Restrictions/Limitations**

Note the following restrictions/limitations for this feature:

• The GGSN/P-GW/SAEGW does not consider the GTP-U tunnel overhead while calculating the MTU value to be sent in the IPv6 MTU option in RAs. Therefore, the operator has to configure the **data-tunnel mtu** by considering the tunnel overhead. Refer to the **Link MTU Considerations** section in Annex-C of 3GPP TS 23.060.

• Existing MTU-related data path behavior for the GGSN/P-GW/SAEGW is unchanged.

• If there is a Gn/Gp Handover followed by session recovery, operators will see the following behavior: The stateless IPv6 session is recovered with the MTU value configured for the current GGSN/P-GW service after the handover. This is existing behavior if the feature is not configured. With this feature enabled, the same recovered MTU value will be sent in periodic RA messages after such a handover occurs when followed by session recovery.

• This feature is not supported for eHRPD. As a result, in scenarios where an LTE-to-eHRPD to LTE-Handover or eHRPD-to-LTE Handover occurs, a new stateless IPv6 session is re-created using the latest APN configuration.

• With this feature enabled, there is no support for an MTU value received by the gateway via the S6b interface.

**IPv6 Prefix-Based Search Support for LTE-WiFi Handoff**

Prior to StarOS release 20.0, LTE-to-WiFi handoffs were failing for some UE devices for a specific customer during Inter-RAT testing for WiFi. The UE devices were using Stateless Address Auto Configuration. This issue was only seen from specific UE devices when the UE is sending the changed IPv6 address on Create Session Response (CSResp) messages during handoffs. Another vendor device had no issues for the LTE-to-WiFi handoff since it was sending the IPv6 address assigned initially during the Create Session Response (CSResp) from P-GW.
When the P-GW performed an IPv6 lookup of the existing LTE session based on the complete IPv6 128-bit address (Prefix + Intf ID), the handover would fail with the error EGTP_CONTEXT_NOT_FOUND.

With StarOS release 20.0, the P-GW performs the IPv6 lookup of the existing LTE session during an LTE-WiFi handoff using only the IPv6 prefix (64-bit). Operators now will see seamless handovers on these calls for UE devices with Stateless Address Auto Configuration. The P-GW will not reject the handoff request if the UE uses a different interface-ID from the one provided during call creation during handoffs for PDN types IPv6 and IPv4v6.

There are no changes on external interfaces. The only change as part of this feature is that the internal search to find the existing session is performed using the 64-bit IPv6 prefix during handoff.

**Restrictions/Limitations**

With Stateless Auto Configuration, when the UE uses a different interface-ID from the one provided by P-GW. The UE then later moves to another location that results in an S1/X2 handover with an S-GW change. As result, the S-GW may have a different IPv6 address for a PDN from the one maintained by the P-GW (that is, the IP Address provided during initial attach) for the same UE. This can result in a difference in the servedPDPDNAddress element in the CDR from the P-GW and S-GW.

This restriction is due to an existing limitation in the 3GPP Modify procedure, such as Modify Bearer Request/Modify Bearer Response, where an exchange of the changed UE IPv6 address is not supported between the P-GW and S-GW during the S1/X2 handover.

It is assumed that the mediation devices will look into the 64-bit prefix of the IPv6 address in CDRs for Stateless Auto Configuration devices.

**Local Break-Out**

Provides a standards-based procedure to enable LTE operators to generate additional revenues by accepting traffic from visited subscribers based on roaming agreements with other mobile operators.

Local Breakout is a policy-based forwarding function that plays an important role in inter-provider roaming between LTE service provider networks. Local Breakout is determined by the SLAs for handling roaming calls between visited and home networks. In some cases, it is more beneficial to locally breakout a roaming call on a foreign network to the visited P-W rather than incur the additional transport costs to backhaul the traffic to the Home network.

If two mobile operators have a roaming agreement in place, Local Break-Out enables the visited user to attach to the V-PLMN network and be anchored by the local P-GW in the visited network. The roaming architecture relies on the HSS in the home network and also introduces the concept of the S9 policy signaling interface between the H-PCRF in the H-PLMN and the V-PCRF in the V-PLMN. When the user attaches to the EUTRAN cell and MME (Mobility Management Entity) in the visited network, the requested APN name in the S6a NAS signaling is used by the HSS in the H-PLMN to select the local S-GW (Serving Gateway) and P-GWs in the visited EPC network.

**LTE Video Calling**

In a Voice over LTE (VoLTE) scenario, the P-GW provides support for LTE Video Calling (LVC). No additional configuration is required to support this functionality.
The P-GW checks the data usage quota for a subscriber at video call setup and periodically during an active video call. The following functionality applies to post paid subscribers with data usage control:

**Quota Check - Call Setup**

If the P-GW determines that the subscriber has reached their data usage quota during the call setup:

- The audio bearer portion of the call is activated. The video bearer portion of the call is NOT activated. The P-GW sends the PCRF a Credit Control Request update (CCR-U) with "OUT_OF_CREDIT" event trigger and the Final-Unit-Action (FUA) received from the OCS. The PCRF removes the Service Data Flow (SDF) from the P-GW, and sends the P-CSCF indication of the failure of the video bearer channel setup.

**Quota Check - During Active Video Call**

If the subscriber exhausts their data usage during a video call:

- The audio bearer portion of the call is preserved. The video bearer portion of the call is terminated. The P-GW sends the PCRF CCR-U with "OUT_OF_CREDIT" event trigger and the Final-Unit-Action (FUA) received from the OCS. The PCRF removes the SDF from the P-GW, and sends the P-CSCF indication of the failure of the video bearer channel setup.

---

**MPLS EXP Marking of User Plane Traffic**

Similar to 802.1p marking, MPLS EXP bit marking is supported for Enterprise APNs that use MPLS tunneling on the SGi interface on the P-GW. The QoS marking used in the LTE/EPC network (QCI per EPS bearer) is mapped to the 802.1p and MPLS EXP bit marking between the P-GW and L2/EPC switch and MPLS/PE routers (this is applicable to the upstream direction, from the P-GW to the Network). MPLS EXP marking related configuration is available as part of the QCI-QOS configuration table. MPLS EXP marking is selected based on QCI of the bearer to which that packet belongs.

**Important**

The P-GW does not support non-standard QCI values unless a valid license key is installed.

QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.

From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128-254. For more information, see Non-standard QCI Support, on page 84.

---

**Mobile IP Registration Revocation**

Mobile IP registration revocation functionality provides the following benefits:

- Timely release of Mobile IP resources at the HSGW and/or P-GW
- Accurate accounting
- Timely notification to mobile node of change in service

Registration Revocation is a general mechanism whereby either the P-GW or the HSGW providing Mobile IP functionality to the same mobile node can notify the other mobility agent of the termination of a binding. Mobile IP Registration Revocation can be triggered at the HSGW by any of the following:
• Session terminated with mobile node for whatever reason
• Session renegotiation
• Administrative clearing of calls
• Session Manager software task outage resulting in the loss of HSGW sessions (sessions that could not be recovered)

Important
Registration Revocation functionality is also supported for Proxy Mobile IP. However, only the P-GW can initiate the revocation for Proxy-MIP calls.

Important
For more information on MIP registration revocation support, refer to the Mobile IP Registration Revocation chapter in this guide.

**MTU Size PCO**

UEs usually use a hardcoded MTU size for IP communication. If this hardcoded value is not in sync with the network supported value, it can lead to unnecessary fragmentation of packets sent by the UE. Thus, in order to avoid unnecessary fragmentation, this feature helps in using the network-provided MTU size instead of the hardcoded MTU in UE.

3GPP defined a new PCO option in Release 10 specifications for the network to be able to provide an IPv4 MTU size to the UE. P-GW supports an option to configure a IPv4 Link MTU size in the APN profile.

If the UE requests IPv4 Link MTU size in the PCO options during Initial Attach or PDN connectivity request, the P-GW will provide the preconfigured value based on the APN.

If the MTU size configuration on APN is changed, the new MTU size will take effect only for new PDN connections and initial attaches. P-GW will not update for the existing PDN connections.

If UE does not request IPv4 Link MTU size, P-GW will not include the IPv4 Link MTU size.

**Multiple PDN Support**

Enables an APN-based user experience that enables separate connections to be allocated for different services including IMS, Internet, walled garden services, or off-deck content services.

The MAG function on the S-GW can maintain multiple PDN or APN connections for the same user session. The MAG runs a single node level Proxy Mobile IPv6 tunnel for all user sessions toward the LMA function of the P-GW. When a user wants to establish multiple PDN connections, the MAG brings up the multiple PDN connections over the same PMIPv6 session to one or more P-GW LMAs. The P-GW in turn allocates separate IP addresses (Home Network Prefixes) for each PDN connection and each one can run one or multiple EPC default & dedicated bearers. To request the various PDN connections, the MAG includes a common MN-ID and separate Home Network Prefixes, APNs and a Handover Indication Value equal to one in the PMIPv6 Binding Updates.
Node Functionality GTP Echo

This feature helps exchange capabilities of two communicating GTP nodes, and uses the new feature based on whether it is supported by the other node.

This feature allows S-GW to exchange its capabilities (MABR, PRN, NTSR) with the peer entities through ECHO messages. By this, if both the peer nodes support some common features, then they can make use of new messages to communicate with each other.

With new "node features" IE support in ECHO request/response message, each node can send its supported features (MABR, PRN, NTSR). This way, S-GW can learn the peer node's supported features. S-GW's supported features can be configured by having some configuration at the service level.

If S-GW wants to use new message, such as P-GW Restart Notification, then S-GW should check if the peer node supports this new feature or not. If the peer does not support it, then S-GW should fall back to old behavior.

If S-GW receives a new message from the peer node, and if S-GW does not support this new message, then S-GW should ignore it. If S-GW supports the particular feature, then it should handle the new message as per the specification.

Non-Optimized e-HRPD to Native LTE (E-UTRAN) Mobility Handover

This feature enables a seamless inter-technology roaming capability in support of dual mode e-HRPD/e-UTRAN access terminals.

The non-optimized inter-technology mobility procedure is rooted at the P-GW as the mobility anchor point for supporting handovers for dual radio technology e-HRPD/E-UTRAN access terminals. To support this type of call handover, the P-GW supports handoffs between the GTP-based S5/S8 (GTPv2-C / GTPv1-U) and PMIPv6 S2a tunneled connections. It also provisions IPv4, IPv6, or dual stack IPv4/IPv6 PDN connections from a common address pool and preserves IP addresses assigned to the UE during inter-technology handover. In the current release, the native LTE (GTP-based) P-GW service address is IPv4-based, while the e-HRPD (PMIP) address is an IPv6 service address.

During the initial network attachment for each APN that the UE connects to, the HSS returns the FQDN of the P-GW for the APN. The MME uses DNS to resolve the P-GW address. When the PDN connection is established in the P-GW, the P-GW updates the HSS with the IP address of the P-GW on PDN establishment through the S6b authentication process. When the mobile user roams to the e-HRPD network, the HSS returns the IP address of the P-GW in the P-GW Identifier through the STA interface and the call ends up in the same P-GW. The P-GW is also responsible for initiating the session termination on the serving access connection after the call handover to the target network.

During the handover procedure, all dedicated EPS bearers must be re-established. On LTE- handovers to a target e-HRPD access network, the dedicated bearers are initiated by the mobile access terminal. In contrast, on handovers in the opposite direction from e-HRPD to LTE access networks, the dedicated bearers are network initiated through Gx policy interactions with the PCRF server.

Finally, in order to support the inter-technology handovers, the P-GW uses common interfaces and Diameter endpoint addresses for the various reference points:
All three types of sessions are maintained during call handovers. The bearer binding will be performed by the HSGW during e-HRPD access and by the P-GW during LTE access. Thus, the Bearer Binding Event Reporting (BBERF) function needs to migrate between the P-GW and the HSGW during the handover. The HSGW establishes a Gxa session during e-HRPD access for bearer binding and releases the session during LTE access. The HSGW also maintains a limited context during the e-HRPD <-> LTE handover to reduce latency in the event of a quick handover from the LTE RAN back to the e-HRPD network.

**Important**

For more information on handoff interfaces, refer to [Supported Logical Network Interfaces (Reference Points)](page 6), on page 6.

---

**Online/Offline Charging**

The Cisco EPC platform offers support for online and offline charging interactions with external OCS and CGF/CDF servers.

**Online Charging**

**Gy/Ro Reference Interfaces**

The StarOS 9.0 online prepaid reference interface provides compatibility with the 3GPP TS 23.203, TS 32.240, TS 32.251 and TS 32.299 specifications. The Gy/Ro reference interface uses Diameter transport and IPv6 addressing. Online charging is a process whereby charging information for network resource usage must be obtained by the network in order for resource usage to occur. This authorization is granted by the Online Charging System (OCS) upon request from the network. The P-GW uses a charging characteristics profile to determine whether to activate or deactivate online charging. Establishment, modification or termination of EPS bearers is generally used as the event trigger on the PCRF to activate online charging PCC rules on the P-GW.

When receiving a network resource usage request, the network assembles the relevant charging information and generates a charging event towards the OCS in real-time. The OCS then returns an appropriate resource usage authorization that may be limited in its scope (e.g. volume of data or duration based). The OCS assigns quotas for rating groups and instructs the P-GW whether to continue or terminate service data flows or IP CAN bearers.

The following Online Charging models and functions are supported:

- Time based charging
- Volume based charging
- Volume and time based charging
- Final Unit Indication and termination or redirection of service data flows when quota is consumed
- Reauthorization triggers to rearm quotas for one or more rating groups using multi-service credit control (MSCC) instances
• Event based charging

• Billing cycle bandwidth rate limiting: Charging policy is enforced through interactions between the PDN GW and Online Charging Server. The charging enforcement point periodically conveys accounting information for subscriber sessions to the OCS and it is debited against the threshold that is established for the charging policy. Subscribers can be assigned a max usage for their tier (gold, silver, bronze for example), the usage can be tracked over a month, week, day, or peak time within a day. When the subscriber exceeds the usage limit, bandwidth is either restricted for a specific time period, or dropped depending on their tier of service.

• Fair usage controls

### Offline Charging

#### Ga/Gz Reference Interfaces

The Cisco P-GW supports 3GPP-compliant offline charging as defined in TS 32.251, TS 32.297 and 32.298. Whereas the S-GW generates SGW-CDRs to record subscriber level access to PLMN resources, the P-GW creates PGW-CDRs to record user access to external networks. Additionally, when Gn/Gp interworking with pre-release SGSNs is enabled, the GGSN service on the P-GW records G-CDRs to record user access to external networks.

To provide subscriber level accounting, the Cisco S-GW and P-GWs support integrated Charging Transfer Functions (CTF) and Charging Data Functions (CDF). Each gateway uses Charging-ID’s to distinguish between default and dedicated bearers within subscriber sessions. The Ga/Gz reference interface between the CDF and CGF is used to transfer charging records via the GTPP protocol. In a standards based implementation, the CGF consolidates the charging records and transfers them via an FTP/S-FTP connection over the Bm reference interface to a back-end billing mediation server. The Cisco EPC gateways also offer the ability to FTP/S-FTP charging records between the CDF and CGF server. CDR records include information such as Record Type, Served IMSI, ChargingID, APN Name, TimeStamp, Call Duration, Served MSISDN, PLMN-ID, etc. The ASR 5500 platform offers a local directory to enable temporary file storage and buffer charging records in persistent memory located on a pair of dual redundant RAID hard disks. Each drive includes 147GB of storage and up to 100GB of capacity is dedicated to storing charging records. For increased efficiency it also possible to enable file compression using protocols such as GZIP. The Offline Charging implementation offers built-in heartbeat monitoring of adjacent CGFs. If the Cisco P-GW has not heard from the neighbor CGF within the configurable polling interval, they will automatically buffer the charging records on the local drives until the CGF reactivates itself and is able to begin pulling the cached charging records.

---

**Important**

In release 20.0 and higher Trusted StarOS builds, the FTP option is no longer available.

The P-GW supports a Policy Charging Enforcement Function (PCEF) to enable Flow Based Bearer Charging (FBC) via the Gy reference interface to adjunct OCS servers (See Online Charging description above).

#### Rf Reference Interface

The Cisco EPC platforms also support the Rf reference interface to enable direct transfer of charging files from the CTF function of the P-GW to external CDF/CGF servers. This interface uses Diameter Accounting Requests (Start, Stop, Interim, and Event) to transfer charging records to the CDF/CGF. Each gateway relies on triggering conditions for reporting chargeable events to the CDF/CGF. Typically as EPS bearers are activated, modified or deleted, charging records are generated. The EPC platforms include information such as Subscription-ID (IMSI), Charging-ID (EPS bearer identifier) and separate volume counts for the uplink and downlink traffic.
Optimization for egtpinmgr Recovery

Prior to StarOS release 20, when the egtpinmgr task restarted it took a significant amount of time for it to recover. As a result, the outage time for which the GGSN, P-GW, SAEGW, and S-GW were unable to accept any new calls during egtpinmgr recovery was high.

In StarOS release 20, the software has been enhanced to optimize the recovery outage window in the event of an egtpinmgr task restart. The optimization has been achieved by optimizing the internal algorithms of egtpinmgr recovery as well as optimizing the data structures required. In addition, recovery time now is dependent only on the number of unique IMSIs and not on the number of sessions for an IMSI.

P-CSCF Recovery

Supports spec-based mechanism to support P-CSCF discovery for GTP-based S2b interface for WiFi integration. This is needed for Voice over WiFi service.

The P-GW can store the P-CSCF FQDN received during the initial registration with the AAA. Upon receiving the P-CSCF restoration flag from the MME/S-GW, the P-GW performs a new DNS query using the existing P-CSCF FQDN to provide the updated list of three P-CSCF IP addresses using PCO.

Peer GTP Node Profile Configuration Support

Provides flexibility to the operators to have different configuration for GTP-C and Lawful Intercept, based on the type of peer or the IP address of the peer

Peer profile feature allows flexible profile based configuration to accommodate growing requirements of customizable parameters with default values and actions for peer nodes of P-GW. With this feature, configuration of GTP-C parameters and disabling/enabling of Lawful Intercept per MCC/MNC or IP address based on rules defined.

A new framework of peer-profile and peer-map is introduced. Peer-profile configuration captures the GTP-C specific configuration and/or Lawful Intercept enable/disable configuration. GTP-C configuration covers GTP-C retransmission (maximum number of retries and retransmission timeout) and GTP echo configuration. Peer-map configuration matches the peer-profile to be applied to a particular criteria. Peer-map supports criteria like MCC/MNC (PLMN-ID) of the peer or IP-address of the peer. Peer-map can then be associated with P-GW service.

Intent of this feature is to provide flexibility to operators to configure a profile which can be applied to a specific set of peers. For example, have a different retransmission timeout for foreign peers as compared to home peers.

PMIPv6 Heartbeat

Proxy Mobile IPv6 (PMIPv6) is a network-based mobility management protocol to provide mobility without requiring the participation of the mobile node in any PMIPv6 mobility related signaling. The core functional entities Mobile Access Gateway (MAG) and the Local Mobility Anchor (LMA) set up tunnels dynamically to manage mobility for a mobile node.

Path management mechanism through Heartbeat messages between the MAG and LMA is important to know the reachability of the peers, to detect failures, quickly inform peers in the event of a recovery from node failures, and allow a peer to take appropriate action.
PMIP heartbeats from the HSGW to the P-GW are supported per RFC 5847. Refer to the heartbeat command in the LMA Service mode or MAG Service mode respectively to enable this heartbeat and configure the heartbeat variables.

Important
For more information on PMIPv6 Heartbeat support, refer to the PMIPv6 Heartbeat chapter in this guide.

Proxy Mobile IPv6 (S2a)

Provides a mobility management protocol to enable a single LTE-EPC core network to provide the call anchor point for user sessions as the subscriber roams between native EUTRAN and non-native e-HRPD access networks.

S2a represents the trusted non-3GPP interface between the LTE-EPC core network and the evolved HRPD network anchored on the HSGW. In the e-HRPD network, network-based mobility provides mobility for IPv6 nodes without host involvement. Proxy Mobile IPv6 extends Mobile IPv6 signaling messages and reuses the HA function (now known as LMA) on the P-GW. This approach does not require the mobile node to be involved in the exchange of signaling messages between itself and the Home Agent. A proxy mobility agent (e.g., MAG function on HSGW) in the network performs the signaling with the home agent and does the mobility management on behalf of the mobile node attached to the network.

The S2a interface uses IPv6 for both control and data. During the PDN connection establishment procedures the P-GW allocates the IPv6 Home Network Prefix (HNP) via Proxy Mobile IPv6 signaling to the HSGW. The HSGW returns the HNP in router advertisement or based on a router solicitation request from the UE. PDN connection release events can be triggered by either the UE, the HSGW or the P-GW.

In Proxy Mobile IPv6 applications the HSGW (MAG function) and P-GW (LMA function) maintain a single shared tunnel and separate GRE keys are allocated in the PMIP Binding Update and Acknowledgement messages to distinguish between individual subscriber sessions. If the Proxy Mobile IP signaling contains Protocol Configuration Options (PCOs) it can also be used to transfer P-CSCF or DNS server addresses.

QoS Bearer Management

Provides a foundation for contributing towards improved Quality of User Experience (QoE) by enabling deterministic end-to-end forwarding and scheduling treatments for different services or classes of applications pursuant to their requirements for committed bandwidth resources, jitter and delay. In this way, each application receives the service treatment that users expect.

An EPS bearer is a logical aggregate of one or more Service Data Flows (SDFs), running between a UE and a P-GW in case of GTP-based S5/S8, and between a UE and HSGW in case of PMIP-based S2a connection. An EPS bearer is the level of granularity for bearer level QoS control in the EPC/E-UTRAN. The Cisco P-GW maintains one or more Traffic Flow Templates (TFT’s) in the downlink direction for mapping inbound Service Data Flows (SDFs) to EPS bearers. The P-GW maps the traffic based on the downlink TFT to the S5/S8 bearer. The Cisco PDN GW offers all of the following bearer-level aggregate constructs:

QoS Class Identifier (QCI): An operator provisioned value that controls bearer level packet forwarding treatments (e.g. scheduling weights, admission thresholds, queue management thresholds, link layer protocol configuration, etc). The Cisco EPC gateways also support the ability to map the QCI values to DiffServ code points in the outer GTP tunnel header of the S5/S8 connection. Additionally, the platform also provides configurable parameters to copy the DSCP marking from the encapsulated payload to the outer GTP tunnel header.
To support 802.1p network traffic prioritization for use in grouping packets into various traffic classes, the P-GW enables operators to map QCI values to 802.1p priorities for uplink and downlink packets.

---

Important

The P-GW does not support non-standard QCI values unless a valid license key is installed.

QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.

From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128-254. For more information, see Non-standard QCI Support, on page 84.

---

**Guaranteed Bit Rate (GBR):** A GBR bearer is associated with a dedicated EPS bearer and provides a guaranteed minimum transmission rate in order to offer constant bit rate services for applications such as interactive voice that require deterministic low delay service treatment.

**Maximum Bit Rate (MBR):** The MBR attribute provides a configurable burst rate that limits the bit rate that can be expected to be provided by a GBR bearer (e.g. excess traffic may get discarded by a rate shaping function). The MBR may be greater than or equal to the GBR for a given Dedicated EPS bearer.

**Aggregate Maximum Bit Rate (AMBR):** AMBR denotes a bit rate of traffic for a group of bearers destined for a particular PDN. The Aggregate Maximum Bit Rate is typically assigned to a group of Best Effort service data flows over the Default EPS bearer. That is, each of those EPS bearers could potentially utilize the entire AMBR, e.g. when the other EPS bearers do not carry any traffic. The AMBR limits the aggregate bit rate that can be expected to be provided by the EPS bearers sharing the AMBR (e.g. excess traffic may get discarded by a rate shaping function). AMBR applies to all Non-GBR bearers belonging to the same PDN connection. GBR bearers are outside the scope of AMBR.

**Policing:** The Cisco P-GW offers a variety of traffic conditioning and bandwidth management capabilities. These tools enable usage controls to be applied on a per-subscriber, per-EPS bearer or per-PDN/APN basis. It is also possible to apply bandwidth controls on a per-APN AMBR capacity. These applications provide the ability to inspect and maintain state for user sessions or Service Data Flows (SDFs) within them using shallow L3/L4 analysis or high touch deep packet inspection at L7. Metering of out-of-profile flows or sessions can result in packet discards or reducing the DSCP marking to Best Effort priority.

---

**RADIUS Support**

Provides a mechanism for performing authorization, authentication, and accounting (AAA) for subscriber PDP contexts based on the following standards:

- RFC-2618, RADIUS Authentication Client MIB, June 1999
- RFC-2620, RADIUS Accounting Client MIB, June 1999
- RFC-2865, Remote Authentication Dial In User Service (RADIUS), June 2000
- RFC-2866, RADIUS Accounting, June 2000
- RFC-2867, RADIUS Accounting Modifications for Tunnel Protocol Support, June 2000
- RFC-2868, RADIUS Attributes for Tunnel Protocol Support, June 2000
- RFC-2869, RADIUS Extensions, June 2000
The Remote Authentication Dial-In User Service (RADIUS) protocol is used to provide AAA functionality for subscriber PDP contexts. (RADIUS accounting is optional since GTPP can also be used.)

Within contexts configured on the system, there are AAA and RADIUS protocol-specific parameters that can be configured. The RADIUS protocol-specific parameters are further differentiated between RADIUS Authentication server RADIUS Accounting server interaction.

Among the RADIUS parameters that can be configured are:

- **Priority**: Dictates the order in which the servers are used allowing for multiple servers to be configured in a single context.

- **Routing Algorithm**: Dictates the method for selecting among configured servers. The specified algorithm dictates how the system distributes AAA messages across the configured AAA servers for new sessions. Once a session is established and an AAA server has been selected, all subsequent AAA messages for the session will be delivered to the same server.

In the event that a single server becomes unreachable, the system attempts to communicate with the other servers that are configured. The system also provides configurable parameters that specify how it should behave should all of the RADIUS AAA servers become unreachable.

The system provides an additional level of flexibility by supporting the configuration RADIUS server groups. This functionality allows operators to differentiate AAA services for subscribers based on the APN used to facilitate their PDP context.

In general, 128 AAA Server IP address/port per context can be configured on the system and it selects servers from this list depending on the server selection algorithm (round robin, first server). Instead of having a single list of servers per context, this feature provides the ability to configure multiple server groups. Each server group, in turn, consists of a list of servers.

This feature works in the following way:

- All RADIUS authentication/accounting servers configured at the context-level are treated as part of a server group named "default". This default server group is available to all subscribers in that context through the realm (domain) without any configuration.

- It provides a facility to create "user defined" RADIUS server groups, as many as 399 (excluding "default" server group), within a context. Any of the user defined RADIUS server groups are available for assignment to a subscriber through the APN configuration within that context.

Since the configuration of the APN can specify the RADIUS server group to use as well as IP address pools from which to assign addresses, the system implements a mechanism to support some in-band RADIUS server implementations (i.e. RADIUS servers which are located in the corporate network, and not in the operator's network) where the NAS-IP address is part of the subscriber pool. In these scenarios, the P-GW supports the configuration of the first IP address of the subscriber pool for use as the RADIUS NAS-IP address.

---

**Important**

For more information on RADIUS AAA configuration, if you are using StarOS 12.3 or an earlier release, refer to the *AAA and GTPP Interface Administration and Reference*. If you are using StarOS 14.0 or a later release, refer to the *AAA Interface Administration and Reference*. 
Removal of Private Extension-based Overcharging Feature

Prior to StarOS release 21.0, the Cisco P-GW and S-GW supported the sending and receiving of overcharging protection data via both a non-3GPP Private Extension Information Element (IE), and a 3GPP Indication IE. However, since 3GPP support to exchange overcharging protection data exists, no operators were using the Overcharging Private Extension (OCP) based solution. It was also reported by some operators that the Private Extension IE carrying overcharging protection data sent by the P-GW was leading to issues at S-GWs of other vendors.

As a result, support for Private Extension-based Overcharging Support is being removed from the Cisco P-GW and S-GW. This has the benefit of preventing unexpected scenarios occurring due to the decoding of a Private Extension ID carrying overcharging protection data at the P-GW/S-GW of other vendors.

Previous and New Behavior for the P-GW

The following table describes the previous and new behavior at the P-GW for Create Session Request (CSReq) and Create Session Response (CSRs) messages due to the removal of Private Extension Overcharging Support.

**Table 2: Previous and New Behavior: CSReq and CSRs Messages at P-GW Due to Removal of Private Extension Overcharging Support**

### S-GW Restoration Support

S-GW Restoration helps in handling the S-GW failure in the EPC network. It allows affected PDNs that fail due to S-GW to be restored by selecting another S-GW to serve the affected PDNs. This avoids unnecessary flooding of signaling for PDN cleanup.

The P-GW maintains the sessions in case path failure is detected or if S-GW restart is detected during recovery IE on GTP-C signaling. The P-GW will ensure that any dropped packets in this scenario are not charged. The P-GW also rejects any bearer additions or modification requests received for the PDN connection maintained after the S-GW failure detection. This occurs until the PDN is restored.

Once the session has been restored by the MME and the P-GW receives a Modify Bearer Request from the restarted S-GW or a different S-GW, then the P-GW continues forwarding any received downlink data and start charging them.

When a subscriber is in S-GW restoration phase, all RARs (expect for Session Termination) reject the PCEF. The P-GW rejects all internal updates which can trigger CCR-U towards the PCRF. The P-GW triggers a CCR-U with AN-GW changes for the PDNs that are restored if the S-GW has changed on restoration.

The MME/S4-SGSN is locally configured to know that the P-GW in the same PLMN supports the S-GW restoration feature. When this feature is enabled at the P-GW, it supports it for all S-GWs/MMEs.

<table>
<thead>
<tr>

<td>No change.</td>
</tr>
</tbody>
</table>

**Important**

In the current release, the S-GW will send a MBReq message with only the indication IE for the Pause/Start Charging procedure. The private extension IE is not sent.

**Important**

If the S-GW receives only the private extension IE from the P-GW in the CSRsp/MBRsp message, then the S-GW ignores the private extension IE. As a result, the S-GW assumes that Overcharging Protection is NOT enabled for the P-GW. So, in this scenario, even if the overcharging condition is met at the S-GW, the S-GW will not send a MBReq message for Charging pause to the P-GW.

**Important**

Only MME/S4-SGSN triggered S-GW restoration procedure will be supported.

S-GW restoration detection based on GTP-U path failure shall not be considered for this release. GTP-C path failure detection should be enabled for enabling this feature.
The P-GW Restart Notification may also be used to signal that the peer P-GW has failed and not restarted. In this case, the P-GW Restart Notification contains a cause value: P-GW not responding. While sending the PRN, the S-GW includes the cause with this new cause value depending on the echo response.

For more details on this feature, refer to the S-GW Restoration Support chapter in this guide.

Source IP Address Validation

Insures integrity between the attached subscriber terminal and the PDN GW by mitigating the potential for unwanted spoofing or man-in-the-middle attacks.

The P-GW includes local IPv4/IPv6 address pools for assigning IP addresses to UEs on a per-PDN basis. The P-GW defends its provisioned address bindings by insuring that traffic is received from the host address that it has awareness of. In the event that traffic is received from a non-authorized host, the P-GW includes the ability to block the non-authorized traffic. The P-GW uses the IPv4 source address to verify the sender and the IPv6 source prefix in the case of IPv6.

SRVCC PS-to-CS Handover Indication Support

This feature helps in notifying the PCRF about the exact reason for PCC rule deactivation on Voice bearer deletion. This exact cause will help PCRF to then take further action appropriately.

This feature ensures complete compliance for SRVCC, including support for PS-to-CS handover indication when voice bearers are released. The support for SRVCC feature was first added in StarOS Release 12.2.

SRVCC service for LTE comes into the picture when a single radio User Equipment (UE) accessing IMS-anchored voice call services switches from the LTE network to the Circuit Switched domain while it is able to transmit or receive on only one of these access networks at a given time. This removes the need for a UE to have multiple Radio Access Technology (RAT) capability.

After handing over the PS sessions to the target, the source MME shall remove the voice bearers by deactivating the voice bearer(s) towards S-GW/P-GW and setting the VB (Voice Bearer) flag of Bearer Flags IE in the Delete Bearer Command message (TS 29.274 v9.5.0).

If the IP-CAN bearer termination is caused by the PS to CS handover, the PCEF may report related PCC rules for this IP-CAN bearer by including the Rule-Failure-Code AVP set to the value PS_TO_CS_HANDOVER (TS 29.212 v10.2.0 and TS 23.203 v10.3.0).

Support for new AVP PS-to-CS-Session-Continuity (added in 3GPP Release 11) inside Charging Rule Install, which indicates if the bearer is selected for PS to CS continuity is not added.

Subscriber Level Trace

Provides a 3GPP standards-based session level trace function for call debugging and testing new functions and access terminals in an LTE environment.

As a complement to Cisco’s protocol monitoring function, the P-GW supports 3GPP standards based session level trace capabilities to monitor all call control events on the respective monitored interfaces including S5/S8, S2a, SGi, and Gx. The trace can be initiated using multiple methods:

- Management initiation via direct CLI configuration
• Management initiation at HSS with trace activation via authentication response messages over S6a reference interface

• Signaling based activation through signaling from subscriber access terminal

Important
Once the trace is provisioned, it can be provisioned through the access cloud via various signalling interfaces.

The session level trace function consists of trace activation followed by triggers. The time between the two events is treated much like Lawful Intercept where the EPC network element buffers the trace activation instructions for the provisioned subscriber in memory using camp-on monitoring. Trace files for active calls are buffered as XML files using non-volatile memory on the local dual redundant hard drives on the ASR 5500 platform. The Trace Depth defines the granularity of data to be traced. Six levels are defined including Maximum, Minimum and Medium with ability to configure additional levels based on vendor extensions.

All call control activity for active and recorded sessions is sent to an off-line Trace Collection Entity (TCE) using a standards-based XML format over a FTP or secure FTP (SFTP) connection.

Important
In release 20.0 and higher Trusted StarOS builds, the FTP option is no longer available.

In the current release, the IPv4 interfaces are used to provide connectivity to the TCE. Trace activation is based on IMSI or IMEI. Once a subscriber level trace request is activated it can be propagated via the S5/S8 signaling to provision the corresponding trace for the same subscriber call on the P-GW. The trace configuration will only be propagated if the P-GW is specified in the list of configured Network Element types received by the S-GW. Trace configuration can be specified or transferred in any of the following message types:

• S5/S8: Create Session Request
• S5/S8: Modify Bearer Request
• S5/S8: Trace Session Activation (New message defined in TS 32.422)

Performance Goals: As subscriber level trace is a CPU intensive activity the max number of concurrently monitored trace sessions per Cisco P-GW is 32. Use in a production network should be restricted to minimize the impact on existing services.

3GPP tracing was enhanced in StarOS Release 15.0 to increase the number of simultaneous traces to 1000. The generated trace files are forwarded to external trace collection entity at regular intervals through (S)FTP if "push" mode is enabled. If the push mode is not used, the files are stored on the local hard drive and must be pulled off by the TCE using FTP or SFTP.

Important
The number of session trace files generated would be limited by the total available hard disk capacity.

3GPP Tracing to Intercept Random Subscriber

Previously, a subscriber identifier like IMSI was required in order to enable trace. Sometimes operators want to enable a trace without knowing the subscriber ID. For example, an operator may want to monitor the next "n" number of calls, or monitor subscribers in a particular IMSI range.
3GPP tracing was enhanced in StarOS Release 15.0 to intercept random subscribers with this feature. The current session trace feature is either signaling or management based, which is very specific to a particular subscriber. The requirement is to trace random subscribers which are not explicitly linked or identified by IMSI in GTP messages or configured through CLI.

The random subscribers could be in an IMSI range, context activation in particular time intervals, etc.

The session trace is activated on demand for a limited period of time for specific analysis purposes. The maximum limit would restrict the number of random subscriber tracing. Random session trace will be given priority over signalling and management-based session trace.

Support for One Million S1-U Peers on the S-GW

Due to customer business requirements and production forecasts, support has been added to the StarOS for one million S1-U connections on a single S-GW.

The S1-U interface is the user plane interface carrying user data between an eNodeB and an S-GW received from the terminal. The StarOS now has the capability to scale the number of S1-U peers to one million per VPN context.

A new CLI command has been added to enable operators to set the number of S1-U peers for which statistics should be collected. The limit is restricted to less than one million peers (128k) due to StarOS memory limitations.

How it Works

The gtpumgr uses the following guidelines while allocating peers:

- When a session installation comes from the Session Manager, a peer is created. If statistics are maintained at the Session Manager, the gtpumgr also creates the peer record with the statistics.

- Peer records are maintained per service.

- The number of peers is maintained at the gtpumgr instance level. The limit is one million S1-U peers per gtpumgr instance.

- If the limit of one million peers is exceeded, then peer creation fails. It causes a call installation failure in the gtpumgr, which leads to an audit failure if an audit is triggered.

The feature changes impact all the interfaces/services using the gtpu-service including GGSN/S4-SGSN/SGW/PGW/SAEGW/ePDG/SaMOG/HNB-GW/HeNB-GW for:

- The Gn and Gp interfaces of the General Packet Radio Service (GPRS)
- The Iu, Gn, and Gp interfaces of the UMTS system
- The S1-U, S2a, S2b, S4, S5, S8, and S12 interfaces of the Evolved Packet System (EPS)

Recovery/ICSR Considerations

- After a session manager/gtpumgr recovery or after an ICSR switchover, the same set of peers configured for statistics collection is recovered.
  - Peers with 0 sessions and without statistics are not recovered.
  - Peers with 0 sessions and with statistics are recovered.
• Peers with Extension Header Support disabled are recovered.

• While upgrading from a previous release, ensure the newer release chassis gtpu peer statistics threshold is equal to or greater than the previous release. This ensures that the GTPU peer statistics are preserved during the upgrade. For example, if you are upgrading from release 19.0 to 20.2, and the 19.0 system has 17,000 GTPU sessions, then configure the threshold on the 20.2 chassis to 17,000 as well.

Configuration/Restrictions

• Due to the large number of GTP-U entities connecting to the StarOS, Cisco recommends disabling the GTP-U Path Management feature.

• The configured threshold is not the hard upper limit for statistics allocation because of the distributed nature of system. It is possible that total GTP-U peers with statistics exceeds the configured threshold value to some extent.

• It is assumed that all 1,000,000 peers are not connected to the node in a point-to-point manner. They are connected through routers.

• There will not be any ARP table size change for the StarOS to support this feature.

TCP Window Size

This feature is not fully qualified in this release. It is available only for testing purposes. For more information, contact your Cisco Accounts representative.

The operator can restrict the effective window size of all downlink TCP packets. A new CLI command window-size is added in the Rulebase Configuration mode to enable this feature.

The P-GW updates the TCP packets with the configured value if the effective window size is greater than the configured window size. Otherwise, the P-GW does not modify the window size of the packet.

The newly updated window size might not be the same as the configured window size because the P-GW does not have control over the Window Scale option (sent with SYN flag). Therefore, the updated window size is rounded off to the nearest value calculated by the Window Scale option.

This feature is not applicable on non-SYN flows as they do not have the Window Scale option is not available.

When TCP Window Size is enabled, Rulebase changes and configuration changes are applicable to both newly created flows and existing flows. The changes will not be applicable if TCP Window Size feature is not enabled for these flows.

Note

There will be a performance impact as PGW updates every downlink packet for a specified Rulebase where the configured window size is lesser than the effective windows size in the packet.
Threshold Crossing Alerts (TCA) Support

Thresholding on the system is used to monitor the system for conditions that could potentially cause errors or outage. Typically, these conditions are temporary (i.e. high CPU utilization, or packet collisions on a network) and are quickly resolved. However, continuous or large numbers of these error conditions within a specific time interval may be indicative of larger, more severe issues. The purpose of thresholding is to help identify potentially severe conditions so that immediate action can be taken to minimize and/or avoid system downtime.

The system supports Threshold Crossing Alerts for certain key resources such as CPU, memory, IP pool addresses, etc. With this capability, the operator can configure threshold on these resources whereby, should the resource depletion cross the configured threshold, a SNMP Trap would be sent.

The following thresholding models are supported by the system:

- **Alert**: A value is monitored and an alert condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

- **Alarm**: Both high and low threshold are defined for a value. An alarm condition occurs when the value reaches or exceeds the configured high threshold within the specified polling interval. The alert is generated then generated and/or sent at the end of the polling interval.

Thresholding reports conditions using one of the following mechanisms:

- **SNMP traps**: SNMP traps have been created that indicate the condition (high threshold crossing and/or clear) of each of the monitored values.

  Generation of specific traps can be enabled or disabled on the chassis. Ensuring that only important faults get displayed. SNMP traps are supported in both Alert and Alarm modes.

- **Logs**: The system provides a facility called threshold for which active and event logs can be generated. As with other system facilities, logs are generated Log messages pertaining to the condition of a monitored value are generated with a severity level of WARNING.

  Logs are supported in both the Alert and the Alarm models.

- **Alarm System**: High threshold alarms generated within the specified polling interval are considered "outstanding" until a the condition no longer exists or a condition clear alarm is generated. "Outstanding" alarms are reported to the system's alarm subsystem and are viewable through an element management system.

  The Alarm System is used only in conjunction with the Alarm model.

---

**Important**

For more information on threshold crossing alert configuration, refer to the *Thresholding Configuration Guide*.

---

**Transaction Rate KPIs - Session Events Per Second**

Prior to StarOS release 20, key performance indicators (KPIs) did not differentiate between successful or unsuccessful PDN session activations and deactivations. In addition, the KPIs did not provide any information related to the Voice-over-LTE (VoLTE) service.
In StarOS release 20, Session Events Per Second (SEPS) KPIs have been implemented to address these issues. These KPIs measure the signaling load on the P-GW/ePDG. Further, network initiated setup/tear down KPIs have been added to measure the event rate for VoLTE call setup and tear down. Together, these measurements assist operators in performing network dimensioning/planning for the P-GW/ePDG node.

For the P-GW, both types of KPIs are supported on the S5, S8, S2a, and S2b Interfaces. Also for the P-GW, SEPS KPIs are supported for any associated eHRPD/PMIP service. Specifically, the following KPIs have been implemented:

**Session Events Per Second (SEPS)**

Session Events per Second KPIs have been implemented to assist operators in measuring the signaling load on the P-GW/ePDG. These SEPS KPIs include the following:

- Total session events (session setup and tear down) per second.
- Successful Session Events (session setup and tear down) per second.
- Unsuccessful Session Events (session setup and tear down) per second.

**N/w Initiated Setup/Tear down Events Per Second**

Network initiated setup/teardown event KPIs have been implemented to assist operators in measuring Voice-over-LTE (VoLTE) call setup and tear down events rate at the P-GW/ePDG. Both Create Bearer Requests (CBReqs) and Delete Bearer Requests (DBReqs) originally initiated by the P-GW and CBReqs and DBReqs initiated by the P-GW as a result of Home Subscriber Server (HSS)- and User Equipment (UE)-initiated events will be accounted for in these KPIs. The N/w Initiated Setup/Tear down Events Per Second KPIs include the following:

- Total N/w Initiated Setup/Teardown Events (VoLTE bearer setup and tear down) per second.
- Successful N/w Initiated Setup/Teardown Events (VoLTE bearer setup and tear down) per second.
- Unsuccessful N/w Initiated Setup/Teardown Events (VoLTE bearer setup and tear down) per second.

**Operation**

The P-GW/ePDG contains 8 buckets for transaction rate statistics collection for both session events per second KPIs and N/w Initiated Setup/Tear down Events per Second KPIs. The buckets are based on a configurable bucket interval that is from 1 to 20 minutes in length. During the configured time interval, an average is computed and stored for the entire bucket interval.

After the first 8 bucket intervals have elapsed and statistics collected, the P-GW continues sequentially through the 8 bucket intervals and eventually overwrites the original 8 bucket-intervals with more recent data. In short, the 8 bucket intervals provide a running value for the last eight bucket-intervals for which the KPIs have been computed. While the statistics are eventually overwritten with new values, all statistic totals are added to the historical statistics, which are not overwritten.

**UE Time Zone Reporting**

This feature enables time-based charging for specialized service tariffs, such as super off-peak billing plans
Time Zone of the UE is associated with UE location (Tracking Area/Routing Area). The UE Time Zone Information Element is an attribute the MME tracks on a Tracking Area List basis and propagates over S11 and S5/S8 signalling to the P-GW.

Time zone reporting can be included in billing records or conveyed in Gx/Gy signaling to external PCRF and OCS servers.

**User Location Change Reporting Support**

The user information change reporting is enabled on GGSN via PCRF using GPRS specific event triggers and GPRS specific credit re-authorization triggers. The user information to be reported include Location Change Reporting (ULI) and Closed Subscriber Group Information Change reporting (UCI).

For Location change reporting for a subscriber session requested by GGSN, the SGSN includes the User Location Information (ULI) if the MS is located in a RAT Type of GERAN, UTRAN or GAN. It also includes the CGI, SAI or RAI depending on whether the MS is in a cell, a service or a routing area respectively. The SGSN may optionally include the User Location Information for other RAT Types.

Closed Subscriber Group (CSG) identifies a group of subscribers who are permitted to access one or more CSG cells of the PLMN as a member of the CSG. A CSG ID is a unique identifier within the scope of PLMN which identifies a CSG in the PLMN associated with a CSG cell or group of CSG cells. For CSG info change reporting for a subscriber session requested by GGSN, the SGSN includes the User CSG Information if the MS is located in the CSG cell or the hybrid cell.

Release 20.0 and later, support has been added to process and handle a MS Info Change notification received with valid information to identify a PDN (non-zero TEID and/or IMSI+NSAPI) and with appropriate ULI and/or UCI information. In case of collision between MS-Info-change message and NRUPC, GGSN will process MS-info-change request first and send out its MS-info-change response. Then the NRUPC will be retried again.

---

**Important**

CSG reporting is not yet supported on GGSN, P-GW, or SAEGW.

---

**Limitations**

Following are the limitations of this feature:

- UCI trigger from PCRF is not supported.
- The MS Info Change reporting action trigger will not be recovered if trigger if:
  - trigger is changed
  - MS reporting action has not gone in CPC/UPC/NRUPC
  - session manager (SM) recovery happens
- The MS Change info message is not supported if it comes on UE level.

**3GPP ULI Reporting Support Enhanced**

This feature enhancement covers ULI related gaps in P-GW and GGSN as per 3GPP standards.
Feature Change

This feature enhancement covers ULI related gaps in P-GW and GGSN as per 3GPP standards.

S4SGSN reports ULI to the P-GW through S-GW. P-GW determines the changes in the ULI with previously received ULI. If any change is detected and same change has been requested by the PCRF as an event trigger then the ULI is reported to the PCRF.

SGSN reports ULI to the GGSN. GGSN determines the changes in the ULI with previously received ULI. If any change is detected and same change has been requested by the PCRF as an event trigger, then the ULI is reported to the PCRF. Support has also been added to detect the change in RAI received as part of the ULI field at GGSN.

Following table summarizes the Change Reporting Action (CRA) values based on Event Triggers received from the PCRF, which the P-GW communicates with S4 SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to S4 SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_LOCATION_CHANGE (13)</td>
<td>Start Reporting CGI/SAI and RAI (5)</td>
</tr>
<tr>
<td>RAI_CHANGE (12)</td>
<td>Start Reporting RAI (2)</td>
</tr>
<tr>
<td>USER_LOCATION_CHANGE + RAI_CHANGE</td>
<td>Start Reporting CGI/SAI and RAI (5)</td>
</tr>
</tbody>
</table>

Following table summarizes the MS Info Change Reporting Action values based on Event Triggers received from the PCRF which GGSN communicates to SGSN.

<table>
<thead>
<tr>
<th>Event Trigger from PCRF</th>
<th>MS Info Change Reporting Action towards SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_LOCATION_CHANGE (13)</td>
<td>Start Reporting CGI/SAI (1)</td>
</tr>
<tr>
<td>RAI_CHANGE (12)</td>
<td>Start Reporting RAI (2)</td>
</tr>
<tr>
<td>BOTH (12,13)</td>
<td>Start Reporting CGI/SAI (1)</td>
</tr>
</tbody>
</table>

P-GW/GGSN reports the CRA/MS Info Change Reporting Action immediately on receiving the Event Triggers without waiting for other events like APN/AMBR update or QoS update.

Behavior Change

Previous of Change Reporting Action: Following table illustrates the old and new behavior of Change Reporting Action with respect to the Event Triggers received from PCRF, when the Access Node is S4SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to S4SGSN</th>
<th>CRA Sent to S4SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>ULI_CHANGE(13)</td>
<td>6 (START_REPORTING_TAI_ECGI)</td>
<td>5 (START_REPORTING/cgi_rai)</td>
</tr>
<tr>
<td>RAI_CHANGE(12)</td>
<td>No CRA Sent</td>
<td>2 (START_REPORTING_RAI)</td>
</tr>
<tr>
<td>BOTH (12,13)</td>
<td>6 (START_REPORTING_TAI_ECGI)</td>
<td>5 (START_REPORTING/cgi_rai)</td>
</tr>
</tbody>
</table>

Behavior of MS Info Change Reporting Action: Following table illustrates the old and new behavior of MS Info CRA with respect to the Event Triggers received from PCRF, when the Access Node is SGSN.
<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to SGSN</th>
<th>CRA Sent to SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>ULI_CHANGE(13)</td>
<td>1 (START_REPORTING_CGI/SAI)</td>
<td>1 (START_REPORTING_CGI/SAI)</td>
</tr>
<tr>
<td>RAI_CHANGE(12)</td>
<td>No CRA Sent</td>
<td>2 (START_REPORTING_RAI)</td>
</tr>
<tr>
<td>BOTH (12,13)</td>
<td>1 (START_REPORTING_CGI/SAI)</td>
<td>1 (START_REPORTING_CGI/SAI)</td>
</tr>
</tbody>
</table>

**Limitations**

1. In GGSN, when a new ULI is received in the Network Request Updated PDP Context (NRUPC) Response, it is not reported to the PCRF.
2. In GGSN, when a dedicated bearer is deleted or call is dropped, ULI change is not detected.

**Virtual APN Support**

Virtual APNs allow differentiated services within a single APN.

The Virtual APN feature allows a carrier to use a single APN to configure differentiated services. The APN that is supplied by the MME is evaluated by the P-GW in conjunction with multiple configurable parameters. Then, the P-GW selects an APN configuration based on the supplied APN and those configurable parameters. APN configuration dictates all aspects of a session at the P-GW. Different policies imply different APNs. After basic APN selection, however, internal re-selection can occur based on the following parameters:

- Service name
- Subscriber type
- MCC-MNC of IMSI
- Domain name part of username (user@domain)
- S-GW address

**Important**

For more information, refer to the `virtual-apn preference` command in *APN Configuration Mode Commands* in the *Command Line Interface Reference*.

**Features and Functionality - Inline Service Support**

This section describes the features and functions of inline services supported on the P-GW. These services require additional licenses to implement the functionality.
Content Filtering

The Cisco P-GW offers two variants of network-controlled content filtering / parental control services. Each approach leverages the native DPI capabilities of the platform to detect and filter events of interest from mobile subscribers based on HTTP URL or WAP/MMS URI requests:

- **Integrated Content Filtering**: A turnkey solution featuring a policy enforcement point and category based rating database on the Cisco P-GW. An offboard AAA or PCRF provides the per-subscriber content filtering information as subscriber sessions are established. The content filtering service uses DPI to extract URLs or URIs in HTTP request messages and compares them against a static rating database to determine the category match. The provisioned policy determines whether individual subscribers are entitled to view the content.

- **Content Filtering ICAP Interface**: This solution is appropriate for mobile operators with existing installations of Active Content Filtering external servers. The service continues to harness the DPI functions of the ASR 5500 platform to extract events of interest. However in this case, the extracted requests are transferred via the Integrated Content Adaptation Protocol (ICAP) with subscriber identification information to the external ACF server which provides the category rating database and content decision functions.

**Integrated Adult Content Filter**

Provides a value-added service to prevent unintended viewing of objectionable content that exploits underage children. Content Filtering offers mobile operators a way to increase data ARPU and subscriber retention through a network-based solution for parental controls and content filtering. The integrated solution enables a single policy decision and enforcement point thereby streamlining the number of signaling interactions with external AAA/Policy Manager servers. When used in parallel with other services such as Enhanced Content Charging (ECS) it increases billing accuracy of charging records by insuring that mobile subscribers are only charged for visited sites they are allowed to access.

The Integrated Adult Content Filter is a subscriber-aware inline service provisioned on an ASR 5500 running P-GW services. Integrated Content Filtering utilizes the local DPI engine and harnesses a distributed software architecture that scales with the number of active P-GW sessions on the system.

Content Filtering policy enforcement is the process of deciding if a subscriber should be able to receive some content. Typical options are to allow, block, or replace/redirect the content based on the rating of the content and the policy defined for that content and subscriber. The policy definition is transferred in an authentication response from a AAA server or Diameter policy message via the Gx reference interface from an adjunct PCRF. The policy is applied to subscribers through rulebase or APN/Subscriber configuration. The policy determines the action to be taken on the content request on the basis of its category. A maximum of one policy can be associated with a rulebase.

**ICAP Interface**

Provides a value-added service to prevent unintended viewing of objectionable content that exploits underage children. Content Filtering offers mobile operators a way to increase data ARPU and subscriber retention through a network-based solution for parental controls and content filtering. The Content Filtering ICAP solution is appropriate for operators with existing installations of Active Content Filtering servers in their networks.

The Enhanced Charging Service (ECS) for the P-GW provides a streamlined Internet Content Adaptation Protocol (ICAP) interface to leverage the Deep Packet Inspection (DPI) to enable external Application Servers to provide their services without performing the DPI functionality and without being inserted in the data flow.
The ICAP interface may be attractive to mobile operators that prefer to use an external Active Content Filtering (ACF) Platform. If a subscriber initiates a WAP (WAP 1.x or WAP 2.0) or Web session, the subsequent GET/POST request is detected by the deep packet inspection function. The URL of the GET/POST request is extracted by the local DPI engine on the ASR 5500 platform and passed, along with subscriber identification information and the subscriber request, in an ICAP message to the Application Server (AS). The AS checks the URL on the basis of its category and other classifications like, type, access level, content category and decides if the request should be authorized, blocked or redirected by answering the GET/POST message. Depending upon the response received from the ACF server, the P-GW either passes the request unmodified or discards the message and responds to the subscriber with the appropriate redirection or block message.

**Header Enrichment: Header Insertion and Encryption**

Header enrichment provides a value-added capability for mobile operators to monetize subscriber intelligence to include subscriber-specific information in the HTTP requests to application servers.

Extension header fields (x-header) are the fields that can be added to headers of a protocol for a specific purpose. The enriched header allows additional entity-header fields to be defined without changing the protocol, but these fields cannot be assumed to be recognizable by the recipient. Unrecognized fields should be ignored by the recipient and must be forwarded by transparent proxies.

Extension headers can be supported in HTTP/WSP GET and POST request packets. The Enhanced Charging Service (ECS) for the P-GW offers APN-based configuration and rules to insert x-headers in HTTP/WSP GET and POST request packets. The charging action associated with the rules will contain the list of x-headers to be inserted in the packets. Protocols supported are HTTP, WAP 1.0 and WAP 2.0 GET, and POST messages.

For more information on ECS, see the *ECS Administration Guide*.

The data passed in the inserted HTTP header attributes is used by end application servers (also known as Upsell Servers) to identify subscribers and session information. These servers provide information customized to that specific subscriber.

The Cisco P-GW can include the following information in the http header:

- User-customizable, arbitrary text string
- Subscriber's MSISDN (the RADIUS calling-station-id, in clear text)
- Subscriber's IMSI
- Subscriber's IP address
- S-GW IP address (in clear text)

X-Header encryption enhances the header enrichment feature by increasing the number of fields that can be supported and through encryption of the fields before inserting them.

The following limitations to insertion of x-header fields in WSP headers apply:

- x-header fields are not inserted in IP fragmented packets before StarOS v14.0.
- In case of concatenated request, x-header fields are only inserted in first GET or POST request (if rule matches for the same). X-header fields are not inserted in the second or later GET/POST requests in the concatenated requests. For example, if there is ACK+GET in packet, x-header is inserted in the GET
packet. However, if GET1+GET2 is present in the packet and rule matches for GET2 and not GET1 x-header is still inserted in GET2. In case of GET+POST also, x-header is not inserted in POST.

- In case of CO, x-header fields are not inserted if the WTP packets are received out of order (even after proper reordering).
- If route to MMS is present, x-headers are not inserted.
- x-headers are not inserted in WSP POST packet when header is segmented. This is because POST contains header length field which needs to be modified after addition of x-headers. In segmented WSP headers, header length field may be present in one packet and header may complete in another packet.

Hash-Value Support for Header Enrichment

Hash-Value strings are implemented as a part of the Header Enrichment feature. P-GW is enhanced to receive and store hash values that are received from the PCRF for each subscriber. The stored hash value is inserted in the HTTP/WSP header making it available for operators to handle subscriber profiles.

Some Mobile Advertisement platforms generate a hashed string based on a subscriber’s MSISDN value. When a hashed string is sent to Content Providers, they identify the subscriber’s profile information and in turn insert advertisements on the subscriber’s browser based on the user’s profile.

To receive Hash-values from the PCRF, a new AVP: Hash-Value; with an octet-string data-type is implemented on the Gx interface. The AVP supports a maximum length of 80 characters. The P-GW ignores the hashed string if it exceeds the maximum length. The hash-value received from the PCRF is inserted in the HTTP/WSP header only if HTTP Header Enrichment is enabled for a subscriber.

The X-Header field is used to insert a Hash-Value in the HTTP/WSP headers. The Hash-Value can be encrypted based on the existing encryption mechanism of X-Header fields. These hash values (encrypted or not encrypted) are inserted in the HTTP/WSP header based on the x-header format configured under Charging Action configuration.

Note

A Hash-Value is check-pointed as a part of the subscriber’s session information. It is check-pointed immediately, once received from the PCRF.

IPNE Service Support

The P-GW supports the IP Network Enabler (IPNE) service. IPNE is a Mobile and IP Network Enabler (MINE) client component that collects and distributes session and network information to MINE servers. The MINE cloud service provides a central portal for wireless operators and partners to share and exchange session and network information to realize intelligent services. For detailed information on IPNE, refer to the IP Network Enabler chapter in this guide.

Network Address Translation (NAT)

NAT translates non-routable private IP address(es) to routable public IP address(es) from a pool of public IP addresses that have been designated for NAT. This enables to conserve on the number of public IP addresses required to communicate with external networks, and ensures security as the IP address scheme for the internal network is masked from external hosts, and each outgoing and incoming packet goes through the translation process.
NAT works by inspecting both incoming and outgoing IP datagrams and, as needed, modifying the source IP address and port number in the IP header to reflect the configured NAT address mapping for outgoing datagrams. The reverse NAT translation is applied to incoming datagrams.

NAT can be used to perform address translation for simple IP and mobile IP. NAT can be selectively applied/denied to different flows (5-tuple connections) originating from subscribers based on the flows’ L3/L4 characteristics—Source-IP, Source-Port, Destination-IP, Destination-Port, and Protocol.

NAT supports the following mappings:

- One-to-One
- Many-to-One

Important

For more information on NAT, refer to the NAT Administration Guide.

NAT64 Support

This feature helps facilitate the co-existence and gradual transition to IPv6 addressing scheme in the networks. Use of NAT64 requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

With the dwindling IPv4 public address space and the growing need for more routable addresses, service providers and enterprises will continue to build and roll out IPv6 networks. However, because of the broad scale IPv4 deployment, it is not practical that the world changes to IPv6 overnight. There is need to protect the IPv4 investment combined with the need to expand and grow the network will force IPv4 and IPv6 networks to co-exist together for a considerable period of time and keep end-user experience seamless.

The preferred approaches are to run dual stacks (both IPv4 and IPv6) on the end hosts, dual stack routing protocols, and dual stack friendly applications. If all of the above is available, then the end hosts will communicate natively using IPv6 or IPv4 (using NAT). Tunneling through the IPv4 or IPv6 is the next preferred method to achieve communication wherever possible. When all these options fail, translation is recommended.

Stateful NAT64 is a mechanism for translating IPv6 packets to IPv4 packets and vice-versa. The system supports a Stateful NAT64 translator based on IETF Behave WG drafts whose framework is described in draft-ietf-behave-v6v4-framework-10. Stateful NAT64 is available as part of the existing NAT licenses from the current system implementation. The NAT44 and NAT64 will co-exist on the chassis and share the resources needed for NATing.

Peer-to-Peer Detection

Allows operators to identify P2P traffic in the network and applying appropriate controlling functions to ensure fair distribution of bandwidth to all subscribers.

Peer-to-Peer (P2P) is a term used in two slightly different contexts. At a functional level, it means protocols that interact in a peering manner, in contrast to client-server manner. There is no clear differentiation between the function of one node or another. Any node can function as a client, a server, or both—a protocol may not clearly differentiate between the two. For example, peering exchanges may simultaneously include client and server functionality, sending and receiving information.

Detecting peer-to-peer protocols requires recognizing, in real time, some uniquely identifying characteristic of the protocols. Typical packet classification only requires information uniquely typed in the packet header.
of packets of the stream(s) running the particular protocol to be identified. In fact, many peer-to-peer protocols can be detected by simple packet header inspection. However, some P2P protocols are different, preventing detection in the traditional manner. This is designed into some P2P protocols to purposely avoid detection. The creators of these protocols purposely do not publish specifications. A small class of P2P protocols is stealthier and more challenging to detect. For some protocols no set of fixed markers can be identified with confidence as unique to the protocol.

Operators care about P2P traffic because of the behavior of some P2P applications (for example, Bittorrent, Skype, and eDonkey). Most P2P applications can hog the network bandwidth such that 20% P2P users can generate as much as traffic generated by the rest 80% non-P2P users. This can result into a situation where non-P2P users may not get enough network bandwidth for their legitimate use because of excess usage of bandwidth by the P2P users. Network operators need to have dynamic network bandwidth / traffic management functions in place to ensure fair distributions of the network bandwidth among all the users. And this would include identifying P2P traffic in the network and applying appropriate controlling functions to the same (for example, content-based premium billing, QoS modifications, and other similar treatments).

Cisco's P2P detection technology makes use of innovative and highly accurate protocol behavioral detection techniques.

---

**Important**

For more information on peer-to-peer detection, refer to the *ADC Administration Guide*.

---

**Personal Stateful Firewall**

The Personal Stateful Firewall is an in-line service feature that inspects subscriber traffic and performs IP session-based access control of individual subscriber sessions to protect the subscribers from malicious security attacks.

The Personal Stateful Firewall supports stateless and stateful inspection and filtering based on the configuration.

In stateless inspection, the firewall inspects a packet to determine the 5-tuple—source and destination IP addresses and ports, and protocol—information contained in the packet. This static information is then compared against configurable rules to determine whether to allow or drop the packet. In stateless inspection the firewall examines each packet individually, it is unaware of the packets that have passed through before it, and has no way of knowing if any given packet is part of an existing connection, is trying to establish a new connection, or is a rogue packet.

In stateful inspection, the firewall not only inspects packets up through the application layer / layer 7 determining a packet's header information and data content, but also monitors and keeps track of the connection's state. For all active connections traversing the firewall, the state information, which may include IP addresses and ports involved, the sequence numbers and acknowledgement numbers of the packets traversing the connection, TCP packet flags, etc. is maintained in a state table. Filtering decisions are based not only on rules but also on the connection state established by prior packets on that connection. This enables to prevent a variety of DoS, DDoS, and other security violations. Once a connection is torn down, or is timed out, its entry in the state table is discarded.

The Enhanced Charging Service (ECS) / Active Charging Service (ACS) in-line service is the primary vehicle that performs packet inspection and charging. For more information on ECS, see the *ECS Administration Guide*. 
Features and Functionality - Optional Enhanced Feature Software

This section describes the optional enhanced features and functions for the P-GW service.

Each of the following features requires the purchase of an additional license to implement the functionality with the P-GW service.

Important

For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

3GPP R13 Emergency Call Support on the ePDG and P-GW

The ePDG and P-GW support emergency call establishment over untrusted WiFi for the P-GW as per 3GPP Release 13. Emergency bearer services are provided to support IMS emergency sessions. Emergency bearer services are functionalities provided by the serving network when the network is configured to support emergency services. Emergency bearer services are provided to normal attached UEs and, depending on local regulation, to UEs that are in limited service state. Receiving emergency services in a limited service state does not require a subscription.

Authentication Authorization Requests (AAA) to Diameter now carry the new Emergency-Indication AVP for Untrusted WiFi emergency calls. Diameter requests related to PDN connections for emergency services have the highest priority. Depending on regional/national requirements and network operator policy, these Diameter requests are the last to be throttled, in the event that the 3GPP AAA Server has to apply traffic reduction. For more information see 3GPP R13 Emergency Call Support on the ePDG and P-GW section.

AAA and Prefix Delegation DHCP Correlation

This feature requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

Currently at the DHCP server, DHCPv6 does not provide any mechanism to correlate allocated IPv6 (/64) prefix to a particular subscriber. This feature correlates the default prefix allocated from AAA server with the delegated prefix allocated from external DHCPv6 server during the PDN connection setup.

Options are available in DHCP Client Profile Configuration Mode to enable P-GW to send USER_CLASS_OPTION in DHCPv6 messages to external DHCPv6 server during delegated prefix setup.

APN Backoff Timer Support

Previously, the P-GW did not distinguish signaling traffic from Delay Tolerant or Low Priority devices such as low priority machine-to-machine traffic.
The UE was able to indicate its device profile to the MME via NAS and Attach Request messages. The MME was able to pass this information to the P-GW via the Signaling Priority Indication Information Element (IE) on the S5 interface. Some UEs may not have supported providing the Signaling Priority Indication IE on S5 interface to the P-GW. As a result, the P-GW could not distinguish between the signaling types. The current release, the P-GW can distinguish between these signaling types.

Also, during overload situations, the P-GW previously allowed new sessions from LAPI devices and treated the traffic from Low Access Priority Indicator (LAPI) devices with the same priority as the normal UEs. With the current StarOS release, during overload conditions, the P-GW can be configured to back off the traffic that is identified as LAPI. The identification is based on either the APN configuration or the signaling priority indicator IE.

The backoff timer algorithm and the R12 GTP-C Load/Overload Control algorithm now work together. This feature provides the benefit of rejecting low priority calls, which, in turn allows for more bandwidth for high priority calls.

For additional information, refer to the APN Backoff Timer Support chapter in this guide.

**Bulkstats for GTP-C Messages by ARP Value**

To comply with the “Long Term Evolution (LTE) Access Network Government Industry Requirements (GIR) for National Security/Emergency Preparedness (NS/EP) Next Generation Network (NGN) Priority” to support emergency calls over Voice over LTE (VoLTE), several Key Performance Indicators (KPIs) have been introduced with this feature. This feature is utilized to collect statistics for total number of GTP-C messages received for Enhanced Multimedia Priority Service (eMPS) session for specified interval (in minutes). The list of GTP-C messages are defined in accordance with the GIR document. As part of this feature:

- The S-GW will generate peg counts of the total number of received GTP-C messages containing an Allocation and Retention Priority (ARP), chosen from the set of values allocated for NS/EP NGN-PS use, for a specified interval (in minutes). This peg count is administered at the S-GW level.

- The P-GW will generate peg counts of the total number of received GTP-C messages containing an ARP, chosen from the set of values allocated for NS/EP NGN-PS use, for a specified interval (in minutes). This peg count is administered at the specific P-GW level.

- The peg counts for GTP-C messages are broken down by message type similar to existing GTP-C message counters. The bulkstats are broken down by applicable S-GW and P-GW service and S5, S8, S11, and S4 interfaces.

In earlier releases, bulkstats were not present for eMPS session. With this release 21.1, bulkstats are added for eMPS session/message.

**Piggy-back Message**

For piggy-back messages, if either of the messages have matching ARP or result into converting non-eMPS session to eMPS session, then both messages are counted as eMPS message and corresponding statistics for both messages are incremented.

If Modify Bearer Request is piggy-backed with Create Bearer Response on S11 interface of S-GW and Create Bearer Response result into converting non-eMPS session into eMPS session, then Modify Bearer Response statistics will not increment for this Modify Bearer Request.
Bulkstats Collection and Reset

Bulkstats are added under eGTP-C Schema and pgw-egtpc-s5s8 Schema. These eMPS bulkstats in eGTP-C Schema and pgw-egtpc-s5s8 Schema holds value only for a bulkstat interval, that is, value of these bulkstats shows number of eMPS messages exchanged during the bulkstat interval.

For more information, see *Bulkstats for GTP-C Messages by ARP Value* section.

Common Gateway Access Support

Common Gateway Access support is a consolidated solution that combines 3G and 4G access technologies in a common gateway supporting logical services of HA, P-GW, and GGSN to allow users to have the same user experience, independent of the access technology available.

In today's scenario, an operator must have multiple access networks (CDMA, eHRPD, and LTE) plus a GSM/UMTS solution for international roaming. Therefore, operators require a solution to allow customers to access services with the same IP addressing behavior and to use a common set of egress interfaces, regardless of the access technology (3G or 4G).

This solution allows static customers to access their network services with the same IP addressing space assigned for wireless data, regardless of the type of connection (CDMA, eHRPD/LTE, or GSM/UMTS). Subscribers using static IP addressing will be able to get the same IP address regardless of the access technology.

Dynamic RADIUS Extensions (Change of Authorization)

Use of Dynamic RADIUS Extensions (CoA and PoD) requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

Dynamic RADIUS extension support provide operators with greater control over subscriber PDP contexts by providing the ability to dynamically redirect data traffic, and or disconnect the PDP context.

This functionality is based on the RFC 3576, Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS), July 2003 standard.

The system supports the configuration and use of the following dynamic RADIUS extensions:

- **Change of Authorization**: The system supports CoA messages from the AAA server to change data filters associated with a subscriber session. The CoA request message from the AAA server must contain attributes to identify NAS and the subscriber session and a data filter ID for the data filter to apply to the subscriber session.

- **Disconnect Message**: The DM message is used to disconnect subscriber sessions in the system from a RADIUS server. The DM request message should contain necessary attributes to identify the subscriber session.

The above extensions can be used to dynamically re-direct subscriber PDP contexts to an alternate address for performing functions such as provisioning and/or account set up. This functionality is referred to as Session Redirection, or Hotlining.

Session redirection provides a means to redirect subscriber traffic to an external server by applying ACL rules to the traffic of an existing or a new subscriber session. The destination address and optionally the destination port of TCP/IP or UDP/IP packets from the subscriber are rewritten so the packet is forwarded to the designated redirected address.
Return traffic to the subscriber has the source address and port rewritten to the original values. The redirect ACL may be applied dynamically by means of the Radius Change of Authorization (CoA) extension.

---

**Important**

For more information on dynamic RADIUS extensions support, refer to the *CoA, RADIUS, And Session Redirection (Hotlining)* chapter in this guide.

---

**Expanded Prioritization for VoLTE/Emergency Calls**

The National Security/Emergency Preparedness (NS/EP) Next Generation Network (NGN) Priority Services (NGN-PS) (formerly called NGN Government Emergency Telecommunications Service (GETS)) is a set of voice, video and data services that are based on services available from public packet-switched Service Providers. The NS/EP NGN-PS provides priority treatment for a Service User’s NS/EP communications and is particularly needed when the Service Providers’ networks are impaired due to congestion and/or damage from natural disasters (such as floods, earthquakes and hurricanes) and man-made disasters (such as physical, cyber or other forms of terrorist attacks).

In earlier releases, the DSCP marking of control message from P-GW and S-GW was based on associated egtpc-service configuration.

With Release 21.1, for control message belonging to eMPS session or containing Allocation and Retention Priority (ARP) associated with eMPS profile, the DSCP marking is based on eMPS profile configured DSCP value.

As part of this enhancement, support is also added for marking of certain GTP-C message at the P-GW and S-GW for priority treatment as defined in the Government Industry Requirements (GIR) NS/EP NGN. For more information, see *Expanded Prioritization for VoLTE/Emergency Calls* section.

---

**ePDG Selection Using PCO**

The purpose of this feature is to enable the PGW to send the ePDG IP addresses in an operator PCO so that when connected to a WiFi network the UE will attach to the closest geographic ePDG. This will aid in setting up the IPSEC tunnel to the closest ePDG and therefore reducing latency for VoWiFi and other features.

A new CLI has been introduced to customize PCO options in the network.

---

**Important**

This is a license-controlled feature. Contact your Cisco account or support representative for detailed licensing information.

---

**Important**

ePDG PCO is supported only for the CS request which are received on the S5-S8 interface. This feature is not applicable for the GGSN calls.

For more information on this feature, see *ePDG Selection Using PCO* chapter of this guide.
GRE Protocol Interface Support

Use of GRE Interface Tunneling requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

The P-GW supports GRE generic tunnel interfaces in accordance with RFC 2784, Generic Routing Encapsulation (GRE). The GRE protocol allows mobile users to connect to their enterprise networks through GRE tunnels.

GRE tunnels can be used by the enterprise customers of a carrier 1) To transport AAA packets corresponding to an APN over a GRE tunnel to the corporate AAA servers and, 2) To transport the enterprise subscriber packets over the GRE tunnel to the corporation gateway.

The corporate servers may have private IP addresses and hence the addresses belonging to different enterprises may be overlapping. Each enterprise needs to be in a unique virtual routing domain, known as VRF. To differentiate the tunnels between same set of local and remote ends, GRE Key will be used as a differentiation.

GRE tunneling is a common technique to enable multi-protocol local networks over a single-protocol backbone, to connect non-contiguous networks and allow virtual private networks across WANs. This mechanism encapsulates data packets from one protocol inside a different protocol and transports the data packets unchanged across a foreign network. It is important to note that GRE tunneling does not provide security to the encapsulated protocol, as there is no encryption involved (like IPSec offers, for example).

GRE tunneling consists of three main components:

- Passenger protocol—protocol being encapsulated. For example: CLNS, IPv4 and IPv6.
- Carrier protocol—protocol that does the encapsulating. For example: GRE, IP-in-IP, L2TP, MPLS and IPSec.
- Transport protocol—protocol used to carry the encapsulated protocol. The main transport protocol is IP.

For more information on GRE protocol interface support, refer to the GRE Protocol Interface chapter in this guide.

GTP-based S2a Interface Support

The S2a interface connects the standalone P-GW and P-GW of the SAEGW with the HSGW of the eHRPD. Prior to StarOS release 20.0, GTP-based S2a interface support was available on the P-GW. With StarOS release 20.0, GTP-based S2a interface support is also supported on the SAEGW. When the WLAN is considered as trusted by the operator, the Trusted WLAN Access Network (TWAN) is interfaced with the EPC as a trusted non-3GPP access via the S2a interface to the P-GW. Support has been extended for WiFi-to-LTE handovers using Make and Break for the SAEGW service. Multi-PDN handovers are also supported as part of this feature.

Operators deploying StarOS release 20.0 on the SAEGW are now able to integrate Trusted WiFi network functionality using this feature.

Supported functionality includes:

- Initial Attach
- WiFi-to-LTE handover
• LTE-to-WiFi handover
• Multi-PDN handovers

GTP-based S2b Interface Support

Use of WiFi Integration functionality requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

This section describes the GTP-based S2b interface implementation on the P-GW. The S2b interface connects the P-GW with the ePDG. The UE tries to simultaneously connect to different APNs through different access networks only if the home network supports such simultaneous connectivity. The UE determines that the network supports such simultaneous connectivity over multiple accesses if the UE is provisioned with or has received per-APN inter-system routing policies. So the UE can have independent PDN connections via multiple access types. The access types supported are 4G and WiFi.

The S2b interface implementation supports the following:
• UE connecting to PDN via WiFi access
• UE multiple PDN connections
• Initial Attach
• LTE to WiFi Handoff
• WiFi to LTE Handoff

Important
For more information on WiFi Integration functionality, refer to the GTP-based S2b Interface Support on the P-GW and SAEGW chapter in this guide.

Voice Over WiFi Support

When the UE moves from WiFi to LTE, the P-GW sends a Delete Bearer Request to the ePDG (WiFi access). Previously, the Delete Bearer Request was sent as soon as a Create Session Request for handoff was received at the P-GW. In some cases (for some specific handsets) this broke the IP sec tunnel between the handset and the WAP. In these instances, the handoff failed. To avoid handoff failure, the P-GW should send a Create Session Response first and delay the Delete Bearer Request until handoff is complete for UE. Next, UE generates a Modify Bearer Request to indicate handoff completion and the Delete Bearer Request is only generated after the P-GW receives the Modify Bearer Request. This indicates that at the P-GW both access types (WiFi and LTE) will remain active until the Modify Bearer Request is received. When UE moves from LTE to WiFi, handoff completion occurs at the Create Session Response.

GTP Throttling

Use of GTP and Diameter Interface Throttling requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

This feature will help control the rate of incoming/outgoing messages on P-GW/GGSN. This will help in ensuring P-GW/GGSN doesn’t get overwhelmed by the GTP control plan messages. In addition, it will help in ensuring the P-GW/GGSN will not overwhelm the peer GTP-C peer with GTP Control plane messages.

This feature requires shaping/policing of GTP (v1 and v2) control messages over Gn/Gp and S5/S8 interfaces. Feature will cover overload protection of P-GW/GGSN nodes and other external nodes with which it
communicates. Throttling would be done only for session level control messages. Path management messages
would not be rate limited at all.

External node overload can happen in a scenario where P-GW/GGSN generates signaling requests at a higher
rate than other nodes can handle. If the incoming message rate is higher than the configured message rate,
extra messages will get silently dropped. Also the actual call setup rate can be lower than the msg-rate
configured, which could be due to delays in setting up the session due to many reasons like slow peer nodes
or overloaded sm. Also the drops done as part of this throttling are silent drops, hence if path failure is
configured for non-echo messages, path failure can be observed.

For protecting external nodes from getting overloaded from P-GW/GGSN control signaling, a framework
will be used to handle shaping/policing of outbound control messages to external interfaces.

**Bypass Rate Limit Function**

The Bypass Rate Limit Function is an enhancement to the existing GTP Throttling feature.

This enhancement requires no additional license. Existing licenses for the GTP-Throttling Feature (RLF
License) and the VoLTE Prioritized Handling feature have been applied and used as follows:

- **RLF License**: The GTP-Throttling feature license has been enhanced to accommodate the message-types
  based RLF throttling bypass.
- **VoLTE Prioritized Handling Feature License**: This license has been enhanced to accommodate the
  emergency call, priority call, and apn-names based RLF throttling bypass.

The GTP Throttling feature helps control the rate of incoming/outgoing messages on P-GW. It prevents the
message flood from P-GW towards S-GW and MME. Currently, following outgoing messages are throttled
by P-GW using the RLF framework:

- Create Bearer Request (CBR)
- Delete Bearer Request (DBR)
- Update Bearer Request (UBR)
- NRUPC
- IPCA
- NRDPC

Once throttling is enabled for outgoing messages, all outgoing messages are throttled except the Create Bearer
Request (CBR) message, which is piggybacked with Create Session Response message.

This feature has been enhanced to control the bypassing of some messages being throttled.

A new command option `throttling-override-policy` has been added to the existing CLI command `gtpc
overload-protection egress rlf-template rlf-temp` which allows you to selectively by-pass throttling for a
configured message type or for all messages in emergency call or priority call or call for the configured APN.
A new CLI command mode `throttling-override-policy` has been also been introduced for Generic syntax for
throttling override policy.

For more information on these commands, refer to the `CLI Reference Guide`.

Operator can configure Overload Protection/RLF Throttling-override (Bypass RLF) on P-GW along with
Overload Control feature at the egress side. In this scenario, the Overload Control based on peer's reduction
metrics will take higher precedence and messages will be throttled based on Overload Control feature first.
If the message is passed to RLF throttling after Overload Control feature processing then the Throttling override (Bypass RLF) will be applied after that according to the configuration. If the Overload Control Feature is not configured and RLF throttling and Bypass RLF throttling is configured, then messages would be throttled based on RLF and Throttling Override (Bypass RLF) feature.

---

**Important**
For more information on these commands, refer to R12 GTP-C Load and Overload Support, on page 86.

---

**HSS and PCRF Based P-CSCF Restoration Support**

Use of P-CSCF Restoration requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

This feature enables support for P-CSCF restoration. The P-CSCF restoration procedures were standardized to minimize the time a UE is unreachable for terminating calls after a P-CSCF failure. In compliance with 3GPP standard Release 13, this feature includes the following P-CSCF restoration mechanisms:

- HSS-based P-CSCF Restoration for Trusted/Untrusted WLAN Access (S2a/S2b)
- PCRF-based P-CSCF Restoration for LTE (S5/S8) and Trusted/Untrusted WLAN Access (S2a/S2b)

**Important**
For more information on this feature, refer to the **HSS and PCRF Based P-CSCF Restoration Support** chapter in this guide.

---

**Inter-Chassis Session Recovery**

Use of Inter-chassis Session Recovery requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

The ASR 5500 provides industry leading carrier class redundancy. The systems protects against all single points of failure (hardware and software) and attempts to recover to an operational state when multiple simultaneous failures occur.

The system provides several levels of system redundancy:

- Under normal N+1 PSC/PSC2 hardware redundancy, if a catastrophic packet processing card failure occurs all affected calls are migrated to the standby packet processing card if possible. Calls which cannot be migrated are gracefully terminated with proper call-termination signaling and accounting records are generated with statistics accurate to the last internal checkpoint.

- If the Session Recovery feature is enabled, any total PSC/PSC2 failure will cause a PSC switchover and all established sessions for supported call-types are recovered without any loss of session.

Even though Cisco provides excellent intra-chassis redundancy with these two schemes, certain catastrophic failures which can cause total chassis outages, such as IP routing failures, line-cuts, loss of power, or physical destruction of the chassis, cannot be protected by this scheme. In such cases, the MME Inter-Chassis Session Recovery feature provides geographic redundancy between sites. This has the benefit of not only providing enhanced subscriber experience even during catastrophic outages, but can also protect other systems such as the RAN from subscriber re-activation storms.
The Interchassis Session Recovery feature allows for continuous call processing without interrupting subscriber services. This is accomplished through the use of redundant chassis. The chassis are configured as primary and backup with one being active and one in recovery mode. A checkpoint duration timer is used to control when subscriber data is sent from the active chassis to the inactive chassis. If the active chassis handling the call traffic goes out of service, the inactive chassis transitions to the active state and continues processing the call traffic without interrupting the subscriber session. The chassis determines which is active through a propriety TCP-based connection called a redundancy link. This link is used to exchange Hello messages between the primary and backup chassis and must be maintained for proper system operation.

- **Interchassis Communication**

  Chassis configured to support Interchassis Session Recovery communicate using periodic Hello messages. These messages are sent by each chassis to notify the peer of its current state. The Hello message contains information about the chassis such as its configuration and priority. A dead interval is used to set a time limit for a Hello message to be received from the chassis' peer. If the standby chassis does not receive a Hello message from the active chassis within the dead interval, the standby chassis transitions to the active state. In situations where the redundancy link goes out of service, a priority scheme is used to determine which chassis processes the session. The following priority scheme is used:

  - router identifier
  - chassis priority
  - SPIO MAC address

- **Checkpoint Messages**

  Checkpoint messages are sent from the active chassis to the inactive chassis. Checkpoint messages are sent at specific intervals and contain all the information needed to recreate the sessions on the standby chassis, if that chassis were to become active. Once a session exceeds the checkpoint duration, checkpoint data is collected on the session. The checkpoint parameter determines the amount of time a session must be active before it is included in the checkpoint message.

---

**Important**

For more information on interchassis session recovery support, refer to the *Interchassis Session Recovery* chapter in the *System Administration Guide*.

### IP Security (IPSec) Encryption

Use of Network Domain Security requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

IPSec encryption enables network domain security for all IP packet switched LTE-EPC networks in order to provide confidentiality, integrity, authentication, and anti-replay protection. These capabilities are insured through use of cryptographic techniques.

The Cisco P-GW supports IKEv1 and IPSec encryption using IPv4 addressing. IPSec enables the following two use cases:

- Encryption of S8 sessions and EPS bearers in roaming applications where the P-GW is located in a separate administrative domain from the S-GW
• IPSec ESP security in accordance with 3GPP TS 33.210 is provided for S1 control plane, S1 bearer plane and S1 management plane traffic. Encryption of traffic over the S1 reference interface is desirable in cases where the EPC core operator leases radio capacity from a roaming partner's network.

Important
For more information on IPSec support, refer to the IPSec Reference.

IPv6 Prefix Delegation from the RADIUS Server and the Local Pool

This feature adds support to obtain the DHCPv6 Prefix Delegation from the RADIUS server or a local pool configured on the GGSN/P-GW/SAEGW. Interface-ID allocation from RADIUS Server is also supported along with this feature.

A User Equipment (UE) or a Customer Premises Equipment (CPE) requests Prefix-Delegation. The P-GW or the GGSN then obtains this prefix from the RADIUS server or the local pool. P-GW and GGSN then advertise the prefix obtained by either RADIUS server or the local pool toward the UE client or the CPE.

This feature is divided into following three features:
• IPv6 Prefix Delegation from the RADIUS Server
• IPv6 Prefix Delegation from the Local Pool
• IPv6 Interface ID from the RADIUS Server

Important
For more information on IPv6 Prefix Delegation, refer IPv6 Prefix Delegation from the RADIUS Server and the Local Pool chapter.

L2TP LAC Support

Use of L2TP LAC requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

The system configured as a Layer 2 Tunneling Protocol Access Concentrator (LAC) enables communication with L2TP Network Servers (LNSs) for the establishment of secure Virtual Private Network (VPN) tunnels between the operator and a subscriber's corporate or home network.

The use of L2TP in VPN networks is often used as it allows the corporation to have more control over authentication and IP address assignment. An operator may do a first level of authentication, however use PPP to exchange user name and password, and use IPCP to request an address. To support PPP negotiation between the P-GW and the corporation, an L2TP tunnel must be setup in the P-GW running a LAC service.

L2TP establishes L2TP control tunnels between LAC and LNS before tunneling the subscriber PPP connections as L2TP sessions. The LAC service is based on the same architecture as the P-GW and benefits from dynamic resource allocation and distributed message and data processing.

The LAC sessions can also be configured to be redundant, thereby mitigating any impact of hardware or software issues. Tunnel state is preserved by copying the information across processor cards.
Lawful Intercept

The feature use license for Lawful Intercept on the P-GW is included in the P-GW session use license. The Cisco Lawful Intercept feature is supported on the P-GW. Lawful Intercept is a licensed-enabled, standards-based feature that provides telecommunications service providers with a mechanism to assist law enforcement agencies in monitoring suspicious individuals for potential illegal activity. For additional information and documentation on the Lawful Intercept feature, contact your Cisco account representative.

Layer 2 Traffic Management (VLANs)

Use of Layer 2 Traffic Management requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Virtual LANs (VLANs) provide greater flexibility in the configuration and use of contexts and services. VLANs are configured as "tags" on a per-port basis and allow more complex configurations to be implemented. The VLAN tag allows a single physical port to be bound to multiple logical interfaces that can be configured in different contexts; therefore, each Ethernet port can be viewed as containing many logical ports when VLAN tags are employed.

Local Policy Decision Engine

Use of the Local Policy Decision Engine requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

The Local Policy Engine is an event-driven rules engine that offers Gx-like QoS and policy controls to enable user or application entitlements. As the name suggests, it is designed to provide a subset of a PCRF in cases where an operator elects not to use a PCRF or scenarios where connections to an external PCRF are disrupted. Local policies are used to control different aspects of a session like QoS, data usage, subscription profiles, and server usage by means of locally defined policies. A maximum of 1,024 local policies can be provisioned on a P-GW system.

Local policies are trigged when certain events occur and the associated conditions are satisfied. For example, when a new call is initiated, the QoS to be applied for the call could be decided based on the IMSI, MSISDN, and APN.

Potential uses cases for the Local Policy Decision Engine include:

- Disaster recovery data backup solution in the event of a loss of PCRF in a mobile core network.
- Dedicated bearer establishment for emergency voice calls.
- Network-initiated bearer establishment on LTE to non-3GPP inter-domain handovers.
Modify Bearer Response using controlled parameters

The P-GW service provides configurable parameters to include Charging-ID, Charging FQDN or Charging Gateway address, and MSISDN in Modify Bearer Response. All Modify Bearer Response messages will send these parameters if CLI is enabled irrespective of scenarios like S-GW relocation and GnGp to LTE handover. This feature is not license-controlled and the behavior is controlled using CLI.

For more information on this feature, refer to the Modify Bearer Response using controlled parameters chapter in this guide.

MPLS Forwarding with LDP

Use of MPLS requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Multi Protocol Label Switching (MPLS) is an operating scheme or a mechanism that is used to speed up the flow of traffic on a network by making better use of available network paths. It works with the routing protocols like BGP and OSPF, and therefore it is not a routing protocol.

MPLS generates a fixed-length label to attach or bind with the IP packet's header to control the flow and destination of data. The binding of the labels to the IP packets is done by the label distribution protocol (LDP).

All the packets in a forwarding equivalence class (FEC) are forwarded by a label-switching router (LSR), which is also called an MPLS node. The LSR uses the LDP in order to signal its forwarding neighbors and distribute its labels for establishing a label switching path (LSP).

In order to support the increasing number of corporate APNs, which have a number of different addressing models and requirements, MPLS is deployed to fulfill at least the following two requirements:

- The corporate APN traffic must remain segregated from other APNs for security reasons.
- Overlapping of IP addresses in different APNs.

When deployed, the MPLS backbone automatically negotiates routes using the labels bound with the IP packets. Cisco P-GW as an LSR learns the default route from the connected provider edge (PE), while the PE populates its routing table with the routes provided by the P-GW.

Important

For more information on MPLS support, refer to the Multi-Protocol Label Switching (MPLS) Support chapter in this guide.

NEMO Service Supported

Use of NEMO requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

The P-GW may be configured to enable or disable Network Mobility (NEMO) service.
When enabled, the system includes NEMO support for a Mobile IPv4 Network Mobility (NEMO-HA) on the P-GW platform to terminate Mobile IPv4 based NEMO connections from Mobile Routers (MRs) that attach to an Enterprise PDN. The NEMO functionality allows bi-directional communication that is application-agnostic between users behind the MR and users or resources on Fixed Network sites.

The same NEMO4G-HA service and its bound Loopback IP address supports NEMO connections whose underlying PDN connection comes through GTP S5 (4G access) or PMIPv6 S2a (eHRPD access).

---

Important

For more information on NEMO support, refer to the *Network Mobility (NEMO)* chapter in this guide.

---

**NEMO Support in GGSN**

Use of Dynamic Network Mobile Routing (NEMO) for GGSN requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

NEMO support in P-GW was added in earlier StarOS releases. In release 15.0, support was added for GGSN as well so that NEMO can be supported for subscribers roaming out on 3G (UMTS/GERAN) networks.

This feature now supports standards-based NEMO feature on GGSN, which allows operators to support Enterprise VPN service with the advantage of faster deployment and flexible bandwidth arrangement for customers.

NEMO (NEtwork MObility) provides wireless connectivity between enterprise core network and remote sites over 3G/4G network. The wireless connection can be used as either primary link or backup link. All the hosts in the remote site can directly communicate with hosts in the core network without using NAT.

Enterprise VPN service is one of the main use case for this feature. Fast deployment and flexible bandwidth arrangement for customers are some of the advantages of this service. Customers include banks, financial institutions, multi-sited enterprises, city public safety departments, transportation fleet, etc.

---

**Network Provided Location Information for IMS**

Use of NPLI requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

This feature enables the P-GW to provide the required access network information to the PCRF within the 3GPP-User-Location-Info AVP, User-Location-Info-Time AVP (if available), and/or 3GPP-MS-TimeZone AVP as requested by the PCRF. The P-GW will also provide the ACCESS_NETWORK_INFO_REPORT event trigger within Event-Trigger AVP.

During bearer deactivation or UE detach procedure, the P-GW will provide the access network information to the PCRF within the 3GPP-User-Location-Info AVP and information on when the UE was last known to be in that location within User-Location-Info-Time AVP. If the PCRF requested User location info as part of the Required-Access-Info AVP and it is not available in the P-GW, then the P-GW will provide the serving PLMN identifier within the 3GPP-SGSN-MCC-MNC AVP.

Previously, the P-GW notified ULI/MS-TimeZone/PLMN-ID to ECS/IMS/PCRF only when their value changed. With this feature, the P-GW receives NetLoc indication in the rules sent by ECS regardless of whether the values changed and it sends this to the ECS/IMS/PCRF. If the P-GW receives NetLoc as '1', then it will inform MS-Timezone. If the P-GW receives NetLoc as '0', then it will inform ULI and ULI Timestamp. If ULI is not available in that case, then the PLMN-ID is sent. If NetLoc indication is received for an update, then the P-GW will indicate this information to the access side in the UBR req using the RetLoc Indication flag.
This is required for VoLTE and aids in charging and LI functionality in IMS domain. This feature allows EPC core to support an efficient way of reporting ULI and Time-Zone information of the subscriber to the IMS core network.

**New Call Policy for Stale Sessions**

Use of new call policy for stale sessions requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

If the newcall policy is set to reject release-existing-session and there are pre-existing sessions for the IMSI/IMEI received in Create Session Req, they will be deleted. This allows for no hung sessions on node with newcall policy reject release configured. When GGSN/P-GW/SAEGW/S-GW releases the existing call, it follows a proper release process of sending Accounting Stop, sending CCR-T to PCRF/OCS, and generating CDR(s).

**Non-standard QCI Support**

Use of non-standard QCIs require that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

Usually, only standards-based QCI values of 1 through 9 are supported on GGSN/P-GW/SAEGW/S-GW/ePDG. From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported on P-GW/GGSN (not standalone GGSN) and carriers can define QCI 128-254 to differentiate between various services/applications carriers provide to the end users in their network.

---

**Important**

For more information on non-standard QCI support, refer to the *Extended QCI Options* chapter in this guide.

**NetLoc for WiFi EPC**

With this feature, the IMS network can retrieve location information of the UE from WLAN access network. This improves location related feature and functionality for the operator. This feature also helps in charging subscribers based on location information.

Please note that the support for LTE NetLoc already exists from prior releases. With this release, NetLoc support is extended for WLAN access. Basic implementation is already supported for passing necessary parameter to different internal modules like SM, IMSA and ECS. For more information, see *NetLoc for WiFi EPC* section.

**Overcharging Protection Support**

Use of Overcharging Protection requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

Overcharging Protection helps in avoiding charging the subscribers for dropped downlink packets while the UE is in idle mode. In some countries, it is a regulatory requirement to avoid such overcharging, so it becomes a mandatory feature for operators in such countries. Overall, this feature helps ensure subscriber are not overcharged while the subscriber is in idle mode.
P-GW will never be aware of UE state (idle or connected mode). Charging for downlink data is applicable at P-GW, even when UE is in idle mode. Downlink data for UE may be dropped at S-GW when UE is in idle mode due to buffer overflow or delay in paging. Thus, P-GW will charge the subscriber for the dropped packets, which isn't desired. To address this problem, with Overcharging Protection feature enabled, S-GW will inform P-GW to stop or resume charging based on packets dropped at S-GW and transition of UE from idle to active state.

Once the criterion to signal "stop charging" is met, S-GW will send Modify Bearer Request (MBReq) to P-GW. MBReq would be sent for the PDN to specify which packets will be dropped at S-GW. MBReq will have a new private extension IE to send "stop charging" and "start charging" indication to P-GW.

When the MBReq with stop charging is received from a S-GW for a PDN, P-GW will stop charging for downlink packets but will continue sending the packets to S-GW.

P-GW will resume sending downlink packets after receiving "stop charging" request when either of these conditions is met:

- When the S-GW (which had earlier sent "stop charging" in MBReq) sends "start charging" in MBReq.
- When the S-GW changes (which indicates that maybe UE has relocated to new S-GW).

**Important**

When Overcharging Protection feature is configured at both P-GW service and APN, configuration at APN takes priority.

---

**Paging Policy Differentiation**

This feature requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

S-GW/P-GW provide configuration control to change the DSCP value of the user-datagram packet and outer IP packet (GTP-U tunnel IP header). DSCP marking is done at various levels depending on the configuration. When the Paging Policy Differentiation (PPD) feature is enabled, however, the user-datagram packet DSCP (tunneled IP packet) marking does not change.

Currently, standards specify QCI to DSCP marking of outer GTP-U header only. All configurations present at ECS, P-GW, and S-GW to change the user-datagram packet DSCP value are non-standard. The standards-based PPD feature dictates that P-CSCF or similar Gi entity marks the DSCP of user-datagram packet. This user-datagram packet DSCP value is sent in DDN message by S-GW to MME/S4-SGSN. MME/S4-SGSN uses this DSCP value to give paging priority.

**Important**

P-GW and S-GW should apply the PPD feature for both Default and Dedicated bearers. As per the specifications, P-GW transparently passes the user-datagram packet towards S-GW. This means, if PPD feature is enabled, operator can't apply different behavior for Default and Dedicated bearers.

**Important**

For more information on paging policy differentiation, refer to the *Paging Policy Differentiation* chapter in this guide.
Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters

Support for QCI and ARP Visibility

As of StarOS release 20.2, the software has been enhanced to support the viewing of QoS statistics on a Quality of Service Class Index (QCI) and Allocation and Retention Priority (ARP) basis.

ARP is a 3GPP mechanism for dropping or downgrading lower-priority bearers in situations where the network becomes congested. The network looks at the ARP when determining if new dedicated bearers can be established through the radio base station. QCI is an operator provisioned value that controls bearer level packet forwarding treatments.

This enhancement enables operators to monitor QoS statistics that identify multiple services running with the same QCI value. In addition, packet drop counters have been introduced to provide the specific reason the Enhanced Charging Service (ECS) dropped a packet. The packet drop counters provide output on a per ARP basis. This provides additional information that operators can use to troubleshoot and identify network issues that may be affecting service.

Important

For the ARP value only the priority level value in the Allocation/Retention Priority (ARP) Information Element (IE) is considered. Pre-emption Vulnerability (PV1) and Pre-emption Capability (PCI) flags in the ARP IE are not considered.

The existing show apn statistics name apn-name and show apn statistics Exec Mode CLI commands have been enhanced. The output of these commands now provides visibility for QoS statistics on a QCI/ARP basis.

Important

For more detailed information, refer to the Extended QCI Options chapter in this guide.

Licensing

ARP Granularity for QCI Level Counters is a license-controlled feature. Per QCI Packet Drop Counters functionality does not require a license. Contact your Cisco account or support representative for licensing details.

Piggyback Support on S2b Interface

This feature supports piggybacking of "Create Session Response" and "CreateBearer Request" messages on ePDG and P-GW over the S2b interface. If piggybacking flag is set by the ePDG in the Create Session Request, P-GW can now send Create Session Response and Create Bearer Request together to the ePDG and eliminate the possibility of reordering of these messages.

R12 GTP-C Load and Overload Support

GTP-C Load Control feature is a licensed, optional feature which allows a GTP control plane node to send its Load Information to a peer GTP control plane node which the receiving GTP control plane peer node uses to augment existing GW selection procedure for the P-GW and S-GW. Load Information reflects the operating status of the resources of the originating GTP control plane node.
Nodes using GTP control plane signaling may support communication of Overload control information in order to mitigate overload situations for the overloaded node through actions taken by the peer node(s). This feature is supported over S5 and S8 interfaces via the GTPv2 control plane protocol.

A GTP-C node is considered to be in overload when it is operating over its nominal capacity resulting in diminished performance (including impacts to handling of incoming and outgoing traffic). Overload control Information reflects an indication of when the originating node has reached such a situation. This information, when transmitted between GTP-C nodes may be used to reduce and/or throttle the amount of GTP-C signaling traffic between these nodes. As such, the Overload control Information provides guidance to the receiving node to decide actions, which leads to mitigation towards the sender of the information.

In brief, load control and overload control can be described in this manner:

- **Load control** enables a GTP-C entity (for example, an S-GW/P-GW) to send its load information to a GTP-C peer (e.g. an MME/SGSN, ePDG, TWAN) to adaptively balance the session load across entities supporting the same function (for example, an S-GW cluster) according to their effective load. The load information reflects the operating status of the resources of the GTP-C entity.

- **Overload control** enables a GTP-C entity becoming or being overloaded to gracefully reduce its incoming signaling load by instructing its GTP-C peers to reduce sending traffic according to its available signaling capacity to successfully process the traffic. A GTP-C entity is in overload when it operates over its signaling capacity, which results in diminished performance (including impacts to handling of incoming and outgoing traffic).

A maximum of 64 different load and overload profiles can be configured.

---

**Important**

Use of R12 Load and Overload Support requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

---

**R12 Load and Overload Factor Calculation Enhancement**

In capacity testing and also in customer deployments it was observed that the chassis load factor for the R12 Load and Overload Support feature was providing incorrect values even when the sessmgr card CPU utilization was high. The root cause is that when the load factor was calculated by taking an average of CPU utilization of sessmgr and demux cards, the demux card CPU utilization never increased more than the sessmgr card CPU utilization. As a result, the system did not go into the overload state even when the sessmgr card CPU utilization was high.

The R12 Load/Overload Control Profile feature has been enhanced to calculate the load factor based on the higher value of similar types of cards for CPU load and memory. If the demux card's CPU utilization value is higher than the sessmgr card's CPU utilization value, then the demux card CPU utilization value is used for the load factor calculation.

A new CLI command is introduced to configure different polling intervals for the resource manager so that the demuxmgr can calculate the load factor based on different system requirements.

---

**Important**

For more detailed information on this feature, refer to the *GTP-C Load and Overload Control Support on the P-GW, SAEGW, and S-GW* chapter in this guide.
Operation

The node periodically fetches various parameters (for example, License-Session-Utilization, System-CPU-Utilization and System-Memory-Utilization), which are required for Node level load control information. The node then calculates the load control information itself either based on the weighted factor provided by the user or using the default weighted factor.

Node level load control information is calculated every 30 seconds. The resource manager calculates the system-CPU-utilization and System-Memory-Utilization at a systems level.

For each configured service, load control information can be different. This can be achieved by providing a weightage to the number of active session counts per service license, for example, ((number of active sessions per service / max session allowed for the service license) * 100).

The node's resource manager calculates the system-CPU-utilization and System-Memory-Utilization at a systems level by averaging CPU and Memory usage for all cards and which might be different from that calculated at the individual card level.

Retrieve MDN from S6b

As per the current implementation, during an initial attach, P-GW selects Mobile Directory Number (MDN) or Mobile Station International Subscriber Directory Number (MSISDN) from the S6b interface. Later, when the call is handed off from P-GW to other services like eHRPD/trusted WiFi/untrusted WiFi or the handoff is done from these services to the P-GW, then the MDN/MSISDN is picked from the create session (CS) request and the S6b authorized MDN/MSISDN is lost. As a result, different values of MDN/MSISDN are sent in the Rf records. Since, typically, operators use MDN to charge subscribers, this results in revenue loss.

This feature retains the MDN/MSISDN value from the S6b interface or the CS request, during the initial attach and even during handoff between P-GW and eHRPD/trusted WiFi/untrusted WiFi. The MDN/MSISDN value does not change in the call lifetime. As a result, all Rf records of a session have the same MDN/MSISDN values.

A new keyword retain-mdn has been added to the CLI command authorize-with-hss. This CLI command keyword, when configured, retains the MDN/MSISDN value. If the CLI command keyword is not configured, the MDN/MSISDN value is not received from the S6b interface. In this case, the MDN/MSISDN value received in the CS request is used.

Important

This feature is not applicable to GnGp handoff.

For more information on this feature, see Retrieve MDN from S6b chapter of this guide.

Session Recovery Support

The feature use license for Session Recovery on the P-GW is included in the P-GW session use license.

Session recovery provides seamless failover and reconstruction of subscriber session information in the event of a hardware or software fault within the system preventing a fully connected user session from being disconnected.

In the telecommunications industry, over 90 percent of all equipment failures are software-related. With robust hardware failover and redundancy protection, any card-level hardware failures on the system can quickly be
corrected. However, software failures can occur for numerous reasons, many times without prior indication. StarOS Release 9.0 adds the ability to support stateful intra-chassis session recovery for P-GW sessions.

When session recovery occurs, the system reconstructs the following subscriber information:

• Data and control state information required to maintain correct call behavior

• Subscriber data statistics that are required to ensure that accounting information is maintained

• A best-effort attempt to recover various timer values such as call duration, absolute time, and others

Session recovery is also useful for in-service software patch upgrade activities. If session recovery is enabled during the software patch upgrade, it helps to preserve existing sessions on the active PSC/PSC2 during the upgrade process.

For more information on session recovery support, refer to the Session Recovery chapter in the System Administration Guide.

**Smartphone Tethering Detection Support**

Use of Smartphone Tethering Detection requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

On the P-GW, using the inline heuristic detection mechanism, it is now possible to detect and differentiate between the traffic from the mobile device and a tethered device connected to the mobile device.

**Traffic Policing**

Use of Per-Subscriber Traffic Policing requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Traffic policing allows you to manage bandwidth usage on the network and limit bandwidth allowances to subscribers.

Traffic policing enables the configuring and enforcing of bandwidth limitations on individual subscribers and/or APNs of a particular traffic class in 3GPP/3GPP2 service.

Bandwidth enforcement is configured and enforced independently on the downlink and the uplink directions.

A Token Bucket Algorithm (a modified trTCM) [RFC2698] is used to implement the Traffic-Policing feature. The algorithm used measures the following criteria when determining how to mark a packet:

• **Committed Data Rate (CDR):** The guaranteed rate (in bits per second) at which packets can be transmitted/received for the subscriber during the sampling interval.

• **Peak Data Rate (PDR):** The maximum rate (in bits per second) that subscriber packets can be transmitted/received for the subscriber during the sampling interval.

• **Burst-size:** The maximum number of bytes that can be transmitted/received for the subscriber during the sampling interval for both committed (CBS) and peak (PBS) rate conditions. This represents the maximum number of tokens that can be placed in the subscriber's "bucket". Note that the committed burst size (CBS) equals the peak burst size (PBS) for each subscriber.
The system can be configured to take any of the following actions on packets that are determined to be in excess or in violation:

- **Drop**: The offending packet is discarded.
- **Transmit**: The offending packet is passed.
- **Lower the IP Precedence**: The packet's ToS bit is set to "0", thus downgrading it to Best Effort, prior to passing the packet. Note that if the packet's ToS bit was already set to "0", this action is equivalent to "Transmit".

**Important**

For more information on traffic policing, refer to the *Traffic Policing and Shaping* chapter in this guide.

### Traffic Shaping

Traffic Shaping is a rate limiting method similar to Traffic Policing, but provides a buffer facility for packets exceeding the configured limit. Once packets exceed the data-rate, the packet is queued inside the buffer to be delivered at a later time.

The bandwidth enforcement can be done in the downlink and the uplink direction independently. If there is no more buffer space available for subscriber data, the system can be configured to either drop the packets or retain it for the next scheduled traffic session.

Traffic will be shaped to the configured APN-AMBR value. Previously, data carried on non-GBR bearers was policed at the configured APN-AMBR rate. APN-AMBR policing dropped the data that did not match the configured APN-AMBR. With APN-AMBR traffic shaping, non-GBR data that does not match the configured APN-AMBR rate will be buffered. When enough memory tokens are available, the data will be transmitted. In addition, operators still have the option to allow operators to drop or transmit the data when the buffer limit is reached.

**Important**

For more information on traffic shaping, refer to the *Traffic Policing and Shaping* chapter in this guide.

### UBR Suppression Feature

The Update Bearer Request (UBR) Suppression feature is a license controlled feature. Please contact your Cisco account or service representative for more information.

As the bit rate is expressed in bps on Gx and kbps on GTP, P-GW does a round-off to convert a Gx request into a GTP request. When P-GW receives RAR from PCRF with minimal bit rate changes (in bps), a UBR is sent, even if the same QoS (in Kbps) is already set for the bearer. The UBR suppression feature enables P-GW to suppress such a UBR where there is no update for any of the bearer parameters.

A new CLI command, `suppress-ubr no-bitrate-change`, has been added to the P-GW service configuration to enable UBR suppression. Once the CLI is configured, P-GW suppresses the UBR if the bit rate is the same after the round-off.

When UBR has multiple bearer contexts, the bearer context for which the bit rate change is less than 1 kbps after round-off is suppressed. If other parameters, such as QCI, ARP, and TFT, that might trigger UBR are
changed and there is no change in bit rates after round-off, then UBR is not suppressed. Suppression of UBR is applicable for UBR triggered by CCA-I, RAR, and Modify Bearer Command.

To summarize, if the license is enabled and the CLI command **suppress-ubr no-bitrate-change** is configured for UBR suppression, then UBR is suppressed if bit rates in kbps are the same after round-off and all other parameters, such as QCI, ARP, and TFT, that might trigger UBR are also unchanged.

**User Location Information Reporting**

Use of User Location Information (ULI) Reporting requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

ULI Reporting allows the eNodeB to report the location of a UE to the MME, when requested by a P-GW.

The following procedures are used over the S1-MME interface to initiate and stop location reporting between the MME and eNodeB:

- **Location Reporting Control**: The purpose of Location Reporting Control procedure is to allow the MME to request that the eNodeB report where the UE is currently located. This procedure uses UE-associated signaling.

- **Location Report Failure Indication**: The Location Report Failure Indication procedure is initiated by an eNodeB in order to inform the MME that a Location Reporting Control procedure has failed. This procedure uses UE-associated signalling.

- **Location Report**: The purpose of Location Report procedure is to provide the UE's current location to the MME. This procedure uses UE-associated signalling.

The start/stop trigger for location reporting for a UE is reported to the MME by the S-GW over the S11 interface. The Change Reporting Action (CRA) Information Element (IE) is used for this purpose. The MME updates the location to the S-GW using the User Location Information (ULI) IE.

The following S11 messages are used to transfer CRA and ULI information between the MME and S-GW:

- **Create Session Request**: The ULI IE is included for E-UTRAN Initial Attach and UE-requested PDN Connectivity procedures. It includes ECGI and TAI. The MME includes the ULI IE for TAU/ X2-Handover procedure if the P-GW has requested location information change reporting and the MME support location information change reporting. The S-GW includes the ULI IE on S5/S8 exchanges if it receives the ULI from the MME. If the MME supports change reporting, it sets the corresponding indication flag in the Create Session Request message.

- **Create Session Response**: The CRA IE in the Create Session Response message can be populated by the S-GW to indicate the type of reporting required.

- **Create Bearer Request**: The CRA IE is included with the appropriate Action field if the Location Change Reporting mechanism is to be started or stopped for the subscriber in the MME.

- **Modify Bearer Request**: The MME includes the ULI IE for TAU/Handover procedures and UE-initiated Service Request procedures if the P-GW has requested location information change reporting and the MME supports location information change reporting. The S-GW includes this IE on S5/S8 exchanges if it receives the ULI from the MME.

- **Modify Bearer Response**: The CRA IE is included with the appropriate Action field if the Location Change Reporting mechanism is to be started or stopped for the subscriber in the MME.
• **Delete Session Request**: The MME includes the ULI IE for the Detach procedure if the P-GW has requested location information change reporting and MME supports location information change reporting. The S-GW includes this IE on S5/S8 exchanges if it receives the ULI from the MME.

• **Update Bearer Request**: The CRA IE is included with the appropriate Action field if the Location Change Reporting mechanism is to be started or stopped for the subscriber in the MME.

• **Change Notification Request**: If no existing procedure is running for a UE, a Change Notification Request is sent upon receipt of an S1-AP location report message. If an existing procedure is running, one of the following messages reports the ULI:
  - Create Session Request
  - Create Bearer Response
  - Modify Bearer Request
  - Update Bearer Response
  - Delete Bearer Response
  - Delete Session Request

If an existing Change Notification Request is pending, it is aborted and a new one is sent.

---

**Important**

Information on configuring User Location Information (ULI) Reporting support is located in the *Configuring Optional Features on the MME* section of the *Mobility Management Entity Configuration* chapter in the *MME Administration Guide*.

---

**3GPP ULI Reporting Support Enhanced**

This feature enhancement covers ULI related gaps in P-GW and GGSN as per 3GPP standards.

**Feature Change**

This feature enhancement covers ULI related gaps in P-GW and GGSN as per 3GPP standards. S4SGSN reports ULI to the P-GW through S-GW. P-GW determines the changes in the ULI with previously received ULI. If any change is detected and same change has been requested by the PCRF as an event trigger then the ULI is reported to the PCRF.

SGSN reports ULI to the GGSN. GGSN determines the changes in the ULI with previously received ULI. If any change is detected and same change has been requested by the PCRF as an event trigger, then the ULI is reported to the PCRF. Support has also been added to detect the change in RAI received as part of the ULI field at GGSN.

Following table summarizes the Change Reporting Action (CRA) values based on Event Triggers received from the PCRF, which the P-GW communicates with S4 SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to S4 SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_LOCATION_CHANGE (13)</td>
<td>Start Reporting CGI/SAI and RAI (5)</td>
</tr>
<tr>
<td>RAI_CHANGE (12)</td>
<td>Start Reporting RAI (2)</td>
</tr>
</tbody>
</table>
Following table summarizes the MS Info Change Reporting Action values based on Event Triggers received from the PCRF which GGSN communicates to SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to S4 SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_LOCATION_CHANGE + RAI_CHANGE</td>
<td>Start Reporting CGI/SAI and RAI (5)</td>
</tr>
</tbody>
</table>

P-GW/GGSN reports the CRA/MS Info Change Reporting Action immediately on receiving the Event Triggers without waiting for other events like APN/AMBR update or QoS update.

**Behavior Change**

**Previous of Change Reporting Action:** Following table illustrates the old and new behavior of Change Reporting Action with respect to the Event Triggers received from PCRF, when the Access Node is S4SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to S4SGSN</th>
<th>CRA Sent to S4SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>ULI_CHANGE(13)</td>
<td>6 (START_REPORTING_TAI_ECGI)</td>
<td>5 (START_REPORTING/cgi_RAI)</td>
</tr>
<tr>
<td>RAI_CHANGE(12)</td>
<td>No CRA Sent</td>
<td>2 (START_REPORTING_RAI)</td>
</tr>
<tr>
<td>BOTH (12,13)</td>
<td>6 (START_REPORTING_TAI_ECGI)</td>
<td>5 (START_REPORTING/cgi_RAI)</td>
</tr>
</tbody>
</table>

**Behavior of MS Info Change Reporting Action:** Following table illustrates the old and new behavior of MS Info CRA with respect to the Event Triggers received from PCRF, when the Access Node is SGSN.

<table>
<thead>
<tr>
<th>Event Trigger From PCRF</th>
<th>CRA Sent to SGSN</th>
<th>CRA Sent to SGSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>ULI_CHANGE(13)</td>
<td>1 (START_REPORTING/cgi/SAI)</td>
<td>1 (START_REPORTING/cgi/SAI)</td>
</tr>
<tr>
<td>RAI_CHANGE(12)</td>
<td>No CRA Sent</td>
<td>2 (START_REPORTING_RAI)</td>
</tr>
<tr>
<td>BOTH (12,13)</td>
<td>1 (START_REPORTING/cgi/SAI)</td>
<td>1 (START_REPORTING/cgi/SAI)</td>
</tr>
</tbody>
</table>

**Limitations**

1. In GGSN, when a new ULI is received in the Network Request Updated PDP Context (NRUPC) Response, it is not reported to the PCRF.
2. In GGSN, when a dedicated bearer is deleted or call is dropped, ULI change is not detected.
Configurable Behavior on PDN Type IPv4v6

With this enhancement, P-GW/GGSN provided a new CLI configuration to enable the following four options when MME/SGSN sets PDN type to IPv4v6 and Dual Address Flag (DAF) is set to False in Create Session Request or Create PDP Request.

1. Option 1: Assign IPv6 address using current method and respond with Create Session Response or Create PDP Response with Success and Cause Code #19 "New PDN type due to single address bearer only".
2. Option 2: Assign IPv4 address and respond with a Create Session Response or Create PDP Response with Success and Cause Code #19 "New PDN type due to single address bearer only".
3. Option 3: Assign IPv6 address and respond with a Create Session Response or Create PDP Response with Success and Cause Code #18 "New PDN type due to network preference".
4. Option 4: Assign IPv4 address and respond with a Create Session Response or Create PDP Response with Success and Cause Code #18 "New PDN type due to network preference".

When the CLI is not configured, the default behavior is Option 1. The gateway supports multiple PDN connections for the same APN to accommodate for Option 1, Option 2, and the UE attempting a second PDN connection. It is possible to configure the CLI for each APN differently.

Previously, there was no configurable support for the type of PDN assigned and the cause code returned in a Create Session Response or Create PDP Response when a Create Session Request or CPC was received for IPv4v6 PDN with DAF False at the P-GW and GGSN.

How the PDN Gateway Works

This section provides information on the function of the P-GW in an EPC E-UTRAN network and presents call procedure flows for different stages of session setup and disconnect.

The P-GW supports the following network flows:

- PMIPv6 PDN Gateway Call/Session Procedures in an eHRPD Network
- GTP PDN Gateway Call/Session Procedures in an LTE-SAE Network

PMIPv6 PDN Gateway Call/Session Procedures in an eHRPD Network

The following topics and procedure flows are included:

- Initial Attach with IPv6/IPv4 Access, on page 94
- PMIPv6 Lifetime Extension without Handover, on page 96
- PDN Connection Release Initiated by UE, on page 97
- PDN Connection Release Initiated by HSGW, on page 98
- PDN Connection Release Initiated by P-GW, on page 100

Initial Attach with IPv6/IPv4 Access

This section describes the procedure of initial attach and session establishment for a subscriber (UE).
Table 6: Initial Attach with IPv6/IPv4 Access Call Flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The subscriber (UE) attaches to the eHRPD network.</td>

<tr>
<td>2</td>
<td>The UE decides to disconnect from the PDN and sends a PPP VSNCP-Term-Req with PDNID=x.</td>
</tr>
<tr>
<td>3</td>
<td>The HSGW starts disconnecting the PDN connection and sends a PPP-VSNCP-Term-Ack to the UE (also with PDNID=x).</td>
</tr>
<tr>
<td>4</td>
<td>The HSGW begins the tear down of the PMIP session by sending a PBU Deregistration to the P-GW with the following attributes: Lifetime=0, MNID, APN, ATT=HRPD, HNP. The PBU Deregistration message should contain all the mobility options that were present in the initial PBU that created the binding.</td>
</tr>
<tr>
<td>5</td>
<td>The P-GW looks up the Binding Cache Entry (BCE) based on the HNP, deletes the binding, and responds to the HSGW with a Deregistration PBA with the same attributes (Lifetime=0, MNID, APN, ATT=HRPD, HNP).</td>
</tr>
<tr>
<td>6</td>
<td>The HSGW optionally sends a Router Advertisement (RA) with assigned HNP and prefix lifetime=0.</td>
</tr>
</tbody>
</table>

PDN Connection Release Initiated by HSGW

This section describes the procedure of a session release by the HSGW.
Table 9: PDN Connection Release by the HSGW Call Flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The UE is attached to the EPC and has a PDN connection with the P-GW for PDN-ID=x and APN with assigned HNP.</td>
</tr>
<tr>
<td>2</td>
<td>The HSGW MAG service triggers a disconnect of the PDN connection for PDNID=x.</td>
</tr>
<tr>
<td>3</td>
<td>The HSGW sends a PPP VSNCP-Term-Req with PDNID=x to the UE.</td>
</tr>
<tr>
<td>4</td>
<td>The UE acknowledges the receipt of the request with a VSNCP-Term-Ack (PDNID=x).</td>
</tr>
<tr>
<td>5</td>
<td>The HSGW begins the tear down of the PMIP session by sending a PBU Deregistration to the P-GW with the following attributes: Lifetime=0, MNID, APN, HNP. The PBU Deregistration message should contain all the mobility options that were present in the initial PBU that created the binding.</td>
</tr>
<tr>
<td>6</td>
<td>The P-GW looks up the BCE based on the HNP, deletes the binding, and responds to the HSGW with a Deregistration PBA with the same attributes (Lifetime=0, MNID, APN, ATT=HRPD, HNP).</td>
</tr>
</tbody>
</table>
The HSGW optionally sends a Router Advertisement (RA) with assigned HNP and prefix lifetime=0.

### PDN Connection Release Initiated by P-GW

This section describes the procedure of a session release by the P-GW.

#### Table 10: PDN Connection Release by the P-GW Call Flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The UE is attached to the EPC and has a PDN connection with the P-GW for PDN-ID=x and APN with assigned HNP.</td>
</tr>
<tr>
<td>2</td>
<td>A P-GW trigger causes a disconnect of the PDN connection for PDNID=x and the PGW sends a Binding Revocation Indication (BRI) message to the HSGW with the following attributes: MNID, APN, HNP.</td>
</tr>
<tr>
<td>3</td>
<td>The HSGW responds to the BRI message with a Binding Revocation Acknowledgment (BRA) message with the same attributes (MNID, APN, HNP).</td>
</tr>
<tr>
<td>4</td>
<td>The HSGW MAG service triggers a disconnect of the UE PDN connection for PDNID=x.</td>
</tr>
</tbody>
</table>
The HSGW sends a PPP VSNCP-Term-Req with PDNID=x to the UE.

The UE acknowledges the receipt of the request with a VSNCP-Term-Ack (PDNID=x).

The HSGW optionally sends a Router Advertisement (RA) with assigned HNP and prefix lifetime=0.

---

**GTP PDN Gateway Call/Session Procedures in an LTE-SAE Network**

The following topics and procedure flows are included:

- **Subscriber-initiated Attach (initial), on page 101**
- **Subscriber-initiated Detach, on page 105**

**Subscriber-initiated Attach (initial)**

This section describes the procedure of an initial attach to the EPC network by a subscriber.
Table 11: Subscriber-initiated Attach (initial) Call Flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The UE initiates the Attach procedure by the transmission of an Attach Request (IMSI or old GUTI, last visited TAI (if available), UE Network Capability, PDN Address Allocation, Protocol Configuration Options, Attach Type) message together with an indication of the Selected Network to the eNodeB. IMSI is included if the UE does not have a valid GUTI available. If the UE has a valid GUTI, it is included.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>The eNodeB derives the MME from the GUTI and from the indicated Selected Network. If that MME is not associated with the eNodeB, the eNodeB selects an MME using an &quot;MME selection function&quot;. The eNodeB forwards the Attach Request message to the new MME contained in a S1-MME control message (Initial UE message) together with the Selected Network and an indication of the E-UTRAN Area identity, a globally unique E-UTRAN ID of the cell from where it received the message to the new MME.</td>
</tr>
<tr>
<td>3</td>
<td>If the UE is unknown in the MME, the MME sends an Identity Request to the UE to request the IMSI.</td>
</tr>
<tr>
<td>4</td>
<td>The UE responds with Identity Response (IMSI).</td>
</tr>
<tr>
<td>5</td>
<td>If no UE context for the UE exists anywhere in the network, authentication is mandatory. Otherwise this step is optional. However, at least integrity checking is started and the ME Identity is retrieved from the UE at Initial Attach. The authentication functions, if performed this step, involves AKA authentication and establishment of a NAS level security association with the UE in order to protect further NAS protocol messages.</td>
</tr>
<tr>
<td>6</td>
<td>The MME sends an Update Location (MME Identity, IMSI, ME Identity) to the HSS.</td>
</tr>
<tr>
<td>7</td>
<td>The HSS acknowledges the Update Location message by sending an Update Location Ack to the MME. This message also contains the Insert Subscriber Data (IMSI, Subscription Data) Request. The Subscription Data contains the list of all APNs that the UE is permitted to access, an indication about which of those APNs is the Default APN, and the 'EPS subscribed QoS profile' for each permitted APN. If the Update Location is rejected by the HSS, the MME rejects the Attach Request from the UE with an appropriate cause.</td>
</tr>
<tr>
<td>8</td>
<td>The MME selects an S-GW using &quot;Serving GW selection function&quot; and allocates an EPS Bearer Identity for the Default Bearer associated with the UE. If the PDN subscription context contains no P-GW address the MME selects a P-GW as described in clause &quot;PDN GW selection function&quot;. Then it sends a Create Default Bearer Request (IMSI, MME Context ID, APN, RAT type, Default Bearer QoS, PDN Address Allocation, AMBR, EPS Bearer Identity, Protocol Configuration Options, ME Identity, User Location Information) message to the selected S-GW.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>9</td>
<td>The S-GW creates a new entry in its EPS Bearer table and sends a Create Default Bearer Request (IMSI, APN, S-GW Address for the user plane, S-GW TEID of the user plane, S-GW TEID of the control plane, RAT type, Default Bearer QoS, PDN Address Allocation, AMBR, EPS Bearer Identity, Protocol Configuration Options, ME Identity, User Location Information) message to the P-GW.</td>
</tr>
<tr>
<td>10</td>
<td>If dynamic PCC is deployed, the P-GW interacts with the PCRF to get the default PCC rules for the UE. The IMSI, UE IP address, User Location Information, RAT type, AMBR are provided to the PCRF by the P-GW if received by the previous message.</td>
</tr>
<tr>
<td>11</td>
<td>The P-GW returns a Create Default Bearer Response (P-GW Address for the user plane, P-GW TEID of the user plane, P-GW TEID of the control plane, PDN Address Information, EPS Bearer Identity, Protocol Configuration Options) message to the S-GW. PDN Address Information is included if the P-GW allocated a PDN address Based on PDN Address Allocation received in the Create Default Bearer Request. PDN Address Information contains an IPv4 address for IPv4 and/or an IPv6 prefix and an Interface Identifier for IPv6. The P-GW takes into account the UE IP version capability indicated in the PDN Address Allocation and the policies of operator when the P-GW allocates the PDN Address Information. Whether the IP address is negotiated by the UE after completion of the Attach procedure, this is indicated in the Create Default Bearer Response.</td>
</tr>
<tr>
<td>12</td>
<td>The Downlink (DL) Data can start flowing towards S-GW. The S-GW buffers the data.</td>
</tr>
<tr>
<td>13</td>
<td>The S-GW returns a Create Default Bearer Response (PDN Address Information, S-GW address for User Plane, S-GW TEID for User Plane, S-GW Context ID, EPS Bearer Identity, Protocol Configuration Options) message to the new MME. PDN Address Information is included if it was provided by the P-GW.</td>
</tr>
<tr>
<td>14</td>
<td>The new MME sends an Attach Accept (APN, GUTI, PDN Address Information, TAI List, EPS Bearer Identity, Session Management Configuration IE, Protocol Configuration Options) message to the eNodeB.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>15</td>
<td>The eNodeB sends Radio Bearer Establishment Request including the EPS Radio Bearer Identity to the UE. The Attach Accept message is also sent along to the UE.</td>
</tr>
<tr>
<td>16</td>
<td>The UE sends the Radio Bearer Establishment Response to the eNodeB. In this message, the Attach Complete message (EPS Bearer Identity) is included.</td>
</tr>
<tr>
<td>17</td>
<td>The eNodeB forwards the Attach Complete (EPS Bearer Identity) message to the MME.</td>
</tr>
<tr>
<td>18</td>
<td>The Attach is complete and UE sends data over the default bearer. At this time the UE can send uplink packets towards the eNodeB which are then tunneled to the S-GW and P-GW.</td>
</tr>
<tr>
<td>19</td>
<td>The MME sends an Update Bearer Request (eNodeB address, eNodeB TEID) message to the S-GW.</td>
</tr>
<tr>
<td>20</td>
<td>The S-GW acknowledges by sending Update Bearer Response (EPS Bearer Identity) message to the MME.</td>
</tr>
<tr>
<td>21</td>
<td>The S-GW sends its buffered downlink packets.</td>
</tr>
<tr>
<td>22</td>
<td>After the MME receives Update Bearer Response (EPS Bearer Identity) message, if an EPS bearer was established and the subscription data indicates that the user is allowed to perform handover to non-3GPP accesses, and if the MME selected a P-GW that is different from the P-GW address which was indicated by the HSS in the PDN subscription context, the MME sends an Update Location Request including the APN and P-GW address to the HSS for mobility with non-3GPP accesses.</td>
</tr>
<tr>
<td>23</td>
<td>The HSS stores the APN and P-GW address pair and sends an Update Location Response to the MME.</td>
</tr>
<tr>
<td>24</td>
<td>Bidirectional data is passed between the UE and PDN.</td>
</tr>
</tbody>
</table>

**Subscriber-initiated Detach**

This section describes the procedure of detachment from the EPC network by a subscriber.
Table 12: Subscriber-initiated Detach Call Flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The UE sends NAS message Detach Request (GUTI, Switch Off) to the MME. Switch Off indicates whether detach is due to a switch off situation or not.</td>
</tr>
<tr>
<td>2</td>
<td>The active EPS Bearers in the S-GW regarding this particular UE are deactivated by the MME sending a Delete Bearer Request (TEID) message to the S-GW.</td>
</tr>
<tr>
<td>3</td>
<td>The S-GW sends a Delete Bearer Request (TEID) message to the P-GW.</td>
</tr>
<tr>
<td>4</td>
<td>The P-GW acknowledges with a Delete Bearer Response (TEID) message.</td>
</tr>
<tr>
<td>5</td>
<td>The P-GW may interact with the PCRF to indicate to the PCRF that EPS Bearer is released if PCRF is applied in the network.</td>
</tr>
<tr>
<td>6</td>
<td>The S-GW acknowledges with a Delete Bearer Response (TEID) message.</td>
</tr>
<tr>
<td>7</td>
<td>If Switch Off indicates that the detach is not due to a switch off situation, the MME sends a Detach Accept message to the UE.</td>
</tr>
<tr>
<td>8</td>
<td>The MME releases the S1-MME signalling connection for the UE by sending an S1 Release command to the eNodeB with Cause = Detach.</td>
</tr>
</tbody>
</table>

Supported Standards

The P-GW service complies with the following standards.

- Release 12 3GPP References, on page 107
- Release 11 3GPP References, on page 107
• Release 10 3GPP References, on page 108
• Release 9 3GPP References, on page 108
• Release 8 3GPP References, on page 109
• 3GPP2 References, on page 110
• IETF References, on page 110
• Object Management Group (OMG) Standards, on page 112

Release 12 3GPP References

The P-GW currently supports the following Release 12 3GPP specifications. Most 3GPP specifications are also used for 3GPP2 support; any specifications that are unique to 3GPP2 are listed under 3GPP2 References.

- 3GPP TS 23.007: Restoration procedures
- 3GPP TS 23.401: General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access
- 3GPP TS 23.402: Architecture enhancements for non-3GPP accesses
- 3GPP TS 29.060: General Packet Radio Service (GPRS); GPRS Tunnelling Protocol (GTP) across the Gn and Gp interface
- 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C); Stage 3
- 3GPP TS 29.281: General Packet Radio System (GPRS) Tunnelling Protocol User Plane (GTPv1-U)

Release 11 3GPP References

The P-GW currently supports the following Release 11 3GPP specifications. Most 3GPP specifications are also used for 3GPP2 support; any specifications that are unique to 3GPP2 are listed under 3GPP2 References.

- 3GPP TS 23.007: Restoration procedures
- 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C)
- 3GPP TS 23.401: General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access
- 3GPP TS 23.402: Architecture enhancements for non-3GPP accesses
- 3GPP TS 29.060: General Packet Radio Service (GPRS); GPRS Tunnelling Protocol (GTP) across the Gn and Gp interface
- 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C); Stage 3
- 3GPP TS 29.281: General Packet Radio System (GPRS) Tunnelling Protocol User Plane (GTPv1-U)
Release 10 3GPP References

The P-GW currently supports the following Release 10 3GPP specifications. Most 3GPP specifications are also used for 3GPP2 support; any specifications that are unique to 3GPP2 are listed under 3GPP2 References.

- 3GPP TS 23.007: Restoration procedures
- 3GPP TS 23.203: Policy and charging control architecture; Stage 2
- 3GPP TS 23.401: General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access
- 3GPP TS 23.402: Architecture enhancements for non-3GPP accesses
- 3GPP TS 29.212: Policy and Charging Control over Gx reference point
- 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C)
- 3GPP TS 29.281: GPRS Tunnelling Protocol User Plane (GTPv1-U)

Release 9 3GPP References

The P-GW currently supports the following Release 9 3GPP specifications. Most 3GPP specifications are also used for 3GPP2 support; any specifications that are unique to 3GPP2 are listed under 3GPP2 References.

- 3GPP TR 21.905: Vocabulary for 3GPP Specifications
- 3GPP TS 22.115: Service aspects; Charging and billing
- 3GPP TS 23.003: Numbering, addressing and identification
- 3GPP TS 23.007: Restoration procedures
- 3GPP TS 23.060. General Packet Radio Service (GPRS); Service description; Stage 2
- 3GPP TS 23.203: Policy and charging control architecture
- 3GPP TS 23.207: End-to-end Quality of Service (QoS) concept and architecture
- 3GPP TS 23.216: Single Radio Voice Call Continuity (SRVCC); Stage 2
- 3GPP TS 23.228: IP Multimedia Subsystem (IMS); Stage 2
- 3GPP TS 23.401: General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access
- 3GPP TS 23.402: Architecture enhancements for non-3GPP accesses
- 3GPP TS 24.008: Mobile radio interface Layer 3 specification; Core network protocols
• 3GPP TS 29.060: General Packet Radio Service (GPRS); GPRS Tunnelling Protocol (GTP) across the Gn and Gp interface
• 3GPP TS 29.061: Interworking between the Public Land Mobile Network (PLMN) supporting packet based services and Packet Data Networks (PDN)
• 3GPP TS 29.212: Policy and Charging Control over Gx reference point
• 3GPP TS 29.214: Policy and Charging control over Rx reference point
• 3GPP TS 29.229: Cx and Dx interfaces based on Diameter protocol
• 3GPP TS 29.230: Diameter applications; 3GPP specific codes and identifiers
• 3GPP TS 29.272: Evolved Packet System (EPS); Mobility Management Entity (MME) and Serving GPRS Support Node (SGSN) related interfaces based on Diameter protocol
• 3GPP TS 29.273: 3GPP EPS AAA Interfaces
• 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C); Stage 3
• 3GPP TS 29.275: Proxy Mobile IPv6 (PMIPv6) based Mobility and Tunnelling protocols; Stage 3
• 3GPP TS 29.281: General Packet Radio System (GPRS) Tunnelling Protocol User Plane (GTPv1-U)
• 3GPP TS 29.282: Mobile IPv6 vendor specific option format and usage within 3GPP
• 3GPP TS 32.240: Telecommunication management; Charging management; Charging architecture and principles
• 3GPP TS 32.251: Telecommunication management; Charging management; Packet Switched (PS) domain charging
• 3GPP TS 32.298: Telecommunication management; Charging management; Charging Data Record (CDR) parameter description
• 3GPP TS 32.299: Telecommunication management; Charging management; Diameter charging application

Release 8 3GPP References

The P-GW currently supports the following Release 8 3GPP specifications. Most 3GPP specifications are also used for 3GPP2 support; any specifications that are unique to 3GPP2 are listed under 3GPP2 References.

• 3GPP TR 21.905: Vocabulary for 3GPP Specifications
• 3GPP TS 23.003: Numbering, addressing and identification
• 3GPP TS 23.007: Restoration procedures
• 3GPP TS 23.060. General Packet Radio Service (GPRS); Service description; Stage 2
• 3GPP TS 23.107: Quality of Service (QoS) concept and architecture
• 3GPP TS 23.203: Policy and charging control architecture
3GPP TS 23.401: General Packet Radio Service (GPRS) enhancements for Evolved Universal Terrestrial Radio Access Network (E-UTRAN) access

3GPP TS 23.402: Architecture enhancements for non-3GPP accesses

3GPP TS 23.869: Support for Internet Protocol (IP) based IP Multimedia Subsystem (IMS) Emergency calls over General Packet Radio Service (GPRS) and Evolved Packet Service (EPS)

3GPP TS 24.008: Mobile radio interface Layer 3 specification; Core network protocols

3GPP TS 24.229: IP Multimedia Call Control Protocol based on SIP and SDP; Stage 3

3GPP TS 27.060: Mobile Station (MS) supporting Packet Switched Services

3GPP TS 29.061: Interworking between the Public Land Mobile Network (PLMN) supporting packet based services and Packet Data Networks (PDN)

3GPP TS 29.210: Charging rule provisioning over Gx interface

3GPP TS 29.212: Policy and Charging Control over Gx reference point

3GPP TS 29.213: Policy and Charging Control signaling flows and QoS

3GPP TS 29.273: 3GPP EPS AAA Interfaces

CHAPTER 2

PDN Gateway Configuration

This chapter provides configuration information for the PDN Gateway (P-GW).

Important
Because each wireless network is unique, the system is designed with a variety of parameters allowing it to perform in various wireless network environments. In this chapter, only the minimum set of parameters are provided to make the system operational. Optional configuration commands specific to the P-GW product are located in the Command Line Interface Reference.

The following procedures are located in this chapter:
• Configuring the System as a Standalone eGTP P-GW, on page 113
• Configuring the System as a Standalone PMIP P-GW in an LTE-SAE Network, on page 141
• Configuring the System as a Standalone PMIP P-GW Supporting an eHRPD Network, on page 161
• Configuring Optional Features on the P-GW, on page 181

Configuring the System as a Standalone eGTP P-GW

This section provides a high-level series of steps and the associated configuration file examples for configuring the system to perform as an eGTP P-GW in a test environment. For a complete configuration file example, refer to the Sample Configuration Files appendix. Information provided in this section includes the following:
• Information Required, on page 113
• How This Configuration Works, on page 122
• eGTP P-GW Configuration, on page 124

Information Required

The following sections describe the minimum amount of information required to configure and make the P-GW operational on the network. To make the process more efficient, it is recommended that this information be available prior to configuring the system.

There are additional configuration parameters that are not described in this section. These parameters deal mostly with fine-tuning the operation of the P-GW in the network. Information on these parameters can be found in the appropriate sections of the Command Line Interface Reference.
Required Local Context Configuration Information

The following table lists the information that is required to configure the local context on an P-GW.

Table 13: Required Information for Local Context Configuration

<table>
<thead>
<tr>

<tbody>
<tr>
<td>IP address and subnet</td>
<td>IPv4 or IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

### GTP-U Service Configuration

<table>
<thead>
<tr>
<th>GTP-U service name</th>
<th>An identification string from 1 to 63 characters (alpha and/or numeric) by which the GTP-U service will be recognized by the system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address</td>
<td>S5/S8 interface IPv4 address.</td>
</tr>
</tbody>
</table>

### P-GW Service Configuration

<table>
<thead>
<tr>
<th>P-GW service name</th>
<th>An identification string from 1 to 63 characters (alpha and/or numeric) by which the P-GW service will be recognized by the system. Multiple names are needed if multiple P-GW services will be used.</th>
</tr>
</thead>
</table>
### Required Information

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
</table>
| PLMN ID              | MCC number: The mobile country code (MCC) portion of the PLMN's identifier (an integer value between 100 and 999).  
                     | MNC number: The mobile network code (MNC) portion of the PLMN's identifier (a 2 or 3 digit integer value between 00 and 999). |

### eGTP Service Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>eGTP Service Name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the eGTP service will be recognized by the system.</td>
</tr>
</tbody>
</table>

### Required PDN Context Configuration Information

The following table lists the information that is required to configure the PDN context on a P-GW.

**Table 15: Required Information for PDN Context Configuration**

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PDN context name</td>
<td>An identification string from 1 to 79 characters (alpha and/or numeric) by which the PDN context is recognized by the system.</td>
</tr>
</tbody>

</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>IP address and subnet</td>
<td>IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

### Required AAA Context Configuration Information

The following table lists the information that is required to configure the AAA context on a P-GW.

**Table 16: Required Information for AAA Context Configuration**

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Gx Interface Configuration (to PCRF)</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
</tbody>
</table>
### Required Information

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address and subnet</td>
<td>IPv4 or IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

### Gx Diameter Endpoint Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End point name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the Gx Diameter endpoint configuration is recognized by the system.</td>
</tr>
<tr>
<td>Origin realm name</td>
<td>An identification string between 1 through 127 characters. The realm is the Diameter identity. The originator's realm is present in all Diameter messages and is typically the company or service name.</td>
</tr>
<tr>
<td>Origin host name</td>
<td>An identification string from 1 to 255 characters (alpha and/or numeric) by which the Gx origin host is recognized by the system.</td>
</tr>
<tr>
<td>Origin host address</td>
<td>The IP address of the Gx interface.</td>
</tr>
<tr>
<td>Peer name</td>
<td>The Gx endpoint name described above.</td>
</tr>
<tr>
<td>Peer realm name</td>
<td>The Gx origin realm name described above.</td>
</tr>
<tr>
<td>Peer address and port number</td>
<td>The IP address and port number of the PCRF.</td>
</tr>
<tr>
<td>Route-entry peer</td>
<td>The Gx endpoint name described above.</td>
</tr>
</tbody>
</table>

### Gy Interface Configuration (to on-line charging server)

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
</tbody>
</table>
### Required Information

<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

### Gy Diameter Endpoint Configuration

<table>
<thead>
<tr>
<th>End point name</th>
<th>An identification string from 1 to 63 characters (alpha and/or numeric) by which the Gy Diameter endpoint configuration is recognized by the system.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin realm name</td>
<td>An identification string between 1 through 127 characters. The realm is the Diameter identity. The originator's realm is present in all Diameter messages and is typically the company or service name.</td>
</tr>
<tr>
<td>Origin host name</td>
<td>An identification string from 1 to 255 characters (alpha and/or numeric) by which the Gy origin host is recognized by the system.</td>
</tr>
<tr>
<td>Origin host address</td>
<td>The IP address of the Gy interface.</td>
</tr>
<tr>
<td>Peer name</td>
<td>The Gy endpoint name described above.</td>
</tr>
<tr>
<td>Peer realm name</td>
<td>The Gy origin realm name described above.</td>
</tr>
<tr>
<td>Peer address and port number</td>
<td>The IP address and port number of the OCS.</td>
</tr>
<tr>
<td>Route-entry peer</td>
<td>The Gy endpoint name described above.</td>
</tr>
</tbody>
</table>

### Gz Interface Configuration (to off-line charging server)

<p>| Interface name                              | An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured. |</p>
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address and subnet</td>
<td>IPv4 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

**Rf Interface Configuration (to off-line charging server)**

| Interface name | An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured. |
| IP address and subnet | IPv4 or IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured. |
| Physical port number | The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces. |
| Gateway IP address | Used when configuring static IP routes from the interface(s) to a specific network. |

**Rf Diameter Endpoint Configuration**

<p>| End point name | An identification string from 1 to 63 characters (alpha and/or numeric) by which the Rf Diameter endpoint configuration is recognized by the system. |
| Origin realm name | An identification string between 1 through 127 characters. The realm is the Diameter identity. The originator's realm is present in all Diameter messages and is typically the company or service name. |</p>
<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Origin host name</td>
<td>An identification string from 1 to 255 characters (alpha and/or numeric) by which the Rf origin host is recognized by the system.</td>
</tr>
<tr>
<td>Origin host address</td>
<td>The IP address of the Rf interface.</td>
</tr>
<tr>
<td>Peer name</td>
<td>The Rf endpoint name described above.</td>
</tr>
<tr>
<td>Peer realm name</td>
<td>The Rf origin realm name described above.</td>
</tr>
<tr>
<td>Peer address and port number</td>
<td>The IP address and port number of the OFCS.</td>
</tr>
<tr>
<td>Route-entry peer</td>
<td>The Rf endpoint name described above.</td>
</tr>
</tbody>
</table>

**How This Configuration Works**

The following figure and supporting text describe how this configuration with a single source and destination context is used by the system to process a subscriber call originating from the GTP LTE network.
1. The S-GW establishes the S5/S8 connection by sending a Create Session Request message to the P-GW including an Access Point name (APN).

2. The P-GW service determines which context to use to provide AAA functionality for the session. This process is described in the *How the System Selects Contexts* section located in the *Understanding the System Operation and Configuration* chapter of the *System Administration Guide*.

3. The P-GW uses the configured Gx Diameter endpoint to establish the IP-CAN session.

4. The P-GW sends a CC-Request (CCR) message to the PCRF to indicate the establishment of the IP-CAN session and the PCRF acknowledges with a CC-Answer (CCA).

5. The P-GW uses the APN configuration to select the PDN context. IP addresses are assigned from the IP pool configured in the selected PDN context.

6. The P-GW responds to the S-GW with a Create Session Response message including the assigned address and additional information.

7. The S5/S8 data plane tunnel is established and the P-GW can forward and receive packets to/from the PDN.
eGTP P-GW Configuration

To configure the system to perform as a standalone eGTP P-GW:

*Figure 8: eGTP P-GW Configurables*

**Step 1**
Set system configuration parameters such as activating PSCs by applying the example configurations found in the *System Administration Guide*.

**Step 2**
Set initial configuration parameters such as creating contexts and services by applying the example configurations found in the *Initial Configuration*, on page 125.

**Step 3**
Configure the system to perform as an eGTP P-GW and set basic P-GW parameters such as eGTP interfaces and IP routes by applying the example configurations presented in the *P-GW Service Configuration*, on page 129.

**Step 4**
Configure the PDN context by applying the example configuration in the *P-GW PDN Context Configuration*, on page 129.

**Step 5**
Enable and configure the active charging service for Gx interface support by applying the example configuration in the *Active Charging Service Configuration*, on page 130.

**Step 6**
Create a AAA context and configure parameters for policy by applying the example configuration in the *Policy Configuration*, on page 132.

**Step 7**
Verify and save the configuration by following the steps found in *Verifying and Saving the Configuration*, on page 134.
Initial Configuration

**Step 1**  Set local system management parameters by applying the example configuration in Modifying the Local Context, on page 125.

**Step 2**  Create the context where the eGTP service will reside by applying the example configuration in Creating and Configuring an eGTP P-GW Context, on page 125.

**Step 3**  Create and configure APNs in the P-GW context by applying the example configuration in Creating and Configuring APNs in the P-GW Context, on page 126.

**Step 4**  Create and configure AAA server groups in the P-GW context by applying the example configuration in Creating and Configuring AAA Groups in the P-GW Context, on page 127.

**Step 5**  Create an eGTP service within the newly created context by applying the example configuration in Creating and Configuring an eGTP Service, on page 128.

**Step 6**  Create and configure a GTP-U service within the P-GW context by applying the example configuration in Creating and Configuring a GTP-U Service, on page 128.

**Step 7**  Create a context through which the interface to the PDN will reside by applying the example configuration in Creating a P-GW PDN Context, on page 128.

Modifying the Local Context

Use the following example to set the default subscriber and configure remote access capability in the local context:

```plaintext
configure
  context local
    interface <lcl_cntxt_intrfc_name>
      ip address <ip_address> <ip_mask>
      exit
    server ftpd
      exit
    server telnetd
      exit
    subscriber default
      exit
    administrator <name> encrypted password <password> ftp
    ip route <ip_addr/ip_mask> <next_hop_addr> <lcl_cntxt_intrfc_name>
      exit
    port ethernet <slot#/port#>
      no shutdown
    bind interface <lcl_cntxt_intrfc_name> local
  end
```

Creating and Configuring an eGTP P-GW Context

Use the following example to create a P-GW context, create an S5/S8 IPv4 interface (for data traffic to/from the S-GW), and bind the S5/S8 interface to a configured Ethernet port:

```plaintext
configure
  gtpp single-source
  context <pgw_context_name> -noconfirm
```
Creating and Configuring APNs in the P-GW Context

Use the following configuration to create an APN:

```
configure
context <pgw_context_name> -noconfirm
apn <name>
  accounting-mode radius-diameter
  associate accounting-policy <rf_policy_name>
  ims-auth-service <gx_ims_service_name>
  aaa group <rf-radius_group_name>
  dns primary <ipv4_address>
```

Notes:

- **gtpp single-source** is enabled to allow the system to generate requests to the accounting server using a single UDP port (by way of a AAA proxy function) rather than each AAA manager generating requests on unique UDP ports.

- The S5/S8 (P-GW to S-GW) interface IP address can also be specified as an IPv6 address using the `ipv6 address` command.

- Set the accounting policy for the Rf (off-line charging) interface. The accounting level types are: flow, PDN, PDN-QCI, QCI, and subscriber. Refer to the Accounting Profile Configuration Mode Commands chapter in the Command Line Interface Reference for more information on this command.

- Set the GTPP group setting for Gz accounting.

---

**interface** `<s5s8_interface_name>`

- `ip address` `<ipv4_address>`
- `exit`

**gtpp group default**

- `gtpp charging-agent address` `<gz_ipv4_address>`
- `gtpp echo-interval` `<seconds>`
- `gtpp attribute diagnostics`
- `gtpp attribute local-record-sequence-number`
- `gtpp attribute node-id-suffix` `<string>`
- `gtpp dictionary` `<name>`
- `gtpp server` `<ipv4_address>` `priority` `<num>`
- `gtpp server` `<ipv4_address>` `priority` `<num>` `node-alive enable`
- `exit`

**policy accounting** `<rf_policy_name>` `-noconfirm`

- `accounting-level` `<level_type>`
- `accounting-event-trigger interim-timeout action stop-start`
- `operator-string` `<string>`
- `cc profile` `<index>` `interval` `<seconds>`
- `exit`

**subscriber default**

- `exit`

**port ethernet** `<slot_number/port_number>`

- `no shutdown`
- `bind interface` `<s5s8_interface_name>` `<pgw_context_name>`
- `end`
dns secondary <ipv4_address>
ip access-group <name> in
ip access-group <name> out
mediation-device context-name <pgw_context_name>
ip context-name <pdn_context_name>
ipv6 access-group <name> in
ipv6 access-group <name> out
active-charging rulebase <name>
end

Notes:

• The IMS Authorization Service is created and configured in the AAA context.

• Multiple APNs can be configured to support different domain names.

• The associate accounting-policy command is used to associate a pre-configured accounting policy with this APN. Accounting policies are configured in the P-GW context. An example is located in the Creating and Configuring an eGTP P-GW Context, on page 125.

Use the following configuration to create an APN that includes Gz interface parameters:

configure
countext <pgw_context_name> -noconfirm
  apn <name>
    bearer-control-mode mixed
    selection-mode sent-by-ms
    accounting-mode gtppp
    gtppp group default accounting-context <aaa_context_name>
    ims-auth-service <gx_ims_service_name>
    ip access-group <name> in
    ip access-group <name> out
    ip context-name <pdn_context_name>
    active-charging rulebase <gz_rulebase_name>
end

Notes:

• The IMS Authorization Service is created and configured in the AAA context.

• Multiple APNs can be configured to support different domain names.

• The accounting-mode GTPP and GTPPP group commands configure this APN for Gz accounting.

Creating and Configuring AAA Groups in the P-GW Context

Use the following example to create and configure AAA groups supporting RADIUS and Rf accounting:

configure
countext <pgw_context_name> -noconfirm
  aaa group <rf-radius_group_name>
    radius attribute nas-identifier <id>
    radius accounting interim interval <seconds>
    radius dictionary <name>
    radius mediation-device accounting server <address> key <key>
    diameter authentication dictionary <name>
Creating and Configuring an eGTP Service

Use the following configuration example to create the eGTP service:

```plaintext
configure
  context <pgw_context_name>
    egtp-service <egtp_service_name> -noconfirm
      interface-type interface-pgw-ingress
      validation mode default
      associate gtpu-service <gtpu_service_name>
      gtpc bind address <s5s8_interface_address>
  end
```

Notes:

- Co-locating a P-GW service on the same ASR 5500 requires that the `gtpc bind address` command uses the same IP address the P-GW service is bound to.

Creating and Configuring a GTP-U Service

Use the following configuration example to create the GTP-U service:

```plaintext
configure
  context <pgw_context_name>
    gtpu-service <gtpu_service_name> -noconfirm
      bind ipv4-address <s5s8_interface_address>
    end
```

Notes:

- The `bind` command can also be specified as an IPv6 address using the `ipv6-address` command.

Creating a P-GW PDN Context

Use the following example to create a P-GW PDN context and Ethernet interface, and bind the interface to a configured Ethernet port.

```plaintext
configure
  context <pdn_context_name> -noconfirm
    interface <sgi_ipv4_interface_name>
      ip address <ipv4_address>
    interface <sgi_ipv6_interface_name>
```
ipv6 address <address>
end

P-GW Service Configuration

Step 1  Configure the P-GW service by applying the example configuration in the Configuring the P-GW Service, on page 129.
Step 2  Specify an IP route to the eGTP Serving Gateway by applying the example configuration in the Configuring a Static IP Route, on page 129.

Configuring the P-GW Service

Use the following example to configure the P-GW service:

```
configure
ccontext <pgw_context_name>
pgw-service <pgw_service_name> -noconfirm
plmn_id mcc <id> mnc <id>
associate egtp-service <egtp_service_name>
associate qci-qos-mapping <name>
end
```

Notes:

• QCI-QoS mapping configurations are created in the AAA context. Refer to the Configuring QCI-QoS Mapping, on page 134 for more information.

• Co-locating a P-GW service on the same ASR 5500 requires the configuration of the associate pgw-service name command within the P-GW service.

Configuring a Static IP Route

Use the following example to configure an IP Route for control and user plane data communication with an eGTP Serving Gateway:

```
configure
ccontext <pgw_context_name>
ip route <sgw_ip_addr/mask> <sgw_next_hop_addr> <pgw_intrfc_name>
end
```

P-GW PDN Context Configuration

Use the following example to configure an IP Pool and APN, and bind a port to the interface in the PDN context:

```
ccontext <pdn_context_name> -noconfirm
interface <sgi_ipv4_interface_name>
ip address <ipv4_address>
exit
interface <sgi_ipv6_interface_name>
ip address <ipv6_address>
exit
```
ip pool <name> range <start_address end_address> public <priority>
ipv6 pool <name> range <start_address end_address> public <priority>
subscriber default
exit
ip access-list <name>
redirect css service <name> any
permit any
exit
ipv6 access-list <name>
redirect css service <name> any
permit any
exit
aaa group default
exit
exit
port ethernet <slot_number/port_number>
no shutdown
bind interface <sgi_ipv4_interface_name> <pdn_context_name>
exit
port ethernet <slot_number/port_number>
no shutdown
bind interface <sgi_ipv6_interface_name> <pdn_context_name>
end

Active Charging Service Configuration

Use the following example to enable and configure active charging:

configure
  require active-charging optimized-mode
active-charging service <name>
ruledef <name>
  <rule>
    .
    .
  <rule>
exit
ruledef default
  ip any-match = TRUE
exit
ruledef icmp-pkts
  icmp any-match = TRUE
exit
ruledef qci3
  icmp any-match = TRUE
exit
ruledef static
  icmp any-match = TRUE
exit
charging-action <name>
  <action>
    .
<action>
exit
charging-action icmp
billing-action egcdr
exit
charging-action qci3
content-id <id>
billing-action rf
qos-class-identifier <id>
allocation-retention-priority <priority>
tft packet-filter qci3
exit
charging-action static
service-identifier <id>
billing-action rf
qos-class-identifier <id>
allocation-retention-priority <priority>
tft packet-filter qci3
exit
packet-filter <packet_filter_name>
ip remote-address = { <ipv4/ipv6_address> | <ipv4/ipv6_address/mask> } 
ip remote-port { = <port_number> | range <start_port_number> to <end_port_number> }
<end_port_number> }
exit
rulebase default
exit
rulebase <name>
<rule_base>
.
.
<rule_base>
exit
rulebase <gx_rulebase_name>
dynamic-rule order first-if-tied
egcdr tariff minute <minute> hour <hour> (optional)
billing-records egcdr
action priority 5 dynamic-only ruledef qci3 charging-action qci3
action priority 100 ruledef static charging-action static
action priority 500 ruledef default charging-action icmp
action priority 570 ruledef icmp-pkts charging-action icmp
egcdr threshold interval <interval>
egcdr threshold volume total <bytes>
end

Notes:

• A rulebase is a collection of rule definitions and associated charging actions.

• As depicted above, multiple rule definitions, charging actions, and rule bases can be configured to support a variety of charging scenarios.

• Charging actions define the action to take when a rule definition is matched.
• Routing and/or charging rule definitions can be created/configured. The maximum number of routing rule definitions that can be created is 256. The maximum number of charging rule definitions is 2048.

• The billing-action egcdr command in the charging-action qc13, icmp, and static examples is required for Gz accounting.

• The Gz rulebase example supports the Gz interface for offline charging. The billing-records egcdr command is required for Gz accounting. All other commands are optional.

---

Important: If uplink packet is coming on the dedicated bearer, only rules installed on the dedicated bearer are matched. Static rules are not matched and packets failing to match the same will be dropped.

---

Policy Configuration

Step 1 Configure the policy and accounting interfaces by applying the example configuration in the Creating and Configuring the AAA Context, on page 132.

Step 2 Create and configure QCI to QoS mapping by applying the example configuration in the Configuring QCI-QoS Mapping, on page 134.

Creating and Configuring the AAA Context

Use the following example to create and configure a AAA context including diameter support and policy control, and bind Ethernet ports to interfaces supporting traffic between this context and a PCRF, an OCS, and an OFCS:

```plaintext
configure
context <aaa_context_name> -noconfirm
  interface <gx_interface_name>
    ipv6 address <address>
  exit
  interface <gy_interface_name>
    ipv6 address <address>
  exit
  interface <gz_interface_name>
    ip address <ipv4_address>
  exit
  interface <rf_interface_name>
    ip address <ipv4_address>
  exit
subscriber default
exit

ims-auth-service <gx_ims_service_name>
  p-cscf discovery table # algorithm round-robin
  p-cscf table # row-precedence # ipv6-address <pcrf_ipv6_adr>
  policy-control
diameter origin endpoint <gx_cfg_name>
diameter dictionary <name>
```
diameter host-select table <#> algorithm round-robin
diameter host-select row-precedence <#> table <#> host <gx_cfg_name>

exit
exit
diameter endpoint <gx_cfg_name>
origin realm <realm_name>
origin host <name> address <aaa_ctx_ipv6_address>
peer <gx_cfg_name> realm <name> address <pcrf_ipv4_or_ipv6_addr>
route-entry peer <gx_cfg_name>
exit

exit
diameter endpoint <gy_cfg_name>
origin realm <realm_name>
origin host <name> address <gy_ipv6_address>
connection retry-timeout <seconds>
peer <gy_cfg_name> realm <name> address <ocs_ipv4_or_ipv6_addr>
route-entry peer <gy_cfg_name>
exit

exit

diameter endpoint <rf_cfg_name>
use-proxy
origin realm <realm_name>
origin host <name> address <rf_ipv4_address>
peer <rf_cfg_name> realm <name> address <ofcs_ipv4_or_ipv6_addr>
route-entry peer <rf_cfg_name>
exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <gx_interface_name> <aaa_context_name>
exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <gy_interface_name> <aaa_context_name>
exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <gs_interface_name> <aaa_context_name>
exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <rf_interface_name> <aaa_context_name>
end

Notes:

- The p-cscf table command under ims-auth-service can also specify an IPv4 address to the PCRF.
- The Gx interface IP address can also be specified as an IPv4 address using the ip address command.
- The Gy interface IP address can also be specified as an IPv4 address using the ip address command.
- The Rf interface IP address can also be specified as an IPv6 address using the ipv6 address command.
Configuring QCI-QoS Mapping

Use the following example to create and map QCI values to enforceable QoS parameters:

```
configure
  qci-qos-mapping <name>
    qci 1 user-datagram dscp-marking <hex>
    qci 3 user-datagram dscp-marking <hex>
    qci 9 user-datagram dscp-marking <hex>
  end
```

Notes:
- The P-GW does not support non-standard QCI values unless a valid license key is installed.
  QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.
  From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128- 254.
- The above configuration only shows one keyword example. Refer to the QCI - QOS Mapping Configuration Mode Commands chapter in the Command Line Interface Reference for more information on the qci command and other supported keywords.

Verifying and Saving the Configuration

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

DHCP Service Configuration

The system can be configured to use the Dynamic Host Control Protocol (DHCP) to assign IP addresses for PDP contexts. IP address assignment using DHCP is done using the following method, as configured within an APN:

**DHCP-proxy**: The system acts as a proxy for client (MS) and initiates the DHCP Discovery Request on behalf of client (MS). Once it receives an allocated IP address from DHCP server in response to DHCP Discovery Request, it assigns the received IP address to the MS. This allocated address must be matched with the an address configured in an IP address pool on the system. This complete procedure is not visible to MS.

As the number of addresses in memory decreases, the system solicits additional addresses from the DHCP server. If the number of addresses stored in memory rises above the configured limit, they are released back to the DHCP server.

There are parameters that must first be configured that specify the DHCP servers to communicate with and how the IP address are handled. These parameters are configured as part of a DHCP service.

---

**Important**

This section provides the minimum instruction set for configuring a DHCP service on system for DHCP-based IP allocation. For more information on commands that configure additional DHCP server parameters and working of these commands, refer to the DHCP Service Configuration Mode Commands chapter of Command Line Interface Reference.
These instructions assume that you have already configured the system level configuration as described in System Administration Guide and P-GW service as described in eGTP P-GW Configuration section of this chapter.

To configure the DHCP service:

**Step 1** Create the DHCP service in system context and bind it by applying the example configuration in the DHCP Service Creation, on page 135.

**Step 2** Configure the DHCP servers and minimum and maximum allowable lease times that are accepted in responses from DHCP servers by applying the example configuration in the DHCP Server Parameter Configuration, on page 135.

**Step 3** Verify your DHCP Service configuration by following the steps in the DHCPv6 Service Configuration Verification, on page 140.

**Step 4** Save your configuration as described in the Verifying and Saving Your Configuration section.

### DHCP Service Creation

Use the following example to create the DHCP service to support DHCP-based address assignment:

```plaintext
configure context <dest_ctxt_name>
    dhcp-service <dhcp_svc_name>
        bind address <ip_address> [nexthop-forwarding-address <nexthop_ip_address>
        [mpls-label input <in_mpls_label_value> output <out_mpls_label_value1>
        [out_mpls_label_value2]]]
    end
```

**Notes:**

- To ensure proper operation, DHCP functionality should be configured within a destination context.

- Optional keyword `nexthop-forwarding-address <nexthop_ip_address> [mpls-label input <in_mpls_label_value> output <out_mpls_label_value1> [out_mpls_label_value2]]` applies DHCP over MPLS traffic.

### DHCP Server Parameter Configuration

Use the following example to configure the DHCP server parameters to support DHCP-based address assignment:

```plaintext
configure context <dest_ctxt_name>
    dhcp-service <dhcp_svc_name>
        dhcp server <ip_address> [priority <priority>
        dhcp server selection-algorithm {first-server|round-robin}
        lease-duration min <minimum_dur> max <max_dur>
        dhcp deadtime <max_time>
        dhcp detect-dead-server consecutive-failures <max_number>
        max-retransmissions <max_number>
        retransmission-timeout <dur_sec>
    end
```
Notes:

- Multiple DHCP services can be configured. Each service can have multiple DHCP servers configured by entering `dhcp server` command multiple times. A maximum of 225 DHCP services can be configured with maximum of 8 DHCP servers configurations per DHCP service.

- The `dhcp detect-dead-server` command and `max-retransmissions` command work in conjunction with each other.

- The retransmission-timeout command works in conjunction with `max-retransmissions` command.

### DHCP Service Configuration Verification

#### Step 1
Verify that your DHCP servers configured properly by entering the following command in Exec Mode:

```sh
display dhcp service all
```

This command produces an output similar to that displayed below where DHCP name is `dhcp1`:

```
Service name: dhcp1
Context: isp
Bind: Done
Local IP Address: 150.150.150.150
Next Hop Address: 192.179.91.3
  MPLS-label:
    Input: 5000
    Output: 1566 1899
Service Status: Started
Retransmission Timeout: 3000 (milli-secs)
Max Retransmissions: 2
Lease Time: 600 (secs)
Minimum Lease Duration: 600 (secs)
Maximum Lease Duration: 86400 (secs)
DHCP Dead Time: 120 (secs)
DHCP Dead consecutive Failure: 5
DHCP T1 Threshold Timer: 50
DHCP T2 Threshold Timer: 88
DHCP Client Identifier: Not Used
DHCP Algorithm: Round Robin
DHCP Servers configured:
  Address: 150.150.150.150
  Priority: 1
DHCP server rapid-commit: disabled
DHCP client rapid-commit: disabled
DHCP chaddr validation: enabled
```

#### Step 2
Verify the DHCP service status by entering the following command in Exec Mode:

```sh
display dhcp service status
```

### DHCPv6 Service Configuration

The system can be configured to use the Dynamic Host Control Protocol (DHCP) for IPv6 to enable the DHCP servers to pass the configuration parameters such as IPv6 network addresses to IPv6 nodes. DHCPv6 configuration is done within an APN.
These instructions assume that you have already configured the system level configuration as described in System Administration Guide and APN as described in P-GW PDN Context Configuration, on page 157.

To configure the DHCPv6 service:

**Step 1** Create the DHCPv6 service in system context and bind it by applying the example configuration in the DHCPv6 Service Creation, on page 137.

**Step 2** Configure the DHCPv6 server and other configurable values for Renew Time, Rebind Time, Preferred Lifetime, and Valid Lifetime by applying the example configuration in the DHCPv6 Server Parameter Configuration, on page 137.

**Step 3** Configure the DHCPv6 client and other configurable values for Maximum Retransmissions, Server Dead Tries, and Server Resurrect Time by applying the example configuration in the DHCPv6 Client Parameter Configuration, on page 138.

**Step 4** Configure the DHCPv6 profile by applying the example configuration in the DHCPv6 Profile Configuration, on page 138.

**Step 5** Associate the DHCPv6 profile configuration with the APN by applying the example configuration in the Associate DHCPv6 Configuration, on page 140.

**Step 6** Verify your DHCPv6 Service configuration by following the steps in the DHCPv6 Service Configuration Verification, on page 140.

**Step 7** Save your configuration as described in the Verifying and Saving Your Configuration chapter.

**DHCPv6 Service Creation**

Use the following example to create the DHCPv6 service to support DHCP-based address assignment:

```
configure
case <dest_ctxt_name>
  dhcpv6-service <dhcpv6_svc_name>
  bind address <ipv6_address> port <port>
end
```

Notes:

- To ensure proper operation, DHCPv6 functionality should be configured within a destination context.
- The Port specifies the listen port and is used to start the DHCPv6 server bound to it. It is optional and if unspecified, the default port is 547.

**DHCPv6 Server Parameter Configuration**

Use the following example to configure the DHCPv6 server parameters to support DHCPv6-based address assignment:

```
configure
case <dest_ctxt_name>
  dhcpv6-service <dhcpv6_svc_name>
  dhcpv6-server
  renew-time <renewal_time>
  rebind-time <rebind_time>
  preferred-lifetime <pref_lifetime>
```

DHCPv6 Service Creation
DHCPv6 Client Parameter Configuration

Use the following example to configure the DHCPv6 client parameters to support DHCPv6-based address assignment:

```plaintext
configure
c  ontex t <dest_ctxt_name>
dhcpv6-service <dhcpv6_svc_name>
dhcpv6-client
    server-ipv6-address <ipv6_addr> port <port> priority <priority>
    max-retransmissions <max_number>
    server-dead-time <dead_time>
    server-resurrect-time <revive_time>
end
```

Notes:

- Multiple DHCP can be configured by entering `dhcp server` command multiple times. A maximum of 256 services (regardless of type) can be configured per system.

- `renew-time` configures the renewal time for prefixes assigned by dhcp-service. Default is 900 seconds.

- `rebind-time` configures the rebind time for prefixes assigned by dhcp-service. Default is 900 seconds.

- `preferred-lifetime` configures the preferred lifetime for prefixes assigned by dhcp-service. Default is 900 seconds.

- `valid-lifetime` configures the valid lifetime for prefixes assigned by dhcp-service. Default is 900 seconds.

DHCPv6 Profile Configuration

Use the following example to configure the DHCPv6 profile:

```plaintext
configure
c  ontex t <dest_ctxt_name>
dhcp-server-profile <server_profile>
    enable rapid-commit-dhcpv6
    process dhcp-option-from { AAA | LOCAL | PDN-DHCP } priority <priority>
```

Notes:

- DHCPv6 client configuration requires an IPv6 address, port, and priority. The port is used for communicating with the DHCPv6 server. If not specified, default port 547 is used. The Priority parameter defines the priority in which servers should be tried out.

- `max-retransmissions` configures the max retransmission that DHCPV6-CLIENT will make towards DHCPV6-SERVER. Default is 20.

- `server-dead-time`: PDN DHCPV6-SERVER is considered to be dead if it does not respond after given tries from client. Default is 5.

- `server-resurrect-time`: PDN DHCPV6-SERVER is considered alive after it has been dead for given seconds. Default is 20.
dhcppv6-server-preference <pref_value>

enable dhcppv6-server-unicast
enable dhcppv6-server-reconf
exit

dhcp-client-profile <client_profile>

    dhcppv6-client-unicast
    client-identifier { IMSI | MSISDN }
    enable rapid-commit-dhcppv6
    enable dhcp-message-spray
    request dhcp-option dns-address
    request dhcp-option netbios-server-address
    request dhcp-option sip-server-address
end

Notes:

- **dhcp-server-profile** command creates a server profile and then enters the DHCP Server Profile configuration mode.

- **enable rapid-commit-dhcppv6** command enables rapid commit on the DHCPPv6 server. By default it is disabled. This is done to ensure that if there are multiple DHCPPv6 servers in a network, with rapid-commit-option, they would all end up reserving resources for the UE.

- **process dhcp-option-from** command configures in what order the configuration options should be processed for a given client request. For a given client configuration, values can be obtained from either AAA, PDN-DHCPP-SERVER, or LOCAL. By default, AAA is preferred over PDN-DHCPP, which is preferred over LOCAL configuration.

- **dhcppv6-server-preference**: According to RFC-3315, DHCPPv6-CLIENT should wait for a specified amount of time before considering responses to its queries from DHCPPv6-SERVERS. If a server responds with a preference value of 255, DHCPPv6-CLIENT need not wait any longer. Default value is 0 and it may have any configured integer between 1 and 255.

- **enable dhcppv6-server-unicast** command enables server-unicast option for DHCPPv6. By default, it is disabled.

- **enable dhcppv6-server-reconf** command configures support for reconfiguration messages from the server. By default, it is disabled.

- **dhcppv6-client-unicast** command Enables client to send messages on unicast address towards the server.

- **dhcp-client-profile** command creates a client profile and then enters the DHCP Client Profile configuration mode.

- **client-identifier** command configures the client-identifier, which is sent to the external DHCP server. By default, IMSI is sent. Another available option is MSISDN.

- **enable rapid-commit-dhcppv6** command configures the rapid commit for the client. By default, rapid-commit option is enabled for both DHCPPv4 & DHCPPv6.

- **enable dhcp-message-spray** command enables dhcp-client to spray a DHCP message to all configured DHCP servers in the PDN. By default this is disabled. With Rapid-Commit, there can only be one server to which this can be sent.

- **request dhcp-option** command configures DHCP options which can be requested by the dhcp-client. It supports the following options:
Associate DHCPv6 Configuration

Use the example to associate the DHCPv6 profile with an APN:

```
configure
c   context <dest_ctxt_name>
c     apn <apn_name>
     dhcpv6 service-name <dhcpv6_svc_name> server-profile <server_profile>
client-profile <client_profile>
     dhcpv6 ip-address-pool-name <dhcpv6_ip_pool>
     dhcpv6 context-name <dest_ctxt>
end
```

DHCPv6 Service Configuration Verification

Step 1 Verify that your DHCPv6 servers configured properly by entering the following command in Exec Mode:
```
show dhcpv6-service all
```
This command produces an output similar to that displayed below where DHCPv6 service name is `dhcp6-service`:

```
Service name: dhcp6-service
Context: A
Bind Address: 2092::192:90:92:40
Bind: Done
Service Status: Started
Server Dead Time: 120 (secs)
Server Dead consecutive Failure: 5
Server Select Algorithm: First Server
Server Renew Time: 400 (secs)
Server Rebind Time: 500 (secs)
Server Preferred Life Time: 600 (secs)
Server Valid Life Time: 700 (secs)
Max Retransmissions: 3 (secs)
Server Dead Tries: 4 (secs)
Server Resurrect Time: 10 (secs)
ipv6 Nd flag: 0_FLAG
DHCPv6 Servers configured:
   Address: 2092::192:90:92:40 Priority: 1 enabled
```

Step 2 Verify the DHCPv6 service status by entering the following command in Exec Mode:
```
show dhcpv6 status service dhcp6-service_name
```
Configuring the System as a Standalone PMIP P-GW in an LTE-SAE Network

This section provides a high-level series of steps and the associated configuration file examples for configuring the system to perform as a P-MIP P-GW in an LTE-SAE test environment. For a complete configuration file example, refer to the Sample Configuration Files appendix. Information provided in this section includes the following:

- Information Required, on page 141
- How This Configuration Works, on page 150
- P-MIP P-GW (LTE) Configuration, on page 152

Information Required

The following sections describe the minimum amount of information required to configure and make the P-GW operational on the network. To make the process more efficient, it is recommended that this information be available prior to configuring the system.

There are additional configuration parameters that are not described in this section. These parameters deal mostly with fine-tuning the operation of the P-GW in the network. Information on these parameters can be found in the appropriate sections of the Command Line Interface Reference.

Required Local Context Configuration Information

The following table lists the information that is required to configure the local context on an P-GW.

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management Interface Configuration</td>
<td></td>
</tr>
<tr>
<td>Interface name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface will be recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>IP address and subnet</td>
<td>IPv4 addresses assigned to the interface.</td>
</tr>
<tr>
<td></td>
<td>Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
</tbody>
</table>
### Required Information

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the management interface(s) to a specific network.</td>
</tr>
<tr>
<td>Security administrator name</td>
<td>The name or names of the security administrator with full rights to the system.</td>
</tr>
<tr>
<td>Security administrator password</td>
<td>Open or encrypted passwords can be used.</td>
</tr>
<tr>
<td>Remote access type(s)</td>
<td>The type of remote access protocol that will be used to access the system, such as telnet, SSH, and/or FTP.  <strong>Important</strong> In release 20.0 and higher Trusted StarOS builds, the telnet and FTP options are no longer available.</td>
</tr>
</tbody>
</table>

**Required P-GW Context Configuration Information**

The following table lists the information that is required to configure the P-GW context on a P-GW.

### Table 18: Required Information for P-GW Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-GW context name</td>
<td>An identification string from 1 to 79 characters (alpha and/or numeric) by which the P-GW context will be recognized by the system.</td>
</tr>
<tr>
<td>Accounting policy name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the accounting policy will be recognized by the system. The accounting policy is used to set parameters for the Rf (off-line charging) interface.</td>
</tr>
<tr>
<td>S5/S8 Interface Configuration (To/from S-GW)</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface will be recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
</tbody>
</table>
### Required Information for PDN Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address and subnet</td>
<td>IPv4 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

### P-GW Service Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-GW service name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the P-GW service will be recognized by the system. Multiple names are needed if multiple P-GW services will be used.</td>
</tr>
</tbody>
</table>

### LMA Service Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LMA Service Name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the LMA service will be recognized by the system.</td>
</tr>
</tbody>
</table>

### Required PDN Context Configuration Information

The following table lists the information that is required to configure the PDN context on a P-GW.

#### Table 19: Required Information for PDN Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>P-GW context name</td>
<td>An identification string from 1 to 79 characters (alpha and/or numeric) by which the P-GW context is recognized by the system.</td>
</tr>
</tbody>
</table>

### IP Address Pool Configuration
### Required Information

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 address pool name and range</td>
<td>An identification string between 1 and 31 characters (alpha and/or numeric) by which the IPv4 pool is recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple pools will be configured.</td>
</tr>
<tr>
<td></td>
<td>A range of IPv4 addresses defined by a starting address and an ending address.</td>
</tr>
<tr>
<td>IPv6 address pool name and range</td>
<td>An identification string between 1 and 31 characters (alpha and/or numeric) by which the IPv6 pool is recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple pools will be configured.</td>
</tr>
<tr>
<td></td>
<td>A range of IPv6 addresses defined by a starting address and an ending address.</td>
</tr>
</tbody>
</table>

### Access Control List Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv4 access list name</td>
<td>An identification string between 1 and 47 characters (alpha and/or numeric) by which the IPv4 access list is recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple lists will be configured.</td>
</tr>
<tr>
<td>IPv6 access list name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the IPv6 access list is recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple lists will be configured.</td>
</tr>
<tr>
<td>Deny/permit type</td>
<td>The types are:</td>
</tr>
<tr>
<td></td>
<td>• any</td>
</tr>
<tr>
<td></td>
<td>• by host IP address</td>
</tr>
<tr>
<td></td>
<td>• by IP packets</td>
</tr>
<tr>
<td></td>
<td>• by source ICMP packets</td>
</tr>
<tr>
<td></td>
<td>• by source IP address masking</td>
</tr>
<tr>
<td></td>
<td>• by TCP/UDP packets</td>
</tr>
</tbody>
</table>
### Required PDN Context Configuration Information

<table>
<thead>
<tr>
<th><strong>Required Information</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Readdress or redirect type</td>
<td>The types are</td>

<td>• redirect css delivery-sequence</td>
</tr>
<tr>
<td></td>
<td>• redirect css service</td>
</tr>
<tr>
<td></td>
<td>• redirect nexthop</td>
</tr>
</tbody>
</table>

#### SGi Interface Configuration (To/from IPv4 PDN)

| **Interface name**                       | An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system.  
|                                          | Multiple names are needed if multiple interfaces will be configured.                                                                                                                                     |
| **IP address and subnet**                | IPv4 addresses assigned to the interface.                                                                                                                                                                |
|                                          | Multiple addresses and subnets are needed if multiple interfaces will be configured.                                                                                                                     |
| **Physical port number**                | The physical port to which the interface will be bound.  
|                                          | Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17.  
|                                          | A single physical port can facilitate multiple interfaces.                                                                                                                                               |
| **Gateway IP address**                  | Used when configuring static IP routes from the interface(s) to a specific network.                                                                                                                     |

#### SGi Interface Configuration (To/from IPv6 PDN)

| **Interface name**                       | An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system.  
|                                          | Multiple names are needed if multiple interfaces will be configured.                                                                                                                                     |
| **IP address and subnet**                | IPv6 addresses assigned to the interface.                                                                                                                                                                |
|                                          | Multiple addresses and subnets are needed if multiple interfaces will be configured.                                                                                                                     |
### Required AAA Context Configuration Information

The following table lists the information that is required to configure the AAA context on a P-GW.

#### Table 20: Required Information for AAA Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Gx Interface Configuration (to PCRF)</strong></td>
<td></td>
</tr>
<tr>
<td>Interface name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface is recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>IP address and subnet</td>
<td>IPv4 or IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
</tbody>
</table>

**Gx Diameter Endpoint Configuration**

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>End point name</td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the Gx Diameter endpoint configuration is recognized by the system.</td>
</tr>
</tbody>
</table>
### Required Information

<table>
<thead>
<tr>
<th><strong>Origin realm name</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
**Required Information** | **Description**
--- | ---
Origin realm name | An identification string between 1 through 127 characters. The realm is the Diameter identity. The originator's realm is present in all Diameter messages and is typically the company or service name.
Origin host name | An identification string from 1 to 255 characters (alpha and/or numeric) by which the Rf origin host is recognized by the system.
Origin host address | The IP address of the Rf interface.
Peer name | The Rf endpoint name described above.
Peer realm name | The Rf origin realm name described above.
Peer address and port number | The IP address and port number of the PCRF.
Route-entry peer | The Rf endpoint name described above.

**How This Configuration Works**

The following figure and supporting text describe how this configuration with a single source and destination context is used by the system to process a subscriber call originating from the PMIP LTE network.
1. The S-GW establishes the S5/S8 connection by sending a Create Session Request message to the P-GW including an Access Point name (APN).

2. The P-GW service determines which context to use to provide AAA functionality for the session. This process is described in the How the System Selects Contexts section located in the Understanding the System Operation and Configuration chapter of the System Administration Guide.

3. The P-GW uses the configured Gx Diameter endpoint to establish the IP-CAN session.

4. The P-GW sends a CC-Request (CCR) message to the PCRF to indicate the establishment of the IP-CAN session and the PCRF acknowledges with a CC-Answer (CCA).

5. The P-GW uses the APN configuration to select the PDN context. IP addresses are assigned from the IP pool configured in the selected PDN context.

6. The P-GW responds to the S-GW with a Create Session Response message including the assigned address and additional information.

7. The S5/S8 data plane tunnel is established and the P-GW can forward and receive packets to/from the PDN.
P-MIP P-GW (LTE) Configuration

To configure the system to perform as a standalone P-MIP P-GW in an LTE-SAE network environment, review the following graphic and subsequent steps.

Figure 10: PMIP P-GW (LTE) Configurables

Step 1 Set system configuration parameters such as activating PSCs by applying the example configurations found in the System Administration Guide.

Step 2 Set initial configuration parameters such as creating contexts and services by applying the example configurations found in the Initial Configuration, on page 153.

Step 3 Configure the system to perform as a PMIP P-GW and set basic P-GW parameters such as PMIP interfaces and an IP route by applying the example configurations presented in the P-GW Service Configuration, on page 156.

Step 4 Configure the PDN context by applying the example configuration in the P-GW PDN Context Configuration, on page 157.

Step 5 Enable and configure the active charging service for Gx interface support by applying the example configuration in the Active Charging Service Configuration, on page 157.

Step 6 Create a AAA context and configure parameters for AAA and policy by applying the example configuration in the AAA and Policy Configuration, on page 178.

Step 7 Verify and save the configuration by following the instructions in the Verifying and Saving the Configuration, on page 161.
**Initial Configuration**

**Step 1** Set local system management parameters by applying the example configuration in Modifying the Local Context, on page 153.

**Step 2** Create the context where the P-GW service will reside by applying the example configuration in Creating and Configuring a P-MIP P-GW Context, on page 153.

**Step 3** Create and configure APNs in the P-GW context by applying the example configuration in Creating and Configuring APNs in the P-GW Context, on page 154.

**Step 4** Create and configure AAA server groups in the P-GW context by applying the example configuration in Creating and Configuring AAA Groups in the P-GW Context, on page 155.

**Step 5** Create and configure a Local Mobility Anchor (LMA) service within the newly created context by applying example configuration in Creating and Configuring an LMA Service, on page 155.

**Step 6** Create a context through which the interface to the PDN will reside by applying the example configuration in Creating a P-GW PDN Context, on page 155.

**Modifying the Local Context**

Use the following example to set the default subscriber and configure remote access capability in the local context:

```
configure
  context local
    interface <lcl_cntxt_intrfc_name>
      ip address <ip_address> <ip_mask>
      exit
      server ftpd
      exit
      server telnetd
      exit
      subscriber default
      exit
      administrator <name> encrypted password <password> ftp
      ip route <ip_addr/ip_mask> <next_hop_addr> <lcl_cntxt_intrfc_name>
      exit
      port ethernet <slot#/port#>
      no shutdown
      bind interface <lcl_cntxt_intrfc_name> local
  end
```

**Creating and Configuring a P-MIP P-GW Context**

Use the following example to create a P-GW context, create an S5/S8 IPv6 interface (for data traffic to/from the S-GW), and bind the S5/S8 interface to a configured Ethernet port:

```
configure
  context <pgw_context_name> -noconfirm
    interface <s5s8_interface_name> tunnel
    ipv6 address <ipv6_address>
    tunnel-mode ipv6ip
```
source interface <name>
destination address <ipv6 address>
exit
exit
policy accounting <rf_policy_name> -noconfirm
accounting-level {level_type}
accounting-event-trigger interim-timeout action stop-start
operator-string <string>
exit
subscriber default
exit
exit
port ethernet <slot_number/port_number>
no shutdown
bind interface <s5s8_interface_name> <pgw_context_name>
end

Notes:

• The S5/S8 (P-GW to S-GW) interface must be an IPv6 address.

• Set the accounting policy for the Rf (off-line charging) interface. The accounting level types are: flow, PDN, PDN-QCI, QCI, and subscriber. Refer to the Accounting Profile Configuration Mode Commands chapter in the Command Line Interface Reference for more information on this command.

Creating and Configuring APNs in the P-GW Context

Use the following configuration to create an APN:

configure
context <pgw_context_name> -noconfirm
apn <name>
  accounting-mode radius-diameter
  ims-auth-service <gx_ims_service_name>
  aaa group <rf-radius_group_name>
  dns primary <ipv4_address>
  dns secondary <ipv4_address>
  ip access-group <name> in
  ip access-group <name> out
  mediation-device context-name <pgw_context_name>
  ip context-name <pdn_context_name>
  ipv6 access-group <name> in
  ipv6 access-group <name> out
  active-charging rulebase <name>
end

Notes:

• The IMS Authorization Service is created and configured in the AAA context.

• Multiple APNs can be configured to support different domain names.
Creating and Configuring AAA Groups in the P-GW Context

Use the following example to create and configure AAA groups supporting RADIUS and Rf accounting:

```plaintext
configure
  context <pgw_context_name> -noconfirm
  aaa group <rf-radius_group_name>
    radius attribute nas-identifier <id>
    radius accounting interim interval <seconds>
    radius dictionary <name>
    radius mediation-device accounting server <address> key <key>
    diameter authentication dictionary <name>
    diameter accounting dictionary <name>
    diameter authentication endpoint <s6b_cfg_name>
    diameter accounting endpoint <rf_cfg_name>
    diameter authentication server <s6b_cfg_name> priority <num>
    diameter accounting server <rf_cfg_name> priority <num>
  exit
  aaa group default
    radius attribute nas-ip-address address <ipv4_address>
    radius accounting interim interval <seconds>
    diameter authentication dictionary <name>
    diameter accounting dictionary <name>
    diameter authentication endpoint <s6b_cfg_name>
    diameter accounting endpoint <rf_cfg_name>
    diameter authentication server <s6b_cfg_name> priority <num>
    diameter accounting server <rf_cfg_name> priority <num>
end
```

Creating and Configuring an LMA Service

Use the following configuration example to create the LMA service:

```plaintext
configure
  context <pgw_context_name>
    lma-service <lma_service_name> -noconfirm
      no aaa accounting
      revocation enable
    bind address <s5s8_ipv6_address>
  end
```

Notes:

- The **no aaa accounting** command is used to prevent duplicate accounting packets.
- Enabling revocation provides for MIP registration revocation in the event that MIP revocation is negotiated with a MAG and a MIP binding is terminated, the LMA can send a revocation message to the MAG.

Creating a P-GW PDN Context

Use the following example to create a P-GW PDN context and Ethernet interface, and bind the interface to a configured Ethernet port.

```plaintext
configure
  context <pdn_context_name> -noconfirm
```
P-GW Service Configuration

Step 1 Configure the P-GW service by applying the example configuration in the Configuring the P-GW Service, on page 156.

Step 2 Specify an IP route to the P-MIP Serving Gateway by applying the example configuration in the Configuring a Static IP Route, on page 156.

Configuring the P-GW Service

Use the following example to configure the P-GW service:

```bash
configure
context <pgw_context_name>
pgw-service <pgw_service_name> -noconfirm
plmn id mcc <id> mnc <id>
associate lma-service <lma_service_name>
associate qci-qos-mapping <name>
authorize external
fqdn host <domain_name> realm <realm_name>
end
```

Notes:

- QCI-QoS mapping configurations are created in the AAA context. Refer to the Configuring QCI-QoS Mapping section for more information.
- External authorization is performed by the 3GPP AAA server through the S6b interface. Internal authorization (APN) is default.
- The `fqdn host` command configures a Fully Qualified Domain Name for the P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Configuring a Static IP Route

Use the following example to configure static IP routes for data traffic between the P-GW and the S-GW:

```bash
configure
context <pgw_context_name>
ipv6 route <ipv6_addr/prefix> next-hop <sgw_addr> interface <sgw_sgw_intrfc_name>
end
```

Notes:

- Static IP routing is not required for configurations using dynamic routing protocols.
P-GW PDN Context Configuration

Use the following example to configure an IP Pool and APN, and bind a port to the interface in the PDN context:

```
configure
c    context <pdn_context_name> -noconfirm
    interface <pdn_sgi_ipv4_interface_name>
    ip address <ipv4_address>
    exit
    interface <pdn_sgi_ipv6_interface_name>
    ip address <ipv6_address>
    exit
    ip pool <name> range <start_address end_address> public <priority>
    ipv6 pool <name> range <start_address end_address> public <priority>
    subscriber default
    ip access-list <name>
    redirect css service <name> any
    permit any
    exit
    ipv6 access-list <name>
    redirect css service <name> any
    permit any
    exit
    aaa group default
    exit
    exit

port ethernet <slot_number/port_number>
    no shutdown
    bind interface <pdn_ipv4_interface_name> <pdn_context_name>
    exit

port ethernet <slot_number/port_number>
    no shutdown
    bind interface <pdn_ipv6_interface_name> <pdn_context_name>
end
```

Active Charging Service Configuration

Use the following example to enable and configure active charging:

```
configure
    require active-charging optimized-mode
    active-charging service <name>
    ruledef <name>
        <rule>
        .
        .
        <rule>
        exit
    ruledef default
        ip any-match = TRUE
        exit
    ruledef icmp-pkts
```
icmp any-match = TRUE
exit
ruledef qci3
  icmp any-match = TRUE
  exit
ruledef static
  icmp any-match = TRUE
  exit
charging-action <name>
  <action>
    .
    .
  <action>
exit
charging-action icmp
  billing-action egcdr
  exit
charging-action qci3
  content-id <id>
  billing-action rf
  qos-class-identifier <id>
  allocation-retention-priority <priority>
  tft packet-filter qci3
  exit
charging-action static
  service-identifier <id>
  billing-action rf
  qos-class-identifier <id>
  allocation-retention-priority <priority>
  tft packet-filter qci3
  exit
packet-filter <packet_filter_name>
  ip remote-address = { <ipv4/ipv6_address> | <ipv4/ipv6_address/mask> }<end_port_number> to
  ip remote-port { = <port_number> | range <start_port_number> to <end_port_number> }
exit
rulebase default
  exit
rulebase <name>
  <rule_base>
    .
    .
  <rule_base>
end

Notes:

• A rulebase is a collection of rule definitions and associated charging actions.

• As depicted above, multiple rule definitions, charging actions, and rule bases can be configured to support a variety of charging scenarios.
• Routing and/or charging rule definitions can be created/configured. The maximum number of routing rule definitions that can be created is 256. The maximum number of charging rule definitions is 2048.

• Charging actions define the action to take when a rule definition is matched.

---

**Important**

If uplink packet is coming on the dedicated bearer, only rules installed on the dedicated bearer are matched. Static rules are not matched and packets failing to match the same will be dropped.

---

**AAA and Policy Configuration**

**Step 1** Configure AAA and policy interfaces by applying the example configuration in the Creating and Configuring the AAA Context, on page 159.

**Step 2** Create and configure QCI to QoS mapping by applying the example configuration in the Configuring QCI-QoS Mapping, on page 161 section.

---

**Creating and Configuring the AAA Context**

Use the following example to create and configure a AAA context including diameter support and policy control, and bind the port to interface supporting traffic between this context and a PCRF:

```bash
configure
catalog <aaa_catalog_name> -noconfirm
context <aaa_context_name> -noconfirm
  interface <s6b_interface_name>
    ip address <ipv4_address>
  exit
interface <gx_interface_name>
  ipv6 address <ipv6_address>
  exit
interface <gy_interface_name>
  ipv6 address <ipv6_address>
  exit
interface <rf_interface_name>
  ip address <ipv4_address>
  exit
subscriber default
  exit
  ims-auth-service <gx_ims_service_name>
    p-cscf discovery table <#> algorithm round-robin
    p-cscf table <#> row-precedence <#> ipv6-address <pcrf_adr>

policy-control
  diameter origin endpoint <gx_cfg_name>
  diameter dictionary <name>
  diameter host-select table <#> algorithm round-robin
  diameter host-select row-precedence <#> table <#> host <gx_cfg_name>
  exit
exit
```
diameter endpoint <s6b_cfg_name>
  origin realm <realm_name>
  origin host <name> address <aaa_ctx_ipv4_address>
  peer <s6b_cfg_name> realm <name> address <aaa_ipv4_addr>
  route-entry peer <s6b_cfg_name>
end

exit

diameter endpoint <gx_cfg_name>
  origin realm <realm_name>
  origin host <name> address <aaa_ctx_ipv6_address>
  peer <gx_cfg_name> realm <name> address <pcrf_addr>
  route-entry peer <gx_cfg_name>
end

exit

diameter endpoint <gy_cfg_name>
  use-proxy
  origin realm <realm_name>
  origin host <name> address <gy_ipv6_address>
  connection retry-timeout <seconds>
  peer <gy_cfg_name> realm <name> address <ocs_ipv6_addr>
  route-entry peer <gy_cfg_name>
end

exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <s6b_interface_name> <aaa_context_name>
end

exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <gx_interface_name> <aaa_context_name>
end

exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <gy_interface_name> <aaa_context_name>
end

exit

port ethernet <slot_number/port_number>
  no shutdown
  bind interface <rf_interface_name> <aaa_context_name>
end

Notes:

• The p-cscf table command under ims-auth-service can also specify an IPv4 address to the PCRF.

• The S6b interface IP address can also be specified as an IPv6 address using the ipv6 address command.

• The Gx interface IP address can also be specified as an IPv4 address using the ip address command.

• The Gy interface IP address can also be specified as an IPv4 address using the ip address command.
• The Rf interface IP address can also be specified as an IPv6 address using the `ipv6 address` command.

**Configuring QCI-QoS Mapping**

Use the following example to create and map QCI values to enforceable QoS parameters:

```plaintext
configure
  qci-qos-mapping <name>
    qci 1 user-datagram dscp-marking <hex>
    qci 3 user-datagram dscp-marking <hex>
    qci 9 user-datagram dscp-marking <hex>
end
```

Notes:

• The P-GW does not support non-standard QCI values unless a valid license key is installed.

QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.

From 3GPP Release 8 onwards, operator-specific/non-standard QCI can be supported and carriers can define QCI 128-254.

• The above configuration only shows one keyword example. Refer to the *QCI - QOS Mapping Configuration Mode Commands* chapter in the *Command Line Interface Reference* for more information on the `qci` command and other supported keywords.

**Verifying and Saving the Configuration**

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

**Configuring the System as a Standalone PMIP P-GW Supporting an eHRPD Network**

This section provides a high-level series of steps and the associated configuration file examples for configuring the system to perform as a P-MIP P-GW supporting an eHRPD test environment. For a complete configuration file example, refer to the *Sample Configuration Files* appendix. Information provided in this section includes the following:

• **Information Required**, on page 161
• **How This Configuration Works**, on page 170
• **P-MIP P-GW (eHRPD) Configuration**, on page 172

**Information Required**

The following sections describe the minimum amount of information required to configure and make the P-GW operational on the network. To make the process more efficient, it is recommended that this information be available prior to configuring the system.
There are additional configuration parameters that are not described in this section. These parameters deal mostly with fine-tuning the operation of the P-GW in the network. Information on these parameters can be found in the appropriate sections of the Command Line Interface Reference.

**Required Local Context Configuration Information**

The following table lists the information that is required to configure the local context on an P-GW.

*Table 21: Required Information for Local Context Configuration*

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Management Interface Configuration</td>
<td></td>
</tr>
<tr>
<td>Interface name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface will be recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>IP address and subnet</td>
<td>IPv4 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td>Physical port number</td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td>Gateway IP address</td>
<td>Used when configuring static IP routes from the management interface(s) to a specific network.</td>
</tr>
<tr>
<td>Security administrator name</td>
<td>The name or names of the security administrator with full rights to the system.</td>
</tr>
<tr>
<td>Security administrator password</td>
<td>Open or encrypted passwords can be used.</td>
</tr>
<tr>
<td>Remote access type(s)</td>
<td>The type of remote access protocol that will be used to access the system, such as telnet, SSH, and/or FTP.</td>
</tr>
</tbody>
</table>

**Important**  In release 20.0 and higher Trusted StarOS builds, the telnet and FTP options are no longer available.

**Required P-GW Context Configuration Information**

The following table lists the information that is required to configure the P-GW context on a P-GW.
### Table 22: Required Information for P-GW Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>P-GW context name</strong></td>
<td>An identification string from 1 to 79 characters (alpha and/or numeric) by which the P-GW context will be recognized by the system.</td>
</tr>
<tr>
<td><strong>Accounting policy name</strong></td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the accounting policy will be recognized by the system. The accounting policy is used to set parameters for the Rf (off-line charging) interface.</td>
</tr>
<tr>
<td><strong>S2a Interface Configuration (To/from HSGW)</strong></td>
<td></td>
</tr>
<tr>
<td><strong>Interface name</strong></td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the interface will be recognized by the system. Multiple names are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td><strong>IP address and subnet</strong></td>
<td>IPv6 addresses assigned to the interface. Multiple addresses and subnets are needed if multiple interfaces will be configured.</td>
</tr>
<tr>
<td><strong>Physical port number</strong></td>
<td>The physical port to which the interface will be bound. Ports are identified by the chassis slot number where the line card resides followed by the number of the physical connector on the card. For example, port 17/1 identifies connector number 1 on the card in slot 17. A single physical port can facilitate multiple interfaces.</td>
</tr>
<tr>
<td><strong>Gateway IP address</strong></td>
<td>Used when configuring static IP routes from the interface(s) to a specific network.</td>
</tr>
<tr>
<td><strong>P-GW Service Configuration</strong></td>
<td></td>
</tr>
<tr>
<td><strong>P-GW service name</strong></td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the P-GW service will be recognized by the system. Multiple names are needed if multiple P-GW services will be used.</td>
</tr>
<tr>
<td><strong>PLMN ID</strong></td>
<td>MCC number: The mobile country code (MCC) portion of the PLMN's identifier (an integer value between 100 and 999). MNC number: The mobile network code (MNC) portion of the PLMN's identifier (a 2 or 3 digit integer value between 00 and 999).</td>
</tr>
</tbody>
</table>
# Required PDN Context Configuration Information

The following table lists the information that is required to configure the PDN context on a P-GW.

## Table 23: Required Information for PDN Context Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>LMA Service Configuration</strong></td>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the LMA service will be recognized by the system.</td>
</tr>
<tr>
<td><strong>LMA Service Name</strong></td>
<td>An identification string from 1 to 79 characters (alpha and/or numeric) by which the P-GW context is recognized by the system.</td>
</tr>
</tbody>
</table>

## IP Address Pool Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IPv4 address pool name and range</strong></td>
<td>An identification string between 1 and 31 characters (alpha and/or numeric) by which the IPv4 pool is recognized by the system. Multiple names are needed if multiple pools will be configured. A range of IPv4 addresses defined by a starting address and an ending address.</td>
</tr>
<tr>
<td><strong>IPv6 address pool name and range</strong></td>
<td>An identification string between 1 and 31 characters (alpha and/or numeric) by which the IPv6 pool is recognized by the system. Multiple names are needed if multiple pools will be configured. A range of IPv6 addresses defined by a starting address and an ending address.</td>
</tr>
</tbody>
</table>

## Access Control List Configuration

<table>
<thead>
<tr>
<th>Required Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IPv4 access list name</strong></td>
<td>An identification string between 1 and 47 characters (alpha and/or numeric) by which the IPv4 access list is recognized by the system. Multiple names are needed if multiple lists will be configured.</td>
</tr>
<tr>
<td>Required Information</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>IPv6 access list name</td>
<td>An identification string between 1 and 79 characters (alpha and/or numeric) by which the IPv6 access list is recognized by the system.</td>
</tr>
<tr>
<td></td>
<td>Multiple names are needed if multiple lists will be configured.</td>
</tr>

| **Gateway IP address** |
| Used when configuring static IP routes from the interface(s) to a specific network. |

### Gy Diameter Endpoint Configuration

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>End point name</strong></td>
</tr>
<tr>
<td>An identification string from 1 to 63 characters (alpha and/or numeric) by which the Gy Diameter endpoint configuration is recognized by the system.</td>
</tr>
</tbody>
</table>

| **Origin realm name** |
| An identification string between 1 through 127 characters. The realm is the Diameter identity. The originator's realm is present in all Diameter messages and is typically the company or service name. |

| **Origin host name** |
| An identification string from 1 to 255 characters (alpha and/or numeric) by which the Gy origin host is recognized by the system. |

| **Origin host address** |
| The IP address of the Gy interface. |

| **Peer name** |
| The Gy endpoint name described above. |

| **Peer realm name** |
| The Gy origin realm name described above. |

| **Peer address and port number** |
| The IP address and port number of the OCS. |

| **Route-entry peer** |
| The Gy endpoint name described above. |

### How This Configuration Works

The following figure and supporting text describe how this configuration with a single source and destination context is used by the system to process a subscriber call originating from the GTP LTE network.
1. The S-GW establishes the S5/S8 connection by sending a Create Session Request message to the P-GW including an Access Point name (APN).

2. The P-GW service determines which context to use to provide AAA functionality for the session. This process is described in the How the System Selects Contexts section located in the Understanding the System Operation and Configuration chapter of the System Administration Guide.

3. The P-GW uses the configured Gx Diameter endpoint to establish the IP-CAN session.

4. The P-GW sends a CC-Request (CCR) message to the PCRF to indicate the establishment of the IP-CAN session and the PCRF acknowledges with a CC-Answer (CCA).

5. The P-GW uses the APN configuration to select the PDN context. IP addresses are assigned from the IP pool configured in the selected PDN context.

6. The P-GW responds to the S-GW with a Create Session Response message including the assigned address and additional information.

7. The S5/S8 data plane tunnel is established and the P-GW can forward and receive packets to/from the PDN.
P-MIP P-GW (eHRPD) Configuration

To configure the system to perform as a standalone P-MIP P-GW in an eHRPD network environment, review the following graphic and subsequent steps.

Figure 12: P-MIP P-GW (eHRPD) Configuration

Step 1  Set system configuration parameters such as activating PSCs by applying the example configurations found in the System Administration Guide.

Step 2  Set initial configuration parameters such as creating contexts and services by applying the example configurations found in Initial Configuration.

Step 3  Configure the system to perform as a P-MIP P-GW and set basic P-GW parameters such as P-MIP interfaces and an IP route by applying the example configurations presented in P-GW Service Configuration, on page 176.

Step 4  Configure the PDN context by applying the example configuration in P-GW PDN Context Configuration, on page 177.

Step 5  Enable and configure the active charging service for Gx interface support by applying the example configuration in Active Charging Service Configuration, on page 177.

Step 6  Create a AAA context and configure parameters for AAA and policy by applying the example configuration in AAA and Policy Configuration.

Step 7  Verify and save the configuration by following the instruction in Verifying and Saving the Configuration, on page 181.
Initial Configuration

Step 1  Set local system management parameters by applying the example configuration in Modifying the Local Context, on page 173.

Step 2  Create the context where the P-GW service will reside by applying the example configuration in Creating and Configuring a P-MIP P-GW Context, on page 173.

Step 3  Create and configure APNs in the P-GW context by applying the example configuration in Creating and Configuring APNs in the P-GW Context, on page 174.

Step 4  Create and configure AAA server groups in the P-GW context by applying the example configuration in Creating and Configuring AAA Groups in the P-GW Context, on page 175 section.

Step 5  Create an eGTP service within the newly created context by applying the example configuration in Creating and Configuring an LMA Service, on page 175.

Step 6  Create a context through which the interface to the PDN will reside by applying the example configuration in Creating a P-GW PDN Context, on page 175.

Modifying the Local Context

Use the following example to set the default subscriber and configure remote access capability in the local context:

```bash
configure
  context local
    interface <lcl_ctxnt_intrfc_name>
      ip address <ip_address> <ip_mask>
    exit
    server ftpd
    exit
    server telnetd
    exit
    subscriber default
    exit
    administrator <name> encrypted password <password> ftp
    ip route <ip_addr/ip_mask> <next_hop_addr> <lcl_ctxnt_intrfc_name>
    exit
    port ethernet <slot#/port#>
    no shutdown
    bind interface <lcl_ctxnt_intrfc_name> local
end
```

Creating and Configuring a P-MIP P-GW Context

Use the following example to create a P-GW context, create an S2a IPv6 interface (for data traffic to/from the HSGW), and bind the S2a interface to a configured Ethernet port:

```bash
configure
  context <pgw_context_name> -noconfirm
    interface <s2a_interface_name> tunnel
    ipv6 address <address>
    tunnel-mode ipv6ip
```
Creating and Configuring APNs in the P-GW Context

Use the following configuration to create an APN:

```
configure
context <pgw_context_name> -noconfirm
apn <name>
  accounting-mode radius-diameter
  associate accounting-policy <rf_policy_name>
  ims-auth-service <gx_ims_service_name>
  aaa group <rf-radius_group_name>
  dns primary <ipv4_address>
  dns secondary <ipv4_address>
  ip access-group <name> in
  ip access-group <name> out
  mediation-device context-name <pgw_context_name>
  ip context-name <pdn_context_name>
  ipv6 access-group <name> in
  ipv6 access-group <name> out
  active-charging rulebase <name>
end
```

Notes:
- The IMS Authorization Service is created and configured in the AAA context.
- Multiple APNs can be configured to support different domain names.

Notes:
- The S2a (P-GW to HSGW) interface must be an IPv6 address.
- Set the accounting policy for the Rf (off-line charging) interface. The accounting level types are: flow, PDN, PDN-QCI, QCI, and subscriber. Refer to the Accounting Profile Configuration Mode Commands chapter in the Command Line Interface Reference for more information on this command.
• The associate accounting-policy command is used to associate a pre-configured accounting policy with this APN. Accounting policies are configured in the P-GW context. An example is located in Creating and Configuring a P-MIP P-GW Context, on page 173.

Creating and Configuring AAA Groups in the P-GW Context

Use the following example to create and configure AAA groups supporting RADIUS and Rf accounting:

```bash
configure
  context <pgw_context_name> -noconfirm
  aaa group <rf-radius_group_name>
    radius attribute nas-identifier <id>
    radius accounting interim interval <seconds>
    radius dictionary <name>
    radius mediation-device accounting server <address> key <key>
    diameter authentication dictionary <name>
    diameter accounting dictionary <name>
    diameter authentication endpoint <s6b_cfg_name>
    diameter accounting endpoint <rf_cfg_name>
    diameter authentication server <s6b_cfg_name> priority <num>
    diameter accounting server <rf_cfg_name> priority <num>
  exit
  aaa group default
    radius attribute nas-ip-address address <ipv4_address>
    radius accounting interim interval <seconds>
    diameter authentication dictionary <name>
    diameter accounting dictionary <name>
    diameter authentication endpoint <s6b_cfg_name>
    diameter accounting endpoint <rf_cfg_name>
    diameter authentication server <s6b_cfg_name> priority <num>
    diameter accounting server <rf_cfg_name> priority <num>
```

Creating and Configuring an LMA Service

Use the following configuration example to create the LMA service:

```bash
configure
  context <pgw_context_name>
    lma-service <lma_service_name> -noconfirm
      no aaa accounting
      revocation enable
      bind address <s2a_ipv6_address>
  end
```

Notes:

• The no aaa accounting command is used to prevent duplicate accounting packets.

• Enabling revocation provides for MIP registration revocation in the event that MIP revocation is negotiated with a MAG and a MIP binding is terminated, the LMA can send a revocation message to the MAG.

Creating a P-GW PDN Context

Use the following example to create a P-GW PDN context and Ethernet interfaces.
configure
c
context <pdn_context_name> -noconfirm

t
interface <sgi_ipv4_interface_name>
ip address <ipv4_address>
exit

t
interface <sgi_ipv6_interface_name>
ipv6 address <address>
end

P-GW Service Configuration

Step 1 Configure the P-GW service by applying the example configuration in Configuring the P-GW Service, on page 176.

Step 2 Specify an IP route to the HRPD Serving Gateway by applying the example configuration in Configuring a Static IP Route, on page 176.

Configuring the P-GW Service

Use the following example to configure the P-GW service:

c
context <pgw_context_name>

t
context <pgw_context_name> -noconfirm

t
pgw-service <pgw_service_name>
associate lma-service <lma_service_name>
associate qci-qos-mapping <name>
authorize external
fqdn host <domain_name> realm <realm_name>
plmn id mcc <id> mnc <id>
end

Notes:

• QCI-QoS mapping configurations are created in the AAA context. Refer to Configuring QCI-QoS Mapping, on page 180 for more information.

• External authorization is performed by the 3GPP AAA server through the S6b interface. Internal authorization (APN) is default.

• The fqdn host command configures a Fully Qualified Domain Name for the P-GW service used in messages between the P-GW and a 3GPP AAA server over the S6b interface.

Configuring a Static IP Route

Use the following example to configure static IP routes for data traffic between the P-GW and the HSGW:

c
context <pgw_context_name>

ipv6 route <ipv6_addr/prefix> next-hop <hsgw_addr> interface <pgw_hsgw_intrfc_name>
end

Notes:

• Static IP routing is not required for configurations using dynamic routing protocols.
P-GW PDN Context Configuration

Use the following example to configure IP pools and IP Access Control Lists (ACLs), and bind ports to the interfaces in the PDN context:

```plaintext
configure
context <pdn_context_name> -noconfirm
  ip pool <name> range <start_address end_address> public <priority>
  ipv6 pool <name> range <start_address end_address> public <priority>
  subscriber default
  exit
  ip access-list <name>
    redirect css service <name> any
    permit any
  exit
  ipv6 access-list <name>
    redirect css service <name> any
    permit any
  exit
  aaa group default
  exit
  exit
  port ethernet <slot_number/port_number>
    no shutdown
    bind interface <pdn_sgi_ipv4_interface_name> <pdn_context_name>
  exit
  port ethernet <slot_number/port_number>
    no shutdown
    bind interface <pdn_sgi_ipv6_interface_name> <pdn_context_name>
end
```

Active Charging Service Configuration

Use the following example to enable and configure active charging:

```plaintext
configure
require active-charging optimized-mode
active-charging service <name>
  ruledef <name>
    <rule_definition>
      .
      .
      <rule_definition>
    exit
  ruledef <name>
    <rule_definition>
      .
      .
      <rule_definition>
    exit
  charging-action <name>
    <action>
```

AAA and Policy Configuration

Notes:

• A rulebase is a collection of rule definitions and associated charging actions.

• Active charging in optimized mode enables the service as part of the session manager instead of part of ACS managers.

• As depicted above, multiple rule definitions, charging actions, and rule bases can be configured to support a variety of charging scenarios.

• Routing and/or charging rule definitions can be created/configured. The maximum number of routing rule definitions that can be created is 256. The maximum number of charging rule definitions is 2048.

• Charging actions define the action to take when a rule definition is matched.

---

Important

If uplink packet is coming on the dedicated bearer, only rules installed on the dedicated bearer are matched. Static rules are not matched and packets failing to match the same will be dropped.

AAA and Policy Configuration

Step 1 Configure AAA and policy interfaces by applying the example configuration in the Creating and Configuring the AAA Context, on page 179 section.

Step 2 Create and configure QCI to QoS mapping by applying the example configuration in the Configuring QCI-QoS Mapping, on page 180 section.
Creating and Configuring the AAA Context

Use the following example to create and configure a AAA context including diameter support and policy control, and bind ports to interfaces supporting traffic between this context, a PCRF, a 3GPP AAA server, an on-line charging server, and an off-line charging server:

```plaintext
configure
context <aaa_context_name> -noconfirm
  interface <s6b_interface_name>
    ip address <ipv4_address>
  exit
  interface <gx_interface_name>
    ipv6 address <address>
  exit
  interface <rf_interface_name>
    ip address <ipv4_address>
  exit
  interface <gy_interface_name>
    ipv6 address <address>
  exit
subscriber default
exit
ims-auth-service <gx_ims_service_name>
  p-cscf discovery table <> algorithm round-robin
  p-cscf table <> row-precedence <> ipv6-address <pcrf_addr>
policy-control
  diameter origin endpoint <gx_cfg_name>
  diameter dictionary <name>
  diameter host-select table <> algorithm round-robin
  diameter host-select row-precedence <> table <> host <gx_cfg_name>
  exit
exit
  diameter endpoint <s6b_cfg_name>
  origin realm <realm_name>
  origin host <name> address <aaa_ctx_ipv4_address>
  peer <s6b_cfg_name> realm <name> address <aaa_ip_addr>
  route-entry peer <s6b_cfg_name>
  exit
  diameter endpoint <gx_cfg_name>
  origin realm <realm_name>
  origin host <name> address <aaa_context_ipv4_address>
  peer <gx_cfg_name> realm <name> address <pcrf_ipv6_addr>
  route-entry peer <gx_cfg_name>
  exit
  diameter endpoint <rf_cfg_name>
  origin realm <realm_name>
  origin host <name> address <aaa_ip_address>
  peer <rf_cfg_name> realm <name> address <ofcs_ip_addr>
  route-entry peer <rf_cfg_name>
  exit
  diameter endpoint <gy_cfg_name>
  use-proxy
```
Configuring QCI-QoS Mapping

Use the following example to create and map QCI values to enforceable QoS parameters:

```
configure
  qci-qos-mapping <name>
    qci 1 user-datagram dscp-marking <hex>
    qci 3 user-datagram dscp-marking <hex>
    qci 9 user-datagram dscp-marking <hex>
  end
```

Notes:

• The P-GW does not support non-standard QCI values unless a valid license key is installed.

QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values.

From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128-254.

P-GW Administration Guide, StarOS Release 21.8
• The above configuration only shows one keyword example. Refer to the QCI - QOS Mapping Configuration Mode Commands chapter in the Command Line Interface Reference for more information on the qci command and other supported keywords.

Verifying and Saving the Configuration

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Configuring Optional Features on the P-GW

The configuration examples in this section are optional and provided to cover the most common uses of the P-GW in a live network. The intent of these examples is to provide a base configuration for testing.

Configuring ACL-based Node-to-Node IP Security on the S5 Interface

The configuration example in this section creates an IKEv2/IPSec ACL-based node-to-node tunnel endpoint on the S5 interface.

Important

Use of the IP Security feature requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Creating and Configuring a Crypto Access Control List

The following example configures a crypto ACL (Access Control List), which defines the matching criteria used for routing subscriber data packets over an IPSec tunnel:

```
configure
  context <pgw_context_name> -noconfirm
  ip access-list <acl_name>
    permit tcp host <source_host_address> host <dest_host_address>
  end
```

Notes:

• The permit command in this example routes IPv4 traffic from the server with the specified source host IPv4 address to the server with the specified destination host IPv4 address.

Creating and Configuring an IPSec Transform Set

The following example configures an IPSec transform set, which is used to define the security association that determines the protocols used to protect the data on the interface:

```
configure
  context <pgw_context_name> -noconfirm
  ipsec transform-set <ipsec_transform-set_name>
    encryption aes-cbc-128
```
Creating and Configuring an IKEv2 Transform Set

The following example configures an IKEv2 transform set:

```
configure
c    context <pgw_context_name> -noconfirm
    ikev2-ikesa transform-set <ikev2_transform-set_name>
        encryption aes-cbc-128
        group 2
        hmac sha1-96
        lifetime <sec>
        prf sha1
    end
```

Notes:

- The encryption algorithm, **aes-cbc-128**, or Advanced Encryption Standard Cipher Block Chaining, is the default algorithm for IKEv2 transform sets configured on the system.

- The **group 2** command specifies the Diffie-Hellman algorithm as Group 2, indicating medium security. The Diffie-Hellman algorithm controls the strength of the crypto exponentials. This is the default setting for IKEv2 transform sets configured on the system.

- The **hmac** command configures the Encapsulating Security Payload (ESP) integrity algorithm. The **sha1-96** keyword uses a 160-bit secret key to produce a 160-bit authenticator value. This is the default setting for IKEv2 transform sets configured on the system.

- The **lifetime** command configures the time the security key is allowed to exist, in seconds.

- The **prf** command configures the IKE Pseudo-random Function which produces a string of bits that cannot be distinguished from a random bit string without knowledge of the secret key. The **sha1** keyword uses a 160-bit secret key to produce a 160-bit authenticator value. This is the default setting for IKEv2 transform sets configured on the system.
Creating and Configuring a Crypto Map

The following example configures an IKEv2 crypto map:

```
configure
  context <pgw_context_name>
    crypto map <crypto_map_name> ikev2-ipv4
      match address <acl_name>
      peer <ipv4_address>
      authentication local pre-shared-key key <text>
      authentication remote pre-shared-key key <text>
      ikev2-ikesa transform-set list <name1> . . . <name6>
      payload <name> match ipv4
        lifetime <seconds>
      ipsec transform-set list <name1> . . . <name4>
    exit
  exit
interface <s5_intf_name>
  ip address <ipv4_address>
  crypto-map <crypto_map_name>
  exit
  port ethernet <slot_number/port_number>
  no shutdown
  bind interface <s5_intf_name> <pgw_context_name>
end
```

Notes:

- The type of crypto map used in this example is IKEv2/IPv4 for IPv4 addressing. An IKEv2/IPv6 crypto map can also be used for IPv6 addressing.
- The `ipsec transform-set list` command specifies up to four IPSec transform sets.

Configuring APN as Emergency

The configuration example in this section configures an emergency APN for VoLTE based E911 support.

In APN Configuration Mode, specify the name of the emergency APN and set the emergency inactivity timeout as follows. You may also configure the P-CSCF FQDN server name for the APN.

```
configure
  context <pgw_context_name> -noconfirm
  apn <name>
    emergency-apn
      timeout emergency-inactivity <seconds>
    p-cscf fqdn <fqdn>
  end
```

Notes:

- By default, an APN is assumed to be non-emergency.
- The `timeout emergency-inactivity` command specifies the timeout duration, in seconds, to check inactivity on the emergency session. `<seconds>` must be an integer value from 1 through 3600.
• By default, emergency inactivity timeout is disabled (0).

• The `p-cscf fqdn` command configures the P-CSCF FQDN server name for the APN. `<fqdn>` must be a string from 1 to 256 characters in length.

• P-CSCF FQDN has more significance than CLI-configured P-CSCF IPv4 and IPv6 addresses.

**Configuring Common Gateway Access Support**

This section describes some advance feature configuration to support multiple access networks (CDMA, eHRPD, and LTE) plus a GSM/UMTS for international roaming with the same IP addressing behavior and access to 3GPP AAA for subscriber authorization. Subscribers using static IP addressing will be able to get the same IP address regardless of the access technology.

This configuration combines 3G and 4G access technologies in a common gateway supporting logical services of HA, P-GW, and GGSN to allow subscribers to have the same user experience, independent of the access technology available.

---

**Important**

This feature is a license-enabled support and you may need to install a feature specific session license on your system to use some commands related to this configuration.

These instructions assume that you have already configured the system level configuration as described in *System Administration Guide* and P-GW service.

To configure the S6b and other advance features:

1. Configure Diameter endpoint by applying the example configuration in *Diameter Endpoint Configuration*, on page 184.
2. Create or modify AAA group by applying the example configuration in *AAA Group Configuration*, on page 185.
3. Modify P-GW service to allow authorization with HSS by applying the example configuration in *Authorization over S6b Configuration*, on page 185.
4. Optional. Create and associate DNS client parameters by applying the example configuration in *DNS Client Configuration*, on page 185.
5. Optional. Modify P-GW service to accept duplicate calls when received with same IP address by applying the example configuration in *Duplicate Call Accept Configuration*, on page 186.
6. Verify your S6b configuration by following the steps in *Common Gateway Access Support Configuration Verification*, on page 186.
7. Save your configuration as described in the *Verifying and Saving Your Configuration* chapter.

**Diameter Endpoint Configuration**

Use the following example to configure the Diameter endpoint:

```
configure
corentext <pgw_ctxt_name> -noconfirm
diameter endpoint <s6b_endpoint_name>
orin host <host_name> address <ip_address>
peer <peer_name> realm <realm_name> address <ip_address> port <port_num>
end
```
Notes:

• `<pgw_ctxt_name>` is name of the context which contains P-GW service on system.

**AAA Group Configuration**

Use the following example create/modify the AAA group for this feature.

```bash
configure
context <fa_ctxt_name>
  aaa group <aaa_grp_name>
    diameter authentication dictionary aaa-custom15
    diameter authentication endpoint <s6b_endpoint_name>
    diameter authentication server <server_name> priority <priority>
  end
end
```

Notes:

• `<s6b_endpoint_name>` is name of the existing Diameter endpoint.

**Authorization over S6b Configuration**

Use the following example to enable the S6b interface on P-GW service with 3GPP AAA/HSS:

```bash
configure
context <pgw_ctxt_name>
  pgw-service <pgw_svc_name>
    plmn id mcc <number> mnc <number>
    authorize-with-hss
    fqdn host <host_name> realm <realm_name>
  end
end
```

Notes:

• `<pgw_svc_name>` is name of the P-GW service which is already created on the system.

**DNS Client Configuration**

Use the following example to enable the S6b interface on P-GW service with 3GPP AAA/HSS:

```bash
configure
context <pgw_ctxt_name>
  ip domain-lookup
  ip name-servers <ip_address/mask>
  dns-client <dns_name>
    bind address <ip_address>
    resolver retransmission-interval <duration>
    resolver number-of-retries <retrie>
    cache ttl positive <ttl_value>
  exit
  pgw-service <pgw_svc_name>
    default dns-client context
  end
```

Notes:
Duplicate Call Accept Configuration

Use the following example to configure P-GW service to accept the duplicate session calls with request for same IP address:

```plaintext
configure
context <pgw_ctxt_name>
pgw-service <pgw_svc_name>
   newcall duplicate-subscriber-requested-address accept
end
```

Notes:

• `<pgw_svc_name>` is name of the P-GW service which is already created on the system.

Common Gateway Access Support Configuration Verification

1. Verify that your common gateway access support is configured properly by entering the following command in Exec Mode:

```plaintext
show pgw-service all
```

The output from this command should look similar to the sample shown below. In this example P-GW service named `PGW1` was configured in the `vpn1` context.

<table>
<thead>
<tr>
<th>Service name:</th>
<th>pgw1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Context:</td>
<td>cn1</td>
</tr>
<tr>
<td>Associated PGW svc:</td>
<td>None</td>
</tr>
<tr>
<td>Associated GTPU svc:</td>
<td>None</td>
</tr>
<tr>
<td>Accounting Context Name:</td>
<td>cn1</td>
</tr>
<tr>
<td>dns-client Context Name:</td>
<td>cn1</td>
</tr>
<tr>
<td>Authorize:</td>
<td>hss</td>
</tr>
<tr>
<td>Fqdn-name:</td>

</table>

Configuring Dynamic Node-to-Node IP Security on the S5 Interface

The configuration example in this section creates an IPSec/IKEv2 dynamic node-to-node tunnel endpoint on the S5 interface.

**Important**

Use of the IP Security feature requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Creating and Configuring an IPSec Transform Set

The following example configures an IPSec transform set, which is used to define the security association that determines the protocols used to protect the data on the interface:
configure
context <pgw_context_name> -noconfirm
ipsec transform-set <ipsec_transform-set_name>
  encryption aes-cbc-128
  group none
  hmac sha1-96
  mode tunnel
end

Notes:
• The encryption algorithm, **aes-cbc-128**, or Advanced Encryption Standard Cipher Block Chaining, is the default algorithm for IPSec transform sets configured on the system.
• The **group none** command specifies that no crypto strength is included and that Perfect Forward Secrecy is disabled. This is the default setting for IPSec transform sets configured on the system.
• The **hmac** command configures the Encapsulating Security Payload (ESP) integrity algorithm. The **sha1-96** keyword uses a 160-bit secret key to produce a 160-bit authenticator value. This is the default setting for IPSec transform sets configured on the system.
• The **mode tunnel** command specifies that the entire packet is to be encapsulated by the IPSec header, including the IP header. This is the default setting for IPSec transform sets configured on the system.

Creating and Configuring an IKEv2 Transform Set

The following example configures an IKEv2 transform set:

configure
context <pgw_context_name> -noconfirm
ikev2-ikesa transform-set <ikev2_transform-set_name>
  encryption aes-cbc-128
  group 2
  hmac sha1-96
  lifetime <sec>
  prf shal
end

Notes:
• The encryption algorithm, **aes-cbc-128**, or Advanced Encryption Standard Cipher Block Chaining, is the default algorithm for IKEv2 transform sets configured on the system.
• The **group 2** command specifies the Diffie-Hellman algorithm as Group 2, indicating medium security. The Diffie-Hellman algorithm controls the strength of the crypto exponentials. This is the default setting for IKEv2 transform sets configured on the system.
• The **hmac** command configures the Encapsulating Security Payload (ESP) integrity algorithm. The **sha1-96** keyword uses a 160-bit secret key to produce a 160-bit authenticator value. This is the default setting for IKEv2 transform sets configured on the system.
• The **lifetime** command configures the time the security key is allowed to exist, in seconds.
• The **prf** command configures the IKE Pseudo-random Function, which produces a string of bits that cannot be distinguished from a random bit string without knowledge of the secret key. The **sha1** keyword
uses a 160-bit secret key to produce a 160-bit authenticator value. This is the default setting for IKEv2 transform sets configured on the system.

Creating and Configuring a Crypto Template

The following example configures an IKEv2 crypto template:

```
configure
  context <pgw_context_name> -noconfirm
  crypto template <crypto_template_name> ikev2-dynamic
    ikev2-ikesa transform-set list <name1> . . . <name6>
    ikev2-ikesa rekey
    payload <name> match childsa match ipv4
      ipsec transform-set list <name1> . . . <name4>
      rekey
    end
end
```

Notes:

- The `ikev2-ikesa transform-set list` command specifies up to six IKEv2 transform sets.
- The `ipsec transform-set list` command specifies up to four IPSec transform sets.

Binding the S5 IP Address to the Crypto Template

The following example configures the binding of the S5 interface to the crypto template:

```
configure
  context <pgw_ingress_context_name> -noconfirm
  gtpu-service <gtpu_ingress_service_name>
    bind ipv4-address <s5_interface_ip_address> crypto-template <sgw_s5_crypto_template>
  exit
  egtp-service <egtp_ingress_service_name>
    interface-type interface-pgw-ingress
    associate gtpu-service <gtpu_ingress_service_name>
    gtpc bind ipv4-address <s5_interface_ip_address>
  exit
  pgw-service <pgw_service_name> -noconfirm
    plmn id mcc <id> mnc <id> primary
    associate egtp-service <egtp_ingress_service_name>
end
```

Notes:

- The `bind` command in the GTP-U and eGTP service configuration can also be specified as an IPv6 address using the `ipv6-address` command.

Configuring Guard Timer on Create Session Request Processing

P-GW has an existing timer "session setup-timeout" which is hard coded to 60 seconds, which is used as a guard timer for session creation. This timer is used for all APNs and is started when a Create Session Request is received for any session creation.
Internal or external processing issues or delay at external interfaces, for example, Gx/Gy, can cause Create Session Request processing to run longer than time expected in end to end call setup. If the session processing is not complete when the timer expires, the Create Session Request processing is stopped and the P-GW performs an internal cleanup by stopping all other corresponding sessions, for example Gx/Gy. The P-GW responds with a Create Session Failure response stating that no resources are available to S-GW. In successful cases when there's no delay timer is stopped during sending out the Create Session Response.

A new CLI command has been introduced to allow a configurable value to override the previously hardcoded default session setup timeout value of 60 seconds. This will help to fine tune the call setup time at P-GW with respect to end to end call setup time.

### Configuring Session Timeout

The following configuration example makes a P-GW session setup timeout configurable.

```plaintext
configure
  context context_name
    pgw-service service_name
      setup-timeout timer-value
        [ default | no ] setup-timeout
    end
end
```

Notes:

- **setup-timeout**: Specifies the session setup timeout period, in seconds. If P-GW is able to process the Create Session Request message before the timer expires, P-GW stops the timer and sends a successful Create Session Response.

  *timer_value* must be an integer from 1 to 120.

  Default: 60 seconds

- **default**: Default value is 60 seconds. If no value is set, the P-GW service sets the timer to the default value.
- **no**: Sets the timer to the default value of 60 seconds.

### Configuring the GTP Echo Timer

The GTP echo timer on the ASR 5500 P-GW can be configured to support two different types of path management: default and dynamic. This timer can be configured on the GTP-C and/or the GTP-U channels.

### Default GTP Echo Timer Configuration

The following examples describe the configuration of the default eGTP-C and GTP-U interface echo timers:

#### eGTP-C

```plaintext
configure
  configure
    context <context_name>
      egtp-service <egtp_service_name>
        gtpc echo-interval <seconds>
        gtpc echo-retransmission-timeout <seconds>
        gtpc max-retransmissions <num>
    end
end
```
Notes:

- The following diagram describes a failure and recovery scenario using default settings of the three gtpc commands in the example above:

![Diagram showing failure and recovery scenario]

- The multiplier (x2) is system-coded and cannot be configured.

GTP-U

```bash
configure
  configure
    context <context_name>
      gtpu-service <gtpu_service_name>
        echo-interval <seconds>
        echo-retransmission-timeout <seconds>
        max-retransmissions <num>
      end
```

Notes:

- The following diagram describes a failure and recovery scenario using default settings of the three GTP-U commands in the example above:
Dynamic GTP Echo Timer Configuration

The following examples describe the configuration of the dynamic eGTP-C and GTP-U interface echo timers:

**eGTP-C**

```plaintext
configure
  configure
    context <context_name>
      egtp-service <egtp_service_name>
        gtpc echo-interval <seconds> dynamic smooth-factor <multiplier>
        gtpc echo-retransmission-timeout <seconds>
        gtpc max-retransmissions <num>
      end
```

- The multiplier (x2) is system-coded and cannot be configured.
Notes:

- The following diagram describes a failure and recovery scenario using default settings of the three `gtpc` commands in the example above and an example round trip timer (RTT) of six seconds:

![Diagram](image)

- The multiplier (x2) and the 100 second maximum are system-coded and cannot be configured.

**GTP-U**

```plaintext
configure
context <context_name>
gtpu-service <gtpu_service_name>
  echo-interval <seconds> dynamic smooth-factor <multiplier>
  echo-retransmission-timeout <seconds>
  max-retransmissions <num>
end
```
Notes:

• The following diagram describes a failure and recovery scenario using default settings of the three gtpc commands in the example above and an example round trip timer (RTT) of six seconds:

![Diagram showing the failure and recovery scenario]

• The multiplier (x2) and the 100 second maximum are system-coded and cannot be configured.

Configuring GTPP Offline Accounting on the P-GW

By default the P-GW service supports GTPP accounting. To provide GTPP offline charging, configure the P-GW with the example parameters below:

```bash
configure
gtpp single-source
context <ingress_context_name>
  subscriber default
    accounting mode gtpp
exit
gtpp group default
  gtpp charging-agent address <gz_ipv4_address>
  gtpp echo-interval <seconds>
  gtpp attribute diagnostics
  gtpp attribute local-record-sequence-number
  gtpp attribute node-id-suffix <string>
  gtpp dictionary <name>
  gtpp server <ipv4_address> priority <num>
  gtpp server <ipv4_address> priority <num> node-alive enable
```
Notes:

• **gtpp single-source** is enabled to allow the system to generate requests to the accounting server using a single UDP port (by way of a AAA proxy function) rather than each AAA manager generating requests on unique UDP ports.

• **gtpp** is the default option for the **accounting mode** command.

• An accounting mode configured for the call-control profile will override this setting.

• **accounting-level** types are: flow, PDN, PDN-QCI, QCI, and subscriber. Refer to the Accounting Profile Configuration Mode Commands chapter in the Command Line Interface Reference for more information on this command.

### Configuring GTP Throttling Feature

The GTP Throttling feature allows the operator to control the rate of incoming/outgoing messages on P-GW/GGSN.

#### Configuring the Outgoing Control Message Throttling

The following configuration helps to enable outgoing control message throttling.

```bash
configure
  context  context_name
    [no] gtpc overload-protection egress rlf-template  rlf_template_name
    throttling-overload-policy  throttling_overload_policy_name
end
```

#### Configuring the Incoming Control Message Throttling

The following configuration helps to enable incoming control message throttling.

```bash
configure
  context  context_name
    [no] gtpc overload-protection ingress msg-rate  msg_rate  [delay-tolerance
```

---

**PDN Gateway Configuration**

194

**P-GW Administration Guide, StarOS Release 21.8**
Configuring Local QoS Policy

The configuration examples in this section create a local QoS policy. A local QoS policy service can be used to control different aspects of a session, such as QoS, data usage, subscription profiles, or server usage, by means of locally defined policies.

Important
Use of the Local QoS Policy feature requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

Creating and Configuring a Local QoS Policy

The following configuration example enables a local QoS policy on the P-GW:

```bash
configure
    local-policy-service <name> -noconfirm
    ruledef <ruledef_name> -noconfirm
        condition priority <priority> <variable> match <string_value>
        condition priority <priority> <variable> match <int_value>
        condition priority <priority> <variable> nomatch <regex>
        exit
    actiondef <actiondef_name> -noconfirm
        action priority <priority> <action_name> <arguments>
        exit
    actiondef <actiondef_name> -noconfirm
        action priority <priority> <action_name> <arguments>
        exit
    eventbase <eventbase_name> -noconfirm
        rule priority <priority> event <list_of_events> ruledef <ruledef_name>
    actiondef <actiondef_name>
end
```

Notes:

- A maximum of 16 local QoS policy services are supported.
- A maximum 256 ruledefs are suggested in a local QoS policy service for performance reasons.
- The `condition` command can be entered multiple times to configure multiple conditions for a ruledef. The conditions are examined in priority order until a match is found and the corresponding condition is applied.
- A maximum of 256 actiondefs are suggested in a local QoS policy service for performance reasons.
- The `action` command can be entered multiple times to configure multiple actions for an actiondef. The actions are examined in priority order until a match is found and the corresponding action is applied.
- Currently, only one eventbase is supported and must be named "default".
• The **rule** command can be entered multiple times to configure multiple rules for an eventbase.

• A maximum of 256 rules are suggested in an eventbase for performance reasons.

• Rules are executed in priority order, and if the rule is matched the action specified in the action def is executed. If an event qualifier is associated with a rule, the rule is matched only for that specific event. If a qualifier of **continue** is present at the end of the rule, the subsequent rules are also matched; otherwise, rule evaluation is terminated on first match.

**Binding a Local QoS Policy**

**Option 1:** The following configuration example binds the previously configured local QoS policy:

```plaintext
configure
  context <pgw_context_name> -noconfirm
  apn <name>
    ims-auth-service <local-policy-service name>
  end
```

Notes:

• A maximum of 16 authorization services can be configured globally in the system. There is also a system limit for the maximum number of total configured services.

• Useful in case of emergency calls; PCRF is not involved.

**Option 2:** The following configuration example may also be used to bind the previously configured local QoS policy or a failure handling template:

```plaintext
configure
  context <pgw_context_name> -noconfirm
  ims-auth-service <auth_svc_name>
  policy-control
    associate failure-handling-template <template_name>
    associate local-policy-service <service_name>
  end
```

Notes:

• Only one failure handling template can be associated with the IMS authorization service. The failure handling template should be configured prior to issuing this command.

• The failure handling template defines the action to be taken when the Diameter application encounters a failure supposing a result-code failure, tx-expiry or response-timeout. The application will take the action given by the template. For more information on failure handling template, refer to the Diameter Failure Handling Template Configuration Mode Commands chapter in the Command Line Interface Reference.

• You must select "local-fallback" in the failure handling template to support fallback to local policy.

• To support fallback to local policy in case of failure at PCRF, the local policy service should be associated with an IMS authorization service. In case of any failures, the local policy template associated with the ims-auth service will be chosen for fallback.
Verifying Local QoS Policy

The following configuration example verifies if local QoS service is enforced:

```text
logging filter active facility local-policy level debug
logging active
show local-policy statistics all
```

Notes:

- Please take extreme caution not to use logging feature in console port and in production nodes.

Configuring X.509 Certificate-based Peer Authentication

The configuration example in this section enables X.509 certificate-based peer authentication, which can be used as the authentication method for IP Security on the P-GW.

---

**Important**

Use of the IP Security feature requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

---

The following configuration example enables X.509 certificate-based peer authentication on the P-GW.

In Global Configuration Mode, specify the name of the X.509 certificate and CA certificate, as follows:

```text
configure
certificate name <cert_name> pem url <cert_pem_url> private-key pem url <private_key_url>
ca-certificate name <ca_cert_name> pem url <ca_cert_url>
end
```

Notes:

- The `certificate name` and `ca-certificate list ca-cert-name` commands specify the X.509 certificate and CA certificate to be used.

- The PEM-formatted data for the certificate and CA certificate can be specified, or the information can be read from a file via a specified URL as shown in this example.

When creating the crypto template for IPSec in Context Configuration Mode, bind the X.509 certificate and CA certificate to the crypto template and enable X.509 certificate-based peer authentication for the local and remote nodes, as follows:

```text
configure
context <pgw_context_name> -noconfirm
crypto template <crypto_template_name> ikev2-dynamic
certificate name <cert_name>
ca-certificate list ca-cert-name <ca_cert_name>
authentication local certificate
authentication remote certificate
end
```

Notes:
• A maximum of 16 certificates and 16 CA certificates are supported per system. One certificate is supported per service, and a maximum of four CA certificates can be bound to one crypto template.

• The certificate name and ca-certificate list ca-cert-name commands bind the certificate and CA certificate to the crypto template.

• The authentication local certificate and authentication remote certificate commands enable X.509 certificate-based peer authentication for the local and remote nodes.

Configuring RFL Bypass Feature

The Bypass Rate Limit Function is an enhancement to the existing GTP Throttling feature. The RLF feature allows the operator to control the bypassing of some messages being throttled.

A new command option throttling-override-policy has been added to the existing CLI command gtpc overload-protection egress rlf-template rlf-temp which allows you to selectively by-pass throttling for a configured message type or for all messages in emergency call or priority call or call for the configured APN. A new CLI command mode throttling-override-policy has been also been introduced for Generic syntax for throttling override policy.

Configuring the Throttling Override Policy Mode

The following configuration helps to create a GTP-C Throttling Override Policy and to enter GTP-C Throttling Override Policy mode.

```
configure
throttling-override-policy throttling-override-policy_name
```

Notes:

Entering the above command sequence results in the following prompt:

```
[local] host_name(config-throttling-override-policy) #
```

Configuring the RLF Bypass Feature

The following configuration configures message types which can bypass the rate limiting function.

```
configure
throttling-override-policy throttling-override-policy_name
  [ default | no ] egress bypass-rlf pgw { msg-type { cbr | db r | ub r | emergency-call | earp-pl-list {1 | 2 | 3 | 4 | 5 … | 15 }+ | apn-names <apn-name1> <apn-name2> <apn-name3> }
end
```

Notes:

• If an empty throttling-override-policy is created, then the default values for all the configurables are zeros/disabled.

• If no throttling-override-policy is associated, then show service configuration for P-GW will show it as "n/a".

• Maximum number of throttling-override-policy that can be added are 1024. This limit is the same as max RLF templates.
Example

The following command configures Create Bearer Request message type at the P-GW node to bypass throttling.

```
  egress bypass-rlf pgw msg-type cbr
```

Auto Correction of VoLTE Sessions

Feature Description

When dynamic rules for IP Multimedia Subsystem (IMS) sessions are lost after a switchover, VoLTE calls are impacted. To recover the calls, the IMS sessions have to be cleared manually to re-establish the PDN with the correct dynamic rules. The Auto Correction of VoLTE Sessions feature enables a dynamic rule check such that when the P-GW receives an RAR (Re-Auth-Request) message, it automatically identifies and rectifies
the issue without manual intervention. This feature only applies to the APN that is configured on that uses the "RAR" message as a trigger for the check.

**How It Works**

After the APN receives any RAR message from the Policy Control and Charging Rules Function (PCRF), a Re-Auth-Answer (RAA) message is immediately sent. When the feature is enabled, an additional check is done at the P-GW to verify if there are any dynamic rules associated with the default bearer. Assuming the Session Initiation Protocol (SIP) rule on the default bearer is recovered, other dedicated bearers are also recovered. If dynamic rules are not associated with the default bearer, the call is terminated. Then, a Delete Bearer Request is sent for the default bearer with the cause code - Reactivation Required. To ensure the reason code is sent, the APN must be configured with "pdn-behavior ims". Subsequently, a Credit-Control-Request-Type (CCR-T) is sent to PCRF and other diameter interfaces (s6b, Gy, and Rf). Thereby, the automatic recovery procedure involves termination of a subscriber connection when an anomaly is detected. The subscriber has to then reconnect to the network. The mobile originated or terminated call is rejected for the subscriber where the dynamic rules are lost after a switchover.

**Configuring the Auto Correction of VoLTE Sessions Feature**

The following section provides the configuration commands to enable or disable the feature.

**Enabling or Disabling the Dynamic Rule Check**

The new CLI command, `pdn validate-post-switchover`, is added to enable the dynamic rule check for the auto correction of the VoLTE session. To enable this feature, configure the command at the base APN. This feature should be configured only for the VoLTE/IMS APNs for which auto recovery is required.

This feature is disabled by default.

To enable or disable the feature, enter the following commands:

```plaintext
configure context <context_name>
    apn <apn_name>
       [no] pdn validate-post-switchover
end
```

**Notes:**

- `no`: Disables the configured Auto correction of VoLTE sessions on the base APN.
- `pdn validate-post-switchover`: Validates the dynamic rules for automatic recovery after a switchover.

**Monitoring and Troubleshooting**

This section provides information regarding show commands and/or their outputs in support of the Auto Correction of VoLTE Sessions feature.

**Show Commands**

This section lists all the show commands available to monitor this feature.
show configuration apn

The above CLI command is introduced to check if the feature is enabled at the APN level. If "pdn validate-post-switchover" is present then the feature is enabled.

show active-charging service statistics

This command has been modified to display the following output:

show active-charging service statistics
ACS Data Statistics:
Packets Dropped due to System-Limit L4-Flows: 0
Packets Dropped - Invalid Len in IP Hdr(Dwlink): 0
Packets Dropped - Invalid Ver in IP Hdr(Dwlink): 0
Packets Not Processed due to Flow-limit: 0
Packets Not Processed due to CLP not found: 0
Packets Dropped CLP in Preservation Mode: 0
Total Pkts: 0
Total Collisions in data session hash: 0

ACS Reject Reason:

No Grp-of-Rdef Match: 0
Bulk Statistics

This section lists all the bulk statistics that have been added, modified, or deprecated to support this feature.

ECS Schema

This section displays the new bulk stats that have been added to indicate dynamic recovery failure:

- **dyn_rule_recovery_failure**:
  
The total number of sessions terminated due to dynamic rule recovery failure.

- **dyn_rule_recovery_num_sess_not_terminated**:
  
The total number of sessions that are not terminated after switchover because dynamic rules were not installed on the default bearer.
Monitoring the Service

This chapter provides information for monitoring service status and performance using the `show` commands found in the Command Line Interface (CLI). These commands have many related keywords that allow them to provide useful information on all aspects of the system ranging from current software configuration through call activity and status.

The selection of keywords described in this chapter is intended to provide the most useful and in-depth information for monitoring the system. For additional information on these and other `show` command keywords, refer to the Command Line Interface Reference.

In addition to the CLI, the system supports the sending of Simple Network Management Protocol (SNMP) traps that indicate status and alarm conditions. Refer to the SNMP MIB Reference for a detailed listing of these traps.

This chapter includes the following topics:

- Monitoring System Status and Performance, on page 203
- Clearing Statistics and Counters, on page 209

Monitoring System Status and Performance

This section contains commands used to monitor the status of tasks, managers, applications and other software components in the system. Output descriptions for most of the commands are located in the Counters and Statistics Reference.

**Including the IMSI/IMEI in System Event Logs of Type Error and Critical**

The P-GW can be configured to provide the IMSI/IMEI in the event log details for the following system event logs of type error and critical, if available. If the IMSI is not available, the P-GW will make a best effort to obtain the IMEI.

Configuring the P-GW to Include the IMSI/IMEI in System Event Logs of Type Error and Critical

The include-ueid keyword has been added to the logging command in Global Configuration Mode. When enabled, the previously mentioned system events of type error and critical will provide the IMSI/IMEI in the logging details, if available.

```
configure
  logging include-ueid
  no logging include-ueid
end
```

Notes:

- `no` disables the inclusion of the IMSI/IMEI in system event logs of type error and critical.
- Use the `show configuration` command to view the current configuration status of the `logging include-ueid` command.
  - logging include-ueid (when enabled)
  - no logging include-ueid (when disabled).

Clearing Statistics and Counters

It may be necessary to periodically clear statistics and counters in order to gather new information. The system provides the ability to clear statistics and counters based on their grouping (PPP, MIPHA, MIPFA, etc.).

Statistics and counters can be cleared using the CLI `clear` command. Refer to the `Command Line Reference` for detailed information on using this command.

**Feature Changes**

Currently, P-GW sends 3GPP-User-Location-Info AVP in CCR-U for the event trigger Successful_Resource_Allocation, only if there is a change in the ULI. This feature has been implemented to comply with the 3GPP specifications. With this feature, P-GW sends 3GPP-User-Location-Info in CCR-U for the event trigger Successful_Resource_Allocation, even if there is no a change in the ULI. If the Resource-Allocation-Notification AVP is included in the Charging-Rule-Install AVP, 3GPP-User-Location-Information is included in the CCR-U sent towards the PCRF.

**Limitations**

Following are the limitations of this feature:

1. This feature works with diameter dictionary dpca-custom8.
2. Resource-Allocation-Notification AVP should be included within a Charging-Rule-Install AVP while installing/modifying rule.
CHAPTER 5

5G Non Standalone

This chapter describes the 5G Non Standalone (NSA) feature in the following sections:

The 5G NSA solution for SAEGW supports the following functionality in this release:

• Feature License
• Dedicated Bearers
• Gy interface
• URLLC QCI

First introduced.                                                                                 21.6

Feature Description

Important

5G NSA feature is license controlled from release 21.8 onwards. Contact your Cisco account representative for detailed information on specific licensing requirements.

The 5G NSA solution for SAEGW supports the following functionalists:

• High Throughput

5G NR offers downlink data throughput up to 20 Gbps and uplink data throughput up to 10 Gbps. Some interfaces in EPC have the support to handle (encode/decode) 5G throughput. For example, NAS supports up to 65.2 Gbps (APN-AMBR) and S5/S8/S10/S3 (GTP-v2 interfaces) support up to 4.2 Tbps. The diameter interfaces S6a and Gx support only up to 4.2Gbps throughput, S1-AP supports only up to 10 Gbps and NAS supports up to 10 Gbps (MBR, GBR). New AVP/IE have been introduced in S6a, Gx, S1-AP, and NAS interfaces to support 5G throughput. See the How It Works section for more information.

• DCNR Support on P-GW:

Supports configuration of DCNR feature at the P-GW-service, by configuring “Extended-BW-NR” feature in IMSA service. Advertises the DCNR feature support by sending “Extended-BW-NR” feature bit in “Feature-List-ID-2” towards PCRF. Forwards AVP "Extended-APN-AMBR-UL" and "Extended-APN-AMBR-DL" in CCR messages when it receives APN-AMBR values greater than 4.2Gbps from MME/S-GW. Decodes the extended AVP "Extended-APN-AMBR-UL" and "Extended-APN-AMBR-DL" when it is received from PCRF.

• Ultra Low Latency Support

Supports 5G requirements of Ultra-Reliable and Low Latency Communications (URLLC). 3GPP introduced URLCC QCI 80 (Non-GBR resource type), QCI 82 and 83 (GBR resource type). P-GW establishes default bearers with URLLC QCI 80, which is typically used by low latency eMBB applications. P-GW establishes dedicated bearers with URLLC QCI 82 and 83 (also with QCI 80 if dedicated bearers of Non-GBR type to be established), which is typically used by discrete automation services (industrial automation).

• Dynamic S-GW and P-GW selection by MME for DCNR capable UE

When DCNR capable UE attempts to register in MME and when all DCNR validations are successful (for example DCNR feature configuration on MME, HSS not sending access-restriction for NR, and son on), the MME sets “UP Function Selection Indication Flags” IE with DCNR flag set to 1 in “Create Session Request” message. This feature is relevant for CUPS architecture to help SGW-C and PGW-C to select SGW-U and PGW-U which supports dual connectivity with NR. When S-GW receives this IE over S11, it sends this IE over S5 to P-GW. S-GW ignores IE if it receives it in Non-CUPS deployment.
APN-Backoff Timer Support

This chapter describes StarOS support for the APN-Backoff Timer feature on the P-GW and SAEGW.

- Feature Description, on page 217
- Configuring APN Backoff Timer Support on the P-GW/SAEGW, on page 219
- Monitoring the Feature, on page 220

Feature Description

Previously, the P-GW did not distinguish signaling traffic from Delay Tolerant or Low Priority devices such as low priority machine-to-machine traffic.

The UE was able to indicate its device profile to the MME via NAS and Attach Request messages. The MME was able to pass this information to the P-GW via the Signaling Priority Indication Information Element (IE) on the S5 interface. Some UEs may not have supported the sending of the Signaling Priority Indication IE on the S5 interface to the P-GW. As a result, the P-GW could not distinguish between the signaling types. With the current release, the P-GW can distinguish between these signaling types.

In addition, during overload situations, the P-GW previously allowed new sessions from Low Access Priority Indicator (LAPI) devices and treated the traffic from LAPI devices with the same priority as the normal UEs. With the current StarOS release, during overload conditions, the P-GW can be configured to back off the traffic that is identified as LAPI. The identification is based on either the APN configuration or the Signaling Priority Indicator IE.

The backoff timer algorithm and the R12 GTP-C Load/Overload Control algorithm work together. This feature provides the benefit of rejecting low priority calls in turn allowing more bandwidth for high priority calls.

Functionality

The following functionality has been implemented to support the APN Backoff Timer functionality:

1. The Signaling Priority Indication IE on the S5 interface in the Create Session Request message identifies the low priority devices.

2. A LAPI APN can be configured. Any call landing on that APN is considered a LAPI call.

3. A back off timer value is configured in the APN. The backoff timer is sent in Create Session Response messages in the P-GW Back-Off Timer IE.
4. If the following conditions are met, the call is rejected with the cause APN Congestion. The configured backoff timer value is inserted in the Back Off Timer IE in the Create Session Response message.
   - Once an incoming call is identified as LAPI due to condition 1 or 2 above.
   - The P-GW is in the overload state.
   - The backoff timer is configured.

5. The M2M license must be present and enabled on the system. The GTP-C Load/Overload feature's configuration and backend reporting of overload parameters works with the M2M license.

6. In some dictionaries (for example, custom35) CDRs have a LAPI field for LAPI calls. This field is populated when the Signaling Priority Indication IE indicates that the call is a LAPI call. However, if the call is of type LAPI due to the LAPI APN configuration, then the CDR should not have the LAPI field.

7. Bulk statistics, counters, and statistics have been implemented at the APN and P-GW service level to show the number of calls rejected due to the APN Backoff Timer feature.

GTP-C Overload Feature and the M2M License

To detect whether the P-GW/SAEGW is in the overload state, the GTP-C Overload feature's framework has been used. It is tied to the M2M license so that only overload configuration and reporting of the overload state is enabled. The remaining overload features such as, sending the OCI towards the peers, throttling, and receiving OCIs from peers do not work. This leads to the following behavioral scenarios:

If a Call is a LAPI call and the Backoff Timer is Configured and the P-GW is in the Overload State:
   - Only M2M License: Call is rejected with cause APN Congestion.
   - Only GTP-C Overload Enabled: Not applicable as backoff timer cannot be configured.
   - Both M2M and Overload Enabled: Call is rejected with cause APN Congestion. That is, LAPI takes priority over the GTP-C Load/Overload feature.

If a Call is Not LAPI or Backoff Timer is Not Configured and the P-GW is in the Overload State:
   - Only M2M License Enabled: No impact. Call is accepted normally.
   - Only Overload License Enabled: Call accepted. OCI will be sent in the Create Session Response message. Overload feature works normally.
   - Both M2M and Overload Features Enabled: Call accepted. OCI is sent in the Create Session Response message. Overload feature works normally. Backoff Timer feature is ignored.

Licensing

The APN Backoff Timer feature requires that the M2M license be enabled on the P-GW/SAEGW. Contact your Cisco account or support representative for licensing details.
Configuring APN Backoff Timer Support on the P-GW/SAEGW

This section describes how to configure APN Backoff Timer Support on the P-GW/SAEGW. The procedure consists of the following tasks:

1. Configuring LAPI Behavior
2. Configuring the Backoff Timer
3. Verifying the Configuration

Configuring LAPI Behavior

Use the following example to configure LAPI behavior:

```
configure
  apn apn_name
    pdn-behavior lapi
  end
end
```

To disable LAPI behavior:

```
configure
  apn apn_name
    no pdn-behavior
  end
end
```

Notes:

- `pdn-behavior lapi` configures the APN as a LAPI APN.
- `no pdn-behavior` disables the LAPI APN configuration.

Caution

Do not configure the emergency APN and `pdn-behavior lapi` settings in the same APN, as these two settings are mutually exclusive. If both settings are configured in the same APN the `pdn-behavior lapi` configuration takes priority. As a result, if both settings are configured and the system is overloaded, the call will be rejected.

To determine if both settings are configured in the same APN, execute the `show configuration error verbose` command in `Exec Mode`. The command output contains a warning if both settings are configured in the same APN.

Configuring the APN Backoff Timer and Jitter Values

The P-GW requires a fixed value and a jitter to introduce randomness in the Backoff Timer value that is returned to the MME for different sessions; this helps prevent a session storm after the Backoff Timer expiry.

Use the example below to configure the APN Backoff Timer and Jitter Values:

```
configure
  apn apn_name
```
Verifying the Configuration

To disable Backoff Timer functionality:

```config
configure
  apn apn_name
    no backoff timer-value
end
```

Notes:

- **backoff timer-value seconds** configures the backoff timer value, in seconds. Valid entry is an integer from 0 to 576000 seconds. There is no default setting.
- **jitter seconds** configures the jitter value, in seconds. Valid entry is from 0 to 1000 seconds. There is no default setting.

Verifying the Configuration

To verify the configuration:

In *Exec Mode*, issue the `show apn name apn_name` command, `apn_name` is the name of the APN for which you want to view configuration settings.

In the command output, look for the following fields:

- pdn behavior: `<lapi>` or `<no pdn-behavior>`
- Backoff Timer Value: `<seconds>` Jitter: `<seconds>`

Verify that the configuration settings are correct. If any of the settings are incorrect, use the configuration procedure in this chapter to reconfigure the incorrect setting(s).

Monitoring the Feature

This section provides information that enables operators to monitor the APN Backoff Timer feature.

Bulk Statistics

APN Schema

The following bulk statistics have been added to the APN Schema to support the APN Backoff Timer feature:

- rej-pdn-backofftimer

P-GW Schema

The following bulk statistic has been added to the P-GW schema to support the APN Backoff Timer feature.

- sessstat-rej-pdn-backofftimer
SAEGW Schema
The following bulk statistic has been added to the SAEGW schema to support the APN Backoff Timer feature:
- pgw-sessstat-rej-pdn-backofftimer

Show Command Output
This section describes the Exec Mode show commands and output available to monitor the APN Backoff Timer Support on the P-GW/SAEGW feature.

show apn name
The output of this command has been enhanced to show the configured backoff timer, jitter, and PDN behavior settings. These settings appear only if the M2M feature license is enabled.
- pdn behavior: lapi
- Backoff Timer Value: <seconds> Jitter: <seconds>

show apn statistics
The output of this command has been enhanced to indicate the number of PDNs rejected as a result of the configured backoff timer value.
- Number of PDNs rejected due to backoff algorithm:

show configuration apn name
The output of this command provides the operator with the current APN Backoff Timer settings.
- pdn-behavior lapi (if feature is enabled)
- backoff timer-value <secs> jitter <secs>

show pgw-service statistics
The output of this command has been enhanced to provide the total number of PDNs rejected due to the configured backoff timer value.
- PDNs Rejected By Reason:
  - APN-Backoff Timer

show session disconnect-reasons
The following disconnect reason has been added to support the APN Backoff Timer feature.
- apn-congestion
show session disconnect-reasons
CHAPTER 7

Backup and Recovery of Key KPI Statistics

This feature allows the backup of GGSN, P-GW, SAEGW, and/or S-GW counters for recovery of key KPI counter values after a session manager (SessMgr) restart.

This chapter includes the following information:

- Feature Description, on page 223
- How It Works, on page 223
- Configuring Backup Statistics Feature, on page 225

Feature Description

Before the Backup and Recovery of Key KPI Statistics feature was implemented, statistics were not backed up and could not be recovered after a SessMgr task restart. Due to this limitation, monitoring the KPI was a problem as the GGSN, P-GW, SAEGW, and S-GW would lose statistical information whenever task restarts occurred.

KPI calculation involves taking a delta between counter values from two time intervals and then determines the percentage of successful processing of a particular procedure in that time interval. When a SessMgr crashes and then recovers, the GGSN, P-GW, SAEGW, and S-GW lose the counter values - they are reset to zero. So, the KPI calculation in the next interval will result in negative values for that interval. This results in a dip in the graphs plotted using the KPI values, making it difficult for operations team to get a consistent view of the network performance to determine if there is a genuine issue or not.

This feature makes it possible to perform reliable KPI calculations even if a SessMgr restart occurs.

How It Works

A key set of counters used in KPI computation will be backed up for recovery if a SessMgr task restarts. The counters that will be backed up are determined by the KPIs typically used in several operator networks.

The backup of counters is enabled or disabled via configuration. The configuration specifies the product (GGSN, P-GW, SAEGW, and/or S-GW) for which counters will be backed up and also a time interval for the backup of the counters.
Architecture

When this feature is enabled (see Configuring Backup Statistics Feature below), the GGSN, P-GW, SAEGW, and/or S-GW only backs up the counters maintained at the SessMgr. The recovery function does not need to be configured or started as it occurs automatically as needed when the feature is enabled.

The counters are backed up to the AAAMgr that is paired with the SessMgr.

Checkpointing

Node-level statistics are checkpointed at AAAMgr. Once statistics are backed up for a specific product, all the associated services, such as eGTP-C and GTP-U statistics, are also checkpointed.

Recovery

When SessMgr restarts, recovery is performed by receiving all the stored statistics from the mapped AAAMgr and the recovered values are added to the backup counters maintained at per-service level. This will not impact session recovery time as the backed up counters are pushed to SessMgr only after session recovery is complete.

Since session recovery is complete, the session managers may start processing calls. In such cases, the counters will continue to be incremented. The recovered values of the corresponding counters will always be added to the existing counters. Gauge counters are checkpointed but not recovered.

Order of Statistics Collection

The upper limit of checkpoint messaging is a maximum of 1 MB. Before picking any node to checkpoint, available memory is checked. If memory is insufficient, the whole node is discarded.

Since there is 1 MB limit, nodes/statistics to checkpoint are prioritized as follows:

1. SAEGW statistics:
   - P-GW and S-GW service node-level statistics collected

2. P-GW service node configuration will store the following statistics:
   - P-GW, eGTP-C ingress, GTP-U ingress, per-interface (s2a, s2b, s5s8), and GGSN (if associated) statistics collected
   - SAEGW associated P-GW service statistics not collected

3. S-GW service node configuration will store the following statistics:
   - S-GW, eGTP-C ingress/egress, and GTP-U ingress/egress statistics collected
   - SAEGW associated S-GW service statistics not collected

4. GGSN statistics:
   - GGSN service statistics, if not associated with P-GW service, collected

5. Session disconnect reasons collected if GGSN/P-GW/SAEGW/S-GW is enabled

Error Handling

If adding new statistics is going to cause overflow of 1 MB buffer, that service and the corresponding node will not be included. Checkpointing of any further nodes will also be stopped. Error level log will be flagged if total memory requirement goes above 1 MB.
Limitations

- A backup interval must be specified and counters are backed up only at the specified interval. For example, if the backup interval is specified as 5 minutes, then counters are backed up every 5 minutes. Suppose backup happened at Nth minute and the configured backup interval is for every 5 minutes, then if a task crash happens at N+4 minutes, the GGSN, P-GW, SAEGW, and/or S-GW recovers only the values backed up at Nth minute and the data for the past 4 minutes is lost.

- Only statistics maintained at the SessMgr are backed up. Statistics at other managers are not backed up or recovered.

- The following statistics are not considered for backup:
  - APN-level statistics
  - eGTP-C APN-QCI statistics
  - DemuxMgr statistics

- The CLI command `clear statistics` will not trigger checkpoint to delete the node statistics on AAAMgr. New checkpoint after timer expiry will overwrite the statistics.

- Maximum of 1 MB of statistics will be stored on AAAMgr. Services after the maximum size limit are not backed up.

- Setting the backup interval to shorter periods of time causes higher system overhead for checkpointing. Alternately, setting the backup interval to longer periods of time results in lower system overhead for checkpointing but higher probability of hitting the 1 MB storage limit.

- If SessMgr restarts and AAAMgr restarts before SessMgr recovers statistics from AAAMgr, then backed up statistics are lost.

- This feature is not applicable for ICSR.

Configuring Backup Statistics Feature

For the Backup and Recovery of Key KPI Statistics feature to work, it must be enabled by configuring the backup of statistics for the GGSN, P-GW, SAEGW, and/or S-GW.

Configuration

The following CLI commands are used to manage the functionality for the backing up of the key KPI statistics feature.

**Enabling**

The following configures the backup of statistics for the GGSN, P-GW, SAEGW, and/or S-GW and enables the Backup and Recovery of Key KPI Statistics feature.

```plaintext
configure
  statistics-backup { ggsn | pgw | saegw | sgw }

exit
```
Setting the Backup Interval

The following command configures the number of minutes (0 to 60) between each backup of the statistics. When the backup interval is not specified, a default value of 5 minutes is used as the backup interval.

```
configure
  statistics-backup-interval minutes
exit
```

**Important**

Setting the backup interval to shorter periods of time causes higher system overhead for checkpointing. Alternately, setting the backup interval to longer periods of time results in lower system overhead for checkpointing but higher probability of hitting the 1 MB storage limit.

Disabling

The following configures the GGSN, P-GW, SAEGW, and/or S-GW to disable the backing up of statistics for the GGSN, P-GW, SAEGW, and/or S-GW.

```
configure
  no statistics-backup { ggsn | pgw | saegw | sgw }
exit
```

Verifying the Backup Statistics Feature Configuration

Use either the `show configuration` command or the `show configuration verbose` command to display the feature configuration.

If the feature was enabled in the configuration, two lines similar to the following will appear in the output of a `show configuration | verbose` command:

```
statistics-backup  pgw
statistics-backup-interval  5
```

Notes:

- The interval displayed is 5 minutes. 5 is the default. If the `statistics-backup-interval` command is included in the configuration, then the 5 would be replaced by the configured interval number of minutes.
- If the command to disable the feature is entered, then no statistics-backup line is displayed in the output generated by a `show configuration | verbose` command.
Bulkstats for Average Data Rate per IPPOOL

Feature Description

In this enhancement, bulkstat support has been added for fetching subscriber average data-rate per IP pool (cumulative of all sessmgr) for all the IP pools configured in the system.
Monitoring and Troubleshooting

This section provides information on how to monitor and troubleshoot using show commands and bulk statistics available to support of this feature.

Bulk Statistics

The following bulk stats have been added to the respective schemas as part of this feature:

Datarate-IPPool Schema

The following bulk statistics are added to the Datarate-IPPool Schema:

- `sess-datarate-ippool-name` - Indicates name of the ip pool for which average data rates are fetched.
- `sess-ave-rate-fuser-bps` - indicates average data-rate(bits/sec) from user in uplink direction per ip pool basis.
- `sess-ave-rate-tuser-bps` - indicates average data-rate(bits/sec) to user in downlink direction per ip pool basis.
- `sess-ave-rate-fuser-pps` - indicates average packets/sec from user in uplink direction per ip pool basis.
- `sess-ave-rate-tuser-pps` - indicates average packets/sec to user in downlink direction per ip pool basis.

Show Commands and/or Outputs

This section provides information regarding show commands and their outputs for this feature.

show bulkstats schemas

This command has been modified to display the following output:

```
Bulk Statistics Server Configuration:
  Server State:        Enabled
  File Limit:          7500 KB
  Sample Interval:     10 minutes (0D 0H 10M)
  Transfer Interval:   15 minutes (0D 0H 15M)
  Receiver Mode:       Secondary-on-failure

------------------- Schemas for File 1----------------------------------------

```

show bulkstats data

This command has been modified to display the Bulk Statistics Server Configuration:

```
Server State:        Enabled
File Limit:          7500 KB
```
show subscribers data-rate ip-pool <pool_name>

This command has been modified to display the following output:

- **Total Subscribers**: 1
- **Active**: 1, **Dormant**: 0
- **Peak rate from user (bps)**: 672, **Peak rate to user (bps)**: 672
- **Average rate from user (bps)**: 455, **Average rate to user (bps)**: 455
- **Sust rate from user (bps)**: 1, **Sust rate to user (bps)**: 1
- **Peak rate from user (pps)**: 1, **Peak rate to user (pps)**: 1
- **Average rate from user (pps)**: 0, **Average rate to user (pps)**: 0

Bulkstats for GTP-C Messages by ARP Value

This chapter describes StarOS support for the Bulkstats for GTP-C Messages by ARP Value feature on the P-GW, SAE-GW, and S-GW.

- Feature Description, on page 231
- Performance Indicator Changes, on page 232

Feature Description

To comply with the “Long Term Evolution (LTE) Access Network Government Industry Requirements (GIR) for National Security/Emergency Preparedness (NS/EP) Next Generation Network (NGN) Priority” to support emergency calls over Voice over LTE (VoLTE), several Key Performance Indicators (KPIs) have been introduced with this feature. This feature is utilized to collect statistics for total number of GTP-C messages received for Enhanced Multimedia Priority Service (eMPS) session for specified interval (in minutes). The list of GTP-C messages are defined in accordance with the GIR document. As part of this feature:

- The S-GW will generate peg counts of the total number of received GTP-C messages containing an Allocation and Retention Priority (ARP), chosen from the set of values allocated for NS/EP NGN-PS use, for a specified interval (in minutes). This peg count is administered at the S-GW level.

- The P-GW will generate peg counts of the total number of received GTP-C messages containing an ARP, chosen from the set of values allocated for NS/EP NGN-PS use, for a specified interval (in minutes). This peg count is administered at the specific P-GW level.

- The peg counts for GTP-C messages are broken down by message type similar to existing GTP-C message counters. The bulkstats are broken down by applicable S-GW and P-GW service and S5, S8, S11, and S4 interfaces.

In earlier releases, bulkstats were not present for eMPS session. With this release 21.1, bulkstats are added for eMPS session/message.

Piggy-back Message

For piggy-back messages, if either of the messages have matching ARP or result into converting non-eMPS session to eMPS session, then both messages are counted as eMPS message and corresponding statistics for both messages are incremented.

If Modify Bearer Request is piggy-backed with Create Bearer Response on S11 interface of S-GW and Create Bearer Response result into converting non-eMPS session into eMPS session, then Modify Bearer Response statistics will not increment for this Modify Bearer Request.
Bulkstats Collection and Reset

Bulkstats are added under eGTP-C Schema and pgw-egtpe-s5s8 Schema. These eMPS bulkstats in eGTP-C Schema and pgw-egtpe-s5s8 Schema holds value only for a bulkstat interval, that is, value of these bulkstats shows number of eMPS messages exchanged during the bulkstat interval.

Limitations

This section identifies the known limitations of the feature:

- Peer level and APN level statistics are not collected.
- MPS statistics recovery is not supported.
- MPS statistics are not collected for CSReq, DDNReq, and change notification messages rejected by demux with ARP for eMPS sessions.
- MPS statistics are not collected for retried/re-transmitted messages.

Licensing

Important

Bulkstats for GTP-C Messages by ARP Value feature requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

Performance Indicator Changes

S-GW Ingress S4 Interface

The following CLI commands are modified to display the eMPS session related GTP-C message statistics for S4 interface of S-GW Ingress:

- `show egtpc statistics interface sgw-ingress interface-type s4`
  - `interface-type`: Displays interface level GTP-C message statistics
  - `s4`: Displays interface level GTP-C message statistics for S4 interface

- `show egtpc statistics egtp-service sgw_egtpc_service_name interface-type s4`
  - `s4`: Interface type S4 for S-GW eGTP-C interface

The output of the above CLI commands displays the following new parameters:

- **Total eMPS Statistics**: Cumulative GTP-C message statistics for messages received/transmitted on eMPS Sessions.
- **Current interval eMPS Statistics**: GTP-C message statistics for messages received/transmitted on eMPS Sessions for current statistics collection interval. Statistics collection interval will be same as...
bulkstats collection interval. If bulk stats collection is not configured, then Current MPS Statistics will be same as Total MPS Statistics.

- **Create Session Request (Total RX):** This counter will be incremented by S-GW when it receives Create session request message on S4 interface containing an ARP value configured in MPS Profile.
- **Create Session Response (Total TX):** This counter will be incremented by S-GW when it transmits Create session response message on S4 interface containing an ARP value configured in MPS Profile.

### S-GW Ingress S11 Interface

The following CLI commands are modified to display the eMPS session related GTP-C message statistics for S11 interface of S-GW Ingress:

- `show egtpc statistics interface sgw-ingress interface-type s11`
  - `interface-type`: Displays interface level GTP-C message statistics
  - `s11`: Displays interface level GTP-C message statistics for S11 interface

- `show egtpc statistics egtp-service sgw_egtpc_service_name interface-type s11`
  - `s11`: Interface type S11 for S-GW eGTP-C interface

The output of the above CLI commands displays the following new parameters:

- **Total eMPS Statistics:** Cumulative GTP-C message statistics for messages received/transmitted on eMPS Sessions.
- **Current interval eMPS Statistics:** GTP-C message statistics for messages received/transmitted on eMPS Sessions for current statistics collection interval. Statistics collection interval will be same as bulkstats collection interval. If bulk stats collection is not configured, then Current MPS Statistics will be same as Total MPS Statistics.
- **Create Session Request (Total RX):** This counter will be incremented by S-GW when it receives Create session request message on S11 interface containing an ARP value configured in MPS Profile.
- **Create Session Response (Total TX):** This counter will be incremented by S-GW when it transmits Create session response message on S11 interface containing an ARP value configured in MPS Profile.
- **Modify Bearer Request (Total RX):** This counter will be incremented by S-GW when it receives Modify Bearer request message on S11 interface containing an ARP value configured in MPS Profile.
- **Modify Bearer Response (Total TX):** This counter will be incremented by S-GW when it transmits Modify Bearer response message on S11 interface containing an ARP value configured in MPS Profile.
- **Create Bearer Request (Total TX):** This counter will be incremented by S-GW when it transmits Create Bearer request message on S11 interface containing an ARP value configured in MPS Profile.
- **Create Bearer Response (Total RX):** This counter will be incremented by S-GW when it receives Create Bearer response message on S11 interface containing an ARP value configured in MPS Profile.
- **Downlink Data Notification (Total TX):** This counter will be incremented by S-GW when it transmits Downlink Data Notification message on S11 interface containing an ARP value configured in MPS Profile.
• **Downlink Data Notification Ack (Total RX):** This counter will be incremented by S-GW when it receives Downlink Data Notification Ack message on S11 interface containing an ARP value configured in MPS Profile.

• **Update Bearer Request (Total TX):** This counter will be incremented by S-GW when it transmits Update Bearer request message on S11 interface containing an ARP value configured in MPS Profile.

• **Update Bearer Response (Total RX):** This counter will be incremented by S-GW when it receives Update Bearer response message on S11 interface containing an ARP value configured in MPS Profile.

**S-GW Egress GTP-based S5/S8 Interface**

The following CLI commands are modified to display the eMPS session related GTP-C message statistics for S5/S8 interface of S-GW Egress:

- `show egtpc statistics interface sgw-egress interface-type s5s8`
  - `interface-type`: Displays interface level GTP-C message statistics
  - `s5s8`: Displays interface level GTP-C message statistics for S5/S8 interface

- `show egtpc statistics egtp-service sgw_egtp_service_name interface-type sgw-s5s8`
  - `sgw-s5s8`: Interface type S5/S8 for S-GW eGTP-C interface

The output of the above CLI commands displays the following new parameters:

• **Total eMPS Statistics:** Cumulative GTP-C message statistics for messages received/transmitted on eMPS Sessions.

• **Current interval eMPS Statistics:** GTP-C message statistics for messages received/transmitted on eMPS Sessions for current statistics collection interval. Statistics collection interval will be same as bulkstats collection interval. If bulk stats collection is not configured, then Current MPS Statistics will be same as Total MPS Statistics.

• **Create Session Request (Total TX):** This counter will be incremented by S-GW when it transmits Create session request message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Create Session Response (Total RX):** This counter will be incremented by S-GW when it receives Create session response message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Modify Bearer Request (Total TX):** This counter will be incremented by S-GW when it transmits Modify Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Modify Bearer Response (Total RX):** This counter will be incremented by S-GW when it receives Modify Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Create Bearer Request (Total RX):** This counter will be incremented by S-GW when it receives Create Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Create Bearer Response (Total TX):** This counter will be incremented by S-GW when it transmits Create Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.

• **Update Bearer Request (Total RX):** This counter will be incremented by S-GW when it receives Update Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.
• **Update Bearer Response (Total TX):** This counter will be incremented by S-GW when it transmits Update Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.

**P-GW Ingress GTP-based S5/S8 Interface**

The following CLI commands are modified to display the eMPS session related GTP-C message statistics for S5/S8 interface of P-GW Ingress:

- `show egtpc statistics interface pgw-ingress interface-type s5s8`
- `show egtpc statistics egtp-service pgw_egtpc_service_name interface-type s5s8`
  - *s5s8:* Interface type S5/S8 for P-GW eGTP-C interface.

The output of the above CLI commands displays the following new parameters:

- **Total eMPS Statistics:** Cumulative GTP-C message statistics for messages received/transmitted on eMPS Sessions.
- **Current interval eMPS Statistics:** GTP-C message statistics for messages received/transmitted on eMPS Sessions for current statistics collection interval. Statistics collection interval will be same as bulkstats collection interval. If bulk stats collection is not configured, then Current MPS Statistics will be same as Total MPS Statistics.
- **Create Session Request (Total RX):** This counter will be incremented by P-GW when it receives Create session request message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Create Session Response (Total TX):** This counter will be incremented by P-GW when it transmits Create session response message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Modify Bearer Request (Total RX):** This counter will be incremented by P-GW when it receives Modify Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Modify Bearer Response (Total TX):** This counter will be incremented by P-GW when it transmits Modify Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Create Bearer Request (Total TX):** This counter will be incremented by P-GW when it receives Create Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Create Bearer Response (Total RX):** This counter will be incremented by P-GW when it receives Create Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Update Bearer Request (Total TX):** This counter will be incremented by P-GW when it transmits Update Bearer request message on S5/S8 interface containing an ARP value configured in MPS Profile.
- **Update Bearer Response (Total RX):** This counter will be incremented by P-GW when it receives Update Bearer response message on S5/S8 interface containing an ARP value configured in MPS Profile.

**clear egtpc**

The following CLI commands are modified to clear eMPS statistics at interface level and eGTP-C service level:
• clear egtpc statistics interface-type interface-pgw-ingress interface s5s8: Clears interface statistics along with eMPS statistics for all eGTP-C services of P-GW Ingress type and S5/S8 interface.

• clear egtpc statistics interface-type interface-sgw-ingress interface-sgw-egress interface s4 | s11 | sgw-s5s8: Clears interface statistics along with eMPS statistics for all eGTP-C services of S-GW Ingress type and S4 or S11 interface/S-GW Egress type and S5/S8 interface.

• clear egtpc statistics egtp-service pgw_egtpc_service_name interface [s5s8]: Clears interface statistics along with eMPS statistics for all P-GW eGTP-C services and S5/S8 interface.

• clear egtpc statistics egtp-service sgw_egtpc_service_name interface [s11 | s4 | sgw-s5s8]: Clears interface statistics along with eMPS statistics for all S-GW eGTP-C services and S4 or S11 or S5/S8 interface.

### P-GW eGTP-C S5/S8 Schema

The following new bulk statistics variables are added to the P-GW eGTP-C S5/S8 schema in support of this feature:

• tun-recv-cresessreq-emps – The total number of tunnel - create session request - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-sent-cresessresp-emps – The total number of tunnel - create session response - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-recv-modbearerreq-emps – The total number of tunnel - modify bearer request - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-sent-modbearerresp-emps – The total number of tunnel - modify bearer response - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-sent-crebearerreq-emps – The total number of tunnel - create bearer request - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-recv-crebearerresp-emps – The total number of tunnel - create bearer response - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-sent-updbearerreq-emps – The total number of tunnel - update bearer request - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

• tun-recv-updbearerresp-emps – The total number of tunnel - update bearer response - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.

### eGTP-C Schema

The following new bulk statistics variables are added to the eGTP-C schema in support of this feature:

• s11-tun-recv-cresessreq-emps – The total number of tunnel - create session request - messages received by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.

• s11-tun-sent-cresessresp-emps – The total number of tunnel - create session response - messages sent by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-recv-modbearerreq-emps** – The total number of tunnel - modify bearer request - messages received by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-sent-modbearerresp-emps** – The total number of tunnel - modify bearer response - messages sent by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-sent-crebearerreq-emps** – The total number of tunnel - create bearer request - messages sent by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-recv-crebearerresp-emps** – The total number of tunnel - create bearer response - messages received by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-sent-updbearerreq-emps** – The total number of tunnel - update bearer request - messages sent by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-recv-updbearerresp-emps** – The total number of tunnel - update bearer response - messages received by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-sent-ddnreq-emps** – The total number of downlink data notification - messages sent by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s11-tun-recv-ddnack-emps** – The total number of downlink data notification acknowledge - messages received by the system for eMPS subscriber on interface s11. This stat is for current bulkstat interval only.
- **s4-tun-recv-cresessreq-emps** – The total number of tunnel - create session request - messages received by the system for eMPS subscriber on interface s4. This stat is for current bulkstat interval only.
- **s4-tun-sent-cresessresp-emps** – The total number of tunnel - create session response - messages sent by the system for eMPS subscriber on interface s4. This stat is for current bulkstat interval only.
- **tun-sent-cresessreq-emps** – The total number of tunnel - create session request - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-received-cresessresp-emps** – The total number of tunnel - create session response - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-sent-modbearerreq-emps** – The total number of tunnel - modify bearer request - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-received-modbearerresp-emps** – The total number of tunnel - modify bearer response - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-received-crebearerreq-emps** – The total number of tunnel - create bearer request - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-sent-crebearerresp-emps** – The total number of tunnel - create bearer response - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-received-updbearerreq-emps** – The total number of tunnel - update bearer request - messages received by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
- **tun-sent-updbearerresp-emps** – The total number of tunnel - update bearer response - messages sent by the system for eMPS subscriber on interface s5s8. This stat is for current bulkstat interval only.
CHAPTER 10

Cisco Ultra Traffic Optimization

This chapter describes the following topics:

• Feature Summary and Revision History, on page 239
• Overview, on page 240
• How Cisco Ultra Traffic Optimization Works, on page 241
• Configuring Cisco Ultra Traffic Optimization, on page 244
• Multi-Policy Support for Traffic Optimization, on page 249
• Monitoring and Troubleshooting, on page 262

Revision History

Revision history details are not provided for features introduced before release 21.2 and N5.1.
Overview

As traffic grows, Quality of Experience (QoE) drops because more consumers are sharing the radio channel with increasingly richer, more data consuming application. Connection speed (bits per second) is crucial. Traditional approaches to maintaining connection speed in the face of traffic growth (that is, Network Densification) focus on hardware-based approaches, such as adding new base stations and building the MIMO. While necessary, this approach is very time consuming and expensive.

The Cisco Ultra Traffic Optimization is a RAN optimization technology that increases subscriber connection speeds in congested cells and, as a result, increases the cell capacity significantly. The result is an optimized RAN, where Mobile Network Operators (MNOs) can deploy fewer cells, on an ongoing basis, and absorb more traffic growth while meeting network quality targets.

Large traffic flows, such as Adaptive Bit Rate (ABR) video, saturate radio resources and swamp the eNodeB scheduler. The Cisco Ultra Traffic Optimization employs machine learning algorithms to detect large traffic flows (such as video) in the network and optimize the delivery of those flows to mitigate the network congestion without changing user quality (that is, video works the same for the end user). In other words, by employing software intelligence at the network core, Cisco Ultra Traffic Optimization mitigates the overwhelming impact video has on the RAN.

The resulting benefits are seen in congested network sites. The Cisco Ultra Traffic Optimization:

- Increases average user throughput.
- Increases congested cell site capacity.
- Reduces scheduler latency.
- Maintains user quality of experience even when more users and more traffic share a cell.
• Is measured directly by eNodeB performance counters (for example, average UE throughput, scheduler latency), which are the key performance indicators that are used for network capacity planning.

• Provides permanent savings in RAN investment requirements.

• Is integrated in the Cisco StarOS P-GW.

• Requires no new hardware or cabling complexity - it can be turned on for a market in an hour.

• Supports all types of traffic, including HTTP(s) and QUIC.

How Cisco Ultra Traffic Optimization Works

The Cisco Ultra Traffic Optimization achieves its gains by shaping video traffic during times of high network load/congestion. It monitors and profiles each individual video flow that passes through the gateway and uses its machine learning algorithms to determine whether that flow is traversing a congested channel. Cisco Ultra Traffic Optimization then flow-controls video to varying levels and time, depending on the degree of detected congestion, and efficiently aligns delivery of the video traffic to less-congested moments while still providing adequate bandwidth to videos to maintain their quality. The result is less network latency and higher user throughputs while maintaining HD video. Cisco Ultra Traffic Optimization does not drop packets or modify data payloads in any way.

The Cisco Ultra Traffic Optimization integrates with standard Cisco P-GW functions such as Application Detection and Control (ADC), allowing mobile operators to define optimization policies that are based on the traffic application type as well as APN, QCI, and other common traffic delineations. Cisco Ultra Traffic Optimization is fully radio network aware, allowing management on a per eNodeB cell basis.

Architecture

StarOS has a highly optimized packet processing framework, the Cisco Ultra Traffic Optimization engine, where the user packets (downlink) are processed in the operating systems user space. The high-speed packet processing, including the various functions of the P-GW, is performed in the user space. The Cisco Ultra Traffic Optimization engine is integrated into the packet processing path of Cisco’s P-GW with a well-defined Application Programming Interface (API) of StarOS.

The following graphic shows a high-level overview of P-GW packet flow with traffic optimization.
Handling of Traffic Optimization Data Record

The Traffic Optimization Data Record (TODR) is generated only on the expiry of idle-timeout of the Cisco Ultra Traffic Optimization engine. No statistics related to session or flow from P-GW is included in this TODR. The data records are a separate file for the Traffic Optimization statistics, and available to external analytics platform.

List of Attributes and File Format

All TODR attributes of traffic optimization is enabled by a single CLI command. The output is always comma separated, and in a rigid format.

**Standard TODR**

The following is the format of a Standard TODR:

```
instance_id,flow_type,srcIP,dstIP,policy_id, proto_type, dscp, flow_first_pkt_rx_time_ms,flow_last_pkt_rx_time_ms,flow_cumulative_rx_bytes
```

Example:

```
1, 0, 173.39.13.38, 192.168.3.106, 0, 1, 0, 1489131332693, 1489131335924, 342292
```

Where:

- **instance_id**: Instance ID.
- **flow_type**: Standard flow (0)
- **srcIP**: Indicates the source IP address.
• **dstIP**: Indicates the destination IP address.

• **policy_id**: Indicates the traffic optimization policy ID.

• **proto_type**: Indicates the IP protocol being used. The IP protocols are: TCP and UDP.

• **dscp**: Indicates the DSCP code for upstream packets.

• **flow_first_pkt_rx_time_ms**: Indicates the timestamp when the first packet was detected during traffic optimization.

• **flow_last_pkt_rx_time_ms**: Indicates the timestamp when the last packet was detected during traffic optimization.

• **flow_cumulative_rx_bytes**: Indicates the number of bytes transferred by this flow.

---

**Large TODR**

The following is a sample output of a Large TODR.

```plaintext
2, 1, 2606:ae00:c663:b66f:0000:0058:be03:ae01, 0172:0020:0224:0059:2200:0000:0000:0033, 0, 0,
1489572442058, 1489572447759, 5051223, 1489572444755, 3900, 3900, 0, 0, 11, 0, 0, 11, 1, 1,
1489572444755, 1950, 4, 0, 0, 1, 1489572446761, 0, 2010, 0, 0, 1, 1489572448771, 0, 2007, 0, 0, 1, 1489572450778, 0, 2008,
0, 0, 1, 148957254786, 0, 2005, 0, 0, 1, 1489572454791, 0, 2003, 0, 0, 1, 1489572455794, 0, 2005, 0, 0, 1, 1489572458799, 0,
2003, 0, 0, 1, 1489572463892, 0, 1946, 0, 0, 0, 1, 1489572466950, 0, 2002, 0, 0, 1, 1489572466952, 0, 197, 0, 0, 1, 1535656666107, 0, 2007, 0, 0, 3, 1, 1535656667114, 0, 2004, 0, 0, 3
```

Where:

• **instance_id**: Instance ID.

• **flow_type**: Large flow (1)

• **srcIP**: Indicates the source IP address.

• **dstIP**: Indicates the destination IP address.

• **policy_name**: Identifies the name of the configured traffic optimization policy.

• **policy_id**: Indicates the traffic optimization policy ID.

• **proto_type**: Indicates the IP protocol being used. The IP protocols are: TCP and UDP.

• **dscp**: Indicates the DSCP code for upstream packets.

• **flow_first_pkt_rx_time_ms**: Indicates the timestamp when the first packet was detected during traffic optimization.

• **flow_last_pkt_rx_time_ms**: Indicates the timestamp when the last packet was detected during traffic optimization.

• **flow_cumulative_rx_bytes**: Indicates the number of bytes transferred by this flow.

• **large_detection_time_ms**: Indicates the timestamp when the flow was detected as Large.

• **avg_burst_rate_kbps**: Indicates the average rate in Kbps of all the measured bursts.

• **avg_eff_rate_kbps**: Indicates the average effective rate in Kbps.

• **final_link_peak_kbps**: Indicates the highest detected link peak over the life of the Large flow.

• **recovered_capacity_bytes**: Indicates the recovered capacity in Kbps for this Large flow.
• **recovered_capacity_ms**: Indicates the timestamp of recovered capacity for this Large flow.

• **phase_count**: Indicates the Large flow phase count.

• **min_gbr_kbps**: Indicates the Minimum Guaranteed Bit Rate (GBR) in Kbps.

• **max_gbr_kbps**: Indicates the Maximum Guaranteed Bit Rate (MBR) in Kbps.

• **phase_count_record**: Indicates the number of phases present in this record.

• **end_of_phases**: 0 (not end of phases) or 1 (end of phases).

• Large flow phase attributes:
  • **phase_type**: Indicates the type of the phase
  • **phase_start_time_ms**: Indicates the timestamp for the start time of the phase.
  • **burst_bytes**: Indicates the burst size in bytes.
  • **burst_duration_ms**: Indicates the burst duration in milliseconds.
  • **link_peak_kbps**: Indicates the peak rate for the flow during its life.
  • **flow_control_rate_kbps**: Indicates the rate at which flow control was attempted (or 0 if non-flow control phase).
  • **max_num_queued_packets**: Identifies the maximum number of packets queued.
  • **policy_id**: Identifies the traffic optimization policy ID.

---

**Licensing**

The Cisco Ultra Traffic Optimization is a licensed Cisco solution. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

**Limitations and Restrictions**

- The values which the P-GW chooses to send to the Cisco Ultra Traffic Optimization engine are the values associated from the bearer GBR and bearer MBR.

- In the current implementation, only downlink GBR and MBR are sent to the engine for traffic optimization.

- UDP/QUIC based Traffic Optimization is supported only on PORT 443.

**Configuring Cisco Ultra Traffic Optimization**

This section provides information on enabling support for the Cisco Ultra Traffic Optimization solution.
Loading Traffic Optimization

Use the following configuration under the Global Configuration Mode to load the Cisco Ultra Traffic Optimization as a solution:

```
configure
  require active-charging traffic-optimization
end
```

After you configure this command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the System Administration Guide for your deployment.

Important

Enabling or disabling the traffic optimization can be done through the Service-scheme framework.

Important

After you configure the `require active-charging traffic-optimization` CLI command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the System Administration Guide for your deployment.

Important

In 21.3, and 21.5 and later releases, the dependency on the chassis reboot is not valid anymore. The Cisco Ultra Traffic Optimization engine is loaded by default. The Cisco Ultra Traffic Optimization configuration CLIs are available when the license is enabled. As such, the `traffic-optimization` keyword has been deprecated.

Enabling Cisco Ultra Traffic Optimization Configuration Profile

Use the following configuration under ACS Configuration Mode to enable the Cisco Ultra Traffic Optimization profile:

```
configure
  active-charging service service_name
    traffic-optimization-profile
end
```

NOTES:

• The above CLI command enables the Traffic Optimization Profile Configuration, a new configuration mode.

Configuring the Operating Mode

Use the following CLI commands to configure the operating mode under Traffic Optimization Profile Configuration Mode for the Cisco Ultra Traffic Optimization engine:
configure
  active-charging service service_name
  traffic-optimization-profile
  mode [ active | passive ]
end

Notes:

• **mode**: Sets the mode of operation for traffic optimization.
  - **active**: Active mode where both traffic optimization and flow monitoring is done on the packet.
  - **passive**: Passive mode where no flow-control is performed but monitoring is done on the packet.

---

**Enabling Cisco Ultra Traffic Optimization Configuration Profile Using Service-scheme Framework**

The service-scheme framework is used to enable traffic optimization at APN, rule base, QCI, and Rule level. There are two main constructs for the service-scheme framework:

- **Subscriber-base** – This helps in associating subscribers with service-scheme based on the subs-class configuration.
  - **subs-class**: The conditions defined under subs-class enables in classifying the subscribers based on rule base, APN, v-APN name. The conditions can also be defined in combination, and both OR as well as AND operators are supported while evaluating them.

- **Service-scheme** – This helps in associating actions based on trigger conditions which can be triggered either at call-setup time, Bearer-creation time, or flow-creation time.
  - **trigger-condition**: For any trigger, the trigger-action application is based on conditions defined under the trigger-condition.
  - **trigger-actions**: Defines the actions to be taken on the classified flow. These actions can be traffic optimization, throttle-suppress, and so on.

---

**Session Setup Trigger**

The `any-match = TRUE`, a wildcard configuration, is the only supported condition for this trigger and so this is applicable to all the flows of the subscriber.

Following is a sample configuration:

```bash
configure
  active-charging service service_name
  service-scheme service_scheme_name
  trigger sess-setup
    priority priority_value trigger-condition trigger_condition_name1
  trigger-action trigger_action_name
  exit
  trigger-condition trigger_condition_name1
    any-match = TRUE
  exit
```
Bearer Creation Trigger

The trigger conditions related to QCI can be used for this trigger, and so this is applicable to all the flows of specific bearers.

The following is a sample configuration:

```plaintext
configure
   active-charging service service_name
   trigger-action trigger_action_name
      traffic-optimization
      exit
   trigger-condition trigger_condition_name1
      any-match = TRUE
      exit
   trigger-condition trigger_condition_name2
      qci = qci_value
      exit
   service-scheme service_scheme_name
      trigger bearer-creation
      priority priority_value
      trigger-condition trigger_condition_name2
      trigger-action trigger_action_name
      exit
   exit
   subs-class sub_class_name
      apn = apn_name
      exit
   subscriber-base subscriber_base_name
      priority priority_value
      subs-class sub_class_name
      bind service-scheme
   service-scheme_name
end
```

Flow Creation Trigger

The trigger conditions related to rule-name and QCI can be used here, and so this is related to specific flow.

The following is a sample configuration:

```plaintext
configure
   active-charging service service_name
   trigger-action trigger_action_name
      traffic-optimization
      exit
   trigger-condition trigger_condition_name1
      any-match = TRUE
      exit
   trigger-condition trigger_condition_name2
      qci = qci_value
      exit
   trigger-condition trigger_condition_name3
      !
```
rule-name = rule_name
exit
service-scheme service_scheme_name
trigger flow-creation
  priority priority_value trigger-condition trigger_condition_name3
trigger-action trigger_action_name
  exit
exit
subs-class sub_class_name
  apn = apn_name
  exit
subscriber-base subscriber_base_name
  priority priority_value subs-class sub_class_name bind service-scheme
  service_scheme_name
end

Notes:

- trigger_condition_name3 can have only rules, only QCI, both rule and QCI, or either of rule and QCI.

The following table illustrates the different levels of Traffic Optimization and their corresponding Subscriber Class configuration and Triggers.

<table>
<thead>
<tr>
<th>Traffic Optimization Levels</th>
<th>Subscriber Class configuration and Triggers</th>
</tr>
</thead>
</table>
| Applicable to all the calls or flows | subs-class scl
  any-match = TRUE
  exit
  Sessetup trigger condition is any-match = TRUE |
| Applicable to all calls or flows of a rulebase | subs-class scl
  rulebase = prepaid
  exit
  Sessetup trigger condition is any-match = TRUE |
| Applicable to all calls or flows of an APN | subs-class scl
  apn = cisco.com
  exit
  Sessetup trigger condition is any-match = TRUE |
| Applicable to all flows of a Bearer | trigger-condition TC1
  qci = 1
  exit
  Bearer creation trigger condition is TC1 |
| Applicable to a particular flow | trigger-condition TC1
  qci = 1
  rule-name = tcp
  multi-line-or all-lines
  exit
  Flow creation trigger condition is TC1 |
In case of LTE to eHRPD handover, since QCI is not valid for eHRPD, it is recommended to configure rule-name as the trigger-condition under service-scheme.

### Generating TODR

Use the following CLI commands under ACS Configuration Mode to enable Traffic Optimization Data Record (TODR) generation:

```text
configure
active-charging service service_name
traffic-optimization-profile
data-record
end
```

**NOTES:**
- If previously configured, use the `no data-record` command to disable generating TODR.

### Multi-Policy Support for Traffic Optimization

Cisco Ultra Traffic Optimization engine supports Traffic Optimization for multiple policies and provides Traffic Optimization for a desired location. It supports a maximum of 32 policies. By default, two policies are pre-configured. Operators can configure several parameters under each Traffic Optimization policy.

This feature includes the following functionalities:
- By default, Traffic Optimization is enabled for TCP and UDP data for a particular Subscriber, Bearer or Flow that use the Service-Schema.

  **Important** UDP/QUIC based Traffic Optimization is supported only on PORT 443.

- Selection of a policy depends on the priority configured. Priorities can be configured for traffic optimization policies using a Trigger Condition. The priority can be set regardless of a specific location where the traffic optimization policy is being applied. A traffic optimization policy can be overridden by another policy based on the priorities configured.

- A configuration to associate a traffic optimization policy with a Trigger Action, under the Service-Schema.

- A configuration to select a Traffic Optimization policy for a Location Trigger. Currently, only eCGI Change Detection is supported under the Local Policy Service Configuration mode.

  **Important** Location Change Trigger is not supported with IPSG.
How Multi-Policy Support Works

Policy Selection
Cisco’s Ultra Traffic Optimization engine provides two default policies – Managed and Unmanaged. When Unmanaged policy is selected, traffic optimization is not performed.

When Managed policy is selected, traffic optimization is performed using default parameters. Managed policy is applied when a policy is not specified in a Trigger Action where traffic optimization is enabled without specifying a policy.

When Managed policy is selected, traffic optimization is performed using default parameters. Managed policy is applied when a policy is not specified in a Trigger Action where traffic optimization is enabled without specifying a policy.

• Session Setup Trigger – If a Trigger Action is applied only for a Session Setup in a Service-Schema, then the trigger action is only applied to new sessions only.

• Bearer Setup Trigger – If a trigger action is applied only for a Bearer Setup, changes in the trigger action will be applicable to newly created bearers and its flows.

• Flow Creation Trigger – Under a trigger condition corresponding to a flow create, conditions can be added based on a rule-name, local-policy-rule or an IP protocol in addition to the trigger condition: any-match.

When traffic optimization on existing flows is disabled because of a trigger condition, then the traffic optimization engine will apply the default Unmanaged policy on them.

Deleting a Policy
Before deleting a Policy profile, all association to a traffic optimization policy should be removed.

For more information on deletion of a policy, refer to the Traffic Optimization Policy Configuration section.

Configuring Multi-Policy Support
The following sections describes the required configurations to support the Multi-Policy Support.

Configuring a Traffic Optimization Profile
Use the following CLI commands to configure a Traffic Optimization Profile.

```bash
configure
  require active-charging
```
### active-charging service service_name
- [ no ] data-record
- [ no ] efd-flow-cleanup-interval cleanup_interval
- [ no ] stats-interval stats_interval
end

**NOTES:**

- **require active-charging:** Enables the configuration requirement for Active Charging service.

**Important**

After you configure this command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.

- **data-record:** Enables the generation of traffic optimization data record.
- **efd-flow-cleanup-interval:** Configures EFD flow cleanup interval. The interval value is an integer that ranges from 10 to 5000 milliseconds.
- **stats-interval:** Configures the flow statistics collection and reporting interval in seconds. The interval value is an integer that ranges from 1 to 60 seconds.
- **stats-options:** Configures options to collect the flow statistics.

**Note**

From Release 21.6 onwards, the **heavy-session** command is deprecated.

### Configuring a Traffic Optimization Policy

Use the following CLI commands to configure a Traffic Optimization Policy.

```
configure
require active-charging
active-charging service service_name
[ no ] traffic-optimization-policy policy_name
[ no ] bandwidth-mgmt
  curbing-control { max-phases max_phase_value [ rate curbing_control_rate [ threshold-rate threshold_rate [ time curbing_control_duration ] ] ] | rate
```

[ no ] curbing-control
heavy-session { standard-flow-timeout [ threshold threshold_value | threshold threshold_value [ standard-flow-timeout timeout_value ] ]
[ no ] heavy-session
link-profile { initial-rate initial_seed_value [ max-rate max_peak_rate_value [ peak-lock ] ] | max-rate [ initial-rate initial_seed_value [ peak-lock ] ] | peak-lock [ initial-rate initial_seed_value [ max-rate max_peak_rate_value ] ] }
[ no ] link-profile
session-params { tcp-ramp-up tcp_rampup_duration [ udp-ramp-up udp_rampup_duration ] | udp-ramp-up udp_rampup_duration [ tcp-ramp-up tcp_rampup_duration ] }
[ no ] session-params
end

NOTES:

• no: Overwrites the traffic-optimization configured parameter(s) with default values. Before deleting a policy profile, all policies associated to the policy profile should be removed. If policy associations are not removed before deletion, the following error message will be displayed:
Failure: traffic-optimization policy in use, cannot be deleted.

• bandwidth-mgmt: Configures bandwidth management parameters.

• backoff-profile: Determines the overall aggressiveness of the back off rates.

• managed: Enables both traffic monitoring and traffic optimization.

• unmanaged: Only enables traffic monitoring.

• min-effective-rate: Configures minimum effective shaping rate in Kbps. The shaping rate value is an integer ranging from 100 to 10000.

• min-flow-control-rate: Configures the minimum rate allowed in Kbps to control the flow of heavy-session-flows during congestion. The control rate value is an integer ranging from 100 to 10000.

• curbing-control: Configures curbing flow control related parameters.

• max-phases: Configures consecutive phases where target shaping rate is below threshold-rate to trigger curbing flow control. The maximum phase value is an integer ranging from 2 to 10.

• rate: Configures the curbing flow-control at a fixed rate in Kbps instead of a dynamic rate. The control rate value is an integer ranging from 0 to 10000. To disable fixed flow control rate, set the flow control rate value to 0.

• threshold-rate: Configures the minimum target shaping rate in kbps to trigger curbing. The threshold rate is an integer ranging from 100 to 10000.

• time: Configures the duration of a flow control phase in milliseconds. The flow control duration value is an integer ranging from 0 to 600000. To disable flow control, set the flow control duration value to 0.
• **heavy-session**: Configures parameters for heavy-session detection.

• **standard-flow-timeout**: Configures the idle timeout in milliseconds, for expiration of standard flows. The timeout value is an integer ranging from 100 to 3000.

• **threshold**: Configures heavy-session detection threshold in bytes. On reaching the threshold, the flow will be monitored and potentially managed. The threshold value is an integer ranging from 0 to 100000000.

• **link-profile**: Configures link profile parameters.

• **initial-rate**: Configures the initial seed value of the acquired peak rate in Kbps for a traffic session. The initial seed value is an integer ranging from 100 to 30000.

• **max-rate**: Configures the maximum learned peak rate allowed in Kbps for a traffic session. The max rate value is an integer ranging from 100 to 30000.

• **peak-lock**: Confirms with the link peak rate available at the initial link peak rate setting.

• **session-params**: Configures session parameters.

• **tcp-ramp-up**: Configures the ramp-up-phase duration in milliseconds, for TCP traffic. The TCP ramp-up duration is an integer ranging from 0 to 5000.

• **udp-ramp-up**: Configures the ramp-up-phase duration in milliseconds, for UDP traffic. The UDP ramp-up duration is an integer ranging from 0 to 5000.

---

**Important**

After you configure **require active-charging** command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.

---

**Session-Params:**
Tcp-Ramp-Up : 5000 (ms)
Udp-Ramp-Up : 0 (ms)

### Associating a Trigger Action to a Traffic Optimization Policy

Use the following CLI commands to associate a Trigger Action to a Traffic Optimization Policy.

```cli
configure
require active-charging
active-charging service service_name
  trigger-action trigger_action_name
    traffic-optimization policy policy_name
    [ no ] traffic-optimization
end
```

**NOTES:**

- **traffic-optimization policy**: Configures a traffic optimization policy.
- **no**: Removes the configured traffic optimization policy.

---

**Important**

After you configure `require active-charging` command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.

### Enabling TCP and UDP

Use the following CLI commands to enable TCP and UDP protocol for Traffic Optimization:

```cli
configure
require active-charging
active-charging service service_name
  trigger-condition trigger_condition_name
    [ no ] ip protocol = [ tcp | udp ]
end
```

**NOTES:**

- **no**: Deletes the Active Charging Service related configuration.
- **ip**: Establishes an IP configuration.
- **protocol**: Indicates the protocol being transported by the IP packet.
- **tcp**: Indicates the TCP protocol to be transported by the IP packet.
- **udp**: Indicates the UDP protocol to be transported by the IP packet.

---

**Important**

After you configure this command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.
Service-Scheme Configuration for Multi-Policy Support

The service-schema framework enables traffic optimization at APN, rule base, QCI, and Rule level. In 21.6, with the Multi-Policy Support feature, traffic optimization in a service-schema framework allows the operator to configure multiple policies and to configure traffic optimization based on a desirable location.

The service-schema framework helps in associating actions based on trigger conditions, which can be triggered either at call-setup time, Bearer-creation time, or flow-creation time.

Session Setup Trigger

The any-match = TRUE, a wildcard configuration, is the only supported condition for this trigger and so this is applicable to all the flows of the subscriber.

Use the following configuration to setup a Session Trigger:

```
configure
  active-charging service service_name
  trigger-action trigger_action_name
  traffic-optimization
  exit
  trigger-condition trigger_condition_name1
  any-match = TRUE
  exit
  service-scheme service_scheme_name
  trigger sess-setup
    priority priority_value
  trigger-condition trigger_condition_name1
  trigger-action trigger_action_name
  exit
  subs-class sub_class_name
  apn = apn_name
  exit
  subscriber-base subscriber_base_name
  priority priority_value
  subs-class sub_class_name
  bind service-scheme
end
```

Sample Configuration

Following is a sample configuration for Session Setup Trigger:

```
service-scheme SS1
  trigger sess-setup
    priority 1
    trigger-condition sess-setup
    trigger-action sess-setup
    #exit
  trigger-condition sess-setup
    any-match = TRUE
    #exit
  trigger-action sess-setup
    traffic-optimization policy sess-setup
    #exit
```

Bearer Creation Trigger

The trigger conditions related to QCI can be used for this trigger, and so this is applicable to all the flows of specific bearers.
Use the following configuration to configure a Bearer Creation Trigger:

```
configure
  active-charging service service_name
  service-scheme service_scheme_name
    trigger bearer-creation
      priority priority_value trigger-condition trigger_condition_name
      trigger-action trigger_action_name
      exit
    trigger-condition trigger_condition_name
      qci = qci_value
      exit
    trigger-action bearer-creation
      traffic-optimization policy bearer-creation
      exit
```

**Sample Configuration**

The following is a sample configuration for Bearer Creation Trigger:

```
service-scheme SS1
  trigger bearer-creation
    priority 1 trigger-condition bearer-creation trigger-action bearer-creation
    exit
  trigger-condition bearer-creation
    qci = 1 to 2
    exit
  trigger-action bearer-creation
    traffic-optimization policy bearer-creation
    exit
```

**Flow Creation Trigger**

The trigger conditions related to rule-name and QCI can be used here, and so this is related to specific flow.

Use the following configuration to configure a flow creation trigger:

```
configure
  active-charging service service_name
  service-scheme service_scheme_name
    trigger bearer-creation
      priority priority_value trigger-condition trigger_condition_name
      trigger-action trigger_action_name
      exit
    trigger-condition trigger_condition_name
      ip-protocol = protocol_type
      rule-name = rule_name
      **Multi-line or All-lines**
      exit
```

**Sample Configuration**

The following is a sample configuration for Flow Creation Trigger using the default Cisco Ultra Traffic Optimization policy:

```
service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition TC5 trigger-action TA4
```
Configuring: ecgi-change

The following demonstrates ecgi-change sample configuration:

**Trigger Condition and Trigger Action in ACS Configuration**

```conf
configure
active-charging-service ACS
  trigger-action TA1
    traffic-optimization policy flow-create-ecgi-change
  #exit
  trigger-condition TC4
    local-policy-rule = ruledef-ecgi
  #exit
end
```

**Service Schema Configuration**

```conf
configure
active-charging-service ACS
  service-scheme SS1
    trigger flow-create
      priority 2 trigger-condition TC4 trigger-action TA1
      #exit
    subs-class SC1
      any-match = TRUE
      #exit
    subscriber-base SB1
      priority 1 subs-class SC1 bind service-scheme SS1
      #exit
end
```

**Local Policy Configuration**

```conf
local-policy-service LP
  ruledef anymatch
    condition priority 1 imsi match *
    #exit
  ruledef ecgi-1
    condition priority 1 ecgi mcc 111 mnc 444 eci match 1AE7F0A 1AE7F0B 1AE7F28 1AE7F29 1AE7F46 1AE7F47 1AEAC00 1AEAC01 1AEAC02 1AEAC0A 1AEAC0B 1AEAC0C 1AEAC14 1AEAC15 1AEAC16 1AEAC28 1AEAC29 1AEAC2A 1AEAC46 1AEAC47 1AEAC48 1AEAC50 1AEAC51 1AEAC52 1AEAC5E 1AEAC66 1AEAC6F 1AEAC70 1AEAC78 1AEAC79 1AEAC7A

**Traffic Optimization Policy Configuration**

```plaintext
configure
active-charging-service ACS
traffic-optimization-policy Config:
  traffic-optimization-policy flow-create-ecgi-change
    heavy-session threshold 400000
#exit
end
```

**Local Policy Configuration**

---

**Important**

Configuring Local Policy needs a Local Policy Decision Engine License. Contact your Cisco account representative for detailed information on specific licensing requirements.

This section describes the location-based traffic optimization policy configuration.

Use the following sample configuration to enable eCGI change rule:

```plaintext
configure
  active-charging service service_name
  local-policy-service service_name
  ruledef ruledef_name
    condition priority priority_value ecgi mcc mcc_value mnc mnc_value eq eq_value
  exit
  actiondef actiondef_name1
    action priority priority_value event-triggers actiondef_name2
  exit
  actiondef actiondef_name2
    action priority priority_value activate-lp-rule ruledef_name
  exit
  eventbase eventbase_name
  rule priority priority_value event event_name ruledef ruledef_name
  actiondef actiondef_name1:continue
  rule priority priority_value event event_name ruledef ruledef_name
  actiondef actiondef_name1:continue
  exit
```

**Service-Scheme Configuration**

```plaintext
configure
  active-charging service service_name
  service-scheme service_scheme_name
  trigger flow-create
    priority priority_value trigger-condition trigger_condition_name
  trigger-action trigger_action_name
```

---

P-GW Administration Guide, StarOS Release 21.8
Configuring L7 Rule

Important

Configuring L7 Rule needs an Application Detection Control License. Contact your Cisco account representative for detailed information on specific licensing requirements.

Use the following CLI to configure an L7 rule:

```
configure
  active-charging service service_name
  service-scheme service_scheme_name
  trigger bearer-creation
    priority priority_value trigger-condition trigger_condition_name
  trigger-action trigger_action_name
  exit
  trigger-condition trigger_condition_name
  rule-name = rule_name
  rule-name = rule_name
  **Multi-line or All-lines**
  trigger-action trigger_action_name
  traffic-optimization policy policy_name
  exit
```

Sample Configuration

The following is a sample configuration for L7 Rules:

```
service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition TC6 trigger-action TA6
    #exit
  trigger-condition TC6
    rule-name = whatsapp
    rule-name = http
    multi-line-or-all-lines
    #exit
  trigger-action TA6
    traffic-optimization policy flow-create-L7-Rules
    #exit
```

Ookla Speedtest

Use the configuration information discussed in the Configuring L7 Rule, on page 260 section.

Sample Configuration

The following is a sample configuration for Ookla Speedtest:
service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition ookla trigger-action ookla
    #exit
  trigger-condition ookla
    rule-name = speedtest
    #exit
  trigger-action ookla
    no traffic-optimization
    #exit

Location and App-based Configuration

Sample Configuration

service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition TC3 trigger-action TA2
    #exit
  trigger-condition TC3
    local-policy-rule = ruledef-ecgi
    rule-name = youtube
    rule-name = whatsapp
    multi-line-or all-lines
    #exit
  trigger-action TA2
    traffic-optimization policy flow-create-ecgi-change
    #exit

Selective Configuration by Disabling TCP and UDP

Sample Configuration

service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition tcponly trigger-action tcponly
    priority 2 trigger-condition udponly trigger-action udponly
    #exit
  trigger-condition tcponly
    ip protocol = tcp
    #exit
  trigger-condition udponly
    ip protocol = udp
    #exit
  trigger-action tcponly
    no traffic-optimization
    #exit
  trigger-action udponly
    no traffic-optimization
    #exit

L7/ADC and Location Trigger based Configuration

Sample Configuration

This sample configuration describes a scenario where an operator wants to always disable Traffic Optimization for Speedtest regardless of location and apply a specific policy for a specific location (ECGI) (except for Speedtest) and override any other policy set by any trigger condition.

Also, for a specific policy optimization, for example: YouTube, the policy selection is performed in a prioritized order as shown below:
Service Scheme Configuration:

```
service-scheme SS1
  trigger flow-create
    priority 1 trigger-condition speedtest-tc trigger-action speedtest-ta
    priority 2 trigger-condition location-tc trigger-action location-ta
    priority 3 trigger-condition youtube-tc trigger-action youtube-ta
  exit
  trigger-condition location-tc
    local-policy-rule = ruledef-ecgi
  exit
  trigger-action location-ta
    traffic-optimization policy flow-create-ecgi-change
  exit
  trigger-condition speedtest-tc
    *rule-name = speedtest
  exit
  trigger-action speedtest-ta
    no traffic-optimization
  exit
  trigger-condition youtube-tc
    rule-name = youtube
  exit
  trigger-action youtube-ta
    traffic-optimization policy youtube-policy
  exit
  * Provided rule-name = speedtest, is configured such that it always detects this traffic.
```

Monitoring and Troubleshooting

This section provides information regarding commands available to monitor and troubleshoot the Cisco Ultra Traffic Optimization solution on the P-GW.

Cisco Ultra Traffic Optimization Show Commands and/or Outputs

This section provides information about show commands and the fields/counters that is introduced in support of Cisco Ultra Traffic Optimization solution.

```
show active-charging traffic-optimization counters { tcp | udp } sessmgr all
```

The `show active-charging traffic-optimization counters sessmgr { all | instance number }` CLI command is introduced where:

- **counters** – Displays aggregate flow counters/statistics from Cisco Ultra Traffic Optimization engine.

*Important* This CLI command is license dependent and visible only if the license is loaded.

Following are the new field/counters:

- Traffic Optimization Flows:
  - Active Normal Flow Count:
  - Active Large Flow Count:
  - Active Managed Large Flow Count:
On executing the above command, the following new fields are displayed for the Multi-Policy Support feature:

- Active Unmanaged Large Flow Count:
- Total Normal Flow Count:
- Total Large Flow Count:
- Total Managed Large Flow Count:
- Total Unmanaged Large Flow Count:
- Total IO Bytes:
- Total Large Flow Bytes:
- Total Recovered Capacity Bytes:
- Total Recovered Capacity ms:

**Important**

This CLI command is license dependent and visible only if the license is loaded.

- TCP Traffic Optimization Flows:
  - Active Normal Flow Count:
  - Active Large Flow Count:
  - Active Managed Large Flow Count:
  - Active Unmanaged Large Flow Count:
  - Total Normal Flow Count:
  - Total Large Flow Count:
  - Total Managed Large Flow Count:
  - Total Unmanaged Large Flow Count:
  - Total IO Bytes:
  - Total Large Flow Bytes:
  - Total Recovered Capacity Bytes:
  - Total Recovered Capacity ms:

- UDP Traffic Optimization Flows:
  - Active Normal Flow Count:
  - Active Large Flow Count:
  - Active Managed Large Flow Count:
  - Active Unmanaged Large Flow Count:
show active-charging traffic-optimization info

This show command has been introduced in Exec Mode, where:

- **traffic-optimization** – Displays all traffic optimization options.
- **info** – Displays Cisco Ultra Traffic Optimization engine information.

The output of this CLI command displays the version, mode, and configuration values. Following are the new fields/counters:

- Version:
- Mode:
- Configuration:
  - Data Records (TODR)
  - Statistics Options
  - EFD Flow Cleanup Interval
  - Statistics Interval

show active-charging traffic-optimization policy

On executing the above command, the following new fields are displayed for the Multi-Policy Support feature:

- Policy Name
- Policy-Id
- Bandwidth-Mgmt
  - Backoff-Profile
  - Min-Effective-Rate
  - Min-Flow-Control-Rate
- Curbing-Control
• Time
• Rate
• Max-phases
• Threshold-Rate

• Link-Profile
  • Initial-Rate
  • Max-Rate
  • Peak-Lock

• Session-Params
  • Tcp-Ramp-Up
  • Udp-Ramp-Up
show active-charging traffic-optimization policy
CoA, RADIUS DM, and Session Redirection (Hotlining)

This chapter describes Change of Authorization (CoA), Disconnect Message (DM), and Session Redirect (Hotlining) support in the system. RADIUS attributes, Access Control Lists (ACLs) and filters that are used to implement these features are discussed. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in this Administration Guide, before using the procedures in this chapter.

Not all functions, commands, and keywords/variables are available or supported for all network function or services. This depends on the platform type and the installed license(s).

- RADIUS Change of Authorization and Disconnect Message, on page 267
- Session Redirection (Hotlining), on page 272

RADIUS Change of Authorization and Disconnect Message

This section describes how the system implements CoA and DM RADIUS messages and how to configure the system to use and respond to CoA and DM messages.

CoA Overview

The system supports CoA messages from the AAA server to change data filters associated with a subscriber session. The CoA request message from the AAA server must contain attributes to identify NAS and the subscriber session and a data filter ID for the data filter to apply to the subscriber session. The filter-id attribute (attribute ID 11) contains the name of an Access Control List (ACL). For detailed information on configuring ACLs, refer to the IP Access Control Lists chapter in the System Administration Guide.

If the system successfully executes a CoA request, a CoA-ACK message is sent back to the RADIUS server and the data filter is applied to the subscriber session. Otherwise, a CoA-NAK message is sent with an error-cause attribute without making any changes to the subscriber session.
DM Overview

The DM message is used to disconnect subscriber sessions in the system from a RADIUS server. The DM request message should contain necessary attributes to identify the subscriber session. If the system successfully disconnects the subscriber session, a DM-ACK message is sent back to the RADIUS server, otherwise, a DM-NAK message is sent with proper error reasons.

License Requirements

The RADIUS Change of Authorization (CoA) and Disconnect Message (DM) are licensed Cisco features. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Enabling CoA and DM

To enable RADIUS Change of Authorization and Disconnect Message:

Step 1  Enable the system to listen for and respond to CoA and DM messages from the RADIUS server as described in Enabling CoA and DM, on page 268.

Step 2  Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Step 3  View CoA and DM message statistics as described in Viewing CoA and DM Statistics, on page 271.

Important  Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands. Not all commands and keywords/variables are available or supported. This depends on the platform type and the installed license(s).

Enabling CoA and DM

Use the following example to enable the system to listen for and respond to CoA and DM messages from the RADIUS server:

```
configure
 context <context_name>
     radius change-authorize-nas-ip <ipv4/ipv6_address>
end
```
Notes:

- `<context_name>` must be the name of the AAA context where you want to enable CoA and DM.

  For more information on configuring the AAA context, if you are using StarOS 12.3 or an earlier release, refer to the Configuring Context-Level AAA Functionality section of the AAA and GTPP Interface Administration and Reference. If you are using StarOS 14.0 or a later release, refer to the AAA Interface Administration and Reference.

- A number of optional keywords and variables are available for the `radius change-authorize-nas-ip` command. For more information regarding this command please refer to the Command Line Interface Reference.

CoA and DM Attributes

For CoA and DM messages to be accepted and acted upon, the system and subscriber session to be affected must be identified correctly.

To identify the system, use any one of the following attributes:

- NAS-IP-Address: NAS IP address if present in the CoA/DM request should match with the NAS IP address.
- NAS-Identifier: If this attribute is present, its value should match to the nas-identifier generated for the subscriber session

To identify the subscriber session, use any one of the following attributes:

- If 3GPP2 service is configured the following attribute is used for correlation identifier:
  - 3GPP2-Correlation-ID: The values should exactly match the 3GPP2-correlation-id of the subscriber session. This is one of the preferred methods of subscriber session identification.

- If 3GPP service is configured the following attributes are used for different identifiers:
  - 3GPP-IMSI: International Mobile Subscriber Identification (IMSI) number should be validated and matched with the specified IMSI for specific PDP context.
  - 3GPP-NSAPI: Network Service Access Point Identifier (NSAPI) should match to the NSAPI specified for specific PDP context.
  - User-Name: The value should exactly match the subscriber name of the session. This is one of the preferred methods of subscriber session identification.
  - Framed-IP-Address: The values should exactly match the framed IP address of the session.
  - Calling-station-id: The value should match the Mobile Station ID.

To specify the ACL to apply to the subscriber session, use the following attribute:

- Filter-ID: CoA only. This must be the name of an existing Access Control List. If this is present in a CoA request, the specified ACL is immediately applied to the specified subscriber session. The Context Configuration mode command, `radius attribute filter-id direction`, controls in which direction filters are applied.

The following attributes are also supported:
• Event-Timestamp: This attribute is a timestamp of when the event being logged occurred.

• If 3GPP2 service is configured following additional attributes are supported:
  • 3GPP2-Disconnect-Reason: This attribute indicates the reason for disconnecting the user. This attribute may be present in the RADIUS Disconnect-request Message from the Home Radius server to the PDSN.
  • 3GPP2-Session-Termination-Capability: When CoA and DM are enabled by issuing the radius change-authorize-nas-ip command, this attribute is included in a RADIUS Access-request message to the Home RADIUS server and contains the value 3 to indicate that the system supports both Dynamic authorization with RADIUS and Registration Revocation for Mobile IPv4. The attribute is also included in the RADIUS Access-Accept message and contains the preferred resource management mechanism by the home network, which is used for the session and may include values 1 through 3.

**CoA and DM Error-Cause Attribute**

The Error-Cause attribute is used to convey the results of requests to the system. This attribute is present when a CoA or DM NAK or ACK message is sent back to the RADIUS server.

The value classes of error causes are as follows:
- 0-199, 300-399 reserved
- 200-299 - successful completion
- 400-499 - errors in RADIUS server
- 500-599 - errors in NAS/Proxy

The following error cause is sent in ACK messages upon successful completion of a CoA or DM request:
- 201- Residual Session Context Removed

The following error causes are sent in NAK messages when a CoA or DM request fails:
- 401 - Unsupported Attribute
- 402 - Missing Attribute
- 403 - NAS Identification Mismatch
- 404 - Invalid Request
- 405 - Unsupported Service
- 406 - Unsupported Extension
- 501 - Administratively Prohibited
- 503 - Session Context Not Found
- 504 - Session Context Not Removable
- 506 - Resources Unavailable
Viewing CoA and DM Statistics

View CoA and DM message statistics by entering the following command:

```
show session subsystem facility aaamgr
```

The following is a sample output of this command.

```
1 AAA Managers
807 Total aaa requests

```
Session Redirection (Hotlining)

Important

Functionality described for this feature in this segment is not applicable for HNB-GW sessions.

Overview

Session redirection provides a means to redirect subscriber traffic to an external server by applying ACL rules to the traffic of an existing or a new subscriber session. The destination address and optionally the destination port of TCP/IP or UDP/IP packets from the subscriber are rewritten so the packet is forwarded to the designated redirected address. Return traffic to the subscriber has the source address and port rewritten to the original values. The redirect ACL may be applied dynamically by means of the RADIUS Change of Authorization (CoA) feature.

Note that the session redirection feature is only intended to redirect a very small subset of subscribers at any given time. The data structures allocated for this feature are kept to the minimum to avoid large memory overhead in the session managers.

License Requirements

The Session Redirection (Hotlining) is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Operation

ACL Rule

An ACL rule named readress server supports redirection of subscriber sessions. The ACL containing this rule must be configured in the destination context of the user. Only TCP and UDP protocol packets are supported. The ACL rule allows specifying the redirected address and an optional port. The source and destination address and ports (with respect to the traffic originating from the subscriber) may be wildcarded. If the redirected port is not specified, the traffic will be redirected to the same port as the original destination port in the datagrams. For detailed information on configuring ACLs, refer to the IP Access Control Lists chapter in the System Administration Guide. For more information on readress server, refer to the ACL Configuration Mode Commands chapter of the Command Line Interface Reference.
Redirecting Subscriber Sessions

An ACL with the `readdress server` rule is applied to an existing subscriber session through CoA messages from the RADIUS server. The CoA message contains the 3GPP2-Correlation-ID, User-Name, Acct-Session-ID, or Framed-IP-Address attributes to identify the subscriber session. The CoA message also contains the Filter-Id attribute which specifies the name of the ACL with the `readdress server` rule. This enables applying the ACL dynamically to existing subscriber sessions. By default, the ACL is applied as both the input and output filter for the matching subscriber unless the Filter-Id in the CoA message bears the prefix `in:` or `out:`.

For information on CoA messages and how they are implemented in the system, refer to RADIUS Change of Authorization and Disconnect Message, on page 267.

---

**Important**

Changing ACL and rulebase together in a single CoA is not supported. For this, two separate CoA requests can be sent through AAA server requesting for one attribute change per request.

---

Session Limits On Redirection

To limit the amount of memory consumed by a session manager a limit of 2000 redirected session entries per session manager is allocated. This limit is equally shared by the set of subscribers who are currently being redirected. Whenever a redirected session entry is subject to revocation from a subscriber due to an insufficient number of available session entries, the least recently used entry is revoked.

Stopping Redirection

The redirected session entries for a subscriber remain active until a CoA message issued from the RADIUS server specifies a filter that does not contain the readdress server ACL rule. When this happens, the redirected session entries for the subscriber are deleted.

All redirected session entries are also deleted when the subscriber disconnects.

Handling IP Fragments

Since TCP/UDP port numbers are part of the redirection mechanism, fragmented IP datagrams must be reassembled before being redirected. Reassembly is particularly necessary when fragments are sent out of order. The session manager performs reassembly of datagrams and reassembly is attempted only when a datagram matches the redirect server ACL rule. To limit memory usage, only up to 10 different datagrams may be concurrently reassembled for a subscriber. Any additional requests cause the oldest datagram being reassembled to be discarded. The reassembly timeout is set to 2 seconds. In addition, the limit on the total number of fragments being reassembled by a session manager is set to 1000. If this limit is reached, the oldest datagram being reassembled in the session manager and its fragment list are discarded. These limits are not configurable.

Recovery

When a session manager dies, the ACL rules are recovered. The session redirect entries have to be re-created when the MN initiates new traffic for the session. Therefore when a crash occurs, traffic from the Internet side is not redirected to the MN.
AAA Accounting

Where destination-based accounting is implemented, traffic from the subscriber is accounted for using the original destination address and not the redirected address.

Viewing the Redirected Session Entries for a Subscriber

View the redirected session entries for a subscriber by entering the following command:

```
show subscribers debug-info { callid <id> | msid <id> | username <name> }
```

The following command displays debug information for a subscriber with the MSID 0000012345:

CHAPTER 12

Collision Handling on the P-GW/SAEGW/S-GW

- Feature Description, on page 277
- How It Works, on page 277
- Configuring Collision Handling, on page 280
- Monitoring the Collision Handling Feature, on page 280

Feature Description

GTPv2 message collisions occur in the network when a node is expecting a particular procedure message from a peer node but instead receives a different procedure message from the peer. GTP procedure collisions are quite common in the network; especially with dynamic Policy and Charging Control, the chances of collisions happening in the network are very high.

These collisions are tracked by statistics and processed based on a pre-defined action for each message collision type. These statistics assist operators in debugging network issues.

Important

If the SAEGW is configured as a pure P-GW or a pure S-GW, operators will see the respective collision statistics if they occur.

Relationships to Other Features

- This feature is a part of the base software license for the P-GW/SAEGW/S-GW. No additional license is required.
- A P-GW, S-GW, or SAEGW service must be configured to view GTPv2 collision statistics.

How It Works

Collision Handling

As GTPv2 message collisions occur, they are processed by the P-GW, SAEGW, and S-GW. They are also tracked by statistics and with information on how the collision was handled.
Specifically, the output of the `show egtpc statistics` verbose command has been enhanced to provide information on GTPv2 message collision tracking and handling at the S-GW and P-GW ingress interfaces. The information available includes:

- **Interface**: The interface on which the collision occurred: SGW (S4/S11), SGW (S5) and P-GW (S8).
- **Old Proc (Msg Type)**: Indicates the ongoing procedure at eGTP-C when a new message arrived at the interface which caused the collision. The Msg Type in brackets specifies which message triggered this ongoing procedure. Note that the Old Proc are per 3GPP TS 23.401.
- **New Proc (Msg Type)**: The new procedure and message type. Note that the New Proc are per 3GPP TS 23.401.
- **Action**: The pre-defined action taken to handle the collision. The action can be one of:
  - **No Collision Detected**
  - **Suspend Old**: Suspend processing of the original (old) message, process the new message, then resume old message handling.
  - **Abort Old**: Abort the original message handling and processes the new message.
  - **Reject New**: Reject the new message, and process the original (old) message.
  - **Silent Drop New**: Drop the new incoming message, and the process the old message.
  - **Parallel Hndl**: Handle both the original (old) and new messages in parallel.
  - **Buffer New**: Buffer the new message and process it once the original (old) message has been processed.
  - **Counter**: The number of times each collision type has occurred.

The *Message Collision Statistics* section of the command output appears only if any of the collision statistics have a counter total that is greater than zero.

**Sample output:**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Old Proc (Msg Type)</th>
<th>New Proc (Msg Type)</th>
<th>Action</th>
<th>Counter</th>
</tr>
</thead>
<tbody>
<tr>
<td>SGW (S5)</td>
<td>NW Init Bearer Create (95)</td>
<td>NW Init PDN Delete (99)</td>
<td>Abort Old</td>
<td>1</td>
</tr>
</tbody>
</table>

In this instance, the output states that at the S-GW egress interface (S5) a Bearer creation procedure is going on due to a CREATE BEARER REQUEST (95) message from the P-GW. Before its response comes to the S-GW from the MME, a new procedure PDN Delete is triggered due to a DELETE BEARER REQUEST (99) message from the P-GW.

The action that is carried out due to this collision at the eGTP-C layer is to abort (Abort Old) the Bearer Creation procedure and carry on normally with the Initiate PDN Delete procedure. The Counter total of 1 indicates that this collision happened once.

**Example Collision Handling Scenarios**

This section describes several collision handling scenarios for the S-GW and P-GW.

The S-GW processes additional collisions at the S-GW ingress interface for:

1. Create Bearer Request or Update Bearer Request messages with Inter-MME/Inter-RAT Modify Bearer Request messages (with and without a ULI change).
2. Downlink Data Notification (DDN) message with Create Bearer Request or Update Bearer Request.

The S-GW behavior to handle these collision scenarios are as follows:
1. A CBReq and MBReq [(Inter MME/Inter RAT (with or without ULI change)] collision at the S-GW ingress interface results in the messages being handled in parallel. The CBReq will wait for a Create Bearer Response (CBRsp) from the peer. Additionally, an MBReq is sent in parallel to the P-GW.

2. An UBReq and MBReq [(Inter MME/Inter RAT (with or without a ULI change)] collision at the SGW ingress interface is handled with a suspend and resume procedure. Once the MBRsp is sent to the peer from the SGW ingress interface, the UBReq procedure is resumed.

3. Create Bearer Request (CBR) or Update Bearer Request (UBR) with Downlink Data Notification (DDN) messages are handled parallel.

As a result, no S-GW initiated Cause Code message 110 (Temporarily rejected due to handover procedure in progress) will be seen as a part of such collisions. Collisions will be handled in parallel.

The following GTP-C example collision handling scenarios may also be seen on the P-GW:

**DBCmd/MBreq Collision Handling:**

The P-GW enables operators to configure the behavior of the P-GW for collision handling of the Delete Bearer command (DBcmd) message when the Modify Bearer Request (MBreq) message for the default bearer is pending at the P-GW.

There are three CLI-controlled options to handle the collision between the DBCmd and MBreq messages:

- Queue the DBcmd message when the MBreq message is pending. The advantage of this option is that the DBcmd message is not lost for most of the collisions. It will remain on the P-GW until the MBRsp is sent out.
- Drop the DBcmd message when the MBreq message is pending. Note that with this option the S-GW must retry the DBcmd.
- Use pre-StarOS 19.0 behavior: abort the MBreq message and handle the DBcmd message. The advantage of this option is that it provides backward compatibility if the operator wants to retain pre-StarOS 19.0 functionality.

The CLI command collision handling provides more flexibility in configuring the handling of the DBcmd message and MBreq message collision scenario. Also refer to Configuring DBcmd Message Behavior, on page 280 in this document for instructions on how to configure the behavior for this collision handling scenario.

**MBReq/CBreq Parallel Processing; Handling CBRsp:**

The P-GW/S-GW has handles the following example collision scenario:

The node queues the CBRsp message and feeds the CBRsp message to the P-GW/S-GW session manager when the MBRsp is sent out. As a result, operators will see no retransmission of CBRsp messages from the MME.

**Handling UBRsp when Transaction is Suspended:**

The P-GW/S-GW handles the following example collision scenario:

When the P-GW/S-GW receives an UBRsp message, then the P-GW/S-GW handles the UBRsp message for the suspended transaction. As a result, The UBRsp message will be buffered until the MBRsp message is sent out.

**Limitations**

There are no known limitations to the collision handling feature on the P-GW/SAEGW/S-GW.
Standards Compliance

Specifications and standards do not specify any hard rules for collision handling cases.

Configuring Collision Handling

Operators can use the Command Line Interface (CLI) to configure the behavior of the P-GW for handling the following GTPv2 message collision:

• DBcmd Message when the MBreq Message for the Default Bearer is pending at the P-GW

Important

Configuration via the CLI is not required for all other P-GW and S-GW collision handling scenarios.

Configuring DBcmd Message Behavior

Use the following example to configure the collision handling behavior for the Delete Bearer command message when the Modify Bearer Request message for the Default Bearer is pending at the P-GW.

```plaintext
configure
call-radio  context  context_name
  egtp-service  egtp_service_name
    collision-handling  dbcmd-over-mbreq { drop | queue }
    { default | no } collision-handling  dbcmd-over-mbreq
end
```

Notes:

• drop: Drop the DBcmd message when the MBreq message is pending.
• queue: Queue the DBcmd message when the MBreq is message is pending.
• The default behavior is to abort the MBReq message and handle the DBcmd message.

Verifying the Configuration

To verify the DBcmd Message when the MBreq Message for the Default Bearer is pending at the P-GW configuration, use the following command in Exec Mode:

```plaintext
show egtpc service all
  Collision handling: DBcmd when MBreq pending: <Queue DBcmd>, <Drop DBcmd>, or <Abort MBreq and handle Dbcmd>
```

Monitoring the Collision Handling Feature

This section describes how to monitor the collision handling feature.
Collision Handling Show Command(s) and/or Outputs

This section provides information regarding show commands and/or their outputs in support of the collision handling on the P-GW/SAEGW/S-GW feature.

**show configuration**

The output of this command indicates if collision handling for the DBcmd message when the MBreq message is pending is enabled or disabled.

- collision-handling dbcmd-over-mbreq queue
- no collision-handling dbcmd-over-mbreq queue

**show egtp-service all**

The output of this command indicates how the P-GW is configured to handle the DBcmd Message when the MBreq Message for the Default Bearer is pending at the P-GW.

- Collision handling:
  - DBcmd when MBreq pending: <Queue DBcmd>, <Drop DBcmd>, or <Abort MBreq and handle DBcmd>

**show egtp statistics verbose**

The output of this command has been enhanced to provide detailed information for all supported GTPv2 message collisions at the P-GW/S-GW ingress interface, including:

- The interface on which the collision occurred.
- The ongoing procedure at eGTP-C when a new message arrived at the interface which caused the collision. The Msg Type in brackets specifies which message triggered this ongoing procedure.
- The new procedure and message type.
- The pre-defined action taken to handle the collision.
- The number of times each collision type has occurred.

---

**Important**

The *Message Collision Statistics* section of the command output appears only if any of the collision statistics have a counter total that is greater than zero.
show egtp statistics verbose
Diamproxy Peer Connection Status Audit

Feature Description

The TCP connections between the Diameter proxy (Diamproxy) and the configured peers for different endpoints can either be in Open or Closed state. The state of these TCP connections for every peer (or endpoints) is maintained at the Diamproxy and the clients (sessmgrs/aaamgrs), for enabling communication with these peers through the Diamproxy. If the connection status of sessmgrs/aaamgrs is IDLE and the Diamproxy is in
OPEN state, then the Diameter messaging failures, resulting in call failures, can be seen. This is the primary reason an audit mechanism and auto-correction is required and useful.

Due to network conditions, the connection state can change randomly. If this change is not communicated appropriately, it can result in discrepancies regarding connection state at the clients. Similarly, when a new peer is configured, the clients initiates PIN Peer messages to Diamproxy to notify the new peer configuration. Due to the throttling done at the Diamproxy, some of the PIN Peer messages get dropped. This can also result in discrepancies in connection state at the clients.

This feature helps in auto-detecting, and correcting these discrepancies by Peer Connection Status Audit mechanism between the Diamproxy and Diabase clients. The Diamproxy periodically publishes current connection status of Diameter peers across all endpoints to the registered Diabase clients (sessmgr/aaamgr tasks). The Diabase client audits the current connection status and takes corrective action if there is any discrepancy in connection status.

How It Works

Following is a brief overview of how this feature works:

1. The Diamproxy initiates endpoint peer connection status audit process with sessmgr and aaamgr.
2. If there is any discrepancy in peer connection status, then the sessmgr and aaamgr initiate an auto-corrective action.
3. Any discrepancy in peer connection status between Diamproxy and sessmgr/aaamgr gets corrected within pre-defined time interval.
4. After any type of recovery event and peer connection status audit process, there is no race condition between peer connection status reconciliation during startup.

The Audit is delayed by 3 minutes for connection stabilization when any of the following events occur:

1. Diamproxy tasks starts.
2. Diamproxy task restarts.
3. ICSR switchover -> Chassis state moves from Standby to Active.
4. Planned card migration -> Start AUDIT 3 minutes from migration end time.
5. Unplanned card migration -> Same as Diamproxy task restart.

Configuring Diamproxy Peer Connection Status Audit

This section provides information about CLI commands available in support of the feature.

Enabling Connection Status Audit Interval

Use the following CLI commands under Global Configuration Mode to enable the connection status audit interval:
configure
diameter-proxy conn-audit interval audit_interval
exit

Notes:

- **diameter-proxy**: Specifies the Diamproxy related configurations.
- **conn-audit**: Specifies the periodic connection status audit processes. Disabled by default.
- **interval audit_interval**: Specifies the connection status audit interval in minutes in the range of 1 through 10. Recommended value is 2 minutes.
- If previously configured, use the default diameter-proxy conn-audit CLI command to disable Diamproxy Peer Connection Status Audit with Diabase clients.
- Enabling Diamproxy Peer Connection Status Audit with Diabase clients might affect performance of the services using Diameter interface.

**Verifying the Diamproxy Peer Connection Status Audit**

Use the following CLI command to verify if the connection status is in SYNC at all Diameter peers.

- show diameter peers full debug
Verifying the Diamproxy Peer Connection Status Audit
Direct Tunnel for 4G (LTE) Networks

This chapter briefly describes support for direct tunnel (DT) functionality over an S12 interface for a 4G (LTE) network to optimize packet data traffic.

Cisco LTE devices (per 3GPP TS 23.401 v8.3.0) supporting direct tunnel include:

- Serving GPRS Support Node (S4-SGSN)
- Serving Gateway (S-GW)
- PDN Gateway (P-GW)

Direct Tunnel is a licensed Cisco feature. A separate feature license is required for configuration. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

The following sections are included in this chapter:

- Direct Tunnel for 4G Networks - Feature Description, on page 287
- How It Works, on page 290
- Configuring Support for Direct Tunnel, on page 319
- Monitoring and Troubleshooting Direct Tunnel, on page 322

Direct Tunnel for 4G Networks - Feature Description

The amount of user plane data will increase significantly during the next few years because of High Speed Packet Access (HSPA) and IP Multimedia Subsystem technologies. Direct tunneling of user plane data between the RNC and the S-GW can be employed to scale UMTS system architecture to support higher traffic rates.

Direct Tunnel (DT) offers a solution that optimizes core architecture without impact to UEs and can be deployed independently of the LTE/SAE architecture.
Direct tunnel is a licensed Cisco feature. A separate feature license is required for configuration. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Important

Establishment of a direct tunnel is controlled by the SGSN; for 4G networks this requires an S4 license-enabled SGSN setup and configured as an S4-SGSN.

Once a direct tunnel is established, the S4-SGSN/S-GW continues to handle the control plane (RANAP/GTP-C) signaling and retains the responsibility of making the decision to establish direct tunnel at PDP context activation.

Figure 13: GTP-U Direct Tunneling

A direct tunnel improves the user experience (for example, expedites web page delivery, reduces round trip delay for conversational services) by eliminating switching latency from the user plane. An additional advantage, direct tunnel functionality implements optimization to improve the usage of user plane resources (and hardware) by removing the requirement from the S4-SGSN/S-GW to handle the user plane processing.

A direct tunnel is achieved upon PDP context activation when the S4-SGSN establishes a user plane tunnel (GTP-U tunnel) directly between the RNC and the S-GW over an S12 interface, using a Create Bearer Response or Modify Bearer Request towards the S-GW.
A major consequence of deploying a direct tunnel is that it produces a significant increase in control plane load on both the SGSN/S-GW and GGSN/P-GW components of the packet core. Hence, deployment requires highly scalable GGSNs/P-GWs since the volume and frequency of Update PDP Context messages to the GGSN/P-GW will increase substantially. The SGSN/S-GW platform capabilities ensure control plane capacity will not be a limiting factor with direct tunnel deployment.

S4-SGSN supports establishment of a GTP-U direct tunnel between an RNC and the S-GW under the scenarios listed below:

- Primary PDP activation
- Secondary PDP activation
- Service Request Procedure
- Intra SGSN Routing Area Update without S-GW change
- Intra SGSN Routing Area Update with S-GW change
- Intra SGSN SRNS relocation without S-GW change
- Intra SGSN SRNS relocation with S-GW change
- New SGSN SRNS relocation with S-GW change
- New SGSN SRNS relocation without S-GW relocation
- E-UTRAN-to-UTRAN Iu mode IRAT handover with application of S12U FTEID for Indirect Data Forwarding Tunnels as well
- UTRAN-to-E-UTRAN Iu mode IRAT handover with application of S12U FTEID for Indirect Data Forwarding Tunnels as well
- Network Initiated PDP Activation

Scenarios that vary at S4-SGSN when direct tunneling is enabled, as compared to DT on a 2G or 3G SGSN using the Gn interface, include:

- RAB Release
- Iu Release
- Error Indication from RNC
How It Works

DT functionality enables direct user plane tunnel between RNC and SGW within the PS domain. With direct tunneling the S4-SGSN provides the RNC with the TEID and user plane address of the S-GW, and also provides the S-GW with the TEID and user plane address of the RNC.

The SGSN handles the control plane signaling and makes the decision when to establish the direct tunnel between RNC and S-GW, or use two tunnels for this purpose (based on configuration).

DT Establishment Logic

The following figure illustrates the logic used within the S4-SGSN/S-GW to determine if a direct tunnel will be setup.
Establishment of Direct Tunnel

The S4-SGSN uses the S12 interface for DT.
Direct Tunnel Activation for Primary PDP Context

For the PDP Context Activation procedure this solution uses new information elements (IEs) for the GPRS Tunnelling Protocol v2 (GTPv2) as defined in TS 29.274. SGSN provides the user plane addresses for RNC and S-GW as S12U FTEIDs as illustrated in the figure below.

The sequence for establishing a direct tunnel between the RNC and S-GW during PDP activation is as follows:

- SGSN sends a Create Session Request to the S-GW with the indication flag DTF (direct tunnel flag) bit set
- In its Create Session Response, the S-GW sends the SGSN an S12U FTEID (Fully Qualified Tunnel Endpoint Identifier).
- The SGSN forwards the S-GW S12U to the RNC during the RAB Assignment Request.
- In its RAB Assignment Response, the RNC sends the SGSN its transport address and Tunnel Endpoint ID (TEID).
- The SGSN forwards the RNC S12 U FTEID o the S-GW via a Modify Bearer Request.

Figure 16: Primary PDP Activation with Direct Tunnel

Direct Tunnel Activation for UE Initiated Secondary PDP Context

The following is the general sequence for establishing a direct tunnel for a Secondary PDP Context Activation:

- The SGSN sends a Bearer Resource Command to the S-GW with no flags set. (S-GW already knows Direct Tunnel is enabled for primary.)
- The S-GW sends a Create Bearer Response that includes the S12U FTEID to the SGSN.
- The SGSN forwards the S-GW S12U to RNC via a RAB Assignment Request.
- In its RAB Assignment Response, the RNC sends its transport address and TEID to the SGSN.
- The SGSN forwards the S12U TEID received from the RNC to the S-GW via a Create Bearer Response.
RAB Release with Direct Tunnel

If the SGSN receives a RAB Release Request from the RNC for bearer contexts activated with Direct Tunnel, it sends a Release Access Bearer Request to the S-GW.

Upon receiving the Release Access Bearer Request, the S-GW removes the S12 U RNC FTEID. If any downlink data appears, the S-GW sends a Downlink Data Notification because it does not have a user plane FTEID with which to forward data.

Bearers with a streaming or conversational class will not be included in the Release Access Bearer Request because these bearers should be deactivated. However, S4-SGSN currently does not support deactivation of streaming/conversational bearers upon RAB release.
Operators should not use conversational or streaming class bearers in S4-SGSN.

**Iu Release with Direct Tunnel**

If the SGSN receives an Iu Release and bearers are activated with direct tunneling, it sends a Release Access Bearer Request to the S-GW.

Bearers with a streaming or conversational class will not be included in the Release Access Bearer Request because these bearers should be deactivated. However, S4-SGSN currently does not support deactivation of streaming or conversational bearers upon Iu release.

Operators should not use conversational or streaming class bearers in S4-SGSN.
When a UE is Idle and wants to establish a data or signaling connection, it sends a Service Request for data. Alternatively, a UE can also send a Service Request to the SGSN when it is paged by the SGSN.

Upon receiving a Service Request for data, the SGSN establishes RABs and sends a Modify Bearer Request to the S-GW with the 12U FTEID received from the RNC.
Downlink Data Notification with Direct Tunnel when UE in Connected State

When RABs are released (but UE retains an Iu connection with the SGSN), the SGSN notifies the S-GW to release the RNC side TEIDs via a Release Access Bearer Request.

If the S-GW receives any downlink GTPU data from the P-GW after receiving the Release Access Bearer Request, it knows neither the RNC TEID nor SGSN user plane TEID to which to forward the data. So it signals the SGSN to establish the RABs. This signaling message is a Downlink Data Notification message from the S-GW.

If the Downlink Data Notification is received from the S-GW, all of the missing RABs are established and a Modify Bearer Request is sent to the S-GW with the RNC S12U FTEID.

Figure 21: Downlink Data Notification with Direct Tunnel

Downlink Data Notification with Direct Tunnel when UE in Idle State

When an Iu is released the UE goes IDLE. The SGSN informs the S-GW to release the RNC side TEIDs by sending a Release Access Bearer Request. After this point if the S-GW receives any downlink GTPU data from the P-GW, it knows neither the RNC TEID nor SGSN user plane TEID to which to forward the data.

If the S-GW receives any downlink GTPU data after receiving the Release Access Bearer Request, it knows neither the RNC TEID nor SGSN user plane TEID to which to forward the data. So it signals the SGSN to establish the RABs. This signaling message is a Downlink Data Notification from the S-GW. If a Downlink Data Notification is received from S-GW when the UE is idle, the SGSN pages the UE before establishing the RABs. The SGSN sends a Modify Bearer Request to the S-GW with the RNC S12U FTEID.
**Intra SGSN Routing Area Update without SGW Change**

For a Routing Area Update without an S-GW change with Direct Tunnel, the SGSN sends a Modify Bearer Request to the S-GW with the RNC FTEID. The SGSN will establish RABs with the target RNC only if the RABs were present with the source RNC.
The table below includes detailed behaviors for a Routing Area Update without S-GW change.

*Table 27: Routing Area Update without S-GW Change Behavior Table*

Routing Area Update with S-GW Change

In a Routing Area Update with an S-GW change, the SGSN sends a Create Session Request with DTF flag set and no user plane FTEID. In its Create Session Response, the S-GW sends an S12U FTEID which is forwarded to the RNC via a RAB Assignment Request.

The SGSN sends the RNC FTEID received in the RAB Assignment Response to the S-GW in a Modify Bearer Request. There are many scenarios to consider during Intra SGSN RAU.

**Intra SRNS with S-GW Change**

In Intra SRNS (Serving Radio Network Subsystem) with S-GW change, the SGSN sends a Create Session Request with DTF flag set and no user plane FTEID. The Create Session Response from the new S-GW contains the SGW S12U FTEID which the SGSN forwards to the Target RNC in a Relocation Request.

The SGSN sends the RNC S12U FTEID to the new S-GW in a Modify Bearer Request.

**Network Initiated Secondary PDP Context Activation**

The S-GW sends a Create Bearer Request for Network Initiated Secondary PDP Context Activation with the SGW S12U FTEID. This FTEID is sent in a RAB Assignment Request to the RNC. The RNC S12U FTEID received in the RAB Assignment Response is sent to the S-GW in a Create Bearer Response.

*Figure 31: Network Initiated Secondary PDP Context Activation 5*

**PGW Init Modification when UE is Idle**

If UE is in IDLE state and PGW Init Modification is received, the SGSN sends the first MBR. Upon getting PGW Init Modification in Idle State, the SGSN queues the PGW Init Modification and feeds a Downlink Data Notification internally. This sets up all RABs (using old QoS) and sends a Modify Bearer Request. When the Downlink Data Procedure is completed, the queued PGW Init Modification is processed.
Limitations

During an intra RAU, intra SRNS or Service Request triggered by RAB establishment, if a few RABs fail the Modify Bearer Request the SGSN will mark those RABs as bearers to be removed. Under current specifications, it is not possible to send a Modify Bearer Request with a few bearers having S12U U-FTEIDs and a few bearers not having U-FTEIDs.

There is an ongoing CR at 3GPP to allow such Modify Bearer Requests and the S-GW should send DDN when it gets downlink data for the bearers that did not have U-FTEIDs. If this CR is approved, the SGSN will support (in a future release) sending a partial set of bearers with S12U FTEID and some bearers without any U-FTEID.
Standards Compliance

The Direct Tunnel complies with the following standards:

- 3GPP TS 23.060 version 10 sec 9.2.2 General Packet Radio Service (GPRS) Service description
- 3GPP TS 29.274 v10.5.0 3GPP Evolved Packet System (EPS) Evolved General Packet Radio Service (GPRS) Tunnelling Protocol for Control plane (GTPv2-C)

Configuring Support for Direct Tunnel

The SGSN determines if setup of a direct tunnel is allowed or disallowed. Currently, the SGSN and S-GW are the only products that provide configuration commands for this feature. All other products that support direct tunnel do so by default.

By default, direct tunnel support is

- disallowed on the SGSN/S-GW
- allowed on the GGSN/P-GW

The SGSN/S-GW direct tunnel functionality is enabled within an operator policy configuration. One aspect of an operator policy is to allow or disallow the setup of direct GTP-U tunnels. If no operator policies are configured, the system looks at the settings in the operator policy named default. If direct tunnel is allowed in the default operator policy, then any incoming call that does not have an applicable operator policy configured will have direct tunnel allowed. For more information about the purpose and uses of operator policies, refer to the section Operator Policy.

Configuring Direct Tunnel on an S4-SGSN

Configuration of a GTP-U direct tunnel (DT) requires enabling DT both in a call control profile and for the RNC.

Important

Direct tunneling must be enabled at both end points to allow direct tunneling for the MS/UE.

Enabling Setup of GTP-U Direct Tunnel

The SGSN determines whether a direct tunnel can be setup and by default the SGSN does not support direct tunnel. The following configuration enables a GTP-U DT in a call control profile:

```
cfg
  call-control-profile policy_name
    direct-tunnel attempt-when-permitted [ to-ggsn | to-sgw ]
  end
```

Notes:

- A call-control profile must have been previously created, configured, and associated with a previously created, configured, and valid operator policy. For information about operator policy creation/configuration, refer to the Operator Policy chapter in this guide.
• Beginning with Release 19.3.5, to-ggsn and to-sgw options have been added to the direct-tunnel command to enable the operator to select the interface the SGSN will use for its direct tunnel. For a collocated Gn/GP-SGSN and an S4-SGSN,
  • Use the keyword attempt-when-permitted without a filter to enable both interface types: GTP-U towards the GGSN and S12 towards the SGW.
  • Use the keyword attempt-when-permitted with the to-ggsn keyword filter to enable only the GTP-U interface between the RNC and the GGSN.
  • Use the keyword attempt-when-permitted with the to-sgw keyword filter to enable only the S4’s S12 interface between the RNC and the SGW.

• To remove the direct tunnel settings from the configuration, use the following command: direct-tunnel attempt-when-permitted [ to-ggsn | to-sgw ]
• Direct tunnel is allowed on the SGSN but will only setup if allowed on both the destination node and the RNC.

Enabling Direct Tunnel to RNCs

SGSN access to radio access controllers (RNCs) is configured in the IuPS service. Each IuPS service can include multiple RNC configurations that determine communications and features depending on the RNC. By default, DT functionality is enabled for all RNCs.

The following configuration sequence enables DT to a specific RNC that had been previously disabled for direct tunneling:

```
config
  context ctxt_name
    iups-service service_name
      rnc id rnc_id
        default direct-tunnel
    end
  end
```

Notes:
• An IuPS service must have been previously created, and configured.
• An RNC configuration must have been previously created within an IuPS service configuration.
• Command details for configuration can be found in the Command Line Interface Reference.

Restricting Direct Tunnels

The following configuration scenario prohibits the S4-SGSN to setup direct tunneling over the S12 interface during Inter SGSN RAUs:

```
config
  call-control-profile profile_name
    rau-inter avoid-s12-direct-tunnel
  end
```

Restrict direct tunneling by a specific RNC. The following configuration scenario restricts the SGSN from attempting to setup a direct tunnel when a call originates from a specific RNC.
Verifying the Call-Control Profile Configuration

Use the following command to display and verify the direct tunnel configuration for the call-control profiles:

```
show call-control-profile full name <profile_name>
```

The output of this command displays all of the configuration, including direct tunnel for the specified call-control profile.

```
Call Control Profile Name = ccp01
: Re-Authentication : Disabled
Direct Tunnel : Not Restricted
GTPU Fast Path : Disabled
```

Verifying the RNC Configuration

Use the following command to display and verify the direct tunnel configuration in the RNC configuration:

```
show iups-service name <service_name>
```

The output of this command displays all of the configuration, including direct tunnel for the specified IuPS service.

```
IService name : iups1
: Available RNC:
  Rnc-Id : 1
  Direct Tunnel : Not Restricted
```

Configuring S12 Direct Tunnel Support on the S-GW

The example in this section configures an S12 interface supporting direct tunnel bypass of the S4 SGSN for inter-RAT handovers.

The direct tunnel capability on the S-GW is enabled by configuring an S12 interface. The S4 SGSN is then responsible for creating the direct tunnel by sending an FTEID in a control message to the S-GW over the S11 interfaces. The S-GW responds with it’s own U-FTEID providing the SGSN with the identification information required to set up the direct tunnel over the S12 interface.
If you modify the `interface-type` command, the parent service (service within which the eGTP/GTP-U service is configured) will automatically restart. Service restart results in dropping of active calls associated with the parent service.

Use the following example to configure this feature.

```plaintext
configure
  context egress_context_name -noconfirm
  interface s12_interface_name
    ip address s12_ipv4_address_primary
    ip address s12_ipv4_address_secondary
  exit
  exit
  port ethernet slot_number/port_number
  no shutdown
  bind interface s12_interface_name egress_context_name
  exit
  context egress_context_name -noconfirm
  gtpu-service s12_gtpu_egress_service_name
    bind ipv4-address s12_interface_ip_address
  exit
  egtp-service s12_egtp_egress_service_name
    interface-type interface-sgw-egress
    validation-mode default
    associate gtpu-service s12_gtpu_egress_service_name
    gtpc bind address s12_interface_ip_address
  exit
  sgw-service sgw_service_name -noconfirm
    associate egress-proto gtp egress-context egress_context_name
  egtp-service s12_egtp_egress_service_name
end
```

Notes:

- The S12 interface IP address(es) can also be specified as IPv6 addresses using the `ipv6 address` command.

## Monitoring and Troubleshooting Direct Tunnel

### show subscribers sgsn-only

The output of this command indicates whether Direct Tunnel has been established.

```
show subscribers sgsn-only full all
```

Username: 123456789012345
Access Type: sgsn-pdp-type-ipv4 Network Type: IP
Access Tech: WCDMA UTRAN
show gmm-sm statistics sm-only

The output of this command indicates the number of total active PDP contexts with direct tunnels.

**show gmm-sm statistics sm-only**

Activate PDP Contexts:

<table>
<thead>
<tr>
<th>Total Actv PDP Ctx:</th>
<th>2G-Avtv Pdp Ctx:</th>
<th>0</th>
</tr>
</thead>
<tbody>
<tr>
<td>3G-Actv Pdp Ctx:</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Gn Interface:</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>S4 Interface:</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>Total Actv Pdp Ctx:</td>
<td>3</td>
<td>1</td>
</tr>
<tr>
<td>with Direct Tunnel:</td>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

**Direct Tunnel Bulk Statistics**

Currently there are no bulk statistics available to monitor the number of PDP contexts with Direct Tunnel.

Bulk statistics under the EGTPC schema are applicable for both Direct Tunnel and Idle Mode Signalling Reduction (ISR) [3G and 2G]. The following statistics track the release access bearer request and response messages which are sent by the SGSN to the S-GW upon Iu or RAB release when either a direct tunnel or ISR is active:

- tun-sent-relaccbearreq
- tun-sent-retransrelaccbearreq
- tun-reccv-relaccbearresp
- tun-reccv-relaccbearrespDiscard
- tun-reccv-relaccbearrespsaccept
- tun-reccv-relaccbearrespsdenied

The following bulkstats under EGTPC schema track Downlink Data Notification (DDN) Ack and failure messages between the S-GW and the SGSN when either direct tunnel or ISR is active:

- tun-reccv-dlinknotif
- tun-reccv-dlinknotifDiscard
- tun-reccv-dlinknotifNorsp
- tun-reccv-retransdlinknotif
- tun-sent-dlinknotifackaccept
- tun-sent-dlinknotifackdenied
- tun-sent-dlinkdatafail

For complete descriptions of these variables, see the EGTPC Schema Statistics chapter in the *Statistics and Counters Reference*.

Feature Description

When a Guaranteed Bit Rate (GBR) dedicated bearer is used, the bandwidth of resources is reserved on the network. If the subscriber data flow is at lower bandwidth than the allocated values, then extra GBR is wasted on the network.

This feature adds flexibility where the Gateway periodically monitors the usage of the GBR on the bearer and depending on the usage. The Gateway steps-up or steps-down the allocated GBR accordingly.

How It Works

This section describes the working of Dynamic GBR functionality.

- Dedicated GBR Bearer is created using local policy configurations on a session setup or on certain call events.
- The SAEGW monitors the GBR after bearer creation for every interval of 30 seconds.
- After every interval, SAEGW verifies the average data-rate with the threshold value configured.
- In case, if the threshold breaches, then the GBR is stepped-up or stepped-down as per the configured value.
- SAEGW allows configuration of an upper and lower threshold of the GBR and also step-up or step-down value corresponding to the upper and lower threshold value.

Upper Threshold Breach

First Threshold Breach:

- Subscriber creates the dedicated bearer with QCI=qci1 with GBR as 1000 kbps with the upper threshold configured as 80%, that is, 800 kbps.
- Every 30 seconds the data-rate is evaluated. If the threshold limit is breached then SAEGW initiates the Update Bearer Request to upgrade the GBR value to step up by the configured percentage value.
- After 30 seconds if data-rate evaluated is more than 800 kbps, then the UBR is initiated to upgrade the GBR. The GBR is upgraded with the aggregate value of the initial configured GBR and the step-up configured percentage. For example, if the step-up increase is configured as 20% (200 kbps), then the Update Bearer Request if triggered with 1200 kbps.

Second Threshold Breach:

- As the GBR is increased to 1200 kbps, new upper threshold being monitored is 80% of 1200, that is, 960 kbps.
- On the next monitoring interval, if data-rate usage crosses 960 kbps, SAEGW again initiates the Update Bearer Request to upgrade the GBR values. These GBR values are upgraded to step-up by configured percentage value (20%). However, this 20% is of the base value, that is 1000, and not 1200 kbps. Hence, the increase is again by 200 kbps and the Update Bearer Request is 1400 kbps as the new GBR.
The step increase percentage is of the base (initial) value of the bearer and not the current negotiated value. The maximum value to which GBR can be stepped up is the configured MBR value.

**Important**

**Lower Threshold Breach**

**First Threshold Breach:**

- Subscriber creates the dedicated bearer with QCI=qci1 with GBR as 1000 kbps with lower threshold is configured as 50%.
- Due to upper threshold breach, SAEGW has upgraded the GBR to 1400 kbps.
- When the usage on the bearer reduces below 700 kbps (50% of current GBR), SAEGW initiates the Update Bearer Request to downgrade the GBR. These GBR values are downgraded to step-down by configured value (say 20%), that is 1400 – 200 = 1200 kbps.

**Important**

The step decrease percentage is of the base (initial) value of the bearer and not the current negotiated value. The GBR value will not be stepped down below the initial negotiated value.

**Second Threshold Breach:**

- As the GBR is decreased to 1200 kbps, the data decreases further to breach the new 50% lower threshold. That is, 50% of 1200 = 600 kbps.
- SAEGW initiates the Update Bearer Request to downgrade the GBR values to step down by configured value (20%). That is, 1200 – 200 = 1000 kbps.

---

**Limitations and Restrictions**

This section provides limitations and restrictions of this feature.

- The SAEGW monitors the bearer bandwidth on every 30-seconds interval.
- If GBR usage exceeds a configurable percentage of a configured threshold, SAEGW initiates a bearer modification procedure. SAEGW initiates this procedure with a bearer QoS update using an upper bound configured value. eNB and UER adjust GBR accordingly.
- If GBR usage falls below a configurable percentage of a configured threshold, SAEGW initiates a bearer modification procedure. This bearer modification procedure is initiated with a Bearer QoS update using a lower bound configured value. eNB and UER adjust GBR accordingly.
- In case multiple rules are configured on the same bearer, then QoS is enforced from the current negotiated bearer values. The individual values under charging action corresponding to the ruledef are not honored if this feature is enabled on the bearer.
• For the monitored bearer, if the bit rate is modified or rule is deleted, then the base value of GBR is changed. This change in base value of GBR leads to change in the step-up or step-down values.

• Session recovery and ICSR are supported.

• The step-up and step-down values are calculated as per the base values of the GBR of the bearer and not the current GBR applied on the bearer.

# Configuring Dedicated GBR Bearer

This section provides the configuration commands added for this feature.

In addition to this, the following new configurations must be enabled.

1. Lower bound GBR (in %) to determine which GBR value to step-down.
2. Upper bound GBR (in %) to determine which GBR value to step-up.
3. Step-up the threshold (in %).
4. Step-down the threshold (in %). This value must be less than step-up threshold.

## trigger

New CLI keywords **bearer-creation** and **monitor-bearer-bandwidth** have been added to this CLI command. The keyword **bearer-creation** triggers for every new bearer created. The keyword **monitor-bearer-bandwidth** triggers whenever the bearer bandwidth is evaluated.

```
configure
  active-charging service <service_name>
  service scheme <service_scheme_name>
  [ no ] trigger { bearer-creation | flow-create | loc-update | monitor-bearer-bandwidth | sess-setup }
end
```

### Notes:

This CLI is disabled by default.

- **no**: If previously configured, deletes the specified configuration.
- **bearer-creation**: Triggers for every new bearer.
- **flow-create**: Triggers for every new flow.
- **loc-update**: Triggers whenever location changes for the subscriber.
- **sess-setup**: Triggers at the session setup.
- **monitor-bearer-bandwidth**: Triggers whenever bearer bandwidth is evaluated.
committed-data-rate

This CLI command has been added under the ACS Trigger Condition configuration mode to configure the committed data rate of the current negotiated value.

```
configure
  active-charging service <service_name>
  trigger-condition <trigger_condn_name>
    [ no ] committed-data-rate { lower_threshold <value_in_percentage>
      | upper_threshold <value_in_percentage> }
  end
```

**Notes:**
- **no**: Disables the committed data rate of the current negotiated value.
- **committed-data-rate**: Specifies the committed data rate of the current negotiated value.
- **lower_threshold**: Configures the threshold as a percentage of the current negotiated value.
- **upper_threshold**: Configures the threshold as a percentage of the current negotiated value.
- **value_in_percentage**: Specifies the percentage of initial configured committed-data-rate value. This is an integer value of 0 to 100.

**step-up**

This new CLI command has been added to the ACS Trigger Action Configuration mode to step up the value of committed data rate.

```
configure
  active-charging service <service_name>
  trigger-action <trigger_action_name>
    [ no ] step-up committed-data-rate <negotiated_value>
  end
```

**Notes:**
- **no**: If previously configured, deletes the specified configuration.
- **step-up**: Steps up the value of committed data rate by the percentage defined in the `negotiated_value`
- **committed-data-rate**: Defines the committed data rate.
  - `negotiated_value`: Specifies the percentage of initial configured committed-data-rate value. This is an integer value of 0 through 100.

**step-down**

This new CLI command has been added to the ACS Trigger Action Configuration mode to step down the value of committed data rate.

```
configure
```
active-charging service <service_name>
    trigger-action <trigger_action_name>
        [ no ] step-down committed-data-rate <negotiated_value>
end

Notes:
- **no**: If previously configured, deletes the specified configuration.
- **step-down**: Steps down the value of the committed data rate by the percentage defined in the `negotiated_value`.
- **committed-data-rate**: Defines the committed data rate.
  
  `negotiated_value`: Specifies the percentage of initial configured committed-data-rate value. This is an integer value of 0 through 100.

### Sample Configuration

This section lists the sample configuration of the CLI commands used in this feature.

```bash
config
    active-charging service ACS
    trigger-action ta1
        step-up committed-data-rate 20
        exit
    trigger-action ta2
        step-down committed-data-rate 30
        exit
    trigger-condition tc1
        qci = 1
        committed-data-rate upper-threshold 80
        exit
    trigger-condition tc2
        qci = 1
        committed-data-rate lower-threshold 50
        exit
    service-scheme scheme1
        trigger monitor-bandwidth
            priority 1 trigger-condition tc1 trigger-action ta1
            priority 2 trigger-condition tc2 trigger-action ta2
            exit
    subs-class class1
        any-match = TRUE
        exit
    subscriber-base base1
        priority 1 subs-class class1 bind service-scheme scheme1
        exit
    exit
```
Chapter 16

ePDG Selection Using PCO

- Feature Description, on page 331
- How it Works, on page 331
- Limitations, on page 332
- Configuring ePDG Selection Using PCO, on page 332
- Monitoring and Troubleshooting ePDG Selection Using PCO Feature, on page 332

Feature Description

The purpose of this feature is to enable the PGW to send the ePDG IP addresses in an operator PCO so that when connected to a WIFI network the UE will attach to the closest geographic ePDG. This will aid in setting up the IPSEC tunnel to the closest ePDG and therefore reducing latency for VoWIFI and other features.

A new CLI has been introduced to customize PCO options in the network.

---

Important

This is a license-controlled feature. Contact your Cisco account or support representative for detailed licensing information.

---

Important

ePDG PCO is supported only for the CS request which are received on the S5-S8 interface. This feature is not applicable for the GGSN calls.

---

How it Works

- One ePDG FQDN can be configured on an APN.
- Operator specific PCO is supported in CSReq/Res on S5/S8 interface and in PBU/PBA on PMIP S2a interface.
- P-GW uses DNS server for FQDN resolution.
- Maximum of 2 IPv4 and 2 IPv6 ePDG addresses can be sent in PCO.
Limitations

This feature is not applicable for the GGSN calls.

Configuring ePDG Selection Using PCO

Configuring epdg fqdn

Use the following example to customize PCO (Protocol Configuration Options) options in the network.

```
configure
  apn apn_name
  pco-options epdg fqdn domain_name
  no pco-options
end
```

Notes:

- **no**: Does not send customized PCO options to any of the UEs.
- **pco-options**: Controls the sending of customized PCO (Protocol Configuration Options) options in the network.
- **epdg**: Enables operator specific epdg selection in the PCO. By default it is disabled.
- **fqdn**: Specifies fully qualified domain name. Based on this, IP addresses would be queried from the DNS.

Verifying the Configuration

The configuration of this feature can be verified using the following commands from the `exec` mode:

- `show configuration`
- `show configuration verbose`

Please see the Monitoring and Troubleshooting section for the command output.

Monitoring and Troubleshooting ePDG Selection Using PCO Feature

The following section describes commands available to monitor the ePDG Selection Using PCO Feature.

Show Commands for ePDG Selection Using PCO Feature

```
show apn apn_name
```

This command displays the following output:
show apn name intershat
PCO Options:
  custom1 Mode: enabled
  Link MTU: 1500

EPCG Selection FQDN: <epdg.com> / N.A.

APN QCI Stats: Disabled
Bearer duration stats config: Disabled
Event Reporting: Disabled

HSGW Static PGW-FQDN:
  Primary FQDN: N/A Secondary FQDN: N/A

show config

This command has been modified to display the following output when ePDG has been configured:

```
pco-options epdg fqdn epdg.com
```

show configuration verbose

This command displays the following output when epdg fqdn is configured:

```
no pco-options epdg
```

show pgw-service statistics name

This command displays the following output:

```
ePDG selection PCO statistics:
IPv6 PCO:
  Request received: 20
  Response sent: 18
  Response not sent as configuration not present: 1
  Response not sent as DNS query fails/ expires: 1
IPv4 PCO:
  Request received: 20
  Response sent: 18
  Response not sent as configuration not present: 1
  Response not sent as DNS query fails/ expires: 1
```

show saegw-service statistics name function pgw

This command displays the following output:

```
ePDG selection PCO statistics:
IPv6 PCO:
  Request received: 20
  Response sent: 18
  Response not sent as configuration not present: 1
  Response not sent as DNS query fails/ expires: 1

Feature Description

For troubleshooting and investigating network issues related to the Diameter interface, it is important to filter the subscriber or UE specific Diameter traffic. Any traffic associated with a particular IMSI can be easily filtered, even without knowing the Diameter session ID, if the IMSI information is embedded into the Diameter Session ID AVP. This feature allows the operator to filter the subscriber or UE specific Diameter traffic.

This feature introduces a new CLI command `session-id include imsi` under the `diameter endpoint configuration` mode to embed IMSI into Diameter session ID AVP over the Gx, Gy, and Gz (Rf) interface.

**Important**

This feature is license controlled. Contact your Cisco account representative for information on how to obtain a license.

How It Works

A new CLI command `session-id include imsi` has been added under the `diameter endpoint configuration` mode to enable/disable inclusion of IMSI in Session-Id AVP for all Diameter sessions associated with that Diameter endpoint. Operators can enable only the required Diameter endpoints and control the inclusion of IMSI in the Session-ID AVP. IMSI information is included in the Diameter Session-ID AVP over the Gx, Gy, and Gz (Rf) interface, if the `session-id include imsi` is enabled on respective Diameter endpoints.

For emergency call with "only IMEI", IMSI information is not available for that emergency PDN. Hence, this IMSI information is not included in Diameter Session-ID at Gx, Gy, and Gz interface, when `session-id include imsi` is enabled. Configuring `session-id include imsi` impacts only new PDN connection and does not have any impact on existing PDN connection behavior (Gx, Gy, and Gz (Rf)) interface. For example, if the CLI command to include IMSI is enabled for the Gy Diameter endpoint after PDN creation. If a new dedicated bearer is created after this configuration change, then in this case Gy session established for a new dedicated bearer is not included IMSI in Gy Diameter session ID.

There is no impact of session manager recovery/ICSR on the session-ID AVP. Session-ID associated with Gx, Gy, and Gz (Rf) session is recovered transparently (which is irrespective of latest endpoint configuration). New sessions come up with session IDs as per the configuration on the newly active chassis.

Limitations

Following are the known limitations of this feature:

- Assuming IMSI information as sensitive information, operator must consider security aspects before enabling this CLI option.
• For an emergency call with "Only IMEI", IMSI information is not available for the emergency PDN, hence it is not included in the diameter Session-ID at Gx, Gy, and Gz (Rf) interface.

• During ICSR upgrade scenario, it is assumed that the new CLI option must be enabled only when the upgraded chassis is in stable state and there exists no chances of ICSR downgrade.

• If new CLI is enabled in the newer version of chassis, ICSR Downgrade is not recommended.

• As new CLI option is not available in old software versions, hence ICSR downgrade is not recommended. Performing ICSR downgrade should have the following impact on the diameter sessions, which have IMSI, included as part of Session-ID.
  
  • Gx and Gy: Existing diameter session (Gx, Gy) should be downgraded with old format of Session-Id. In that case, both P-GW and PCRF are out of sync leading to hanging session at P-GW or/and PCRF. Any communication from PCRF (RAR)/P-GW (CCR-U) can lead to stale session deletion.
  
  • Gz (Rf): However, Rf sessions should be recovered properly and any Rf signaling is sent out to Rf servers properly but responses cannot be processed as diamproxy cannot parse the new format session id which again puts Rf sessions into stale state until purged.

Configuring Diameter Accounting Interim Interval

The following CLI command has been added under the diameter endpoint configuration mode to include IMSI in Diameter session-ID per Diameter endpoint at Gx, Gy, and Gz (Rf). Configuration changes will be applicable only to new Sessions at Gx, Gy and Rf. Configuration changes will not have any impact on existing sessions behavior at Gx, Gy, and Rf. For Gy, multiple Diameter sessions can be initiated per subscriber and the session ID format setting will bind to the subscriber. The setting will be taken to effect when the first Diameter session is established and following Gy sub sessions will keep using the session ID format used in first session.

```
cfg> context context_name
diameter endpoint endpoint_name
    [no] session-id include imsi
end
```

Notes:

• session-id: Describes Diameter Session-ID format

• include: Includes configured information in Diameter Session-ID

• imsi: Includes International Mobile Subscriber Identification (IMSI) in Diameter Session-ID

• no: Disables this feature, that is, IMSI is not included in the Diameter Session-ID, which is the default behavior.

• By default, CLI is disabled, hence IMSI will not be populated in Diameter Session-ID.
Monitoring and Troubleshooting

The following sections describe commands available to monitor the feature.

Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of the feature.

show configuration

The output of the above command is modified to display the following new field depending on whether the CLI is enabled or disabled:

- session-id include imsi
- no session-id include imsi

show configuration [ verbose ]

The output of the above command is modified to display the following new field depending on whether the CLI is enabled or disabled:

- session-id include imsi
- no session-id include imsi

Revision History

Important

Revision history details are not provided for features introduced before releases 21.2 and N5.1.
**Feature Changes**

Currently, P-GW supports enabling S6b authentication for 3G access on GGSN service level configuration. For LTE or Wi-Fi access, S6b authentication is supported on both P-GW service level and APN level configuration. If the S6b authentication is enabled for particular APN, when the subscriber joined on LTE transfers to Wi-Fi then 3G, UE does re-registration of the IMS session on 3G. Different P-GW is selected. However, SGSN does not update the new P-GW. HSS has the history of the old P-GW. When the subscriber transfers back to LTE and then to Wi-Fi, it hands over to the old P-GW. However, the old P-GW does not have the new IMS session and this result in the handover failure. With this feature, S6b authorization is enabled for 3G access at the APN level to let P-GW update the new P-GW ID to HSS. This addresses the inconsistency. Two new CLI keywords have been added at the APN level to enable S6b authentication for 3G access and GnGp handover.

**Previous Behavior:** During a call when S6b communication happened, the same connection state was maintained across to-and-fro in 3G to 4G handover, although GGSN service did not have explicit configuration present.

**New Behavior:** Two new CLI keywords `gn-gp-enabled` and `gn-gp-disabled` have been added to the CLI command `authorize-with-hss` at the APN level. The keyword `gn-gp-enabled` enables the S6b authentication for 3G access during the call connect and gn-gp handover. The keyword `gn-gp-disabled` terminates S6b connection when the subscriber moves to 3G access. This is used to override the legacy handover behavior where the session was continued irrespective of the configuration.

**Customer Impact:** These new keywords are not configured by default when `authorize-with-hss` or `authorize-with-hss egtp` are configured. You have to explicitly enable this customized behavior by configuring the CLI commands introduced for this feature.

### Configuring Commands for Enabling S6b for IMS APN

S6b authentication can be enabled at the APN level, two new keywords have been added to the `authorize-with-hss` CLI command.

To enable or disable S6b, execute the following command:

```
configure
  context  context_name
    apn  apn_name
      authorize-with-hss [ egtp [ gn-gp-enabled ] [ s2b [ gn-gp-enabled [ report-ipv6-addr ] ] [ s5-s8 [ gn-gp-disabled | gn-gp-enabled ] [ report-ipv6-addr ] | lma [ s6b-aaa-group aaa-group-name | report-ipv6-addr ] | report-ipv6-addr ] ]
```
[ default | no ] authorize-with-hss
exit

NOTES:

• gn-gp-disabled: Disables S6b authorization for 3G initial attach and GNGP handover.
• gn-gp-enabled: Enables S6b authorization for 3G initial attach and GNGP handover.
• s2b: Enable S6b authorization for egtp-S2b.
• s5-s8: Enable S6b authorization for egtp-S5S8.
• report-ipv6-addr: Enables IPv6 reporting through AAR toward the S6b interface.

Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of the feature.

show apn name

This CLI command is modified to include the gn-gp enabled or disabled status:

• Authorization with S6b: HSS-EGTP-S5S8 GN-GP-Disabled
• Authorization with S6b: HSS-EGTP-S5S8 GN-GP-Enabled

show config apn intershat

The following new fields are added to the show command to indicate the gn-gp enabled or disabled status:

• authorize-with-hss egtp s5-s8 gn-gp-enabled
• authorize-with-hss egtp s5-s8 gn-gp-disabled
show config apn intershat
CHAPTER 19

Emergency Call Support on the ePDG and P-GW

This feature provides emergency call support on the ePDG and P-GW.

- Feature Description, on page 343
- How it Works, on page 344
- Configuring AAA Failure Handling for s2b Emergency Calls, on page 348

Feature Description

The ePDG and P-GW support emergency call establishment over untrusted WiFi for the P-GW as per 3GPP Release 13. Emergency bearer services are provided to support IMS emergency sessions. Emergency bearer services are functionalities provided by the serving network when the network is configured to support emergency services. Emergency bearer services are provided to normal attached UEs and, depending on local regulation, to UEs that are in limited service state. Receiving emergency services in a limited service state does not require a subscription.

Authentication Authorization Requests (AAA) to Diameter now carry the new Emergency-Indication AVP for Untrusted WiFi emergency calls. Diameter requests related to PDN connections for emergency services have the highest priority. Depending on regional/national requirements and network operator policy, these Diameter requests are the last to be throttled, in the event that the 3GPP AAA Server has to apply traffic reduction.

Supported Functionality

3GPP Release 13 Emergency Call Support on the ePDG and P-GW includes the following functionality:

- Emergency call establishment over untrusted WiFi for the P-GW. The P-GW includes the new Emergency-Indication AVP over the AAA s6b interface only during Emergency PDN connection establishment.

- Lawful Intercept is supported for Emergency PDNs over the s2b interface.

- Various Create Session Request message IEs have been modified to support all four different behaviors of emergency bearer establishment.

- Intra- and Inter-chassis recovery are supported for emergency call over the s2b interface.

- Network initiated dedicated bearer creation is supported for emergency calls over the s2b interface.

- The maximum APN restriction is ignored for emergency APN.
• Multiple PDNs are supported for emergency calls over the s2b interface.
• Context replacement for emergency calls over the s2b interface without IMSI with same IMEI is supported.
• P-GW emergency related statistics and bulkstats are available.
• Graceful shutdown of s2b emergency calls is supported.

**Previous Behavior:** Emergency calls were not supported for the s2b interface. Also, handoff between the s2b interface and LTE was not supported for emergency calls.

**New Behavior:** Emergency calls are now supported on the s2b interface and handover is also supported for emergency calls from the s2b interface to LTE and vice-versa for "authenticated imsi" only.

---

**How it Works**

The ePDG sends a Create Session Request (CSReq) message to the P-GW. The P-GW deduces the emergency related policies to apply from the Access Point Name (APN) received in the CSReq message. For emergency attached User Equipment (UE), if the International Mobile Station Identifier (IMSI) cannot be authenticated or the UE has not provided it, then the International Mobile Equipment Identifier (IMEI) is used as UE identifier.

*Figure 33: Call Flow: 3GPP R13 Emergency Call Support on the ePDG and P-GW*
The P-GW sends the **Emergency-Indication** AVP over the s6b interface so that the 3GPP AAA server only applies specific policies for emergency services. For an unauthenticated UE, the 3GPP AAA server does not update the Home Subscriber Server (HSS) with the identity of the P-GW. For an authenticated UE, this indication is sent together with the "PDN GW currently in use for emergency services" message, which comprises the PDN GW address and the indication that the PDN connection is for emergency services to the HSS, which stores it as part of the UE context for emergency services.

Support is available for all four different behaviors of emergency bearer establishment:

- Valid UEs only.
- Only UEs that are authenticated are allowed.
- IMSI required, authentication optional.
- All UEs are allowed.

This section describes the new Attribute Value Pair (AVP) and modified Information Elements that support the feature.

**Emergency-Indication AVP**

A new **Emergency-Indication** AVP is defined in the Authentication and Authorization Request to signal a request to establish a PDN connection for emergency services.

The P-GW signals a new Emergency-Indication AVP to the 3GPP AAA Server in the Authorization Request over the S6b interface. In this case, the 3GPP AAA Server does not check the APN received from the P-GW (which contains an emergency APN) against the APNs authorized in the user subscription. This AVP is supported in the standard S6b dictionary **aaa-custom21**.

**Information Elements**

This section describes other important elements in a Create Session Request that have been modified to work properly with the feature.

**Table 32: Information Elements in a Create Session Request**

</tbody>
</table>
**Emergency Handover Support**

Two types of emergency call handovers are supported:

- **Handover of Emergency Calls from Untrusted WiFi to LTE**: Handover of s2b emergency calls to LTE is supported. Since an emergency call in LTE does not have s6b interface authorization enabled, handover of emergency calls from untrusted WiFi to LTE triggers a Session Termination Request (STR) to the s6b server.

- **Handover of Emergency Calls from LTE to S2b**: Handovers from LTE to S2b are supported. While the UE moves from LTE to untrusted WiFi, LTE triggers an Authentication Authorization Request (AAR) to the s6b server with the AVP *Emergency-Indication* sent in that Authentication and Authorization Request (AAR). Also, an STR is sent when a WiFi (s2b) call is cleared.

**Configuring AAA Failure Handling for s2b Emergency Calls**

Emergency calls over the s2b interface should not be rejected due to a failure from the S6b server. To ensure this, failure handling must be configured in the APN which is used for emergency calls.

Handling is configured in the *aaa group* so that emergency calls continue regardless of failures as indicated by the result code.

To configure AAA failure handling for s2b emergency calls:

```
configure
  context ingress_context_name
    aaa group default
      diameter authentication failure-handling authorization-request result-code 3000 to 5999 action continue
      diameter authentication failure-handling authorization-request request-timeout action continue
end
```

Note the following assumptions:

- If an IP-CAN Session Modification Request triggered by the PCRF removes all PCC rules with a QCI other than the default bearer QCI and the QCI used for IMS signaling, then the PCEF starts a configurable emergency inactivity timer. When the configured period of time expires, the P-GW initiates an IP-CAN Session Termination Request for the IP-CAN session serving the IMS Emergency session.

- If the Gx/S6b interface returns a Virtual APN, which is not configured as an emergency APN, then the call is rejected with the cause code “APN_DENIED_NO_SUBSCRIPTION.”
CHAPTER 20

Expanded Prioritization for VoLTE/Emergency Calls

This chapter describes the StarOS support for the Expanded Prioritization for VoLTE/Emergency Calls feature on the P-GW, SAE-GW, and S-GW.

- Feature Description, on page 349
- How It Works, on page 351
- Configuring Expanded Prioritization for VoLTE/Emergency Calls, on page 352
- Monitoring and Troubleshooting the Expanded Prioritization for VoLTE/Emergency Calls, on page 354

Feature Description

The National Security/Emergency Preparedness (NS/EP) Next Generation Network (NGN) Priority Services (NGN-PS) (formerly called NGN Government Emergency Telecommunications Service (GETS)) is a set of voice, video and data services that are based on services available from public packet-switched Service Providers. The NS/EP NGN-PS provides priority treatment for a Service User’s NS/EP communications and is particularly needed when the Service Providers’ networks are impaired due to congestion and/or damage from natural disasters (such as floods, earthquakes and hurricanes) and man-made disasters (such as physical, cyber or other forms of terrorist attacks).

In earlier releases, the DSCP marking of control message from P-GW and S-GW was based on associated egtpc-service configuration.

With Release 21.1, for control message belonging to eMPS session or containing Allocation and Retention Priority (ARP) associated with eMPS profile, the DSCP marking is based on eMPS profile configured DSCP value.

As part of this enhancement, support is also added for marking of certain GTP-C message at the P-GW and S-GW for priority treatment as defined in the Government Industry Requirements (GIR) NS/EP NGN.

Relationships to Other Features

Bulkstats for GTP-C Messages by ARP Value: The S-GW/P-GW will generate peg counts of the total number of received GTP-C messages containing an ARP, chosen from the set of values allocated for NS/EP NGN-PS use, for a specified interval (in minutes). This peg count is administered at the S-GW/P-GW level.
To prevent throttling of GTP-C messages corresponding to eMPS PDNs or messages containing ARP from set of configured ARP(PL) reserved for NS/EP NGN priority service, following configuration are to be considered:

1. **Load Overload control**
   
   In overload control profile, the set of ARPs reserved for NS/EP NGN-PS use for eMPS services should also be defined under `throttling-behavior exclude` and `self-protection-behavior exclude` CLI commands. This will ensure that incoming GTP-C messages for eMPS PDN or containing ARP from set of reserved ARP for eMPS use are not throttled. Example of configuring Load Overload configuration:

   ```
   configure
   gtpc-overload-control-profile profile_name
   throttling-behavior { earp { 1...15 } * } { exclude }
   self-protection-behavior { earp { 1...15 } * } { exclude }
   end
   ```

2. **For Prioritized handling of calls under Congestion condition**

   ARP reserved under NS/EP NGN-PS for eMPS services is recommended to be configured under following congestion control CLI command. This will ensure that new call requests are not throttled during congestion condition defined by the `congestion-control` CLI command at context level:

   ```
   configure
   context context_name
   egtp-service service_name
   gtpc allow-on-congestion arp arp_value
   end
   ```

3. **GTP-C RLF Throttling**

   - If GTP-C RLF Throttling feature is enabled, then `gtpc overload-protection egress throttling-override-policy` CLI command should be configured with ARP(PL), reserved for NS/EP NGN-PS use, for eMPS services to bypass RLF throttling.

   - If GTP-C RLF Throttling for incoming messages is configured using `gtpc overload-protection ingress msg-rate message_rate` CLI command, then eMPS related messages can get throttled. Currently, there is no bypass policy for incoming RLF throttling.

---

**Important**

Any existing features which works on ARP (PL) configurations will continue to work as before irrespective of whether ARP values configured are same as reserved under NS/EP NGN-PS for eMPS services. If existing features need to work with eMPS requirements, then same ARP (PL) values should be configured as reserved NS/EP NGN-PS for eMPS services.

---

**Licensing**

The DSCP marking capability requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.
How It Works

<tr>
<td>R-146</td>
<td>[216] In the case where the S5/S8 Interface is GTP-based, the PDN-GW shall mark for priority treatment the S5/S8 “Create Bearer Request” and “Update Bearer Request” messages from the PDN-GW to the S-GW which contain an indication that a UE currently has an established/updated bearer or bearers for NS/EP NGN-PS.</td>
</tr>
</tbody>
</table>
Configuring Expanded Prioritization for VoLTE/Emergency Calls

The following section provides the configuration commands to enable the feature.

Configuring eMPS Profile and its Associated Attributes

At Configuration Mode level, CLI command option is introduced to define an eMPS profile and its associated attributes like:

- **eARP configuration:** This configuration is used for marking a bearer/PDN as an eMPS.

- **DSCP configuration:** This configuration is used at S-GW/P-GW to mark various outgoing GTP-C messages associated with an eMPS PDN with configured DSCP marking.

```
configure
[ no ] emps-profile emps_profile_name -noconfirm
[ no ] earp { [ 1...15 ] { [ 1...15 ] { [ 1...15 ] } } }
[ no ] dscp-marking dscp_value
end
```

Notes:

- **emps-profile emps_profile_name:** Configures eMPS profile for defining attributes of an eMPS session. The `emps_profile_name` is a string of size from 1 to 63.

- **earp:** Configures a maximum of 3 eARP priority level (PL) values so that sessions with configured eARP priority values can be marked as eMPS sessions.

- **-noconfirm:** Creates a new eMPS profile without prompting for confirmation.

- **dscp-marking dscp_value:** Specifies the DSCP value to be applied to eMPS sessions. The `dscp_value` is a hexadecimal number between 0x0 and 0x3F.

- Maximum of 3 eARP values can be configured under an eMPS profile. The above CLI syntax provides flexibility to configure one or more (max 3) eARP values in a single command. For example:
  ```
  earp 1 2 3
  - Or -
  earp 4
  ```

- The latest set of eARP values configured will overwrite the previous configuration. For example: Invoking below two commands in sequence will configure only eARP value 4.
  ```
  earp 1 2 3
  earp 4
  ```

- eMPS profile name should be unique and is treated case insensitive across context.

- The **no earp** command can be used to disable all configured eARP values. However, this will not delete the corresponding eMPS profile. The **no emps-profile emps_profile_name** CLI command will delete the profile.
• Warning message: When **no** of a non-existent eMPS profile is executed, a warning message is displayed. For example:

```
no emps-profile xyz
```

```
eMPS Profile : xyz does not exist
```

There will be no warning message if **no** of an un-configured eARP is executed.

• There will be a warning and confirmation message when existing profile is deleted:

```
This operation will result in deletion of this eMPS Profile.
Are you sure? [Yes|No]:
```

• Maximum of 64 different eMPS profiles can be configured.

## Associating an eMPS Profile with P-GW Service

The commands illustrated below associates an eMPS profile to P-GW service.

```
configure
  context context_name
    pgw-service service_name
      associate emps-profile emps_profile_name
  end
```

Notes:

• **no associate emps-profile**: Disables the feature.

• **emps-profile emps_profile_name**: Associates an eMPS profile with the P-GW service. The `emps_profile_name` is a string of size 1 to 63.

• The eMPS profile name in input is treated as case insensitive.

• By default, no eMPS profile is associated with pgw-service.

• For SAE-GW associated P-GW service, the eMPS profiles should be same as configured in associated S-GW service. In case of any discrepancy, it will be reported in the `show configuration error` CLI command output.

## Associating an eMPS Profile with S-GW Service

The commands illustrated below associates an eMPS profile to S-GW service.

```
configure
  context context_name
    sgw-service service_name
      associate emps-profile emps_profile_name
  end
```

Notes:

• **no associate emps-profile**: Disables the feature.

• **emps-profile emps_profile_name**: Associates an eMPS profile with the S-GW service. The `emps_profile_name` is a string of size 1 to 63.
• The eMPS profile name in input is treated as case insensitive.
• By default, no eMPS profile is associated with sgw-service.
• For SAE-GW associated S-GW service, the eMPS profiles should be same as configured in associated P-GW service. In case of any discrepancy, it will be reported in the show configuration error CLI command output.

Monitoring and Troubleshooting the Expanded Prioritization for VoLTE/Emergency Calls

This section provides information regarding show commands and/or their outputs in support of this enhancement.

Show Command(s) and/or Outputs

show emps-profile { all | name <emps_profile_name> }

The above CLI command is introduced to see a particular or all eMPS profile(s) configured with its associated attributes. Also, the output of an existing show config [ verbose ] CLI command is modified to reflect an eMPS configuration:

• earp configured: <earp_value>
• dscp-marking configured: <dscp-value>

These CLI commands can be used to verify if the configuration is appropriate.

show pgw-service { name <name> | all }

The output of this command is modified to reflect the eMPS profile associated with the P-GW service:

• eMPS Profile Name : <emps_profile_name>

Important

Maximum of one eMPS profile can be associated with P-GW service at a time; the latest configuration will overwrite the previously associated configuration.

show sgw-service { name <name> | all }

The output of this command is modified to reflect the eMPS profile associated with the S-GW service:

• eMPS Profile Name : <emps_profile_name>

Important

Maximum of one eMPS profile can be associated with S-GW service at a time; the latest configuration will overwrite the previously associated configuration.
show subscribers pgw-only full all

The output of this command is modified to reflect whether the session is eMPS or not. For example:

Username: 0123456789@username
Subscriber Type : Visitor
Status : Online/Active
State : Connected
Connect Time : Wed Sep  7 07:02:49 2016
Auto Delete : No
Idle time : 00h00m08s
MS TimeZone : n/a
Access Type: gtp-pdn-type-ipv4 Network Type: IP
Access Tech: eUTRAN pgw-service-name: pgw_service
Callid: 00004e21 IMSI: 123456789012341
MSISDN: 0123456789
Interface Type: S5S8GTP Low Access Priority: N/A
TWAN Mode: N/A
**eMPS Bearer: Yes**
Emergency Bearer Type: N/A
IMS-media Bearer: No

show subscribers saegw-only full all

The output of this command is modified to reflect whether the session is eMPS or not. For example:

Username: 0123456789@username
SAEGW Call mode : Co-located
Subscriber Type : Home

MSISDN: 0123456789
TWAN Mode: N/A
**eMPS Bearer: Yes**
MS TimeZone : n/a
MEI : 1122344567877788 Accounting mode : GTPP

show pgw-service statistics

The output of this command is modified to display the eMPS PDN statistics information. For example:

PDNs By Emergency-Type:
Emergency PDNs:
  Active: 0 Setup: 0
  Authentic IMSI: 0 Authentic IMSI: 0

**eMPS PDNs:**
  **Current Active:** 1  **Cumulative Activated:** 1
  **Cumulative De-activated:** 1
  IPv4v6 PDN-Type Received with DAF False : 0

Where:

- **Current Active**: Increments when any PDN is setup as an eMPS PDN or upgraded to eMPS PDN. Decrements when an eMPS PDN is released or when it degrades to a non-eMPS PDN.
- **Cumulative Activated**: Increments when any PDN is setup as an eMPS PDN or upgrades to an eMPS PDN.
• **Cumulative De-activated**: Increments when an eMPS PDN is released or when it degrades to a non-eMPS PDN.

**show saegw-service statistics all function pgw**

The output of this command is modified to display the eMPS PDN statistics information. For example:

```
PDNs By Emergency-Type:
Emergency PDNs:
  Active:  0  Setup:  0
  Authentic IMSI:  0  Authentic IMSI:  0

eMPS PDNs:
  Current Active:  1  Cumulative Activated:  1
  Cumulative De-activated:  1
IPv4v6 PDN-Type Received with DAF False :  0
```

Where:

• **Current Active**: Increments when any PDN is setup as an eMPS PDN or upgraded to eMPS PDN. Decrments when an eMPS PDN is released or when it degrades to a non-eMPS PDN.

• **Cumulative Activated**: Increments when any PDN is setup as an eMPS PDN or upgrades to an eMPS PDN.

• **Cumulative De-activated**: Increments when an eMPS PDN is released or when it degrades to a non-eMPS PDN.

**show saegw-service statistics**

The output of this command is modified to display the eMPS statistics for PGW-Anchored/SGW-Anchored PDNs associated with the saegw-service. For example:

```
PDNs By Emergency-Type:
Emergency PDNs:
  Active:  0  Setup:  0
  Released:  0

Colocated PDNs:
  Current Active:  1  Cumulative Activated:  1
  Cumulative De-activated:  0
PGW-Anchor PDNs:
  Current Active:  1  Cumulative Activated:  1
  Cumulative De-activated:  0
SGW-Anchor PDNs:
  Current Active:  1  Cumulative Activated:  1
  Cumulative De-activated:  0
```

The above statistics information are further classified based on SAE-GW call types:

• **Colocated eMPS PDNs**: It reflects the eMPS PDN statistics information for collapsed PDNs.

• **PGW-Anchor eMPS PDNs**: It reflects the eMPS PDN statistics information for PGW-Anchor PDNs.
• **SGW-Anchor eMPS PDNs**: It reflects the eMPS PDN statistics information for SGW-Anchor PDNs.

Where:

- **Current Active**: Increments when any PDN is setup as an eMPS PDN or upgraded to eMPS PDN. Decrements when an eMPS PDN is released or when it degrades to a non-eMPS PDN.
- **Cumulative Activated**: Increments when any PDN is setup as an eMPS PDN or upgrades to an eMPS PDN.
- **Cumulative De-activated**: Increments when an eMPS PDN is released or when it degrades to a non-eMPS PDN.

**show sgw-service statistics all**

The output of this command is modified to reflect whether the session is eMPS or not. For example:

```
Subscribers Total:
    Active: 0  Setup: 2
    Released: 1

eMPS PDN Statistics:
    Current Active: 1  Cumulative Activated: 1
    Cumulative De-activated: 0
```

**show saegw-service statistics all function sgw**

The output of this command is modified to display the eMPS PDN statistics information. For example:

```
Subscribers Total:
    Active: 0  Setup: 0
    Released: 0

eMPS PDN Statistics:
    Current Active: 1  Cumulative Activated: 1
    Cumulative De-activated: 0
```

**show configuration error**

System will show configuration errors for following scenarios:

- When different eMPS profiles are configured under pgw-service and sgw-service associated to same sae-gw service. For example:

  ```
  ####################################################
  Displaying SAEGW-Service system errors
  ####################################################
  Error : eMPS profile of SGW <sgw-service> and PGW service <pgw_service> is not same for SAEGW service <saegw-service> in the context <context_name>. Total 1 error(s) in this section !
  ```

- When non-existent emps-profile is associated to pgw-service. For example:

  ```
  ####################################################
  Displaying PGW-Service system errors
  ####################################################
  ```
Bulkstats for Expanded Prioritization for VoLTE/Emergency Calls

PGW Schema

The following bulk statistics have been added to the P-GW schema as part of this enhancement:

- `sessstat-pdn-emps-current-active` – The total number of currently active P-GW eMPS PDNs.
- `sessstat-pdn-emps-cumulative-activated` – The total number of P-GW PDNs that are either setup as an eMPS PDN or upgrades to an eMPS PDN.
- `sessstat-pdn-emps-cumulative-deactivated` – The total number of P-GW PDNs that were either released or degrades to a non-eMPS PDN.

SGW Schema

The following bulk statistics have been added to the S-GW schema as part of this enhancement:

- `sessstat-pdn-emps-current-active` – The total number of currently active S-GW eMPS PDNs.
- `sessstat-pdn-emps-cumulative-activated` – The total number of S-GW PDNs that are either setup as an eMPS PDN or upgrades to an eMPS PDN.
- `sessstat-pdn-emps-cumulative-deactivated` – The total number of S-GW PDNs that were either released or degrades to a non-eMPS PDN.

SAEGW Schema

The following bulk statistics have been added to the SAE-GW schema as part of this enhancement:

- `pgw-anchor-pdns-emps-current-active` – The total number of currently active P-GW anchored eMPS PDNs.
- `pgw-anchor-pdns-emps-cumulative-activated` – The total number of P-GW anchored PDNs that are either setup as an eMPS PDN or upgrades to an eMPS PDN.
- `pgw-anchor-pdns-emps-cumulative-deactivated` – The total number of P-GW anchored PDNs that were either released or degrades to a non-eMPS PDN.
- `saegw-colocated-pdns-emps-current-active` – The total number of currently active SAE-GW collapsed eMPS PDNs.
- `saegw-colocated-pdns-emps-cumulative-activated` – The total number of SAE-GW collapsed PDNs that are either setup as an eMPS PDN or upgrades to an eMPS PDN.
- **saegw-colocated-pdns-emps-cumulative-deactivated** – The total number of SAE-GW collapsed PDNs that were either released or degrades to a non-eMPS PDN.

- **sgw-anchor-pdns-emps-current-active** – The total number of currently active S-GW anchored eMPS PDNs.

- **sgw-anchor-pdns-emps-cumulative-activated** – The total number of S-GW anchored PDNs that are either setup as an eMPS PDN or upgrades to an eMPS PDN.

- **sgw-anchor-pdns-emps-cumulative-deactivated** – The total number of S-GW anchored PDNs that were either released or degrades to a non-eMPS PDN.
Bulkstats for Expanded Prioritization for VoLTE/Emergency Calls
This chapter describes extended QCI functionality.

- Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters, on page 361
- DSCP Marking Based on Both QCI and ARP Values, on page 374
- New Standard QCI Support, on page 377
- Non-standard QCI Support, on page 414

**Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters**

This section describes the Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters feature.

**Feature Description**

This section describes the Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters feature.

**Support for QCI and ARP Visibility**

As of StarOS release 20.2, the software has been enhanced to support the viewing of QoS statistics on a Quality of Service Class Index (QCI) and Allocation and Retention Priority (ARP) basis.

ARP is a 3GPP mechanism for dropping or downgrading lower-priority bearers in situations where the network becomes congested. The network looks at the ARP when determining if new dedicated bearers can be established through the radio base station. QCI is an operator provisioned value that controls bearer level packet forwarding treatments.

This enhancement enables operators to monitor QoS statistics that identify multiple services running with the same QCI value. In addition, packet drop counters have been introduced to provide the specific reason the Enhanced Charging Service (ECS) dropped a packet. The packet drop counters provide output on a per ARP basis. This provides additional information that operators can use to troubleshoot and identify network issues that may be affecting service.
For the ARP value only the priority level value in the Allocation/Retention Priority (ARP) Information Element (IE) is considered. Pre-emption Vulnerability (PVI) and Pre-emption Capability (PCI) flags in the ARP IE are not considered.

The existing `show apn statistics name apn-name` and `show apn statistics Exec Mode` CLI commands have been enhanced. The output of these commands now provides visibility for QoS statistics on a QCI/ARP basis.

### Licensing

ARP Granularity for QCI Level Counters is a license-controlled feature. Per QCI Packet Drop Counters functionality does not require a license. Contact your Cisco account or support representative for licensing details.

### Configuring ARP Granularity for QCI Level Counters

This section describes how to configure the ARP Granularity for QCI Level Counters feature.

Configuring the feature consists of the following tasks:

1. Create a Stats Profile.
2. Enable the Collection of Per QCI Packet Drop Counters.
3. Enable the Collection of QCI/ARP Level Statistics.
4. Associate a Stats Profile with an APN.
5. Verify the Configuration.

### Create a Stats Profile

Use the following example to access `Global Configuration Mode` and create a Stats Profile:

```bash
configure
  stats-profile stats_profile_name
end
```

Notes:

- `stats_profile_name` must be an alphanumeric string from 1 to 63 characters in length.
Enable the Collection of Packet Drop Statistics

Use the following example to access Stats Profile Configuration Mode and create a Stats Profile and enable the collection of packet drop statistics:

```
configure
  stats-profile stats_profile_name
    packet-drop
  end
```

To disable the collection of packet drop statistics:

```
configure
  stats-profile stats_profile_name
    no packet-drop
  end
```

Notes:

- `stats_profile_name` must be the name of an existing Stats Profile. The name must be an alphanumeric string from 1 to 63 characters in length.
- `packet-drop`: enables the collection of packet drop statistics for the specified Stats Profile.
- `no packet-drop`: disables the collection of packet drop statistics for the specified Stats Profile.

Enable the Collection of QCI/ARP Level Statistics

Use the following example to access Stats Profile Configuration Mode and enable the collection of QCI/ARP level statistics for a Stats Profile:

```
configure
  stats-profile stats_profile_name
    qci { all | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | [ non-std { non-gbr | gbr } ] } { arp { all | [ 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |12 | 13 | 14 | 15 ] + } }
  end
```

To disable the collection of QCI/ARP statistics:

```
configure
  stats-profile stats_profile_name
    no qci { all | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | [ non-std { non-gbr | gbr } ] } { arp { all | [ 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |12 | 13 | 14 | 15 ] + } }
  end
```

Notes:

- `stats_profile_name` must be the name of an existing Stats Profile. The name must be an alphanumeric string from 1 to 64 characters in length.
- `qci`: configures the collection of ARP priority level statistics for the specified QCI(s).
- `non-std`: configures the collection of ARP priority level statistics for non-standard QCIs.
- `non-gbr`: configures the collection of ARP priority level statistics for non-standard non-guaranteed bit rate (GBR) QCIs.
• **gbr**: configures the collection of ARP priority level statistics for non-standard GBR QCIs.
• **arp**: configures the collection of ARP priority level statistics for the specified ARP values.
• **no**: disables the collection of ARP priority level statistics for the specified qci and arp settings.

### Associate a Stats Profile with an APN

Use the following example to access *APN Configuration Mode* and associate a Stats Profile with an APN:

```bash
configure
  apn apn_name
    stats-profile stats_profile_name
  end
end
```

To disassociate a Stats Profile from a specified APN:

```bash
configure
  apn apn_name
    no stats-profile
  end
end
```

**Notes:**

- **stats_profile_name**: must be the name of an existing Stats Profile. The name must be an alphanumeric string from 1 to 63 characters in length.
- A maximum of 64 Stats Profiles can be configured per P-GW/SAEGW/GGSN service.
- **no stats-profile**: disassociates the Stats Profile from the APN.

---

**Important**

If a Stats Profile is associated with more than 12 APNs, the following memory and performance impact warning is provided:

```
[WARNING] Configuring QCI/ ARP level statistics for more then 12 APNs will have memory and performance impact. Do you want to continue [Y/N]
```

### Verify the Configuration

Use the following procedure to verify the configuration:

First, verify that the Stats Profile is associated with the correct APN. In *Exec Mode*, enter the following command:

```bash
show apn name apn_name
```

**Notes:**

- In the command output, look for the **stats profile** field. It should contain the name of the Stats Profile which is associated with this APN.

Next, verify that the Stats Profile configuration settings are correct. In *Exec Mode*, enter the following command:

```bash
show stats-profile name stats_profile_name
```

**Notes:**
• Where `stats_profile_name` is the name of the Stats Profile for which you want to view settings.

• The command output includes the following information:
  • Stats Profile name
  • Packet-drop configuration settings for both QCI and ARP
  • QCI ARP combinations for which the StarOS will collect granular ARP statistics

If any of the above settings are incorrect, perform the configuration procedure again to reconfigure the Stats Profile with the proper settings.

**Monitoring Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters**

This section describes how to monitor the Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters feature.

**Bulk Statistics**

This section provides the bulk statistics that have been added to support the ARP Granularity and per QCI Packet Drop Counters feature.

**APN Schema**

The following bulk statistics have been added to the APN Schema to support the New Standard QCIs feature.

```
qci65-actbear
cqi65-setupbear
cqi65-relbear
cqi65-uplinkpkt-fwd
cqi65-dwlinkpkt-fwd

```
Show Commands

This section provides the Exec Mode show commands that are available to support the Per Packet QCI Drop Counters and ARP Granularity for QCI Level Counters feature.

show apn statistics

The qci and arp keywords have been added to this command. The new keywords enable operators to view output for four basic scenarios that apply to the Per QCI Packet Drop Counters and ARP Granularity for QCI Level Counters feature.

Scenario 1

View packet drop counters with granularity at the QCI/ARP level for a single APN. The output of this command is useful for isolating network issues that may be affecting packet drops.

show apn statistics name apn_name qci { all | 1-9 | non-std { gbr | non-gbr } } } ) ) arp { all | 1-15 }

Notes:

• apn_name: must be the name of a configured APN created in APN Configuration Mode.
show apn statistics qci { all | 1-9 | non-std { gbr | non-gbr } } arp { all | 1-15 }

Notes:

- **apn_name**: must be the name of a configured APN created in **APN Configuration Mode**.
- **qci**: displays packet drop statistics for the specified QCI(s).
- **all**: displays packet drop statistics for all QCI(s).
- **1-9**: displays packet drop statistics for QCI <n>. Must be a QCI number from 1 to 9.
- **non-std**: displays packet drop statistics for non-standard QCIs.
- **non-gbr**: displays packet drop statistics for non-standard non-gbr QCIs
- **gbr**: displays packet drop statistics for non-standard GBR QCIs.
- **arp**: displays statistics for the specified ARP priority level(s)
- **all**: displays packet drop statistics for all ARP priority levels.
- **1-15**: displays statistics for the specified ARP priority level.

**Scenario 2**

View packet drop counters with granularity at the QCI/ARP level for all APNs.

**Scenario 3**

View the new packet drop counters at granularity of QCI level, and pre-existing QCI level counters for the specified APN.
show apn statistics

Extended QCI Options

- **1-9**: displays packet drop statistics for QCI \(<n>\). Must be a QCI number from 1 to 9.
- **non-std**: displays packet drop statistics for non-standard QCIs.
- **non-gbr**: displays packet drop statistics for non-standard non-gbr QCIs
- **gbr**: displays packet drop statistics for non-standard GBR QCIs.
- **arp**: displays statistics for the specified ARP priority level(s)
- **all**: displays packet drop statistics for all ARP priority levels.
- **1-15**: displays statistics for the specified ARP priority level.

Scenario 4

View the packet drop counters at the granularity of the QCI level, and view pre-existing QCI counters consolidated for all APNs.

```
show apn statistics qci { all | 1-9 | non-std { gbr | non-gbr } }
```

Notes:

- **apn_name**: must be the name of a configured APN created in *APN Configuration Mode*.
- **qci**: displays packet drop statistics for the specified QCI(s).
- **all**: displays packet drop statistics for all QCI(s).
- **1-9**: displays packet drop statistics for QCI \(<n>\). Must be a QCI number from 1 to 9.
- **non-std**: displays packet drop statistics for non-standard QCIs.
- **non-gbr**: displays packet drop statistics for non-standard non-gbr QCIs
- **gbr**: displays packet drop statistics for non-standard GBR QCIs.
- **arp**: displays statistics for the specified ARP priority level(s)
- **all**: displays packet drop statistics for all ARP priority levels.
- **1-15**: displays statistics for the specified ARP priority level.

The output of the `show apn statistics name apn_name qci all arp all` command has been enhanced to display the following new statistics:

**show configuration**

The output of this command has been enhanced to show the Stats Profile configuration settings.

- `stats-profile <stats_profile_name>`
- `qci <qci number> arp <arp number>`
- `packet-drop (if packet-drop is enabled)`

**show stats-profile name**

This new command in *Exec Mode* shows the configuration settings for the specified Stats Profile.

- Stats Profile Name: `<stats_profile_name>`
- `qci <qci number> arp <arp_number(s)>`
- `packet-drop <if packet drop is enabled>`

---

**DSCP Marking Based on Both QCI and ARP Values**

**Feature Description**

P-GW allows users to perform DSCP marking based on QoS Class Identifier (QCI) values. This functionality has been expanded to include the Priority Level (PL) values 1-15 of Allocation and Retention Priority (ARP), which allows users to assign different DSCP values for bearers with the same QCI but different ARP priority values. For example, the ability to assign DSCP values based on QCI+ARP could be used to meet compliance on priority and emergency calling via VoLTE.

Applies to the P-GW for the following interfaces:

- S5
- S8
- SGi
- S2b

Applies to the S-GW for the following interfaces:
Relationships to Other Features

ECS populates the DSCP values in inner IP header. These values are fetched from the DSCP table by means of a sessions manager API. Since DSCP values are now available for QCI-ARP combination, the API is replaced by a wrapper API that will accept both QCI and ARP and provide the DSCP values to ECS in a new data structure.

The API will return correct values in the following scenarios:

1. QCI-DSCP table is not configured, or it is not associated for this session.
   API will return an indication to ECS that table was not found.

2. Table is configured, but entry for the given QCI value is not present in the table.
   API will not populate the structure and keep the same unaltered.

3. Entry for given QCI is present, but it is not available for the given QCI-ARP pair.
   The default DSCP values for that particular QCI will be populated in the return structure.

4. Entry for given QCI-ARP combination is present.
   The DSCP values for given QCI-ARP combination will be populated in the return structure.

Once values are received from SM, ECS caches these values and uses the cached values for marking the further packets. Another lookup into the table is done only when there is a mismatch between the currently cached QCI-ARP value and the current packet's QCI-ARP value. Therefore, any change in the QCI-ARP table would be affected for inner DSCP marking on existing flows only in case of QCI or ARP change.

Licensing

DSCP marking capability requires that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

How It Works

The expansion of functionality to allow assigning different DSCP values for bearers with the same QCI, but different APR values, works as follows.

- DSCP marking of packets based on QCI+ARP combination allowed
- QCI + ARP configuration will override any DSCP entry for that QCI+ARP combination
- QCI only DSCP entry will override all existing QCI+ARP configuration
- Applying associated DSCP marking for QCI+ARP for Uplink and Downlink functionality is also allowed
Configuring DSCP Marking Based on Both QCI and ARP Values

This section describes how to configure DSCP marking based on both QCI and ARP values.

Configuring QCI-QoS Mapping

Use the following example to create and map QCI and ARP values to enforceable Quality of Service (QoS) parameters:

```plaintext
configure
  qci-qos-mapping name
    qci num [ arp-priority-level arp_value ] [ downlink [ encaps-header { copy-inner | dscp-marking dscp-marking-value } ] [ internal-qos priority priority ] [ user-datagram dscp-marking dscp-marking-value ] [ uplink [ downlink] [ encaps-header { copy-inner | dscp-marking dscp-marking-value } ] [ internal-qos priority priority ] [ user-datagram dscp-marking dscp-marking-value ] ]
end
```

Notes:

- The P-GW does not support non-standard QCI values unless a valid license key is installed. QCI values 1 through 9 are standard values defined in 3GPP TS 23.203; the P-GW supports these standard values. In addition, QCI values 65, 66, 69, and 70 can be used in StarOS release 21.0 and later.

  From 3GPP Release 8 onwards, operator-specific/non-standard QCIs are supported and carriers can define QCI 128-254.

- **arp-priority-level arp_value**: Specifies the address retention priority (ARP) priority level.
  
  `arp_value` must be an integer from 1 through 15.

- The above configuration only shows one keyword example. Refer to the QCI - QOS Mapping Configuration Mode Commands chapter in the Command Line Interface Reference for more information on the `qci` command and other supported keywords.

Use the following example to disable QCI and ARP values:

```plaintext
configure
  qci-qos-mapping name
    no qci num [ arp-priority-level arp_value ]
end
```

Assessing QCI-QoS Mapping Configuration

Use the following example to specify that the P-GW service is to be associated with an existing QCI-QoS mapping configuration:

```plaintext
configure
  context context_name
    pgw-service pgw_service_name
      associate qci-qos-mapping name
end
```

Notes:
• QCI-QoS mapping configurations are created in the AAA context.

Use the following example to specify that the S-GW service is to be associated with an existing QCI-QoS mapping configuration:

```bash
configure
  context context_name
    sgw-service sgw_service_name
      associate qci-qos-mapping name
    end
  end
Notes:
  • QCI-QoS mapping configurations are created in the AAA context.
```

**Configuring CS5 Marking for GTP-C**

Use the following example to mark DSCP precedence CS5 on control packets:

```bash
configure
  context context_name
    ggsn-service ggsn_service_name
      ip qos-dscp gtpc cs5
    end
Notes:
  • Designates Class Selector 5 DSCP precedence for GTP-C packets.
```

**Verifying the Configuration**

Use the following command in Exec mode to display/verify the configuration.

```bash
show configuration
```

**Monitoring DSCP Marking Based on Both QCI and ARP Values**

**Output of Show Commands**

This section provides information regarding show commands and/or their outputs in support of DSCP marking based on both QCI and ARP values.

```bash
show qci-qos-mapping table all
```

The output of this command has been enhanced to show the ARP value:

• arp-priority-level

**New Standard QCI Support**

CDETS: CSCuy20910 - Support of new standard QCIs (65, 66, 69, 70)

**Applicable Products:** P-GW, SAEGW, S-GW
Feature Description

The P-GW/SAEGW/S-GW support additional new 3GPP-defined standard QCIs. QCIs 65, 66, 69, and 70 are now supported for Mission Critical and Push-to-Talk (MCPTT) applications. These new standard QCIs are supported in addition to the previously supported QCIs of 1 through 9, and operator-defined QCIs 128 through 254.

The StarOS will continue to reject QCIs 10 through 127 sent by the PCRF.

Licensing

Important

New Standard QCI Support is a licensed feature. Contact your Cisco account or support representative for licensing details.

How it Works

Although the 3GPP specification mentions that only QCIs 65 and 69 can co-exist, there is no hard restriction on the QCIs in the StarOS implementation of this feature, as that is applicable to the PCRF. The P-GW acts as a pass-through node and allows QCIs 65 and 69 if a different QCI combination is requested from PCRF.

With support for standard QCIs 65, 66, 69, and 70 present, the implementation has also added support across the following StarOS interfaces:

- **Gx**: Gx processes Default Bearer QoS and Rule Validation allowing the new Mission Critical (MC)/Push to Talk (PTT) QCIs. When the MC/PTT bit is not negotiated with the PCRF, the PCEF will reject the creation of a bearer or reject call setup.

- **sessmgr**: The P-GW sessmgr now processes the updating and modification of QoS. The P-GW rejects all UE initiated BRC creation for the new standard QCIs.

- **ECS**: ECS accepts the new standard QCIs when received from the PCRF and will reject them when either the license is not configured or the same is received in 3G. The ECS is able to update a Default bearer with this QoS change or create a Dedicated Bearer for the new standard QCIs.

Handoff Behavior

For Gn/Gp handoffs, local mapping via the CLI is supported so that the P-GW/SAEGW/S-GW is in sync with the MME-to-SGSN context transfer. The following scenarios are supported:

**No Local QoS Mapping Present**: When no local mapping is present for the new QCIs, a call handoff from 4G to 3G will be rejected.

**Local QoS Mapping Present**: Three scenarios are supported when local mapping is present:

- **Local Mapping present for MME-SGSN and PCRF Out of Synchronization**: When local mapping is present it is assumed that the QoS mapping in the P-GW is in sync with the mapping from the MME to SGSN. Even if the QoS mapping for one of the transferred PDPs during a Gn/Gp handoff is not in sync with MME-SGSN mapping, the P-GW/SAEGW/S-GW still continues with the handoff with the local mapping present. However, the CDR generated while waiting for the PCRF response during the handoff would be out of sync with the CDR’s received after the handoff.
• **Mapping present for MME-SGSN and PCRF in Synchronization**: When local mapping is in sync with the MME-SGSN there is no difference in the CDR generated after the handoff.

• **Partial Mapping Present**: Partial mapping occurs when some MC/PTT QCI(s) have mapping and the remainder of the MC/PTT QCI(s) do not have mapping. In this case the call is dropped.

**Expected Call Flow Output**

This section provides detailed information on the expected call flow output for various scenarios with the New Standard QCI support feature:

- New Call Procedure
- Handoff Procedures
- UE Initiated Bearer Creation
- Bearer Creation
- Bearer Update

These sections describe new behaviors and provide behavior clarification for this feature. Behavior not described is similar to that for Standard QCIs.

**New Call Procedure**

This section provides detailed information on the expected call flow output for various new call procedure scenarios with the New Standard QCI Support feature.

**Table 33: Expected Call Flow Output: New Call Procedure**

Configuring New Standard QCIs

Configuring New Standard QCIs consists of the following tasks:

- Configuring QCI-QoS Mapping
- Configuring Local Mapping for Gn/Gp Support
- Configuring Transaction Rate Network Initiated Setup/Teardown Events
- Enable Mission Critical QCIs

Configuring QCI-QoS Mapping

Standard QCI options 65, 66, 69, and 70 have been added to the `qci` command in QCI-QoS Mapping Configuration Mode.

To configure QCI-QoS Mapping for new standard QCIs:

```
configure
    qci-qos-mapping qci_qos_map_name
        qci { 1-9 | 65 | 66 | 69 | 70 }
    end
```

To disable new QCI-QoS mapping for new standard QCIs:

```
configure
    qci-qos-mapping qci_qos_map_name
```

Extended QCI Options
no qci { 1-9 | 65 | 66 | 69 | 70 }
end

Notes:
• qci options 65 and 66 are available for guaranteed bit rate (GBR) network initiated QCI values only.
• qci options 69 and 70 are available for non-GBR network initiated QCI values only.
• no disables the specified standard qci value.

Configuring Local QCI Mapping for Gn/Gp QoS Support

Use the following example to configure local QCI mapping for Gn/Gp support:

configure
  qci qos-mapping mapping_name
    qci { 1-9 | 65 | 66 | 69 | 70 } pre-rel8-qos-mapping qci_value
  end

Notes:
• qci: When the MPS license is disabled, this value must be a Standard QoS Class Identifier (QCI) from 1 to 9. When the MPS license is enabled, this value must be a Standard QCI from 1 to 9, or 65, 66, 69, 70.
• qci 65 and 66 are Mission Critical/Push to Talk (MC/PTT) GBR values and values 69 and 70 are MC/PTT Non-GBR values.
• qci values 65 and 66 can only be mapped to QCI values 1 through 4, and QCI values 69 and 70 can only be mapped to QCI values 5 through 9.

Configuring Transaction Rate Network Initiated Setup/Teardown Events

To configure transaction rate network initiated setup/teardown events for new standard QCI values:

configure
  transaction-rate nw-initiated-setup-teardown-events qci { 1-9 | 65 | 66 | 69 | 70 | 128-254 }
  end

To disable transaction rate network initiated setup/teardown events for new standard QCI values:

configure
  no transaction-rate nw-initiated-setup-teardown-events qci qci_value
  end

Notes:
• 65 and 66 are available options for GBR network-initiated QCI values.
• 69 and 70 are available options for non-GBR network-initiated QCI values.
• no disables transaction rate network initiated setup/teardown events for the specified new standard QCI value.
Enable Mission Critical QCIs

The `mission-critical-qcis` keyword in the `diameter encode-supported-features` command is required for support between the PCEF and PCRF for new standard QCI support. Use the following example to enable mission critical QCIs in Policy Control Configuration Mode:

```
configure
  context context_name
    ims-auth-service ims-ggsn-auth
    policy-control
      diameter encode-supported-features mission-critical-qcis
  end
```

To disable this feature, enter the following commands:

```
configure
  context context_name
    ims-auth-service ims-ggsn-auth
    policy-control
      no diameter encode-supported-features
  end
```

Notes:

- The LTE Wireless Priority Feature Set must be enabled to configure the `mission-critical-qcis` option. The LTE Wireless Priority Feature Set is a license-controlled feature. Contact your Cisco account or support representative for licensing details.

## Verifying the Configuration

Use the following example to verify the new standard QCI configuration:

```
show qci-qos-mapping table name qci_qos_mapping_table_name
```

Notes:

- The command output provides all qci-qos mapping attributes, including the new standard qci number. If any of the attributes are incorrect, repeat the configuration procedure in this chapter to correct the settings.

## Monitoring the Feature

This section describes how to monitor the New Standard QCI Support feature.

### Bulk Statistics

This section lists the bulk statistics that have been added to support the New Standard QCIs feature.

### APN Schema

The following bulk statistics have been added to the APN Schema to support the New Standard QCIs feature.

</tr>
</tbody>
</table>
The output of this command has been enhanced to provide packet and byte information for QCI values 65, 66, 69, and 70. New statistics are in *italics*.
show pgw-service statistics all verbose

The output of this command has been enhanced to provide new standard QCI information by QoS characteristics and IPv4v6 PDN Data statistics. New statistics are in *italics*.

**Bearers By QoS characteristics:**

**Active:**

- QCI 1: 0

**Setup:**

- QCI 1: 0

**Released:**

- QCI 1: 0

**IPv4v6 PDN Data Statistics:**

**Uplink:**

- QCI 1: 0

**Downlink:**

- QCI 1: 0
The output of this command has been enhanced to provide information related to the new standard QCIIs. New statistics are in italics.

P-GW Administration Guide, StarOS Release 21.8
Non-standard QCI Support

This section describes the Non-standard QCI Support feature.

Feature Description

Usually, only standards-based QCI values of 1 through 9 are supported on GGSN/P-GW/SAEGW/S-GW/ePDG. A license, however, allows non-standard QCIs (128-254) to be used on P-GW/GGSN (not standalone GGSN).

Licensing

Use of non-standard QCIs require that a valid license key be installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

How It Works

From 3GPP Release 8 onwards, operator-specific/non-standard QCIs can be supported and carriers can define QCI 128-254. QCI values 0 and 10 to 255 are defined as follows:

- 0: Reserved
- 10-127: Reserved
- 128-254: Operator-specific/Non-standard QCI
- 255: Reserved

Unique operator-specific QCIs (128-254) can be used to differentiate between various services/applications carriers provide to the end users in their network.

Limitations

- Non-standard QCIs can only be supported with S5/S8/S2a/S2b interfaces.
- The Gn interface is not supported.

Standards Compliance

- 3GPP Specification TS 23.203: Policy and charging control architecture
- 3GPP Specification TS 29.212: Policy and Charging Control over Gx reference point

Configuring Non-standard QCI Support

The `operator-defined-qci` command in the QCI-QoS Mapping Configuration Mode configures the non-standard QCIs in P-GW so that calls can be accepted when non-standard QCI values are received from UE or PCRF. Unique DSCP parameters (uplink and downlink) and GBR or Non-GBR can also be configured.

As non-standard QCIs are not supported in GGSN, `pre-rel8-qos-mapping` is used as a reference for mapping the non-standard QCI values to pre-rel8 QoS values during 3G calls or GnGp handovers.
Configuring Non-standard QCI Support in P-GW

Use the following command to configure non-standard QCI support in P-GW so that calls can be accepted when non-standard QCI values are received from UE or PCRF.

```
configure
cqi-qos-mapping name
no operator-defined-qci num
end
```

Notes:

- This command is only visible if the license key supporting non-standard QCIs is installed. Contact your Cisco Account or Support representative for information on how to obtain a license.

- **operator-defined-qci num**: Specifies the operator-defined QCI value to be enabled.
  
  `num` must be an integer from 128 through 254.

  Standards-based QCI values 1 through 9 are configured through the `qci` command.

- **pre-rel8-qos-mapping num**: Maps non-standard QCI to a standard QCI that has the characteristics (TC, THP, SI, TD, SSD) similar to desired pre-rel8 standard QoS values during 3G call or GnG handover.

  `num` must be an integer from 1 through 4 for GBR and 5 through 9 for non-GBR. QCI values 1 through 9 are defined in 3GPP Specification TS 23.203 "Policy and charging control architecture".

3G GGSN Call

If the **pre-rel8-qos-mapping** field is not configured for the non-standard QCI under P-GW which is associated with a GGSN, then the 3G call would be rejected.

GnGp Handoff

1. If the **pre-rel8-qos-mapping** field is not configured for the non-standard QCI for default bearer, then the handoff would be rejected.

2. If the **pre-rel8-qos-mapping** field is not configured for the non-standard QCI for dedicated bearer, then only that bearer would be rejected during handoff.

3. In the following scenario:

   • default bearer with standard QCI or non-standard QCI (with **pre-rel8-qos-mapping** configured)
   • more than one dedicated bearer (some with standard QCI, some with non-standard QCI with **pre-rel8-qos-mapping** configured, and some with non-standard QCI with no mapping)

During LTE-to-GnGp handoff:

- UPC Request for all the dedicated bearers with non-standard QCI with no mapping would be rejected
- handoff will be successful for the remaining bearers
Monitoring Non-standard QCI Support

Bulk Statistics

This section provides information regarding bulk statistics in support of non-standard QCI support.

APN Schema

The following counters have been added in support of non-standard QCIs (GBR and Non-GBR):

- nonstdqci-nongbr-uplinkpkt-drop-mbrcxd
- nonstdqci-nongbr-dwlinkpkt-drop-mbrcxd
- nonstdqci-nongbr-uplinkbyte-drop-mbrcxd
- nonstdqci-nongbr-dwlinkbyte-drop-mbrcxd
- nonstdqci-nongbr-rejbearer
- nonstdqci-gbr-uplinkpkt-drop-mbrcxd
- nonstdqci-gbr-dwlinkpkt-drop-mbrcxd
- nonstdqci-gbr-uplinkbyte-drop-mbrcxd
- nonstdqci-gbr-dwlinkbyte-drop-mbrcxd
- nonstdqci-gbr-rejbearer

Output of Show Commands

This section provides information regarding show commands and/or their outputs in support of non-standard QCI support.

show apn statistics

The output of this command has been enhanced to show the following non-standard QCI counters (GBR and Non-GBR):

- Non-Std QCI(Non-GBR)
  - Bearer Rejected
  - Uplink Bytes dropped(MBR Excd)
  - Downlink Bytes dropped(MBR Excd)
  - Uplink pkts dropped(MBR Excd)
  - Downlink pkts dropped(MBR Excd)
- Non-Std QCI(GBR)
  - Bearer Rejected
  - Uplink Bytes dropped(MBR Excd)
  - Downlink Bytes dropped(MBR Excd)
  - Uplink pkts dropped(MBR Excd)
  - Downlink pkts dropped(MBR Excd)

show qci-qos-mapping table all

The output of this command has been enhanced to show when non-standard QCI are configured:

- Operator-defined-qci
- pre-rel8-qos-mapping
CHAPTER 22

GRE Protocol Interface

This chapter provides information on Generic Routing Encapsulation protocol interface support in the GGSN or P-GW service node. The product Administration Guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in the respective product Administration Guide, before using the procedures in this chapter.

---

**Important**

GRE protocol interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

---

**Important**

Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

---

**Introduction**

GRE protocol functionality adds one additional protocol on Cisco's multimedia core platforms (ASR 5500 or higher) to support mobile users to connect to their enterprise networks through Generic Routing Encapsulation (GRE).
GRE tunnels can be used by the enterprise customers of a carrier 1) To transport AAA packets corresponding to an APN over a GRE tunnel to the corporate AAA servers and, 2) To transport the enterprise subscriber packets over the GRE tunnel to the corporation gateway.

The corporate servers may have private IP addresses and hence the addresses belonging to different enterprises may be overlapping. Each enterprise needs to be in a unique virtual routing domain, known as VRF. To differentiate the tunnels between same set of local and remote ends, GRE Key will be used as a differentiator.

It is a common technique to enable multi-protocol local networks over a single-protocol backbone, to connect non-contiguous networks and allow virtual private networks across WANs. This mechanism encapsulates data packets from one protocol inside a different protocol and transports the data packets unchanged across a foreign network. It is important to note that GRE tunneling does not provide security to the encapsulated protocol, as there is no encryption involved (like IPSEC offers, for example).

GRE Tunneling consists of three main components:

• Passenger protocol-protocol being encapsulated. For example: CLNS, IPv4 and IPv6.
• Carrier protocol-protocol that does the encapsulating. For example: GRE, IP-in-IP, L2TP, MPLS and IPsec.
• Transport protocol-protocol used to carry the encapsulated protocol. The main transport protocol is IP.

The most simplified form of the deployment scenario is shown in the following figure, in which GGSN has two APNs talking to two corporate networks over GRE tunnels.

**Figure 34: GRE Interface Deployment Scenario**

---

**Supported Standards**

Support for the following standards and requests for comments (RFCs) have been added with this interface support:
• RFC 1701, Generic Routing Encapsulation (GRE)
• RFC 1702, Generic Routing Encapsulation over IPv4 networks
• RFC 2784, Generic Routing Encapsulation (GRE)
• RFC 2890, Key and Sequence Number Extensions to GRE

Supported Networks and Platforms

This feature supports all systems with StarOS Release 9.0 or later running GGSN and/or SGSN service for the core network services. The P-GW service supports this feature with StarOS Release 12.0 or later.

Licenses

GRE protocol interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Services and Application on GRE Interface

GRE interface implementation provides the following functionality with GRE protocol support.

How GRE Interface Support Works

The GRE interface provides two types of data processing; one for ingress packets and another for egress packets.

Ingress Packet Processing on GRE Interface

Figure given below provides a flow of process for incoming packets on GRE interface.

Note that in case the received packet is a GRE keep-alive or a ping packet then the outer IPV4 and GRE header are not stripped off (or get reattached), but instead the packet is forwarded as is to the VPN manager or kernel respectively. In case of all other GRE tunneled packets the IPV4 and GRE header are stripped off before sending the packet for a new flow lookup.
Figure 35: Ingress Packet Processing on GRE Interface

1. Start
2. Lookup based on outer DA-SA and is it GRE
   - Yes
   - No
3. Set received tunneled packet flag
4. Does received GRE have Sequence Number, CRC, or GRE Key?
   - Yes
   - No
5. Is it a GRE Keypair?
   - Yes
   - No
6. Send packet to configured VPN mgr
7. Get Flow Record (Tunnel header and VRF number)
8. Process the PPE:
   1. Remove the outer IPv4 header and GRE header
   2. Use the VRF number to further lookups.
9. Normal flow processing based on inner IP packet in the VRF indicated by the flow record of previous successful flow record
10. Forwarding lookup in the VRF
11. Send the packet to the kernel without the tunnel header for further processing
12. End
Egress Packet Processing on GRE Interface

Figure given below provides a flow of process for outgoing packets on GRE interface:

*Figure 36: Egress Packet Processing on GRE Interface*

1. Start
2. Receive IPv4 packet with correct FLOWID
3. Do a forwarding lookup.
4. Lookup Successful?
   - Yes: Get Forwarding Record
   - No: Take default route
5. Does it have load balancing enabled?
   - No: Based on Flow record information, prepare the GRE header and outer IPv4 header
   - Yes: Process the packet as if it was an IPv4 packet received from Session Manager
6. End
GRE Interface Configuration

This section provides a high-level series of steps and the associated configuration examples for configuring the system with GRE interface in GGSN or P-GW services.

Important

This section provides the minimum instruction set to enable the GRE Protocol Interface support functionality on a GGSN or P-GW. Commands that configure additional functions for this feature are provided in the Command Line Interface Reference.

These instructions assume that you have already configured the system level configuration as described in System Administration Guide and specific product Administration Guide.

To configure the system to support GRE tunnel interface:

**Step 1** Configure the virtual routing and forwarding (VRF) in a context by applying the example configurations presented in Virtual Routing And Forwarding (VRF) Configuration, on page 422.

**Step 2** Configure the GRE tunnel interface in a context by applying the example configurations presented in GRE Tunnel Interface Configuration, on page 423.

**Step 3** Enable OSPF for the VRF and for the given network by applying the example configurations presented in Enabling OSPF for VRF, on page 423.

**Step 4** Associate IP pool and AAA server group with VRF by applying the example configurations presented in Associating IP Pool and AAA Group with VRF, on page 424.

**Step 5** Associate APN with VRF through AAA server group and IP pool by applying the example configurations presented in Associating APN with VRF, on page 424.

**Step 6** Optional. If the route to the server is not learnt from the corporate over OSPFv2, static route can be configured by applying the example configurations presented in Static Route Configuration, on page 424.

**Step 7** Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

**Step 8** Verify configuration of GRE and VRF related parameters by applying the commands provided in Verifying Your Configuration, on page 425.

Virtual Routing And Forwarding (VRF) Configuration

This section provides the configuration example to configure the VRF in a context:

```
configure
  context <vpn_context_name> -noconfirm
  ip vrf <vrf_name>
    ip maximum-routes <max_routes>
end
```

Notes:
• <vpn_context_name> is the name of the system context you want to use for VRF. For more information, refer System Administration Guide.
• A maximum of 300 VRFs per context and up to 2,048 VRFs per chassis can be configured on system.
• <vrf_name> is name of the VRF which is to be associated with various interfaces.
• A maximum of 10000 routes can be configured through ip maximum-routes <max_routes> command.

**GRE Tunnel Interface Configuration**

This section provides the configuration example to configure the GRE tunnel interface and associate a VRF with GRE interface:

```plaintext
configure
c   context <vpn_context_name>
   ip interface <intfc_name> tunnel
   ip vrf forwarding <vrf_name>
      ip address <internal_ip_address/mask>
      tunnel-mode gre
      source interface <non_tunn_intfc_to_corp>
      destination address <global_ip_address>
      keepalive interval <value> num-retry <retry>
end
```

Notes:
• <vpn_context_name> is the name of the system context you want to use for GRE interface configuration. For more information, refer Command Line Interface Reference.
• A maximum of 511 GRE tunnels + 1 non-tunnel interface can be configured in one context. System needs at least 1 non-tunnel interface as a default.
• <intfc_name> is name of the IP interface which is defined as a tunnel type interface and to be used for GRE tunnel interface.
• <vrf_name> is the name of the VRF which is preconfigured in context configuration mode.
• <internal_ip_address/mask> is the network IP address with sub-net mask to be used for VRF forwarding.
• <non_tunn_intfc_to_corp> is the name a non-tunnel interface which is required by system as source interface and preconfigured. For more information on interface configuration refer System Administration Guide.
• <global_ip_address> is a globally reachable IP address to be used as a destination address.

**Enabling OSPF for VRF**

This section provides the configuration example to enable the OSPF for VRF to support GRE tunnel interface:

```plaintext
configure
c   context <vpn_context_name>
   router ospf
      ip vrf <vrf_name>
      network <internal_ip_address/mask>
end
```

Notes:
• <vpn_context_name> is the name of the system context you want to use for OSPF routing. For more information, refer Routing in this guide.
• `<vrf_name>` is the name of the VRF which is preconfigured in context configuration mode.
• `<internal_ip_address/mask>` is the network IP address with sub-net mask to be used for OSPF routing.

**Associating IP Pool and AAA Group with VRF**

This section provides the configuration example for associating IP pool and AAA groups with VRF:

```bash
configure
text context <vpn_context_name>
ip pool <ip_pool_name> <internal_ip_address/mask> vrf <vrf_name>
exit
aaa group <aaa_server_group>
ip vrf <vrf_name>
end
```

Notes:
• `<vpn_context_name>` is the name of the system context you want to use for IP pool and AAA server group.
• `<ip_pool_name>` is name of a preconfigured IP pool. For more information refer System Administration Guide.
• `<aaa_server_group>` is name of a preconfigured AAA server group. For more information refer AAA Interface Administration and Reference.
• `<vrf_name>` is the name of the VRF which is preconfigured in context configuration mode.
• `<internal_ip_address/mask>` is the network IP address with sub-net mask to be used for IP pool.

**Associating APN with VRF**

This section provides the configuration example for associating an APN with VRF through AAA group and IP pool:

```bash
configure
text context <vpn_context_name>
apn <apn_name>
  aaa group <aaa_server_group>
ip address pool name <ip_pool_name>
end
```

Notes:
• `<vpn_context_name>` is the name of the system context you want to use for APN configuration.
• `<ip_pool_name>` is name of a preconfigured IP pool. For more information refer System Administration Guide.
• `<aaa_server_group>` is name of a preconfigured AAA server group. For more information refer AAA Interface Administration and Reference.
• `<vrf_name>` is the name of the VRF which is preconfigured in context configuration mode.

**Static Route Configuration**

This section provides the optional configuration example for configuring static routes when the route to the server is not learnt from the corporate over OSPFv2:
**Verifying Your Configuration**

This section explains how to display and review the configurations after saving them in a .cfg file as described in the *System Administration Guide* and also to retrieve errors and warnings within an active configuration for a service.

---

**Important**

All commands listed here are under Exec mode. Not all commands are available on all platforms.

These instructions are used to verify the GRE interface configuration.

---

**Step 1**

Verify that your interfaces are configured properly by entering the following command in Exec Mode:

```
show ip interface
```

The output of this command displays the configuration of the all interfaces configured in a context.

```
Intf Name: foo1
Intf Type: Broadcast
Description:  
IP State: UP (Bound to 17/2 untagged, ifIndex 285343745)
IP Address: 1.1.1.1 Subnet Mask: 255.255.255.0
Bcast Address: 1.1.1.255 MTU: 1500
Resoln Type: ARP ARP timeout: 60 secs
L3 monitor LC-port switchover: Disabled
Number of Secondary Addresses: 0
Intf Name: foo2
Intf Type: Tunnel (GRE)
Description:  
VRF: vrf=tun
IP State: UP (Bound to local address 1.1.1.1 (foo1), remote address 5.5.5.5)
IP Address: 10.1.1.1 Subnet Mask: 255.255.255.0
Intf Name: foo3
Intf Type: Tunnel (GRE)
Description:  
IP State: DOWN (state explaining the reason of being down)
IP Address: 20.20.20.1 Subnet Mask: 255.255.255.0
```

**Step 2**

Verify that GRE keep alive is configured properly by entering the following command in Exec Mode:

```
show ip interface gre-keepalive
```
The output of this command displays the configuration of the keepalive for GRE interface configured in a context.
GGSN UPC Collision Handling

Feature Description

In StarOS 14.0 and earlier, during collision between SGSN initiated UPC request and GGSN Initiated UPC request, pre-defined rules were activated at GGSN without waiting for network requested UPC (NRUPC) response and there were no packet drops.

From StarOS release 15.0 onward, predefined rules were activated only on receiving NRUPC response at GGSN and not in case of collision. This resulted in packet drops.

In StarOS 20.0, the **GGSN UPC Collision Handling** feature addresses the problem of packet drops. During collision between SGSN initiated UPC request and GGSN initiated UPC Request, SGSN initiated UPC request gets higher priority over NRUPC and there is no call or data loss during call establishment or during mid-call phase. This feature can be enabled or disabled using a CLI and is enabled by default.

How It Works

In StarOS release 14.0 and earlier:

- Predefined rules were activated at GGSN without waiting for network requested UPC (NRUPC) response.
- SGSN initiated UPCReq was received at GGSN before NRUPC response (collision).
- SGSN initiated UPCReq aborted the NRUPC.
- Session manager (SM) did not send failure message to ECS.
- However, the predefined rules were already activated at GGSN (without waiting for NRUPC response). Hence, there were no packet drops.

From StarOS release 15.0 onward, predefined rules were activated only on receiving NRUPC response at GGSN and were not activated in case of collision. There was no static catch-all rule defined in rulebase. This caused packet drops.
In StarOS 20.0, the **GGSN UPC Collision Handling** feature addresses the problem of packet drops. During collision between SGSN initiated UPC request and GGSN initiated UPC Request, SGSN initiated UPC request gets higher priority over NRUPC and there is no call or data loss during call establishment or during mid-call phase. This feature can be enabled or disabled using a CLI and is enabled by default.

- When GGSN detects collision between SGSN initiated UPC request and NRUPC on primary PDP context, NRUPC is retried (with different sequence number) after sending UPC Response.

- When GGSN detects collision between SGSN initiated UPC request for Inter-SGSN handoff and NRUPC with TFT and after handoff BCM mode is changed from Mixed mode to MS-Only mode, NRUPC is retried (with different sequence number) after sending UPC Response, but without TFT.

- When GGSN detects collision between an SGSN initiated UPC and a NRUPC on secondary PDP context, NRUPC is aborted and PCRF is notified. When multiple CCR-U support is not enabled on GGSN, CCR-U for aborted NRUPC (on secondary PDP context) is not informed to PCRF. In this case, PCRF will not be aware of this aborted transaction (rule failure).

### Limitations

- Behavior for GnGp GGSN has been modified for this feature, in this release. Behavior for GGSN remains unaltered.

- When NRUPC received from Direct Tunnel (due to "Direct Tunnel Error Indication") collides with SGSN initiated UPC request, NRUPC is aborted and not retried. This does not affect the functionality as, when "Direct Tunnel Error Indication" is received from access side, NRUPC is triggered again.

- When a request for handoff to LTE is received before receiving NRUPC response, the behavior remains unchanged. In this case, the pending NRUPC request is aborted. If the NRUPC request received is for rule installation, the request remains in the pending state and the rule is not installed. As there is no static rule and the rule installation request is in pending state, the PDP context stays up without an installed rule.

### Configuring GGSN UPC Collision Handling

Operators can use the Command Line Interface (CLI) to configure the collision between SGSN initiated UPC request and network initiated UPC Request.

**gtpc handle-collision**

This command in the service configuration mode can be used to the collision between SGSN initiated UPC request and network initiated UPC Request.

**GGSN Service**

```plaintext
configure
  context context_name
    ggsn-service service_name
      [ no | default ] gtpc handle-collision upc nrupc
end
```

**P-GW Service**
configure
context context_name
  pgw-service service_name
      [ no | default ] gtpc handle-collision upc nrupc
end

S-GW Service
configure
context context_name
  sgw-service service_name
      [ no | default ] gtpc handle-collision upc nrupc
end

SAEGW Service
configure
context context_name
  saegw-service service_name
      [ no | default ] gtpc handle-collision upc nrupc
end

Notes:
- **no**: Disables collision handling between SGSN initiated UPC and NRUPC request.
- **default**: Sets default collision handling behavior between SGSN initiated UPC and NRUPC request. By default, collision handling is enabled.
- **handle-collision upc nrupc**: Enables/Disables collision handling between SGSN initiated UPC and network requested UPC. By default, collision handling is enabled.

**Verifying the Configuration**

The configuration of this feature can be verified using the following commands from the exec mode:

- **show configuration**
- **show configuration verbose**

Please see the *Monitoring and Troubleshooting GGSN UPC Collision Handling* section for the command output.

**Monitoring and Troubleshooting GGSN UPC Collision Handling**

The following section describes commands available to monitor GGSN UPC Collision Handling.

**Show Commands for GGSN UPC Collision Handling**

**show configuration**

This command displays the following output:

ggsn-service ggsn-service
associate gtpu-service gtpu-service
associate pgw-service pgw_service
associate peer-map map_ggsn
no gtpc handle-collision upc nrupc

show configuration verbose
This command displays the following output:

```
ggsn-service ggsn-service
associate gtpu-service gtpu-service
associate pgw-service pgw_service
associate peer-map map_ggsn
no gtpc handle-collision upc nrupc
```

show ggsn-service name service_name
This command displays the following output:

```
Service name: ggsn-service
Context: ingress
... Suppress NRUPC triggered by UPC: Disabled
Collision handling for UPC-NRUPC: Enabled/Disabled
```

show gtpc statistics
This command displays the number of NRUPC and SGSN initiated UPC collisions happening for primary and secondary PDP context for a GGSN service. This command displays the following output:

```
Active Subscribers:
  Total: 1
  2G: 0
  3G: 1
...
MS Info Change Reporting Messages:

GTP-based S2b Interface Support on the P-GW and SAEGW

This chapter describes the GTP-based S2b interface support feature on the standalone P-GW and the SAEGW.

- Feature Description, on page 433
- How the S2b Architecture Works, on page 435
- How the S2a Architecture Works, on page 463
- Configuring the GTP-based S2b Interface on the P-GW and SAEGW, on page 477
- Monitoring the GTP-based S2b Interface Feature, on page 478
- Monitoring the GTP-based S2a Interface Feature, on page 480

Feature Description

This section describes the GTP-based S2a/S2b interface implementation on the P-GW and SAEGW.

GTP-based S2b Interface Support on the Standalone P-GW and SAEGW

GTP-based S2b interface support is a license-controlled feature. Contact your Cisco account or support representative for licensing information.

The S2b interface reference point connects the standalone P-GW with the ePDG and the P-GW of the SAEGW with the ePDG. Communication runs between the non-trusted non-3GPP ePDG (Evolved Packet Data Gateway) and the P-GW uses PMIPv6 (Proxy Mobile IP version 6) for providing access to the EPC. GTPv2-C is the signaling protocol used on the S2b. The S2b interface is based on 3GPP TS 29.274.

The S2b interface uses the PMIPv6 protocol to establish WLAN UE sessions with the P-GW. It also supports the transport of P-CSCF attributes and DNS attributes in PBU (Proxy-MIP Binding Update) and PBA (Proxy-MIP Binding Acknowledgment) messages as part of the P-CSCF discovery performed by the WLAN UEs. When the P-CSCF Address information is missing, P-CSCF Discovery is initiated upon an S4-SGSN-to-LTE (and vice versa) handoff. If the P-CSCF Address information is already available, there is no need to explicitly trigger another P-CSCF Discovery upon S4-SGSN to LTE (and vice versa) handoff.

Example: The UE tries to simultaneously connect to different APNs through different access networks only if the home network supports such simultaneous connectivity. The UE determines that the network supports
such simultaneous connectivity over multiple accesses if the UE is provisioned with or has received per-APN inter-system routing policies. So the UE can have independent PDN connections via multiple access types.

The access types supported are 4G and WiFi.

The S2b interface implementation on the P-GW and SAEGW supports the following functionality:

- UE connecting to PDN via WiFi access
- UE multiple PDN connections
- Initial Attach
- LTE to WiFi Handoff
- WiFi to LTE Handoff

### GTP-based S2a Interface Support on the Standalone P-GW and SAEGW

**Important**

GTP-Based S2a Interface Support is a licensed-controlled feature. Contact your Cisco account or support representative for detailed licensing information.

Prior to StarOS release 20.0, GTP-based S2a interface support was available on the P-GW. With StarOS release 20.0, GTP-based S2a interface support is also supported on the SAEGW. Operators deploying StarOS release 20.0 on the SAEGW are now able to integrate Trusted WiFi network functionality using this feature.

The S2a interface connects the standalone P-GW and P-GW of the SAEGW with the HSGW of the eHRPD. Specifically, the S2a interface supports the bearer interface by providing signaling and mobility support between a trusted non-3GPP access point (HSGW) and the standalone P-GW or P-GW of the SAEGW. It is based on Proxy Mobile IP but also supports Client Mobile IPv4 FA mode which allows connectivity to trusted non-3GPP IP access points that do not support PMIP.

When the WLAN is considered as trusted by the operator, the Trusted WLAN Access Network (TWAN) is interfaced with the EPC as a trusted non-3GPP access via the S2a interface to the P-GW. Support has been extended for WiFi-to-LTE handovers using Make and Break for the SAEGW service. Multi-PDN handovers are also supported as part of this feature.

Supported functionality includes:

- Initial Attach
- WiFi-to-LTE handover
- LTE-to-WiFi handover
- Multi-PDN handovers

Supported protocols include:

- Transport Layer: UDP, TCP
- Tunneling: GRE IPv6
- Network Layer: IPv4, IPv6
- Data Link Layer: ARP
- Physical Layer: Ethernet
Relationships to Other Features

This section describes how the GTP-based S2b and S2a interface support feature is related to other features.

- A P-GW service must be configured and operational before GTP-based s2b interface support can be configured on the standalone P-GW and SAEGW.
- GTP-based S2b interface support must also be configured and operational on the ePDG to support this feature.
- A P-GW service must be configured and operational before GTP-based S2a interface support can be configured on the standalone P-GW and SAEGW.

How the S2b Architecture Works

Standalone P-GW Architecture for S2b Interface Support

The GTP-based S2b interface architecture is part of the P-GW deployment in the E-UTRAN/EPC Network. The P-GW communicates with the ePDG over the S2b interface, and the ePDG connects to the WLAN offload architecture via an IPSec interface.

Figure 37: Standalone P-GW: GTP-based S2b Interface Implementation in the E-UTRAN/EPC Network
SAEGW Architecture for S2b Interface Support

The GTP-based S2b interface architecture is part of the SAEGW deployment in the E-UTRAN/EPC Network. The P-GW of the SAEGW communicates with the ePDG over the S2b interface, and the ePDG connects to the WLAN offload architecture via an IPSec interface.

Figure 38: SAEGW: GTP-based S2b Interface Implementation in the E-UTRAN/EPC Network

Limitations on S2b Interface Support for the P-GW and SAEGW

Note the following limitations of the GTP-based S2b interface implementation on the P-GW and SAEGW:

- Only the following interfaces/access types from the WiFi Offload and VLC Flows are supported:
  - Access Types:
    - WiFi
    - LTE
  - Interfaces:
    - S6b
    - Gy
    - Rf
GTP-based S2b Interface Support on the P-GW and SAEGW

Standalone P-GW Call Flows

This section provides call flows that illustrate the basic functionality of the GTP-based S2b interface support on the standalone P-GW.

Figure 39: Initial Attach Call Flow - P-GW

- Gx
- GTPv2 (S2b)
- Legacy Lawful Intercept is supported on the S2b interface on the standalone P-GW, but is not qualified on the S2b interface on the SAEGW at this time.

<td>P-GW to S-GW: Create Session Response + Create Bearer Request. The P-GW responds with a Create Session Response message to the S-GW. The P-GW provides IPv6 Prefix. Subject to operator configuration the P-GW can begin to forward downlink data and the S-GW shall buffer any downlink data packets.</td>
</tr>
<tr>
<td>17</td>
<td>P-GW to OFCS: ACR. After the P-GW sends the PBA, the P-GW shall send an ACR-Interim to the OFCS.</td>
</tr>
<tr>
<td>18</td>
<td>OFCS to P-GW: ACA. The OFCS responds with an ACA to the P-GW.</td>
</tr>
<tr>
<td>19</td>
<td>Create Session Response. The S-GW sends Create Session Response to the MME.</td>
</tr>
<tr>
<td>20</td>
<td>Initial Context Setup Request/Attach Accept. The Attach Accept is sent as NAS PDU in the Initial Context Setup Request from MME to eNodeB. Attach Accept message contains new GUTI.</td>
</tr>
<tr>
<td></td>
<td>These procedures occur independently of the location procedures. These procedures only apply to initial attach scenarios.</td>
</tr>
<tr>
<td>21</td>
<td>RRC Connection Re-configuration. The eNodeB sends the RRC Connection Reconfiguration message including the EPS Radio Bearer Identity to the UE, and the Attach Accept message to the UE. The APN is provided to the UE to notify it of the APN for which the activated default bearer is associated.</td>
</tr>
<tr>
<td>22</td>
<td>RRC Connection Re-configuration Complete. The UE sends the RRC Connection Reconfiguration Complete message to the eNodeB.</td>
</tr>
<tr>
<td>23</td>
<td>Initial Context Setup Response. The eNodeB sends Initial Context Setup Response to the MME.</td>
</tr>
<tr>
<td>24</td>
<td>Uplink Information Transfer. The UE sends an Uplink Information Transfer message.</td>
</tr>
<tr>
<td>25</td>
<td>Attach Complete. The eNodeB forwards the received Attach Complete message in an Uplink NAS Transport as part of NAS PDU.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>26</td>
<td>Uplink Information Transfer. When the UE has received Activate dedicated EPS Bearer Context Request message in the Attach Accept message, the UE sends Activate Dedicated EPS Bearer Context Accept message in a Uplink Information Transfer message.</td>
</tr>
<tr>
<td>27</td>
<td>UL NAS Transport. The eNB passes the Activate Dedicated EPS Bearer Context Accept message received in Step 14.b, to the MME in a UL NAS Transport message. At this time, the uplink data can be sent on the dedicated bearer.</td>
</tr>
<tr>
<td>32</td>
<td>Router Solicitation. This step may happen any time after step 26. For IPv6 PDN, the UE may send a Router Solicitation to the P-GW.</td>
</tr>
<tr>
<td>33</td>
<td>Router Advertisement. This step may happen any time after step 29 if the UE requested IPv4v6 or IPv6 PDN type. On receipt of the RS or prior the P-GW shall send a Router Advertisement and include the globally unique /64 IPv6 prefix previously assigned.</td>
</tr>
<tr>
<td>28</td>
<td>Modify Bearer Request / Create Bearer Response. On receiving both Initial Context Setup Response and Attach Complete, the MME sends a Modify Bearer Request message to the S-GW. The MME piggybacks the Modify Bearer Request message on the Create Bearer Response message.</td>
</tr>
<tr>
<td>29</td>
<td>The S-GW processes each message independently. The S-GW forwards the Create Bearer Response to the P-GW. At this time, the P-GW can send downlink data on the dedicated bearer for the IMS traffic. Since Handover Indication is set to TRUE in the Modify Bearer Request, the S-GW sends Modify Bearer Request to the P-GW separately. Based on TS 23.401, the P-GW switches the downlink traffic to S5 upon receiving this message. However, subject to operator configuration, this switching occurs at Create Session Request above (C3).</td>
</tr>
<tr>
<td>30</td>
<td>The P-GW sends Modify Bearer Response (Cause) message to the S-GW.</td>
</tr>
<tr>
<td>C1</td>
<td>P-GW to OCS: CCR-U. If the Online AVP is set in the CCA from the PCRF, the P-GW shall conditionally send a CCR-Update to the OCS to request online charging quota for the PDN session.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>C1. CCA-u</td>
<td>OCS to P-GW: CCA. The OCS responds with a CCA to the P-GW.</td>
</tr>
<tr>
<td>31</td>
<td>The S-GW sends Modify Bearer Response to the MME. The S1 S-GW F-TEID is the same as the S1-U S-GW F-TEID sent in Create Session Response from the S-GW to the MME. The S-GW can now start sending downlink packets to eNB and the switching of the data path from WiFi to LTE occurs after the Modify Bearer Response.</td>
</tr>
<tr>
<td>33a</td>
<td>SIP Re-registration RAT Change. The UE sends a SIP Re-Register to the P-CSCF to indicate that it detected a RAT change and assigned IP address remained unchanged.</td>

Standards Compliance

This section lists the industry-standards and references that were used in developing the GTP-based S2b interface implementation on the P-GW and SAEGW:

The following standards and references were used in developing the GTP-based S2b interface support feature.

- 3GPP TS 23.003-a.1.0 Numbering, addressing and identification
- 3GPP TS 23.234-a.0.0, 3GPP system to Wireless Local Area Network (WLAN) Interworking
- 3GPP TS 23.261-a.1.0, IP flow mobility and seamless Wireless Local Area Network (WLAN) Offload
- 3GPP TS 23.401: GPRS Enhancement for E-UTRAN Access
- 3GPP TS 23.402-a.4.0 Architecture Enhancements for non-3GPP Accesses
- 3GPP TS 24.302-a.4.0: Access to the 3GPP Evolved Packet Core (EPC) via non-3GPP access networks.
- 3GPP TS 24.312-a.3.0 Access Network Discovery and Selection Function (ANDSF) Management Object (MO)
- 3GPP TS 29.273-a.3.0 Evolved Packet System (EPS); 3GPP EPS AAA interfaces
- 3GPP TS 29.274- Evolved General Packet Radio Service (GPRS) Tunneling Protocol for Control plane (GTPv2-C); Stage 3
- 3GPP TS 33.234-a.0.0 Wireless Local Area Network (WLAN) interworking security
- 3GPP TS 33.402-a.0.0 Security aspects of non-3GPP accesses
- IETF RFC 3588: Diameter Base Protocol.
- IETF RFC 3602: The AES-CBC Cipher Algorithm and Its Use with IPSec
- IETF RFC 3715 IPSec-Network Address Translation (NAT) Compatibility Requirements
- IETF RFC 3748: Extensible Authentication Protocol (EAP)
- IETF RFC 3948: UDP Encapsulation of IPSec ESP Packets.
- IETF RFC 4306: Internet Key Exchange Protocol Version 2
- IETF RFC 4739: Multiple Authentication Exchange in IKEv2 protocol
- IETF RFC 5996 Internet Key Exchange Protocol Version 2 (IKEv2)

How the S2a Architecture Works

This section provides information that describes the S2a interface architecture on the standalone P-GW and SAEGW.

Standalone P-GW and SAEGW Architecture for S2a Interface Support

Diagrams for the S2a interface architecture for the standalone P-GW and SAEGW appear below.

The S2a interface connects the standalone P-GW and P-GW of the SAEGW with the HSGW of the eHRPD. Specifically, the S2a interface supports the bearer interface by providing signaling and mobility support between a trusted non-3GPP access point (HSGW) and the standalone P-GW or P-GW of the SAEGW. It is based on Proxy Mobile IP but also supports Client Mobile IPv4 FA mode which allows connectivity to trusted non-3GPP IP access points that do not support PMIP.
Figure 45: S2a Interface Architecture for the Standalone P-GW

Figure 46: S2a Interface Architecture for the SAEGW
Limitations on S2a Interface Support on the P-GW and SAEGW

Note the following limitations of the GTP-based S2a interface implementation on the P-GW and SAEGW:

- Access Type technologies supported are WiFi and LTE.
- Interfaces supported include:
  - S6b
  - Gy
  - Rf
  - Gx
  - GTPv2

Standalone P-GW S2a Call Flows

The following call flow diagrams describe the basic functionality of the S2a interface when deployed in a standalone P-GW architecture.

</tbody>
</table>

**Important**

GTP-based S2a/S2b interface support on the P-GW and SAEGW is a license-controlled feature. Contact your Cisco account or support representative for licensing details.
If you modify the `interface-type` command, the parent service (service within which the eGTP/GTP-U service is configured) will automatically restart. Service restart results in dropping of active calls associated with the parent service.

```plaintext
config context ingress_context_name
  eegtp-service egtp_service_name
    interface-type interface-pgw-ingress s2b
end
```

Disable S2b interface support by entering the following commands:

```plaintext
config context ingress_context_name
  eegtp-service egtp_service_name
    interface-type interface-pgw-ingress
end
```

**Verifying the Configuration**

This section describes how to verify the GTP-based S2a/S2b interface configuration on the P-GW and SAEGW. Use the `show configuration` command from Exec Mode to verify that the configuration is active. Look for the eGTP service configuration section in the output:

```plaintext
egtp-service EGTP
  interface-type interface-pgw-ingress s2a s2b
```

Once the S2b license is installed and active, run a WiFi Initial Attach Call to check that a successful call is setup. From Exec Mode, use the `show subscribers all` command to verify that the call was successful.

**Monitoring the GTP-based S2b Interface Feature**

This section provides commands that operators can use to monitor the GTP-based S2b interface feature on the P-GW and SAEGW.

**GTP-based S2b Interface Show Commands**

This section provides information regarding show commands and/or their outputs for GTP-based S2b interface support.

```plaintext
show pgw-service statistics all
```

For S2b interface support on the standalone P-GW: This command provides statistics on the number of attempts, failures, and successes for the following S2b interface functions:

- S2bGTP-to-LTE handovers
- LTE-to-S2bGTP handovers
show subscribers epdg-address

This command provides information on the S2b P-GW subscribers connected to the ePDG over the S2b interface.

show subscribers saegw-only epdg-address

This command shows information related to subscribers of the P-GW of the SAEGW connected to a specific ePDG over the S2b interface.

show subscribers saegw-only interface-type S2bGTP

This command shows information related to GTP P-GW subscribers of the SAEGW connected via the S2b interface.

show subscribers summary pgw-address

This command provides information on the number of Active and Dormant GTP S2b IPv4 and IPv6 subscribers.

show subscribers pgw-only full all

For S2b interface support on the standalone P-GW: Use this command to view S2b call related information for P-GW subscribers. The output will provide the following S2b specific information:

- Interface Type (S2b PGW GTP-C interface)
- MAC Address
- ePDG c-teid (ePDG control tunnel endpoint identifier)
- ePDG u-teid (ePDG bearer tunnel endpoint identifier)
- ePDG c-addr (ePDG control IP address)
- ePDG u-addr (ePDG bearer IP address)

show subscribers pgw-only epdg-address

For S2b interface support on the standalone P-GW: Use this command to view all S2b information for all the subscribers' sessions that exist on the P-GW for a specific ePDG. The ePDG is specified by the epdg-address (in IPv4 or IPv6 address format).

show subscribers summary epdg-address

For S2b interface support on the standalone P-GW: Use this command to view statistics for all the subscribers' sessions that exists on the P-GW that belong to the S2b interface on a specific ePDG. The ePDG is specified by the epdg-address.

show subscribers summary interface-type S2bGTP

For S2b interface support on the standalone P-GW: View the number of active and dormant subscriber sessions on the P-GW that belong to the S2b interface.

show subscribers saegw-only full all

For S2b interface support on the SAEGW: This command provides S2b call-related information for P-GW subscribers, including:
show saegw-service statistics all function pgw

For S2b interface support on the SAEGW: This command provides statistics related to successes, failures and attempts for various S2bGTP handovers for all P-GW SAEGW services, including:

- S2bGTP-to-LTE handover
  - Attempted
  - Succeeded
  - Failed

- LTE-to-S2bGTP handover
  - Attempted
  - Succeeded
  - Failed

Monitoring the GTP-based S2a Interface Feature

This section provides information on how to monitor the GTP-based S2a interface feature.

GTP-based S2a Interface Show Commands

This section provides information regarding show commands and/or their outputs for GTP-based S2a interface support.

show pgw-service statistics all

The output of this command has been enhanced to provide statistics on S2aGTP-to-LTE and LTE-to-S2aGTP handovers. It records the total number of handover attempts, and the number of attempts that succeeded and failed.

show saegw-service statistics all

The output of this command provides information related to subscribers, bearers, and PDNs on the S2a interface.
**show saegw-service statistics all function-pgw**

The output of this command provides subscriber, PDN and handover statistics for the P-GW function of the SAEGW on the S2a interface.

**show session-subsystem facility sessmgr service-type pgw-ingress**

The output of this command has been enhanced to provide S2a interface session information to troubleshoot subscriber session problems and for general monitoring for orphaned sessions. If this command is entered with no keywords, the information displayed is cumulative for all sessions facilitated by the system.

**show subscribers pgw-only full all**

The output of this command has been enhanced to show S2a call-related information, including access technology, TWAN, and TEID information.

**show subscribers saegw-only full all**

The output of this command contains subscriber information related to the S2a interface, including subscriber ID information, TEID and address information, and input/output packets recorded and dropped.

**show subscribers saegw-only interface-type S2aGTP**

The S2aGTP keyword has been added to this command to enable operators to view detailed information for S2a subscriber sessions, including call code, CALLID, IMSI/IMEI, APN and Time-Idle.

**show subscribers summary interface-type S2aGTP**

The output provides interface type details on subscribers connected via the S2a interface. The output provides interface type details on subscribers connected via the S2a interface. Information is given for both IPv4, IPv6, and IPv4v6 interfaces.

**show subscribers summary pgw-address**

The output of this command contains S2a subscriber information for the specified P-GW. Interface information is included for IPv4, IPv6 and IPv4v6 interfaces.
show subscribers summary pgw-address
CHAPTER 25

3GPP R12 GTP-C Load and Overload Control Support on the P-GW, SAEGW, and S-GW

This chapter describes the 3GPP Release 12 GTP-C Load and Overload Control feature on the P-GW, SAEGW, and S-GW.

- Feature Description, on page 483
- How It Works, on page 484
- Creating and Configuring a 3GPP R12 GTP-C Load Control Profile, on page 485
- Creating and Configuring a 3GPP R12 GTP-C Overload Control Profile, on page 490
- Monitoring and Troubleshooting the 3GPP R12 GTP-C Load and Overload Control Feature, on page 497

Feature Description

This section describes the 3GPP R12 GTP-C Load and Overload Control feature.

Important

Use of the 3GPP R12 Load and Overload Control feature requires that a valid license key be installed. Contact your Cisco account or support representative for information on how to obtain a license.

The 3GPP R12 GTP-C Load and Overload Control feature is a licensed, optional feature which allows a GTP control plane node to send its load information to a peer GTP control plane node which the receiving GTP control plane peer node uses to augment existing GW selection procedure for the P-GW and S-GW. Load information reflects the operating status of the resources of the originating GTP control plane node.

Nodes using GTP control plane signaling may support communication of overload control information in order to mitigate overload situations for the overloaded node through actions taken by the peer node(s). This feature is supported over the S4, S11, S5 and S8 interfaces via the GTPv2 control plane protocol.

A GTP-C node is considered to be in overload when it is operating over its nominal capacity resulting in diminished performance (including impacts to handling of incoming and outgoing traffic). Overload control information reflects an indication of when the originating node has reached such a situation. This information, when transmitted between GTP-C nodes, may be used to reduce and/or throttle the amount of GTP-C signaling traffic between these nodes. As such, the overload control information provides guidance to the receiving node to decide upon the correct actions, which leads to mitigation towards the sender of the information.

To summarize, load control and overload control can be described in this manner:
• **Load Control:** Load control enables a GTP-C entity (for example, an P-GW/SAEGW/S-GW) to send its load information to a GTP-C peer (for example, an MME/SGSN, ePDG, TWAN) to adaptively balance the session load across entities supporting the same function (for example, an S-GW cluster) according to their effective load. The load information reflects the operating status of the resources of the GTP-C entity.

• **Overload Control:** Overload control enables a GTP-C entity becoming or being overloading to gracefully reduce its incoming signaling load by instructing its GTP-C peers to reduce sending traffic according to its available signaling capacity to successfully process the traffic. A GTP-C entity is in overload when it operates over its signaling capacity, which results in diminished performance (including impacts to handling of incoming and outgoing traffic).

### Load and Overload Factor Calculation Enhancement

In capacity testing and also in customer deployments it was observed that the chassis load factor for the 3GPP R12 Load and Overload Support feature was providing incorrect values even when the sessmgr card CPU utilization was high. The root cause is that when the load factor was calculated by taking an average of CPU utilization of sessmgr and demux cards, the demux card CPU utilization never increased more than the sessmgr card CPU utilization. As a result, the system did not go into the overload state even when the sessmgr card CPU utilization was high.

The 3GPP R12 Load/Overload Control Profile feature has been enhanced to calculate the load factor based on the higher value of similar types of cards for CPU load and memory. If the demux card's CPU utilization value is higher than the sessmgr card's CPU utilization value, then the demux card CPU utilization value is used for the load factor calculation.

A new CLI command, gtpc-system-param-poll interval, is introduced to configure different polling intervals for the resource manager so that the demuxmgr can calculate the load factor based on different system requirements.

### Relationships to Other Features

Note the following before configuring the GTPP R12 GTP-C Load and Overload Control feature:

• One of the following services must be configured on the node before GTP-C Load and Overload Control can be configured.
  - P-GW
  - SAEGW
  - S-GW

• Once configured, the GTP-C Load and Overload Control profiles must be associated with a P-GW, SAEGW, or S-GW service to function properly in the network.

### How It Works

The node periodically fetches various parameters (for example, License-Session-Utilization, System-CPU-Utilization, and System-Memory-Utilization), which are required for Node level load control information. The node then calculates the load/overload control information itself either based on the weighted factor provided by the user or using the default weighted factor.

Node level load control information is calculated every 30 seconds. The resource manager calculates the system-CPU-utilization and System-Memory-Utilization at a systems level.
For each configured service, load control information can be different. This can be achieved by providing a weightage to the number of active session counts per service license, for example, \([\text{number of active sessions per service} / \text{max session allowed for the service license}] \times 100\).

The node's resource manager calculates the system-CPU-utilization and System-Memory-Utilization at a systems level by averaging CPU and Memory usage for all cards and which might be different from that calculated at the individual card level.

Creating and Configuring a 3GPP R12 GTP-C Load Control Profile

This section describes how to create and configure a 3GPP R12 GTP-C load control profile.

Configuration Overview

Creating and configuring a 3GPP R12 GTP-C load control profile consists of the following procedures:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Create a load control profile. Refer to Creating the GTPP R12 Load Control Profile, on page 485.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Configure the load control weightage settings. Refer to Configuring the 3GPP R12 Load Control Profile Weightage Settings, on page 486.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Configure the load control inclusion frequency. Refer to Configuring the 3GPP R12 Load Control Profile Inclusion Frequency, on page 486.</td>
</tr>
<tr>
<td>Step 4</td>
<td>P-GW Only. Configure the load control threshold. Refer to Configuring the 3GPP R12 Load Control Threshold, on page 487.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Configure load control information handling. Refer to Configuring 3GPP R12 Load Control Information Handling, on page 487.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Configure load control information publishing. Refer to Configuring 3GPP R12 Load Control Information Publishing, on page 487.</td>
</tr>
<tr>
<td>Step 7</td>
<td>Configure the 3GPP R12 GTP-C Polling Parameter Interval. Refer to Configuring the 3GPP R12 GTP-C Polling Parameter Interval, on page 488.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Associate the load control profile with a P-GW, SAEGW, or S-GW service. Refer to Associating the 3GPP R12 Load Control Profile with a P-GW, SAEGW, or S-GW Service., on page 488.</td>
</tr>
<tr>
<td>Step 9</td>
<td>Verify the configuration settings. Refer to Verifying the 3GPP R12 Load Control Configuration, on page 489.</td>
</tr>
<tr>
<td>Step 10</td>
<td>Save the configuration. Refer to Saving the Configuration, on page 490.</td>
</tr>
</tbody>
</table>

Creating the GTPP R12 Load Control Profile

Use the following example to create a load control profile on the P-GW/SAEGW/S-GW:

```bash
config
gtpc-load-control-profile profile_name
end
```

Notes:

- The profile name must be an alphanumeric string from 1 to 64 characters in length.
Once you have created the load control profile, you will enter **GTP-C Load Control Profile Configuration Mode**.

### Configuring the 3GPP R12 Load Control Profile Weightage Settings

This section describes how to set weightage percentages for system CPU, memory, and license session utilization as part of a GTP-C load control profile configuration. These settings constitute the basic load control profile for this network element. These parameters allow the P-GW/S-GW/SAEGW to send its load information to a peer GTP control plane node which the receiving GTP control plane peer node uses to augment existing GW selection procedures for the P-GW and S-GW. Load information reflects the operating status of the resources of the originating GTP control plane node.

Use the following example to configure the load control profile weightage settings on the P-GW/SAEGW/S-GW:

```config
config gtpc-load-control-profile profile_name
  weightage system-cpu-utilization percentage system-memory-utilization percentage license-session-utilization percentage
end
```

**Notes:**

- **system-cpu-utilization percentage**: Configures system CPU utilization weightage as a percentage of 100.
  
  `percentage` must be an integer from 0 to 100. The default is 40.

- **system-memory-utilization percentage**: Configures system memory utilization weightage as a percentage of 100. `percentage` must be an integer from 0 to 100. The default is 30.

- **license-session-utilization percentage**: Configures license session utilization weightage as a percentage of 100. `percentage` must be an integer from 0 to 100. The default is 30.

---

**Important**

All parameters must be specified. The total of all three parameter settings should equal, but not exceed, 100.

### Configuring the 3GPP R12 Load Control Profile Inclusion Frequency

This section describes how to set the parameters that determine the inclusion frequency of the Load Control Information Element (LCI) for a GTP-C Load Control Profile configuration. The LCI is a 3GPP-specific Information Element that is sent to peers when a configured threshold is reached. This parameter specifies how often the operator wants to send this information to the node’s peers.

Use the following example to configure the load control profile inclusion frequency on the P-GW/SAEGW/S-GW:

```config
config gtpc-load-control-profile profile_name
  inclusion-frequency { advertisement-interval interval_in_seconds | change-factor change_factor }
end
```

---

**Important**

All parameters must be specified. The total of all three parameter settings should equal, but not exceed, 100.
Notes:

• **inclusion frequency**: Configures parameters to determine the inclusion frequency of the LCI.
• **advertisement-interval interval_in_seconds**: Configures advertisement-interval for the LCI in seconds. This specifies how often load control information should be sent to the peers. If configured to 0, the node will send load control information in each and every outgoing message to the peers. *interval_in_seconds* must be an integer from 0 to 3600. The default is 300.
• **change-factor change_factor**: Configures the change factor for the load control profile. If the load control change factor changes by the configured factor, whether it is an increase or decrease in load, the load control information is sent to the peers. This information is only sent to the peers when the load factor changes by the factor configured. *change_factor* must be an integer from 1 to 20. The default is 5.

### Configuring the 3GPP R12 Load Control Threshold

This section describes how to configure the minimum threshold value above which P-GW-provided load control information should be utilized for calculating the P-GW effective weight during initial node selection.

Use the following example to configure Load Control Profile threshold on the P-GW.

```
cfg
  gtpc-load-control-profile profile_name
    threshold time_in_seconds
  end
```

Notes:

• The default threshold value is 50.

### Configuring 3GPP R12 Load Control Information Handling

The handling of load control information for the home or visited PLMN can be enabled/disabled via this procedure.

Use the following example to enable/disable load control profile information handling on the SAEGW/S-GW/P-GW.

```
cfg
  gtpc-load-control-profile profile_name
    load-control-handling { home | visited }
    no load-control-handling { home | visited }
  end
```

Notes:

• **no** disables load-control-handling for the specified option.

### Configuring 3GPP R12 Load Control Information Publishing

The publishing of load control information can be enabled/disabled for the home or visited PLMN.

Use the following example to enable/disable load control profile information publishing on the P-GW/SAEGW/S-GW.
config

gtpc-load-control-profile profile_name
load-control-publishing { home | visited }
no load-control-publishing { home | visited }
end

Notes:
• no disables load control profile information publishing for the specified option.

Configuring the 3GPP R12 GTP-C Polling Parameter Interval

In capacity testing and also in customer deployments it was observed that the chassis load factor for the 3GPP R12 Load and Overload Support feature was providing incorrect values even when the sessmgr card CPU utilization was high. The root cause is that when the load factor was calculated by taking an average of CPU utilization of sessmgr and demux cards, the demux card CPU utilization never increased more than the sessmgr card CPU utilization. As a result, the system did not go into the overload state even when the sessmgr card CPU utilization was high.

The 3GPP R12 Load/Overload Control Profile feature has been enhanced to calculate the load factor based on the higher value of similar types of cards for CPU load and memory. If the demux card's CPU utilization value is higher than the sessmgr card's CPU utilization value, then the demux card CPU utilization value is used for the load factor calculation.

Beginning with StarOS release 21, a new CLI command, gtpc-system-param-poll interval, is introduced in Context Configuration Mode to configure different polling intervals for the resource manager so that the demuxmgr can calculate the load factor based on different system requirements. This command sets the time period over which to monitor the chassis level CPU, Memory, and Session count information from the resource manager.

To configure the GTP-C polling parameter interval:

config

context context_name
  gtpc-system-param-poll interval seconds
  default gtpc-system-param-poll interval
end

• Where seconds is the time period over which to monitor the chassis level CPU, Memory, and Session count information from the resource manager. Valid entries are from 15 to 300 seconds. The default setting is 30 seconds.

• default returns the setting to its default value of 30 seconds.

Caution

Setting the time interval to a low value may impact system performance.

Associating the 3GPP R12 Load Control Profile with a P-GW, SAEGW, or S-GW Service.

Once the 3GPP R12 GTP-C load control profile is created, it must be associated with an existing P-GW, SAEGW, or S-GW service.
Use the following examples to associate the GTP-C load control profile with an existing P-GW, SAEGW, or S-GW service.

**P-GW Service Association:**

```bash
configure
  context  context_name
    pgw-service pgw_service_name
      associate gtpc-load-control-profile profile_name
      no associate gtpc-load-control-profile
end
```

Notes:

- `no` disables the service association for the GTP-C Load Control Profile.

**S-GW Service Association:**

```bash
configure
  context  context_name
    sgw-service sgw_service_name
      associate gtpc-load-control-profile profile_name
      no associate gtpc-load-control-profile
end
```

Notes:

- `no` disables the service association for the GTP-C Load Control Profile.

**SAEGW Service Association:**

```bash
configure
  context  context_name
    sgw-service sgw_service_name
      associate gtpc-load-control-profile profile_name
      exit
    pgw-service pgw_service_name
      associate gtpc-load-control-profile profile_name
      exit
    saegw-service saegw_service_name
      associate sgw-service sgw_service_name
      associate pgw-service pgw_service_name
      exit
```

**Verifying the 3GPP R12 Load Control Configuration**

Use the following command to view the load control profile configuration settings:

```bash
show gtpc-overload-control-profile full name load_control_profile_name
```

The output of this command provides the configuration settings of all load control parameters, including:

- Weightage
- Inclusion Frequency
- Load control information handling
- Load control information publishing
- Load threshold
Saving the Configuration

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Creating and Configuring a 3GPP R12 GTP-C Overload Control Profile

This section describes how to create and configure a 3GPP R12 GTP-C overload control profile on the P-GW/SAEGW/S-GW.

Configuration Overview

**Step 1** Create the GTP-C overload control profile. Refer to Creating the GTPP R12 Overload Control Profile, on page 490.

**Step 2** Configure the weightage settings. Refer to Configuring 3GPP R12 Overload Control Weightage Settings, on page 491.

**Step 3** Configure the inclusion frequency. Refer to Configuring the 3GPP R12 Overload Control Inclusion Frequency, on page 491.

**Step 4** Configure the validity period. Refer to Configuring the 3GPP R12 Overload Control Validity Period, on page 492.

**Step 5** Configure the tolerance settings. Refer to Configuring 3GPP R12 Overload Control Tolerance Limits, on page 492.

**Step 6** Configure the throttling behavior for the node. Refer to Configuring 3GPP R12 Overload Control Throttling Behavior, on page 493.

**Step 7** Configure the message prioritization. Refer to Configuring 3GPP R12 Overload Control Message Prioritization, on page 494.

**Step 8** Configure self-protection behavior for the node. Refer to Configuring 3GPP R12 Overload Control Self-Protection Behavior, on page 494.

**Step 9** Configure overload control information handling. Refer to Configuring 3GPP R12 Overload Control Information Handling, on page 495.

**Step 10** Configure overload control information publishing. Refer to Configuring 3GPP R12 Overload Control Information Publishing, on page 495.

**Step 11** Configure the GTP-C polling parameter interval. Refer to Configuring the 3GPP R12 GTP-C Polling Parameter Interval, on page 488.

**Step 12** Associate the overload control configuration with an existing P-GW/SAEGW/S-GW service. Refer to Associating the 3GPP R12 Overload Control Configuration with a P-GW, SAEGW, or S-GW Service, on page 496.

**Step 13** Verify the overload control configuration. Refer to Verifying the 3GPP R12 Overload Control Configuration, on page 497.

**Step 14** Save the configuration. Refer to Saving the 3GPP R12 Overload Control Configuration, on page 497.

Creating the GTPP R12 Overload Control Profile

Use the following example to create the GTP-C Overload Control Profile:
Configuring 3GPP R12 Overload Control Weightage Settings

This section describes how to configure GTP-C Overload Control weightage parameters. These parameters constitute the basic settings for this GTP-C Overload Control Profile. Communication of these parameters indicate to peers when this network element is becoming or being overloaded. When this occurs, the NE will be able to instruct its peers to gracefully reduce its incoming signaling load by instructing the peers to reduce sending traffic according to its available signaling capacity to successfully process the traffic. A GTP-C entity is in overload when it operates over its signaling capacity, which results in diminished performance (including impacts to handling of incoming and outgoing traffic).

Use the following example to configure the GTP-C Overload Control Weightage settings on the P-GW/SAEGW/S-GW.

```
configure
  gtpc-overload-control-profile profile_name
  weightage system-cpu-utilization percentage
  system-memory-utilization percentage
  license-session-utilization percentage
  default weightage
end
```

Notes:

- Total weightage for all parameters should be 100.
- `system-cpu-utilization percentage`: Configures system CPU utilization weightage as a percentage of 100. `percentage` must be an integer from 0 to 100. The default is 40.
- `system-memory-utilization percentage`: Configures system memory utilization weightage as a percentage of 100. `percentage` must be an integer from 0 to 100. The default is 30.
- `license-session utilization percentage`: Configures license session utilization weightage as a percentage of 100. `percentage` must be an integer from 0 to 100. The default is 30.

Configuring the 3GPP R12 Overload Control Inclusion Frequency

This section describes how to set the parameters that determine the inclusion frequency of the Overload Control Information Element (OCI) for a GTP-C Load Control Profile configuration. The OCI is a 3GPP-specific IE that is sent to peers when a configured threshold is reached. This parameter specifies how often the operator wants to send this information to the peers.

Use the following example to configure the overload control profile inclusion frequency on the P-GW/SAEGW/S-GW.

```
configure
  gtpc-overload-control-profile profile_name
end
```
inclusion-frequency { advertisement-interval interval_in_seconds | change-factor change_factor }
default inclusion-frequency { advertisement-interval | change-factor }
end

Notes:

- inclusion frequency: Configures parameters to decide inclusion frequency of the OCI information element.
- advertisement-interval interval_in_seconds: Configures the advertisement-interval for overload control in seconds. Specifies how often overload control information should be sent to the peers. If configured to 0, the node will send overload control information in each and every outgoing message to the peers. interval_in_seconds must be an integer from 0 to 3600. The default is 300.
- change-factor change_factor: P-GW only. Configures the change factor for overload control. If the overload control factor changes by a configured factor, whether by an increase or decrease, the overload control information should be sent to the peers. This information is only sent to the peers when the overload factor changes by the factor configured. change_factor must be an integer from 1 to 20. The default is 5.

### Configuring the 3GPP R12 Overload Control Validity Period

This section describes how to configure the overload control validity period. The validity period is the length of time during which the overload condition specified by the overload control information element is to be considered as valid, unless overridden by subsequent new overload control information.

Use the following example to configure the GTP-C Overload Control validity period on the P-GW/SAEGW/S-GW.

```config
configure
gtpc-overload-control-profile profile_name
    validity-period seconds
    default validity-period
end
```

Notes:

- validity-period seconds: Configures the validity of overload control information. seconds must be an integer from 1 to 3600. The default is 600 seconds.

### Configuring 3GPP R12 Overload Control Tolerance Limits

Use this example to configure GTP-C Overload Control Tolerance limits.

```config
configure
gtpc-overload-control-profile profile_name
tolerance { initial-reduction-metric percentage | threshold
    report-reduction-metric percentage self-protection-limit percentage }
default tolerance { initial-reduction-metric | threshold }
end
```

Notes:
• **initial-reduction-metric percentage**: Configures initial overload reduction metric value to be advertised upon reaching minimum overload tolerance limit. When reaching the configured minimum threshold, this parameter specifies how much the node wants the peers to reduce incoming traffic. `percentage` must be an integer from 1 to 100. The default is 10.

• **threshold report-reduction-metric percentage**: Configures the minimum overload tolerance threshold for advertising overload reduction metric to the peer. When the minimum threshold is reached, the node will report this information to peers. When the maximum limit is reached, the node will go into self-protection mode. `percentage` must be an integer from 1 to 100. The default is 80.

• The **threshold report-reduction-metric** should always be lower than the **self-protection-limit**.

• **self-protection-limit percentage**: Configures the maximum overload tolerance threshold after which node will move to self protection mode. When the maximum limit is reached, the node will start rejecting all incoming messages, except for delete messages. The node will not initiate any new messages to the peers. This is to mitigate the overload condition. `percentage` must be an integer from 1 to 100. The default is 95.

### Configuring 3GPP R12 Overload Control Throttling Behavior

Use this command to configure throttling behavior based on peer’s overload reduction-metric by excluding some or all emergency events and/or messages with configured EARP. Message throttling applies only to initial messages. Triggered request or response messages should not be throttled since that would result in the retransmission of the corresponding request message by the sender.

If **throttling-behavior** is configured, the profile can be associated with an S-GW or P-GW service. If a P-GW specific keyword is configured, and the profile is associated with an S-GW service, the S-GW will ignore the P-GW specific configuration. Only the parameters specific to S-GW or P-GW will be utilized.

Use this example to configure GTP-C overload control throttling behavior on the P-GW/SAEGW/S-GW.

```config
configure
gtpc-overload-control-profile  profile_name
  throttling-behavior { earp [ 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
  | 11 | 12 | 13 | 14 | 15 ]* exclude } | emergency-events exclude }
  no throttling-behavior [ earp [ 1 |2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
  | 11 | 12 | 13 | 14 | 15 ]* exclude | emergency-events exclude ]
end
```

**Notes:**

• **throttling-behavior**: Configures throttling behavior based on peer’s overload reduction-metric.

• **earp**: Excludes the specified messages with configured earp from throttling due to peer’s overload-reduction metric. If a bearer with configured EARP is created or updated, it will be excluded from throttling.

• **emergency-events exclude**: P-GW Only. Excludes all emergency events from throttling due to the peer’s overload reduction-metric. While reducing messages towards the peer based on the overload information received from the peer, the P-GW will exclude events sent for emergency sessions.
Configuring 3GPP R12 Overload Control Message Prioritization

In the R12 GTP-C Load Overload control feature, it is possible to apply message throttling, (when a peer indicates it is overloaded), based on message priority. To apply message prioritization it is necessary to configure the percentage of two groups of messages that each node (P-GW or ePDG) is expected to generate. The operator can define the expected number of messages as a percentage for each message group.

Use the following example to configure message prioritization.

```
configure
gtpc-overload-control-profile  profile_name
    message-prioritization  group1  percentage  group2  percentage
    no message-prioritization
    default  message-prioritization
end
```

Notes:
- **group1** specifies the message priority percentage for the following messages:
  - Update Bearer Request message for default bearer generated from P-GW ingress
  - Update Bearer Request message for dedicated bearer generated from P-GW ingress
  - Handoff Create Session Request message generated from ePDG egress.
- **group2** specifies the message priority percentage for the following messages:
  - Create Bearer Request message for default bearer generated from P-GW ingress
  - PDN connection requested Create Session Request message from ePDG egress
- The total percentage for the message groups should equal 100.
- **group1** messages will have the highest priority (1) and are dropped last. **group2** messages will have the lowest priority (2) and are dropped first.
- **default** returns the group message priority settings to their default value. The default for each group is 50.
- The default behavior for this command is enabled. To disable the command use the **no** option.

Configuring 3GPP R12 Overload Control Self-Protection Behavior

This functionality enables the operator to configure APN names and EARp priority level values for self-protection mode so that incoming request messages for emergency packet data node (PDN) connections and/or configured EARp priority values are not rejected even if the system is under self-protection mode.

Use this example to configure GTP-C overload control self-protection behavior.

```
configure
    gtpc-overload-control-profile   profile_name
        self-protection-behavior {  apn  apn_name*  exclude |  earp {  1 |  2 |  3 |  4 |  5 |  6 |  7 |  8 |  9 | 10 | 11 | 12 | 13 | 14 | 15* } exclude } }  
        no  self-protection-behavior {  apn  apn_name*  exclude |  earp {  1 |  2 |  3 |  4 |  5 |  6 |  7 |  8 |  9 | 10 | 11 | 12 | 13 | 14 | 15* } exclude } }  
end
```

Notes:
- **apn** configures up to three APN names to be allowed under self-protection behavior.
• **earp** configures up to three EARP priority level values so that incoming request messages for the configured evolved ARP priority values are not rejected even if the system is under self-protection mode.
• **no** disables the specified options.

### Configuring 3GPP R12 Overload Control Information Handling

Use this command to enable/disable the handling of overload control information for the home or visited PLMN.

```bash
configure
gtpc-load-control-profile profile_name
  overload-control-handling { home | visited }
  no overload-control-handling { home | visited }
  default overload-control-handling
end
```

Notes:

• **home**: Enables the handling of load control information for the home PLMN.
• **visited**: Enables the handling of load control information for the visited PLMN.
• **default**: Returns load control handling to its default behavior (enabled).

### Configuring 3GPP R12 Overload Control Information Publishing

Enables or disables the publishing of load control information towards the home or visited PLMN.

```bash
configure
gtpc-overload-control-profile profile_name
  overload-control-publishing { home | visited }
  no overload-control-publishing { home | visited }
  default overload-control-publishing
end
```

Notes:

• **home**: Enables the publishing of load control information towards the home PLMN.
• **visited**: Enables the publishing of load control information towards the visited PLMN.
• **default**: Returns load control handling to its default behavior (enabled).

### Configuring the 3GPP R12 GTP-C Polling Parameter Interval

In capacity testing and also in customer deployments it was observed that the chassis load factor for the 3GPP R12 Load and Overload Support feature was providing incorrect values even when the sessmgr card CPU utilization was high. The root cause is that when the load factor was calculated by taking an average of CPU utilization of sessmgr and demux cards, the demux card CPU utilization never increased more than the sessmgr card CPU utilization. As a result, the system did not go into the overload state even when the sessmgr card CPU utilization was high.

The 3GPP R12 Load/Overload Control Profile feature has been enhanced to calculate the load factor based on the higher value of similar types of cards for CPU load and memory. If the demux card's CPU utilization value is higher than the sessmgr card's CPU utilization value, then the demux card CPU utilization value is used for the load factor calculation.
Beginning with StarOS release 21, a new CLI command, `gtpc-system-param-poll interval`, is introduced in Context Configuration Mode to configure different polling intervals for the resource manager so that the demuxmgr can calculate the load factor based on different system requirements. This command sets the time period over which to monitor the chassis level CPU, Memory, and Session count information from the resource manager.

To configure the GTP-C polling parameter interval:

```
config
  context context_name
    gtpc-system-param-poll interval seconds
    default gtpc-system-param-poll interval
  end
• Where `seconds` is the time period over which to monitor the chassis level CPU, Memory, and Session count information from the resource manager. Valid entries are from 15 to 300 seconds. The default setting is 30 seconds.
• `default` returns the setting to its default value of 30 seconds.
```

⚠️ Caution

Setting the time interval to a low value may impact system performance.

### Associating the 3GPP R12 Overload Control Configuration with a P-GW, SAEGW, or S-GW Service

Once the 3GPP R12 overload control profile has been configured, it must be associated with an existing P-GW, SAEGW, or S-GW service.

Use the following examples to associate the overload control configuration to an existing service.

#### P-GW Service Association:

```
configure
  context context_name
    pgw-service pgw_service_name
      associate gtpc-overload-control-profile profile_name
      no associate gtpc-overload-control-profile
  end
```

Notes:

• `no` disables the service association for the GTP-C Load Control Profile.

#### S-GW Service Association:

```
configure
  context context_name
    sgw-service sgw_service_name
      associate gtpc-overload-control-profile profile_name
      no associate gtpc-overload-control-profile
      end
```

Notes:
• no disables the service association for the GTP-C Load Control Profile.

SAEGW Service Association::

configure
  context  context_name
    sgw-service  sgw_service_name
      associate  gtpc-overload-control-profile  profile_name
    exit
    pgw-service  pgw_service_name
      associate  gtpc-overload-control-profile  profile_name
    exit
    saegw-service  saegw_service_name
      associate  sgw-service  sgw_service_name
      associate  pgw-service  pgw_service_name
    exit

Verifying the 3GPP R12 Overload Control Configuration

Use the following command to view the overload control configuration settings.

show gtpc-overload-control-profile full name overload_control_profile_name

The output of this command provides all overload control profile configuration settings, including:

• Weightage
• Tolerance
• Inclusion Frequency
• Validity Period
• Throttling Profile
• Self-Protection Behavior
• Overload control information Handling
• Overload control information Publishing
• Message Prioritization

Saving the 3GPP R12 Overload Control Configuration

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Monitoring and Troubleshooting the 3GPP R12 GTP-C Load and Overload Control Feature

This section provides information to assist operators in monitoring the 3GPP R12 GTP-C Load and Overload Control feature.
3GPP R12 GTP-C Load and Overload Show Commands

This section provides information regarding show commands in support of the 3GPP R12 Load and Overload Control feature.

**show egtpc statistics egtp-service <egtp-service name>**

The output of this command provides detailed granular statistics for 3GPP R12 load and overload control profile statistics that have been transmitted (TX) and received (RX). Statistics are provided on a per egtp-service basis.

**show gtpc-load-control-profile full all**

The output of this command provides all configuration settings for all 3GPP R12 load control profiles configured on the node. Use this command to determine if the load control profile is configured as intended.

**show gtpc-load-control-profile full name <name>**

Use this command to view all configuration settings for the specified 3GPP R12 load control profile.

**show gtpc-overload-control-profile full all**

The output of this command provides all configuration settings for all 3GPP R12 overload control profiles configured on the node. Use this command to determine if the overload control profile is configured as intended.

**show gtpc-overload-control full name <name>**

The output of this command provides all configuration settings for all 3GPP R12 Overload Control Profiles configured on the node. Use this command to determine if the Overload Control Profile is configured as intended.

**show pgw-service all**

Use this command to obtain the names of all 3GPP R12 load control and 3GPP R12 overload control profiles configured on the P-GW.

**show sgw-service all**

Use this command to obtain the names of all 3GPP R12 Load Control and Overload Control profiles configured on the S-GW.

**eGTP-C Bulk Statistics**

The following statistics are included in the eGTP-C Schema in support of the 3GPP R12 Load and Overload Control feature:

- **load-overload-own-lci**
- **load-overload-own-oci**
- **load-overload-num-msg-throttled**
- **load-overload-num-ovrload-cond-reached**

For descriptions of these variables, see "eGTP Schema Statistics" in the *Statistics and Counters Reference*.
Gx Interface Support

This chapter provides information on configuring Gx interface to support policy and charging control for subscribers.

The IMS service provides application support for transport of voice, video, and data independent of access support. Roaming IMS subscribers require apart from other functionality sufficient, uninterrupted, consistent, and seamless user experience during an application session. It is also important that a subscriber gets charged only for the resources consumed by the particular IMS application used.

It is recommended that before using the procedures in this chapter you select the configuration example that best meets your service model, and configure the required elements for that model as described in this Administration Guide.

The following topics are covered in this chapter:

- Rel. 7 Gx Interface, on page 499
- Rel. 8 Gx Interface, on page 526
- Rel. 9 Gx Interface, on page 549
- Rel. 10 Gx Interface, on page 557
- Supported Gx Features, on page 566

Rel. 7 Gx Interface

Rel. 7 Gx interface support is available on the Cisco ASR chassis running StarOS 8.1 or StarOS 9.0 and later releases for the following products:

- GGSN
- IPSG

This section describes the following topics:

- Introduction, on page 500
- Terminology and Definitions, on page 502
- How Rel. 7 Gx Works, on page 517
- Configuring Rel. 7 Gx Interface, on page 521
- Gathering Statistics, on page 526
Introduction

For IMS deployment in GPRS/UMTS networks the system uses Rel. 7 Gx interface for policy-based admission control support and flow-based charging. The Rel. 7 Gx interface supports enforcing policy control features like gating, bandwidth limiting, and so on, and also supports flow-based charging. This is accomplished via dynamically provisioned Policy Control and Charging (PCC) rules. These PCC rules are used to identify Service Data Flows (SDF) and do charging. Other parameters associated with the rules are used to enforce policy control.

The PCC architecture allows operators to perform service-based QoS policy, and flow-based charging control. In the PCC architecture, this is accomplished mainly by the Policy and Charging Enforcement Function (PCEF)/Cisco Systems GGSN and the Policy and Charging Rules Function (PCRF).

In GPRS/UMTS networks, the client functionality lies with the GGSN, therefore in the IMS authorization scenario it is also called the Gateway. In the following figure, Gateway is the Cisco Systems GGSN, and the PCEF function is provided by Enhanced Charging Service (ECS). The Rel 7. Gx interface is implemented as a Diameter connection. The Gx messages mostly involve installing/modifying/removing dynamic rules and activating/deactivating predefined rules.

The Rel. 7 Gx reference point is located between the Gateway and the PCRF. This reference point is used for provisioning and removal of PCC rules from the PCRF to the Gateway, and the transmission of traffic plane events from the Gateway to the PCRF. The Gx reference point can be used for charging control, policy control, or both by applying AVPs relevant to the application. The following figure shows the reference points between various elements involved in the policy and charging architecture.
Within the Gateway, the IMSA and DPCA modules handle the Gx protocol related functions (at the SessMgr) and the policy enforcement and charging happens at ECS. The Gy protocol related functions are handled within the DCCA module (at the ECS). The following figure shows the interaction between components within the Gateway.
Supported Networks and Platforms

This feature is supported on all chassis with StarOS Release 8.1 and later running GGSN service for the core network services.

License Requirements

The Rel. 7 Gx interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Supported Standards

The Rel 7. Gx interface support is based on the following standards and RFCs:

- 3GPP TS 29.213 V7.4.0 (2008-03): 3rd Generation Partnership Project; Technical Specification Group Core Network and Terminals; Policy and Charging Control signalling flows and QoS parameter mapping; (Release 7)
- RFC 3588, Diameter Base Protocol; September 2003
- RFC 4006, Diameter Credit-Control Application; August 2005

Terminology and Definitions

This section describes features and terminology pertaining to Rel. 7 Gx functionality.
Policy Control

The process whereby the PCRF indicates to the PCEF how to control the IP-CAN bearer.

Policy control comprises the following functions:

• **Binding**: Binding is the generation of an association between a Service Data Flow (SDF) and the IP CAN bearer (for GPRS a PDP context) transporting that SDF.

The QoS demand in the PCC rule, as well as the SDF template are input for the bearer binding. The selected bearer will have the same QoS Class as the one indicated by the PCC rule.

Depending on the type of IP-CAN and bearer control mode, bearer binding can be executed either by the PCRF, or both PCRF and PCEF.

• For UE-only IP-CAN bearer establishment mode, the PCRF performs bearer binding. When the PCRF performs bearer binding, it indicates the bearer (PDP context) by means of Bearer ID. The Bearer ID uniquely identifies the bearer within the PDP session.

• For UE/NW IP-CAN bearer establishment mode, the PCRF performs the binding of the PCC rules for user controlled services, while the PCEF performs the binding of the PCC rules for the network-controlled services.

Prior to Release 16.0, the rule binding was getting rejected. In 16.0 and later releases, the binding of PCEF rules will be successful when BCM mode is set to UE-only for EPS IP-CAN bearer without "bearer-ID" in the PCRF messages such as RAR or CCA-U.

In the 3G to 4G handover scenario, rule binding and rule removal will be successful in UE-only mode and any filter (and related info) changes because of this modification/installation/removal will not be notified to UE as updates in UE only mode cannot be sent to UE. These rules are only considered for charging and the expectation is that the same rules are again modified in 4G (if handover is done) so that the filters (and related info) can be notified to UE.

In releases prior to 18, P-GW/GGSN does not send CCR-U with Charging Rule report for rule binding failure occurred during 4G to 3G HO in a collision case where create/update bearer response in 3G/4G is pending and update bearer of 3G HO is received. In 18 and later releases, CCR-U is generated and sent to PCRF for reporting rule failure when the collision happens during GnGp HO scenario.

This additional Gx message (CCR-U) triggered will require multiple CCR-Us to be configured when RAT_TYPE trigger is enabled. Otherwise, the subscriber call will be dropped whenever the collision happens during HO.

• **Gating Control**: Gating control is the blocking or allowing of packets, belonging to an SDF, to pass through to the desired endpoint. A gate is described within a PCC rule and gating control is applied on a per SDF basis. The commands to open or close the gate leads to the enabling or disabling of the passage for corresponding IP packets. If the gate is closed, all packets of the related IP flows are dropped. If the gate is opened, the packets of the related IP flows are allowed to be forwarded.

• **Event Reporting**: Event reporting is the notification of and reaction to application events to trigger new behavior in the user plane as well as the reporting of events related to the resources in the Gateway (PCEF).

  • Event triggers may be used to determine which IP-CAN session modification or specific event causes the PCEF to re-request PCC rules. Although event trigger reporting from PCEF to PCRF can apply for an IP CAN session or bearer depending on the particular event, provisioning of event triggers will be done at session level.
Note that in 11.0 and later releases, RAR with unknown event triggers are silently ignored and responded with DIAMETER_SUCCESS. In earlier releases, when unknown event triggers were received in the RAR command from PCRF, invalid AVP result code was set in the RAA command.

- The Event Reporting Function (ERF) receives event triggers from PCRF during the Provision of PCC Rules procedure and performs event trigger detection. When an event matching the received event trigger occurs, the ERF reports the occurred event to the PCRF. If the provided event triggers are associated with certain parameter values then the ERF includes those values in the response back to the PCRF. The Event Reporting Function is located in the PCEF.

In StarOS releases prior to 14.0, SUCCESSFULRESOURCE_ALLOCATION (22) event trigger was sent for rules irrespective of successful installation. In 14.0 and later releases, SUCCESSFULRESOURCE_ALLOCATION (22) event trigger will be sent under the following conditions:

- When a rule is installed successfully (and the event trigger is armed by PCRF and resource-allocation-notification is enabled).
- On partial failure, i.e., when two or more rules are installed and at least one of the rules were successfully installed. (and the event trigger is armed by PCRF and resource-allocation-notification is enabled).

On complete failure, i.e., none of the rules were installed, the event-trigger SUCCESSFULRESOURCE_ALLOCATION (22) will not be sent.

**Important**

In this release, event triggers "IP-CAN_CHANGE" and "MAX_NR_BEARERS_REACHED" are not supported.

- **QoS Control**: QoS control is the authorization and enforcement of the maximum QoS that is authorized for a SDF or an IP-CAN bearer or a QoS Class Identifier (QCI). In case of an aggregation of multiple SDFs (for GPRS a PDP context), the combination of the authorized QoS information of the individual SDFs is provided as the authorized QoS for this aggregate.

- QoS control per SDF allows the PCC architecture to provide the PCEF with the authorized QoS to be enforced for each specific SDF.

- The enforcement of the authorized QoS of the IP-CAN bearer may lead to a downgrading or upgrading of the requested bearer QoS by the Gateway (PCEF) as part of a UE-initiated IP-CAN bearer establishment or modification. Alternatively, the enforcement of the authorized QoS may, depending on operator policy and network capabilities, lead to network-initiated IP-CAN bearer establishment or modification. If the PCRF provides authorized QoS for both, the IP-CAN bearer and PCC rule(s), the enforcement of authorized QoS of the individual PCC rules takes place first.

- QoS authorization information may be dynamically provisioned by the PCRF, or it can be a predefined PCC rule in the PCEF. In case the PCRF provides PCC rules dynamically, authorized QoS information for the IP-CAN bearer (combined QoS) may be provided. For a predefined PCC rule within the PCEF, the authorized QoS information takes effect when the PCC rule is activated. The PCEF combines the different sets of authorized QoS information, that is the information received from the PCRF and the information corresponding to the predefined PCC rules. The PCRF knows the authorized QoS information of the predefined PCC rules and takes this information into account when activating them. This ensures that the combined authorized QoS of a set of PCC rules that are
activated by the PCRF is within the limitations given by the subscription and operator policies regardless of whether these PCC rules are dynamically provided, predefined, or both.

**Important**
In this release, QoS Resource Reservation is not supported.

Supported Features:

- Provisioning and Policy Enforcement of Authorized QoS: The PCRF may provide authorized QoS to the PCEF. The authorized QoS provides appropriate values for resources to be enforced.

- Provisioning of "Authorized QoS" Per IP CAN Bearer: The authorized QoS per IP-CAN bearer is used if the bearer binding is performed by the PCRF.

- Policy Enforcement for "Authorized QoS" per IP CAN Bearer: The PCEF is responsible for enforcing the policy-based authorization, that is to ensure that the requested QoS is in-line with the "Authorized QoS" per IP CAN Bearer.

- Policy Provisioning for Authorized QoS Per SDF: The provisioning of authorized QoS per SDF is a part of PCC rule provisioning procedure.
  - Policy Enforcement for Authorized QoS Per SDF: If an authorized QoS is defined for a PCC rule, the PCEF limits the data rate of the SDF corresponding to that PCC rule not to exceed the maximum authorized bandwidth for the PCC rule by discarding packets exceeding the limit.
  - Upon deactivation or removal of a PCC rule, the PCEF frees the resources reserved for that PCC rule. If the PCRF provides authorized QoS for both the IP-CAN bearer and PCC rule(s), the enforcement of authorized QoS of the individual PCC rules takes place first.

**Important**
In this release, coordination of authorized QoS scopes in mixed mode (BCM = UE_NW) is not supported.

- Provisioning of Authorized QoS Per QCI: If the PCEF performs the bearer binding, the PCRF may provision an authorized QoS per QCI for non-GBR bearer QCI values. If the PCRF performs the bearer binding the PCRF does not provision an authorized QoS per QCI. The PCRF does not provision an authorized QoS per QCI for GBR bearer QCI values.

**Important**
Only standards-based QCI values of 1 through 9 are supported. QCI values 1 through 9 are defined in 3GPP Specification TS 23.203 "Policy and charging control architecture".

- Policy Enforcement for Authorized QoS per QCI: The PCEF can receive an authorized QoS per QCI for non GBR-bearer QCI values.

- Other Features:
  - Bearer Control Mode Selection: The PCEF may indicate, via the Gx reference point, a request for Bearer Control Mode (BCM) selection at IP-CAN session establishment or IP-CAN session
modification (as a consequence of an SGSN change). It will be done using the "PCC Rule Request" procedure.

If the Bearer-Control-Mode AVP is not received from PCRF, the IP-CAN session is not terminated. The value negotiated between UE/SGSN/GGSN is considered as the BCM. The following values are considered for each of the service types:

• GGSN: The negotiated value between UE/SGSN/GGSN is considered.

In the following scenarios UE_ONLY is chosen as the BCM:

Scenario 1:
• UE-> UE_ONLY
• SGSN-> UE_ONLY
• GGSN-> UE_ONLY
• PCRF-> NO BCM

Scenario 2:
• UE-> UE_ONLY
• SGSN-> UE_ONLY
• GGSN-> Mixed
• PCRF-> NO BCM

• GTP-PGW: BCM of UE_NW is considered.
• IPSG: BCM of UE_ONLY is considered.
• HSGW/SGW/PDIF/FA/PDSN/HA/MIPV6HA: BCM of NONE is considered.

• PCC Rule Error Handling: If the installation/activation of one or more PCC rules fails, the PCEF includes one or more Charging-Rule-Report AVP(s) in either a CCR or an RAA command for the affected PCC rules. Within each Charging-Rule-Report AVP, the PCEF identifies the failed PCC rule(s) by including the Charging-Rule-Name AVP(s) or Charging-Rule-Base-Name AVP(s), identifies the failed reason code by including a Rule-Failure-Code AVP, and includes the PCC-Rule-Status AVP.

If the installation/activation of one or more new PCC rules (that is, rules that were not previously successfully installed) fails, the PCEF sets the PCC-Rule-Status to INACTIVE for both the PUSH and the PULL modes.

If a PCC rule was successfully installed/activated, but can no longer be enforced by the PCEF, the PCEF sends the PCRF a new CCR command and include a Charging-Rule-Report AVP. The PCEF includes the Rule-Failure-Code AVP within the Charging-Rule-Report AVP and sets the PCC-Rule-Status to INACTIVE.

In releases prior to 18, P-GW/GGSN does not send CCR-U with Charging Rule report for rule binding failure occurred during 4G to 3G HO in a collision case where create/update bearer response in 3G/4G is pending and update bearer of 3G HO is received. In 18 and later releases, CCR-U is generated and sent to PCRF for reporting rule failure when the collision happens during GnGp HO scenario.
This additional Gx message (CCR-U) triggered will require multiple CCR-Us to be configured when RAT_TYPE trigger is enabled. Otherwise, the subscriber call will be dropped whenever the collision happens during HO.

- Time of the Day Procedures: PCEF performs PCC rule request as instructed by the PCRF. Revalidation-Time when set by the PCRF, causes the PCEF to trigger a PCRF interaction to request PCC rules from the PCRF for an established IP CAN session. The PCEF stops the timer once the PCEF triggers a REVALIDATION_TIMEOUT event.

---

**Important**

In 11.0 and later releases, Rule-Activation-Time / Rule-Deactivation-Time / Revalidation-Time AVP is successfully parsed only if its value corresponds to current time or a later time than the current IPSG time, else the AVP and entire message is rejected. In earlier releases the AVP is successfully parsed only if its value corresponds to a later time than the current IPSG time, else the AVP and entire message is rejected.

In releases prior to 17.0, if "Rule-Deactivation-Time" AVP for a predefined rule was omitted in a CCA-U or RAR message, then any previous value for this AVP was continued to be used in the chassis. In 17.0 and later releases, if Rule-Deactivation-Time AVP is omitted in CCA/RAR, then any previous value for this AVP is no longer valid. The new behavior is compliant to the 3GPP specification for Gx, version 12.1.0.

If PCRF enables the same predefined rule again in RAR/CCA-U without Rule-Deactivation-Time AVP, then the deactivation-time for this rule, if any, will be removed.

For switching to the old behavior, PCRF should re-send the same value of Rule-Deactivation-Time AVP along with predef-rule name in the PCRF message (RAR, CCA-U).

---

**Important**

This behavior change is applicable only to predefined rules.

Support for Firewall Policy on Gx: The Diameter AVP "SN-Firewall-Policy" has been added to the Diameter dynamic dictionary to support Firewall policy on Gx interface. This AVP can be encoded in CCA-I message to apply/overwrite the fw-and-nat policy that has either been statically assigned to the PDP context via APN configuration or dynamically assigned via RADIUS in Access-Accept. This AVP can also parsed in any CCA-U or RAR message to modify the fw-and-nat policy that is currently assigned to the PDP context.

---

**Charging Control**

Charging Control is the process of associating packets belonging to a SDF to a charging key, and applying online charging and/or offline charging, as appropriate. Flow-based charging handles differentiated charging of the bearer usage based on real time analysis of the SDFs. In order to allow for charging control, the information in the PCC rule identifies the SDF and specifies the parameters for charging control. The PCC rule information may depend on subscription data.

In the case of online charging, it is possible to apply an online charging action upon PCEF events (for example, re-authorization upon QoS change).

It is possible to indicate to the PCEF that interactions with the charging systems are not required for a PCC rule, that is to perform neither accounting nor credit control for this SDF, and then no offline charging information is generated.

Supported Features:
• Provisioning of Charging-related Information for the IP-CAN Session.

• Provisioning of Charging Addresses: Primary or secondary event charging function name (Online Charging Server (OCS) addresses or the peer names).

---

Important

In this release, provisioning of primary or secondary charging collection function name (Offline Charging Server (OFCS) addresses) over Gx is not supported.

• Provisioning of Default Charging Method: In this release, the default charging method is sent in CCR-I message. For this, new AVPs Online/Offline are sent in CCR-I message based on the configuration. The Online/Offline AVP received at command level applies only to dynamic rules if they are not configured at PCC rule level.

Charging Correlation

For the purpose of charging correlation between SDF level and application level (for example, IMS) as well as on-line charging support at the application level, applicable charging identifiers and IP-CAN type identifiers are passed from the PCRF to the AF, if such identifiers are available.

For IMS bearer charging, the IP Multimedia Core Network (IM CN) subsystem and the Packet Switched (PS) domain entities are required to generate correlated charging data.

In order to achieve this, the Gateway provides the GGSN Charging Identifier (GCID) associated with the PDP context along with its address to the PCRF. The PCRF in turn sends the IMS Charging Identifier (ICID), which is provided by the P-CSCF, to the Gateway. The Gateway generates the charging records including the GCID as well as the ICID if received from PCRF, so that the correlation of charging data can be done with the billing system.

PCRF also provides the flow identifier, which uniquely identifies an IP flow in an IMS session.

Policy and Charging Control (PCC) Rules

A PCC rule enables the detection of an SDF and provides parameters for policy control and/or charging control. The purpose of the PCC rule is to:

• Detect a packet belonging to an SDF.
  • Select downlink IP CAN bearers based on SDF filters in the PCC rule.
  • Enforce uplink IP flows are transported in the correct IP CAN bearer using the SDF filters within the PCC rule.

• Identify the service that the SDF contributes to.

• Provide applicable charging parameters for an SDF.

• Provide policy control for an SDF.

The PCEF selects a PCC rule for each packet received by evaluating received packets against SDF filters of PCC rules in the order of precedence of the PCC rules. When a packet matches a SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied.

There are two types of PCC rules:
• **Dynamic PCC Rules**: Rules dynamically provisioned by the PCRF to the PCEF via the Gx interface. These PCC rules may be either predefined or dynamically generated in the PCRF. Dynamic PCC rules can be installed, modified, and removed at any time.

• **Predefined PCC Rule**: Rules preconfigured in the PCEF by the operators. Predefined PCC rules can be activated or deactivated by the PCRF at any time. Predefined PCC rules within the PCEF may be grouped allowing the PCRF to dynamically activate a set of PCC rules over the Gx reference point.

A third type of rule, the static PCC rule can be preconfigured in the chassis by the operators. Static PCC rules are not explicitly known in the PCRF, and are not under control of the PCRF. Static PCC rules are bound to general purpose bearer with no Gx control.

A PCC rule consists of:

• **Rule Name**: The rule name is used to reference a PCC rule in the communication between the PCEF and PCRF.

• **Service Identifier**: The service identifier is used to identify the service or the service component the SDF relates to.

• **Service Data Flow Filter(s)**: The service flow filter(s) is used to select the traffic for which the rule applies.

• **Precedence**: For different PCC rules with overlapping SDF filter, the precedence of the rule determines which of these rules is applicable. When a dynamic PCC rule and a predefined PCC rule have the same priority, the dynamic PCC rule takes precedence.

• **Gate Status**: The gate status indicates whether the SDF, detected by the SDF filter(s), may pass (gate is open) or will be discarded (gate is closed) in uplink and/or in downlink direction.

• **QoS Parameters**: The QoS information includes the QoS class identifier (authorized QoS class for the SDF), the Allocation and Retention Priority (ARP), and authorized bitrates for uplink and downlink.

In earlier releases, ECS used only the Priority-Level part of ARP byte for bearer binding, (along with QCI). Now the entire ARP byte is used for bearer binding (along with QCI). Since the capability and vulnerability bits are optional in a dynamic rule, if a dynamic rule is received without these flags, it is assumed that the capability bit is set to 1 (disabled) and vulnerability bit is set to 0 (enabled). For predefined rules, currently configuring these two flags is not supported, so as of now all predefined rules are assumed to have capability bit set to 1 (disabled) and vulnerability bit set to 0 (enabled).

• **Charging key** (rating group)

• **Other charging parameters**: The charging parameters define whether online and offline charging interfaces are used, what is to be metered in offline charging, on what level the PCEF will report the usage related to the rule, and so on.
In this release, configuring the Metering Method and Reporting Level for dynamic PCC rules is not supported.

PCC rules also include Application Function (AF) record information for enabling charging correlation between the application and bearer layer if the AF has provided this information via the Rx interface. For IMS, this includes the IMS Charging Identifier (ICID) and flow identifiers.

Important

ASR 5500 supports only eight flow information including the flow description per dynamic charging rule in a Gx message.

In releases prior to 14.0, there were only 10 PCC rules that were recovered per bearer in the event of a session manager crash. In 14.0 and later releases, this limit has been increased to 24. That is, up to 24 PCC rules can be recovered post ICSR.

With the increase in the limit of PCC rules that can be recovered, the rules are not lost and hence the charging applied to the end users are not impacted.

In releases prior to 17.0, when P-GW received PCC rules from PCRF and it results in Create Bearer or Update Bearer to be triggered towards MME/S-GW, the PCC rules were kept in a pending-active state. Any modification request that was received for these pending-active rules were not currently honored by the P-GW. In 17.0 and later releases, when modification for the PCC rules in pending-active state is received, the modified parameters will be buffered at P-GW. After the response for the pending request is received from the access network, P-GW will process the modification of the buffered parameters and if required generate another update towards network.

PCC Procedures over Gx Reference Point

Request for PCC Rules

The PCF, via the Gx reference point, requests for PCC rules in the following instances:

• At IP-CAN session establishment
• At IP-CAN session modification

PCC rules can also be requested as a consequence of a failure in the PCC rule installation/activation or enforcement without requiring an event trigger.

Provisioning of PCC Rules

The PCRF indicates, via the Rel. 8 Gx reference point, the PCC rules to be applied at the PCEF. This may be using one of the following procedures:

• PULL (provisioning solicited by the PCEF): In response to a request for PCC rules being made by the PCEF, the PCRF provisions PCC rules in the CC-Answer.
• PUSH (unsolicited provisioning): The PCRF may decide to provision PCC rules without obtaining a request from the PCEF. For example, in response to information provided to the PCRF via the Rx reference point, or in response to an internal trigger within the PCRF. To provision PCC rules without a request from the PCEF, the PCRF includes these PCC rules in an RA-Request message. No CCR/CCA messages are triggered by this RA-Request.
For each request from the PCEF or upon unsolicited provisioning, the PCRF provisions zero or more PCC rules. The PCRF may perform an operation on a single PCC rule by one of the following means:

- To activate or deactivate a PCC rule that is predefined at the PCEF, the PCRF provisions a reference to this PCC rule within a Charging-Rule-Name AVP and indicates the required action by choosing either the Charging-Rule-Install AVP or the Charging-Rule-Remove AVP.

- To install or modify a PCRF-provisioned PCC rule, the PCRF provisions a corresponding Charging-Rule-Definition AVP within a Charging-Rule-Install AVP.

- To remove a PCC rule which has previously been provisioned by the PCRF, the PCRF provisions the name of this rule as value of a Charging-Rule-Name AVP within a Charging-Rule-Remove AVP.

---

**Important**

In 11.0 and later releases, the maximum valid length for a charging rule name is 63 bytes. When the length of the charging rule name is greater than 63 bytes, a charging rule report with RESOURCES_LIMITATION as Rule-Failure-Code is sent. This charging rule report is sent only when the length of the rule name is lesser than 128 characters. When the charging rule name length is greater than or equal to 128 characters no charging rule report will be sent. In earlier releases, the length of the charging rule name constructed by PCRF was limited to 32 bytes.

Releases prior to 14.0, when PCRF has subscribed to Out of Credit trigger, on session connect when one rule validation fails and also when an Out of Credit was received from OCS for another rule, P-GW was trying to report these failures in different CCR-U to PCRF. However, the second CCR-U of Out of credit was getting dropped internally.

In 14.0 and later releases, on session connect, P-GW combines the rule failure and out of credit in the same CCR-U and sends to PCRF.

### Selecting a PCC Rule for Uplink IP Packets

If PCC is enabled, the PCEF selects the applicable PCC rule for each received uplink IP packet within an IP CAN bearer by evaluating the packet against uplink SDF filters of PCRF-provided or predefined active PCC rules of this IP CAN bearer in the order of the precedence of the PCC rules.

---

**Important**

When a PCRF-provided PCC rule and a predefined PCC rule have the same precedence, the uplink SDF filters of the PCRF-provided PCC rule is applied first.

---

**Important**

In 11.0 and later releases, IMSA and ECS allow the PCRF to install two (or more) dynamic rules with the same precedence value. In earlier releases, for two distinct dynamic rules having the same precedence the second rule used to be rejected.

When a packet matches an SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied. Uplink IP packets which do not match any PCC rule of the corresponding IP CAN bearer are discarded.
Selecting a PCC Rule and IP CAN Bearer for Downlink IP Packets

If PCC is enabled, the PCEF selects a PCC rule for each received downlink IP packet within an IP CAN session by evaluating the packet against downlink SDF filters of PCRF-provided or predefined active PCC rules of all IP CAN bearers of the IP CAN session in the order of the precedence of the PCC rules.

When a PCRF-provided PCC rule and a predefined PCC rule have the same precedence, the downlink SDF filters of the PCRF-provided PCC rule are applied first.

When a packet matches a SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied. The Downlink IP Packet is transported within the IP CAN bearer where the selected PCC rule is mapped. Downlink IP packets that do not match any PCC rule of the IP CAN session are discarded.

The following procedures are also supported:

- Indication of IP-CAN Bearer Termination Implications
- Indication of IP-CAN Session Termination: When the IP-CAN session is being terminated (for example, for GPRS when the last PDP Context within the IP-CAN session is being terminated) the PCEF contacts the PCRF.
- Request of IP-CAN Bearer Termination: If the termination of the last IP CAN bearer within an IP CAN session is requested, the PCRF and PCEF apply the "Request of IP-CAN Session Termination" procedure.
- Request of IP-CAN Session Termination: If the PCRF decides to terminate an IP CAN session due to an internal trigger or trigger from the SPR, the PCRF informs the PCEF. The PCEF acknowledges to the PCRF and instantly removes/deactivates all the PCC rules that have been previously installed or activated on that IP-CAN session.

The PCEF applies IP CAN specific procedures to terminate the IP CAN session. For GPRS, the GGSN send a PDP context deactivation request with the teardown indicator set to indicate that the termination of the entire IP-CAN session is requested. Furthermore, the PCEF applies the "Indication of IP CAN Session Termination" procedure.

In 12.0 and later releases, volume or rule information obtained from PCRF is discarded if the subscriber is going down.

Volume Reporting Over Gx

This section describes the 3GPP Rel. 9 Volume Reporting over Gx feature, which is supported by all products supporting Rel. 7 Gx interface.

License Requirements

The Volume Reporting over Gx is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

In 12.0 and later releases, no separate license is required for Charging over Gx / Volume Reporting over Gx feature. This feature can be enabled as part of "Policy Interface" license.
Supported Standards

The Volume Reporting over Gx feature is based on the following standard:

Feature Overview

The Volume Reporting over Gx feature provides PCRF the capability to make real-time decisions based on the data usage by subscribers.

Important

Volume Reporting over Gx is applicable only for volume quota.

In release 10.0, only total data usage reporting is supported, uplink/downlink level reporting is not supported. In 10.2 and later releases, it is supported.

The PCEF only reports the accumulated usage since the last report for usage monitoring and not from the beginning.

If the usage threshold is set to zero (infinite threshold), no further threshold events will be generated by PCEF, but monitoring of usage will continue and be reported at the end of the session.

In 12.2 and later releases, usage reporting on bearer termination is supported.

The following steps explain how Volume Reporting over Gx works:

1. PCEF after receiving the message from PCRF parses the usage monitoring related AVPs, and sends the information to IMSA.

2. IMSA updates the information to ECS.

3. Once the ECS is updated with the usage monitoring information from PCRF, the PCEF (ECS) starts tracking the data usage.

4. For session-level monitoring, the ECS maintains the amount of data usage.

5. For PCC rule monitoring, usage is monitored with the monitoring key as the unique identifier. Each node maintains the usage information per monitoring key. When the data traffic is passed, the usage is checked against the usage threshold values and reported as described in the Usage Reporting section.

6. The PCEF continues to track data usage after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session.

Usage Monitoring

- Usage Monitoring at Session Level: PCRF subscribes to the session-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to SESSION_LEVEL(0). After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. In 11.0 and later releases, Monitoring Key at session level is supported.
In 12.0 and later releases, enabling and disabling session usage in a single message from PCRF is supported. This is supported only if the monitoring key is associated at session level.

In 12.0 and later releases, monitoring of usage based on input/output octet threshold levels is supported. Usage is reported based on the enabled threshold level. If multiple levels are enabled, usage will be reported on all the enabled levels even if only one of the levels is breached. Monitoring will be stopped on the missing threshold levels in the response for the usage report from PCRF (expected to provide the complete set again if PCRF wants to continue monitoring on the multiple levels enabled earlier).

Total threshold level along with UL/DL threshold level in the GSU AVP is treated as an error and only total threshold level is accepted.

In releases prior to 17.0, extra CCR-U was generated for a monitoring key when the following requests are received in the response to the CCR-U which reported the usage for the same monitoring key.

- immediate reporting request with monitoring key at rule level
- immediate reporting request with or without monitoring key at session level
- explicit disable request at rule level
- explicit disable request at session level

In 17.0 and later releases, extra CCR-U is not generated for a monitoring key when all the above mentioned requests are received in the response to the CCR-U which reported the usage for the same monitoring key. Also, extra CCR-U is not generated when immediate reporting request without monitoring key at rule level is received in the response to the CCR-U which reported the usage for all the active monitoring keys.

- Usage Monitoring at Flow Level: PCRF subscribes to the flow-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to PCC_RULE_LEVEL(1). Monitoring Key is mandatory in case of a flow-level monitoring since the rules are associated with the monitoring key and enabling/disabling of usage monitoring at flow level can be controlled by PCRF using it. After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

Usage monitoring is supported for static, predefined rules, and dynamic rule definitions.

- Usage Monitoring for Static Rules: In the case of static rules, the usage reporting on last rule removal associated with the monitoring key is not applicable. In this case only the usage monitoring information is received from the PCRF.

- Usage Monitoring for Predefined Rules: If the usage monitoring needs to be enabled for the predefined rules, PCRF sends the rule and the usage monitoring information containing the monitoring key and the usage threshold. The Monitoring key should be the same as the one pre-configured in PCEF for that predefined rule. There can be multiple rules associated with the same monitoring key. Hence enabling a particular monitoring key would result in the data being tracked for multiple rules having the same monitoring key. After DPCA parses the AVPs IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

- Usage Monitoring for Dynamic Rules: If the usage monitoring needs to be enabled for dynamic ruledefs, PCRF provides the monitoring key along with a charging rule definition and the usage monitoring information containing the monitoring key and the usage threshold. This would result in the usage monitoring being done for all the rules associated with that monitoring key. After DPCA parses the AVPs, IMSA updates the information to ECS. Once ECS is updated, the usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.
Monitoring key for dynamic rules defined is dynamically assigned by PCRF which is the only difference with predefined rules in case of usage monitoring.

In releases prior to 15.0, when threshold breach happens for multiple monitoring keys at the same time, only one of the monitoring keys' usage is reported and the rest of the monitoring keys' usage is reported in CCR-T (threshold set to infinity). On Tx expiry/TCP link error, unreported usage is stored at ECS and reported only on session termination.

In 15.0 and later releases, only one of the monitoring keys' usage is reported first. Upon receiving successful response from PCRF, the rest of the monitoring keys' usage is reported to PCRF. On Tx expiry/TCP link error, unreported usage is stored at ECS. Any future successful interaction with PCRF for the session will send unreported UMI to PCRF.

Usage Reporting

Usage at subscriber/flow level is reported to PCRF under the following conditions:

- **Usage Threshold Reached**: PCEF records the subscriber data usage and checks if the usage threshold provided by PCRF is reached. This is done for both session and rule level reporting.
  
  For session-level reporting, the actual usage volume is compared with the usage volume threshold.
  
  For rule-level reporting the rule that hits the data traffic is used to find out if the monitoring key is associated with it, and based on the monitoring key the data usage is checked. Once the condition is met, it reports the usage information to IMSA and continues monitoring. IMSA then triggers the CCR-U if "USAGE_REPORT" trigger is enabled by the PCRF. The Usage-Monitoring-Information AVP is sent in this CCR with the "Used-Service-Unit" set to the amount of data usage by subscriber.
  
  If PCRF does not provide a new usage threshold in the usage monitoring information as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no usage status is reported.
  
  In the non-standard Volume Reporting over Gx implementation, usage monitoring will be stopped once the threshold is breached, else the monitoring will continue. There will be no further usage reporting until the CCA is received.

- **Usage Monitoring Disabled**: If the PCRF explicitly disables the usage monitoring with Usage-Monitoring-Support AVP set to USAGE_MONITORING_DISABLED, the PCEF stops monitoring and reports the usage information (when the monitoring was enabled) to PCRF if the usage monitoring is disabled by PCRF as a result of CCR from PCEF which is not related to reporting usage, other external triggers, or a PCRF internal trigger. If the PCRF does not provide a new usage threshold as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no further usage status is reported.

- **IP CAN Session Termination**: When the IP CAN session is terminated, the accumulated subscriber usage information is reported to PCRF in the CCR-T from PCEF. If PCC usage level information is enabled by PCRF, the PCC usage will also be reported.

  PCRF uses RAR message and includes Session-Release-Cause AVP in it to initiate IP CAN Session Termination. However, there are some scenarios where PCRF may want to terminate the IP CAN Session in CCA messages. In order to avoid an unnecessary additional message, PCRF can inform P-GW to terminate the subscriber in CCA-U message itself. Hence, in 17.0 and later releases, the Session Release Cause has been added in CCA messages for all Gx dictionaries.

- **PCC Rule Removal**: When the PCRF deactivates the last PCC rule associated with a usage monitoring key, the PCEF sends a CCR with the data usage for that monitoring key. If the PCEF reports the last
PCC rule associated with a usage monitoring key is inactive, the PCEF reports the accumulated usage for that monitoring key within the same CCR command if the Charging-Rule-Report AVP was included in a CCR command; otherwise, if the Charging-Rule-Report AVP was included in an RAA command, the PCEF sends a new CCR command to report accumulated usage for the usage monitoring key. In 12.0 and later releases, usage reporting on last rule deactivation using rule deactivation time set by PCRF is supported.

Releases prior to 14.0, when PCC rule was tried to be removed while waiting for access side update bearer response, the charging rules were not removed. In 14.0 and later releases, on receiving message from PCRF, the rule that is meant for removal is marked and then after the access side procedure is complete the rule is removed.

- PCRF Requested Usage Report: In 10.2 and later releases, the accumulated usage since the last report is sent even in case of immediate reporting, the usage is reset after immediate reporting and usage monitoring continued so that the subsequent usage report will have the usage since the current report. In earlier releases the behavior was to accumulate the so far usage in the next report.

- Release 12.2 onwards, usage reporting on bearer termination can be added. When a bearer is deleted due to some reason, the rules associated with the bearer will also be removed. So, the usage will be reported on the monitoring key(s) whose associated rule is the last one that is removed because of bearer termination.

- Revalidation Timeout: In the non-standard implementation, if usage monitoring and reporting is enabled and a revalidation timeout occurs, the PCEF sends a CCR to request PCC rules and reports all accumulated usage for all enabled monitoring keys since the last report (or since usage reporting was enabled if the usage was not yet reported) with the accumulated usage at IP-CAN session level (if enabled) and at service data flow level (if enabled) This is the default behavior.

In the case of standard implementation, this must be enabled by CLI configuration.

---

**Important**

The Usage Reporting on Revalidation Timeout feature is available by default in non-standard implementation of Volume Reporting over Gx. In 10.2 and later releases, this is configurable in the standard implementation. This is not supported in 10.0 release for standard based volume reporting.

---

Once the usage is reported, the usage counter is reset to zero. The PCEF continues to track data usage from the zero value after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session and and the usage accumulated between the CCR-CCA will be discarded.

In releases prior to 17.0, CCR-U triggered on server retries does not take server granted quota into account for reporting USU. In 17.0 and later releases, CCR-U triggered on server retries takes server granted quota into account for reporting USU. For newly created MSCC, interim quota configuration is taken as reference for reporting USU.

For information on how to configure the Volume Reporting over Gx feature, see Configuring Volume Reporting over Gx, on page 525.

---

**ICSR Support for Volume Reporting over Gx (VoRoGx)**

In releases prior to 15.0, post the ICSR switchover, any existing session for which the PCRF has enabled volume reporting used to continue indefinitely until the session is terminated or until CCR-U is sent for a given trigger, without having the volume counted via Gx.
To summarize, after an ICSR switchover, volume reporting over Gx is no longer done for existing sessions. Also, volume usage is not synced to standby chassis.

In 15.0 and later releases, volume threshold and volume usage are synced to standby chassis to support volume reporting over Gx for existing sessions post switchover.

Without this support, it cannot cause a subscriber to use higher speeds than what s/he is supposed to get, if volume reporting is for example used to enforce fair usage; the operator may already consider this a revenue loss. It will also severely impact roaming subscribers who are supposed to get a notification and be blocked/redirected once the limits set by the EU roaming regulation are reached. If a session continues now without being blocked, the operator is not allowed to charge for data beyond the limit and will have a significant and real revenue loss (roaming partner may still charge for the data used on their SGSNs).

**How Rel. 7 Gx Works**

This section describes how dynamic policy and charging control for subscribers works with Rel. 7 Gx interface support in GPRS/UMTS networks.

The following figure and table explain the IMSA process between a system and IMS components that is initiated by the UE.

In this example, the Diameter Policy Control Application (DPCA) is the Gx interface to the PCRF. The interface between IMSA with PCRF is the Gx interface, and the interface between Session Manager (SessMgr) and Online Charging Service (OCS) is the Gy interface. Note that the IMSA service and DPCA are part of SessMgr on the system and separated in the figure for illustration purpose only.

---

**Important**

In 14.0 and later releases, the DPCA and the IMSA will be acting as one module within the Policy Server interface application.
Table 50: Rel. 7 Gx IMS Authorization Call flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>UE (IMS subscriber) requests for primary PDP context activation/creation.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>SessMgr allocates an IP address to the UE.</td>
</tr>
<tr>
<td>3</td>
<td>SessMgr requests IMS Authorization, if IMSA is enabled for the APN.</td>
</tr>
<tr>
<td>4</td>
<td>IMSA allocates resources for the IP CAN session and the bearer, and selects the PCRF to contact based on the user's selection key (for example, msisdn).</td>
</tr>
<tr>
<td>5</td>
<td>IMSA requests the DPCA module to issue an auth request to the PCRF.</td>
</tr>
<tr>
<td>6</td>
<td>DPCA sends a CCR initial message to the selected PCRF. This message includes the Context-Type AVP set to PRIMARY and the IP address allocated to the UE. The message may include the Bearer-Usage AVP set to GENERAL. The Bearer-Operation is set to Establishment. The Bearer ID is included if the PCRF does the bearer binding.</td>
</tr>
<tr>
<td>7</td>
<td>PCRF may send preconfigured charging rules in CCA, if a preconfigured rule set for general purpose PDP context is provided in PCRF. The dynamic rules and the authorized QoS parameters could also be included by the PCRF.</td>
</tr>
<tr>
<td>8</td>
<td>DPCA passes the charging rule definition, charging rule install, QoS information received from the PCRF, event triggers, and so on, along with the Bearer ID that corresponds to the rules received from the PCRF to IMSA. IMSA stores the information. If the Bearer ID is absent, and PCRF does the bearer binding, the rule is skipped. Whereas, if the Bearer ID is absent and the PCEF does the bearer binding, the rule is passed onto the ECS to perform bearer binding.</td>
</tr>
<tr>
<td>9</td>
<td>DPCA calls the callback function registered with it by IMSA.</td>
</tr>
<tr>
<td>10</td>
<td>IMSA stores the bearer authorized QoS information and notifies the SessMgr. Other PCRF provided information common to the entire PDP session (event trigger, primary/secondary OCS address, and so on) is stored within the IMSA. After processing the information, IMSA notifies the SessMgr about the policy authorization complete.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>11</td>
<td>If the validation of the rules fails in IMSA/DPCA, a failure is notified to PCRF containing the Charging-Rule-Report AVP. Else, IMSA initiates creation of ECS session. The APN name, primary/secondary OCS server address, and so on are sent to the ECS from the SessMgr.</td>
</tr>
<tr>
<td>12</td>
<td>ECS performs credit authorization by sending CCR(I) to OCS with CC-Request-Type set to INITIAL_REQUEST to open the credit control session. This request includes the active Rulebase-Id (default rulebase ID from the APN/AAA) and GPRS specific attributes (for example, APN, UMTS QoS, and so on).</td>
</tr>
<tr>
<td>13</td>
<td>OCS returns a CCA initial message that may activate a statically configured Rulebase and may include preemptive quotas.</td>
</tr>
<tr>
<td>14</td>
<td>ECS responds to SessMgr with the response message.</td>
</tr>
<tr>
<td>15</td>
<td>SessMgr requests IMSA for the dynamic rules.</td>
</tr>
<tr>
<td>16</td>
<td>IMSA sends the dynamic rules to SessMgr. Note that, in 14.0 and later releases, the RAR messages are allowed before the session is established. In earlier releases, until the primary PDP context is established, all RAR messages from the PCRF were rejected. Also note that, in 14.0 and later releases, the RAR message is rejected and RAA is sent with 3002 result code when the recovery of dynamic rule information and audit of Session Manager are in progress. Earlier, the RAR messages were processed by DPCA even when the recovery audit was in progress.</td>
</tr>
<tr>
<td>17</td>
<td>SessMgr sends the dynamic rule information to the ECS. The gate flow status information and the QoS per flow (charging rule) information are also sent in the message.</td>
</tr>
<tr>
<td>18</td>
<td>ECS activates the predefined rules received, and installs the dynamic rules received. Also, the gate flow status and the QoS parameters are updated by ECS as per the dynamic charging rules. The Gx rulebase is treated as an ECS group-of-rulesdefs. The response message contains the Charging Rule Report conveying the status of the rule provisioning at the ECS. ECS performs PCEF bearer binding for rules without bearer ID.</td>
</tr>
</tbody>
</table>
If the provisioning of rules fails partially, the context setup is accepted, and a new CCR-U is sent to the PCRF with the Charging-Rule-Report containing the PCC rule status for the failed rules. If the provisioning of rules fails completely, the context setup is rejected.

Depending on the response for the PDP Context Authorization, SessMgr sends the response to the UE and activates/rejects the call. If the Charging-Rule-Report contains partial failure for any of the rules, the PCRF is notified, and the call is activated. If the Charging-Rule-Report contains complete failure, the call is rejected.

Based on the PCEF bearer binding for the PCC rules at Step 18, the outcome could be one or more network-initiated PDP context procedures with the UE (Network Requested Update PDP Context (NRUPC) / Network Requested Secondary PDP Context Activation (NRSPCA)).

### Configuring Rel. 7 Gx Interface

To configure Rel. 7 Gx interface functionality, the IMS Authorization service must be configured at the context level, and then the APN configured to use the IMS Authorization service.

To configure Rel. 7 Gx interface functionality:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>19</td>
<td>If the provisioning of rules fails partially, the context setup is accepted, and a new CCR-U is sent to the PCRF with the Charging-Rule-Report containing the PCC rule status for the failed rules. If the provisioning of rules fails completely, the context setup is rejected.</td>
</tr>
<tr>
<td>20</td>
<td>Depending on the response for the PDP Context Authorization, SessMgr sends the response to the UE and activates/rejects the call. If the Charging-Rule-Report contains partial failure for any of the rules, the PCRF is notified, and the call is activated. If the Charging-Rule-Report contains complete failure, the call is rejected.</td>
</tr>
<tr>
<td>21</td>
<td>Based on the PCEF bearer binding for the PCC rules at Step 18, the outcome could be one or more network-initiated PDP context procedures with the UE (Network Requested Update PDP Context (NRUPC) / Network Requested Secondary PDP Context Activation (NRSPCA)).</td>
</tr>
</tbody>
</table>

**Step 1** Configure IMS Authorization service at the context level for IMS subscriber in GPRS/UMTS network as described in Configuring IMS Authorization Service at Context Level, on page 522.

**Step 2** Verify your configuration as described in Verifying the Configuration, on page 524.

**Step 3** Configure an APN within the same context to use the IMS Authorization service for IMS subscriber as described in Applying IMS Authorization Service to an APN, on page 524.

**Step 4** Verify your configuration as described in Verifying Subscriber Configuration, on page 525.

**Step 5** *Optional:* Configure the Volume Reporting over Gx feature as described in Configuring Volume Reporting over Gx, on page 525.

**Step 6** Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command **save configuration.** For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

**Important** Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.
Configuring IMS Authorization Service at Context Level

Use the following example to configure IMS Authorization service at context level for IMS subscribers in GPRS/UMTS networks:

```bash
configure
c    context <context_name>
        ims-auth-service <imsa_service_name>
        p-cscf discovery table { 1 | 2 } algorithm {
ip-address-modulus | msisdn-modulus | round-robin }
p-cscf table { 1 | 2 } row-precedence <precedence_value> {
address <ip_address> | ipv6-address <ipv6_address> } [ secondary { address
<ip_address> | ipv6-address <ipv6_address> } ]
policy-control
diameter origin endpoint <endpoint_name>
diameter dictionary <dictionary>
diameter request-timeout <timeout_duration>
diameter host-select table { { { 1 | 2 } algorithm {
ip-address-modulus | msisdn-modulus | round-robin } } | prefix-table { 1 | 2 } }
diameter host-select row-precedence <precedence_value>
table { { { 1 | 2 } host <host_name> [ realm <realm_id> ] [ secondary host
<host_name> [ realm <realm_id> ] ] } | { prefix-table { 1 | 2 } msisdn-prefix-from <msisdn_prefix_from> msisdn-prefix-to <msisdn_prefix_to> host
<host_name> [ realm <realm_id> ] [ secondary host <sec_host_name> [ realm <sec_real_id> ] algorithm { active-standby | round-robin } ] } } [-noconfirm]

diameter host-select reselect subscriber-limit
<subscriber_limit> time-interval <duration>
    failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } {
diameter-result-code { any-error | <result_code> [ to <end_result_code> ] } }
{ continue | retry-and-terminate | terminate }
end
```

Notes:

- `<context_name>` must be the name of the context where you want to enable IMS Authorization service.
- `<imsa_service_name>` must be the name of the IMS Authorization service to be configured for Rel. 7 Gx interface authentication.
- In releases prior to 18, a maximum of 16 authorization services can be configured globally in the system. There is also a system limit for the maximum number of total configured services. In 18 and later releases, up to a maximum of 30 IMS authorization service profiles can be configured within the system.
- Secondary P-CSCF IP address can be configured in the P-CSCF table. Refer to the Command Line Interface Reference for more information on the `p-cscf table` command.

In 18 and later releases, the syntax for `p-cscf table` configuration command is:

```bash
p-cscf table { 1 | 2 } row-precedence <precedence_value> {
ipv4-address ipv4_address [ ipv6-address ipv6_address ] | ipv6-address ipv6_address [ipv4-address ipv4_address ]} [ secondary {ipv4-address ipv4_address [ipv6-address ipv6_address ] }
```
To enable Rel. 7 Gx interface support, pertinent Diameter dictionary must be configured. For information on the specific Diameter dictionary to use, contact your Cisco account representative.

When configuring the MSISDN prefix range based PCRF selection mechanism:

To enable the Gx interface to connect to a specific PCRF for a range of subscribers configure `msisdn-prefix-from <msisdn_prefix_from>` and `msisdn-prefix-to <msisdn_prefix_to>` with the starting and ending MSISDNs respectively.

To enable the Gx interface to connect to a specific PCRF for a specific subscriber, configure both `msisdn-prefix-from <msisdn_prefix_from>` and `msisdn-prefix-to <msisdn_prefix_to>` with the same MSISDN.

In StarOS 8.1 and later releases, per MSISDN prefix range table a maximum of 128 rows can be added. In StarOS 8.0 and earlier releases, a maximum of 100 rows can be added.

The MSISDN ranges must not overlap between rows.

The Round Robin algorithm for PCRF selection is effective only over a large number of PCRF selections, and not at a granular level.

Optional: To configure the Quality of Service (QoS) update timeout for a subscriber, in the IMS Authorization Service Configuration Mode, enter the following command:

```
qos-update-timeout <timeout_duration>
```

**Important**  This command is obsolete in release 11.0 and later releases.

Optional: To configure signalling restrictions, in the IMS Authorization Service Configuration Mode, enter the following commands:

```
signaling-flag { deny | permit }

signaling-flow permit server-address <ip_address> [ server-port { <port_number> | range <start_number> to <end_number> } ] [ description <string> ]
```

Optional: To configure action on packets that do not match any policy gates in the general purpose PDP context, in the IMS Authorization Service Configuration Mode, enter the following command:

```
traffic-policy general-pdp-context no-matching-gates direction { downlink | uplink } { forward | discard }
```

To configure the PCRF host destinations configured in the GGSN/PCEF, use the `diameter host-select` CLI commands.

To configure the GGSN/PCEF to use a pre-defined rule when the Gx fails, set the `failure-handling cc-request-type` CLI to `continue`. Policies available/in use will continue to be used and there will be no further interaction with the PCRF.

For provisioning of default charging method, use the following configurations. For this, the AVPs Online and Offline will be sent in CCR-I message based on the configuration. The Online/Offline AVP received at command level applies only to dynamic rules if they are not configured at PCC rule level.

- To send Enable Online:
configure
active-charging service <ecs_service_name>
charging-action <charging_action_name>
cca charging credit
exit

- To send Enable Offline:

configure
active-charging service <ecs_service_name>
rulebase <rulebase_name>
billing-records rf
exit

Verifying the Configuration

To verify the IMS Authorization service configuration:

---

**Step 1**
Change to the context where you enabled IMS Authorization service by entering the following command:
```
context <context_name>
```

**Step 2**
Verify the IMS Authorization service's configurations by entering the following command:
```
show ims-authorization service name <imsa_service_name>
```

---

Applying IMS Authorization Service to an APN

After configuring IMS Authorization service at the context-level, an APN must be configured to use the IMS Authorization service for an IMS subscriber.

Use the following example to apply IMS Authorization service functionality to a previously configured APN within the context configured as described in Configuring Rel. 7 Gx Interface, on page 521.

```
configure
  context <context_name>
  apn <apn_name>
    ims-auth-service <imsa_service_name>
    active-charging rulebase <rulebase_name>
  end
```

Notes:

- `<context_name>` must be the name of the context in which the IMS Authorization service was configured.
- `<imsa_service_name>` must be the name of the IMS Authorization service configured for IMS authentication in the context.
- For Rel. 7 Gx, the ECS rulebase must be configured in the APN.
• ECS allows change of rulebase via Gx for PCEF binding scenarios. When the old rulebase goes away, all the rules that were installed from that rulebase are removed. This may lead to termination of a few bearers (PDP contexts) if they are left without any rules. If there is a Gx message that changes the rulebase, and also activates some predefined rules, the rulebase change is made first, and the rules are activated from the new rulebase. Also, the rulebase applies to the entire call. All PDP contexts (bearers) in one call use the same ECS rulebase.

• For predefined rules configured in the ECS, MBR/GBR of a dynamic/predefined rule is checked before it is used for PCEF binding. All rules (dynamic as well as predefined) have to have an MBR associated with them and all rules with GBR QCI should have GBR also configured. So for predefined rules, one needs to configure appropriate peak-data-rate, committed-data-rate as per the QCI being GBR QCI or non-GBR QCI. For more information, in the ACS Charging Action Configuration Mode, see the flow limit-for-bandwidth CLI command.

• For interpretation of the Gx rulebase (Charging-Rule-Base-Name AVP) from PCRF as ECS group-of-ruledefs, configure the following command in the Active Charging Service Configuration Mode:

```
policy-control charging-rule-base-name active-charging-group-of-ruledefs
```

### Verifying Subscriber Configuration

Verify the IMS Authorization service configuration for subscriber(s) by entering the following command:

```
show subscribers ims-auth-service <imsa_service_name>
```

<imsa_service_name> must be the name of the IMS Authorization service configured for IMS authentication.

### Configuring Volume Reporting over Gx

This section describes the configuration required to enable Volume Reporting over Gx.

To enable Volume Reporting over Gx, use the following configuration:

```
configure
   active-charging service <ecs_service_name>
   rulebase <rulebase_name>
       action priority <priority> dynamic-only ruledef <ruledef_name>
   charging-action <charging_action_name> monitoring-key <monitoring_key>
       exit
   exit
   context <context_name>
       ims-auth-service <imsa_service_name>
       policy-control
           event-update send-usage-report [ reset-usage ]
       end
```

Notes:

• The maximum accepted monitoring key value by the PCEF is 4294967295. If the PCEF sends a greater value, the value is converted to an Unsigned Integer value.

• The event-update CLI which enables volume usage report to be sent in event updates is available only in 10.2 and later releases. The optional keyword reset-usage enables to support delta reporting wherein the usage is reported and reset at PCEF. If this option is not configured, the behavior is to send the usage information as part of event update but not reset at PCEF.
Gathering Statistics

This section explains how to gather Rel. 7 Gx statistics and configuration information.

In the following table, the first column lists what statistics to gather, and the second column lists the action to perform.

Table 51: Gathering Rel. 7 Gx Statistics and Information

<table>
<thead>

Rel. 8 Gx Interface

Rel. 8 Gx interface support is available on the Cisco ASR chassis running StarOS 10.0 or StarOS 11.0 and later releases.

This section describes the following topics:
This section provides information on configuring Rel. 8 Gx interface for HA and PDSN to support policy and charging control for subscribers in CDMA networks.

The IMS service provides application support for transport of voice, video, and data independent of access support. Roaming IMS subscribers in CDMA networks require, apart from other functionality sufficient, uninterrupted, consistent, and seamless user experience during an application session. It is also important that a subscriber gets charged only for the resources consumed by the particular IMS application used.

It is recommended that before using the procedures in this section you select the configuration example that best meets your service model, and configure the required elements for that model as described in this Administration Guide.

This section describes the following topics:

- Introduction, on page 527
- Terminology and Definitions, on page 529
- How it Works, on page 537
- Configuring HA/PDSN Rel. 8 Gx Interface Support, on page 540
- Gathering Statistics, on page 543

Introduction

For IMS deployment in CDMA networks the system uses Rel. 8 Gx interface for policy-based admission control support and flow-based charging (FBC). The Rel. 8 Gx interface supports enforcing policy control features like gating, bandwidth limiting, and so on, and also supports FBC. This is accomplished via dynamically provisioned Policy Control and Charging (PCC) rules. These PCC rules are used to identify Service Data Flows (SDF) and to do charging. Other parameters associated with the rules are used to enforce policy control.

The PCC architecture allows operators to perform service-based QoS policy and FBC control. In the PCC architecture, this is accomplished mainly by the Policy and Charging Enforcement Function (PCEF)/HA/PDSN and the Policy and Charging Rules Function (PCRF). The client functionality lies with the HA/PDSN, therefore in the IMS Authorization (IMSA) scenario it is also called the Gateway. The PCEF function is provided by the Enhanced Charging Service (ECS). The Gx interface is implemented as a Diameter connection. The Gx messaging mostly involves installing/modifying/removing dynamic rules and activating/deactivating predefined rules.

The Gx reference point is located between the Gateway/PCEF and the PCRF. This reference point is used for provisioning and removal of PCC rules from the PCRF to the Gateway/PCEF, and the transmission of traffic plane events from the Gateway/PCEF to the PCRF. The Gx reference point can be used for charging control, policy control, or both by applying AVPs relevant to the application.

The following figure shows the reference points between elements involved in the policy and charging architecture.
Within the Gateway, the IMSA and DPCA modules handle the Gx protocol related functions (at the SessMgr) and the policy enforcement and charging happens at ECS. The Gy protocol related functions are handled within the DCCA module (at the ECS).

The following figure shows the interaction between components within the Gateway.
License Requirements

The HA/PDSN Rel. 8 Gx interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Supported Standards

HA/PDSN Rel 8. Gx interface support is based on the following standards and RFCs:

- 3GPP TS 23.203 V8.3.0 (2008-09) 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Policy and charging control architecture (Release 8)
- 3GPP TS 29.212 V8.6.0 (2009-12) 3rd Generation Partnership Project; Technical Specification Group Core Network and Terminals; Policy and Charging Control over Gx reference point (Release 8)
- 3GPP TS 29.213 V8.1.1 (2008-10) 3rd Generation Partnership Project; Technical Specification Group Core Network and Terminals; Policy and Charging Control signalling flows and QoS parameter mapping; (Release 8)
- RFC 3588, Diameter Base Protocol; September 2003
- RFC 4006, Diameter Credit-Control Application; August 2005

Terminology and Definitions

This section describes features and terminology pertaining to HA/PDSN Rel. 8 Gx functionality.

Policy Control

The process whereby the PCRF indicates to the PCEF how to control the IP-CAN session.

Policy control comprises the following functions:

- Binding
Gating Control

Gating control is the blocking or allowing of packets belonging to an SDF, to pass through to the desired endpoint. A gate is described within a PCC rule and gating control is applied on a per SDF basis. The commands to open or close the gate leads to the enabling or disabling of the passage for corresponding IP packets. If the gate is closed, all packets of the related IP flows are dropped. If the gate is open, the packets of the related IP flows are allowed to be forwarded.

Event Reporting

Important

Unconditional reporting of event triggers from PCRF to PCEF when PCEF has not requested for is not supported.

Important

In the HA/PDSN Rel. 8 Gx implementation, only the AN_GW_CHANGE (21) event trigger is supported.

Event reporting is the notification of and reaction to application events to trigger new behavior in the user plane as well as the reporting of events related to the resources in the Gateway (PCEF). Event triggers may be used to determine which IP-CAN session modification or specific event causes the PCEF to re-request PCC rules. Event trigger reporting from PCEF to PCRF, and provisioning of event triggers happens at IP-CAN session level.

The Event Reporting Function (ERF) located in the PCEF, receives event triggers from PCRF during the Provision of PCC Rules procedure and performs event trigger detection. When an event matching the received event trigger occurs, the ERF reports the occurred event to the PCRF. If the provided event triggers are associated with certain parameter values then the ERF includes those values in the response to the PCRF.

QoS Control

Important

In the HA/PDSN Rel. 8 Gx implementation, only authorized IP-CAN Session is supported. Provisioning of authorized QoS per IP-CAN bearer, policy enforcement for authorized QoS per QCI, and coordination of authorized QoS scopes in mixed mode are not applicable.

QoS control is the authorization and enforcement of the maximum QoS that is authorized for an SDF. In case of an aggregation of multiple SDFs, the combination of the authorized QoS information of the individual
SDFs is provided as the authorized QoS for this aggregate. QoS control per SDF allows the PCC architecture to provide the PCEF with the authorized QoS to be enforced for each specific SDF.

QoS authorization information may be dynamically provisioned by the PCRF, or it can be a predefined PCC rule in the PCEF. For a predefined PCC rule within the PCEF, the authorized QoS information takes affect when the PCC rule is activated. The PCEF combines the different sets of authorized QoS information, that is the information received from the PCRF and the information corresponding to the predefined PCC rules. The PCRF knows the authorized QoS information of the predefined PCC rules and takes this information into account when activating them. This ensures that the combined authorized QoS of a set of PCC rules that are activated by the PCRF is within the limitations given by the subscription and operator policies regardless of whether these PCC rules are dynamically provided, predefined, or both.

Supported features include:

- Provisioning and Policy Enforcement of Authorized QoS: The PCRF may provide authorized QoS to the PCEF. The authorized QoS provides appropriate values for resources to be enforced.
- Policy Provisioning for Authorized QoS Per SDF: The provisioning of authorized QoS per SDF is a part of PCC rule provisioning procedure.
- Policy Enforcement for Authorized QoS Per SDF: If an authorized QoS is defined for a PCC rule, the PCEF limits the data rate of the SDF corresponding to that PCC rule not to exceed the maximum authorized bandwidth for the PCC rule by discarding packets exceeding the limit.
- Upon deactivation or removal of a PCC rule, the PCEF frees the resources reserved for that PCC rule.

Other Features

This section describes some of the other features.

PCC Rule Error Handling

If the installation/activation of one or more PCC rules fails, the PCEF communicates the failure to the PCRF by including one or more Charging-Rule-Report AVP(s) in either a CCR or a RAA command for the affected PCC rules. Within each Charging-Rule-Report AVP, the PCEF identifies the failed PCC rule(s) by including the Charging-Rule-Name AVP(s) or Charging-Rule-Base-Name AVP(s), identifies the failed reason code by including a Rule-Failure-Code AVP, and includes the PCC-Rule-Status AVP.

If the installation/activation of one or more new PCC rules (that is, rules that were not previously successfully installed) fail, the PCEF sets the PCC-Rule-Status to INACTIVE for both the PUSH and the PULL modes.

If a PCC rule was successfully installed/activated, but can no longer be enforced by the PCEF, the PCEF sends the PCRF a new CCR command and includes the Charging-Rule-Report AVP. The PCEF includes the Rule-Failure-Code AVP within the Charging-Rule-Report AVP and sets the PCC-Rule-Status to INACTIVE.

In releases prior to 18, P-GW/GGSN does not send CCR-U with Charging Rule report for rule binding failure occurred during 4G to 3G HO in a collision case where create/update bearer response in 3G/4G is pending and update bearer of 3G HO is received. In 18 and later releases, CCR-U is generated and sent to PCRF for reporting rule failure when the collision happens during GnGp HO scenario.

This additional Gx message (CCR-U) triggered will require multiple CCR-U to be configured when RAT_TYPE trigger is enabled. Otherwise, the subscriber call will be dropped whenever the collision happens during HO.

In the HA/PDSN Gx implementation, the following rule failure codes are supported:

- RATING_GROUP_ERROR (2)
• SERVICE_IDENTIFIER_ERROR (3)
• GW/PCEF_MALFUNCTION (4)
• RESOURCES_LIMITATION (5)

If the installation/activation of one or more PCC rules fails during RAR procedure, the RAA command is sent with the Experimental-Result-Code AVP set to DIAMETER_PCC_RULE_EVENT (5142).

Time of the Day Procedures

PCEF performs PCC rule request as instructed by the PCRF. Revalidation-Time when set by the PCRF, causes the PCEF to trigger a PCRF interaction to request PCC rules from the PCRF for an established IP-CAN session. The PCEF stops the timer once the PCEF triggers a REVALIDATION_TIMEOUT event.

When installed, the PCC rule is inactive. If Rule-Activation-Time / Rule-Deactivation-Time is specified, then the PCEF sets the rule active / inactive after that time.

In releases prior to 17.0, if "Rule-Deactivation-Time" AVP for a predefined rule was omitted in a CCA-U or RAR message, then any previous value for this AVP was continued to be used in the chassis. In 17.0 and later releases, if Rule-Deactivation-Time AVP is omitted in CCA/RAR, then any previous value for this AVP is no longer valid. The new behavior is compliant to the 3GPP specification for Gx, version 12.1.0.

If PCRF enables the same predefined rule again in RAR/CCA-U without Rule-Deactivation-Time AVP, then the deactivation-time for this rule, if any, will be removed.

For switching to the old behavior, PCRF should re-send the same value of Rule-Deactivation-Time AVP along with predef-rule name in the PCRF message (RAR, CCA-U).

Note

This behavior change is applicable only to predefined rules.

Support for Firewall Policy on Gx

The Diameter AVP "SN-Firewall-Policy" has been added to the Diameter dynamic dictionary to support Firewall policy on Gx interface. This AVP can be encoded in CCA-I message to apply/overwrite the fw-and-nat policy that has either been statically assigned to the PDP context via APN configuration or dynamically assigned via RADIUS in Access-Accept. This AVP can also parsed in any CCA-U or RAR message to modify the fw-and-nat policy that is currently assigned to the PDP context.

Charging Control

Important

In the HA/PDSN Rel. 8 Gx implementation, offline charging is not supported.

Charging Control is the process of associating packets belonging to an SDF to a charging key, and applying online charging as appropriate. FBC handles differentiated charging of the bearer usage based on real-time analysis of the SDFs. In order to allow for charging control, the information in the PCC rule identifies the SDF and specifies the parameters for charging control. The PCC rule information may depend on subscription data.

Online charging is supported via the Gy interface. In the case of online charging, it is possible to apply an online charging action upon PCEF events (for example, re-authorization upon QoS change).
It is possible to indicate to the PCEF that interactions with the charging systems are not required for a PCC rule, that is to perform neither accounting nor credit control for this SDF, then neither online nor offline charging is performed.

Supported Features:

- Provisioning of charging-related information for the IP-CAN Session
- Provisioning of charging addresses: Primary or secondary event charging function name (Online Charging Server (OCS) addresses)

**Important**

In the HA/PDSN Rel. 8 Gx implementation, provisioning of primary or secondary charging collection function name (Offline Charging Server (OFCS) addresses) over Gx is not supported.

- Provisioning of Default Charging Method: In this release, the default charging method is sent in CCR-I message. For this, new AVPs Online/Offline are sent in CCR-I message based on the configuration. The Online/Offline AVP received at command level applies only to dynamic rules if they are not configured at PCC rule level.

**Charging Correlation**

In the HA/PDSN Rel. 8 Gx implementation, Charging Correlation is not supported. PCRF provides the flow identifier, which uniquely identifies an IP flow in an IMS session.

**Policy and Charging Control (PCC) Rules**

A PCC rule enables the detection of an SDF and provides parameters for policy control and/or charging control. The purpose of the PCC rule is to:

- Detect a packet belonging to an SDF in case of both uplink and downlink IP flows based on SDF filters in the PCC rule (packet rule matching).
  
  If no PCC rule matches the packet, the packet is dropped.

- Identify the service that the SDF contributes to.

- Provide applicable charging parameters for an SDF.

- Provide policy control for an SDF.

The PCEF selects a PCC rule for each packet received by evaluating received packets against SDF filters of PCC rules in the order of precedence of the PCC rules. When a packet matches an SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied.

There are two types of PCC rules:

- Dynamic PCC Rules: Rules dynamically provisioned by the PCRF to the PCEF via the Gx interface. These PCC rules may be either predefined or dynamically generated in the PCRF. Dynamic PCC rules can be activated, modified, and deactivated at any time.

- Predefined PCC Rule: Rules preconfigured in the PCEF by the operators. Predefined PCC rules can be activated or deactivated by the PCRF at any time. Predefined PCC rules within the PCEF may be grouped allowing the PCRF to dynamically activate a set of PCC rules over the Gx reference point.
A third kind of rule, the static PCC rule can be preconfigured in the chassis by the operators. Static PCC rules are not explicitly known in the PCRF, and are not under control of the PCRF. Static PCC rules are bound to general purpose bearer with no Gx control.

A PCC rule consists of:

- **Rule Name**: The rule name is used to reference a PCC rule in the communication between the PCEF and PCRF.
- **Service Identifier**: The service identifier is used to identify the service or the service component the SDF relates to.
- **Service Data Flow Filter(s)**: The service flow filter(s) is used to select the traffic for which the rule applies.
- **Precedence**: For different PCC rules with overlapping SDF filter, the precedence of the rule determines which of these rules is applicable. When a dynamic PCC rule and a predefined PCC rule have the same priority, the dynamic PCC rule takes precedence.
- **Gate Status**: The gate status indicates whether the SDF, detected by the SDF filter(s), may pass (gate is open) or will be discarded (gate is closed) in uplink and/or in downlink direction.
- **QoS Parameters**: The QoS information includes the QoS class identifier (authorized QoS class for the SDF), and authorized bitrates for uplink and downlink.
- **Charging Key (rating group)**
- **Other charging parameters**: The charging parameters define whether online charging interfaces are used, on what level the PCEF will report the usage related to the rule, etc.

Configuring the Metering Method and Reporting Level for dynamic PCC rules is not supported.

PCC rules also include Application Function (AF) record information for enabling charging correlation between the application and bearer layer if the AF has provided this information via the Rx interface. For IMS, this includes the IMS Charging Identifier (ICID) and flow identifiers.

ASR 5500 supports only eight flow information including the flow description per dynamic charging rule in a Gx message.

In releases prior to 14.0, there were only 10 PCC rules that were recovered per bearer in the event of a session manager crash. In 14.0 and later releases, this limit has been increased to 24. That is, up to 24 PCC rules can be recovered post ICSR.

With the increase in the limit of PCC rules that can be recovered, the rules are not lost and hence the charging applied to the end users are not impacted.

In releases prior to 17.0, when P-GW received PCC rules from PCRF and it results in Create Bearer or Update Bearer to be triggered towards MME/S-GW, the PCC rules were kept in a pending-active state. Any modification request that was received for these pending-active rules were not currently honored by the P-GW.
In 17.0 and later releases, when modification for the PCC rules in pending-active state is received, the modified parameters will be buffered at P-GW. After the response for the pending request is received from the access network, P-GW will process the modification of the buffered parameters and if required generate another update towards network.

**PCC Procedures over Gx Reference Point**

**Request for PCC Rules**

The PCEF, via the Gx reference point, requests for PCC rules in the following instances:

- At IP-CAN session establishment
- At IP-CAN session modification

PCC rules can also be requested as a consequence of a failure in the PCC rule installation/activation or enforcement without requiring an event trigger.

**Provisioning of PCC Rules**

The PCRF indicates, via the Rel. 8 Gx reference point, the PCC rules to be applied at the PCEF. This may be using one of the following procedures:

- **PULL** (provisioning solicited by the PCEF): In response to a request for PCC rules being made by the PCEF, the PCRF provisions PCC rules in the CC-Answer.

- **PUSH** (unsolicited provisioning): The PCRF may decide to provision PCC rules without obtaining a request from the PCEF. For example, in response to information provided to the PCRF via the Rx reference point, or in response to an internal trigger within the PCRF. To provision PCC rules without a request from the PCEF, the PCRF includes these PCC rules in an RA-Request message. No CCR/CCA messages are triggered by this RA-Request.

For each request from the PCEF or upon unsolicited provisioning, the PCRF provisions zero or more PCC rules. The PCRF may perform an operation on a single PCC rule by one of the following means:

- To activate or deactivate a PCC rule that is predefined at the PCEF, the PCRF provisions a reference to this PCC rule within a Charging-Rule-Name AVP and indicates the required action by choosing either the Charging-Rule-Install AVP or the Charging-Rule-Remove AVP.

- To install or modify a PCRF-provisioned PCC rule, the PCRF provisions a corresponding Charging-Rule-Definition AVP within a Charging-Rule-Install AVP.

- To remove a PCC rule which has previously been provisioned by the PCRF, the PCRF provisions the name of this rule as value of a Charging-Rule-Name AVP within a Charging-Rule-Remove AVP.

---

**Important**

In 11.0 and later releases, the maximum valid length for a charging rule name is 63 bytes. When the length of the charging rule name is greater than 63 bytes, a charging rule report with RESOURCES_LIMITATION as Rule-Failure-Code is sent. This charging rule report is sent only when the length of the rule name is lesser than 128 characters. When the charging rule name length is greater than or equal to 128 characters no charging rule report will be sent. In earlier releases, the length of the charging rule name constructed by PCRF was limited to 32 bytes.
Releases prior to 14.0, when PCRF has subscribed to Out of Credit trigger, on session connect when one rule validation fails and also when an Out of Credit was received from OCS for another rule, P-GW was trying to report these failures in different CCR-U to PCRF. However, the second CCR-U of Out of credit was getting dropped internally.

In 14.0 and later releases, on session connect, P-GW combines the rule failure and out of credit in the same CCR-U and sends to PCRF.

Selecting a PCC Rule for Uplink IP Packets

If PCC is enabled, the PCEF selects the applicable PCC rule for each received uplink IP packet within an IP-CAN session by evaluating the packet against uplink SDF filters of PCRF-provided or predefined active PCC rules of this IP-CAN session in the order of the precedence of the PCC rules.

Important

When a PCRF-provided PCC rule and a predefined PCC rule have the same precedence, the uplink SDF filters of the PCRF-provided PCC rule are applied first.

When a packet matches an SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied. Uplink IP packets which do not match any PCC rule of the corresponding IP-CAN session are discarded.

Selecting a PCC Rule for Downlink IP Packets

If PCC is enabled, the PCEF selects a PCC rule for each received downlink IP packet within an IP-CAN session by evaluating the packet against downlink SDF filters of PCRF-provided or predefined active PCC rules of the IP-CAN session in the order of precedence of the PCC rules.

Important

When a PCRF-provided PCC rule and a predefined PCC rule have the same precedence, the downlink SDF filters of the PCRF-provided PCC rule are applied first.

When a packet matches an SDF filter, the packet matching process for that packet is completed, and the PCC rule for that filter is applied. Downlink IP packets that do not match any PCC rule of the IP-CAN session are discarded.

The following procedures are also supported:

- Indication of IP-CAN Session Termination: When the IP-CAN session is being terminated the PCEF contacts the PCRF.

- Request of IP-CAN Session Termination: If the PCRF decides to terminate an IP-CAN session due to an internal trigger or trigger from the SPR, the PCRF informs the PCEF. The PCEF acknowledges to the PCRF and instantly removes/deactivates all the PCC rules that have been previously installed or activated on that IP-CAN session.

The PCEF applies IP-CAN specific procedures to terminate the IP-CAN session. The HA/PDSN sends a MIP Revocation Request with the teardown indicator set to indicate that the termination of the entire IP-CAN session is requested. Furthermore, the PCEF applies the "Indication of IP-CAN Session Termination" procedure.

- Use of the Supported-Features AVP during session establishment to inform the destination host about the required and optional features that the origin host supports.
How it Works

This section describes how HA/PDSN Rel. 8 Gx Interface support works.

The following figure and table explain the IMS Authorization process between a system and IMS components that is initiated by the UE.

In this example, the Diameter Policy Control Application (DPCA) is the Gx interface to the PCRF. The interface between IMSA with PCRF is the Gx interface, and the interface between Session Manager (SessMgr) and Online Charging Service (OCS) is the Gy interface. Note that the IMSA service and DPCA are part of SessMgr on the system and separated in the figure for illustration purpose only.

In 14.0 and later releases, the DPCA and the IMSA will be acting as one module within the Policy Server interface application.
Table 52: HA/PDSN Rel. 8 Gx IMS Authorization Call flow Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>UE (IMS subscriber) requests for MIP Registration Request.</td>
</tr>
<tr>
<td>2</td>
<td>SessMgr allocates an IP address to the UE.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>3</td>
<td>SessMgr requests IMS Authorization, if IMSA is enabled for the subscriber. IMSA service can either be configured in the subscriber template, or can be received from the AAA.</td>
</tr>
<tr>
<td>4</td>
<td>IMSA allocates resources for the IP-CAN session, and selects the PCRF to contact based on the user's selection key (for example, round-robin).</td>
</tr>
<tr>
<td>5</td>
<td>IMSA requests the DPCA module to issue an auth request to the PCRF.</td>
</tr>
<tr>
<td>6</td>
<td>DPCA sends a CCR initial message to the selected PCRF.</td>
</tr>
<tr>
<td>7</td>
<td>PCRF may send preconfigured charging rules in CCA. The dynamic rules and the authorized QoS parameters could also be included by the PCRF.</td>
</tr>
<tr>
<td>8</td>
<td>DPCA passes the charging rule definition, charging rule install, QoS information received from the PCRF, event triggers, etc. IMSA stores the information.</td>
</tr>
<tr>
<td>9</td>
<td>DPCA calls the callback function registered with it by IMSA.</td>
</tr>
<tr>
<td>10</td>
<td>PCRF-provided information common to the entire IP-CAN session (event trigger, primary/secondary OCS address, etc.) is stored within the IMSA. After processing the information, IMSA notifies the SessMgr about the policy authorization complete.</td>
</tr>
<tr>
<td>11</td>
<td>If the validation of the rules fails in IMSA/DPCA, a failure is notified to PCRF containing the Charging-Rule-Report AVP. Else, IMSA initiates creation of ECS session. The primary/secondary OCS server address, etc. are sent to the ECS from the SessMgr.</td>
</tr>
<tr>
<td>12</td>
<td>ECS performs credit authorization by sending CCR(I) to OCS with CC-Request-Type set to INITIAL_REQUEST to open the credit control session. This request includes the active Rulebase-Id (default rulebase ID from the AAA).</td>
</tr>
<tr>
<td>13</td>
<td>OCS returns a CCA initial message that may activate a statically configured Rulebase and may include preemptive quotas.</td>
</tr>
<tr>
<td>14</td>
<td>ECS responds to SessMgr with the response message.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>15</td>
<td>SessMgr requests IMSA for the dynamic rules.</td>
</tr>
</tbody>
</table>
| 16   | IMSA sends the dynamic rules to SessMgr.  
Note that, in 14.0 and later releases, the RAR messages are allowed before the session is established.  
In earlier releases, until the MIP session is established, all RAR messages from the PCRF were rejected.  
Also note that, in 14.0 and later releases, the RAR message is rejected and RAA is sent with 3002 result code when the recovery of dynamic rule information and audit of Session Manager are in progress.  
Earlier, the RAR messages were processed by DPCA even when the recovery audit was in progress. |
| 17   | SessMgr sends the dynamic rule information to the ECS. The gate flow status information and the QoS per flow (charging rule) information are also sent in the message. |
| 18   | ECS activates the predefined rules received, and installs the dynamic rules received. Also, the gate flow status and the QoS parameters are updated by ECS as per the dynamic charging rules. The Gx rulebase is treated as an ECS group-of-ruledefs. The response message contains the Charging Rule Report conveying the status of the rule provisioning at the ECS. |
| 19   | If the provisioning of rules fails partially, the context setup is accepted, and a new CCR-U is sent to the PCRF with the Charging-Rule-Report containing the PCC rule status for the failed rules. If the provisioning of rules fails completely, the context setup is rejected. |
| 20   | Depending on the response for the MIP Session Authorization, SessMgr sends the response to the UE and activates/rejects the call. If the Charging-Rule-Report contains partial failure for any of the rules, the PCRF is notified, and the call is activated. If the Charging-Rule-Report contains complete failure, the call is rejected. |

**Configuring HA/PDSN Rel. 8 Gx Interface Support**

To configure HA/PDSN Rel. 8 Gx Interface functionality:

1. At the context level, configure IMSA service for IMS subscribers as described in Configuring IMS Authorization Service at Context Level, on page 541.
2. Within the same context, configure the subscriber template to use the IMSA service as described in Applying IMS Authorization Service to Subscriber Template, on page 542.

3. Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

---

Important

Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

---

Confusing IMS Authorization Service at Context Level

Use the following example to configure IMSA service at context level for IMS subscribers:

```
configure
  context <context_name>
    ims-auth-service <imsa_service_name>
      policy-control
        diameter origin endpoint <endpoint_name>
        diameter dictionary <dictionary>
        diameter request-timeout <timeout_duration>
        diameter host-select table { 1 | 2 } algorithm round-robin
          diameter host-select row-precedence <precedence_value>
          table { 1 | 2 } host <primary_host_name> [ realm <primary_realm_id> ] [ secondary host <secondary_host_name> [ realm <secondary_realm_id> ] ] [ -noconfirm ]
          failure-handling cc-request-type { any-request | initial-request | terminate-request | update-request } {
            diameter-result-code { any-error | <result_code> [ to <end_result_code> ] } } {
              continue | retry-and-terminate | terminate }
            exit
          exit
          diameter endpoint <endpoint_name> [ -noconfirm ]
            origin realm <realm_name>
            use-proxy
            origin host <host_name> address <ip_address>
            no watchdog-timeout
            response-timeout <timeout_duration>
            connection timeout <timeout_duration>
            connection retry-timeout <timeout_duration>
            peer <primary_peer_name> [ realm <primary_realm_name> ] address <ip_address> [ port <port_number> ]
            peer <secondary_peer_name> [ realm <secondary_realm_name> ] address <ip_address> [ port <port_number> ]
          end
```

Notes:

- `<context_name>` must be the name of the context where you want to enable IMSA service.
Verifying the IMSA Service Configuration

To verify the IMSA service configuration:

1. Change to the context where you enabled IMSA service by entering the following command:
   ```
   context <context_name>
   ```

2. Verify the IMSA service configuration by entering the following command:
   ```
   show ims-authorization service name <imsa_service_name>
   ```

Applying IMS Authorization Service to Subscriber Template

After configuring IMSA service at the context-level, within the same context subscriber template must be configured to use the IMSA service for IMS subscribers.

Use the following example to apply IMSA service functionality to subscriber template within the context configured as described in Configuring IMS Authorization Service at Context Level, on page 541.

```    
configure
  context <context_name>
  subscriber default
    encrypted password <encrypted_password>
    ims-auth-service <imsa_service_name>
    ip access-group <access_group_name> in
    ip access-group <access_group_name> out
    ip context-name <context_name>
    mobile-ip home-agent <ip_address>
    active-charging rulebase <rulebase_name>
  end
```

Notes:

- `<context_name>` must be the name of the context in which the IMSA service was configured.
• `<imsa_service_name>` must be the name of the IMSA service configured for IMS authentication in the context.

• The ECS rulebase must be configured in the subscriber template.

• For interpretation of the Gx rulebase (Charging-Rule-Base-Name AVP) from PCRF as ECS group-of-ruledefs, configure the following command in the Active Charging Service Configuration Mode:

```
policy-control charging-rule-base-name active-charging-group-of-ruledefs
```

### Verifying the Subscriber Configuration

Verify the IMSA service configuration for subscriber(s) by entering the following command in the Exec CLI configuration mode:

```
show subscribers ims-auth-service `<imsa_service_name>`
```

**Notes:**

• `<imsa_service_name>` must be the name of the IMSA service configured for IMS authentication.

### Gathering Statistics

This section explains how to gather Rel. 8 Gx statistics and configuration information.

In the following table, the first column lists what statistics to gather, and the second column lists the action to perform.

<table>
<thead>
<tr>
<th>Statistics/Information</th>
<th>Action to perform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information and statistics specific to policy control in IMS Authorization service.</td>
<td><code>show ims-authorization policy-control statistics</code></td>
</tr>
<tr>
<td>Information and statistics specific to the authorization servers used for IMS Authorization service.</td>
<td><code>show ims-authorization servers ims-auth-service</code></td>
</tr>
<tr>
<td>Information of all IMS Authorization service.</td>
<td><code>show ims-authorization service all</code></td>
</tr>
<tr>
<td>Statistics of IMS Authorization service.</td>
<td><code>show ims-authorization service statistics</code></td>
</tr>
<tr>
<td>Information, configuration, and statistics of sessions active in IMS Authorization service.</td>
<td><code>show ims-authorization sessions all</code></td>
</tr>
<tr>
<td>Complete information, configuration, and statistics of sessions active in IMS Authorization service.</td>
<td><code>show ims-authorization sessions full</code></td>
</tr>
<tr>
<td>Summarized information of sessions active in IMS Authorization service.</td>
<td><code>show ims-authorization sessions summary</code></td>
</tr>
<tr>
<td>Complete statistics for active charging service sessions.</td>
<td><code>show active-charging sessions full</code></td>
</tr>
<tr>
<td>Information for all rule definitions configured in the service.</td>
<td><code>show active-charging ruledef all</code></td>
</tr>
</tbody>
</table>
### Statistics/Information

<table>
<thead>
<tr>
<th>Information for all rulebases configured in the system.</th>
<th>show active-charging rulebase all</th>
</tr>
</thead>
<tbody>
<tr>
<td>Information on all group of ruledefs configured in the system.</td>
<td>show active-charging group-of-ruledefs all</td>
</tr>
</tbody>
</table>
| Information on policy gate counters and status. | show ims-authorization policy-gate { counters | status }  
This command is no longer an option in StarOS release 11.0 and beyond. |

---

## P-GW Rel. 8 Gx Interface Support

### Introduction

The Gx reference point is located between the Policy and Charging Rules Function (PCRF) and the Policy and Charging Enforcement Function (PCEF) on the Packet Data Network (PDN) Gateway (P-GW). The Gx reference point is used for provisioning and removal of PCC rules from the PCRF to the PCEF and the transmission of traffic plane events from the PCEF to the PCRF. The Gx reference point can be used for charging control, policy control, or both, by applying AVPs relevant to the application.

The PCEF is the functional element that encompasses policy enforcement and flow based charging functionality. This functional entity is located at the P-GW. The main functions include:

- Control over the user plane traffic handling at the gateway and its QoS.
- Service data flow detection and counting, as well as online and offline charging interactions.
- For a service data flow that is under policy control, the PCEF allows the service data flow to pass through the gateway if and only if the corresponding gate is open.
- For a service data flow that is under charging control, the PCEF allows the service data flow to pass through the gateway if and only if there is a corresponding active PCC rule and, for online charging, the OCS has authorized the applicable credit with that charging key.
- If requested by the PCRF, the PCEF will report to the PCRF when the status of the related service data flow changes.
- In case the SDF is tunnelled at the BBERF, the PCEF informs the PCRF about the mobility protocol tunnelling header of the service data flows at IP-CAN session establishment.

### Terminology and Definitions

This section describes features and terminology pertaining to Rel. 8 Gx functionality.

### Volume Reporting Over Gx

This section describes the 3GPP Rel. 9 Volume Reporting over Gx feature.
License Requirements

The Volume Reporting over Gx is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Important

In 12.0 and later releases, no separate license is required for Charging over Gx / Volume Reporting over Gx feature. This feature can be enabled as part of "Policy Interface" license.

Supported Standards

The Volume Reporting over Gx feature is based on the following standard:

Feature Overview

The Volume Reporting over Gx feature provides PCRF the capability to make real-time decisions based on the data usage by subscribers.

Important

Volume Reporting over Gx is applicable only for volume quota.

In release 10.0, only total data usage reporting is supported, uplink/downlink level reporting is not supported. In 10.2 and later releases, it is supported.

The PCEF only reports the accumulated usage since the last report for usage monitoring and not from the beginning.

If the usage threshold is set to zero (infinite threshold), no further threshold events will be generated by PCEF, but monitoring of usage will continue and be reported at the end of the session.

In 12.2 and later releases, usage reporting on bearer termination is supported.

The following steps explain how Volume Reporting over Gx works:

1. PCEF after receiving the message from PCRF parses the usage monitoring related AVPs, and sends the information to IMSA.
2. IMSA updates the information to ECS.
3. Once the ECS is updated with the usage monitoring information from PCRF, the PCEF (ECS) starts tracking the data usage.
4. For session-level monitoring, the ECS maintains the amount of data usage.
5. For PCC rule monitoring, usage is monitored with the monitoring key as the unique identifier. Each node maintains the usage information per monitoring key. When the data traffic is passed, the usage is checked against the usage threshold values and reported as described in the Usage Reporting section.
6. The PCEF continues to track data usage after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of...
Usage Monitoring

• Usage Monitoring at Session Level: PCRF subscribes to the session-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to SESSION_LEVEL(0). After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. In 11.0 and later releases, Monitoring Key at session level is supported.

In 12.0 and later releases, enabling and disabling session usage in a single message from PCRF is supported. This is supported only if the monitoring key is associated at session level.

In 12.0 and later releases, monitoring of usage based on input/output octet threshold levels is supported. Usage is reported based on the enabled threshold level. If multiple levels are enabled, usage will be reported on all the enabled levels even if only one of the levels is breached. Monitoring will be stopped on the missing threshold levels in the response for the usage report from PCRF (expected to provide the complete set again if PCRF wants to continue monitoring on the multiple levels enabled earlier).

Total threshold level along with UL/DL threshold level in the GSU AVP is treated as an error and only total threshold level is accepted.

In releases prior to 17.0, extra CCR-U was generated for a monitoring key when the following requests are received in the response to the CCR-U which reported the usage for the same monitoring key.

• immediate reporting request with monitoring key at rule level
• immediate reporting request with or without monitoring key at session level
• explicit disable request at rule level
• explicit disable request at session level

In 17.0 and later releases, extra CCR-U is not generated for a monitoring key when all the above mentioned requests are received in the response to the CCR-U which reported the usage for the same monitoring key. Also, extra CCR-U is not generated when immediate reporting request without monitoring key at rule level is received in the response to the CCR-U which reported the usage for all the active monitoring keys.

• Usage Monitoring at Flow Level: PCRF subscribes to the flow-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to PCC_RULE_LEVEL(1). Monitoring Key is mandatory in case of a flow-level monitoring since the rules are associated with the monitoring key and enabling/disabling of usage monitoring at flow level can be controlled by PCRF using it. After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

Usage monitoring is supported for static, predefined rules, and dynamic rule definitions.

• Usage Monitoring for Static Rules: In the case of static rules, the usage reporting on last rule removal associated with the monitoring key is not applicable. In this case only the usage monitoring information is received from the PCRF.

• Usage Monitoring for Predefined Rules: If the usage monitoring needs to be enabled for the predefined rules, PCRF sends the rule and the usage monitoring information containing the monitoring key and the usage threshold. The Monitoring key should be same as the one pre-configured in PCEF for that predefined rule. There can be multiple rules associated with the same monitoring key. Hence
enabling a particular monitoring key would result in the data being tracked for multiple rules having the same monitoring key. After DPCA parses the AVPs IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

- **Usage Monitoring for Dynamic Rules:** If the usage monitoring needs to be enabled for dynamic ruledefs, PCRF provides the monitoring key along with a charging rule definition and the usage monitoring information containing the monitoring key and the usage threshold. This would result in the usage monitoring being done for all the rules associated with that monitoring key. After DPCA parses the AVPs, IMSA updates the information to ECS. Once ECS is updated, the usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. Monitoring key for dynamic ruledef is dynamically assigned by PCRF which is the only difference with predefined rules in case of usage monitoring.

In releases prior to 15.0, when threshold breach happens for multiple monitoring keys at the same time, only one of the monitoring keys' usage is reported and the rest of the monitoring keys' usage is reported in CCR-T (threshold set to infinity). On Tx expiry/TCP link error, unreported usage is stored at ECS and reported only on session termination.

In 15.0 and later releases, only one of the monitoring keys' usage is reported first. Upon receiving successful response from PCRF, the rest of the monitoring keys' usage is reported to PCRF. On Tx expiry/TCP link error, unreported usage is stored at ECS. Any future successful interaction with PCRF for the session will send unreported UMI to PCRF.

**Usage Reporting**

Usage at subscriber/flow level is reported to PCRF under the following conditions:

- **Usage Threshold Reached:** PCEF records the subscriber data usage and checks if the usage threshold provided by PCRF is reached. This is done for both session and rule level reporting.

  For session-level reporting, the actual usage volume is compared with the usage volume threshold.

  For rule-level reporting the rule that hits the data traffic is used to find out if the monitoring key is associated with it, and based on the monitoring key the data usage is checked. Once the condition is met, it reports the usage information to IMSA and continues monitoring. IMSA then triggers the CCR-U if "USAGE_REPORT" trigger is enabled by the PCRF. The Usage-Monitoring-Information AVP is sent in this CCR with the "Used-Service-Unit" set to the amount of data usage by subscriber.

  If PCRF does not provide a new usage threshold in the usage monitoring information as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no usage status is reported.

  In the non-standard Volume Reporting over Gx implementation, usage monitoring will be stopped once the threshold is breached, else the monitoring will continue. There will be no further usage reporting until the CCA is received.

- **Usage Monitoring Disabled:** If the PCRF explicitly disables the usage monitoring with Usage-Monitoring-Support AVP set to USAGE_MONITORING_DISABLED, the PCEF stops monitoring and reports the usage information (when the monitoring was enabled) to PCRF if the usage monitoring is disabled by PCRF as a result of CCR from PCEF which is not related to reporting usage, other external triggers, or a PCRF internal trigger. If the PCRF does not provide a new usage threshold as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no further usage status is reported.
• IP CAN Session Termination: When the IP CAN session is terminated, the accumulated subscriber usage information is reported to PCRF in the CCR-T from PCEF. If PCC usage level information is enabled by PCRF, the PCC usage will also be reported.

PCRF uses RAR message and includes Session-Release-Cause AVP in it to initiate IP CAN Session Termination. However, there are some scenarios where PCRF may want to terminate the IP CAN Session in CCA messages. In order to avoid an unnecessary additional message, PCRF can inform P-GW to terminate the subscriber in CCA-U message itself. Hence, in 17.0 and later releases, the Session Release Cause has been added in CCA messages for all Gx dictionaries.

• PCC Rule Removal: When the PCRF deactivates the last PCC rule associated with a usage monitoring key, the PCEF sends a CCR with the data usage for that monitoring key. If the PCEF reports the last PCC rule associated with a usage monitoring key is inactive, the PCEF reports the accumulated usage for that monitoring key within the same CCR command if the Charging-Rule-Report AVP was included in a CCR command; otherwise, if the Charging-Rule-Report AVP was included in an RAA command, the PCEF sends a new CCR command to report accumulated usage for the usage monitoring key. In 12.0 and later releases, usage reporting on last rule deactivation using rule deactivation time set by PCRF is supported.

Releases prior to 14.0, when PCC rule was tried to be removed while waiting for access side update bearer response, the charging rules were not removed. In 14.0 and later releases, on receiving message from PCRF, the rule that is meant for removal is marked and then after the access side procedure is complete the rule is removed.

• PCRF Requested Usage Report: In 10.2 and later releases, the accumulated usage since the last report is sent even in case of immediate reporting, the usage is reset after immediate reporting and usage monitoring continued so that the subsequent usage report will have the usage since the current report. In earlier releases the behavior was to accumulate the so far usage in the next report.

• Release 12.2 onwards, usage reporting on bearer termination can be added. When a bearer is deleted due to some reason, the rules associated with the bearer will also be removed. So, the usage will be reported on the monitoring key(s) whose associated rule is the last one that is removed because of bearer termination.

• Revalidation Timeout: In the non-standard implementation, if usage monitoring and reporting is enabled and a revalidation timeout occurs, the PCEF sends a CCR to request PCC rules and reports all accumulated usage for all enabled monitoring keys since the last report (or since usage reporting was enabled if the usage was not yet reported) with the accumulated usage at IP-CAN session level (if enabled) and at service data flow level (if enabled) This is the default behavior.

In the case of standard implementation, this must be enabled by CLI configuration.

---

**Important**

The Usage Reporting on Revalidation Timeout feature is available by default in non-standard implementation of Volume Reporting over Gx. In 10.2 and later releases, this is configurable in the standard implementation. This is not supported in 10.0 release for standard based volume reporting.

---

Once the usage is reported, the usage counter is reset to zero. The PCEF continues to track data usage from the zero value after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session and and the usage accumulated between the CCR-CCA will be discarded.
In releases prior to 17.0, CCR-U triggered on server retries does not take server granted quota into account for reporting USU. In 17.0 and later releases, CCR-U triggered on server retries takes server granted quota into account for reporting USU. For newly created MSCC, interim quota configuration is taken as reference for reporting USU.

For information on how to configure the Volume Reporting over Gx feature, refer to Configuring Volume Reporting over Gx, on page 525.

**ICSR Support for Volume Reporting over Gx (VoRoGx)**

In releases prior to 15.0, post the ICSR switchover, any existing session for which the PCRF has enabled volume reporting used to continue indefinitely until the session is terminated or until CCR-U is sent for a given trigger, without having the volume counted via Gx.

To summarize, after an ICSR switchover, volume reporting over Gx is no longer done for existing sessions. Also, volume usage is not synced to standby chassis.

In 15.0 and later releases, volume threshold and volume usage are synced to standby chassis to support volume reporting over Gx for existing sessions post switchover.

Without this support it cannot cause a subscriber to use higher speeds than what s/he is supposed to get, if volume reporting is for example used to enforce fair usage; the operator may already consider this a revenue loss. It will also severely impact roaming subscribers who are supposed to get a notification and be blocked/redirected once the limits set by the EU roaming regulation are reached. If a session continues now without being blocked, the operator is not allowed to charge for data beyond the limit and will have a significant and real revenue loss (roaming partner may still charge for the data used on their SGSNs).

**Rel. 9 Gx Interface**

Rel. 9 Gx interface support is available on the Cisco ASR chassis running StarOS 12.2 and later releases.

**P-GW Rel. 9 Gx Interface Support**

**Introduction**

The Gx reference point is located between the Policy and Charging Rules Function (PCRF) and the Policy and Charging Enforcement Function (PCEF) on the Packet Data Network (PDN) Gateway (P-GW). The Gx reference point is used for provisioning and removal of PCC rules from the PCRF to the PCEF and the transmission of traffic plane events from the PCEF to the PCRF. The Gx reference point can be used for charging control, policy control, or both, by applying AVPs relevant to the application.

The PCEF is the functional element that encompasses policy enforcement and flow based charging functionality. This functional entity is located at the P-GW. The main functions include:

- Control over the user plane traffic handling at the gateway and its QoS.
- Service data flow detection and counting, as well as online and offline charging interactions.
- For a service data flow that is under policy control, the PCEF allows the service data flow to pass through the gateway if and only if the corresponding gate is open.
- For a service data flow that is under charging control, the PCEF allows the service data flow to pass through the gateway if and only if there is a corresponding active PCC rule and, for online charging, the OCS has authorized the applicable credit with that charging key.
• If requested by the PCRF, the PCEF reports to the PCRF when the status of the related service data flow changes.

• In case the SDF is tunnelled at the BBERF, the PCEF informs the PCRF about the mobility protocol tunneling header of the service data flows at IP-CAN session establishment.

Important
ASR 5000 supports only eight flow information including the flow description per dynamic charging rule in a Gx message.

### Terminology and Definitions
This section describes features and terminology pertaining to Rel. 9 Gx functionality.

### Volume Reporting Over Gx
This section describes the 3GPP Rel. 9 Volume Reporting over Gx feature.

#### License Requirements
The Volume Reporting over Gx is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Important
In 12.0 and later releases, no separate license is required for Charging over Gx / Volume Reporting over Gx feature. This feature can be enabled as part of "Policy Interface" license.

#### Supported Standards
The Volume Reporting over Gx feature is based on the following standard:

#### Feature Overview
The Volume Reporting over Gx feature provides PCRF the capability to make real-time decisions based on the data usage by subscribers.
Volume Reporting over Gx is applicable only for volume quota.

In release 10.0, only total data usage reporting is supported, uplink/downlink level reporting is not supported. In 10.2 and later releases, it is supported.

In release 10.0, only total data usage reporting is supported, uplink/downlink level reporting is not supported. In 10.2 and later releases, it is supported.

The PCEF only reports the accumulated usage since the last report for usage monitoring and not from the beginning.

If the usage threshold is set to zero (infinite threshold), no further threshold events will be generated by PCEF, but monitoring of usage will continue and be reported at the end of the session.

In 12.2 and later releases, usage reporting on bearer termination is supported.

The following steps explain how Volume Reporting over Gx works:

1. PCEF after receiving the message from PCRF parses the usage monitoring related AVPs, and sends the information to IMSA.
2. IMSA updates the information to ECS.
3. Once the ECS is updated with the usage monitoring information from PCRF, the PCEF (ECS) starts tracking the data usage.
4. For session-level monitoring, the ECS maintains the amount of data usage.
5. For PCC rule monitoring, usage is monitored with the monitoring key as the unique identifier. Each node maintains the usage information per monitoring key. When the data traffic is passed, the usage is checked against the usage threshold values and reported as described in the Usage Reporting section.
6. The PCEF continues to track data usage after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session.

Usage Monitoring

- Usage Monitoring at Session Level: PCRF subscribes to the session-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to SESSION_LEVEL(0). After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. In 11.0 and later releases, Monitoring Key at session level is supported.

In 12.0 and later releases, enabling and disabling session usage in a single message from PCRF is supported. This is supported only if the monitoring key is associated at session level.

In 12.0 and later releases, monitoring of usage based on input/output octet threshold levels is supported. Usage is reported based on the enabled threshold level. If multiple levels are enabled, usage will be reported on all the enabled levels even if only one of the levels is breached. Monitoring will be stopped on the missing threshold levels in the response for the usage report from PCRF (expected to provide the complete set again if PCRF wants to continue monitoring on the multiple levels enabled earlier).
Total threshold level along with UL/DL threshold level in the GSU AVP is treated as an error and only total threshold level is accepted.

In releases prior to 17.0, extra CCR-U was generated for a monitoring key when the following requests are received in the response to the CCR-U which reported the usage for the same monitoring key.

- immediate reporting request with monitoring key at rule level
- immediate reporting request with or without monitoring key at session level
- explicit disable request at rule level
- explicit disable request at session level

In 17.0 and later releases, extra CCR-U is not generated for a monitoring key when all the above mentioned requests are received in the response to the CCR-U which reported the usage for the same monitoring key. Also, extra CCR-U is not generated when immediate reporting request without monitoring key at rule level is received in the response to the CCR-U which reported the usage for all the active monitoring keys.

- Usage Monitoring at Flow Level: PCRF subscribes to the flow-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to PCC_RULE_LEVEL(1). Monitoring Key is mandatory in case of a flow-level monitoring since the rules are associated with the monitoring key and enabling/disabling of usage monitoring at flow level can be controlled by PCRF using it. After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

Usage monitoring is supported for static, predefined rules, and dynamic rule definitions.

- Usage Monitoring for Static Rules: In the case of static rules, the usage reporting on last rule removal associated with the monitoring key is not applicable. In this case only the usage monitoring information is received from the PCRF.

- Usage Monitoring for Predefined Rules: If the usage monitoring needs to be enabled for the predefined rules, PCRF sends the rule and the usage monitoring information containing the monitoring key and the usage threshold. The Monitoring key should be same as the one pre-configured in PCEF for that predefined rule. There can be multiple rules associated with the same monitoring key. Hence enabling a particular monitoring key would result in the data being tracked for multiple rules having the same monitoring key. After DPCA parses the AVPs IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

- Usage Monitoring for Dynamic Rules: If the usage monitoring needs to be enabled for dynamic ruledefs, PCRF provides the monitoring key along with a charging rule definition and the usage monitoring information containing the monitoring key and the usage threshold. This would result in the usage monitoring being done for all the rules associated with that monitoring key. After DPCA parses the AVPs, IMSA updates the information to ECS. Once ECS is updated, the usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. Monitoring key for dynamic ruledef is dynamically assigned by PCRF which is the only difference with predefined rules in case of usage monitoring.

In releases prior to 15.0, when threshold breach happens for multiple monitoring keys at the same time, only one of the monitoring keys' usage is reported and the rest of the monitoring keys' usage is reported in CCR-T (threshold set to infinity). On Tx expiry/TCP link error, unreported usage is stored at ECS and reported only on session termination.
In 15.0 and later releases, only one of the monitoring keys' usage is reported first. Upon receiving successful response from PCRF, the rest of the monitoring keys' usage is reported to PCRF. On Tx expiry/TCP link error, unreported usage is stored at ECS. Any future successful interaction with PCRF for the session will send unreported UMI to PCRF.

Usage at subscriber/flow level is reported to PCRF under the following conditions:

- **Usage Threshold Reached:** PCEF records the subscriber data usage and checks if the usage threshold provided by PCRF is reached. This is done for both session and rule level reporting.
  
  For session-level reporting, the actual usage volume is compared with the usage volume threshold. For rule-level reporting the rule that hits the data traffic is used to find out if the monitoring key is associated with it, and based on the monitoring key the data usage is checked. Once the condition is met, it reports the usage information to IMSA and continues monitoring. IMSA then triggers the CCR-U if "USAGE_REPORT" trigger is enabled by the PCRF. The Usage-Monitoring-Information AVP is sent in this CCR with the "Used-Service-Unit" set to the amount of data usage by subscriber.
  
  If PCRF does not provide a new usage threshold in the usage monitoring information as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no usage status is reported.

  In the non-standard Volume Reporting over Gx implementation, usage monitoring will be stopped once the threshold is breached, else the monitoring will continue. There will be no further usage reporting until the CCA is received.

- **Usage Monitoring Disabled:** If the PCRF explicitly disables the usage monitoring with Usage-Monitoring-Support AVP set to USAGE_MONITORING_DISABLED, the PCEF stops monitoring and reports the usage information (when the monitoring was enabled) to PCRF if the usage monitoring is disabled by PCRF as a result of CCR from PCEF which is not related to reporting usage, other external triggers, or a PCRF internal trigger. If the PCRF does not provide a new usage threshold as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no further usage status is reported.

- **IP CAN Session Termination:** When the IP CAN session is terminated, the accumulated subscriber usage information is reported to PCRF in the CCR-T from PCEF. If PCC usage level information is enabled by PCRF, the PCC usage will also be reported.
  
  PCRF uses RAR message and includes Session-Release-Cause AVP in it to initiate IP CAN Session Termination. However, there are some scenarios where PCRF may want to terminate the IP CAN Session in CCA messages. In order to avoid an unnecessary additional message, PCRF can inform P-GW to terminate the subscriber in CCA-U message itself. Hence, in 17.0 and later releases, the Session Release Cause has been added in CCA messages for all Gx dictionaries.

- **PCC Rule Removal:** When the PCRF deactivates the last PCC rule associated with a usage monitoring key, the PCEF sends a CCR with the data usage for that monitoring key. If the PCEF reports the last PCC rule associated with a usage monitoring key is inactive, the PCEF reports the accumulated usage for that monitoring key within the same CCR command if the Charging-Rule-Report AVP was included in a CCR command; otherwise, if the Charging-Rule-Report AVP was included in an RAA command, the PCEF sends a new CCR command to report accumulated usage for the usage monitoring key. In 12.0 and later releases, usage reporting on last rule deactivation using rule deactivation time set by PCRF is supported.
Releases prior to 14.0, when PCC rule was tried to be removed while waiting for access side update bearer response, the charging rules were not removed. In 14.0 and later releases, on receiving message from PCRF, the rule that is meant for removal is marked and then after the access side procedure is complete the rule is removed.

- **PCRF Requested Usage Report**: In 10.2 and later releases, the accumulated usage since the last report is sent even in case of immediate reporting, the usage is reset after immediate reporting and usage monitoring continued so that the subsequent usage report will have the usage since the current report. In earlier releases the behavior was to accumulate the so far usage in the next report.

- **Release 12.2 onwards**, usage reporting on bearer termination can be added. When a bearer is deleted due to some reason, the rules associated with the bearer will also be removed. So, the usage will be reported on the monitoring key(s) whose associated rule is the last one that is removed because of bearer termination.

- **Revalidation Timeout**: In the non-standard implementation, if usage monitoring and reporting is enabled and a revalidation timeout occurs, the PCEF sends a CCR to request PCC rules and reports all accumulated usage for all enabled monitoring keys since the last report (or since usage reporting was enabled if the usage was not yet reported) with the accumulated usage at IP-CAN session level (if enabled) and at service data flow level (if enabled) This is the default behavior.

  In the case of standard implementation, this must be enabled by CLI configuration.

---

**Important**

The Usage Reporting on Revalidation Timeout feature is available by default in non-standard implementation of Volume Reporting over Gx. In 10.2 and later releases, this is configurable in the standard implementation. This is not supported in 10.0 release for standard based volume reporting.

Once the usage is reported, the usage counter is reset to zero. The PCEF continues to track data usage from the zero value after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session and and the usage accumulated between the CCR-CCA will be discarded.

In releases prior to 17.0, CCR-U triggered on server retries does not take server granted quota into account for reporting USU. In 17.0 and later releases, CCR-U triggered on server retries takes server granted quota into account for reporting USU. For newly created MSCC, interim quota configuration is taken as reference for reporting USU.

For information on how to configure the Volume Reporting over Gx feature, see the *Configuring Volume Reporting over Gx*, on page 525 section.

---

**ICSR Support for Volume Reporting over Gx (VoRoGx)**

In releases prior to 15.0, post the ICSR switchover, any existing session for which the PCRF has enabled volume reporting used to continue indefinitely until the session is terminated or until CCR-U is sent for a given trigger, without having the volume counted via Gx.

To summarize, after an ICSR switchover, volume reporting over Gx is no longer done for existing sessions. Also, volume usage is not synched to standby chassis.

In 15.0 and later releases, volume threshold and volume usage are synched to standby chassis to support volume reporting over Gx for existing sessions post switchover.
Without this support it cannot cause a subscriber to use higher speeds than what s/he is supposed to get, if volume reporting is for example used to enforce fair usage; the operator may already consider this a revenue loss. It will also severely impact roaming subscribers who are supposed to get a notification and be blocked/redirected once the limits set by the EU roaming regulation are reached. If a session continues now without being blocked, the operator is not allowed to charge for data beyond the limit and will have a significant and real revenue loss (roaming partner may still charge for the data used on their SGSNs).

3GPP Rel.9 Compliance for IPFilterRule

This section describes the overview and implementation of 3GPP Rel.9 Compliance for IPFilterRule feature. This section discusses the following topics for this feature:

- Feature Description, on page 555
- Configuring Rel.9 Compliant AVPs, on page 556
- Monitoring and Troubleshooting the 3GPP Rel.9 Compliance for IPFilterRule, on page 557

Feature Description

Currently, PCEF is 3GPP Rel. 8 compliant for IPFilterRule in Flow-Description AVP, TFT-Filter, and Packet-Filter-Content AVPs. When PCRF sends the CCA-U or RAR with Flow-Description AVP in Rel. 9 format during a network initiated dedicated bearer creation or modification, PCEF was misinterpreting the source and destination IP address, resulting in sending a wrong TFT to UE.

When the PCRF is upgraded to 3GPP Rel. 9, PCEF still sends CCR-U with Flow-Description, TFT-Filter and Packet-Filter-Content AVPs in Rel. 8 format during UE initiated secondary bearer creation or modification.

To make the PCEF 3GPP Rel. 9 compliant for Flow-Description AVP, TFT-Filter, and Packet-Filter-Content AVPs, the following changes are implemented:

- Interpretation of the source and destination IP address in IPFilterRule in Flow-Description AVP is changed to maintain 3GPP Rel.9 compliance. That is, when a Rel. 9 Flow-Description for UPLINK is received during a network-initiated bearer creation or modification, the source IP address is interpreted as remote and the destination as local IP address.

- Traffic flow direction is interpreted from a new Diameter AVP "Flow-Direction". This new AVP indicates the direction or directions that a filter is applicable, downlink only, uplink only or both downlink and uplink (bi-directional).

- IMSA module is modified to encode TFT-Packet-Filter-Information and Packet-Filter-Information AVPs in Rel. 9 format if the negotiated supported feature is Rel. 9 and above.

- Configuration support is provided to enable Rel.9 changes for Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs sent by PCEF in CCR-U. The **diameter 3gpp-r9-flow-direction** CLI command is used to enable Rel. 9 changes. When this CLI command is configured and negotiated supported feature is Rel. 9 or above (both gateway and PCRF are Rel. 9+ compliant), P-GW sends Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs in Rel. 9 format.

Backward compatibility is maintained, i.e. both Rel. 8 (permit in/out) and Rel. 9 (permit out with flow-direction) formats are accepted by PCEF.

Per the 3GPP Rel. 8 standards, the IPFilterRule in Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs is sent as "permit in" for UPLINK and "permit out" for DOWNLINK direction. From 3GPP Rel. 9 onwards, the Flow-Description AVP within the Flow-Information AVP will have only "permit out" and the
traffic flow direction is indicated through Flow-Direction AVP. In 3GPP Rel. 9 format, both UPLINK and DOWNLINK are always sent as "permit out" and hence the usage of "permit in" is deprecated.

---

**Important**

This feature is applicable for 3GPP Rel. 9 compliant PCEF and PCRF only when the supported feature negotiated in CCA-I is Rel. 9 or above through the `diameter update-dictionary-avps {3gpp-r9 | 3gpp-r10}` CLI command.

---

### Relationships to Other Features

This feature works only when the `diameter update-dictionary-avps` CLI command is configured as 3gpp-r9 or 3gpp-r10. That is, PCEF will send Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs in 3GPP Rel. 9 format only when `diameter 3gpp-r9-flow-direction` CLI command is enabled and negotiated supported feature is Rel. 9 or above. The `diameter 3gpp-r9-flow-direction` CLI command for activating this feature must be used only after the PCRF is upgraded to Rel. 9.

### Configuring Rel.9 Compliant AVPs

The following section provides the configuration commands to enable Rel.9 changes for Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs.

#### Encoding AVPs for 3GPP Compliance

Use the following configuration commands to control PCEF from sending Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs in Rel. 9 format.

```plaintext
configure
  context context_name
    ims-auth-service service_name
    policy-control
      diameter 3gpp-r9-flow-direction
end
```

- **3gpp-r9-flow-direction**: Encodes Flow-Direction, Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs based on 3GPP Rel. 9 specification. By default, this feature is disabled.
- This CLI configuration is applicable only for TFT-Filter, Packet-Filter-Content, and Flow-Description AVPs sent by PCEF in CCR-U.
- This CLI command must be used only after the PCRF is upgraded to Rel. 9.
- This CLI command works in conjunction with `diameter update-dictionary-avps {3gpp-r9 | 3gpp-r10}`. When `diameter 3gpp-r9-flow-direction` is configured and negotiated supported feature is 3gpp-r9 or above, PCEF will send Flow-Description, TFT-Filter, and Packet-Filter-Content AVPs in 3GPP Rel. 9 format.

### Verifying the Configuration for AVP Compliance

Use the following command to verify the configuration status of this feature.

```plaintext
show ims-authorization service name service_name
```

`service_name` must be the name of the IMS Authorization service configured for IMS authentication.
The "3GPP R9 Flow Direction Compliance" field can be used to determine whether this feature is enabled or disabled.

```
[local]# show ims-authorization service name gngp-gx
Context: gngp
IMS Authorization Service name: gngp-gx
Service State: Enabled
Service Mode: Single Interface Policy and Charging

... Diameter Policy Control:
Endpoint: gx
Origin-Realm: xyz.com
Dictionary: r8-gx-standard
Supported Features:
  3gpp-r9
...
```

Monitoring and Troubleshooting the 3GPP Rel.9 Compliance for IPFilterRule

This section provides information regarding show commands and/or their outputs in support of this feature. The following operations should be performed for any failure related to this feature:

- Verify if the feature is enabled using `show ims-authorization service name <service_name>` CLI command. If not enabled, configure the `diameter 3gpp-r9-flow-direction` CLI command and check if it works.

- Execute `monitor protocol` command, and check if supported feature negotiated in CCA-I is Rel. 9 or above. If not, this feature will not work. Set the supported feature using `diameter update-dictionary-avps { 3gpp-r9 | 3gpp-r10 }` CLI command.

- If the failure is still observed, obtain the following information and contact Cisco account representative for further analysis:
  - monitor protocol log with options 24 (GTPC) and 75-3 (App Specific Diameter - DIAMETER Gx/Ty/Gxx) turned on
  - logs with acsmgr enabled
  - Output of `show active-charging sessions full all` and show ims-authorization sessions CLI commands

```
show ims-authorization service name
```

A new field "3GPP R9 Flow Direction Compliance" is added to the output of this show command to indicate whether the Rel. 9 Flow-Direction change is enabled or disabled.

Rel. 10 Gx Interface

Rel. 10 Gx interface support is available on the Cisco ASR chassis running StarOS 15.0 and later releases.
This section describes the following topic:

- P-GW Rel. 10 Gx Interface Support, on page 558

P-GW Rel. 10 Gx Interface Support

Introduction

The Gx reference point is located between the Policy and Charging Rules Function (PCRF) and the Policy and Charging Enforcement Function (PCEF) on the Packet Data Network (PDN) Gateway (P-GW). The Gx reference point is used for provisioning and removal of PCC rules from the PCRF to the PCEF and the transmission of traffic plane events from the PCEF to the PCRF. The Gx reference point can be used for charging control, policy control, or both, by applying AVPs relevant to the application.

The PCEF is the functional element that encompasses policy enforcement and flow based charging functionality. This functional entity is located at the P-GW. The main functions include:

- Control over the user plane traffic handling at the gateway and its QoS.
- Service data flow detection and counting, as well as online and offline charging interactions.
- For a service data flow that is under policy control, the PCEF allows the service data flow to pass through the gateway if and only if the corresponding gate is open.
- For a service data flow that is under charging control, the PCEF allows the service data flow to pass through the gateway if and only if there is a corresponding active PCC rule and, for online charging, the OCS has authorized the applicable credit with that charging key.
- If requested by the PCRF, the PCEF will report to the PCRF when the status of the related service data flow changes.
- In case the SDF is tunnelled at the BBERF, the PCEF informs the PCRF about the mobility protocol tunnelling header of the service data flows at IP-CAN session establishment.

Important

ASR 5500 supports only eight flow information including the flow description per dynamic charging rule in a Gx message.

Terminology and Definitions

This section describes features and terminology pertaining to Rel. 10 Gx functionality.

Volume Reporting Over Gx

This section describes the 3GPP Rel. 10 Volume Reporting over Gx feature.

License Requirements

The Volume Reporting over Gx is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.
In 12.0 and later releases, no separate license is required for Charging over Gx / Volume Reporting over Gx feature. This feature can be enabled as part of "Policy Interface" license.

Supported Standards

The Volume Reporting over Gx feature is based on the following standard:

Feature Overview

The Volume Reporting over Gx feature provides PCRF the capability to make real-time decisions based on the data usage by subscribers.

Important

Volume Reporting over Gx is applicable only for volume quota.

In release 10.0, only total data usage reporting is supported, uplink/downlink level reporting is not supported. In 10.2 and later releases, it is supported.

The PCEF only reports the accumulated usage since the last report for usage monitoring and not from the beginning.

If the usage threshold is set to zero (infinite threshold), no further threshold events will be generated by PCEF, but monitoring of usage will continue and be reported at the end of the session.

In 12.2 and later releases, usage reporting on bearer termination is supported.

The following steps explain how Volume Reporting over Gx works:

1. PCEF after receiving the message from PCRF parses the usage monitoring related AVPs, and sends the information to IMSA.

2. IMSA updates the information to ECS.

3. Once the ECS is updated with the usage monitoring information from PCRF, the PCEF (ECS) starts tracking the data usage.

4. For session-level monitoring, the ECS maintains the amount of data usage.

5. For PCC rule monitoring, usage is monitored with the monitoring key as the unique identifier. Each node maintains the usage information per monitoring key. When the data traffic is passed, the usage is checked against the usage threshold values and reported as described in the Usage Reporting section.

6. The PCEF continues to track data usage after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session.

Usage Monitoring

• Usage Monitoring at Session Level: PCRF subscribes to the session-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit
AVP and Usage-Monitoring-Level AVP set to SESSION_LEVEL(0). After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. In 11.0 and later releases, Monitoring Key at session level is supported.

In 12.0 and later releases, enabling and disabling session usage in a single message from PCRF is supported. This is supported only if the monitoring key is associated at session level.

In 12.0 and later releases, monitoring of usage based on input/output octet threshold levels is supported. Usage is reported based on the enabled threshold level. If multiple levels are enabled, usage will be reported on all the enabled levels even if only one of the levels is breached. Monitoring will be stopped on the missing threshold levels in the response for the usage report from PCRF (expected to provide the complete set again if PCRF wants to continue monitoring on the multiple levels enabled earlier).

Total threshold level along with UL/DL threshold level in the GSU AVP is treated as an error and only total threshold level is accepted.

In releases prior to 17.0, extra CCR-U was generated for a monitoring key when the following requests are received in the response to the CCR-U which reported the usage for the same monitoring key.

- immediate reporting request with monitoring key at rule level
- immediate reporting request with or without monitoring key at session level
- explicit disable request at rule level
- explicit disable request at session level

In 17.0 and later releases, extra CCR-U is not generated for a monitoring key when all the above mentioned requests are received in the response to the CCR-U which reported the usage for the same monitoring key. Also, extra CCR-U is not generated when immediate reporting request without monitoring key at rule level is received in the response to the CCR-U which reported the usage for all the active monitoring keys.

- Usage Monitoring at Flow Level: PCRF subscribes to the flow-level volume reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to PCC_RULE_LEVEL(1). Monitoring Key is mandatory in case of a flow-level monitoring since the rules are associated with the monitoring key and enabling/disabling of usage monitoring at flow level can be controlled by PCRF using it. After the AVPs are parsed by DPCA, IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

Usage monitoring is supported for static, predefined rules, and dynamic rule definitions.

- Usage Monitoring for Static Rules: In the case of static rules, the usage reporting on last rule removal associated with the monitoring key is not applicable. In this case only the usage monitoring information is received from the PCRF.

- Usage Monitoring for Predefined Rules: If the usage monitoring needs to be enabled for the predefined rules, PCRF sends the rule and the usage monitoring information containing the monitoring key and the usage threshold. The Monitoring key should be same as the one pre-configured in PCEF for that predefined rule. There can be multiple rules associated with the same monitoring key. Hence enabling a particular monitoring key would result in the data being tracked for multiple rules having the same monitoring key. After DPCA parses the AVPs IMSA updates the information to ECS. Once ECS is updated usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present.

- Usage Monitoring for Dynamic Rules: If the usage monitoring needs to be enabled for dynamic ruledefs, PCRF provides the monitoring key along with a charging rule definition and the usage
monitoring information containing the monitoring key and the usage threshold. This would result in the usage monitoring being done for all the rules associated with that monitoring key. After DPCA parses the AVPs, IMSA updates the information to ECS. Once ECS is updated, the usage monitoring is started and constantly checked with the usage threshold whenever the data traffic is present. Monitoring key for dynamic rule def is dynamically assigned by PCRF which is the only difference with predefined rules in case of usage monitoring.

In releases prior to 15.0, when threshold breach happens for multiple monitoring keys at the same time, only one of the monitoring keys' usage is reported and the rest of the monitoring keys' usage is reported in CCR-T (threshold set to infinity). On Tx expiry/TCP link error, unreported usage is stored at ECS and reported only on session termination.

In 15.0 and later releases, only one of the monitoring keys' usage is reported first. Upon receiving successful response from PCRF, the rest of the monitoring keys' usage is reported to PCRF. On Tx expiry/TCP link error, unreported usage is stored at ECS. Any future successful interaction with PCRF for the session will send unreported UMI to PCRF.

Usage Reporting

Usage at subscriber/flow level is reported to PCRF under the following conditions:

- Usage Threshold Reached: PCEF records the subscriber data usage and checks if the usage threshold provided by PCRF is reached. This is done for both session and rule level reporting.
  For session-level reporting, the actual usage volume is compared with the usage volume threshold.
  For rule-level reporting the rule that hits the data traffic is used to find out if the monitoring key is associated with it, and based on the monitoring key the data usage is checked. Once the condition is met, it reports the usage information to IMSA and continues monitoring. IMSA then triggers the CCR-U if "USAGE_REPORT" trigger is enabled by the PCRF. The Usage-Monitoring-Information AVP is sent in this CCR with the "Used-Service-Unit" set to the amount of data usage by subscriber.
  If PCRF does not provide a new usage threshold in the usage monitoring information as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no usage status is reported.
  In the non-standard Volume Reporting over Gx implementation, usage monitoring will be stopped once the threshold is breached, else the monitoring will continue. There will be no further usage reporting until the CCA is received.

- Usage Monitoring Disabled: If the PCRF explicitly disables the usage monitoring with Usage-Monitoring-Support AVP set to USAGE_MONITORING_DISABLED, the PCEF stops monitoring and reports the usage information (when the monitoring was enabled) to PCRF if the usage monitoring is disabled by PCRF as a result of CCR from PCEF which is not related to reporting usage, other external triggers, or a PCRF internal trigger. If the PCRF does not provide a new usage threshold as a result of CCR from PCEF when the usage threshold is reached, the usage monitoring is stopped at PCEF and no further usage status is reported.

- IP CAN Session Termination: When the IP CAN session is terminated, the accumulated subscriber usage information is reported to PCRF in the CCR-T from PCEF. If PCC usage level information is enabled by PCRF, the PCC usage will also be reported.
  PCRF uses RAR message and includes Session-Release-Cause AVP in it to initiate IP CAN Session Termination. However, there are some scenarios where PCRF may want to terminate the IP CAN Session in CCA messages. In order to avoid an unnecessary additional message, PCRF can inform P-GW to
terminate the subscriber in CCA-U message itself. Hence, in 17.0 and later releases, the Session Release Cause has been added in CCA messages for all Gx dictionaries.

- **PCC Rule Removal**: When the PCRF deactivates the last PCC rule associated with a usage monitoring key, the PCEF sends a CCR with the data usage for that monitoring key. If the PCEF reports the last PCC rule associated with a usage monitoring key is inactive, the PCEF reports the accumulated usage for that monitoring key within the same CCR command if the Charging-Rule-Report AVP was included in a CCR command; otherwise, if the Charging-Rule-Report AVP was included in an RAA command, the PCEF sends a new CCR command to report accumulated usage for the usage monitoring key. In 12.0 and later releases, usage reporting on last rule deactivation using rule deactivation time set by PCRF is supported.

Releases prior to 14.0, when PCC rule was tried to be removed while waiting for access side update bearer response, the charging rules were not removed. In 14.0 and later releases, on receiving message from PCRF, the rule that is meant for removal is marked and then after the access side procedure is complete the rule is removed.

- **PCRF Requested Usage Report**: In 10.2 and later releases, the accumulated usage since the last report is sent even in case of immediate reporting, the usage is reset after immediate reporting and usage monitoring continued so that the subsequent usage report will have the usage since the current report. In earlier releases the behavior was to accumulate the so far usage in the next report.

- **Release 12.2 onwards**, usage reporting on bearer termination can be added. When a bearer is deleted due to some reason, the rules associated with the bearer will also be removed. So, the usage will be reported on the monitoring key(s) whose associated rule is the last one that is removed because of bearer termination.

- **Revalidation Timeout**: In the non-standard implementation, if usage monitoring and reporting is enabled and a revalidation timeout occurs, the PCEF sends a CCR to request PCC rules and reports all accumulated usage for all enabled monitoring keys since the last report (or since usage reporting was enabled if the usage was not yet reported) with the accumulated usage at IP-CAN session level (if enabled) and at service data flow level (if enabled) This is the default behavior.

In the case of standard implementation, this must be enabled by CLI configuration.

---

**Important**

The Usage Reporting on Revalidation Timeout feature is available by default in non-standard implementation of Volume Reporting over Gx. In 10.2 and later releases, this is configurable in the standard implementation. This is not supported in 10.0 release for standard based volume reporting.

Once the usage is reported, the usage counter is reset to zero. The PCEF continues to track data usage from the zero value after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then usage monitoring does not continue in the PCEF for that IP CAN session and and the usage accumulated between the CCR-CCA will be discarded.

In releases prior to 17.0, CCR-U triggered on server retries does not take server granted quota into account for reporting USU. In 17.0 and later releases, CCR-U triggered on server retries takes server granted quota into account for reporting USU. For newly created MSCC, interim quota configuration is taken as reference for reporting USU.

For information on how to configure the Volume Reporting over Gx feature, refer to Configuring Volume Reporting over Gx, on page 525.
**ICSR Support for Volume Reporting over Gx (VoRoGx)**

In releases prior to 15.0, post the ICSR switchover, any existing session for which the PCRF has enabled volume reporting used to continue indefinitely until the session is terminated or until CCR-U is sent for a given trigger, without having the volume counted via Gx.

To summarize, after an ICSR switchover, volume reporting over Gx is no longer done for existing sessions. Also, volume usage is not synced to standby chassis.

In 15.0 and later releases, volume threshold and volume usage are synced to standby chassis to support volume reporting over Gx for existing sessions post switchover.

Without this support it cannot cause a subscriber to use higher speeds than what s/he is supposed to get, if volume reporting is for example used to enforce fair usage; the operator may already consider this a revenue loss. It will also severely impact roaming subscribers who are supposed to get a notification and be blocked/redirected once the limits set by the EU roaming regulation are reached. If a session continues now without being blocked, the operator is not allowed to charge for data beyond the limit and will have a significant and real revenue loss (roaming partner may still charge for the data used on their SGSNs).

**Use of the Supported-Features AVP on the Gx Interface**

The Supported-Features AVP is used during session establishment to inform the destination host about the required and optional features that the origin host supports. The client will, in the first request in a Diameter session indicate the set of features required for the successful processing of the session. If there are features supported by the client that are not advertised as part of the required set of features, the client will provide in the same request this set of optional features that are optional for the successful processing of the session. The server will, in the first answer within the Diameter session indicate the set of features that it has in common with the client and that the server will support within the same Diameter session. Any further command messages will always be compliant with the list of supported features indicated in the Supported-Features AVPs and features that are not indicated in the Supported-Features AVPs during session establishment. Features that are not advertised as supported will not be used to construct the command messages for that Diameter session. Unless otherwise stated, the use of the Supported-Features AVP on the Gx reference point will be compliant with the requirements for dynamic discovery of supported features and associated error handling.

The base functionality for the Gx reference point is the 3GPP Rel. 7 standard and a feature is an extension to that functionality. If the origin host does not support any features beyond the base functionality, the Supported-Features AVP may be absent from the Gx commands. As defined in 3GPP TS 29.229, when extending the application by adding new AVPs for a feature, the new AVPs will have the M bit cleared and the AVP will not be defined mandatory in the command ABNF.

The Supported-Features AVP is of type grouped and contains the Vendor-Id, Feature-List-ID and Feature-List AVPs. On the Gx reference point, the Supported-Features AVP is used to identify features that have been defined by 3GPP and hence, the Vendor-Id AVP will contain the vendor ID of 3GPP (10415). If there are multiple feature lists defined for the Gx reference point, the Feature-List-ID AVP will differentiate those lists from one another.
<table>
<thead>
<tr>
<th>Feature bit</th>
<th>Feature</th>
<th>M/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Rel8</td>

<tr>
<td>4</td>
<td>SponsoredConnectivity</td>
<td>O</td>
<td>This feature indicates support for sponsored data connectivity feature. If the PCEF supports this feature, the PCRF may authorize sponsored data connectivity to the subscriber.</td>
</tr>
</tbody>
</table>

In releases prior to 15.0, the Supported-Features AVP was not encoded in CCR-U messages, but it was supported only in CCR-I message. If Rel. 8 dictionary or any dictionary beyond Rel. 8 is used and PCRF does not provide Supported-Features AVP in CCA-I, then the call gets dropped.

In 15.0 and later releases, if PCEF configures Diameter dictionary as release 8, 9 or 10, then PCRF sends Supported-Features AVP so that PCEF will know what feature PCRF supports. If PCEF receives supported features lesser than or greater than requested features then supported feature will be mapped to the lower one.

Whenever the custom dictionary "dpca-custom24" is configured, the Supported-Features AVP including Vendor-Id AVP will be sent in all CCR messages.
**Rule-Failure-Code AVP**

The Rule-Failure-Code AVP indicates the reason that the QoS/PCC rules cannot be successfully installed/activated or enforced. The Rule-Failure-Code AVP is of type Enumerated. It is sent by the PCEF to the PCRF within a Charging-Rule-Report AVP to identify the reason a PCC Rule is being reported.

In releases prior to 15.0, only 11 rule failure codes were defined as the values for this AVP. In 15.0 and later releases, two new rule failure codes INCORRECT_FLOW_INFORMATION (12) and NO_BEARER_BOUND (15) are added. The name of the existing rule failure code 9 is changed to MISSING_FLOW_INFORMATION. For 3GPP Rel. 10, rule failure code 9 maps to GW/PCEF_MALFUNCTION.

**Sponsored Data Connectivity**

With Sponsored Data Connectivity, the sponsor has a business relationship with the operator and the sponsor reimburses the operator for the user's data connectivity in order to allow the user access to an associated Application Service Provider's (ASP) services. Alternatively, the user pays for the connectivity with a transaction which is separate from the subscriber's charging. It is assumed the user already has a subscription with the operator.

Sponsored Data Connectivity feature is introduced in Rel. 10 of 3GPP TS 29.212 specification. If Sponsored Data Connectivity is supported, the sponsor identity for a PCC rule identifies the 3rd party organization (the sponsor) who is willing to pay for the operator's charge for connectivity required to deliver a service to the end user.

The purpose of this feature is to identify the data consumption for a certain set of flows differently and charge it to sponsor. To support this, a new reporting level "SPONSORED_CONNECTIVITY_LEVEL" is added for reporting at Sponsor Connection level and two new AVPs "Sponsor-Identity" and "Application-Service-Provider-Identity" have been introduced at the rule level.

Sponsored Data Connectivity will be performed for service data flows associated with one or more PCC rules if the information about the sponsor, the application service provider and optionally the threshold values are provided by the Application Function (AF).

The provisioning of sponsored data connectivity per PCC rule will be performed using the PCC rule provisioning procedure. The sponsor identity will be set using the Sponsor-Identity AVP within the Charging-Rule-Definition AVP of the PCC rule. The application service provider identity will be set using the Application-Service-Provider-Identity AVP within the Charging-Rule-Definition AVP of the PCC rule. Sponsor-Identity AVP and Application-Service-Provider-Identity AVP will be included if the Reporting-Level AVP is set to the value SPONSORED_CONNECTIVITY_LEVEL.

When receiving the flow based usage thresholds from the AF, the PCRF will use the sponsor identity to generate a monitoring key. The PCRF may also request usage monitoring control, in this case, only the flow based usage is applied for the sponsored data connectivity. If requested, the PCEF may also report the usage to the PCRF.

A new CLI command "diameter encode-supported-features" has been added in Policy Control Configuration mode to send supported features with Sponsor Identity. For more information on the command, see the Command Line Interface Reference.

Sponsored connectivity feature will be supported only when both P-GW and PCRF support 3GPP Rel. 10. P-GW advertises release as a part of supported features in CCR-I to PCRF. If P-GW supports Release 10 and also sponsored connectivity but PCRF does not support it (as a part of supported features in CCA-I), this feature will be turned off.

This feature implementation impacts only the Gx dictionary "dpca-custom15". Also note that this feature is supported only for the dynamic rules.
**Volume Reporting**

For Volume Reporting over Gx, PCRF generates a unique monitoring key based on sponsor identity. Since flows with different monitoring keys are treated differently, flows with sponsor ID are charged differently.

**Supported Gx Features**

**Assume Positive for Gx**

In a scenario where both the primary and secondary PCRF servers are overloaded, the PCRF returns an error to P-GW and HSGW. Current behavior for the P-GW and HSGW is to terminate the session if both primary and secondary return a failure or timeout.

This feature is developed to enhance this behavior by applying local policy on the GW to ensure that the subscriber session continues. P-GW / HSGW should implement Assume Positive feature to handle errors and based on the event type implement specific rules.

---

**Important**

Use of Gx Assume Positive requires that a valid license key be installed. Contact your Cisco account representative for information on how to obtain a license.

The failure handling behavior is enhanced to ensure that the subscriber service is maintained in case of PCRF unavailability. It is also required that the GW reduces the traffic towards the PCRF when receiving a Diameter Too Busy (3004) by stopping the transmission and reception of Diameter messages (CCRs and RARs) to and from the PCRF for a configurable amount of time.

In case of any of the following failures with PCRF, the GW chooses to apply failure handling which results in subscriber termination or to allow browsing without any more policy enforcement.

- TCP link failure
- Application Timer (Tx) expiry
- Result code based failures

In 14.1 and later releases, the PCRF is allowed to fall back to Local Policy for all connection level failures, result code/experimental result code failures. Local Policy may choose to allow the subscriber for a configured amount of time. During this time any subscriber/internal event on the call would be handled from Local Policy. After the expiry of the timer, the subscriber session can be either terminated or else PCRF can be retried. Note that the retry attempt to PCRF happens only when the timer-expiry event is configured as reconnect-to-server.

The fallback support is added to the failure handling template and the local policy service needs to be associated to IMS Authorization service.

Once the local policy is applied, all PCRF enabled event triggers will be disabled. When the subscriber session is with the local-policy, the GW skips sending of CCR-T and cleans up the session locally.

For a session that was created with active Gx session, the GW sends the CCR-T to primary and on failure sends the CCR-T to the secondary PCRF. If the CCR-T returns a failure from both primary and secondary or times out, the GW cleans up the session locally.

Fallback to Local Policy is done in the following scenarios:

- Tx timer expiry
- Diabase Error
• Result Code Error (Permanent/Transient)
• Experimental Result Code
• Response Timeout

The following points are applicable only in the scenario where reconnect to PCRF is attempted.

• If the subscriber falls back to local-policy because of CCR-I failure, CCR-I will be sent to the PCRF after the timer expiry. On successful CCA-I call will be continued with PCRF or else the call will be continued with local-policy and retry-count will be incremented.

• If the subscriber falls back to local-policy because of the CCR-U failure, IMS Authorization application waits for some event change to happen or to receive an RAR from PCRF.

• In case of event change after the timer expiry, CCR-U will be sent to PCRF. On successful CCA-U message, call will be continued with PCRF or else call will be with local-policy and retry-count will be incremented.

• If RAR is received after the timer-expiry the call will be continued with the PCRF. On expiry of maximum of retries to connect to PCRF, call will be disconnected.

**Default Policy on CCR-I Failure**

The following parameters are supported for local configuration on P-GW. The configuration parameters are configurable per APN and per RAT Type.

The following fields for a Default Bearer Charging Rule are configurable per APN and per RAT Type:

• Rule Name
• Rating Group
• Service ID
• Online Charging
• Offline Charging
• QCI
• ARP
  • Priority Level
  • QCI
  • QVI
• Max-Requested-Bandwidth
  • UL
  • DL

Flow Description and Flow Status are not configurable but the default value will be set to Any to Any and Flow Status will be set to Enabled.

The following command level fields are configurable per APN and per RAT Type:

• AMBR
  • UL
  • DL
• QCI
• ARP
Gx Back off Functionality

This scenario is applicable when Primary PCRF cluster is unavailable but the secondary PCRF is available to handle new CCR-I messages.

When the chassis receives 3004 result-code then back-off timer will be started for the peer and when the timer is running no messages will be sent to that peer.

The timer will be started only when the value is being configured under endpoint configuration.

Releases prior to 15.0, when the IP CAN session falls back to local policy it remained with local policy until the termination timer expires or the subscriber disconnects. Also, the RAR message received when the local-policy timer was running got rejected with the cause "Unknown Session ID".

In 15.0 and later releases, P-GW/GGSN provides a fair chance for the subscriber to reconnect with PCRF in the event of CCR failure. To support this feature, configurable validity and peer backoff timers are introduced in the Local Policy Service and Diameter endpoint configuration commands. Also, the RAR received when the local-policy timer is running will be rejected with the cause "DIAMETER_UNABLE_TO_DELIVER".

In releases prior to 17.0, rule report was not sent in the CCR messages when PCRF is retried after the expiry of validity timer. In 17.0 and later releases, rule report will be sent to the PCRF during reconnect when the CLI command **diameter encoderevent-avps local-fallback** is configured under Policy Control Configuration mode.

Support for Volume Reporting in Local Policy

This feature provides support for time based reconnect to PCRF instead of the event based for CCR-U failure scenarios.

In releases prior to 17.0, the following behaviors were observed with respect to the Volume Reporting for Local Policy:

- In the event of CCR-U failure, CCR-U was triggered to PCRF only on receiving subscriber event.
- When a CCR-U failure happened and a call continued without Gx, unreported volume is lost as the threshold is set to infinity. In next CCR-U triggered to PCRF, the cumulative volume was sent to PCRF.
- RAR was rejected with result-code diameter_unable_to_comply (3002) when the validity timer is running.

In 17.0 and later releases, with the timer-based implementation, this feature introduces the following changes to the existing behavior:

- When send-usage-report is configured, the CCR-U with usage report will be sent immediately after the local-policy timer-expiry.
- The unreported usage will not be returned to ECS. Thus, usage since last tried CCR-U will be sent to PCRF.
- RAR will be accepted and the rules received on RAR will be installed even when the timer is running.

Session can be connected to PCRF immediately instead of waiting for subscriber event, and the updated usage report can be sent.
Support for Session Recovery and Session Synchronization

Currently PCRF and ASR 5500 gateway node are in sync during normal scenarios and when Gx assume positive is not applied. However, there are potential scenarios where the PCRF might have been locally deleted or lost the Gx session information and it is also possible that due to the loss of message, gateway node and PCRF can be out of sync on the session state.

While these are rare conditions in the network, the desired behavior is to have PCRF recover the Gx session when it is lost and also to have PCRF and gateway sync the rule and session information. This feature provides functionality to ensure PCRF and gateway can sync on session information and recover any lost Gx sessions. Configuration support has been provided to enable session recovery and session sync features.

In releases prior to 17.0, the implementation is as follows:

- If the PCRF deletes or loses session information during a Gx session update (CCR-U) initiated by the gateway, PCRF will respond back with DIAMETER_UNKNOWN_SESSION_ID resulting in session termination even in the case of CCR-U.
- If the PCRF deletes or loses session information and an Rx message is received, PCRF will not be able to implement corresponding rules and will result in failure of subscriber voice or video calls.
- For subscriber's existing Rx sessions and active voice/video calls, PCRF will not be able to initiate cleanup of the sessions towards the gateway and can result in wastage of the resources in the network (dedicated bearers not removed) or can result in subscriber not able to place calls on hold or conference or remove calls from hold.
- For out of sync scenarios, PCRF and gateway could be implementing different policies and can result in wastage of resources or in poor subscriber experience. Existing behavior does not provide for a way to sync the entire session information.

In 17.0 and later releases, the gateway (GW) node and PCRF now supports the ability to exchange session information and the GW provides the complete subscriber session information to enable PCRF to build the session state. This will prevent the occurrence of the above mentioned scenarios and ensure that GW and PCRF are always in sync. The keywords session-recovery and session-sync are used with the diameter encode-supported-features CLI command in Policy Control Configuration mode to support Gx Synchronization.

Configuring Gx Assume Positive Feature

To configure Gx Assume Positive functionality:

**Step 1**
At the global configuration level, configure Local Policy service for subscribers as described in the Configuring Local Policy Service at Global Configuration Level, on page 570.

**Step 2**
At the global configuration level, configure the failure handling template to use the Local Policy service as described in the Configuring Failure Handling Template at Global Configuration Level, on page 571.

**Step 3**
Within the IMS Authorization service, associate local policy service and failure handling template as described in the Associating Local Policy Service and Failure Handling Template, on page 571.

**Step 4**
Verify your configuration as described in the Verifying Local Policy Service Configuration, on page 571.

**Step 5**
Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.
Important Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

Configuring Local Policy Service at Global Configuration Level

Use the following example to configure Local Policy Service at global configuration level for subscribers:

```plaintext
configure
  local-policy-service LOCAL_PCC
    ruledef 2G_RULE
      condition priority 1 apn match .*
      exit
    ruledef all-plmn
      condition priority 1 serving-plmn match .*
      exit
    actiondef 2G_UPDATE
      action priority 1 activate-ambr uplink 18000 downlink 18000
      action priority 2 reject-requested-qos
      exit
    actiondef action1
      action priority 2 allow-requested-qos
      exit
    actiondef allow
      action priority 1 allow-session
      exit
    actiondef delete
      action priority 1 terminate-session
      exit
    actiondef lp_fall
      action priority 1 reconnect-to-server
      exit
    actiondef time
      action priority 1 start-timer timer duration 10
    exit
  eventbase default
    rule priority 1 event fallback ruledef 2G_RULE actiondef time
    continue
      rule priority 2 event new-call ruledef 2G_RULE actiondef action1
      rule priority 3 event location-change ruledef 2G_RULE actiondef
      action1
      rule priority 5 event timer-expiry ruledef 2G_RULE actiondef
      lp_fall
      rule priority 6 event request-qos default-qos-change ruledef
    2G_RULE actiondef allow
  end
```

Notes:
• On occurrence of some event, event will be first matched based on the priority under the eventbase default. For the matched rule and if the corresponding ruledef satisfies, then specific action will be taken.

Configuring Failure Handling Template at Global Configuration Level

Use the following example to configure failure handling template at global configuration level:

```plaintext
configure
  failure-handling-template <template_name>
    msg-type any failure-type any action continue local-fallback
  end
```

Notes:

• When the TCP link failure, Application Timer (Tx) expiry, or Result code based failure happens, the associated failure-handling will be considered and if the failure-handling action is configured as local-fallback, then call will fall back to local-fallback mode.

Associating Local Policy Service and Failure Handling Template

Use the following example to associate local policy service and failure handling template:

```plaintext
configure
  context <context_name>
    ims-auth-service <service_name>
      associate local-policy-service <lp_service_name>
      associate failure-handling <failure-handling-template-name>
  end
```

Verifying Local Policy Service Configuration

To verify the local policy service configuration, use this command:

```plaintext
show local-policy statistics service service_name
```

Time Reporting Over Gx

This section describes the Time Reporting over Gx feature supported for GGSN in this release.

License Requirements

No separate license is required for Time Reporting over Gx feature. This feature can be enabled as part of "Policy Interface" license.

Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Feature Overview

This non-standard Time Usage Reporting over Gx feature is similar to Volume Usage Reporting over Gx. PCRF provides the time usage threshold for entire session or particular monitoring key in CCA or RAR. When the given threshold breached usage report will be sent to PCRF in CCR. This time threshold is independent of data traffic. Apart from the usage threshold breach there are other scenarios where usage report will be send to PCRF.
Time reporting over Gx is applicable only for time quota. The PCEF only reports the accumulated time usage since the last report for time monitoring and not from the beginning.

If the time usage threshold is set to zero (infinite threshold), no further threshold events will be generated by PCEF, but monitoring of usage will continue and be reported at the end of the session.

Time usage reporting on bearer termination is supported. When a bearer is deleted due to some reason, the rules associated with the bearer will also be removed. So, the usage will be reported on the monitoring key(s) whose associated rule is the last one that is removed because of bearer termination.

The following steps explain how Time Reporting over Gx works:

1. PCEF after receiving the message from PCRF parses the time monitoring related AVPs, and sends the information to IMSA.
2. IMSA updates the information to ECS.
3. Once the ECS is updated with the time monitoring information from PCRF, the PCEF (ECS) starts tracking the time usage.
4. For session-level monitoring, the ECS maintains the amount of time usage.
5. For PCC rule monitoring, usage is monitored with the monitoring key as the unique identifier. Each node maintains the time usage information per monitoring key.
6. The PCEF continues to track time usage after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then time monitoring does not continue in the PCEF for that IP CAN session.

Limitations

This section lists the limitations for Time Reporting over Gx in this release.

- Only integer monitoring key will be supported like Volume Reporting over Gx
- If the same monitoring key is used for both time and data volume monitoring then disabling monitoring key will disable both time and data usage monitoring.
- If the same monitoring key is used for both time and data usage monitoring and if an immediate report request is received, then both time and volume report of that monitoring key will be sent.

Usage Monitoring

Two levels of time usage reporting are supported:

- Usage Monitoring at Session Level
- Usage Monitoring at Flow Level

Usage Monitoring at Session Level

PCRF subscribes to the session level time reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to SESSION_LEVEL (0).
**Usage Monitoring at Flow Level**

PCRF subscribes to the flow level time reporting over Gx by sending the Usage-Monitoring-Information AVP with the usage threshold level set in Granted-Service-Unit AVP and Usage-Monitoring-Level AVP set to PCC_RULE_LEVEL(1). Monitoring Key is mandatory in case of a flow level monitoring since the rules are associated with the monitoring key and enabling or disabling of usage monitoring at flow level can be controlled by PCRF using it. Usage monitoring is supported for both predefined rules and dynamic rule definition.

**Usage Monitoring for Predefined and Static Rules**

If the usage monitoring needs to be enabled for the predefined rules, PCRF sends the rule and the usage monitoring information containing the monitoring key and the usage threshold. The monitoring key should be same as the one pre-configured in PCEF for that predefined rule. There can be multiple rules associated with the same monitoring key. Hence enabling a particular monitoring key would result in the time being tracked for multiple rules having the same monitoring key. Similarly, usage monitoring information is sent from PCRF for the static rules also.

**Usage Monitoring for Dynamic Ruledefs**

If the usage monitoring needs to be enabled for dynamic ruledefs, PCRF provides the monitoring key along with a charging rule definition and the usage monitoring information containing the monitoring key and the usage threshold. This results in the usage monitoring being done for all the rules associated with that monitoring key.

**Usage Reporting**

Time usage at subscriber/flow level is reported to PCRF under the following conditions:

- **Usage Threshold Reached:** PCEF records the subscriber usage and checks if the usage threshold provided by PCRF is reached. Once the condition is met, it reports the usage information to IMSA and continues monitoring. IMSA then triggers the CCR-U if "USAGE_REPORT" trigger is enabled by PCRF. The Usage-Monitoring-Information AVP is sent in this CCR with the "CC-Time" in "Used-Service-Unit" set to track the time usage of the subscriber.

- **Usage Monitoring Disabled:** If PCRF explicitly disables the usage monitoring with Usage-Monitoring-Support AVP set to USAGE_MONITORING_DISABLED, PCEF stops monitoring and reports the usage information (when the monitoring was enabled) to PCRF if the usage monitoring is disabled by PCRF as a result of CRR from PCEF which is not related to reporting usage, other external triggers, or a PCRF internal trigger.

- **IP CAN Session Termination:** When the IP CAN session is terminated, the accumulated subscriber usage information is reported to PCRF in the CCR-T from PCEF.

PCRF uses RAR message and includes Session-Release-Cause AVP in it to initiate IP CAN Session Termination. However, there are some scenarios where PCRF may want to terminate the IP CAN Session in CCA messages. In order to avoid an unnecessary additional message, PCRF can inform P-GW to terminate the subscriber in CCA-U message itself. Hence, in 17.0 and later releases, the Session Release Cause has been added in CCA messages for all Gx dictionaries.

- **PCC Rule Removal:** When the PCRF deactivates the last PCC rule associated with a usage monitoring key, PCEF sends a CCR with the usage time for that monitoring key. If the PCEF reports the last PCC rule associated with a usage monitoring key is inactive, the PCEF reports the accumulated usage for that monitoring key within the same CCR command if the Charging-Rule-Report AVP was included in a CCR command; otherwise, if the Charging-Rule-Report AVP was included in an RAA command, the PCEF sends a new CCR command to report accumulated usage for the usage monitoring key.
• PCRF Requested Usage Report: When PCRF provides the Usage-Monitoring-Information with the Usage-Monitoring-Report set to USAGE_MONITORING_REPORT_REQUIRED, PCEF sends the time usage information. If the monitoring key is provided by PCRF, time usage for that monitoring key is notified to PCRF regardless of usage threshold. If the monitoring key is not provided by PCRF, time usage for all enabled monitoring keys is notified to PCRF.

• Event Based Reporting: The event based reporting can be enabled through the CLI command event-update send-usage-report events. When an event like sgsn change, qos change or revalidation-timeout is configured under this CLI, time usage report is generated whenever that event happens.

Once the usage is reported, the usage counter is reset to zero. The PCEF continues to track time usage from the zero value after the threshold is reached and before a new threshold is provided by the PCRF. If a new usage threshold is not provided by the PCRF in the acknowledgement of an IP-CAN Session modification where its usage was reported, then time usage monitoring does not continue in the PCEF for that IP CAN session.

For information on how to configure the Time Reporting over Gx feature, see the Configuring Time Reporting over Gx, on page 574.

Configuring Time Reporting over Gx

This section describes the configuration required to enable Time Reporting over Gx.

To enable Time Reporting over Gx, use the following configuration:

```
configure
    active-charging service <ecs_service_name>
    rulebase <rulebase_name>
        action priority <priority> dynamic-only ruledef <ruledef_name>
    charging-action <charging_action_name> monitoring-key <monitoring_key>
        exit
        exit
        context <context_name>
        ims-auth-service <imsa_service_name>
    policy-control
        event-update send-usage-report [ reset-usage ]
    end
```

Notes:

• The configuration for enabling Time Reporting over Gx is same as the Volume Reporting over Gx configuration. If a time threshold is received from PCRF then Time monitoring is done, and if a volume threshold is received then Volume monitoring will be done.

• The maximum accepted monitoring key value by the PCEF is 4294967295. If the PCEF sends a greater value, the value is converted to an Unsigned Integer value.

• The event-update CLI enables time usage report to be sent in event updates. The optional keyword reset-usage enables to support delta reporting wherein the usage is reported and reset at PCEF. If this option is not configured, the behavior is to send the time usage information as part of event update but not reset at PCEF.
Support for Multiple Active and Standby Gx Interfaces to PCRF

In the earlier Gx implementation, Diameter Policy Control Application has the limitation to mandatorily configure hosts as part of IMS Authorization service or associate a host template and select the hosts to be communicated for each subscriber session. Since the peer selection can happen at diabase and application need not select any hosts, this feature is developed to remove the restrictions imposed in the application and allow diabase to pick the peers in a round robin fashion. In addition, this feature will take care of peer selection at diabase even when the hosts picked by application are not active. This change in behavior is controlled through the CLI command "endpoint-peer-select" as the default behavior is to drop the call if the server discovery fails at application.

When the call is established, IMSA module checks the host selection table/prefix table/host template associated in IMSA service to pick the primary and secondary peers to be contacted. If no host table/prefix table/host template is configured or none of the rows in prefix table are matching or the hosts selected by IMSA are inactive, then based on the CLI configuration the control is given to diabase module which will select the peers in a round robin fashion or terminate the call based on the CLI configuration.

When the CCR message results in a diabase error/Tx expiry/response timeout, then IMSA will let diabase select an alternate route by excluding the peer which resulted in the failure and switch to the peer if the lookup is successful.

When CCR/CCA message is exchanged with the directly connected host selected by diabase and RAR message is received from new host, then IMSA will skip host configuration check and let further communication to happen with the new host. If the directly connected host is selected by application during call establishment, then IMSA will check if the new host is the secondary server per application. When the CCR/CCA message is exchanged with indirectly connected host through DRA which is picked by diabase and RAR message is received from same host through another DRA, then IMSA will skip host configuration check and let further communication to happen with the same host through the new DRA. If the DRA is selected by application during call establishment, then IMSA will check if the new DRA is the secondary server per application. Even if RAR message is received from different host though another DRA, IMSA will skip host configuration check and let further communication to happen with the new host through the new DRA.

Configuring Diameter Peer Selection at Diabase in Failure Scenarios

The following configuration enables diabase to select the Diameter peers when IMSA fails.

```
configure
c  context  context_name
    ims-auth-service  service_name
    policy-control
        endpoint-peer-select [ on-host-select-failure | on-inactive-host ]
        { default | no } endpoint-peer-select
    end
end
```

Notes:

- This command is used to perform server selection at diabase when the hosts could not be selected by IMS Authorization application or when the hosts selected by the IMS Authorization application is inactive. For example, host table is not configured in IMSA service, host table is configured but not activated, none of the rows in prefix table match the subscriber, host template is not associated with IMSA service, host template could not select the hosts.
- **on-host-select-failure**: Specifies to perform server selection at Diabase when the hosts could not be selected by IMS Authorization application.
• **on-inactive-host**: Specifies to perform server selection at diabase when the hosts selected by application are inactive.
  
  • This CLI command is added in policy control configuration mode to maintain backward compatibility with the old behavior of terminating the call when server selection fails at IMS Authorization application.

### Support for Multiple CCR-Us over Gx Interface

ASR 5500 node earlier supported only one pending CCR-U message per session over Gx interface. Any request to trigger CCR-U (for access side updates/internal updates) were ignored/dropped, when there was already an outstanding message pending at the node. PCEF and PCRF were out of synch if CCR-U for critical update was dropped (like RAT change/ULI change).

In 17.0 and later releases, ASR 5500 supports multiple CCR-U messages at a time per session through the use of a configurable CLI command "**max-outstanding-ccr-u**" under IMS Authorization Service configuration mode. That is, this CLI will allow the user to configure a value of up to 12 as the maximum number of CCR-U messages per session.

The CLI-based implementation allows sending request messages as and when they are triggered and processing the response when they are received. The gateway does re-ordering if the response messages are received out of sequence.

To support multiple outstanding messages towards PCRF, the following items should be supported:

- **Allowing IMSA to send multiple CCR-U messages** – This can be achieved through the use of **max-outstanding-ccr-u** command in the IMS Authorization Service configuration mode.
- **Queueing of response message for ordering** – DPCA should parse the received message irrespective of order in which they are received. IMSA will check whether to forward the response to session manager or queue it locally.
- **Peer switch** – When multiple CCR-Uss are triggered, IMSA will start Tx timer for each request sent out. On first Tx expiry, IMSA/DPCA will do peer switch. That is, IMSA will stop all other requests’ Tx timers and switch to secondary peer (if available) or take appropriate failure handling action.
- **Failure handling** – On peer switch failure due to Tx expiry, DPCA will take failure handling action based on the configuration present under ims-auth-service.
- **Handling back pressure** – In case of multiple CCR-Uss triggered to Primary PCRF and due to Tx timeout all the messages are switched to Secondary PCRF. If Secondary server is already in backpressure state, then IMSA will put first message in the backpressure queue and once after message is processed next pending request will be put into BP queue.
- **Volume reporting** – In case of multiple CCR-Uss for usage report is triggered (for different monitoring keys) and failure handling is configured as "**continue send-ccrt-on-call-termination**", on first Tx timeout or response timeout, usage report present in all the CCR-Uss will be sent to ECS. All the unreported usage will be sent in CCR-T message when the subscriber goes down. If "**event-update send-usage-report**" CLI is present, then there are chances of reporting usage for same monitoring key in multiple CCR-Uss.

Though the **max-outstanding-ccr-u** CLI command supports configuring more than one CCR-U, only one outstanding CCR-U for access side update is sent out at a time and multiple CCR-Uss for internal updates are sent.

These are the access side updates for which CCR-U might be triggered:

- Bearer Resource Command
- Modify Bearer Request (S-GW change, RAT change, ULI change)
- Modify Bearer Command

These are the following internal updates for which CCR-U is triggered:
- S-GW restoration
- Bearer going down (GGSN, BCM UE_Only)
- ULI/Timezone notification
- Default EPS bearer QoS failure
- APN AMBR failure
- Charging-Rule-Report
- Out of credit / reallocation of credit
- Usage reporting
- Tethering flow detection
- Access network charging identifier

### Configuring Gateway Node to Support Back-to-Back CCR-U$s$

The following configuration enables or disables the gateway to send multiple back-to-back CCR-U$s$ to PCRF.

```bash
configure
  context context_name
    ims-auth-service service_name
    policy-control
      [ default ] max-outstanding-ccr-u value
  end
end
```

**Notes:**
- `value` must be an integer value from 1 through 12. The default value is 1.

### Support for RAN/NAS Cause IE on Gx Interface

New supported feature "Netloc-RAN-NAS-Cause" has been introduced to be in compliance with the Release 12 specification of 3GPP TS 29.212. This feature is used to send detailed RAN and/or NAS release cause code information from the access network to PCRF. It requires that the NetLoc feature is also supported.

**Important**

This feature can be enabled only when the NetLoc feature license is installed.

A new Diameter AVP "RAN-NAS-Release-Cause" will be included in the Charging-Rule-Report AVP and in CCR-T for bearer and session deletion events respectively, when the NetLoc-RAN-NAS-Cause supported feature is enabled. This AVP will indicate the cause code for the subscriber/bearer termination.

### Configuring Supported Feature Netloc-RAN-NAS-Cause

The following configuration enables the supported feature "Netloc-RAN-NAS-Cause".

```bash
configure
  context context_name
    ims-auth-service service_name
    policy-control
      diameter encode-supported-features netloc-ran-nas-cause
  end
end
```

**Notes:**
• **netloc-ran-nas-cause**: Enables the Netloc-RAN-NAS-Cause feature. By default, this supported feature will be disabled.
  • If the supported features "netloc-ran-nas-code" and "netloc" are enabled, then netloc-ran-nas-cause code will be sent to PCRF.

To disable this supported feature, use the following command:

```
[ default | no ] diameter encode-supported-features
```

### Support ADC Rules over Gx Interface

In this release, P-GW will use Application Detection and Control (ADC) functionality over Gx as defined in the Release 11 specification of 3GPP standard.

ADC extension over Gx provides the functionality to notify PCRF about the start and stop of a specific protocol or a group of protocols, and provide the possibility to PCRF that with the knowledge of this information, change the QoS of the user when the usage of application is started and until it is finished.

The provision of ADC information is done through the ADC rule, the action initiated by PCRF is done through the PCC rule.

ADC rules are certain extensions to dynamic and predefined PCC rules in order to support specification, detection and reporting of an application flow. These rules are installed (modified/removed) by PCRF via CCA-1/CCA-U/RAR events. ADC rules can be either dynamic PCC or predefined PCC rules, and the existing attributes of dynamic and predefined rules will be applicable.

Dynamic PCC rule contains either traffic flow filters or Application ID. When Application ID is present, the rule is treated as ADC rule. Application ID is the name of the ruledef which is pre-defined in the boxer configuration. This ruledef contains application filters that define the application supported by P2P protocols.

PCEF will process and install ADC rules that are received from PCRF interface, and will detect the specified applications and report detection of application traffic to the PCRF. PCRF in turn controls the reporting of application traffic.

PCEF monitors the specified applications that are enabled by PCRF and generates Start/Stop events along with the Application ID. Such application detection is performed independent of the bearer on which the ADC PCC rule is bound to. For instance, if ADC rule is installed on a dedicated bearer whereas the ADC traffic is received on default bearer, application detection unit still reports the start event to PCRF.

**Important**

ADC Rule support is a licensed-controlled feature. Contact your Cisco account representative for detailed information on specific licensing requirements.

In support of this feature, the following Diameter AVPs are newly added to the Charging-Rule-Definition AVP, which PCEF will receive from PCRF.

• **TDF-Application-Identifier**: It references the application detection filter which the PCC rule for application detection and control in the PCEF applies. The TDF-Application-Identifier AVP references also the application in the reporting to the PCRF.
  
• **Redirect-Information**: This indicates whether the detected application traffic should be redirected to another controlled address.
  
• **Mute-Notification**: This AVP is used to mute the notification to the PCRF of the detected application's start/stop for the specific ADC/PCC rule from the PCEF.
• Application Detection Information: If Mute-Notification AVP is not enclosed with charging rule report and APPLICATION_START/APPLICATION_STOP event trigger is enabled then PCEF will send Application-Detection-Information to PCRF corresponding TDF-Application-Identifier.

In addition, these two new event triggers "APPLICATION_START" and "APPLICATION_STOP" are generated for reporting purpose.

**ADC over Gx Enhancement**

With release 21.3.12, the Cisco P-GW is capable of buffering APP_STOP messages for a flow, if the flow matches with a new ADC rule. A maximum of five APP_STOP messages is buffered per flow.

APP_STOP buffering can be enabled with the adc **app-notification** CLI command in the ACS Rulebase Configuration mode. This command should be applied when the flow is being created. Changes to configuration will be applied to the newly created flows.

---

**Important**

In 21.3.12 and later releases, the **notify** command is deprecated. The **notify** command has been replaced by the **app-notification** command.

---

When a flow is terminated, all the buffered APP_STOP messages are sent to the PCRF. During flow termination, if the ADC rule is no longer active, the APP_STOP message is not sent to the PCRF.

When a bearer is terminated, the flows present on that bearer are also deleted. On termination, the APP_STOP messages are sent for these flows. APP_STOP messages are only sent for those flows that were present on the bearer at the point of termination.

Since the APP_STOP message is buffered at a flow-level, there is an increase in memory utilization for every rule stored in the Session Manager.

---

**Note**

This enhancement does not affect the Custom-Mute feature as it is implemented at a flow-level.

**Limitations**

The limitations for the ADC over Gx feature are:

- ADC does not support group of ruledefs.
- Registration of the duplicate application IDs are not supported.
- Readdress/Redirection for P2P flows will not be supported.
- Redirection happens only on transactions of GET/Response.
- Port based, IP Protocol based, and URL based applications are not supported.
- Pre-configured options (precedence, redirect-server-ip) for dynamic ADC rules are not supported.
- Simultaneous instances of an application for the same subscriber are not distinguished.
- Flow recovery is not supported for application flows.

**Configuring ADC Rules over Gx**

The following configuration enables ADC rules over Gx interface.
configure
case context_name
    ims-auth-service service_name
    policy-control
diameter encode-supported-features adc-rules
end

Notes:
• The keyword "adc-rules" will be available only when the feature-specific license is configured.
• For ADC 6th bit of supported feature will be set.

To disable the support for ADC Rules over Gx, use the following command:
[ default | no ] diameter encode-supported-features

GoR Name Support in TDF-Application-Identifier

ASR 5500 supports dynamic rules to be installed with GoR name as TDF-Application-Identifier. When ADC rule is installed as a dynamic rule from PCRF, the TDF-Application-Identifier can include the GoR name pre-configured in the P-GW.

If the ADC feature is enabled, PCRF can send TDF-Application-Identifier as the name of GoR predefined in the P-GW configuration.

• When dynamic charging-rules with the Charging-Rule-Definition AVP are activated from PCRF, the PCRF can specify the GoR name configured in ECS as TDF-Application-Identifier.

• When dynamic charging-rules with the Charging-Rule-Definition AVP are activated, the PCRF can remove or modify the rule through the Charging-Rule-Definition using RAR. During rule activation or modification, the PCRF can add, modify or remove the charging-rule attributes of the rule.

The configuration changes for TDF-Application-Identifier from PCRF are listed below:

• A non-ADC dynamic rule can be changed to ADC dynamic rule by sending TDF-Application-Identifier AVP with relevant ruledef or GoR name.

ADC dynamic rule cannot be changed to non-ADC dynamic rule.

• The following AVPs will be modified and applied when received from PCRF:
  • Precedence
  • Rating-Group/Service-Identifier/Sponsor-Identity (mandatory depending on the Reporting-Level)
  • Metering-Method
  • Online/Offline
  • QoS-Information
  • Monitoring-Key
  • Redirect-Information

• Dynamic route will be updated for all protocols of rules that are part of TDF-Application-Identifier GoR.
Any change in dynamic rule priority or TDF-Application-Identifier value will lead to sending of APP-START and APP-STOP event notifications as new rule match. If an APP-START notification was sent already before rule modification, the corresponding APP-STOP notification will not be sent.

Runtime deletion of associated GoR will take immediate effect and APP-STOP notification will not be sent if an APP-START was already sent. Addition of GoR at service level will need to have rules to be re-installed for the new addition to take effect for both dynamic and predefined ADC rules.

**ADC Mute Customization**

Earlier, 3GPP ADC over Gx did not support application MUTE status change. Once the application was muted, it was not possible to unmute it. From release 21.1, this feature introduces custom MUTE/UNMUTE functionality. ASR 5500 PCEF now supports customization to control reporting of the Application Detection Information CCRUs. For this, an AVP has been introduced with two possible values - custom MUTE and custom UNMUTE.

- A Gx message might contain both Standards based MUTE and the custom MUTE.
- Standards based MUTE is given preference over the custom MUTE/UNMUTE.
- A dynamic ADC rule can be installed and modified with a custom MUTE.
- Custom-Mute-Notification AVP can be sent by the PCRF in CCA-I and RAR.
- A dynamic ADC rule can be modified with a custom UNMUTE.
- On a custom MUTE for a given dynamic ADC rule, PCEF sends a single APPLICATION_START/APPLICATION_STOP response for the entire application traffic rather the per flow APPLICATION_START/APPLICATION_STOP response.
- On a custom MUTE for a given dynamic ADC rule, if no APPLICATION_START has been sent prior to the custom MUTE then a single APPLICATION_START is sent on the next flow packet that hits the dynamic rule.
- On a custom MUTE for a given dynamic rule, the APPLICATION_START response is sent with the flow's 5-tuple information.
- A dynamic ADC rule can be installed and modified with a custom MUTE.
- On a custom MUTE for a given dynamic rule, the APPLICATION_START response is sent with TDF-Application-Instance-Identifier = 0.
- On a custom MUTE for a given dynamic rule, a single APPLICATION_STOP is sent when the last flow associated with the given dynamic rule is terminated. Such an APPLICATION_STOP will not contain 5-tuple information of the last flow and is sent with TDF-Application-Instance-Identifier = 0.
- On a custom UNMUTE for a given dynamic rule, APPLICATION_STARTs response is matched with the given dynamic rule and then sent to all the forthcoming flows.
- There is no change in behavior for a custom UNMUTE, which has not been custom MUTED or standard MUTED before UNMUTING. APPLICATION_STARTs and APPLICATION_STOPs is continued to be sent per flow as before.
- On a custom UNMUTE, PCEF sends an APPLICATION_STOP each for all flows that terminate then onwards.
- A given dynamic rule is recovered in both SR and ICSR including the Custom MUTE/UNMUTE status. The APPLICATION_START status for a given dynamic rule is check-pointed and recovered. This ensures that an extra APPLICATION_START is not sent to the PCRF post recoveries.
Enhancement to the ADC Custom Mute/Unmute Functionality

Revision History

Revision history details are not provided for features introduced before release 21.2.

Feature Changes

The "ADC mute customization" feature introduced custom MUTE/UNMUTE functionality to control reporting of the Application Detection Information CCRUs. With the custom MUTE PCRF AVP, the PCRF informed P-GW when to disable/enable the ADC application notifications.

This feature enhances the "ADC mute customization" feature further and report the flow activities between custom mute and unmute events. P-GW learns the flow activities between custom mute events and then reports them to PCRF after the custom unmute event has occurred on the ADC rule. It minimizes the ADC application start and stop mechanism in standard ADC mute and unmute case.

A new CLI command has been implemented at the rulebase, which when configured, reports ADC application start and stop notifications only once per rule. This helps in reducing messaging flows towards the PCRF.

Limitations

Following are the limitations of this feature:
• P-GW stores maximum of 12 learned flows per ADC rule. Once the limit 12 has been reached, P-GW forgets the oldest flow and learns about the latest flow. Once P-GW receives the custom unmute event, it notifies the PCRF about the learned notifications. P-GW sends application stop notification, if the application start notification for the flow is sent.

• Flow information stored for sending the application start notifications to the PCRF after the event of the custom unmute is not recovered.

• On LTE to WiFi handover, the values received from the PCRF for custom mute or custom unmute per ADC dynamic rule gets applied in the new RAT. If there is no value received in the handover context, the previous values before the RAT change are retained for all the ADC dynamic rules which are present.

• If the CLI command `adc notify` is enabled, then the single ADC application start and stop notification is notified to the PCRF. If there are multiple flows which match the same ADC dynamic rule, only one application start and stop notification is sent to the PCRF.

• This feature is implemented only for the dynamic rules.

**How it Works**

Following is the sequence of events that occur when P-GW receives packet and ADC rule event occurs from PCRF:

1. Packet reaches the ECS rule matching engine.

2. The rule matching engine checks if the ADC dynamic rule is matched. It also checks if the custom mute is applied through the PCRF or rulebase level CLI. A single application start notification is sent, if not sent earlier.

3. For all the subsequent flows matching the same ADC rule, application start notification is stored. These notifications are sent in the CCRU after the custom unmute event is received.

Following are some important points:

• The values received from the PCRF has the highest priority. Hence, standard mute has the highest priority than custom-mute/custom-unmute. The CLI `adc notify once` has the least priority.

• If the CLI `adc notify once` is configured at the rulebase, the converse `no adc notify` does not have any impact. To converse the CLI impact, do either of the following tasks:
  • Switch the rulebase in which the CLI `adc notify once` is not configured.
  • Send the "custom unmute" for that particular dynamic rule.

**Configuring the ADC Notifications**

The new CLI command, `adc notify`, has been added to the active charging service mode.

When this CLI is configured, a single application start or application stop notification for the ADC flow matching per rule is sent to the PCRF. If this CLI is configured and the PCRF sends the custom mute notification, then the PCRF notification takes precedence over the standard behavior for reporting the notification.

The default value of this keyword is false. If this CLI is not configured, then no action is taken on sending the ADC notifications.

To enable or disable the feature, enter the following commands:

configure
  active-charging service <service_name>
  rulebase <rulebase_name>
[no] adc notify [once]
end

For configuring single notification use the following command:

adc notify once

Notes:

- **no**: Disables the ADC notifications and ADC notifications are sent as per default behavior.
- **adc**: Configures the ADC notifications.
- **notify**: Configures the application notification. If this keyword is not configured, ADC notifications are sent as per default behavior.
- **once**: Configures the application notification only once. PCRF takes the priority.

---

**Support for TAI and ECGI Change Reporting**

This section describes the overview and implementation of TAI and ECGI Change Reporting feature.

This section discusses the following topics for this feature:

- Feature Description, on page 584
- How it Works, on page 585
- Monitoring and Troubleshooting the TAI and ECGI Change Reporting Feature, on page 586

---

**Feature Description**

For activating User Location Reporting for a UE over Gx, PCRF sends RAR/CCA with the "USER_LOCATION_CHANGE (13)" event trigger. On receiving this event trigger, P-GW typically sends Change Reporting Action (CRA) Information Element (IE) with "Start Reporting" towards MME to enable the Location-Change reporting for the UE in MME.

In the current architecture, the "USER_LOCATION_CHANGE (13)" trigger is used to report the changes in User Location Information (ULI), Tracking Area Identity (TAI) and E-UTRAN Cell Global Identifier (ECGI). In release 19.4 and beyond, separate event triggers TAI_CHANGE (26) and ECGI_CHANGE (27) are supported for reporting the changes in TAI and ECGI correspondingly. CLI changes are done to display the new event triggers in show configuration commands.

---

**Important**

For TAI reporting to work, the **diameter map usage-report** CLI command must be configured in Policy Control configuration mode to use the value 33.

PCRF subscribes to the CRA event for reporting change of TAI and ECGI. P-GW sends event trigger in CCR-U only if it is subscribed by PCRF. When PCRF installs the event trigger for ECGI Change and/or TAI change, any change in ECGI and TAI (based on installed triggers) is reported.
The TAI and ECGI Change Reporting feature complies with 3GPP TS 29.212 v9.7.0. This feature is supported on Gx interface so that UE can be tracked on ECGI/TAI change and reported to PCRF. For more information on the User Location Information Reporting feature, see the administration guide for the product that you are deploying.

In releases prior to 19.3, the CRA event included in Create Session Response (CSRsp) for reporting location change was always set to START_REPORTING_ECGI (4).

In release 19.4 and beyond, the CRA value varies based on the event triggers received from PCRF.

Change Reporting Support Indication (CRSI) and ULI are also supported inBearer Resource Command.
P-GW sends the ULI received in Delete Bearer Command from MME to PCRF when the corresponding Delete Bearer Response is received. When the ULI is included in both Delete Bearer Command and Delete Bearer Response, the ULI in Delete Bearer Response is sent to the PCRF. In the absence of ULI in Delete Bearer Response, then the ULI received in Delete Bearer Command is sent to PCRF.

Relationships to Other Features

This feature has a dependency on USAGE_REPORT value of Event-Trigger AVP. This feature works only when the value of USAGE_REPORT is set to 33. This can be achieved using the diameter map usage-report CLI command in Policy Control configuration mode.

How it Works

P-GW sends Event Trigger value based on the event trigger detected by P-GW in CCR-U. P-GW sends Event Trigger and ULI Type in CCR-U to PCRF as per the following table.

<table>
<thead>
<tr>
<th>Event Trigger from PCRF</th>
<th>CRA Value</th>
<th>Event Detected at P-GW</th>
<th>What to Inform PCRF</th>
</tr>
</thead>
</table>
| ULI_CHANGE             | 6         | TAI_CHANGE or ECGI_CHANGE | Event Trigger: ULI_CHANGE  
                         |           |                        | ULI Type: TAI + ECGI |
| TAI_CHANGE             | 3         | TAI_CHANGE             | Event Trigger: TAI_CHANGE  
                         |           |                        | ULI Type: TAI |
| ECGI_CHANGE            | 4         | ECGI_CHANGE            | Event Trigger: ECGI_CHANGE  
                         |           |                        | ULI Type: ECGI |
| ULI_CHANGE + TAI_CHANGE| 6         | TAI_CHANGE             | Event Trigger: ULI_CHANGE+TAI_CHANGE  
                         |           |                        | ULI Type: TAI+ECGI |
| ULI_CHANGE + ECGI_CHANGE| 6        | ECGI_CHANGE            | Event Trigger: ULI_CHANGE + ECGI_CHANGE  
                         |           |                        | ULI Type: TAI+ECGI |

Limitations

TAI and ECGI Change Reporting feature is supported only when `diameter map usage-report` CLI command is configured as 33.

Monitoring and Troubleshooting the TAI and ECGI Change Reporting Feature

This section provides information regarding show commands and/or their outputs in support of the TAI and ECGI Change Reporting feature.

**show ims-authorization sessions full all**

The following fields are added to the output of this show command in support of this feature:

- TAI-Change - Displays this event trigger when TAI has changed for a subscriber session.
- ECGI-Change - Displays this event trigger when ECGI has changed for a subscriber session.

**show ims-authorization service statistics all**

The following statistics are added to the output of this show command in support of this feature:

- TAI Change - Displays the total number of times P-GW has reported TAI_CHANGE (26) event trigger to PCRF.
- ECGI Change - Displays the total number of times P-GW has reported ECGI_CHANGE (27) event trigger to PCRF.

Location Based Local-Policy Rule Enforcement

This section describes the overview and implementation of Location-based Local-Policy (LP) Rule Enforcement feature.

This section discusses the following topics for this feature:

- Feature Description, on page 587
Feature Description

This feature is introduced to activate different predefined rules for different E-UTRAN Cell Global Identifiers (ECGIs) when the subscriber is connected to a corporate APN. The subscriber has to explicitly bring down the connection with the corporate APN and re-establish session with Internet APN when out of the company area. It is assumed that corporate APN does not use PCRF and use only Local-Policy. In this case, all calls matching the APN is directed to the Local-Policy.

Important

For this feature to work, the license to activate Local-Policy must be configured. For more information on the licensing requirements, contact your local Cisco account representative.

To activate different predefined rules for ECGI, Local-Policy configurations are enhanced to support:

- Configuration and validation of a set of ECGIs
- Installation of ECGI_CHANGE event trigger through Change Reporting Action (CRA) event
- Detection of ECGI_CHANGE event

This feature supports the following actions to be applied based on the ECGI match with Local-Policy rule defined condition:

- Enable a redirect rule on ECGI_CHANGE event notification when the ECGI belongs to a certain group
- Enable a wildcard rule for any other ECGIs

Relationships to Other Features

This feature has a dependency on TAI and ECGI Change Reporting feature, which provides a framework to report ECGI-Change from session manager module to IMSA/Local-Policy module.

How it Works

This section describes how the Local Policy Rule selection and enforcement happens based on ECGI-CHANGE event trigger.

Flows

The following figure describes how the ECGI-CHANGE event is being handled in Local-Policy, MME and P-GW.
When a new call is established the ECGI-CHANGE event trigger is sent from Local-Policy. P-GW requests the MME for ECGI reporting by sending CRA of 4 in Create Session Response (CSRsp). MME informs the P-GW of ECGI Change through Change Notification request/Modify Bearer Request (MBReq). Local-Policy configuration at P-GW will handle the ECGI-CHANGE event and take appropriate action based on the ECGI group to which the new ECGI belongs. One action could be to activate a certain redirect rule when ECGI belongs to a certain group, and other action could be to enable a wildcard rule for any other ECGI.

**Limitations**

This section identifies the known limitations of this feature.

- ECGI Change detection and triggering is a pre-requisite for this feature.
- This feature is supported for Local-Policy-only (lp-only) mode wherein, all requests and responses within a particular APN directly go to Local-Policy without contacting PCRF. That is, this feature does not work in Local-Policy fallback mode and dual mode wherein both PCRF and Local-Policy co-exist.
Configuring Location Based Local Policy Rule Enforcement Feature

This section provides the configuration of parameters within Local-Policy to enable rule enforcement based on ECGI-Change event notification.

Configuring ECGI Change Trigger

Use the following configuration to install ECGI-Change trigger from local-policy.

```config
configure
    local-policy-service service_name
    actiondef actiondef_name
    action priority priority event-triggers ecgi-change
    exit
    eventbase default
    rule priority priority event new-call ruledef ruledef_name actiondef actiondef_name [ continue ]
end
```

Notes:

- **priority priority**: Specifies a priority for the specified action. `priority` must be unique and an integer from 1 to 2048.
- **ecgi-change**: This keyword specifies to install ECGI-CHANGE event trigger. If enabled, ECGI-CHANGE event trigger is sent from local-policy.
- This CLI command is configured in local-policy if operator wants to enable ECGI-Change notification in MME by sending a CRA value.

Applying Rules for ECGI-Change Event

Use the following configuration to enable ECGI Change detection and take specific action for ECGI-CHANGE event reported by MME.

```config
configure
    local-policy-service service_name
    eventbase eventbase_name
    rule priority priority event ecgi-change ruledef ruledef_name actiondef actiondef_name [ continue ]
end
```

Notes:

- **priority priority**: Specifies a priority for the specified rule. `priority` must be unique and an integer from 1 to 2048.
- **ruledef ruledef_name**: Associates the rule with a specific ruledef. `ruledef_name` must be an existing ruledef within this local QoS policy service.
- **actiondef actiondef_name**: Associates the rule with a specific actiondef. `actiondef_name` must be an existing actiondef within this local QoS policy service expressed as an alphanumeric string of 1 through 63 characters.
- **ecgi-change**: Enables a new event to detect ECGI-CHANGE and applies specific action for the ECGI-CHANGE event as defined in actiondef configuration.
• continue: Subsequent rules are also matched; otherwise, rule evaluation is terminated on first match.

Enforcing Local Policy Rule based on ECGI Value

Use the following configuration to apply rules based on the ECGI value received in ECGI-Change event notification by MME.

```
configure
  local-policy-service service_name
    ruledef ruledef_name
      condition priority priority ecgi mcc mcc_num mnc mnc_num eci { eq | ge | gt | le | lt | match | ne | nomatch } regex | string_value | int_value | set }
    end
```

Notes:

• priority priority: Specifies a priority for the specified condition. priority must be unique and an integer from 1 to 2048.

• ecgi mcc mcc_num mnc mnc_num eci: Configures ECGI with values for MCC, MNC and ECI.
  • mcc mcc_num: MCC is a three digit number between 001 to 999. It is a string of size 3 to 3.
  • mnc mnc_num: MNC is a two/three digit number between 01 to 999. It is a string of size 2 to 3.
  • eci: ECI is a hexadecimal number between 0x1 to 0xffffffff. It is a string of size 1 to 7.

• This CLI command is configured in local-policy if operator wants to take specific action based on certain ECGI value received in ECGI-Change event notification by MME.

Verifying the Location Based LP Rule Enforcement Configuration

Use the following command to verify the configuration of this feature.

```
show configuration context
```

This feature is supported for Local-Policy-only mode wherein, all requests and responses within a particular APN directly go to Local-Policy without contacting PCRF.

Here is an example configuration for this feature.

```
configure
  context source
    apn corporate-apn
      ims-auth-service LocalPolicy_1
    exit
  exit
end

configure
  local-policy-service LocalPolicy_1
    ruledef any-imsi
      condition priority 1 imsi match *
```
exit
ruledef ecgi-group
  condition priority 1 ecgi mcc 123 mnc 456 eci eq ffff
exit
actiondef ecgi-trigger
  action priority 1 event-triggers ecgi-change
exit
actiondef ecgi-redirect-rule
  action priority 1 activate-rule name rule-1
exit
eventbase default
  rule priority 1 event new-call ruledef any-imsi actiondef ecgi-trigger
  rule priority 2 event ecgi-change ruledef ecgi-group actiondef ecgi-redirect-rule
  rule priority 3 event location-change ruledef ecgi-group actiondef ecgi-redirect-rule
exit
end

Monitoring and Troubleshooting the Location Based LP Rule Enforcement Feature

This section provides information regarding show commands and/or their outputs in support of the Location Based Local Policy Rule Enforcement feature.

Use the following CLI commands to troubleshoot if any issue is encountered with this feature.

show configuration context
logging filter active facility local-policy level debug
show local-policy statistics
show active-charging sessions full

show local-policy statistics summary

The following statistics are added to the output of this show command to support the ECGI-CHANGE event trigger installation:

- Event Statistics:
  - ECGI Change - Displays the number of ECGI-CHANGE event triggers that has been received by Local-Policy.

- Variable Matching Statistics
  - ECGI - Displays the number of times the ECGI is matched and the specific action is applied based on the event.
Gx Support for GTP based S2a/S2b

In releases prior to 18, for WiFi integration in P-GW, Gx support was already available for GTP based S2a/S2, but the implementation was specific to a particular customer.

In 18 and later releases, the Gx support for GTP based S2a/S2 interface is extended to all customers. This implementation is in compliance with standard Rel.8 Non-3GPP specification part of 29.212, along with C3-101419 C3-110338 C3-110225 C3-120852 C3-130321 C3-131222 CRs from Rel.10/Rel.11.

As part of this enhancement, the following changes are introduced:

- AVP support for TWAN ID is provided
- TWAN-ID is added to r8-gx-standard dictionary

Gx-based Virtual APN Selection

This section describes the overview and implementation of Gx based Virtual APN Selection feature.

This section discusses the following topics for this feature:

- Feature Description, on page 592
- Configuring Gx based Virtual APN Selection Feature, on page 593
- Monitoring and Troubleshooting the Gx based Virtual APN Selection, on page 593

Feature Description

Overview

The current implementation supports Virtual APN (VAPN) Selection through RADIUS or local configuration. In Release 19, ASR 5500 uses PCRF and Gx interface for Virtual APN selection to achieve signaling reduction. A new supported feature "virtual-apn" with feature bit set to 4 is added to the IMSA configuration. This configuration enables Gx based Virtual APN Selection feature for a given IMS authorization service. When this configuration is enabled at P-GW/GGSN, then P-GW/GGSN advertises this feature to PCRF through the Supported-Features AVP in CCR-I. When the VAPN is selected, then the PCRF rejects the CCR-I message with the Experimental-Result-Code AVP set to 5999 (DIAMETER_GX_APN_CHANGE), and sends a new APN through the Called-Station-Id AVP in CCA-I message. The existing call is then disconnected and reestablished with the new virtual APN. Note that the Experimental Result Code 5999 will have the Cisco Vendor ID.

Important

Enabling this feature might have CPU impact (depending on the number of calls using this feature).

License Requirements

This feature requires a valid license to be installed prior to configuring this feature. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.
Limitations

The following are the limitations of this feature:

- Virtual APN supported feature negotiation, Experimental Result Code (5999), Called-Station-Id AVP should be received to establish the call with new virtual APN. When any one of conditions is not met then the call will be terminated.

- Failure-handling will not be taken into account for 5999 result-code when received in the CCA-I message.

- When the Experimental Result Code 5999 is received in the CCA-U then failure-handling action will be taken.

- If the Called-Station-Id AVP is received in CCA-U or CCA-T, then the AVP will be ignored.

- If virtual-apn is received in local-policy initiated initial message then the call will be terminated.

- When PCRF repeatedly sends the same virtual-apn, then the call will be terminated.

Configuring Gx based Virtual APN Selection Feature

The following section provides the configuration commands to enable the Gx based Virtual APN Selection.

```
configure
  context  context_name
    ims-auth-service  service_name
    policy-control
      diameter  encode-supported-features  virtual-apn
  end
```

Notes:

- **virtual-apn**: This keyword enables configuration of Gx-based Virtual APN Selection feature. By default, this feature is disabled.

- This keyword is license dependent. For more information, contact your Cisco account representative.

Verifying the Gx based Virtual APN Configuration

Use the following command in Exec mode to display whether the Gx based Virtual APN Selection feature is configured as part of the Supported-Features AVP.

```
show ims-authorization sessions full all
```

The "Negotiated Supported Features" field in this show command output displays the configuration status. This supported feature is displayed only when the feature license is configured.

Monitoring and Troubleshooting the Gx based Virtual APN Selection

This section provides information regarding show commands and/or their outputs in support of this feature.

```
show ims-authorization policy-control statistics
```

The following field has been added to the output of this show command to track the number of times the PCRF sends the Diameter Experimental Result Code (5999) when a new virtual APN is selected.

- **Gx APN Change**

For descriptions of this statistics, see the *Statistics and Counters Reference* guide.
Debugging Statistics

Use the following command to debug the Gx based Virtual APN calls.

```
show session subsystem facility sessmgr debug-info
```

This command displays the detailed statistics associated with the Gx-based VAPN feature. For example, number of Gx VAPN received, number of AAAMGR/SGX/DHCP messages after enabling Gx VAPN, and Gx VAPN calls setup time.

Bulk Statistics for Gx based Virtual APN Selection Feature

**IMSA Schema**

The following new bulk statistic variable is added to the IMSA schema to track the number of times the PCRF sends the Diameter Experimental Result Code (5999) when a new virtual APN is selected.

- `dpca-expres-gx-apn-change`

For descriptions of this variable, see the *Statistics and Counters Reference* guide.

**System Schema**

The following new disconnect reason is added to the System schema to track the number of times a P-GW/GGSN/SAEGW session was disconnected due to validation failure of virtual APN received from PCRF.

- `gx-vapn-selection-failed (618)`

For descriptions of this variable, see the *Statistics and Counters Reference* guide.

Graceful Handling of RAR from Different Peers

In StarOS Gx architecture, every Diameter session is associated with a Primary and a Secondary peer when host select is configured at the IMSA service. The behavior for processing RAR prior to release 20 is as follows:

- If the RAR is received from the Primary peer for the session, the RAR is responded using the Primary peer connection.

- If the RAR is received from a Secondary peer for the session, host-switch takes effect. This results in the RAA (and any further session signaling) happening via the Secondary peer.

- If the RAR is received via a third peer which is neither the Primary nor the Secondary peer for the session, the RAR is dropped.

In certain networks where PCRF and PCEF are connected through multiple DRAs the PCRF may select the DRA in a round-robin fashion and the RAR for a session may come from a peer which is neither Primary nor Secondary. In order to handle such a scenario, the ability to respond to the RAR received from a non-primary and non-secondary peer was added. In this case, the RAR is answered via the peer from which RAR was received. However any future signaling for the session will still occur via the previously communicating peer. If the RAR is received via the secondary peer, the host-switch occurs and the behavior remains unchanged. In order to be able to process the RAR from a third peer, that peer must be configured in the Diameter endpoint configuration. Further, this issue is seen only when host select is configured at IMSA service. When the host selection happens at endpoint level, this issue is not seen.
Assume there are three DRAs and they are configured as shown in the sample configuration below:

```conf
configure
test
diameter endpoint Gx

... peer DRA1 realm realmName address 192.168.23.3
    peer DRA2 realm realmName address 192.168.23.3 port 3869
    peer DRA3 realm realmName address 192.168.23.3 port 3870
exit
ims-auth-service imsa-Gx
policy-control
diameter host-select row-precedence 1 table 1 host DRA1
secondary host DRA2
end
```

Without the feature, when RAR is received from DRA3, it is rejected. With the feature enabled, RAR from DRA3 is responded via DRA3 only and Peer switch will not occur in this case and subsequent messaging will be sent through DRA1 or DRA2 if any prior peer switch had happened.

### Limitations

This section identifies the limitations for this feature.

- RAR will be rejected when received from different origin host.
- RAR will be rejected when received from a DRA not configured in Diameter endpoint.

## NetLoc Feature Enhancement

This feature adds compliance with 3GPP standard R13 version to the existing NetLoc feature functionality.

### Feature Description

This is a license controlled feature. Netloc feature license key is required to be enabled. Contact your Cisco account representative for information on how to obtain a license.

This feature adds compliance with 3GPP standard R13 version to the existing NetLoc feature functionality. Using this NetLoc feature, the IMS network can retrieve location information of the UE from the access or LTE network. This enhances the location related functionality and charging based on the location information.

This feature introduces the following behavior changes:

- Assuming that NetLoc feature is enabled on chassis and Access Network Information (ANI-45) Event trigger is installed, following behavior changes have been introduced:
<table>
<thead>
<tr>
<th>PCRF Gx Interface Interaction</th>

</tr>
</tbody>
</table>

**Important**

ULI and ULI timestamp is considered as paired. If the ULI timestamp is forwarded, it is forwarded and received with the ULI. If the ULI is received and the ULI timestamp is not received, then that P-GW does not forward the old timestamp.

- Inclusion of AVP support of NETLOC-ACCESS-NOT-SUPPORTED on Gx interface. This inclusion of AVP is based on the below conditions:
  - RAT type is other than E-UTRAN, UTRAN, WCDMA, GPRS, GERAN, and W-LAN
  - IP CAN type is other than 3GPP EPS, GPRS, and non 3GPP EPS
  - Re-Auth-Request is received with Required-Access-Info AVP.
  - NetLoc feature is enabled on the chassis.
  - Event-Trigger ACCESS_NETWORK_INFO_REPORT (45) is installed.
<table>
<thead>

<table>
<thead>
<tr>
<th><strong>S-GW CDR behavior</strong></th>
<th><strong>Post 21.1 Release behavior in Custom 35/Custom 24 Dictionary</strong></th>
<th><strong>Custom24 Dictionary (standard dictionary)/ Custom 35 Dictionary (AT&amp;T)</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>ULI is received in Delete Bearer Command/Delete Bearer Request /Delete Session Request.</td>
<td>ULI was not part of CDR generation.</td>
<td>ULI is Recorded as LastUserLocationInformation AVP in the S-GW CDR generation. The attribute is controlled using a CLI command.</td>
</tr>
<tr>
<td>MS TZ is received in Delete Bearer Command/Delete Bearer Request /Delete Session Request.</td>
<td>MS TZ was not part of CDR generation.</td>
<td>MS TZ is Recorded as LastMSTimeZone AVP in S-GW CDR generation. The attribute is controlled using a CLI command. CDR is released as Normal Release. MS TZ is not detected in this case as full trigger and does not release extra CDR with MS TZ changes cause.</td>
</tr>
</tbody>
</table>
Limitations

1. This feature enhancement is applicable only for S-GW, P-GW, and SAEGW. For GGSN ad SGSN, there is no change in the behavior of the NetLoc feature.

2. The attributes `Last-MS-Timezone` and `Last ULI attributes` have been added in the dictionaries custom24 and custom35 for S-GW CDR generation only.

3. The keywords `last-ms-timezone` and `last-uli` added to the CLI command `gtppp attribute` are applicable and limited to only S-GW CDR generation.

4. `Last-MS-Timezone` and `Last ULI attributes` added in dictionary custom35 (customer specific dictionary) and custom52 (3GPP R13 standard compliance) are applicable and limited to P-GW CDR generation only. These attributes are not CLI controlled.

Command Changes

gtppp-attribute

This CLI command allows the specification of the optional attributes to be present in the Call Detail Records (CDRs) that the GPRS/PDN/UMTS access gateway generates. It also defines that how the information is presented in CDRs by encoding the attribute field values. The keywords `last-ms-timezone` and `last-uli` have been added to this CLI command to control attribute while CDR generation.

Important

The keywords added are applicable only for S-GW CDR. They are not applicable for P-GW CDR.

```
configure
    context <context_name>
        gtppp group group_name
            gtppp attribute { last-ms-timezone | last-uli | .. }
            [no | default ] gtppp attribute { last-ms-timezone | last-uli | .. }
        end
```

Notes:

- **no**: Removes the configured GTPP attributes from the CDRs.
- **default**: Sets the default GTPP attributes in the generated CDRs. It also sets the default presentation of attribute values in generated CDRs.
- **last-ms-timezone**: Sets the "Last MS-Timezone" in the CDR field. This option would be disabled when the default option is used.
- **last-uli**: Sets the "Last ULI" in the CDR field. This option would be disabled when the default option is used.

Performance Indicator Changes

```
show configuration
```

This command has been modified to display the following output:

- Last-MS-Timezone present
show gtp group name group_name

This command has been modified to display the following output:

Last-MS-Timezone present: yes
Last-User Location Information present: yes

RAN-NAS Cause Code Feature Enhancement

This chapter describes the RAN-NAS Cause Code Feature Enhancement.

Feature Description

This is a license controlled feature. You must enable the existing license of NPLI. Contact your Cisco account representative for information on how to obtain a license.

This feature introduces support for 3GPP RAN/NAS cause code IE for "Failed Create Bearer Response", "Failed Updated Bearer Response", and "Delete Bearer Response" at the Gx interface, the P-GW, and S-GW CDRs. This will enable the operator to get detailed RAN/NAS release cause code information from the access network. RAN/NAS cause can be received from the access side in either of the following messages:

• Failed Create Bearer Response
• Failed Update Bearer Response
• Delete Session Request
• Delete Bearer Response
• Delete Bearer Command

This support of 3GPP Release 12 RAN/NAS cause IE on the S4, S11, S5, and S8 interfaces exists for "Delete Session Request" and "Delete Bearer" command through private extension as well as Standard IE for customer specific dictionaries Gx- d pca-custom15 and Gz-Custom35.

However, RAN/NAS cause received in the "ERAB creation Failure", "ERAB modification Failure", and "ERAB release indication" messages were not processed at the S-GW and P-GW. Hence, it was also not forwarded to the PCRF by P-GW neither populated in the P-GW and S-GW CDRs. With this feature enhancement, support has been added to process the RAN/NAS cause codes at the S-GW (S4,S11 interface) and P-GW (S5,S8 interface) for the "Create bearer response", "Update bearer response", and "Delete bearer response". Also, RAN/NAS cause codes will be forwarded to the PCRF by the P-GW and will be populated in the P-GW and S-GW CDRs.

There is no requirement to add the support for the 3GPP Release 12 RAN/NAS cause IE received in the private extension for "Create Bearer Response", "Update Bearer Response", and "Delete Bearer Response". Private extension support for 3GPP Release 12 cause code IE in "Delete Session Request" and "Delete Bearer Command" will continue to be supported.
This feature enhancement introduces the following RAN/NAS cause IE behavior changes at the Gx interface for dpea-custom15 dictionary and at Gz interface for custom35 dictionary.

### Table 56: Gx Interface Requirements for RAN/NAS Cause

<table>
<thead>
<tr>
<th>Message</th>
<th>GTP Cause</th>
<th>Gx Message Carrying RAN-NAS Cause Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Bearer</td>
<td>Accepted</td>
<td>RAN/NAS cause is not expected as per 29.274 Table 7.2.4-2. So if it is received, it is ignored and is not forwarded to the PCRF.</td>
</tr>
<tr>
<td></td>
<td>Temporarily rejected due to HO in progress.</td>
<td>RAN/NAS cause with this GTP cause is not applicable as per 29.274 Table C.4. So if received it is ignored and is not forwarded to the PCRF.</td>
</tr>
<tr>
<td></td>
<td>Other GTP Causes</td>
<td>CCR-U</td>
</tr>
<tr>
<td>Update Bearer</td>
<td>Accepted</td>
<td>RAN/NAS cause is not expected as per 29.274 Table 7.2.16-2. So if it is received, it is ignored and is not forwarded to the PCRF.</td>
</tr>
<tr>
<td></td>
<td>No Resources</td>
<td>CCR-U</td>
</tr>
<tr>
<td></td>
<td>Available</td>
<td>Important If the UE-initiated (MBC) bearer modification fails with the GTP cause &quot;NO RESOURCES AVAILABLE&quot;, then P-GW deletes the entire PDN session. In this case, RAN-NAS cause information is forwarded as part of the CCR-T message.</td>
</tr>
<tr>
<td></td>
<td>Context Not Found</td>
<td>If the update bearer response is received with the message level cause as &quot;CONTEXT NOT FOUND&quot;, which leads to the PDN deletion, then the RAN-NAS cause information is forwarded as part of the CCR-T message.</td>
</tr>
<tr>
<td></td>
<td>Temporarily rejected due to HO in progress.</td>
<td>RAN/NAS cause with this GTP cause is not applicable as per 29.274 Table C.4. So if this cause is received, it is ignored and is not forwarded to the PCRF.</td>

</tbody>
</table>
### Gx Interface Support

<table>
<thead>
<tr>
<th>Message</th>
<th>GTP Cause</th>
<th>Gx Message Carrying RAN-NAS Cause Information</th>
</tr>
</thead>
</table>
| Delete Bearer Response      | Temporarily rejected due to HO in progress | RAN/NAS cause with this GTP cause is not applicable as per 29.274 Table C.4. So if this cause is received, it is ignored and is not forwarded to the PCRF. **Important** As per existing design of S-GW, if "Delete Bearer Response" is received with GTP cause "Temporarily rejected due to handover/ TAU/ RAU procedure in progress" it changes GTP cause to "Request Accepted" and forwards it to the P-GW. In this case, if RAN/NAS cause is received in the "Delete Bearer Response", S-GW will forward it to the P-GW. And at the P-GW since "Delete Bearer Response" is received with the GTP cause "Request Accepted" hence RAN/NAS cause is forwarded to the PCRF and populated in the P-GW CDR. This behavior will be seen for SAEGW and S-GW + P-GW combination call.  

| Accepted / Other GTP CCR-UCauses | **Important** If RAN/NAS cause is received in the delete bearer response that is initiated by the network through RAR/CCA-U, then P-GW will not send CCR-U to the PCRF to report the RAN/NAS cause. This support is introduced in 29.212 release 13.5 with "Enhance RAN/NAS" feature. |

### Table 57: Gx Interface Requirements for RAN/NAS Cause

<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Failed Update Bearer Response</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Delete Bearer Response</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### Limitations

Following are the limitations of this feature:

- Support of RAN/NAS cause over S2a and S2b interfaces is not supported.
• Support of RAN/NAS cause information has not been added for standard Gx and Gz dictionaries.

• P-GW processes first two RAN/NAS cause IE (max one RAN and max one NAS) information received from the GTP interface. For example, if the access network misbehaves and sends RAN/NAS cause list with two NAS and one RAN then only first two causes are considered and validated. In this case, these are two NAS causes, only first NAS cause will be populated at the Gx interface and in the CDRs as only one NAS is allowed.

• As per spec 32.251 Table 5.2.3.4.1.1 and Table 5.2.3.4.2.1, there is no trigger to generate the S-GW CDRs and P-GW CDRs for failed create bearer response and failed update bearer response. Hence, RAN/NAS cause received in "Failed Create Bearer" response and "Failed Update Bearer" response will not be sent to the Gz interface.

• In "Delete Bearer" scenario, S-GW CDRs are generated immediately after receiving "Delete Bearer" request. Hence, RAN/NAS cause received in the "Delete Bearer" response is not populated in the S-GW CDRs.

• If RAN/NAS cause is received in the "Delete Bearer" response that is initiated by the network through RAR/CCA-U, P-GW will not send CCR-U to the PCRF to report the RAN/NAS cause. This support is introduced in spec 29.212 release 13.5 with "Enhance RAN/NAS" feature.

• If the RAN-NAS-Cause feature is supported, only RAN/NAS cause is forwarded to PCRF. ANI information will be forwarded only when NetLoc feature is enabled. Below table describes various scenarios,

<table>
<thead>
<tr>
<th>Scenario</th>
<th>RAN/NAS Cause Behavior</th>
<th>ANI Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP-CAN Bearer</td>
<td>If the RAN-NAS-Cause feature is supported (If Netloc-ran-nas-cause CLI is configured and Supported-Features = RAN-NAS-CAUSE was asserted in the Gx CCR-I/CCA-I), PCEF will include the received RAN cause and/or the NAS cause due to bearer termination, in the RAN-NAS-Release-Cause AVP included in the Charging-Rule-Report AVP.</td>
<td>ANI information received during bearer termination is populated in the CCR-U, if Required-Access-Info was asserted when one or more of the failed charging rules installation request was received in CCA-U/RAR (If Netloc CLI is configured and Supported-Features = Netloc was asserted in Gx CCR-I/CCA-I).</td>

<td>ANI information received during session termination is populated in CCR-T, if Required-Access-Info was asserted when one or more of the failed charging rules installation request was received in the CCA-U/RAR (If Netloc CLI is configured and Supported-Features = Netloc was asserted in the Gx CCR-I/CCA-I).</td>
</tr>
<tr>
<td>Termination</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Command Changes

diameter encode-supported-features netloc netloc-ran-nas-cause

The behavior of this CLI command has been modified in this feature enhancement.

**Previous Behavior**: To enable the RAN/NAS Cause feature, it was mandatory to enable the NetLoc feature. For this, it was mandatory to configure the `netloc` keyword in the CLI command `diameter encode-supported-features netloc netloc-ran-nas-cause`.

**New Behavior**: Now, you can enable the RAN/NAS feature without configuring the NetLoc feature. This implied that it is not mandatory to configure the `netloc` keyword in the CLI command `diameter encode-supported-features netloc netloc-ran-nas-cause`.

configure > context context_name > ims-auth-service service_name > policy-control
diameter encode-supported-features netloc netloc-ran-nas-cause

### Session Disconnect During Diamproxy-Session ID Mismatch

This section describes how to clear the subscriber sessions that are impacted due to the mismatch in Diamproxy grouping information and Session ID.

This section discusses the following topics for this feature:

- Feature Description, on page 604
- Configuring System to Delete Diamproxy-Session ID Mismatched Sessions, on page 605
- Monitoring and Troubleshooting the Mismatched Session Deletion Feature, on page 606

### Feature Description

During rapid back-to-back ICSR switchover or extensive multiple process failures, the Diameter proxy-Session manager mapping information is not preserved across ICSR pairs. This mismatch in the Diameter proxy-Session ID results in rejection of RAR with 5002 - DIAMETER_UNKNOWN_SESSION_ID cause code. This behavior impacts the VoLTE call setup procedure. Hence, this feature is introduced to clear the subscriber sessions that are impacted due to the mismatch in the Diameter proxy-session manager mapping. New CLI configuration...
is provided to control the behavior and new bulk statistic counter is supported to report the Diamproxy-Session ID mismatch.

The bulk statistic counter will be incremented only when session is cleared upon receiving RAR message with 5002 result code and detecting session-ID Diamproxy mapping mismatch. A Delete Bearer Request is sent to S-GW with a Reactivation Requested as the cause code while suppressing the CCR-T from being sent to PCRF. So, the subscriber reattaches immediately without impacting the subsequent VoLTE calls, encountering only one failure instead of manual intervention.

---

**Important**

This enhancement is applicable only to IMS PDN so that there is a limit of one failure when encountering this situation instead of manual intervention. This is applicable to only the Gx RARs.

---

**Configuring System to Delete Diamproxy-Session ID Mismatched Sessions**

The following section provides the configuration commands to enable the system to clear the subscriber sessions that are impacted due to the mismatch in Diamproxy grouping information and Session ID.

**Clearing Mismatched Subscriber Sessions**

Use the following configuration commands to configure the system to disconnect the subscriber sessions based on signaling trigger when session ID and Diamproxy mismatch is identified.

```
configure
  context context_name
    ims-auth-service service_name
    policy-control
      diameter clear-session sessid-mismatch
end
```

- `sessid-mismatch`: Clears the session with mismatched session ID. This CLI configuration is optional.
- The default configuration is `no diameter clear-session`. By default, the sessions will not be cleared.

**Verifying the Configuration to Delete Mismatched Sessions**

Use the following command to verify the configuration status of this feature.

```
show ims-authorization service name service_name
```

`service_name` must be the name of the IMS Authorization service configured for IMS authentication.

This command displays all the configurations that are enabled within the specified IMS authorization service. The "Session-Id Mismatch Clear Session" field can be used to determine whether this feature is enabled or disabled.

```
[local]st40# show ims-authorization service name service1
  Context: test
  IMS Authorization Service name: service1
  Service State: Enabled
  Service Mode: Single Interface Policy and Charging
  ...
  Diameter Policy Control:
    Endpoint: gx
    Origin-Realm: xyz.com
    Dictionary: standard
```
Monitoring and Troubleshooting the Mismatched Session Deletion Feature

This section provides information regarding show commands and/or their outputs in support of this feature. The following operations should be performed for any failure related to this feature:

- Verify if the feature is enabled using `show ims-authorization service name <service_name>` CLI command. If not enabled, configure the `diameter clear-session sessid-mismatch` CLI command and check if it works.
- Collect the output of `show ims-authorization policy-control statistics debug-info` and `show diameter statistics proxy debug-info` commands and analyze the debug statistics.
- Check the system logs that are reported while deleting the affected sessions. For further analysis, contact Cisco account representative.

`show ims-authorization service name`

A new field "Session-Id Mismatch Clear Session" is added to the output of this show command to indicate whether this feature is enabled or disabled within the specified IMS authorization service.

IMSA Schema

The following bulk statistic variable is added to this schema to report the Diamproxy-Session ID mismatch.

- `dpca-rar-dp-mismatch` - This counter displays the total number of sessions cleared while receiving RAR because of session-ID Diamproxy mapping mismatch.

Support for Negotiating Mission Critical QCIs

This section describes the overview and implementation of the Mission Critical QCIs Negotiation feature. This section includes the following topics:

- Feature Description, on page 607
- Configuring DPCA for Negotiating Mission Critical QCIs, on page 607
- Monitoring and Troubleshooting the Mission Critical QCI, on page 608
Feature Description

To support Mission Critical (MC) Push to Talk (PTT) services, a new set of standardized QoS Class Identifiers (QCIs) (65, 66, 69, 70) have been introduced. These are 65-66 (GBR) and 69-70 (non-GBR) network-initiated QCIs defined in 3GPP TS 23.203 v13.6.0 and 3GPP TS 23.401 v13.5.0 specifications. These QCIs are used for Premium Mobile Broadband (PMB)/Public Safety solutions.

Important

The MC-PTT QCI feature requires Wireless Priority Service (WPS) license to be configured. For more information, contact Cisco account representative.

Previous Behavior: The gateway accepted only standard QCIs (1-9) and operator defined QCIs (128-254). If the PCRF sends QCIs with values between 10 and 127, then the gateway rejects the request. MC QCI support was not negotiated with PCRF.

New Behavior: PCRF accepts the new standardized QCI values 69 and 70 for default bearer creation and 65, 66, 69 and 70 for dedicated bearer creation.

For this functionality to work, a new configurable attribute, mission-critical-qcis, is introduced under the diameter encode-supported-features CLI command. When this CLI option is enabled, the gateway allows configuring MC QCIs as a supported feature and then negotiates the MC-PTT QCI feature with PCRF through Supported-Features AVP.

The gateway rejects the session create request with MC-PTT QCIs when the WPS license is not enabled and Diameter is not configured to negotiate MC-PTT QCI feature, which is part of Supported Feature bit.

For more information on this feature and associated configurations, refer to P-GW Enhancements for 21.0 section in the Release Change Reference guide.

Configuring DPCA for Negotiating Mission Critical QCIs

The following section provides the configuration commands to enable support for MC-PTT QCI feature.

Enabling Mission Critical QCI Feature

Use the following configuration commands to enable MC-PTT QCI feature.

```
configure
  context context_name
    ims-auth-service service_name
    policy-control
      diameter encode-supported-features mission-critical-qcis
    end
end
```

Notes:

- mission-critical-qcis: This keyword enables MC-PTT QCI feature. By default, this feature will not be enabled.

- This keyword can be enabled only if the WPS license is configured. For more information, contact your Cisco account representative.

- To disable the negotiation of this feature, the existing no diameter encode-supported-features command needs to be configured. On executing this command, none of the configured supported features will be negotiated with PCRF.
Verifying the Mission Critical QCI Feature Configuration

The `show ims-authorization sessions full all` command generates a display that indicates the configuration status of this feature.

The following sample display is only a portion of the output which shows `mission-critical-qcis` among the Negotiated Supported Features.

```
show ims-authorization sessions full all
CallId: 00004e29  Service Name: ims-ggsn-auth
  IMSI: 123456789012341
  ....
  Negotiated Supported Features:
  3gpp-r8
  `mission-critical-qcis`
  Bound PCRF Server: 192.1.1.1
  Primary PCRF Server: 192.1.1.1
  Secondary PCRF Server: NA
  ....
```

Monitoring and Troubleshooting the Mission Critical QCI

The following section describes commands available to monitor the Mission Critical QCI feature.

Mission Critical QCI Show Command(s) and/or Outputs

`show ims-authorization sessions full all`

On running the above mentioned show command, statistics similar to the following are displayed and will indicate if the Mission Critical QCI feature is enabled or not.

```
show ims-authorization sessions full all
CallId: 00004e29  Service Name: ims-ggsn-auth
  IMSI: 123456789012341
  ....
  Negotiated Supported Features:
  3gpp-r8
  `mission-critical-qcis`
  ....
```

HSS and PCRF-based P-CSCF Restoration Support for WLAN

This section describes the overview and implementation of the HSS-based and PCRF-based P-CSCF Restoration feature for WLAN and EPC networks.

This section includes the following topics:

- Feature Description, on page 609
- Configuring the HSS/PCRF-based P-CSCF Restoration, on page 610
- Monitoring and Troubleshooting the HSS/PCRF-based P-CSCF Restoration, on page 611
**Feature Description**

The P-CSCF restoration procedures were standardized to minimize the time a UE is unreachable for terminating calls after a P-CSCF failure. In compliance with 3GPP standard Release 13, this feature is developed to include the following P-CSCF restoration mechanisms:

- HSS-based P-CSCF Restoration for Trusted/Untrusted WLAN Access (S2a/S2b)
- PCRF-based P-CSCF Restoration for LTE (S5/S8) and Trusted/Untrusted WLAN Access (S2a/S2b)

---

**Important**

HSS-based P-CSCF Restoration was supported at P-GW for LTE (S5/S8) prior to StarOS release 21.0.

This feature provides support for both basic and extended P-CSCF Restoration procedures.

---

The P-CSCF Restoration is a license-controlled feature. A valid feature license must be installed prior to configuring this feature. Contact your Cisco account representative for more information.

---

**Important**

- HSS-based P-CSCF Restoration for WLAN:

  If the P-CSCF restoration mechanism is supported, gateway indicates the restoration support to AAA server through Feature-List AVP in the Authorization Authentication Request (AAR) message sent over S6b interface. The Feature-List AVP is part of the Supported-Features grouped AVP. The Bit 0 of the Feature-List AVP is used to indicate P-CSCF Restoration support for WLAN.

  During the P-CSCF Restoration, 3GPP AAA server, after having checked that the PGW supports the HSS-based P-CSCF restoration for WLAN, sends a P-CSCF restoration indication to the P-GW over S6b in a Re-authorization Request (RAR) command. A new Diameter AVP “RAR-Flags” is encoded in the RAR message with the Bit 1 set, would indicate to the gateway that the AAA server requests the execution of HSS-based P-CSCF restoration procedures for WLAN.

  The existing CLI command `diameter authentication` under AAA Group configuration is extended to encode P-CSCF Restoration feature as part of Supported-Features AVP in the AAR message.

  **Important**

  Supported-Features will be sent in every AAR message for RAT type WLAN. Feature negotiation is required in every AAR. ReAuth AAR will also do the feature renegotiation.

- PCRF-based P-CSCF Restoration:

  PCEF supporting P-CSCF restoration mechanism indicates the restoration support in CCR-I message through the Supported-Features AVP. The 24th Bit of the Supported-Feature-List AVP indicates whether this mechanism is supported or not.

  The existing CLI command `diameter encode-supported-features` in Policy Control configuration is extended to allow the negotiation of P-CSCF Restoration feature support with PCRF. A new Diameter AVP “PCSCF-Restoration-Indication” is introduced to indicate to PCEF that a P-CSCF Restoration is requested. This is achieved by setting AVP value to 0.
Supported-Features AVP is negotiated in CCR-I of all access types (eHRPD, P-GW, GGSN); however, Restoration trigger, if received, is ignored in eHRPD and GGSN.

Limitations

• As per the 3GPP standard specification, if S6b re-authorization request is used for P-CSCF Restoration for WLAN, then for extended P-CSCF Restoration the gateway may send authorization request with only mandatory AVPs. However, in the current implementation, ReAuth used for extended P-CSCF Restoration is a common authorization request of normal ReAuth. It will contain all the AVP of ReAuthorization AAR.

For more information on this feature and associated configurations, refer to P-GW Enhancements for 21.0 and SAEGW Enhancements for 21.0 section in the Release Change Reference guide.

Configuring the HSS/PCRF-based P-CSCF Restoration

The following section provides the configuration commands to enable support for HSS-based and PCRF-based P-CSCF Restoration feature.

Enabling P-CSCF Restoration Indication on S6b AAA interface

Use the following configuration commands for encoding Supported-Features AVP in the AAR message sent to AAA server via S6b interface.

```
configure context context_name
    aaa group group_name
        diameter authentication encode-supported-features pcscf-restoration-indication
end
```

Notes:

• **encode-supported-features**: Encodes Supported-Features AVP.
• **pcscf-restoration-indication**: Enables the P-CSCF Restoration Indication feature.
• **default encode-supported-features**: Configures the default setting, that is not to send the Supported-Features AVP in AAR message.
• **no encode-supported-features**: Disables the CLI command to not send the Supported-Features AVP.
• The **pcscf-restoration-indication** keyword is license dependent. For more information, contact your Cisco account representative.

Enabling P-CSCF Restoration Indication on Gx interface

Use the following configuration to enable P-CSCF Restoration Indication feature on Gx interface.

```
configure context context_name
    ims-auth-service service_name
        policy-control
            diameter encode-supported-features pcscf-restoration-indication
end
```
Notes:

- **pcscf-restoration-ind**: Enables the P-CSCF Restoration Indication feature. This keyword is license dependent. For more information, contact your Cisco account representative. By default, this feature is disabled.

- **default encode-supported-features**: The default configuration is to remove/reset the supported features.

- **no encode-supported-features**: Removes the previously configured supported features.

### Verifying the HSS/PCRF-based P-CSCF Restoration

#### show ims-authorization sessions full all

This command generates a display that indicates the negotiation status of this feature.

The following sample display is only a portion of the output which shows **pcscf-restoration-ind** among the Negotiated Supported Features.

```
show ims-authorization sessions full all

CallId: 00004e22   Service Name: imsa-Gx
IMSI: 123456789012341
...
Negotiated Supported Features:
  3gpp-r8
  pcscf-restoration-ind
  ...
```

#### show aaa group all

This show command displays **pcscf-restoration-ind** as part of Supported-Features, if this feature is configured under AAA group.

```
show aaa group all

Group name: default
Context: local
Diameter config:
  Authentication:
    ...
  Supported-Features: pcscf-restoration-ind
    ...
```

### Monitoring and Troubleshooting the HSS/PCRF-based P-CSCF Restoration

This section provides information regarding show commands and/or their outputs in support of this feature.

The following operations can be performed for troubleshooting any failure related to this feature:

- Verify if the feature is enabled using **show ims-authorization sessions full all** and **show aaa group all** CLI commands. If not enabled, configure the required CLI commands both under Policy Control and AAA group configuration and check if it works.

- Execute **monitor protocol** command and check if the support for P-CSCF Restoration feature is negotiated in CCR-I and AAR messages. If not, enable the respective CLI commands for this feature to work.

- If the failure is still observed, obtain the following information and contact Cisco account representative for further analysis:
- Monitor protocol log with options 74 (EGTPC) and 75 (App Specific Diameter –Gx/S6b) turned on
- Logs with sessmgr, imsa, and diameter-auth enabled
- Output of show session disconnect reason CLI command and the relevant statistics at service level

**Show Commands and/or Outputs**

**show ims-authorization sessions full all**

The Negotiated Supported Features field in this show command output displays whether or not the P-CSCF Restoration feature is negotiated with PCRF.

This supported feature is displayed only when the feature license is configured.

**show aaa group all**

The Supported Features field in this show command output displays whether or not the P-CSCF Restoration feature is configured as part of the Supported-Features AVP.

This supported feature is displayed only when the feature license is configured.

**show license information**

If the license to enable the P-CSCF Restoration feature is configured, then the show license information command displays the associated license information.

**Monitoring Logs**

This section provides information on how to monitor the logs that are generated relating to the HSS/PCRF-based P-CSCF Restoration feature.

**S6b Diameter Protocol Logs**

The Supported-Features field is available in AAR/AAA section. The log output generated will appear similar to the following:

```
<<<OUTBOUND  15:37:23:561 Eventid:92870(S)
 ....
 [V] [M] Supported-Features:
 [M] Vendor-Id: 10415
 [V] Feature-List-ID: 1
 [V] Feature-List: 1
 ....
INBOUND>>>>> 15:37:23:562 Eventid:92871(S)
 ....
[V] [M] Supported-Features:
 [M] Vendor-Id: 10415
 [V] Feature-List-ID: 1
 [V] Feature-List: 1
 ....
```

The RAR-Flags field is available in RAR section. The log output generated will appear similar to the following:

```
INBOUND>>>>> 15:37:43:562 Eventid:92871(S)
 ....
 [M] Re-Auth-Request-Type: AUTHORIZE_ONLY (0)
 [V] RAR-Flags: 2
 ....
```
Gx Diameter Protocol Logs

Under **Supported-Features**, the P-CSCF Restoration **Feature-List** is available in CCR-I/CCA-I section. The output generated will appear similar to the following:

```
<<<<OUTBOUND 13:52:06:117 Eventid:92820(5)
....
[V] [M] Supported-Features:
[M] Vendor-Id: 10415

Feature Description

When a PCC (Dynamic or Predefined) rule installation fails, the PCEF initiates a CCR-U toward the PCRF to report the failed rule. In case the PCRF responds back with same rule definition, then the rule failure CCR-U is initiated again. This results in a loop of rule failure.

With this feature, gateways have the ability to prevent the loop by reporting the rule install failure to PCRF only once until it is successfully installed.

How It Works

This feature is configurable through a CLI command with which, once a failure is being reported for a subscriber, failure for the same rule is suppressed for that subscriber until it is installed successfully. The rulenames are preserved for a subscriber for which the failures are reported. However, when the condition of the rule failure is rectified for an error (for example, rule definition is added to the configuration and the rule is successfully installed), then the gateway removes the rulename from the failed rules list. So, if the failure for that particular rule occurs again, it is reported to the PCRF.

The failed rulename is not checkpointed and so, if a recovery event like session recovery or an ICSR occurs then the failure of these rules are reported once again.

Configuring Loop Prevention for Dynamic Rules

This section explains the configuration procedures required to enable the feature.

Enabling ACS Policy to Control Loop Prevention

Use the following commands under ACS Configuration Mode to enable or disable the feature which prevents the rule failure loop between PCRF and PCEF:

```
configure
    active-charging service<service_name>
    policy-control report-rule-failure-once
end
```

Notes:

- When configured, CCR-U will be sent only once for the same rule failure.
- By default, the feature is disabled.
- If previously configured, use the `no policy-control report-rule-failure-once` to disable the feature.
Monitoring and Troubleshooting

The following sections describe commands available to monitor the feature.

Show Commands and Outputs

This section provides information regarding show commands and their outputs for the Loop Prevention for Dynamic Rules feature.

show active-charging service all

The output of the above command has been enhanced to display the status (Enabled/Disabled) of the feature. For example:

```
show active-charging service all
  .
  .
  Report Rule Failure Once: Enabled
```

show active-charging subscribers full all

The output of the above command has been enhanced to display the new parameter which shows the total number of rule failures not reported. For example:

```
<table>
<thead>
<tr>
<th>Callid:</th>
<th>Active Charging Service name:</th>
<th>ACSMgr Card/Cpu:</th>
<th>Active charging service scheme:</th>
</tr>
</thead>
<tbody>
<tr>
<td>4e21</td>
<td>acs</td>
<td>15/0</td>
<td></td>
</tr>
<tr>
<td>ACSMgr Instance:</td>
<td>1</td>
<td>Number of Sub sessions:</td>
<td>1</td>
</tr>
<tr>
<td>Data Sessions Active:</td>
<td>0</td>
<td>Dynamic Routes created:</td>
<td>0</td>
</tr>
<tr>
<td>Uplink Bytes:</td>
<td>0</td>
<td>Downlink Bytes:</td>
<td>0</td>
</tr>
<tr>

Feature Description

Prior to Release 21.2, the Cisco StarOS platform had a single configuration parameter for sending accounting interim records to RADIUS and Diameter Rf servers. Consequently, it was not possible to send accounting
interim records to RADIUS and Diameter Rf servers with different intervals using the available CLI options. This feature provides a CLI controlled mechanism to have different interim intervals for Diameter Rf and RADIUS accounting applications. Having a separate configurable CLI and interim interval timer values for RADIUS and Diameter Rf servers provides enhanced usability.

**How It Works**

Currently, the Diameter accounting uses the value configured for RADIUS accounting interim interval. With this feature, configurable through a CLI command, provides an option to separately configure Diameter accounting interim interval for Rf interface. Until Diameter interim CLI is configured with either “no” option or any specific timer value, as a measure for compatibility, RADIUS interim interval value is used for Diameter interim interval. Once Diameter configuration takes effect, any change to RADIUS configuration will not affect Diameter configuration and vice versa. The following table shows the Diameter interim interval values used for different scenarios.

<table>
<thead>
<tr>
<th>Radius Configuration</th>
<th>Diameter Configuration</th>
<th>Diameter Interim Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>No configuration OR Interim Interval: X OR Interim disabled</td>
<td>Interim Interval: Y</td>
<td>Interim Interval: Y Note: X may or may not be same as Y</td>
</tr>
<tr>
<td>No configuration OR Interim Interval: X OR Interim disabled</td>
<td>Interim disabled using “No” option</td>
<td>Interim disabled</td>
</tr>
<tr>
<td>No configuration OR Interim Interval: X OR Interim disabled</td>
<td>No configuration</td>
<td>Fallback to RADIUS configuration</td>
</tr>
</tbody>
</table>

- Recovery/ICSR behavior: Interim interval configuration used at the time of PDN creation is applicable for entire lifetime of PDN. Recovery/ICSR will not have any impact of existing PDN behavior with regard to Diameter interim interval.

- ICSR Upgrade/Downgrade behavior:
  - Existing session will be recovered based on RADIUS configuration present in old chassis.
  - New session behavior is as per configuration available on newly active chassis.
Limitations

Following are the known limitations of this feature:

1. In case Diameter interim interval CLI is not configured, the P-GW retains the older behavior where Diameter accounting uses the same interim interval value configured for RADIUS accounting.

2. Once diameter accounting configuration is done, it’s not possible to go back to the older behavior.

Configuring Diameter Accounting Interim Interval

Use the following commands under AAA Server Group Configuration Mode to configure Diameter accounting interim interval independently from RADIUS accounting interim interval:

```bash
configure
context context_name
  aaa group group_name
    diameter accounting interim interval interval_in_seconds
end
```

Notes:

• `interval_in_seconds`: Specifies the interim interval, and must be in the range of 50 through 40000000.

• If previously configured, use the `no diameter accounting interim interval` to disable the interim accounting messages on Rf interface.

• There is no default Diameter interim interval value.

• In case Diameter interim interval CLI is not configured, the P-GW retains the older behavior where Diameter accounting uses RADIUS interim interval configuration available in AAA server group configuration block.

Monitoring and Troubleshooting

The following sections describe commands available to monitor the feature.

Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of the feature.

```bash
show aaa group { name <group_name> | all }
```

The output of the above command is modified to display the following new field to show the current configuration for interim interval used for upcoming Diameter Rf accounting sessions:

• Interim-timeout: &lt;50-40000000&gt; or &lt;None&gt;

Following is a sample output where Diameter interim interval is not configured:

```bash
show aaa group name default
Group name: default
Context: pgw
Diameter config:
  Accounting:
```
Following is a sample output where Diameter interim interval is configured with the value 900:

```
show aaa group name default
Group name: default
Context: pgw
Diameter config:
  Accounting:
    Request-timeout: 20
    Interim-timeout: 900
```

The output of the above command is modified to display the following new field to show the interval of interim messages in seconds:

- `diameter accounting interim interval <value_in_seconds>`

Following is a sample output where Diameter interim interval is configured with the value 60:

```
show configuration context isp verbose
config
  context isp
    aaa group default
diameter accounting interim interval 60
```

### Enhancement to OCS Failure Reporting for Gy

#### Feature Information

**Feature Description**

When Cisco-Event-Trigger-Type AVP is installed by PCRF in CCA-I, CCA-U or in RAR messages with value CREDIT_CONTROL_FAILURE (5), then the Cisco-Event grouped AVP is sent by the P-GW to PCRF in CCR-U message with the exact value of OCS failure code. This trigger is sent only when Gy failure occurs and based on the configuration (Credit-Control-Failure-Handling), the ‘Continue’ action is taken and Gy session moves to Offline state.

In releases prior to the implementation of this enhancement, if a failure code was received from OCS in the range of 3000-3999, then Cisco-CC-Failure-Type was sent with the value 3XXX. Similarly, for error codes in the range of 4000-4999 or 5000-5999, Cisco-CC-Failure-Type was reported as 4XXX or 5XXX respectively. With this enhancement, the exact failure code is reported to the PCRF instead of the range. For example, when the Cisco-Event-Trigger-Type is CREDIT_CONTROL_FAILURE (5) and OCS failure code is 3002 in CCA-U, then in CCR-U towards PCRF Cisco-CC-Failure-Type (as part of grouped AVP Cisco-Event) is sent with a value of 3002.

### Support Added for RAN/NAS Cause Code for S5/S8 and S2b Interfaces

Feature Changes

This is a license controlled feature. There are separate licenses for this feature. You must enable the existing license of NPLI or contact your Cisco account representative for information on how to obtain the custom license.

For billing co-ordination at IMS domain and VoWiFi deployments, an operator may require access to the RAN or NAS (or both) release cause code information available at P-CSCF. The P-GW provides detailed RAN/NAS cause information with ANI information received from the access network to the P-GW and further down to the PCRF based on the following events:

- Bearer deactivation (Delete Bearer Response/Delete Bearer Command)
- Session deactivation (Delete Session Request)
- Bearer creation/modification failures (Create/Update Bearer Response with cause as FAILURE)

The IMS network can retrieve detailed RAN and/or NAS release cause codes information from the access network that is used for call performance analysis, user QoE analysis, and proper billing reconciliation. This feature is supported on the S5, S8, Gx, and S2b interfaces.

This feature includes support RAN/NAS cause IE in Create Bearer Response, Update Bearer Response, Delete Bearer Response, Delete Bearer Command, and Delete Session Request. The following table shows the supported protocol type for RAN/NAS cause IE.

<table>
<thead>
<tr>
<th>Interface</th>
<th>Supported Protocol Type for RAN/NAS IE</th>
</tr>
</thead>
<tbody>
<tr>
<td>S5/S8</td>
<td>S1AP Cause (1)/EMM Cause (2)/ESM Cause (3)</td>
</tr>
<tr>
<td>S2b</td>
<td>Diameter Cause (4)/IKEv2 Cause (5)</td>
</tr>
</tbody>
</table>
Any protocol type value that is received apart from the supported protocol type values listed in the table are ignored and not forwarded to the PCRF.

**GTP interface Requirements for RAN/NAS Cause**

For S5/S8 interface, RAN/NAS cause is supported for the following messages for the dpca-custom8 dictionary:

- Failed Create Bearer Response
- Failed Update Bearer Response
- Delete Session Request
- Delete Bearer Response
- Delete Bearer Command

For S2b interface, RAN/NAS cause is supported for the following messages for the custom dpca-custom8 dictionary:

- Failed Create Bearer Response
- Failed Update Bearer Response
- Delete Session Request

**Gx interface Requirements for RAN/NAS Cause**

The RAN/NAS cause is added for the custom dpca-custom8 dictionary to ensure that the RAN/NAS cause is populated. The Gx interface behavior to handle RAN/NAS cause is as follows:

**Table 59: Gx Interface Requirements for RAN/NAS Cause**

<table>
<thead>
<tr>
<th>Message</th>
<th>GTP Cause</th>
<th>Gx Message Carrying RAN-NAS Cause Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Bearer Response</td>
<td>Accepted</td>
<td>RAN/NAS cause is not expected as per 29.274 Table 7.2.4-2. Therefore, if it is received, it is ignored and not forwarded to the PCRF.</td>
</tr>
<tr>

</tr>
<tr>
<td>Other GTP Causes</td>
<td>CCR-U</td>
<td></td>
</tr>
</tbody>
</table>
**Message** | **GTP Cause** | **Gx Message Carrying RAN-NAS Cause Information**
--- | --- | ---
Delete Bearer Response | Temporarily rejected due to HO in progress | RAN/NAS cause with this GTP cause is not applicable as per 29.274 Table C.4. Therefore, if it is received, it is ignored and not forwarded to the PCRF.  
**Note**  
- If RAN/NAS cause is received in the Delete Bearer Response, which is triggered as a part of the Delete Bearer command and cause as “Request Accepted”, P-GW forwards the RAN/NAS cause (received in Delete Bearer Response) to the PCRF.  
- If RAN/NAS cause is received in the Delete Bearer command and Delete Bearer Response with HO in progress, the RAN/NAS Cause received in the Delete Bearer command is forwarded to the PCRF.  
- If RAN/NAS Cause is received in the Delete Bearer command and Delete Bearer Response with Accepted/Other Cause and new RAN/NAS Cause, the new RAN/NAS cause is forwarded to the PCRF.

Accepted / Other GTP CCR-U Causes | CCR-U | If RAN/NAS cause is received in the delete bearer response that is initiated through RAR/CCA-U, then P-GW does not send CCR-U to the PCRF to report the RAN/NAS cause.  
**Note**  
This support is introduced in 29.212 release 13.5 with “Enhance RAN/NAS” feature.

Delete Session Request | Accepted | CCR-T

**ANI Behavior Towards PCRF**

Section 4.5.6, 4.5.7, 4.5.12 of 3GPP 29.212 v13.4.0 mentions that if the RAN-NAS-Cause feature is supported, the PCEF should provide the available access network information within the 3GPP-User-Location-Info AVP (if available), TWAN-Identifier (if available and Trusted-WLAN feature is supported), User-Location-Info-Time AVP (if available), and 3GPP-MS-TimeZone AVP (if available).

In the earlier releases, the dpca-custom8 dictionary did not support USER-LOCATION-INFO-TIME AVP.

In this release, the USER-LOCATION-INFO-TIME AVP is added to the dpca-custom8 dictionary, which is sent to the PCRF (if available) as a part of ANI. Also, new PROTOCOL-TYPE, 1 to 5 are supported for RAN/NAS. This AVP can be seen in the CCR-U and CCR-T (whenever applicable). Also the new PROTOCOL-TYPE (S1AP Cause, EMM Cause, ESM Cause, IKEv2, DIAMETER) is visible on the Gx interface (if the same is received over the S5/S8/S2b interface).

**ANI Behavior for S5/S8 Interface**
Along with RAN/NAS cause, P-GW also sends following information to the PCRF, if available, for the dpca-custom8 dictionary:

Table 60: Mapping of GTP IE to ANI AVPs on Gx Interface

<table>
<thead>
<tr>
<th>GTP IE</th>
<th>Gx AVP</th>
</tr>
</thead>
<tbody>
<tr>
<td>UE Time Zone</td>
<td>3GPP-MS-TimeZone</td>
</tr>
<tr>
<td>ULI Timestamp</td>
<td>User-Location-Info-Time</td>
</tr>
<tr>
<td>User Location Information</td>
<td>3GPP-User-Location-Info</td>
</tr>
</tbody>
</table>

ANI information is sent to the PCRF irrespective of the event triggers configured when the RAN/NAS feature is enabled.

ANI Behavior for S2b Interface

ANI information is not sent towards PCRF for the dpca-custom8 dictionary. Also, the TWAN-Identifier is not supported as part of ANI for the dpca-custom8 dictionary.

Limitations

Following are the limitations of this feature:

- Support of RAN/NAS cause information is added only for the dpca-custom8 dictionary.
- PGW processes first two RAN/NAS cause IE (max one RAN and max one NAS) information received from the GTP interface. For example, if the access network misbehaves and sends RAN/NAS cause list with two NAS and one RAN then only first two causes are considered and validated. In this case, there are two NAS causes, only first NAS cause is populated at the Gx interface.
- RAN/NAS information is populated only on the Gx interface, no other interface is impacted.

Command Changes

diameter encode-supported-features netloc-ran-nas-cause

Use the existing CLI command, `diameter encode-supported-features netloc-ran-nas-cause` to enable the RAN/NAS cause on each of the S5/S8 and S2b interfaces.

This feature is disabled by default.

To enable this feature, enter the following commands:

```
configure
context ISPl
  ims-auth-service IMSGx
  policy-control
daemon diameter encode-supported-features netloc-ran-nas-cause
end
```
diameter encode-supported-features netloc-ran-nas-cause
Gx Support for eMPS

Feature Description

The National Security/Emergency Preparedness (NS/EP) Next Generation Network (NGN) Priority Services (NGN-PS) (formerly called NGN Government Emergency Telecommunications Service (GETS)) is a set of voice, video and data services that are based on services available from public packet-switched Service Providers, and that provide priority treatment in support of National Security and Emergency Preparedness (NS/EP) communications. A Service Provider is a public telecommunications service provider authorized by the NCS to provide GETS (including Legacy GETS), Wireless Priority Service (WPS), and/or NS/EP NGN Priority Services (NS/EP NGN-PS). The NS/EP NGN-PS provides priority treatment for a Service User’s NS/EP communications and is required when the Service Providers’ networks are impaired due to congestion and/or damaged from natural disasters (such as floods, earthquakes, and hurricanes) and man-made disasters (such as physical, cyber, or other forms of terrorist attacks).

With this feature, support is added for NS/EP NGN priority service over the network which eventually requires the P-GW node to first identify an eMPS bearer/session (based on configured Enhanced Multimedia Priority Service (eMPS) evolved Allocation and Retention Priority (eARP)), and then prioritize their GTP and Gx signaling over the network.

---

Important

For supplemental information related to eMPS profile configuration (configuring the eMPS ARPs, which are used to identify a bearer/session as an eMPS bearer/session), and eMPS statistics, refer to the *Expanded Prioritization for VoLTE/Emergency Calls* chapter in the *P-GW Administration Guide* or the *SAEGW Administration Guide*.

---

Prioritization of GTP and Gx Signaling

1. Prioritizing the GTP signaling for eMPS sessions implies:
   - Excluding the eMPS session’s GTP control traffic from throttling due to Load Overload Control (For supplemental information about Load Overload Control, refer to the *3GPP R12 GTP-C Load and Overload Control Support on the P-GW, SAEGW, and S-GW* chapter in the *P-GW Administration Guide* or the *SAEGW Administration Guide*).

2. Prioritizing the Gx signaling for eMPS sessions implies:
   - Excluding the eMPS session’s Gx traffic from outgoing RLF throttling (RLF throttling is only applicable for Gx outgoing messages).
   - Excluding the eMPS session’s Gx traffic from max-outstanding queue decisions.

Parsing the DRMP AVP from RAR Messages

Support is also extended for parsing the DRMP AVP from RAR messages on the Gx interface. And, if the DRMP value is received as 0, the corresponding response (RAA) message is prioritized, that is to say, excluded from Gx RLF throttling and max-outstanding queue decisions.
Relationships to Other Features

This feature is related to eMPS profile, Load Overload Control, Gx RLF throttling, and Max-outstanding configuration features, and one or more among these features may require additional license key to be installed.

How It Works

The following is a high-level overview of how this feature works:

- The newly introduced CLI command, `diameter session-prioritization`, is used to enable or disable Gx signaling prioritization for eMPS sessions. This CLI command is at policy-control configuration in IMS-authorization service, and it is required to:
  - Exclude the eMPS session’s Gx traffic from RLF throttling.
  - Exclude the eMPS session’s Gx traffic from max-outstanding queue decisions.

  The following Gx signaling is excluded from RLF throttling and max-outstanding queue decisions:
  - All Gx signaling for an eMPS session.
  - Gx signaling related to eMPS upgrade/downgrade toggling which also includes inter-access technology handovers.
  - Gx signaling which is initiated as part of eMPS upgrade failure (UBRsp/CBRsp failures from access side).

- Support is added for parsing DRMP AVP from RAR and prioritizing corresponding RAA if the DRMP value is received as 0. This behavior is enabled by default and applicable to both eMPS and non-eMPS sessions, and independent of the diameter session-prioritization CLI command.

- **GTP Load Overload Throttling behavior**: The Cisco P-GW supports GTP Load Overload Throttling for both self-overload and peer-overload scenarios. However, GTP signaling for eMPS sessions should be excluded from throttling even under these conditions. For this prioritization to work, all the eARP values configured under eMPS profile must be configured under Load Overload profile configuration (for both self-overload and peer-overload). For additional eARP values configured under Load Overload profile configuration (self-overload and peer-overload), the legacy behavior of self-overload and peer-overload continues.

  If there is any change in the eARP values configured under eMPS profile configuration:

  1. For existing sessions:
      1. The new configuration is considered for eMPS upgrade/downgrade toggling, when there is any change in eARP value of existing bearer(s) of that session or at the time of bearer creation for that session.
      2. Till the session is marked eMPS, the legacy behavior of self-overload and peer-overload continues for the newly configured eARP values.

  2. For new sessions:
      1. New configuration takes effect seamlessly.
• Session recovery and ICSR recover the eMPS state of the session.

• As per Government Industry Requirements (GIR) document, eMPS marking is done only for P-GW EUTRAN and S4-SGSN PDNs.

Limitations

Following are the known limitations of the feature:

• When a session is marked eMPS, it will continue to be excluded from GTP throttling under GTP self-overload situation even after it has been downgraded to a non-eMPS session.

• If for a session, any Update Bearer Request or Create Bearer Request which can upgrade the session from non-eMPS to eMPS fails due to internal failure, the corresponding CCR-U may not be prioritized sometimes.

Configuring Gx Support for eMPS

This section provides information about the CLI commands available in support of the feature.

Configuring eMPS Profile

Use the following commands to configure eMPS profile, which is used to identify/mark a bearer/session as an eMPS bearer/session.

```plaintext
configure
  emps-profile emps_profile
    earp earp_value earp_value
  end
```

For supplemental information related to eMPS profile configuration (configuring the eMPS ARPs, which are used to identify a bearer/session as an eMPS bearer/session), and eMPS statistics, refer to the Expanded Prioritization for VoLTE/Emergency Calls chapter in the P-GW Administration Guide or the SAEGW Administration Guide.

Enabling Gx Prioritization for eMPS Sessions

Use the following commands under the Policy Control Configuration Mode to enable prioritization of Gx messages based on eMPS state of the session.

```plaintext
configure
  context context_name
    ims-auth-service service_name
      policy-control
        [ no ] diameter session-prioritization
      end
  end
```

Notes:
• By default, the `diameter session-prioritization` CLI command is disabled and Gx messages will not be prioritized based on eMPS value.

• If previously configured, use the `no diameter session-prioritization` CLI command to set the default behavior.

• The `diameter session-prioritization` CLI takes affect when Gx, along with eMPS profile, is enabled in the configuration.

Enabling GTP Prioritization for eMPS Sessions under GTP Load Overload Throttling

Use the following configurations for prioritizing the eMPS sessions related to GTP signaling, in case the GTP Peer Overload Control and/or Self-Protection configuration is enabled in the system. These configurations provide option to exclude eMPS session’s GTP traffic from throttling under Peer Overload/Self Protection conditions.

```
configure
    emps-profile emps_profile_name
        earp earp_value earp_value
end

configure
    gtpc-overload-control-profile overload_profile
        throttling-behavior earp earp_value earp_value exclude
        self-protection-behavior earp earp_value earp_value exclude
end
```

Notes:

• `emps-profile emps_profile_name`: Configures eMPS profile for defining attributes of an eMPS session. The `emps_profile_name` is a string of size from 1 to 63.

• `earp`: Configures a maximum of 3 eARP priority level (PL) values so that sessions with configured eARP priority values can be marked as eMPS sessions. Maximum of 3 eARP values can be configured under an eMPS profile.

• As per above configuration, sessions with any one bearer with either eARP value will be excluded from Load Overload GTP Throttling.

For supplemental information related to GTP-C overload control throttling/self-protection behavior and configurations details, refer to the 3GPP R12 GTP-C Load and Overload Control Support on the P-GW, SAEGW, and S-GW chapter in the P-GW Administration Guide or the SAEGW Administration Guide.

For supplemental information related to eMPS profile configuration (configuring the eMPS ARPs, which are used to identify a bearer/session as an eMPS bearer/session), and eMPS statistics, refer to the Expanded Prioritization for VoLTE/Emergency Calls chapter in the P-GW Administration Guide or the SAEGW Administration Guide.

For information related to configuration of Gx RLF Throttling and Gx max-outstanding queue, refer the CLI Configuration Guide.
Verifying the Gx Support for eMPS Configuration

This section provides information to verify the Gx Support for eMPS configuration.

**show configuration**

The output of this CLI command has been enhanced to display the following new field:

- diameter session-prioritization

**show configuration verbose**

The output of this CLI command has been enhanced to display the following new field:

  RAR with other priority: 2
```
Gy Interface Support

This chapter provides an overview of the Gy interface and describes how to configure the Gy interface. Gy interface support is available on the Cisco system running StarOS 9.0 or later releases for the following products:

- GGSN
- HA
- IPSG
- PDSN
- P-GW

It is recommended that before using the procedures in this chapter you select the configuration example that best meets your service model, and configure the required elements for that model as described in the administration guide for the product that you are deploying.

- Introduction, on page 633
- Features and Terminology, on page 635
- Configuring Gy Interface Support, on page 672

Introduction

The Gy interface is the online charging interface between the PCEF/GW (Charging Trigger Function (CTF)) and the Online Charging System (Charging-Data-Function (CDF)).

The Gy interface makes use of the Active Charging Service (ACS) / Enhanced Charging Service (ECS) for real-time content-based charging of data services. It is based on the 3GPP standards and relies on quota allocation. The Online Charging System (OCS) is the Diameter Credit Control server, which provides the online charging data to the PCEF/GW. With Gy, customer traffic can be gated and billed in an online or prepaid style. Both time- and volume-based charging models are supported. In these models differentiated rates can be applied to different services based on ECS shallow- or deep-packet inspection.

In the simplest possible installation, the system will exchange Gy Diameter messages over Diameter TCP links between itself and one prepay server. For a more robust installation, multiple servers would be used. These servers may optionally share or mirror a single quota database so as to support Gy session failover from one server to the other. For a more scalable installation, a layer of proxies or other Diameter agents can be introduced to provide features such as multi-path message routing or message and session redirection features.

The following figure shows the Gy reference point in the policy and charging architecture.
The following figure shows the Gy interface between CTF/Gateway/PCEF/Client running ECS and OCS (CDF/Server). Within the PCEF/GW, the Gy protocol functionality is handled in the DCCA module (at the ECS).

License Requirements

The Gy interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on
installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

**Supported Standards**

Gy interface support is based on the following standards:

- IETF RFC 4006: Diameter Credit Control Application; August 2005
- 3GPP TS 32.299 V9.6.0 (2010-12) 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Telecommunication management; Charging management; Diameter charging applications (Release 9)

**Features and Terminology**

This section describes features and terminology pertaining to Gy functionality.

**Charging Scenarios**

<table>
<thead>
<tr>
<th>Important</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Online charging for events</strong> (&quot;Immediate Event Charging&quot; and &quot;Event Charging with Reservation&quot;) is not supported. Only &quot;Session Charging with Reservation&quot; is supported.</td>
</tr>
</tbody>
</table>

**Session Charging with Reservation**

Session Charging with Unit Reservation is used for credit control of sessions.

**Decentralized Unit Determination and Centralized Rating**

In this scenario, the CTF requests the reservation of units prior to session supervision. An account debit operation is carried out following the conclusion of session termination.

**Centralized Unit Determination and Centralized Rating**

In this scenario, the CTF requests the OCS to reserve units based on the session identifiers specified by the CTF. An account debit operation is carried out following the conclusion of session.

**Decentralized Unit Determination and Decentralized Rating**

<table>
<thead>
<tr>
<th>Important</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decentralized Rating is not supported in this release. Decentralized Unit determination is done using CLI configuration.</td>
</tr>
</tbody>
</table>

In this scenario, the CTF requests the OCS to assure the reservation of an amount of the specified number of monetary units from the subscriber's account. An account debit operation that triggers the deduction of the amount from the subscriber's account is carried out following the conclusion of session establishment.
Basic Operations

**Important**

Immediate Event Charging is not supported in this release. "Reserve Units Request" and "Reserve Units Response" are done for Session Charging and not for Event Charging.

Online credit control uses the basic logical operations "Debit Units" and "Reserve Units".

- **Debit Units Request;** sent from CTF to OCS: After receiving a service request from the subscriber, the CTF sends a Debit Units Request to the OCS. The CTF may either specify a service identifier (centralised unit determination) or the number of units requested (decentralised unit determination). For refund purpose, the CTF sends a Debit Units Request to the OCS as well.

- **Debit Units Response;** sent from OCS to CTF: The OCS replies with a Debit Units Response, which informs the CTF of the number of units granted as a result of the Debit Units Request. This includes the case where the number of units granted indicates the permission to render the requested service. For refund purpose, the OCS replies with a Debit Units Response.

- **Reserve Units Request;** sent from CTF to OCS: Request to reserve a number of units for the service to be provided by an CTF. In case of centralised unit determination, the CTF specifies a service identifier in the Reserve Unit Request, and the OCS determines the number of units requested. In case of decentralised unit determination, the number of units requested is specified by the CTF.

- **Reserve Units Response;** sent from OCS to CTF: Response from the OCS which informs the CTF of the number of units that were reserved as a result of the "Reserve Units Request".

Session Charging with Unit Reservation (SCUR) use both the "Debit Units" and "Reserve Units" operations. SCUR uses the Session Based Credit Control procedure specified in RFC 4006. In session charging with unit reservation, when the "Debit Units" and "Reserve Units" operations are both needed, they are combined in one message.

**Important**

Cost-Information, Remaining-Balance, and Low-Balance-Indication AVPs are not supported.

The consumed units are deducted from the subscriber's account after service delivery. Thus, the reserved and consumed units are not necessarily the same. Using this operation, it is also possible for the CTF to modify the current reservation, including the return of previously reserved units.

Re-authorization

The server may specify an idle timeout associated with a granted quota. Alternatively, the client may have a configurable default value. The expiry of that timer triggers a re-authorization request.

Mid-session service events (re-authorisation triggers) may affect the rating of the current service usage. The server may instruct the credit control client to re-authorize the quota upon a number of different session related triggers that can affect the rating conditions.

When a re-authorization is trigger, the client reports quota usage. The reason for the quota being reported is notified to the server.
Threshold based Re-authorization Triggers

The server may optionally include an indication to the client of the remaining quota threshold that triggers a quota re-authorization.

Termination Action

The server may specify to the client the behavior on consumption of the final granted units; this is known as termination action.

Diameter Base Protocol

The Diameter Base Protocol maintains the underlying connection between the Diameter Client and the Diameter Server. The connection between the client and server is TCP based. There are a series of message exchanges to check the status of the connection and the capabilities.

- Capabilities Exchange Messages: Capabilities Exchange Messages are exchanged between the diameter peers to know the capabilities of each other and identity of each other.
  - Capabilities Exchange Request (CER): This message is sent from the client to the server to know the capabilities of the server.
  - Capabilities Exchange Answer (CEA): This message is sent from the server to the client in response to the CER message.

Important

Acct-Application-Id is not parsed and if sent will be ignored by the PCEF/GW. In case the Result-Code is not DIAMETER_SUCCESS, the connection to the peer is closed.

- Device Watchdog Request (DWR): After the CER/CEA messages are exchanged, if there is no more traffic between peers for a while, to monitor the health of the connection, DWR message is sent from the client. The Device Watchdog timer (Tw) is configurable in PCEF/GW and can vary from 6 through 30 seconds. A very low value will result in duplication of messages. The default value is 30 seconds. On two consecutive expiries of Tw without a DWA, the peer is taken to be down.

Important

DWR is sent only after Tw expiry after the last message that came from the server. Say if there is continuous exchange of messages between the peers, DWR might not be sent if (Current Time - Last message received time from server) is less than Tw.

- Device Watchdog Answer (DWA): This is the response to the DWR message from the server. This is used to monitor the connection state.

- Disconnect Peer Request (DPR): This message is sent to the peer to inform to shutdown the connection. PCEF/GW only receives this message. There is no capability currently to send the message to the diameter server.
• Disconnect Peer Answer (DPA): This message is the response to the DPR request from the peer. On receiving the DPR, the peer sends DPA and puts the connection state to “DO NOT WANT TO TALK TO YOU” state and there is no way to get the connection back except for reconfiguring the peer again.

A timeout value for retrying the disconnected peer must be provided.

• Tw Timer Expiry Behavior: The connection between the client and the server is taken care by the DIABASE application. When two consecutive Tw timers are expired, the peer state is set to idle and the connection is retried to be established. All the active sessions on the connection are then transferred to the secondary connection if one is configured. All new session activations are also tried on the secondary connection.

There is a connection timeout interval, which is also equivalent to Tw timer, wherein after a CER has been sent to the server, if there is no response received while trying to reestablish connection, the connection is closed and the state set to idle.

**Diameter Credit Control Application**

The Diameter Credit Control Application (DCCA) is a part of the ECS subsystem. For every prepaid customer with Diameter Credit Control enabled, whenever a session comes up, the Diameter server is contacted and quota for the subscriber is fetched.

**Quota Behavior**

Various forms of quotas are present that can be used to charge the subscriber in an efficient way. Various quota mechanisms provide the end user with a variety of options to choose from and better handling of quotas for the service provider.

**Time Quotas**

The Credit-Control server can send the CC-Time quota for the subscriber during any of the interrogation of client with it. There are also various mechanisms as discussed below which can be used in conjunction with time quota to derive variety of methods for customer satisfaction.

• Quota Consumption Time: The server can optionally indicate to the client that the quota consumption must be stopped after a period equal to the “Quota Consumption Time” in which no packets are received or at session termination, whichever is sooner. The idle period equal to the Quota Consumption Time is included in the reported usage. The quota is consumed normally during gaps in traffic of duration less than or equal to the Quota-Consumption-Time. Quota consumption resumes on receipt of a further packet belonging to the service data flow.

If packets are allowed to flow during a CCR (Update)/CCA exchange, and the Quota-Consumption-Time AVP value in the provided quota is the same as in the previously provided quota, then the Quota-Consumption-Time runs normally through this procedure. For example, if 5 seconds of a 10 second QCT timer have passed when a CCR(U) is triggered, and the CCA(U) returns 2 seconds later, then the QCT timer will expire 3 seconds after the receipt of the CCA and the remaining unaccounted 5 seconds of usage will be recorded against the new quota even though no packets were transmitted with the new quota.

A locally configurable default value in the client can be used if the server does not send the QCT in the CCA.

• Combinational Quota: Discrete-Time-Period (DTP) and Continuous-Time-Period (CTP) defines mechanisms that extends and generalize the Quota-Consumption-Time for consuming time_quota.
Both DTP and CTP use a "base-time-interval" that is used to create time-envelopes of quota used.

Instead of consuming the quota linearly, DTP and CTP consume the granted quota discretely in chunks of base-time-interval at the start of each base-time-interval.

Selection of one of this algorithm is based on the "Time-Quota-Mechanism" AVPs sent by the server in CCA.

Reporting usage can also be controlled by Envelope-Reporting AVP sent by the server in CCA during the quota grant. Based on the value of this AVP, the usage can be reported either as the usage per envelope or as usual cumulative usage for that grant.

Discrete-Time-Period: The base-time-interval defines the length of the Discrete-Time-Period. So each time-envelope corresponds to exactly one Discrete-Time-Period. So when a traffic is detected, an envelope of size equal to Base-Time-Interval is created. The traffic is allowed to pass through the time-envelope. Once the traffic exceeds the base-time-interval another new envelope equal to the base-time-interval is created. This continues till the quota used exceeds the quota grant or reaches the threshold limit for that quota.

Continuous-Time-Period: Continuous time period mechanism constructs time envelope out of consecutive base-time intervals in which the traffic occurred up to and including a base time interval which contains no traffic. Therefore the quota consumption continues within the time envelope, if there was traffic in the previous base time interval. After an envelope has closed, then the quota consumption resumes only on the first traffic following the closure of the envelope. The envelope for CTP includes the last base time interval which contains no traffic.

The size of the envelope is not constant as it was in Parking meter. The end of the envelope can only be determined retrospectively.

Quota Hold Time: The server can specify an idle timeout associated with a granted quota using the Quota-Holding-Time AVP. If no traffic associated with the quota is observed for this time, the client understands that the traffic has stopped and the quota is returned to the server. The client starts the quota holding timer when quota consumption ceases. This is always when traffic ceases, i.e. the timer is re-started at the end of each packet. It applies equally to the granted time quota and to the granted volume quota. The timer is stopped on sending a CCR and re-initialized on receiving a CCA with the previous used value or a new value of Quota-Holding-Time if received.

Alternatively, if this AVP is not present, a locally configurable default value in the client is used. A Quota-Holding-Time value of zero indicates that this mechanism is not used.

Quota Validity Time: The server can optionally send the validity time for the quota during the interrogation with the client. The Validity-Time AVP is present at the MSCC level and applies equally to the entire quota that is present in that category. The quota gets invalidated at the end of the validity time and a CCR-Update is sent to the server with the Used-Service-Units AVP and the reporting reason as VALIDITY_TIME. The entire quota present in that category will be invalidated upon Quota-Validity-Time expiry and traffic in that category will be passed or dropped depending on the configuration, till a CCA-Update is received with quota for that category.

Validity-Time of zero is invalid. Validity-Time is relative and not absolute.

In releases prior to 17.0, the AVP "SN-Remaining-Service-Unit" was not sent in the CCR-T and CCR-U messages with reporting Reason FINAL when the FUI action was received as Redirect and the granted units was zero in CCA. In 17.0 and later releases, for the Final-Reporting, the AVP "SN-Remaining-Service-Unit" will be encoded.
The "SN-Remaining-Service-Unit" AVP behavior is inherited from "Used-Service-Unit" AVP. This Final-Reporting is missing for the Remaining-Service-Unit AVP, which is now incorporated.

**Volume Quota**

The server sends the CC-Total-Octets AVP to provide volume quota to the subscriber. DCCA currently supports only CC-Total-Octets AVP, which applies equally to uplink and downlink packets. If the total of uplink and downlink packets exceeds the CC-Total-Octets granted, the quota is assumed to be exhausted.

If CC-Input-Octets and/or CC-Output-Octets is provided, the quota is counted against CC-Input-Octets and/or CC-Output-Octets respectively.

---

**Important**

Restricting usages based on CC-Input-Octets and CC-Output-Octets is not supported in this release.

---

**Units Quota**

The server can also send a CC-Service-Specific-Units quota which is used to have packets counted as units. The number of units per packet is a configurable option.

**Granting Quota**

Gy implementation assumes that whenever the CC-Total-Octets AVP is present, volume quota has been granted for both uplink and downlink.

If the Granted-Service-Unit contains no data, Gy treats it as an invalid CCA.

If the values are zero, it is assumed that no quota was granted.

If the AVP contains the sub AVPs without any data, it is assumed to be infinite quota.

Additional parameters relating to a category like QHT, QCT is set for the category after receiving a valid volume or time grant.

If a default quota is configured for the subscriber, and subscriber traffic is received it is counted against the default quota. The default quota is applicable only to the initial request and is not regranted during the course of the session. If subscriber disconnects and reconnects, the default quota will be applied again for the initial request.

**Requesting Quota**

Quotas for a particular category type can be requested using the Requested-Service-Unit AVP in the CCR. The MSCC is filled with the Rating-Group AVP which corresponds to the category of the traffic and Requested-Service-Unit (RSU) AVP without any data.

The Requested-Service-Unit can contain the CC AVPs used for requesting specific quantity of time or volume grant. Gy CLI can be used to request quota for a category type.

Alternatively quota can also be requested from the server preemptively for a particular category in CCR-I. When the server grants preemptive quota through the Credit control answer response, the quota will be used only when traffic is hit for that category. Quota can be preemptively requested from the Credit Control server from the CLI.

In 12.3 and earlier releases, when no pre-emptive quota request is present in CCR-I, on hitting server unreachable state for initial request, MSCC AVP with RSU is present in the CCR-I on server retries. Release
14.0 onwards, the MSCC AVP is skipped in the CCR-I on server retries. Corresponding quota usage will be reported in the next CCR-U (MSCC AVP with USU and RSU).

**Reporting Quota**

Quotas are reported to the server for number of reasons including:

- Threshold
- QHT Expiry
- Quota Exhaustion
- Rating Condition Change
- Forced Reauthorization
- Validity Time Expiry
- Final during Termination of Category Instance from Server

For the above cases except for QHT and Final, the Requested-Service-Unit AVP is present in the CCR.

Reporting Reason is present in CCR to let the server know the reason for the reporting of Quota. The Reporting-Reason AVP can be present either in MSCC level or at Used Service Unit (USU) level depending on whether the reason applies to all quotas or to single quota.

When one of these conditions is met, a CCR Update is sent to the server containing a Multiple-Services-Credit-Control AVP(s) indicating the reason for reporting usage in the Reporting-Reason and the appropriate value(s) for Trigger, where appropriate. Where a threshold was reached, the DCCA still has the amount of quota available to it defined by the threshold.

For all other reporting reasons the client discards any remaining quota and either discards future user traffic matching this category or allows user traffic to pass, or buffers traffic according to configuration.

For Reporting-Reason of Rating Condition Change, Gy requires the Trigger Type AVP to be present as part of the CCR to indicate which trigger event caused the reporting and re-authorization request.

For Reporting-Reason of end user service denied, this happens when a category is blacklisted by the credit control server, in this case a CCR-U is sent with used service unit even if the values as zero. When more quota is received from the server for that particular category, the blacklisting is removed.

If a default quota has been set for the subscriber then the usage from the default quota is deducted from the initial GSU received for the subscriber for the Rating Group or Rating Group and Service ID combination.

**Default Quota Handling**

- If default quota is set to 0, no data is passed/reported.
- If default quota is configured and default quota is not exhausted before OCS responds with quota, traffic is passed. Initial default quota used is counted against initial quota allocated. If quota allocated is less than the actual usage then actual usage is reported and additional quota is requested. If no additional quota is available then traffic is denied.
- If default quota is not exhausted before OCS responds with denial of quota, gateway blocks traffic after OCS response. Gateway will report usage on default quota even in this case in CCR-U (FINAL) or CCR-T.
- If default quota is consumed before OCS responds, if OCS is not declared dead (see definition in use case 1 above) then traffic is blocked until OCS responds.
Thresholds

The Gy client supports the following threshold types:

- Volume-Quota-Threshold
- Time-Quota-Threshold
- Units-Quota-Threshold

A threshold is always associated with a particular quota and a particular quota type. In the Multiple-Services-Credit-Control AVP, the Time-Quota-Threshold, Volume-Quota-Threshold, and Unit-Quota-Threshold are optional AVPs.

They are expressed as unsigned numbers and the units are seconds for time quota, octets for volume quota and units for service specific quota. Once the quota has reached its threshold, a request for more quotas is triggered toward the server. User traffic is still allowed to flow. There is no disruption of traffic as the user still has valid quota.

The Gy sends a CCR-U with a Multiple-Services-Credit-Control AVP containing usage reported in one or more User-Service-Unit AVPs, the Reporting-Reason set to THRESHOLD and the Requested-Service-Unit AVP without data.

When quota of more than one type has been assigned to a category, each with its own threshold, then the threshold is considered to be reached once one of the unit types has reached its threshold even if the other unit type has not been consumed.

When reporting volume quota, the DCCA always reports uplink and downlink separately using the CC-Input-Octets AVP and the CC-Output-Octets AVP, respectively.

On receipt of more quotas in the CCA the Gy discard any quota not yet consumed since sending the CCR. Thus the amount of quota now available for consumption is the new amount received less any quota that may have been consumed since last sending the CCR.

Conditions for Reauthorization of Quota

Quota is re-authorized/requested from the server in case of the following scenarios:

- Threshold is hit
- Quota is exhausted
- Validity time expiry
- Rating condition change:
  - Cellid change: Applicable only to GGSN and P-GW implementations.
  - LAC change: Applicable only to GGSN and P-GW implementations.
  - QoS change
  - RAT change
  - SGSN/Serving-Node change: Applicable only to GGSN and P-GW implementations.

Discarding or Allowing or Buffering Traffic to Flow

Whenever Gy is waiting for CCA from the server, there is a possibility of traffic for that particular traffic type to be encountered in the Gy. The behavior of what needs to be done to the packet is determined by the
configuration. Based on the configuration, the traffic is either allowed to pass or discarded or buffered while waiting for CCA from the server.

This behavior applies to all interrogation of client with server in the following cases:

- No quota present for that particular category
- Validity timer expiry for that category
- Quota exhausted for that category
- Forced Reauthorization from the server

In addition to allowing or discarding user traffic, there is an option available in case of quota exhausted or no quota circumstances to buffer the traffic. This typically happens when the server has been requested for more quota, but a valid quota response has not been received from the server, in this case the user traffic is buffered and on reception of valid quota response from the server the buffered traffic is allowed to pass through.

**Procedures for Consumption of Time Quota**

- **QCT is zero**: When QCT is deactivated, the consumption is on a wall-clock basis. The consumption is continuous even if there is no packet flow.

- **QCT is active**: When QCT is present in the CCA or locally configured for the session, then the consumption of quota is started only at the time of first packet arrival. The quota is consumed normally till last packet arrival plus QCT time and is passed till the next packet arrival.

  If the QCT value is changed during intermediate interrogations, then the new QCT comes into effect from the time the CCA is received. For instance, if the QCT is deactivated in the CCA, then quota consumptions resume normally even without any packet flow. Or if the QCT is activated from deactivation, then the quota consumption resume only after receiving the first packet after CCA.

- **QHT is zero**: When QHT is deactivated, the user holds the quota indefinitely in case there is no further usage (for volume quota and with QCT for time quota). QHT is active between the CCA and the next CCR.

- **QHT is non-zero**: When QHT is present in CCA or locally configured for the session, then after a idle time of QHT, the quota is returned to the server by sending a CCR-Update and reporting usage of the quota. On receipt of CCR-U, the server does not grant quota. QHT timer is stopped on sending the CCR and is restarted only if QHT is present in the CCA.

  QHT timer is reset every time a packet arrives.

**Envelope Reporting**

The server may determine the need for additional detailed reports identifying start time and end times of specific activity in addition to the standard quota management. The server controls this by sending a CCA with Envelope-Reporting AVP with the appropriate values. The DCCA client, on receiving the command, will monitor for traffic for a period of time controlled by the Quota-Consumption-Time AVP and report each period as a single envelope for each Quota-Consumption-Time expiry where there was traffic. The server may request envelope reports for just time or time and volume. Reporting the quota back to the server, is controlled by Envelope AVP with Envelope-Start-Time and Envelope-End-Time along with usage information.
Credit Control Request

Credit Control Request (CCR) is the message that is sent from the client to the server to request quota and authorization. CCR is sent before the establishment of MIP session, and at the termination of the MIP session. It can be sent during service delivery to request more quotas.

- Credit Control Request - Initial (CCR-I)
- Credit Control Request - Update (CCR-U)
- Credit Control Request - Terminate (CCR-T)
- Credit Control Answer (CCA)
- Credit Control Answer - Initial (CCA-I)
- Credit Control Answer - Update (CCA-U)

  If the MSCC AVP is missing in CCA-U it is treated as invalid CCA and the session is terminated.

- Credit Control Answer - Terminate (CCA-T)

In releases prior to 16.0, CCR-T was immediately sent without waiting for CCA-U if the call was cleared and there was a pending CCA-U. In 16.0 and later releases, if call is cleared when there is a pending update, the gateway will wait for CCA-U to arrive or timeout to happen (whichever happens first).

In releases prior to 20, CCR-Ts were not reported over Gy interface when the calls were terminated due to audit failure during ICSR switchover. In 20 and later releases, DCCA allows generation of CCR-Ts in this scenario.

The following figure depicts the call flow for a simple call request in the GGSN/P-GW/IPSG Gy implementation.
The following figure depicts the call flow for a simple call request in the HA Gy implementation.
Tx Timer Expiry Behavior

A timer is started each time a CCR is sent out from the system, and the response has to arrive within Tx time. The timeout value is configurable in the Diameter Credit Control Configuration mode.

In case there is no response from the Diameter server for a particular CCR, within Tx time period, and if there is an alternate server configured, the CCR is sent to the alternate server after Tw expiry as described in “Tw Timer expiry behavior” section.

It also depends on the Credit-Control-Session-Failover AVP value for the earlier requests. If this AVP is present and is coded to FAILOVER_SUPPORTED then the credit-control message stream is moved to the secondary server, in case it is configured. If the AVP value is FAILOVER_NOT_SUPPORTED, then the call is dropped in case of failures, even if a secondary server is configured.

In releases prior to 16.0, once a CCR-U was sent out over Gy interface, ACR-I message was immediately triggered (or containers were cached) based on policy accounting configuration and did not wait for CCA-U. In 16.0 and later releases, containers are closed only after CCA-U is received successfully. That is, Rf trigger will be sent only after receiving CCA-U message.

Redirection

In the Final-Unit-Indication AVP, if the Final-Unit-Action is REDIRECT or Redirect-Server AVP is present at command level, redirection is performed.

The redirection takes place at the end of consumption of quota of the specified category. The Gy sends a CCR-Update without any RSU or Rating-Group AVP so that the server does not give any more quotas.
If the Final-Unit-Action AVP is RESTRICT_ACCESS, then according to the settings in Restriction-Filter-Rule AVP or Filter-Id AVP, Gy sends CCR-Update to the server with used quota.

**Triggers**

The Diameter server can provide with the triggers for which the client should reauthorize a particular category. The triggers can be configured locally as well but whatever trigger is present in the CCA from the server will have precedence.

---

**Important**

In this release, Gy triggers are not supported for HA.

The trigger types that are supported are:

- SGSN/Serving-Node Change
- QoS Change - Any
- RAT Change
- LAC Change
- CellID Change

On any event as described in the Trigger type happens, the client reauthorizes quota with the server. The reporting reason is set as RATING_CONDITION_CHANGE.

**Tariff Time Change**

The tariff change mechanism applies to each category instance active at the time of the tariff change whenever the server indicated it should apply for this category.

The concept of dual coupon is supported. Here, the server grants two quotas, which is accompanied by a Tariff-Time-Change, in this case the first granted service unit is used until the tariff change time, once the tariff change time is reached the usage is reported up to the point and any additional usage is not accumulated, and then the second granted service unit is used.

If the server expects a tariff change to occur within the validity time of the quota it is granting, then it includes the Tariff-Time-Change AVP in the CCA. The DCCA report usage, which straddles the change time by sending two instances of the Used-Service-Unit AVP, one with Tariff-Change-Usage set to UNIT_BEFORE_TARIFF_CHANGE, and one with Tariff-Change-Usage set to UNIT_AFTER_TARIFF_CHANGE, and this independently of the type of units used by application. Both Volume and Time quota are reported in this way.

The Tariff time change functionality can as well be done using Validity-Time AVP, where in the Validity-Time is set to Tariff Time change and the client will reauthorize and get quota at Validity-Time expiry. This will trigger a lot of reauthorize request to the server at a particular time and hence is not advised.

Tariff-Time-Usage AVP along with the Tariff-Time-Change AVP in the answer message to the client indicates that the quotas defined in Multiple-Services-Credit-Control are to be used before or after the Tariff Time change. Two separate quotas are allocated one for before Tariff-Time-Change and one for after Tariff-Time-Change. This gives the flexibility to the operators to allocate different quotas to the users for different periods of time. In this case, the DCCA should not send the Before-Usage and After-Usage counts in the update messages to the server. When Tariff-Time-Change AVP is present without Tariff-Time-Usage AVP in the answer message, then the quota is used as in single quota mechanism and the client has to send before usage and after usage quotas in the updates to the server.
In this release, Gy does not support UNIT_INDETERMINATE value.

**Final Unit Indication**

The Final-Unit-Indication AVP can be present in the CCA from the server to indicate that the given quota is the final quota from the server and the corresponding action as specified in the AVP needs to be taken.

**Final Unit Indication at Command Level**

Gy currently does not support FUI AVP at command level. If this AVP is present at command level it is ignored. If the FUI AVP is present at command level and the Final-Unit-Action AVP set to TERMINATE, Gy sends a CCR-Terminate at the expiry of the quota, with all quotas in the USU AVP.

**Important**

FUI AVP at command level is only supported for Terminate action.

**Final Unit Indication at MSCC Level**

If the Final-Unit-Indication AVP is present at MSCC level, and if the Final-Unit-Action AVP is set to TERMINATE, a CCR-Update is sent at the expiry of the allotted quota and report the usage of the category that is terminated.

For information on redirection cases refer to the Redirection, on page 646.

**Credit Control Failure Handling**

CCFH AVP defines what needs to be done in case of failure of any type between the client and the server. The CCFH functionality can be defined in configuration but if the CCFH AVP is present in the CCA, it takes precedence. CCFH AVP gives flexibility to have different failure handling.

Gy supports the following Failure Handling options:

- TERMINATE
- CONTINUE
- RETRY AND TERMINATE

**CCFH with Failover Supported**

In case there is a secondary server is configured and if the CC-Session-Failover AVP is set to FAILOVER_SUPPORTED, the following behavior takes place:

- **Terminate**: On any Tx expiry for the CCR-I the message is discarded and the session is torn down. In case of CCR-Updates and Terminates the message is sent to the secondary server after response timeout and the session is proceeded with the secondary server. In case there is a failure with the secondary server too, the session is torn down.

- **Continue**: On any Tx expiry, the message is sent to the secondary server after response timeout and the session is proceeded with the secondary server. In case there is a failure with the secondary server too, the session is still established, but without quota management.

- **Retry and Terminate**: On any Tx expiry, the message is sent to the secondary server after the response timeout. In case there is a failure with secondary server too, the session is taken down.
CCFH with Failover Not Supported

In case there is a secondary server configured and if the CC-Session-Failover AVP is set to FAILOVER_NOT_SUPPORTED, the following behavior takes place as listed below. Same is the case if there is no secondary server configured on the system.

- **Terminate:** On any Tx expiry, the session is taken down.
- **Continue:** On any Tx expiry, the session is still established, but without quota management.
- **Retry and Terminate:** On any Tx expiry, the session is taken down.

Failover Support

The CC-Session-Failover AVP and the Credit-Control-Failure-Handling (CCFH) AVP may be returned by the CC server in the CCA-I, and are used by the DCCA to manage the failover procedure. If they are present in the CCA they override the default values that are locally configured in the system.

If the CC-Session-Failover is set to FAILOVER_NOT_SUPPORTED, a CC session will never be moved to an alternative Diameter Server.

If the value of CC-Session-Failover is set to FAILOVER_SUPPORTED, then the Gy attempts to move the CC session to the alternative server when it considers a request to have failed, i.e:

- On receipt of result code "DIAMETER_UNABLE_TO_DELIVER", "DIAMETER_TOO_BUSY", or "DIAMETER_LOOP_DETECTED".
- On expiry of the request timeout.
- On expiry of Tw without receipt of DWA, if the server is connected directly to the client.

The CCFH determines the behavior of the client in fault situations. If the Tx timer expires then based on the CCFH value the following actions are taken:

- **CONTINUE:** Allow the MIP session and user traffic for the relevant category or categories to continue, regardless of the interruption (delayed answer). Note that quota management of other categories is not affected.
- **TERMINATE:** Terminate the MIP session, which affects all categories.
- **RETRY_AND_TERMINATE:** Allow the MIP session and user traffic for the relevant category or categories to continue, regardless of the interruption (delayed answer). The client retries to send the CCR when it determines a failure-to-send condition and if this also fails, the MIP session is then terminated.

After the failover action has been attempted, and if there is still a failure to send or temporary error, depending on the CCFH action, the following action is taken:

- **CONTINUE:** Allow the MIP session to continue.
- **TERMINATE:** Terminate the MIP session.
- **RETRY_AND_TERMINATE:** Terminate the MIP session.

Recovery Mechanisms

DCCA supports a recovery mechanism that is used to recover sessions without much loss of data in case of Session Manager failures. There is a constant check pointing of Gy data at regular intervals and at important events like update, etc.
The DCCA supports a maximum of three bearers (including default) for the ICSR Checkpointing and Recovery. When more than three bearers are configured in the DCCA, checkpointing occurs from Active to Standby for all the bearers. However, during recovery, only the first three bearers are recovered and the rest remain in the memory consuming resources.

For more information on recovery mechanisms, please refer to the System Administration Guide.

**Error Mechanisms**

Following are supported Error Mechanisms.

**Unsupported AVPs**

All unsupported AVPs from the server with "M" bit set are ignored.

**Invalid Answer from Server**

If there is an invalid answer from the server, Gy action is dependent on the CCFH setting:

- In case of continue, the MIP session context is continued without further control from Gy.
- In case of terminate and retry-and-terminate, the MIP session is terminated and a CCR-T is sent to the diameter server.

**Result Code Behavior**

- **DIAMETER_RATING_FAILED**: On reception of this code, Gy discards all traffic for that category and does not request any more quota from the server. This is supported at the MSCE level and not at the command level.
- **DIAMETER_END_USER_SERVICE_DENIED**: On reception of this code, Gy temporarily blacklists the category and further traffic results in requesting new quota from the server. This is supported at the MSCE level and not at the command level.
- **DIAMETER_CREDIT_LIMIT_REACHED**: On reception of this code, Gy discards all traffic for that category and waits for a configured time, after which if there is traffic for the same category requests quota from the server. This is supported at the MSCE level and not at the command level.
- **DIAMETER_CREDIT_CONTROL_NOT_APPLICABLE**: On reception of this code, Gy allows the session to establish, but without quota management. This is supported only at the command level and not at the MSCE level.
- **DIAMETER_USERUNKNOWN**: On reception of this code, DCCA does not allow the credit control session to get established, the session is terminated. This result code is supported only at the command level and not at the MSCE level.

For all other permanent/transient failures, Gy action is dependent on the CCFH setting.

**Supported AVPs**

The Gy functionality supports the following AVPs:

- Supported Diameter Credit Control AVPs specified in RFC 4006:
• CC-Input-Octets (AVP Code: 412):
  Gy supports this AVP only in USU.
• CC-Output-Octets (AVP Code: 414):
  Gy supports this AVP only in USU.
• CC-Request-Number (AVP Code: 415)
• CC-Request-Type (AVP Code: 416):
  Gy currently does not support EVENT_REQUEST value.
• CC-Service-Specific-Units (AVP Code: 417)
• CC-Session-Failover (AVP Code: 418)
• CC-Time (AVP Code: 420):
  Gy does not support this AVP in RSU.
• CC-Total-Octets (AVP Code: 421):
  Gy does not support this AVP in RSU.
• Credit-Control-Failure-Handling (AVP Code: 427)
• Final-Unit-Action (AVP Code: 449):
  Supported at Multiple-Services-Credit-Control grouped AVP level and not at command level.
• Final-Unit-Indication (AVP Code: 430):
  Fully supported at Multiple-Services-Credit-Control grouped AVP level and partially supported (TERMINATE) at command level.
• Granted-Service-Unit (AVP Code: 431)
• Multiple-Services-Credit-Control (AVP Code: 456)
• Multiple-Services-Indicator (AVP Code: 455)
• Rating-Group (AVP Code: 432)
• Redirect-Address-Type (AVP Code: 433):
  Gy currently supports only URL (2) value.
• Redirect-Server (AVP Code: 434)
• Redirect-Server-Address (AVP Code: 435)
• Requested-Service-Unit (AVP Code: 437)
• Result-Code (AVP Code: 268)
• Service-Context-Id (AVP Code: 461)
• Service-Identifier (AVP Code: 439)
• Subscription-Id (AVP Code: 443)
• Subscription-Id-Data (AVP Code: 444)
• Subscription-Id-Type (AVP Code: 450)
• Tariff-Change-Usage (AVP Code: 452):
  Gy does NOT support UNIT_INDETERMINATE (2) value.
• Tariff-Time-Change (AVP Code: 451)
• Used-Service-Unit (AVP Code: 446):
  Gy sends only incremental counts for all the AVPs from the last CCA-U.
• User-Equipment-Info (AVP Code: 458)
• User-Equipment-Info-Type (AVP Code: 459):
  Gy currently supports only IMEISV value.
  Cisco GGSN and P-GW support IMEISV by default.
• User-Equipment-Info-Value (AVP Code: 460)
• Validity-Time (AVP Code: 448)

• Supported 3GPP specific AVPs specified in 3GPP TS 32.299:
  • 3GPP-Charging-Characteristics (AVP Code: 13)
  • 3GPP-Charging-Id (AVP Code: 2)
  • 3GPP-GGSN-MCC-MNC (AVP Code: 9)
  • 3GPP-GPRS-QoS-Negotiated-Profile (AVP Code: 5)
  • 3GPP-IMSI-MCC-MNC (AVP Code: 8)
  • 3GPP-NSAPI (AVP Code: 10)
  • 3GPP-PDP-Type (AVP Code: 3)
  • 3GPP-RAT-Type (AVP Code: 21)
  • 3GPP-Selection-Mode (AVP Code: 12)
  • 3GPP-Session-Stop-Indicator (AVP Code: 11)
  • 3GPP-SGSN-MCC-MNC (AVP Code: 18)
  • 3GPP-User-Location-Info (AVP Code: 22)
  • Base-Time-Interval (AVP Code: 1265)
  • Charging-Rule-Base-Name (AVP Code: 1004)
  • Envelope (AVP Code: 1266)
  • Envelope-End-Time (AVP Code: 1267)
  • Envelope-Reporting (AVP Code: 1268)
  • Envelope-Start-Time (AVP Code: 1269)
  • GGSN-Address (AVP Code: 847)
- Offline-Charging (AVP Code: 1278)
- PDP-Address (AVP Code: 1227)
- PDP-Context-Type (AVP Code: 1247)
  This AVP is present only in CCR-I.
- PS-Information (AVP Code: 874)
- Quota-Consumption-Time (AVP Code: 881):
  This optional AVP is present only in CCA.
- Quota-Holding-Time (AVP Code: 871):
  This optional AVP is present only in the CCA command. It is contained in the
  Multiple-Services-Credit-Control AVP. It applies equally to the granted time quota and to the granted
  volume quota.
- Reporting-Reason (AVP Code: 872):
  Gy currently does not support the POOL_EXHAUSTED (8) value. It is used in case of credit-pooling
  which is currently not supported.
- Service-Information (AVP Code: 873):
  Only PS-Information is supported.
- SGSN-Address (AVP Code: 1228)
- Time-Quota-Mechanism (AVP Code: 1270):
  The Gy server may include this AVP in an Multiple-Services-Credit-Control AVP when granting
  time quota.
- Time-Quota-Threshold (AVP Code: 868)
- Time-Quota-Type (AVP Code: 1271)
- Trigger (AVP Code: 1264)
- Trigger-Type (AVP Code: 870)
- Unit-Quota-Threshold (AVP Code: 1226)
- Volume-Quota-Threshold (AVP Code: 869)

- Supported Diameter AVPs specified in 3GPP TS 32.299 V8.1.0:
  - Auth-Application-Id (AVP Code: 258)
  - Destination-Host (AVP Code: 293)
  - Destination-Realm (AVP Code: 283)
  - Disconnect-Cause (AVP Code: 273)
  - Error-Message (AVP Code: 281)
  - Event-Timestamp (AVP Code: 55)
  - Failed-AVP (AVP Code: 279)

Unsupported AVPs

This section lists the AVPs that are NOT supported.

• NOT Supported Credit Control AVPs specified in RFC 4006:
  • CC-Correlation-Id
  • CC-Money
  • CC-Sub-Session-Id
  • CC-Unit-Type (AVP Code: 454)
  • Check-Balance-Result
  • Cost-Information (AVP Code: 423)
  • Cost-Unit (AVP Code: 445)
  • Credit-Control
  • Currency-Code (AVP Code: 425)
  • Direct-Debiting-Failure-Handling (AVP Code: 428)
  • Exponent (AVP Code: 429)
• G-S-U-Pool-Identifier (AVP Code: 453)
• G-S-U-Pool-Reference (AVP Code: 457)
• Requested-Action (AVP Code: 436)
• Service-Parameter-Info (AVP Code: 440)
• Service-Parameter-Type (AVP Code: 441)
• Service-Parameter-Value (AVP Code: 442)
• Unit-Value (AVP Code: 424)
• Value-Digits (AVP Code: 447)

• NOT supported Diameter AVPs specified in 3GPP TS 32.299 V8.1.0:
  • Acct-Application-Id (AVP Code: 259)
  • Error-Reporting-Host (AVP Code: 294)
  • Experimental-Result (AVP Code: 297)
  • Experimental-Result-Code (AVP Code: 298)
  • Proxy-Host
  • Proxy-Info
  • Proxy-State

• NOT supported 3GPP-specific AVPs specified in 3GPP TS 32.299 V8.1.0:

PLMN and Time Zone Reporting

For some implementations of online charging, the OCS requires the PCEF to reporting location-specific subscriber information. For certain subscriber types, subscriber information such as PLMN, Time Zone, and ULI can be sent over the Gy interface as the subscriber changes location, time zone, and serving networks to provide accurate online charging services. Such information can be reported independently from time and volume-based reporting.

PLMN and Time Zone Reporting feature is enabled to support location event reporting based on triggers from Gx, when the following conditions are met:

- Session-based Gy is not initiated due to the absence of charging-actions in rulebase with Credit-Control enabled or due to delayed Gy session initiation.
- PLMN and Time Zone Reporting feature is either enabled in the credit control group or through the use of triggers received from Gx.

If session-based Gy initiation fails or the session goes offline due to configuration or network issues, event-based Gy session will not be initiated.

Note that the failure-handling will not be supported for event-based Gy.

Though, in event-based Gy, multiple events can be reported independently and simultaneously this is presently not supported. If an event occurs when the CCA-Event (CCA-E) of the previously reported event is awaited, then the new event is queued and reported only when a CCA-E is received or the message is timed out.

To enable the PLMN and Time Zone Reporting feature, the PCRF shall send the Trigger AVP (Trigger Type 1, Trigger Type 2) at the command level in a CCA.

The Event-based Gy session will be terminated in the following scenarios:

- On termination of the bearer/subscriber (subscriber level Gy).
- Initiation of session-based Gy session (delayed session initiation).
- Once the CCR-E transaction is complete and there are no further events to report.

For information on how to configure this feature, refer to the Gy Interface Support chapter in the administration guide for the product that uses the Gy interface functionality.
Interworking between Session-based Gy and Event-based Gy

If both session-based Gy and event-based Gy mode are activated, then session-based Gy will take precedence i.e. all the events will be reported through CCR-U if the corresponding triggers are enabled. Event-based Gy mode will be active only when session-based Gy has been disabled and has never been activated previously for this session during its lifetime.

OCS Unreachable Failure Handling Feature

The OCS Unreachable Failure Handling feature is required to handle when OCS goes down or unavailable. This feature is otherwise noted as Assume Positive for Gy.

The OCS is considered unavailable/unreachable in the following scenarios:

- PCEF transmits a CCR-U or CCR-I message but no response is received before the specified timeout
- Diameter Watchdog request times out to the current RDR, causing the TCP connection state to be marked down
- Diameter command-level error codes received in a CCA
- If the PCEF is unable to successfully verify transmission of a CCR-T, the PCEF will not assign interim quota, because the user has disconnected.

In 15.0 and later releases, the error result codes can be configured using the CLI command `servers-unreachable behavior-triggers initial-request { result-code { any-error | result-code [ to end-result-code ] } }` to trigger the server unreachable mode. The same is applicable for the update request also. For more information on the CLI command, see the Credit Control Configuration Mode Commands chapter of the Command Line Interface Reference. However, if the CLI command `no servers-unreachable behavior-triggers { initial-request | update-request | result-code | any-error | result-code [ to end-result-code ] }` is configured, then the default set of hard-coded error codes are applicable.

The default set is:

- UNABLE_TO_DELIVER 3002
- UNABLE_TOO_BUSY 3004
- LOOP_DETECTED 3005
- ELECTION_LOST 4003
- Permanent failures 5001-5999 except 5002, 5003 and 5031.

In 12.2 and later releases, existing failure handling mechanism is enhanced such that the subscriber can be allowed to browse for a pre-configured amount of interim-volume and/or interim-time if OCS becomes unreachable due to transport connection failure or gives an impression that OCS is unreachable owing to slow response for Diameter request messages.

The purpose of this feature is to support Gy based data sessions in the event of an OCS outage. Diameter client allows the user's data session to continue for some fixed quota and then retries the OCS server to restore normal functionality. This feature adds more granularity to the existing failure handling mechanism.

With the implementation of this feature, Gy reporting during outages is supported. A temporary time and/or volume quota is assigned to the user in the event of an OCS outage which will be used during the outage period.

When the OCS returns to service, the GW reports all used quota back to OCS and continues with normal Gy reporting.
For each DCCA-service, CLI control is available for the following options:

- Interim quota volume (in bytes) and quota time (seconds). Both values will apply simultaneously, if configured together and if either quota time or quota volume is exhausted, the Diameter client retries the OCS.
- Option to limit the number of times a session can be assigned a temporary quota. If the user exceeds this amount, the session will be terminated/converted to postpaid.

The quota value is part of the dcca-service configuration, and will apply to all subscribers using that dcca-service. The temporary quota will be specified in volume (bytes) and/or time (seconds) to allow enforcement of both quota tracking mechanisms individually or simultaneously.

When a user consumes the interim total quota or time configured for use during failure handling scenarios, the GW retries the OCS server to determine if functionality has been restored. In the event that services have been restored, quota assignment and tracking will proceed as per standard usage reporting procedures. Data used during the outage will be reported to the OCS.

In the event that the OCS services have not been restored, the GW re-allocates the configured amount of quota and/or time to the user. The GW reports all accumulated used data back to OCS when OCS is back online. If multiple retries and interim allocations occur, the GW reports quota used during all allocation intervals. This cycle will continue until OCS services have been successfully restored, or the maximum number of quota assignments has been exhausted.

Support for OCS unreachable CLI commands is added under Diameter Credit Control Configuration mode.

For the P-GW/XGW/GGSN, this behavior will apply to all APNs and subscribers that have online charging enabled by the PCRF. In the HA, this behavior will apply to all users that have online charging enabled by the AAA. Settings will be applied to the dcca-service.

In Release 15.0, the following enhancements are implemented as part of the Assume Positive Gy feature:

- Configurable per error code treatment to enter assume positive mode
- Graceful session restart upon receipt of a 5002 error

---

**Important**

Note that the Graceful session restart feature is customer specific. For more information contact your Cisco account representative.

**Configurable per Error Code Treatment**

This feature allows the customers to configure error result codes using the CLI command "servers-unreachable behavior-triggers" that will trigger entering assume positive mode on the fly for CCR-Initial and CCR-Update messages. CCR-Terminate message is currently not supported.

Any error result codes from the range 3xxx to 5xxx can be specified using the CLI commands. This feature has been implemented to provide more flexibility and granularity in the way assume positive mode is triggered for error result codes.

**Graceful Session Restart**

Graceful session restart upon receipt of a 5002 error code is supported for server retried CCR-U messages during assume positive state. Also, any unreported usage from the time, server retried CCR-U sent till CCA-I is received, will be reported immediately by triggering CCR-U with usages for the same.
Important
Note that the Graceful session restart feature is customer specific. For more information contact your Cisco account representative.

Any pending updates are aborted once CCA-U with 5002 is received from the server. Also CCR-U is triggered immediately following session restart only if there are any unreported usages pending.

Important
When the server responds with 5002 error result code, it does not include any granted service units for the requested rating groups.

For more information on the commands introduced in support of this feature, see the Credit Control Configuration Mode Command chapter in the Command Line Interface Reference.

Enhancement to OCS Failure Reporting for Gy

Feature Description
When Cisco-Event-Trigger-Type AVP is installed by PCRF in CCA-I, CCA-U or in RAR messages with value CREDIT_CONTROL_FAILURE (5), then the Cisco-Event grouped AVP is sent by the P-GW to PCRF in CCR-U message with the exact value of OCS failure code. This trigger is sent only when Gy failure occurs and based on the configuration (Credit-Control-Failure-Handling), the ‘Continue’ action is taken and Gy session moves to Offline state.

In releases prior to the implementation of this enhancement, if a failure code was received from OCS in the range of 3000-3999, then Cisco-CC-Failure-Type was sent with the value 3XXX. Similarly, for error codes in the range of 4000-4999 or 5000-5999, Cisco-CC-Failure-Type was reported as 4XXX or 5XXX respectively. With this enhancement, the exact failure code is reported to the PCRF instead of the range. For example, when the Cisco-Event-Trigger-Type is CREDIT_CONTROL_FAILURE (5) and OCS failure code is 3002 in CCA-U, then in CCR-U towards PCRF Cisco-CC-Failure-Type (as part of grouped AVP Cisco-Event) is sent with a value of 3002.

Backpressure Handling
Diameter base (Diabase) maintains an outbound stream. When an application wants to write a message into a socket, the message handle of those messages are stored in the outbound stream. Only on receiving the response to the corresponding request, the stored message handle is removed from the outbound stream. In order to rate-limit the message transactions based on the responses received from the server, ASR 5500 maintains a limit on the number of messages stored in the outbound stream. This is done using "max-outstanding <" CLI (default value is 256). If the number of messages created by the application exceeds the max-outstanding limit, diabase sends a 'Backpressure' indication to the application to wait till it receives a decongestion indication from diabase to try again.

On receiving a response from the server, the corresponding request message handle will be removed from the outbound stream, creating a slot for another message to be written by the application. In order to intimate this slot availability, decongestion notification is sent to the registered application. The application in turn loops through all sessions and processes the pending trigger to be sent.
When the application loops through the sessions in the system, it traverses the sessions in a sorted order and checks each session whether it has to send a pending CCR-Initial or CCR-Terminate or CCR-Update. When the first session gets the slot to fill the outbound stream, it writes the message into the stream. Now the slot gets back into filled state, reaching the max-outstanding limit again. So the rest of the sessions will still continue to be in backpressed state.

Backpressured request like Credit-Control-Initial and Credit-Control-Terminate are given higher priority over Credit-Control-Update as they are concerned with the creation or termination of a session. So on top of the decongestion notification, DCCA has some internal timers which periodically try to send the message out. So in case of heavy backpressure condition, the probability of CCR-I or CCR-T being sent out is more than CCR-U.

**Gy Backpressure Enhancement**

This feature facilitates maintaining a list of DCCA sessions that hit backpressure while creating a message i.e., backpressured list, eliminating the current polling procedure. This will maintain a single queue for all types of messages (CCR-I, CCR-U, CCR-T, CCR-E) that are backpressed. The messages will be sent in FIFO order from the queue.

After processing a session from the backpressure queue DCCA will check for the congestion status of the peer and continue only if the peer has empty slots in the outstanding message queue to accommodate further CCRs.

Releases prior to 16.0, the gateway has a max-outstanding configuration to manage a number of messages that are waiting for response from OCS. When the max-outstanding is configured to a low value, then the frequency to be in congested state is very high.

CPU utilization is very high if the max-outstanding count is low and network is congested.

In 16.0 and later releases, all DCCA sessions associated with the CCR messages that are triggered BACKPRESSURE (when max-outstanding has been reached) will be queued in backpressure list which is maintained per ACS manager instance (credit-control) level.

This list will not have any specific configurable limits on the number of sessions that will be queued in it. This is because there is an inherent limit that is already present which is dependent on the number of subscriber/DCCA sessions.

With this new separate backpressured list, CPU utilization will come down under high backpressure case.

**Gy Support for GTP based S2a/S2b**

For WiFi integration in P-GW, Gy support is provided for GTP based S2a/S2b in Release 18.0. This implementation is in compliance with standard Rel-11 non-3GPP access spec of 32.399: S5-120748 S5-131017 S5-143090.

As part of this enhancement, the following AVP changes are introduced:

- Added TWAN as a new enum value for Serving-Node-Type AVP
- Added a new Diameter AVP "TWAN-User-Location-Info". This is a grouped AVP and it contains the UE location in a Trusted WLAN Access Network (TWAN): BSSID and SSID of the access point.

The TWAN AVPs will be effective only for 3GPP release 11 and it is added only to the standard Gy dictionary. That is, the TWAN AVP will be included in CCR-I/CCR-U/CCR-T messages only when the CLI command "diameter update-dictionary-avps 3gpp-rel11" is configured.
Generating OOC/ROC with Changing Association between Rule and RG

The existing Gy implementation prevents duplicate Out-of-Credit (OOC) / Reallocation of Credit (ROC) report for the same rule to the PCRF. Subscriber throttling with the same rule with different Rating-Group across OOC event does not work. To overcome this, the following implementation is considered:

When a Rating-Group runs out of credit, OOC is sent to all rules that are currently associated with that Rating-Group. This is done irrespective of whether that rule was already OOC’d or not. Similarly, when a Rating-Group gets quota after being in OOC state, a ROC is sent to all rules that are currently associated with that Rating-Group. This is done irrespective of whether that rule was already ROC’d or not.

In releases prior to 18, MSCC’s state was previously being maintained at MSCC and rule-level to suppress OOC/ROC events. So if MSCC triggered an OOC/ROC the same was suppressed by the status maintained at the rule-level if the previous event on the rule was the same.

In 18 and later releases, the rule level status bits are no longer used to avoid similar back-to-back OOC/ROC events. Now, the triggering of OOC/ROC events will solely be dependent on the MSCC state and triggers.

Customers might see an increase in OOC/ROC events on Gx if they change the association of the rule and RG or if they use the Override feature.

Static Rulebase for CCR

An APN/subscriber can have a single rulebase applied to it, but allowing a static rulebase configuration to always pass a different or same rulebase to the OCS through CCR messages.

A new CLI command "charging-rulebase-name rulebase_name" has been introduced under Credit Control (CC) group to override/change the rulebase name present in APN/subscriber template, in the CCR AVP "Charging-Rule-Base-Name". The rulebase value configured in CC group will be sent to OCS via CCR. If this CLI command is not configured, then the rulebase obtained from APN/subscriber template will be sent to OCS.

The configured value of rulebase under CC group is sent in all CCR (I/U/T) messages. This implies that any change in rulebase value in CC group during mid-session gets reflected in the next CCR message.

This feature, when activated with the CLI command, reduces the complication involved in configuration of services like adding and removing services per enterprise on the OCS system.

CC based Selective Gy Session Control

This section describes the overview and implementation of the Selective Gy Session Control feature based on Charging Characteristics (CC) profile of the subscriber.

This section discusses the following topics for this feature:

• Feature Description, on page 664
• Configuring CC based Selective Gy Session Control, on page 665
• Monitoring and Troubleshooting the Selective Gy Session Control Feature, on page 666

Feature Description

The functionality that allows users to configure certain Charging Characteristics (CC) values as prepaid/postpaid is available for GGSN service. In Release 17, this functionality is extended to P-GW service.
To enable/disable Gy session based on the CC value received, the APN configuration is extended so that additional credit-control-groups/prepaid prohibited value can be configured for each of the CC values.

The cc profile cc-profile-index prepaid prohibited CLI command is used to configure the CC values to disable Credit-Control based charging. The P-GW/GGSN/SAEGW service subscriber sessions using this APN, can use this configuration to stop the triggering of Gy messages towards the OCS.

The UE provides the charging characteristics value and the active subscriber is connected through an APN. The CC index mapping is done for a corresponding CC group/prepaid prohibited value configured under the APN. Depending on the match, the Gy session is enabled or disabled towards the OCS.

The Session controller stores/updates the APN configuration in the AAA manager. During the session setup, the session manager fills the CC value received in session authenticate request, and sends it to AAA manager. The AAA manager matches this against the locally stored APN configuration, and selects the desired credit-control-group/prepaid-prohibited configuration for the session. Then the session manager passes this credit-control-group/prepaid-prohibited information received from the AAA manager to ACS manager.

When the local authentication (session setup request) is done, the credit-control group with the matching charging characteristic is selected and used. If there is no matching charging characteristic configuration found for the credit-control group selection, then the default credit-control group for the APN is selected.

When a particular CC is configured as postpaid, any session with this CC does not trigger Gy connection. Any change in the CC during the lifetime of session is ignored.

The CC based Gy Session Controlling feature is applicable only for the CC value received via GTP-Auth-Request, and during the session establishment. The CC value updated via AAA/PCRF after the session setup will not cause any change in already selected credit-control group. Once the credit-control group is selected after session setup, this feature is not applicable.

Relationships to Other Features

This feature can also be used when the CC profile configuration is enabled through the GGSN service. When the CC profile is configured under APN service and GGSN service, the prepaid prohibited configuration for the matching CC profile is applied irrespective of the services.

Limitations

The following are the limitations of this feature:

- One charging characteristic value can be mapped to only one credit-control-group/prepaid-prohibited configuration within one APN.
- The charging-characteristic based OCS selection is possible only during the session-setup. Once the credit-control-group is selected (after session setup), this feature is not applicable.

Configuring CC based Selective Gy Session Control

The following sections provide the configuration commands to configure the Gy Session Control feature based on the CC profile of the subscriber.

Configuring CC Value

The following commands are used to configure Charging Characteristic values as postpaid/prepaid to disable/enable Gy session towards the OCS.

```
configure
  context context_name
  apn apn_name
```
Verifying the Selective Gy Session Control Configuration

UsethefollowingcommandinExecmodetodisplay/verifytheconfigurationofSelectiveGySessionControl feature.

```
show configuration
```

Monitoring and Troubleshooting the Selective Gy Session Control Feature

This section provides information regarding show commands and/or their outputs in support of the Selective Gy Session Control feature.

```
show active-charging sessions
```

The "Credit-Control" field that appears as part of the `show active-charging sessions | callid | imsi | msisdn` command output enables the user to determine the credit control state as "On" for online charging enabled session or "Off" for prepaid prohibited session and monitor the subscriber session.

Credit-Control Group in Rulebase Configuration

This section describes the overview and implementation of the Credit-Control (CC) Group Selection based on the rulebase of the subscriber.

This section discusses the following topics for this feature:

- Feature Description, on page 666
- Configuring Credit-Control Group in Rulebase, on page 667
- Monitoring and Troubleshooting the CC-Group Selection in Rulebase, on page 668

Feature Description

This feature is introduced to customize the behavior for different types of subscribers in the Assume Positive scenario. This customization is made by enabling the users to specify a desired Credit-Control (CC) group based on the rulebase dynamically selected by PCRF.
Typically, the behavior for Assume Positive is configured within the CC group. In releases prior to 20, there were options to choose the CC group through APN/subscriber-profiles, IMSA, or AAA configurations. In this release, the CC group selection functionality is extended to rulebase configuration.

This feature is explicitly required in scenarios where IMSA was not used, AAA server could not send CC group during authentication, and only a single APN/subscriber-profile was used for all the subscribers. In such situations, this feature targets to provide a premium CC group within rulebase to enable premium treatment to subscribers based on their types.

This feature introduces a new configurable option inside the rulebase configuration, so that the users can specify the desired CC group whenever the rulebase is selected during the subscriber session setup. This configured CC group overrides or has a higher priority than the CC group configured within the subscriber profile/APN. If the AAA or PCRF server sends the CC-Group AVP, the CC group value defined through the AVP overrides the rulebase configured CC group.

When this feature is enabled, the configuration allows specifying an association between the rulebase name and the CC group so that when a premium subscriber connects, a premium rulebase and a premium CC group are selected.

---

**Important**

Mid-session configuration change will not impact the existing subscribers in the system. This configuration change will be effected only to the new sessions.

Implementing this new configuration option enables different types of Assume-Positive behavior for subscribers based on the available quota. This results in achieving preferential treatment for premium customers.

The precedence order for selection of the CC group is defined as:

- PCRF provided CC group
- AAA provided CC group
- Rulebase configured CC group
- Subscriber Profile/APN selected CC group
- Default Credit-Control group

**Important**

This feature should not be used when there is an option for AAA server to send the CC group during authentication process. If during the authentication, AAA server sends a CC group, and the rulebase selected has a CC group defined within, then the rulebase defined CC group is selected for the session.

**Limitations**

There are no limitations or restrictions with this feature. However, it is important to keep in mind the precedence order for CC group selection.

**Configuring Credit-Control Group in Rulebase**

The following sections provide the configuration commands to configure the Credit-Control Group based on the rulebase of the subscriber.
Defining Credit-Control Group

The following commands are used to configure a desired Credit-Control group name when using the rulebase selected by PCRF.

```plaintext
configure
require active-charging
active-charging service service_name
    rulebase rulebase_name
    credit-control-group cc_group_name
end
```

After you configure these commands, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the System Administration Guide for your deployment.

**Important**

- **cc_group_name**: Specifies name of the credit control group as an alphanumeric string of 1 through 63 characters.
- **no credit-control-group**: Removes the previously configured CC group from the rulebase configuration. This is the default setting.
- This CLI configuration is applicable only during the session setup. Mid-session change in the CC group is not allowed.
- This is an optional CLI configuration, and used only when customized Assume Positive behavior is required for subscribers.
- If this CLI command is configured, the selection of the CC group will be based on the precedence order. That is, the rulebase defined CC group has higher precedence over the CC group value specified in the Subscriber/APN profile.
- If the CC group configuration is not present in the rulebase, the default subscriber/APN profile configuration is applied.

Verifying the Credit-Control Group Configuration

Use the following command in Exec mode to display/verify the configuration of CC group in rulebase.

```plaintext
show configuration verbose
```

Monitoring and Troubleshooting the CC-Group Selection in Rulebase

This section provides information regarding show commands and/or their outputs in support of this feature.

```plaintext
show active-charging sessions full
```

The output of this show CLI command displays the selected credit-control-group for the session. The output details are useful in verifying and troubleshooting the issues with this feature.

```plaintext
show configuration errors
```

This show CLI will list an error if the credit-control group that is configured inside the rulebase is not defined.
**show configuration verbose**

This command will show the "credit-control-group" option specified for the rulebase. For troubleshooting purpose, capture the output of `show configuration verbose` and `show subscribers full` along with the `monitor-protocol` output containing "Radius Access-Accept".

**Combined CCR-U Triggering for QoS Change Scenarios**

In release 20, the number of CCR-U's sent to the OCS is controlled for QoS change scenarios in P-GW call. This new behavior is introduced in the system to easily handle the issues with Transactions Per Second (TPS) on OCS.

In releases prior to 20, for a change in the default EPS bearer QoS and APN AMBR received from PCRF for LTE or S2b WiFi calls, P-GW used to send two separate CCR-U's to OCS through Gy interface, one each for QoS change and AMBR change. In 20 and later releases, when default EPS bearer QoS and APN AMBR values are changed, P-GW sends update request to access side to change default bearer and APN AMBR in a single message. P-GW will apply APN AMBR and default bearer QoS accordingly and will send only one CCR-U on Gy for this change condition.

---

**Important**

This behavior change is applicable only to P-GW calls. This change has no impact to the Rf/CDR records, and GGSN/P-GW eHRPD calls.

Also, note that this behavior is not applicable for split TFT case (QoS + APN AMBR + TFT) wherein multiple Update Bearer Requests are sent towards the access side.

**Re-activating Offline Gy Session after Failure**

This section describes the feature to re-enable Offline Gy session on detecting failure at Diameter Credit Control Application.

This section includes the following topics:

**Feature Description**

With this feature, a mechanism to re-enable the Offline Gy session back to Online charging, based on indication from PCRF is introduced in this release. Upon receiving the Online AVP from PCRF, the gateway will establish the Gy session.

In previous releases, there was no provision to activate Gy once the session was marked as Offline. On detecting failure at Diameter Credit Control Application, the configured Credit Control Failure Handling (CCFH) action would be taken. Once the Gy session has taken the CCFH Continue action, the subscriber session could not be retried/re-enabled.

The Online AVP in the Charging-Rule-Definition is considered as the trigger/indication from PCRF to enable the Offline Gy session, after the CCFH Continue action been taken. The Online AVP at the command level from PCRF will not be considered as a trigger to enable the Offline Gy session. As per 3GPP 29.212 (release 12.12.0), the Online AVP (1009) is an optional AVP inside the Charging-Rule-Definition grouped AVP (1003).

**Limitations and Restrictions**

This section lists the limitations and configuration restrictions with this feature:
• This feature is limited only to Volume Quota mechanism. Special handling is not done for Quota-Validity-Time (QVT) and Quota-Hold-Time (QHT) timers. When the Gy session goes offline and comes back again, these timers are not started. The timers will be started only when the next CCA-U provides the information from OCS.

• When the Gy session is marked Online, CDR closure is not required and this is handled by the billing system.

• This feature is not extended to the event-based credit-control sessions.

• When the CCFH action is taken due to MSCC level failure, the existing behavior is retained and the following behavior is observed:
  • CCFH Continue – Continue the category (MSCC) without charging at Gy and this is applicable to the MSCC (not to the entire session). The MSCC state in the output of the show active-charging sessions full command will display "No Charge".
  • CCFH Terminate/Retry-and-Terminate – The bearer gets terminated.

• When the Result-Code 4011 (DIAMETER_CREDIT_CONTROL_NOT_APPLICABLE) is received at MSCC level, the category is marked Free-of-Charge and no further accounting for this category is done. When this result code is received at command level, the Gy session is made Offline. The Offline Gy session can be made Online again using the Online AVP from PCRF and the accounting will resume normally (CCR-U will be seen at OCS for this session).

• When CCFH Continue is configured and CCR-I failure occurs, the following behavior is observed:
  • Diabase Error – When diabase error (TCP connection down) occurs, the Gy session is marked Offline and the session-state is maintained (session-ID created). When re-enabling the Gy session, a new CCR-I is sent immediately (without waiting for data).
  • Response Timeout – When the response timeout happens, if the CCR-I is sent at session-setup and the session-setup timeout happens before response-timeout, then the bearer itself will be terminated. The diameter send-crrl traffic-start configuration can be used optionally so that the CCR-I timeout does not affect the bearer creation.
  • When the Gy session goes Offline due to CCR-I response timeout and the Gy session is marked Online, the same Session-ID will be used.
  • If the Gy session went offline due to CCR-I error response, the session-information is deleted (next session-ID used will be different).

• In case of rule-movement across bearers (LTE to WiFi or vice-versa) where the Online rule is moved/associated to an existing bearer, the status of the Gy session is not changed.

• The trigger for marking the Offline Gy Session to Online is only based on the Online AVP received from the PCRF in the Charging-Rule-Definition.

### Configuring Offline Gy Session after Failure

The following section provides the configuration commands to re-enable the offline Gy session.

#### Re-enabling Offline Gy Session

Use the following configuration to re-enable offline Gy session after failure.
configure
  active-charging service service_name
  credit-control
    [ no ] offline-session re-enable
end

Notes:
  • When offline-session re-enable is configured and the PCRF installs/modifies a rule with "Online" AVP value set to 1, then the Offline DCCA will be marked Online.
  • The default configuration is no offline-session re-enable. This feature is disabled by default and when disabled only the show configuration verbose command will display this configuration.

Verifying the Configuration
Use the following command to verify the offline/online state transition timestamp:

  show active-charging sessions full

Monitoring and Troubleshooting the Offline Gy Session after Failure
This section provides information regarding show commands and/or their outputs in support of this feature.
The following operations should be performed to troubleshoot any failure related to this feature:
  • The CLI output of the show active-charging sessions full command can be verified. The "Last State Change Time" field indicates the timestamps at which a session went Offline and came back Online.
  • The messages from monitor subscriber next-call command can be enabled with "verbosity 3" to analyze the message exchanges happening for the subscriber.
  • The "acsmgr" and "debug" level logs can be enabled for further debugging.

show active-charging sessions full
The following new fields are added to the output of this command to display the state transition timestamp:
  • Last State Change Time:
    • Offline/Online – The Offline timestamp is updated when the Gy session goes Offline. The Online timestamp is updated when the session is back Online.

Suppress AVPs
This feature adds enhancement to the Support MVNO Information in Gx, Gy and CDRs feature.

Feature Description
This feature adds enhancement to the Support MVNO Information in Gx, Gy and CDRs feature. SAEGW sends MVNO-Reseller-ID and MVNO-Subclass-ID AVPs in the Gy messages towards the OCS and CDR, whenever these AVPs are received by SAEGW from the PCRF.

With this enhancement, this behavior is now CLI controlled and a new CLI command has been introduced to suppress the AVPs being sent in the Gy interface.
Old Behavior: Reseller-id and subclass-id AVPs were send in Gy when the same were received from PCRF for the ATT dictionary.

New Behavior: New CLI command `suppress_avp` has been added which allows to suppress the Reseller-id and subclass-id AVPs.

Command Changes

`suppress_avp`

New CLI command has been added to the Credit Control Group configuration mode to suppress the AVPs. Configuring this CLI command would suppress the MVNO-subclass-id and MVNO-Reseller-Id AVPs.

```
configure
  active-charging service <acs_service_name>
  credit-control group <group_name>
    diameter suppress-avp reseller-id subclass-id
      [ no | default ] diameter suppress-avp reseller-id subclass-id
  end
```

Notes:

- **no**: Disables AVP suppression. Whenever PCRF sends the MVNO-subclassid and MVNO-Reseller-id AVPs in the Gx interface, the same is sent in the Gy message.
- **default**: Sets the default configuration. AVPs are not suppressed by default. Whenever PCRF sends the MVNO-subclassid and MVNO-Reseller-id AVPs in the Gx interface, the same is sent in the Gy message.
- **supress-avp**: Suppresses both MVNO-subclassid and MVNO-Reseller-id AVPs.
- **reseller-id**: Supresses the MVNO-Reseller-Id AVP.
- **subclass-id**: Supresses the MVNO-Sub-Class-Id AVP.

Performance Indicator Changes

`show configuration`

This command has been modified to display the following output:

```
credit-control group default
  diameter origin endpoint sundar
  diameter peer-select peer minid1 secondary-peer minid2
  diameter session failover
  diameter dictionary dcca-custom32
  failure-handling initial-request continue
  failure-handling update-request continue
  diameter dynamic-rules request_quota on-traffic-match
  diameter suppress-avp reseller-id subclass-id
```

Configuring Gy Interface Support

To configure Gy interface support:

**Step 1** Configure the core network service as described in this Administration Guide.
Step 2 Configure Gy interface support as described in the sections Configuring GGSN / P-GW / IPSG Gy Interface Support, on page 673 and Configuring HA / PDSN Gy Interface Support, on page 674.

Step 3 Configure Event-based Gy support as described in Configuring PLMN and Time Zone Reporting, on page 675.

Step 4 Optional. Configure OCS Unreachable Failure Handling Feature or Assume Positive for Gy Feature as described in Configuring Server Unreachable Feature, on page 676.

Step 5 Optional. Configure Static Rulebase for CCR as described in Configuring Static Rulebase for CCR, on page 677.

Step 6 Optional. Configure Gy for GTP based S2a/S2b as described in Configuring Gy for GTP based S2a/S2b, on page 677.

Step 7 Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Important Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

---

## Configuring GGSN / P-GW / IPSG Gy Interface Support

To configure the standard Gy interface support for GGSN/P-GW/IPSG, use the following configuration:

```plaintext
configure
  context <context_name>
    diameter endpoint <endpoint_name>
      origin realm <realm>
      origin host <diameter_host> address <ip_address>
      peer <peer> realm <realm> address <ip_address>
    exit
  exit
active-charging service <ecs_service_name>
  credit-control [ group <cc_group_name> ]
    diameter origin endpoint <endpoint_name>
    diameter peer-select peer <peer> realm <realm>
    diameter pending-timeout <timeout_period>
    diameter session failover
    diameter dictionary <dictionary>
    failure-handling initial-request continue
    failure-handling update-request continue
    failure-handling terminate-request continue
    exit
  exit
context <context_name>
  apn <apn_name>
    selection-mode sent-by-ms
    ims-auth-service <service>
    ip access-group <access_list_name> in
    ip access-group <access_list_name> out
    ip context-name <context_name>
    active-charging rulebase <rulebase_name>
```
credit-control-group <cc_group_name>
end

Notes:

• For information on configuring IP access lists, refer to the Access Control Lists chapter in the System Administration Guide.

• For more information on configuring ECS ruledefs, refer to the ACS Ruledef Configuration Mode Commands chapter in the Command Line Interface Reference.

• For more information on configuring ECS charging actions, refer to the ACS Charging Action Configuration Mode Commands chapter in the Command Line Interface Reference.

• For more information on configuring ECS rulebases, refer to the ACS Rulebase Configuration Mode Commands chapter in the Command Line Interface Reference.

Configuring HA / PDSN Gy Interface Support

To configure HA / PDSN Gy interface support, use the following configuration:

```
configure
c  ontex t <context_name>
      d iamet er e ndpoint <endpoint_name>
      o rigin realm <realm>
      o rigin host <diameter_host> address <ip_address>
      peer <peer> realm <realm> address <ip_address>
      exit
      active-charging service <ecs_service_name>
      ruledef <ruledef_name>
      ip any-match = TRUE
      exit
      charging-action <charging_action_name>
      content-id <content_id>
      cca charging credit rating-group <rating_group>
      exit
      rulebase <rulebase_name>
      action priority <action_priority> ruledef <ruledef_name>
      charging-action <charging_action_name>
      exit
      credit-control [ group <cc_group_name> ]
      diameter origin endpoint <endpoint_name>
      diameter peer-select peer <peer> realm <realm>
      diameter pending-timeout <timeout>
      diameter session failover
diameter dictionary <dictionary>
      failure-handling initial-request continue
      failure-handling update-request continue
      failure-handling terminate-request continue
      pending-traffic-treatment noquota buffer
      pending-traffic-treatment quota-exhausted buffer
      exit
```
exit
context <context_name>
subscriber default
  ip access-group <acl_name> in
  ip access-group <acl_name> out
  ip context-name <context_name>
  active-charging rulebase <rulebase_name>
  credit-control-group <cc_group_name>
end

Notes:

• For information on configuring IP access lists, refer to the Access Control Lists chapter in the System Administration Guide.

• For more information on configuring ECS ruledefs, refer to the ACS Ruledef Configuration Mode Commands chapter in the Command Line Interface Reference.

• For more information on configuring ECS charging actions, refer to the ACS Charging Action Configuration Mode Commands chapter in the Command Line Interface Reference.

• For more information on configuring ECS rulebases, refer to the ACS Rulebase Configuration Mode Commands chapter in the Command Line Interface Reference.

Configuring PLMN and Time Zone Reporting

PLMN and Time Zone Reporting feature requires a credit-control group to be defined in the APN or subscriber configuration or there must be a default credit-control group configured. The following CLI commands are available to enable/disable PLMN and Time Zone Reporting feature.

To enable PLMN and Time Zone Reporting through subscriber-template, use the following configuration:

configure
  context <context_name>
    subscriber name <subscriber_name>
    dns primary <primary_ipaddress>
    dns secondary <secondary_ipaddress>
    ip access-group test in
    ip access-group test out
    ip context-name <context_name>
    credit-control-client event-based-charging
    active-charging rulebase <rulebase_name>
  exit
end

Notes:

• The credit-control-client event-based-charging command should be used to enable PLMN and Time Zone Reporting.

For more information on configuring PLMN and Time Zone Reporting feature, refer to the Command Line Interface Reference.

To enable PLMN and Time Zone Reporting through APN template, use the following configuration:
Rest of the parameters needed for Event-based Gy such as dictionary, endpoint will be picked from the credit-control group.

In a scenario where the triggers are configured through the CLI command and another set of triggers are also received from Gx, then the triggers from Gx will have a higher priority.

**Configuring Server Unreachable Feature**

The Server Unreachable feature requires a failure handling behavior to be defined in the Diameter Credit Control configuration. The following CLI commands are available to enable/disable OCS Unreachable Failure Handling feature.

To enable OCS Unreachable Failure Handling feature, use the following configuration:

```bash
configure
require active-charging
  active-charging service <service_name>
    credit-control
      servers-unreachable { initial-request | update-request } { continue | terminate } [ { after-interim-volume <bytes> | after-interim-time <seconds> } + server-retries <retry_count> ]
      servers-unreachable behavior-triggers { initial-request | update-request } transport-failure [ response-timeout | tx-expiry ] servers-unreachable behavior-triggers initial-request { result-code { any-error | result-code [ to end-result-code ] } }
      servers-unreachable behavior-triggers update-request { result-code { any-error | result-code [ to end-result-code ] } }
end
```

After you configure `configure, require active-charging, active-charging service <service_name>`, and `credit-control` CLI commands, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.

**Notes:**
• This CLI command "servers-unreachable \{ initial-request | update-request \} \{ continue | terminate \} | { after-interim-volume ..." allows configuring interim-volume and interim-time in the following ways:
  • after-interim-volume <bytes> alone followed by server-retries.
  • after-interim-time <secs> alone followed by server-retries.
  • after-interim-volume <bytes> after-interim-time <secs> followed by server-retries.

• This CLI command "servers-unreachable behavior-triggers" is used to trigger the servers-unreachable failure handling at either Tx expiry or Response timeout (This CLI is similar to retry-after-tx-expiry in "failure-handling update-request continue retry-after-tx-expiry" command.).

• This CLI command "servers-unreachable behavior-triggers initial-request \{ result-code \{ any-error | result-code \{ to end-result-code \} \} \}" is used to trigger the servers-unreachable failure handling based on the configured Diameter error result codes.

For more information on configuring this feature, refer to the Command Line Interface Reference.

**Configuring Static Rulebase for CCR**

To allow static configuration of rulebase name to be passed to OCS via CCR message, use the following configuration:

```
configure
  require active-charging
  active-charging service service_name
  credit-control group ccgroup_name
  charging-rulebase-name rulebase_name
  no charging-rulebase-name
end
```

After you configure `configure, require active-charging, active-charging service service_name, and credit-control group ccgroup_name` CLI commands, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the System Administration Guide for your deployment.

**Notes:**

• By default, the rulebase obtained from APN/subscriber template will be sent to OCS through the CCR message.

For more information on configuring this feature, refer to the Command Line Interface Reference.

**Configuring Gy for GTP based S2a/S2b**

To provide Gy Support for WiFi integration in P-GW for GTP based S2a/S2b, use the following configuration:

```
configure
  require active-charging
  active-charging service service_name
  credit-control group ccgroup_name
```

P-GW Administration Guide, StarOS Release 21.8
diameter update-dictionary-avps 3gpp-rel11
[ default | no ] diameter update-dictionary-avps
end

Notes:

- **3gpp-rel11**: Provides support for 3GPP Rel.11 specific AVPs in the standard Gy dictionary.

---

**Important**

After you configure `configure`, `require active-charging`, `active-charging service service_name`, and `credit-control group ccgroup_name` CLI commands, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the `System Administration Guide` for your deployment.

---

### Gathering Statistics

This section explains how to gather Gy related statistics and configuration information.

In the following table, the first column lists what statistics to gather, and the second column lists the action to perform.

<table>
<thead>
<tr>
<th>Statistics/Information</th>
<th>Action to perform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete statistics for ECS sessions.</td>
<td><code>show active-charging sessions full</code></td>

Revision History

Important

Revision history details are not provided for features introduced before releases 21.2 and N5.5.
Feature Description

In releases prior to 21.3, the Gy failure-handling-template (FH-template) had no option to block the chargeable traffic while retaining the PDN session.

In 21.3 and later releases, "continue discard-traffic" option has been added to Gy failure-handling-template to block the chargeable traffic while retaining the PDN session.

How It Works

This section provides a brief overview of how this feature works:

- A new option to continue the session, but drop the traffic, is introduced in the FH-template that is associated with a Credit Control Group. An existing CLI command is enhanced to enable the feature.

- When the "continue discard-traffic" FH action is enforced, all traffic is blocked for the given DCCA session. The DCCA session refers to the PDN (and all bearers therein) or to a specific bearer. The matching bearers a DCCA session corresponds to, continues as it is for FH action "continue". Only the traffic that requires online charging is dropped.

- The "continue discard-traffic" status remains enforced unless a Rule modification or installation is received from the PCRF for a pure dynamic rule. The online AVP (online = 1) is sent eventually from the PCRF which resumes the Gy session for the given bearer (sub session). This behavior is based on the "offline-session re-enable" CLI that is available in the credit-control-group configuration mode.

- All traffic that requires online-charging is dropped.

- The charging action is identified and only if the charging action requires "online" charging, the corresponding drop action is taken.

- The "continue discard-traffic" status on a subscriber remains as is post recovery. Traffic is blocked after recovery as long as Gx does not re-enable the Gy session.

Note

- The Gy Failure Handling Enhancement feature works along with the OCS Failure Reporting to PCRF (introduced in Release 21.0) and the Enhancement to OCS Failure Reporting for Gy (introduced in Release 21.2) features. Refer to the respective Release Change Reference for additional information.

- When the CCFH/FH-Template is configured with Continue action (or this new FH-Template “continue-discard”) and the corresponding action is being taken, then the reporting to the PCRF happens as per the OCS Failure Reporting to PCRF feature.
Configuring Gy Failure Handling

Use the following commands under the Diameter Failure Handling Template Configuration Mode to discard data traffic while retaining the subscriber session.

```plaintext
configure
  failure-handling-template template_name
    msg-type { credit-control-initial | credit-control-terminate |
  credit-control-update } failure-type any action continue discard-traffic
end
```

Notes:

- Use the `msg-type { credit-control-initial | credit-control-terminate | credit-control-update } failure-type any action continue discard-traffic` CLI command to specify the behavior if there is a communication failure with the prepaid server. If there are different failure handling configurations present within the template for the same message type, the action is applied as per the latest error encountered.

- The enhancement of "discard-traffic" is added to action "continue". This blocks data traffic while retaining the subscriber session.

- If previously configured, use the `no msg-type { credit-control-initial | credit-control-terminate | credit-control-update } failure-type any` CLI command to remove the configuration associated with the failure handling template.

- The "discard-traffic" keyword can only be configured along with "continue" action, and it takes affect when the respective failure occurs.

- This CLI option is disabled by default. The "discard-traffic" keyword needs explicit configuration if the respective discard action is desired.

Monitoring and Troubleshooting the Gy Failure Handling

This section provides information regarding monitoring and troubleshooting the feature.

Gy Failure Handling Show Command(s) and/or Outputs

This section provides information regarding show commands and/or their outputs in support of the feature.

`show active-charging credit-control statistics`

The output of this show command has been enhanced to display the following new field in support of this feature:

- Action-Drop:

Following is a partial sample output:

```
Failure Handling Stats:
  Action-Terminated: 0        Action-Continue: 0
  Offline Active Sessions: 0  Action-Drop: 0
```
HSS and PCRF Based P-CSCF Restoration Support

This feature enables support for HSS-based and PCRF-based P-CSCF restoration that helps to minimize the time a UE is unreachable for terminating calls after a P-CSCF failure.

• Feature Description, on page 683
• How It Works, on page 684
• Configuring the HSS/PCRF-based P-CSCF Restoration, on page 693
• Monitoring and Troubleshooting the HSS/PCRF-based P-CSCF Restoration, on page 695

Feature Description

The P-CSCF restoration procedures were standardized to minimize the time a UE is unreachable for terminating calls after a P-CSCF failure. In compliance with 3GPP standard Release 13, this feature includes the following P-CSCF restoration mechanisms:

• HSS-based P-CSCF Restoration for Trusted/Untrusted WLAN Access (S2a/S2b)
• PCRF-based P-CSCF Restoration for LTE (S5/S8) and Trusted/Untrusted WLAN Access (S2a/S2b)

Important

HSS-based P-CSCF Restoration was supported at P-GW for LTE (S5/S8) prior to StarOS release 21.0.

This feature provides support for both basic and extended P-CSCF Restoration procedures.

HSS-based P-CSCF Restoration for WLAN

If the P-CSCF restoration mechanism is supported, gateway indicates the restoration support to AAA server through Feature-List AVP in the Authorization Authentication Request (AAR) message sent over S6b. The Feature-List AVP is part of the Supported-Features grouped AVP. The Bit 0 of the Feature-List AVP is used to indicate P-CSCF Restoration support for WLAN.

During the P-CSCF Restoration, 3GPP AAA server, after having checked that the P-GW supports the HSS-based P-CSCF restoration for WLAN, sends a P-CSCF restoration indication to the P-GW over S6b in a Re-authorization Request (RAR) command. A new Diameter AVP “RAR-Flags” is encoded in the RAR message with the Bit 1 set, would indicate to the gateway that the AAA server requests the execution of HSS-based P-CSCF restoration procedures for WLAN.
The existing CLI command **diameter authentication** under AAA Group configuration is extended to encode P-CSCF Restoration feature as part of Supported-Features AVP in the AAR message.

---

**Important**

Supported-Features will be sent in every AAR message for RAT type WLAN. Feature negotiation is required in every AAR. ReAuth AAR will also do the feature renegotiation.

Emergency PDN HSS based P-CSCF Restoration for S5/S8 will be performed if CLI is configured at P-GW service to support the restoration for emergency PDNs.

**PCRF-based P-CSCF Restoration**

PCEF supporting P-CSCF restoration mechanism indicates the restoration support in CCR-I message through the Supported-Features AVP. The 24th Bit of the Supported-Feature-List AVP indicates whether this mechanism is supported or not.

The existing CLI command **diameter encode-supported-features** in Policy Control configuration is extended to allow the negotiation of P-CSCF Restoration feature support with PCRF. A new Diameter AVP “**PCSCF-Restoration-Indication**” is introduced to indicate to PCEF that a P-CSCF Restoration is requested. This is achieved by setting AVP value to 0.

Supported-Features AVP is negotiated in CCR-I of all access types (eHRPD, P-GW, GGSN); however, Restoration trigger, if received, is ignored in eHRPD and GGSN.

**Limitations**

- As per the 3GPP standard specification, if S6b re-authorization request is used for P-CSCF Restoration for WLAN, then for extended P-CSCF Restoration the gateway may send authorization request with only mandatory AVPs. However, in the current implementation, ReAuth used for extended P-CSCF Restoration is a common authorization request of normal ReAuth. It will contain all the AVP of ReAuthorization AAR.
- For P-CSCF Restoration extension mechanism during P-CSCF ReDiscovery with P-CSCF FQDN, local DNS cache will be queried first. If FQDN is already present in local DNS cache, then DNS query will not be sent out to the DNS server and P-GW will immediately get the DNS response.

Since local DNS cache flush will not be done, operator should configure the cache accordingly.

**Licensing**

Use of P-CSCF Restoration requires that a valid license key be installed. Contact your local Sales or Support representative for information on how to obtain a license.

**How It Works**

- Restoration is supported for IPv4/IPv6/IPv4v6 calls.
- With extension, Restoration Support UBR will always go on default bearer.
• P-GW does not compare any of the stored values with the new updated P-CSCF IP addresses; it relies on the DNS provided/discovered values and forwards the P-CSCF IP addresses as is.

• P-CSCF Restoration will be performed for all PDN connections, regardless of APN configuration of IMS/non-IMS.

• Upon receiving P-CSCF Restoration trigger for extended mechanism, P-CSCF address discovery priority is first for P-CSCF FQDN. If FQDN is already present in DNS cache, then as per current implementation of HSS based (S5/S8) P-CSCF Restoration, DNS query will not be sent to the DNS server and P-GW will immediately get the DNS response.

Since local DNS cache flush will not be done, operator should configure the cache accordingly.

• In case of S6b RAR, P-GW supports configuration for whether to perform ReAuthentication Request and Response (AAR/AAA) with extended restoration support.

Authentication after RAR for restoration is not mandatory as it increases the authentication signaling flow at AAA Server. In order to maintain backward compatibility with the existing Diameter Relay Agents (DRA)/AAA servers, which expect authentication after RAR, authentication can be configured for RAR with P-CSCF Restoration.

• If the DNS resolution for FQDN fails or P-GW does not have P-CSCF address configured in any other way, P-GW will still send UBR with no P-CSCF address PCO/APCO during restoration.

• If the P-CSCF Restoration is already in progress, then restoration will not be performed again for any second restoration indication received.

• For basic P-CSCF Restoration, call will be cleared with disconnect reason "ue-pcscf-reselect-not-supported (613)".

• P-GW does not expect change in S6b P-CSCF FQDN during ReAuth. In the rare scenario that P-CSCF FQDN is changed in S6b ReAuth, then the new FQDN will be used in next P-CSCF Discovery. If P-CSCF FQDN if changed during ReAuth, then it is not recovered.

• For S6b, every AAR supported-feature will be negotiated. ReAuth AAR will also do the feature renegotiation. It’s expected that S6b AAA server should do the renegotiation in every AAA. This is specifically applicable to LTE-WiFi and vice versa handoff. During LTE attachment, supported-feature will not be sent. During WiFi handoff, however, support for P-CSCF Restoration should be indicated in AAR.

• Supported-feature on Gx for P-CSCF Restoration will apply to GGSN/eHRPD calls as well to support handoff scenarios.

• For S6b RAT type WLAN, AAA group supports configuration to control when AAR is sent with the supported-feature to S6b server. If AAA group disables this functionality, then once the AAA response comes with supported-feature it is considered not negotiated. Thus, negotiation depends on the CLI configuration of supported-feature at the time of handling AAA.

• Supported-feature for P-CSCF Restoration in S6b will only go for RAT type WLAN.

• During IPv6 reporting S6b information update, if information update AAA is pending and RAR for restoration is received, then only the restoration will be handled. In this case, ReAuth will not be performed again for extended restoration, even if configured.

• APCO for Update Bearer Request (UBRequest) for extended P-CSCF Restoration in ePDG will be sent at bearer context level itself. APCO is not at message level for UBRequest.
• If S6b RAR ReAuth is pending and AAA of ReAuth is not yet received when RAR for restoration is received, then only the restoration will be handled. In this case, ReAuth will not be performed again for extended restoration, even if configured.

• For PCRF based P-CSCF Restoration/HSS based (S2a/S2b) P-CSCF Restoration, if UE PDN type and the PCO requested P-CSCF address do not match (for example, PDN type is IPv4 and PCO P-CSCF requested in IPv6, and vice versa), then basic restoration will be performed.

• UE Capability PCO and P-CSCF Restoration for S5/S8:

<table>

<td>Basic Restoration</td>
</tr>
</tbody>
</table>

For S2a only, if MCM mode/WPMSI flag and UE P-CSCF re-selection support and P-CSCF address request is received, then only extended P-CSCF Restoration will be performed. For all other scenarios, if P-CSCF Restoration Indication is received, then basic P-CSCF Restoration is performed.

If both MCM/SCM flag are set, then it's considered SCM.

For S2b only, if UE P-CSCF re-selection support and P-CSCF address request is received during establishment or handoff is received, then only extended P-CSCF Restoration will be performed. For all other scenarios, if P-CSCF Restoration Indication is received, then basic P-CSCF Restoration is performed.

Call Flows

PCRF Based P-CSCF Restoration for LTE (S5/S8)

The PCRF-based P-CSCF Restoration makes use of the path through an alternative P-CSCF and PCRF to inform the P-GW regarding P-CSCF Restoration.

There are two mechanisms to handle the P-CSCF Restoration support:

1. Basic Restoration Support: UE does not support the P-CSCF Re-selection. P-GW informs UE to release the PDN connection. P-GW initiates bearer deactivation procedure for the default bearer with cause "reactivation requested".

2. Extended Restoration Support: P-GW sends the UBR with PCO having list of alternate P-CSCF addresses after the P-CSCF rediscovery. The optional extension avoids the PDN deactivation and re-activation and is based on the P-GW identifying whether or not the UE supports "Update PDP context/bearer at P-CSCF failure". The UE indicates this capability to the P-GW at the activation of the PDN connection in a PCO parameter.
P-CSCF Restoration for WLAN (S2a/S2b)

This section describes solutions to support P-CSCF Restoration for UEs with WLAN access.

There are two mechanisms to handle the P-CSCF Restoration support:

1. **Basic Restoration Support**: The basic mechanism for the HSS-based solution and for the PCRF-based solution relies on the release of the PDN connection, followed by its re-establishment to trigger a new IMS registration by the UE.
2. **Extended Restoration Support**: The extension mechanism for trusted WLAN and untrusted WLAN access avoids the release of the PDN connection and triggers a new IMS registration by the UE over the existing PDN connection.

   The extension mechanism for trusted WLAN is supported only for multi-connection mode (MCM).

In the basic P-CSCF Restoration for TWAN access or untrusted WLAN access, the P-GW sets the cause "Reactivation requested" when tearing down the PDN connection.

If the re-authorization request is used for the purpose of the P-CSCF Restoration for WLAN, only the P-CSCF Restoration Request bit shall be set in the RAR Flags.

If the P-CSCF Restoration Request bit in the RAR Flags is set in ReAuthorization request (S6b):

- When P-GW triggers the extended P-CSCF restoration mechanism, the P-GW may send the authorization request.
- When P-GW triggers the basic P-CSCF restoration mechanism, the P-GW shall send a Session Termination Request to the 3GPP AAA Server.

**For Trusted WLAN Access**

- The TWAN shall advertise the support of the WLCPPDN connection modification request procedure over S2a at establishment (or handover) of the PDN connection. This allows the P-GW to use the P-CSCF Restoration extension on this TWAN.
- UE capability (UE support of the P-CSCF Restoration extension for the TWAN access) to the P-GW at the establishment (or handover) of the PDN connection over the WLAN is transferred via PCO IE.
- Upon receipt of a P-CSCF Restoration Indication, the P-GW may invoke this P-CSCF Restoration extension procedure if:
  - The UE is accessing the EPC via a TWAN in the multi-connection mode
  - The UE indicated support of this extension for the TWAN access via PCO, and
  - If the TWAN indicated support of the WLCPPDN connection modification procedure.
  - If UE requested P-CSCF address at establishment or handover.

Otherwise, the basic restoration procedure is executed.

- For a trusted WLAN with the single connection mode or the transparent single connection mode, only the basic P-CSCF Restoration mechanism may apply.
- In the P-CSCF Restoration extension procedure for TWAN access, the P-GW shall send the updated list of the addresses of available P-CSCFs toward the UE via the TWAN using the PCO IE.

For Un-Trusted WLAN Access

An ePDG which supports the P-CSCF Restoration extension for untrusted WLAN shall forward the UE capability (UE support of the P-CSCF restoration extension) in the APCO information element to the P-GW over the S2b interface at the PDN connection establishment (or handover) over S2b.

In the P-CSCF Restoration extension procedure for untrusted WLAN access, the P-GW shall send the updated list of the addresses of available P-CSCFs toward the UE via the ePDG using the APCO IE.

Configuring the HSS/PCRF-based P-CSCF Restoration

The following section provides the configuration commands to enable support for HSS-based and PCRF-based P-CSCF Restoration feature.

Enabling P-CSCF Restoration Indication on S6b AAA Interface

Use the following configuration commands for encoding Supported-Features AVP in the AAR message to AAA server via S6b interface.

```
configure
  context context_name
    aaa group group_name
      diameter authentication encode-supported-features
      pcscf-restoration-indication
    end
end
```

Notes:

- `encode-supported-features`: Encodes Supported-Features AVPs.
- `pcscf-restoration-indication`: Enables the P-CSCF Restoration Indication feature.
- `default encode-supported-features`: Configures the default setting, that is not to send the Supported-Features AVP in AAR message.
- `no encode-supported-features`: Disables the CLI command to not send the Supported-Features AVP.
- `pcscf-restoration-indication`: Keyword is license dependent. For more information, contact your Cisco account representative.

Enabling P-CSCF Restoration Indication on Gx Interface

Use the following configuration for P-CSCF Restoration supported feature.

```
configure
  context context_name
    ims-auth-service service_name
      policy-control
        diameter encode-supported-features pcscf-restoration-ind
      end
    end
end
```

Notes:

- `pcscf-restoration-ind`: Enables the P-CSCF Restoration Indication feature. This keyword is license dependent. For more information, contact your Cisco account representative. By default, this feature is disabled.
- `default encode-supported-features`: The default configuration, which is removing/resetting the supported features.
- `no encode-supported-features`: Removes the previously configured supported features.
Enabling P-CSCF Restoration for Emergency PDNs

Use the following configuration to enable P-CSCF Restoration for Emergency PDNs.

```plaintext
configure
  context context_name
  pgw-service service_name
    pcsf-restoration { hss-solution | custom-hss-solution }
    pcsf-restoration emergency-pdn
  end
```

Notes:

- `{ hss-solution | custom-hss-solution }`: Enables standards-based or private extension-based HSS solution for P-CSCF Restoration. This keyword must be configured on a separate command line from emergency-pdn.
- `emergency-pdn`: Enables P-CSCF Restoration for Emergency PDNs. This keyword is license dependent. For more information, contact your Cisco account representative. By default, this feature is disabled.
- `default pcsf-restoration`: P-CSCF Restoration is disabled for Emergency PDNs and Private Extn mechanism will be used for P-CSCF Restoration.
- `no pcsf-restoration emergency-pdn`: Disables P-CSCF restoration for Emergency PDNs.

Enabling Re-Auth After S6b Triggered P-CSCF Restoration of WLAN

Use the following configuration to enable Re-Auth after S6b triggered P-CSCF Restoration of WLAN.

```plaintext
configure
  context context_name
  pgw-service service_name
    pcsf-restoration s6b-reauth
  end
```

Notes:

- `s6b-reauth`: Enables Re-Auth after S6b triggered P-CSCF Restoration of WLAN. Only applicable for S2a and S2b. By default, Re-Auth will be performed for P-CSCF restoration extension on S6b. This keyword is license dependent. For more information, contact your Cisco account representative. By default, this feature is disabled.
- `default pcsf-restoration`: Re-Auth will be performed for P-CSCF restoration extension on S6b.
- `no pcsf-restoration s6b-reauth`: Disables Re-Auth after P-CSCF restoration extension on S6b.
Verifying the HSS/PCRF-based P-CSCF Restoration

show aaa group all
This show command displays *pcscf-restoration-ind* as part of Supported-Features if this feature is configured under AAA group.

show aaa group all
Group name: default
Context: local
Diameter config:
Authentication:
....
Supported-Features: pcscf-restoration-ind
....

show ims-authorization sessions full all
This command generates a display that indicates the negotiation status of this feature.

The following sample display is only a portion of the output which shows *pcscf-restoration-ind* among the Negotiated Supported Features.

show ims-authorization sessions full all
CallId: 00004e22 Service Name: imsa-Gx
IMSI: 123456789012341
....
Negotiated Supported Features:
3gpp-r8
pcscf-restoration-ind
....

show pgw-service name <pgw_service>
This command generates a display that indicates the configuration status of this feature.

The following sample display is only a portion of the output.

P-GW service output is enhanced to clearly specify HSS-based solution of MME-Triggered; this avoids confusion with the HSS-based S6b Triggered solution. In addition, it displays whether P-CSCF Restoration supported for Emergency PDNs and/or Re-Auth After s6b Triggered P-CSCF Restoration is enabled.

show pgw-service name <pgw_service>
Service name : pgw_service
Restoration solution : HSS-based MME-Triggered (Rel12)
P-CSCF Restoration supported for Emergency PDNs : Yes/No
Re-Auth After s6b Triggered P-CSCF Restoration : Enabled / Disabled
....

Monitoring and Troubleshooting the HSS/PCRF-based P-CSCF Restoration

This section provides information regarding show commands and/or their outputs in support of this feature.
The following operations can be performed for troubleshooting any failure related to this feature:

- Verify if the feature is enabled using `show ims-authorization sessions full all` and `show aaa group all` CLI commands. If not enabled, configure the required CLI commands both under Policy Control and AAA group configuration and check if it works.

- Execute `monitor protocol` command and check if the support for P-CSCF Restoration feature is negotiated in CCR-I and AAR messages. If not, enable the respective CLI commands for this feature to work.

- If the failure is still observed, obtain the following information and contact Cisco account representative for further analysis:
  - Monitor protocol log with options 74 (EGTPC) and 75 (App Specific Diameter –Gx/S6b) turned on
  - Logs with sessmgr, imsa, and diameter-auth enabled
  - Output of `show session disconnect reason` CLI command and the relevant statistics at service level

### Output of Show Commands

**show aaa group all**

The **Supported Features** field in this show command output displays whether or not the P-CSCF Restoration feature is configured as part of the Supported-Features AVP.

This supported feature is displayed only when the feature license is configured.

**show ims-authorization sessions full all**

The **Negotiated Supported Features** field in this show command output displays whether or not the P-CSCF Restoration feature is negotiated with PCRF.

This supported feature is displayed only when the feature license is configured.

**show license information**

If the license to enable the P-CSCF Restoration feature is configured, then the **show license information** command displays the associated license information.

**show pgw-service name <pgw_service>**

P-GW service output is enhanced to clearly specify HSS-based solution of **MME-Triggered**; this avoids confusion with the HSS-based S6b Triggered solution. In addition, it displays whether **P-CSCF Restoration supported for Emergency PDNs** and/or **Re-Auth After s6b Triggered P-CSCF Restoration** is enabled.

```
show pgw-service name <pgw_service>

Service name : pgw_service
Restoration solution : HSS-based MME-Triggered (Rel12)
P-CSCF Restoration supported for Emergency PDNs : Yes/No
Re-Auth After s6b Triggered P-CSCF Restoration : Enabled / Disabled
```
show pgw-service statistics all

This command provides statistics on the number of P-CSCF Restorations.

The MME received P-CSCF Restoration count has moved from "P-CSCF Restoration Indications received:" to "MME triggered Restoration". Now, "P-CSCF Restoration Indications received:" shows total number of P-CSCF Restoration indications received (HSS Triggered and PCRF Triggered). Bulkstat counter "sesstat-pcscf-recovery-count" will continue to display the MME received P-CSCF Restoration only.

The total number of triggers received on any interface (MME/PCRF/S6b) = Basic + Extended + Ignored (ignored for reasons such as restoration already in progress, license not present, validation check fails, or call not connected).

PDNs Released By Reason:
- Network initiated release: 0
- MME initiated release: 0
- Admin disconnect: 0
- S4 SGSN initiated release: 0
- GTP-U error ind: 0
- SGW path failure: 0
- Local fallback timeout: 0
- UE P-CSCF Reselect not supported: 0

S2bGTP-to-eHRPD handover: Attempted: 0 Succeeded: 0 Failed: 0

eHRPD-to-S2bGTP handover: Attempted: 0 Succeeded: 0 Failed: 0

P-CSCF Restoration Indications received: <total_count at service level>

HSS Triggered Restoration:
- MME Triggered Restoration: <>
- Basic Restoration Performed: <>
- Extension Restoration Performed: <>

S6b Triggered Restoration:
- Basic Restoration Performed: <>
- Extension Restoration Performed: <>

PCRF Triggered Restoration:
- Basic Restoration Performed: <>
- Extension Restoration Performed: <>

Data Statistics Per Interface:

show srp checkpoint statistics active verbose

This command provides the following P-CSCF Restoration micro checkpoint information:

Total pgw ubr_mbr micro-chkpnt sent: 0
Total pcscf update micro-chkpnt sent: 0

show srp checkpoint statistics standby verbose

This command provides the following P-CSCF Restoration micro checkpoint information:
Monitoring Logs

This section provides information on how to monitor the logs that are generated relating to the HSS/PCRF-based P-CSCF Restoration feature.

Gx Diameter Protocol Logs

Under Supported-Features, the P-CSCF Restoration Feature-List is available in CCR-I/CCA-I section. The output generated will appear similar to the following:

```
<<<<OUTBOUND 13:52:06:117 Eventid:92820(S)
....
[V] [M] Supported-Features:
  [M] Vendor-Id: 10415
  [V] Feature-List-ID: 1
  [V] Feature-List: 16777217
....
INBOUND>>>>> 13:52:06:118 Eventid:92821(S)
....
[V] [M] Supported-Features:
  [M] Vendor-Id: 10415
  [V] Feature-List-ID: 1
  [V] Feature-List: 16777216
....
```

The PCSCF-Restoration-Indication AVP is available in RAR. The output generated will appear similar to the following:

```
INBOUND>>>>> 13:52:26:119 Eventid:92821(S)
....
[M] Re-Auth-Request-Type: AUTHORIZE_ONLY (0)
[V] PCSCF-Restoration-Indication: 0
....
```

S6b Diameter Protocol Logs

The Supported-Features field is available in AAR/AAA section. The log output generated will appear similar to the following:

```
<<<<OUTBOUND 15:37:23:561 Eventid:92870(S)
....
[V] [M] Supported-Features:
  [M] Vendor-Id: 10415
  [V] Feature-List-ID: 1

ICAP Interface Support

This chapter provides information on configuring the external Active Content Filtering servers for a core network service subscriber. This chapter also describes the configuration and commands that are used to implement this feature.

It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in respective product Administration Guide, before using the procedures in this chapter.

The following products currently support ICAP interface functionality:

- GGSN
- P-GW

ICAP Interface Support Overview

This feature supports streamlined ICAP interface to leverage Deep Packet Inspection (DPI) to enable external application servers to provide their services without performing DPI, and without being inserted in the data flow. For example with an external Active Content Filtering (ACF) Platform.

A high-level view of the streamlined ICAP interface support for external ACF is shown in the following figure:
The system with ECS is configured to support DPI and the system uses this capability for content charging as well. WAP and HTTP traffic is content filtered over the ICAP interface. RTSP traffic that contains adult content can also be content filtered on the ICAP interface. Only the RTSP Request packets will be considered for content filtering over the ICAP interface.

If a subscriber initiates a WAP (WAP1.x or WAP2.0) or Web session, the subsequent GET/POST request is detected by the DPI function. The URL of the GET/POST request is extracted and passed, along with subscriber identification information and the subscriber request, in an ICAP message to the application server. The application server checks the URL on the basis of its category and other classifications like, type, access level, content category and decides if the request should be authorized, blocked, or redirected by answering to the GET/POST with:

- A 200 OK message if the request is accepted.
- A 302 Redirect message in case of redirection. This redirect message includes the URL to which the subscriber must be redirected.
- Deny-response code 200 for RTSP requests is not supported. Only 403 "Forbidden" deny-response code will be supported.

Depending on the response received, the system with ECS will either pass the request unmodified, or discard the message and respond to the subscriber with the appropriate redirection or block message.

Content charging is performed by the Active Charging Service (ACS) only after the request has been controlled by the application server. This guarantees the appropriate interworking between the external application and content-based billing. In particular, this guarantees that charging will be applied to the appropriate request in case of redirection, and that potential charging-based redirections (i.e. Advice of Charge, Top Up page, etc.) will not interfere with the decisions taken by the application server.

Functions of the ACF include:

- Retrieval of subscriber policies based on the subscriber identity passed in the ICAP message
- Determining the appropriate action (permit, deny, redirect) to take for the type of content based on subscriber profile
- Communication of the action (permit, deny, or redirect) decision for the URL back to the ACS module
**Supported Networks and Platforms**

This feature supports the Cisco ASR 5500 platform for the core network services configured on the system. For additional platform information, refer to the appropriate *System Administration Guide* and/or contact your Cisco account representative.

**License Requirements**

External Content Filtering Server support through Internet Content Adaptation Protocol (ICAP) interface is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements.

For information on installing and verifying licenses, refer to the *Managing License Keys* section of the *Software Management Operations* chapter in the *System Administration Guide*.

**Failure Action on Retransmitted Packets**

ICAP rating is enabled for retransmitted packet when default ICAP failure action was taken on an ICAP request for that flow. ICAP default failure action is taken on the pending ICAP request for a connection when the connection needs to be reset and there is no other redundant connection available. For example, in the ICAP request timeout and ICAP connection timeout scenarios. In these cases the retransmitted packet in the uplink direction is sent for ICAP rating again.

In case of WAP CO, uplink retransmitted packet for the WAP transactions for which ICAP failure action was taken will be sent for ICAP rating. WSP header of the retransmitted packet is not parsed by the WSP analyzer. The URL received in the previous packet for that transaction is used for ICAP rating. If failure action was taken on multiple WTP transactions for the same flow (case: WTP concatenated GET request) then uplink retransmitted packet for each of the transaction is sent for rating again.

In case of HTTP, uplink retransmitted packets for the HTTP flow on which ICAP failure action is taken is sent for ICAP rating. The URL present in the current secondary session (last uplink request) is used for ICAP rating. However, if there were multiple outstanding ICAP request for the same flow (pipelined request) then for the retransmitted packet the URL that will be sent for rating will be that of the last GET request.

Retransmission in various cases of failure-action taken on re-transmitted packets when the ICAP response is not received for the original request and the retransmitted request comes in:

- **WSP CO:**
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/block. It is possible that the WAP gateway sends the response for the permitted GET request. Hence, there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: The retransmitted packet is not sent for ICAP rating.
  - Redirect: The retransmitted packet is not sent for ICAP rating.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed/blocked.
  - Terminate flow: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction is allowed or blocked. The WAP gateway may send an Abort transaction for this
GET request if the WSP disconnect packet sent while terminating the flow is received by the WAP gateway.

• HTTP:
  - Permit: The uplink packet is sent for ICAP rating and depending on the ICAP response the last HTTP GET request. It is possible that the HTTP server sends the response for the permitted GET request. Hence there is a race condition and the subscriber may be able to view the web page even thought the rating was redirect or content insert.
  - Content Insert: Retransmitted packets are dropped and not charged.
  - Redirect: Retransmitted packets are dropped and not charged.
  - Discard: The uplink packet is sent for ICAP rating and depending on the ICAP response the WTP transaction allowed/blocked.
  - Terminate flow: Retransmitted packets are dropped and not charged.

• RTSP:
  The following scenarios describe the failure actions where an RTSP request is received from the client. If ICAP is enabled, then the request goes to the ICAP server for content filtering.
  - Allow: If the failure action configured is "allow", the RTSP request packet is sent out after applying the appropriate disposition action. Here, the flow remains the same as in the case if the ICAP response received is 200 OK.
  - Content Insert: If the failure action configured is "content-insertion <string of size 1 to 128>", then this failure action for RTSP request will not be supported. Instead the failure action "Discard" for such an RTSP request will be supported.
  - Redirect-URL: If the failure action configured is "redirect-url <string of size 1 to 128>", then a TCP FIN_ACK packet with an RTSP "302 Moved Temporarily" response header is inserted towards the client containing the said URL for redirection. A TCP RST packet is inserted towards the server. The underlying TCP connection is thus closed. If the RTSP client wants to retry to the redirected URL, the opening of a new TCP connection must be initiated.
  - Discard: If the failure action configured is "discard", then the RTSP request packet received from the client is quietly discarded and no notification is sent to the client.
  - Terminate flow: If the failure action configured is "terminate-flow", then the TCP connection is torn down by injecting a TCP FIN-ACK towards the client and a RST packet towards the server. However, no notification will be sent to the RTSP client and the server regarding this flow termination.

ICAP Client Communication with RFC 3507 compliance

The ICAP Content Filtering solution is extended to support ICAP client communication with ICAP server on Cisco ASR 5500 P-GW and HA in compliance with RFC 3507 - Internet Content Adaptation Protocol (ICAP). Only HTTP Request modification and partial enhancement of error codes per RFC 3507 is addressed in this release. The ICAP client running on P-GW/HA communicates with external ICAP server over ICAP protocol. If content filtering is enabled for a subscriber, all HTTP GET requests from that subscriber are validated by
the content filtering server (ICAP server), and is allowed, denied or redirected depending on the content categorization request.

Content-Filtering can be enabled for subscribers either through Override Control (OC) feature for predefined and static rules, or L7 Dynamic Rule Activation feature. A configurable option is added in the Content Filtering Server Group Configuration Mode to configure ICAP header that includes two parameters - Subscriber number information and CIPA (Children's Internet Protection Act) category.

Override Control and L7 Dynamic Rule Activation are license-controlled features. A valid feature license must be installed prior to configuring these features. Contact your Cisco account representative for more information.

- **Important**

  • Subscriber Number: The "Subscription ID" AVP is sent from gateway to PCRF in CCR message. The AVP values are received to the gateway from HSS. The gateway does not receive this AVP in CCI-A message.
  
  • CIPA category: The category string will be provided by PCRF and is included as an extension header in ICAP request modification message. The AVP will be received from PCRF in CCA-I or RAR.

**Dictionary and AVP Support**

A new Content Filtering (CF) dictionary "custom4" is introduced and the following new AVPs are added to r8-gx-standard and custom4 dictionaries.

- Override-Content-Filtering-State: This attribute carries information about Content Filtering status (CF state) of rules or charging-action. This AVP is used for overriding the content-filtering status of static and predefined rules. This attribute is included in the Override-Control grouped AVP.

- CIPA: This attribute contains the Children's Internet Protection Act (CIPA) category string value that is treated as an ICAP plan identifier. This identifier helps ICAP server in locating the correct Content Filtering plan i.e. CIPA category based on which the packet is processed.

  This attribute value is received from PCRF over Gx interface and is included in ICAP header while sending ICAP request.

- L7-Content-Filtering-State: This attribute carries information about Content Filtering status (CF state) of L7 rules. This attribute indicates whether or not the ICAP functionality is enabled or disabled for L7 charging rule definition received for installation from PCRF. Based on this attribute value, the traffic matching to the dynamic rule is sent to ICAP server.

  This attribute is included in the L7-Application-Description grouped AVP for L7 rule processing. This is applicable only for HTTP protocol.

**Important**

CIPA and flags for controlling content filtering via OC and L7 Dynamic Rules features is applicable only for r8-gx-standard dictionary.

In addition to the new AVP support, L7-Field AVP in the L7-Application-Description grouped AVP is encoded to additionally accept ANY-MATCH as the input. The current framework does not support the existing field "vlan-id" in Override-Control, which is present in charging action. Hence, the Override-Content-Filtering-State AVP replaces Override-VLAN-ID to support OC.
When subscriber initiates create session request, P-GW/HA sends CCR-I message to PCRF to obtain subscriber profile. PCRF responds with CCA-I message that contains CIPA and OC information if ICAP functionality is enabled for this subscriber.

In the case of L7 dynamic rules, the Content-Filtering capability is enabled by sending L7-Content-Filtering-State AVP in L7-Application-Description grouped AVP. At least one L7 filter should be present when L7-Content-Filtering-State is received for the dynamic rule. If L7-Content-Filtering-state AVP is sent along with L7 filter information AVP, then the Content-Filtering state will not be considered. Hence, the filter received with L7-Content-Filtering-State will not be processed and the L7 rule will be discarded.

In the case of Override Control, when content filtering is enabled for subscriber, PCRF sends ICAP flag through Override-Control AVP. This AVP overwrites charging action to enable ICAP feature for that subscriber.

Refer to the *AAA Interface Administration and Reference* for more information on the supported AVPs.

**Limitations**

The limitations for this feature are listed below:

- Only IPv4 addressing scheme is supported.
- ICAP content filtering is applicable only for HTTP traffic. HTTPS traffic is not supported by ICAP client.
- Accelerated path will not be supported for this feature.

---

**Configuring ICAP Interface Support**

This section describes how to configure the Content Filtering Server Group (CFSG) through Internet Content Adaptation Protocol (ICAP) interface between ICAP client and ACF server (ICAP server).

**Important**

This section provides the minimum instruction set for configuring external content filtering servers on ICAP interface on the system. For more information on commands that configure additional parameters and options, refer to *CFSG Configuration Mode Commands* chapter in *Command Line Interface Reference*.

To configure the system to provide ICAP interface support for external content filtering servers:

**Step 1**
Create the Content Filtering Server Group and create ICAP interface with origin (local) IP address of chassis by applying the example configuration in *Creating ICAP Server Group and Address Binding*, on page 707.

**Step 2**
Specify the active content filtering server (ICAP server) IP addresses and configure other parameters for ICAP server group by applying the example configuration in *Configuring ICAP Server and Other Parameters*, on page 707.

**Step 3**
Configure the content filtering mode to external content filtering server group mode in ECS rule base by applying the example configuration in *Configuring ECS Rulebase for ICAP Server Group*, on page 708.

**Step 4**
Configure the charging action to forward HTTP/RTSP/WAP GET request to external content filtering servers on ICAP interface in Active Charging Configuration mode by applying the example configuration in *Configuring Charging Action for ICAP Server Group*, on page 708.

**Step 5**
Verify your ICAP interface and external content filtering server group configuration by following the steps in *Verifying the ICAP Server Group Configuration*, on page 709.
**Step 6**  Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

---

**Creating ICAP Server Group and Address Binding**

Use the following example to create the ICAP server group and bind the IP addresses:

```plaintext
configure
custom <icap_ctxt_name> [ -noconfirm ]
  content-filtering server-group <icap_svr_grp_name> [ -noconfirm ]
    origin address <ip_address>
  end
```

Notes:

- `<ip_address>` is local IP address of the CFSG endpoint.

---

**Configuring ICAP Server and Other Parameters**

Use the following example to configure the active content filtering (ICAP server) and other related parameters:

```plaintext
configure
custom <icap_context_name>
  content-filtering server-group <icap_server_grp_name>
   icap server <ip_address> [ port <port_number> ] [ max <max_msgs> ]
   priority <priority> ] [ standby ]
   connection retry-timeout <retry_timeout>
   deny-message <msg_string>
   dictionary { custom1 | custom2 | custom3 | custom4 | standard }
   failure-action { allow | content-insertion <content_string> | discard
   redirect-url <url> | terminate-flow }
   header extension options { cipa-category cipa_category_name |
   subscriber-number subscriber_num_name } +
   response-timeout <timeout>
  end
```

Notes:

- In 8.1 and later releases, a maximum of five ICAP servers can be configured per Content Filtering Server Group. In release 8.0, only one ICAP Server can be configured per Content Filtering Server Group.
- The `standby` keyword can be used to configure the ICAP server as standby. A maximum of ten active and standby ICAP servers per Content Filtering Server Group can be configured. The active and standby servers under the same server group can be configured to work in active-standby mode.
- The maximum outstanding request per ICAP connection configured using the optional `max <max_msgs>` keyword is limited to one. Therefore, any other value configured using the `max` keyword will be ignored.
- *Optional.* To configure the ICAP URL extraction behavior, in the Content Filtering Server Group configuration mode, enter the following command:

  ```plaintext
  url-extraction { after-parsing | raw }
  ```
By default, percent-encoded hex characters in URLs sent from the ACF client to the ICAP server will be converted to corresponding ASCII characters and sent.

- The **custom4** dictionary is a custom-defined dictionary that specifies user-defined information in the ICAP request message. The ICAP request message includes subscriber number and CIPA category values. When **custom4** dictionary is configured, ICAP requests are formed as part of ICAP RFC 3507 request mode request. If any other dictionary is configured, the earlier implementation of ICAP client will not be partial RFC compliant.

- The **header extension options** command configures ICAP header parameters - subscriber number and CIPA category.

### Configuring ECS Rulebase for ICAP Server Group

Use the following example to configure the content filtering mode to ICAP server mode in the ECS rulebase for content filtering:

```plaintext
configure
  require active-charging [ optimized-mode ]
  active-charging service <acs_svc_name> [ -noconfirm ]
  rulebase <rulebase_name> [ -noconfirm ]
    content-filtering mode server-group <cf_server_group>
end
```

**Notes:**

- In release 8.1, the **optimized-mode** keyword enables ACS in the Optimized mode, wherein ACS functionality is managed by SessMgrs. In release 8.1, ACS must be enabled in the Optimized mode.

- In release 8.3, the **optimized-mode** keyword is obsolete. With or without this keyword ACS is always enabled in Optimized mode.

- In release 8.0 and release 9.0 and later, the **optimized-mode** keyword is not available.

---

**Important**

After you configure `configure, require active-charging [ optimized-mode ], active-charging service <acs_svc_name> [ -noconfirm ], and rulebase CLI commands, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the *System Administration Guide* for your deployment.

---

### Configuring Charging Action for ICAP Server Group

Use the following example to configure the charging action to forward HTTP/WAP GET request to ICAP server for content processing.

```plaintext
configure
  active-charging service <acs_svc_name>
    charging-action <charging_action_name> [ -noconfirm ]
      [ no ] content-filtering processing server-group
end
```
Notes:

- If the content-filtering flag supplied by charging action is required to configure the Override Control feature, then the `no content-filtering processing` command must be configured. This will ensure overriding content-filtering processing to be enabled or disabled through the Override Control feature.

### Verifying the ICAP Server Group Configuration

This section explains how to display and review the configurations after saving them in a .cfg file and also to retrieve errors and warnings within an active configuration for a service.

---

**Important**

All commands listed here are under Exec mode. Not all commands are available on all platforms.

These instructions are used to verify the configuration for this feature.

---

**Step 1**  
Verify your ICAP Content Filtering Server Group configuration by entering the following command in Exec Mode:

```plaintext
show content-filtering server-group
```

The following is a sample output. In this example, an ICAP Content Filtering server group named `icap_cfsg1` was configured.

```plaintext
Content Filtering Group: icap_cfsg1
  Context: icap1
  Origin Address: 1.2.3.4
  ICAP Address(Port): 1.2.3.4(1344)
  Max Outstanding: 256
  Priority: 1
  Response Timeout: 30(secs)  Connection Retry Timeout: 30(secs)
  Dictionary: standard
  Timeout Action: terminate-flow
  Deny Message: "Service Not Subscribed"
  URL-extraction: after-parsing
  Header Extension Options: subscriber-number i-sub
  Content Filtering Group Connections: NONE
Total content filtering groups matching specified criteria: 1
```

**Step 2**  
Verify any configuration error in your configuration by entering the following command in Exec Mode:

```plaintext
show configuration errors
```
Verifying the ICAP Server Group Configuration
Inclusion of APN AMBR in the Create Session Response

- Feature Information, on page 711
- Feature Changes, on page 712
- Command Changes, on page 712
- Performance Indicator Changes, on page 713

Feature Changes

Currently, APN AMBR is included in the Create Session Response even if it is not modified by the PCRF. This feature has been implemented to comply to the 3GPP specifications. With this feature, now APN AMBR will be included on the S5/S8, S4/S11, and S2a/S2b interfaces if the received APN-AMBR has been modified by the PCRF.

**Previous Behavior:** APN AMBR was included in Create Session Response even if it was not modified by the PCRF.

**New Behavior:** Now, APN AMBR will be included on the S5/S8, S4/S11, and S2a/S2b interfaces if the received APN-AMBR has been modified by the PCRF. A new CLI command has been added to enable/disable inclusion of the APN-AMBR value in the Create Session Response for the modified value received by the PCRF.

Important

P-GW supports APN-AMBR value upto 4294967 kbps.

Command Changes

**egtp**

Two new keywords have been added to the `egtp` command to enable/disable inclusion of APN-AMBR value in Create Session Response for modified value received by PCRF.

```
  configure
  context context_name
  pgw service service_name
    [ default | no ] egtp create-session-rsp apn-ambr-always-include
  end
```

**Notes:**

- **default:** APN AMBR is not included in the CS Response if APN AMBR is not received from the PCRF. P-GW supports APN-AMBR value upto 4294967 kbps.
- **no:** Does not include APN AMBR in the CS Response. This is the default behavior.
• **create-session-rsp**: Provides an option to include APN-AMBR in the Create Session Response

• **apn-ambr-always-include**: Always includes APN-AMBR IE in Create Session Response.

### Performance Indicator Changes

**show config**

This command has been modified to display the following output:

```
plmn id mcc 404 mnc 00
plmn id mcc 404 mnc 005 primary
plmn id mcc 404 mnc 090
fqdn host abc.net realm 3gpp.org
dns-client context ISP1
associate ggsn-service GGSN
associate egtp-service PGW21EGTP
egtp create-session-rsp apn-ambr-always-include
```

**show pgw-service name**

This command has been modified to display the following output:

```
EGTP SGW Restoration Handling: Disabled
Session Hold Timer: n/a
Timeout: n/a
EGTP Modify bearer cmd negotiate qos: Disabled
EGTP GnGp Modify bearer res with APN-AMBR: Disabled
EGTP Modify bearer res with CHARGING-ID: Disabled
EGTP Modify bearer res with CHARGING-FQDN or CHARGING-GW-ADDRESS: Disabled
EGTP Modify bearer res with MSISDN: Disabled
EGTP Modify Bearer Response with Context Not Found cause if IMEI/IMEISV mismatch: Disabled
EGTP Bit Rate in Rounded Down Kbps: Disabled
EGTP Suppress Update Bearer Request (no bitrate change): Disabled
EGTP Create Session Response with APN-AMBR IE: Enabled
```
show pgw-service name

</tr>
</tbody>
</table>

Feature Description

In the existing setup, the HA Manager supports monitoring of Proxy Mobile IPv6 (PMIP) sessions for up to 256 peers through the heartbeat mechanism. Now there is a requirement to increase the monitoring of peers from 256 to 128000.

To increase the number of PMIP sessions to enable more peers to be monitored for path failure with the heartbeat mechanism, a new CLI `monitor-max-peers` is added under the LMA Service Configuration mode. This feature supports the following behavior:

- When configured, the maximum number of peers that can be supported for heartbeat monitoring can be increased from 256 to 128000 peers.
- The first 128000 peers are identified during the calls irrespective of whether the heartbeat mechanism is enabled or not.
- A separate list is maintained for retransmission heartbeats and periodic heartbeats for batch processing.
- The decision to monitor peers is done at the time of call setup, recovery, and ICSR. For example, consider that there are more than 256 peers (considering the CLI is configured for a maximum of 128000 peers) that are being monitored for heartbeat. Later, this configuration is changed to default, which is for a maximum of only 256 peers. Then, monitoring continues for all peers until HA Manager recovery or ICSR (with monitor-max-peers configuration of a maximum 256 peers) occurs.
- The parameters for batch processing for heartbeat messages are changed as follows:

<table>
<thead>
<tr>
<th></th>
<th>Batch Size (before)</th>
<th>Batch Size</th>
<th>Batch Interval (before)</th>
<th>Batch Interval</th>
</tr>
</thead>
<tbody>
<tr>
<td>Periodic heartbeat batch</td>
<td>100</td>
<td>550</td>
<td>200 ms</td>
<td>200 ms</td>
</tr>
<tr>
<td>Retransmission heartbeat batch</td>
<td>100</td>
<td>550</td>
<td>200 ms</td>
<td>100 ms</td>
</tr>
</tbody>
</table>

- If more than 10% of peers (12800 peers) are not responding, then the detection of path failure of nodes is delayed. This delay is to avoid a huge impact on performance when such a condition occurs.

If retransmissions start occurring for more than the batch size expected based on the calculations, then the heartbeat messages follow the periodic timer for sending heartbeat messages. For example, if the configuration of the heartbeat interval is 60 seconds, retransmission timeout is 3 seconds, and maximum retries is 3.

Now if the number of heartbeat messages for retransmissions exceed the expected batch size, then instead of a retransmission occurring every 3 seconds, retransmissions of heartbeat messages start with interval of 60 seconds. Therefore, under normal condition if a peer path failure was detected at a maximum of 9 seconds (3*3), it is now detected at 180 seconds (60*3).
• Minimum heartbeat interval must be 60 seconds.

If 128000 peers are configured for monitoring heartbeat, then heartbeat interval must not be configured for less than 60 seconds. If the heartbeat interval is configured for less than 60 seconds, then a configuration error is displayed.

• Minimum heartbeat retransmission timeout should be three seconds.

If 128000 peers are configured for monitoring heartbeat, then heartbeat retransmission timeout must not be configured for less than three seconds. If the heartbeat interval is configured for less than 60 seconds, then a configuration error is displayed.

• The CLI is configured at the service level but the list is maintained at the instance level. Therefore, it is recommended that all services have the same configuration.

If services have different configuration, then the limitation is based on that service level configuration. However, the maximum number of peers is determined based on how many peers are already there in that instance.

For example, consider two services: lma1 and lma2. lma1 has the monitor-max-peers configured as 128000 peers. lma2 has monitor-max-peers configured as 256 peers. Now if the call comes from lma1, it checks the max peers limitation of 128000 peers. If the call comes from lma2, it checks max peers limitations of 256. However, for lma2 it may include all 256 peers that are being monitored in lma1.

Note

This feature is customer-specific. For more information, contact your Cisco account representative.

Configuring the Increase in Number of PMIP Sessions Supported with the Heartbeat Mechanism Feature

The following section provides the configuration commands to enable or disable the feature.

**heartbeat monitor-max-peers**

This new CLI command supports monitoring of a maximum of 128000 PMIP sessions through the heartbeat mechanism. This CLI is added under the LMA Service Configuration mode.

To configure monitoring of a maximum number of PMIP sessions, enter the following commands:

```
context context_name
configure lma-service service_name
[ default ] heartbeat monitor-max-peers
end
```

Notes

• **default**: Monitors 256 peers through the heartbeat mechanism. This CLI is disabled by default.

• **heartbeat monitor-max-peers**: Monitors a maximum of 128000 peers through the heartbeat mechanism.
Monitoring and Troubleshooting

This section provides information regarding show commands and/or their outputs in support of this feature.

Show Commands and/or Outputs

The output of the following CLI command has been enhanced in support of the feature.

show lma-service all

The following show lma-service all CLI command now includes the configured heartbeat monitor max peers value.

On configuring the new CLI – heartbeat monitor-max-peers:

```
show lma-service all
Heartbeat Support:   Enabled
Heartbeat Interval:  60
Heartbeat Retransmission timeout:  1
Heartbeat Max Retransmissions:  1
Heartbeat Monitor Max Peers:  128000
```

On configuring the default CLI – default heartbeat monitor-max-peers

```
show lma-service all
Heartbeat Support:   Enabled
Heartbeat Interval:  60
Heartbeat Retransmission timeout:  1
Heartbeat Max Retransmissions:  1
Heartbeat Monitor Max Peers:  256
```

Restrictions:

• A maximum of 128000 PMIP sessions can be monitored with the new CLI.

• The following CLI restrictions are added for configuring heartbeat monitor-max-peers CLI command.

At service startup time (boxer configuration boot):

If heartbeat interval is less than 60 seconds (for the Lma-service) or retransmission timeout is less than 3 seconds (across Lma-servicess) then the monitor-max-peers command displays a configuration error and the monitor-max-peers configuration is not applied and vice-versa.

At the time of updating the Service configuration:

• While configuring the heartbeat interval of less than 60 seconds if the monitor-max-peers is already configured in that Lma-service or across Lma-services then it displays a configuration error.

• While configuring a heartbeat retransmission timeout of less than 3 seconds if the monitor-max-peers is already configured in that Lma-service or across Lma-services then it displays a configuration error.

• While configuring monitor-max-peers if that Lma-service or across Lma-services has a heartbeat interval of less than 60 seconds or the heartbeat retransmission timeout is less than 3 seconds, then it displays a configuration error.

CLI error displayed:
configure
context pgw
lma-service lma-v6
heartbeat interval 40
heartbeat monitor-max-peers
Failure: Recommended heartbeat interval: 60+, retransmission timeout: 3+, to configure monitor-max-peers. Please retry.
heartbeat retransmission timeout 2
heartbeat monitor-max-peers
Failure: Recommended heartbeat interval: 60+, retransmission timeout: 3+, to configure monitor-max-peers. Please retry.
end

configure
context pgw
lma-service lma-v6
heartbeat interval 60
heartbeat retransmission timeout 3
heartbeat monitor-max-peers
heartbeat interval 40
Failure: Recommended heartbeat interval: 60+, in presence of monitor-max-peers. Please retry.
heartbeat retransmission timeout 2
Failure: Recommended heartbeat retransmission timeout: 3+, in presence of monitor-max-peers. Please retry.
end

• Unusual logs are displayed as follows when there is more than 10% path failure and there is a delay in the detection of path failure.

  “Retransmissions list size exceeds than expected, hb message will be sent with periodicity of configured HB interval for callid 20016”
Increase in Monitoring of Peers Supported Through Heartbeat Mechanism for PMIP Sessions

```bash
show lma-service all
```

Feature Description

Inline TCP Optimization is an integrated solution to service providers to increase the TCP flow throughput for TCP connections. This solution enables faster transmission of data for a better user experience.

The Inline TCP Optimization solution ensures accelerated TCP flows using a proprietary algorithm that provides efficient and optimal throughput at a given time. A TCP proxy has been integrated with this solution to monitor and control the TCP congestion window for optimal throughput.

The Inline TCP Optimization solution also supports split TCP sessions to accommodate wireless requirements and provides feature parity with other existing inline services.

Note

Optimization only applies to the downlink data on the Gn interface.

The Inline TCP Optimization feature is license controlled. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

How It Works

The TCP Optimization feature includes the following functionalities:

- TCP Connection Splicing: The TCP connections are split into two connections; one connection towards Gn and the other connection towards Gi, inside P-GW. The connections are split in a transparent manner in the P-GW so that the UE and the Gi servers are transparent to the connection being split.

- TCP Proxy ensures seamless movement of data across these two TCP split connections.

- TCP Optimization is deployed on the Gn interface (towards the UE) of the TCP stack. A user-space TCP stack in P-GW is used.

- Cisco library for TCP optimization:
• Provides algorithms that are designed to increase the TCP throughput.
• Interfaces with the User-space TCP stack (Gn interface) and notifies appropriate events that occur in the TCP connection and takes actions accordingly.
• Provides APIs to integrate the Cisco Library (for TCP optimization) and StarOS.

TCP Acceleration is enabled during the start of the TCP flow (when SYN packet is received). It cannot be disabled later during the flow.

Configuring Inline TCP Optimization

Enabling TCP Acceleration under Active Charging Service

Use the following configuration to enable TCP acceleration:

```plaintext
configure
require active-charging
active-charging service service_name
tcp-acceleration
end
```

NOTES:
• `tcp-acceleration`: Enables TCP acceleration under the ACS Configuration mode.

Enabling TCP Acceleration under Trigger Action

Use the following configuration to enable TCP acceleration:

```plaintext
configure
require active-charging
active-charging service service_name
trigger-action trigger_action_name
tcp-acceleration profile profile_name
end
```

NOTES:
• `tcp-acceleration`: Enables TCP acceleration under the ACS Trigger Action Configuration mode.
• `profile`: Identifies the TCP acceleration profile. The `profile_name` is a string ranging from 1 to 63 characters.

Configuring a TCP Acceleration Profile

Use the following configuration to configure a TCP Acceleration Profile:
configure
  require active-charging
  active-charging service service_name
      [ no ] tcp-acceleration-profile profile_name
end

NOTES:

- **tcp-acceleration-profile**: Configures the TCP Acceleration feature profile for inline TCP optimization.
- **no**: Disables the TCP Acceleration profile.

## Configuring TCP Acceleration Profile Parameters

Use the following commands to configure the TCP acceleration profile parameters:

```plaintext
configure
  require active-charging
  active-charging service service_name
      [ no ] tcp-acceleration-profile profile_name
        aclflags flag_value
        default aclflags
        buffer-size { [ downlink [ 128KB | 256KB | 512KB | 1024KB | 1536KB | 2048KB | 2560KB | 3072KB | 3584KB | 4096KB ] ] | [ uplink [ 128KB | 256KB | 512KB | 1024KB | 1536KB | 2048KB | 2560KB | 3072KB | 3584KB | 4096KB ] ] }
        cwnd-gain { dynamic { off | on } [ factor factor_value ] | factor factor_value | dynamic { off | on } } }
        default cwnd-gain
        default buffer-size [ downlink | uplink ]
        initial-cwnd-size window_size
        default initial-cwnd-size
        max-rtt max_rtt_value
        default max-rtt
        mss mss_value
        default mss
end

NOTES:

- **default**: Assigns or restores default values to its following commands.
- **aclflags**: Configures TCP acceleration related optimization flags. The flag_value is an integer ranging from 0 to 65535.
- **buffer-size**: Configures the TCP Proxy buffer size for downlink and uplink data in Kilobytes.
• **cwnd-gain**: Configures the TCP congestion window gain. This command is used by the TCP optimization engine to continuously calculate the actual congestion window size. Scaling the window size allows the TCP optimization engine to manage the in-flight of data in the engine.

  • The `dynamic` option in this command automatically scales-up the congestion window gain to ensure that it is sized correctly to allow for RTT variation during the flow.

  • The `factor` option configures the TCP congestion window gain factor. The `factor_value` is an integer ranging from 1 to 16378.

  **Note**: This command is supported from 21.9.1 and later releases

• **initial-cwnd-size**: Configures the initial congestion window size in segments. The `window_size` is an integer ranging from 1 to 65535.

• **max-rtt**: Configures the maximum RTT value in milliseconds. The `max_rtt_value` is an integer ranging from 1 to 10000.

• **mss**: Configures the maximum segment size for TCP in Bytes. The `mss_value` is an integer ranging from 496 to 65535.

### Configuring Post-Processing Rule Name under Trigger Condition

Use the following commands to configure the post-processing rule names:

```
configure
  require active-charging
  active-charging service service_name
  trigger-condition trigger_condition_name
    post-processing-rule-name { = | contains | ends-with | starts-with }
      rule_name
[ no ] post-processing-rule-name rule_name
end
```

**NOTES:**

• **post-processing-rule-name**: Sets condition for a particular post-processing rule. The following operators specify how the rules are matched:

  • `=`: Equals

  • `!=`: Not Equals

  • `contains`: Contains

  • `ends-with`: Ends with.

  • `starts-with`: Starts with

  • `name`: Specifies the name of the post-processing rule.
Configuring TCP Acceleration Related EDR Attributes

Use the following configuration to configure the EDR attributes:

```
configure
  require active-charging
  active-charging service service_name
  edr-format edr_format_name
    rule-variable tcp [ sn-tcp-accl | sn-tcp-accl-reject-reason | sn-tcp-min-rtt | sn-tcp-rtt ] priority priority_value
end
```

NOTES:

- **rule variable**: Assigns a rule variable attributes for EDR or UDR.
- **tcp**: Specifies Transmission Control Protocol (TCP) related fields.
  - **sn-tcp-accl**: Specifies the TCP Acceleration status for the TCP flow.
    - **0**: TCP Acceleration is not enabled on the flow.
    - **1**: TCP Acceleration is enabled on the flow.
    - **2**: Flow is eligible and attempted, but not TCP Accelerated.
    - **3**: Flow is eligible, but not attempted for TCP Acceleration
  - **sn-tcp-accl-reject-reason**: Specifies reason for not accelerating the TCP flow.
  - **sn-tcp-min-rtt**: Specifies min RTT observed for accelerated TCP flow.
  - **sn-tcp-rtt**: Specifies smoothed RTT for accelerated TCP flow.
- **priority**: Specifies the CSV position of the field (protocol rule) in the EDR. Priority must be an integer from 1 through 65535.

Monitoring and Troubleshooting

This section provides information regarding monitoring and troubleshooting the feature.

Show Command(s) and/or Outputs

This section provides information regarding show commands and/or their outputs in support of this feature.

```
show configuration
```

The output of this command displays the following fields for this feature:

- tcp-acceleration
- tcp-accelration profile tap
- buffer-size downlink size uplink size
• initial-cwnd-size
• max-rtt
• mss

show tcp-acceleration-profile { [ all ] | [ name profile-name ] }

The output of this command displays the following fields for this feature:

• TCP Acceleration Profile Name
  • Initial Congestion Window
  • Max RTT
  • MSS
  • Buffer Size (Downlink)
  • Buffer Size (Uplink)
  • Cwnd Gain Factor
  • Cwnd Gain Dynamic
  • Accl Flags

• Total tcp-acceleration-profile found

show active-charging tcp-acceleration info

The output of this command displays the following fields for this feature:

• TCP Acceleration Library Information
  • Version

show active-charging tcp-acceleration statistics sessmgr all

The output of this command displays the following fields for this feature:

• TCP acceleration Statistics
  • Total Accelerated Flows
  • Current Accelerated Flows
  • Released Accelerated Flows
  • Rejected Accelerated Flows
    • Feature Not Supported
    • RAT Type Not Supported
    • Bearer Not Supported
    • Resource Not Available (Memory)
show active-charging flows full all

The output of this command displays the following fields for this feature:

- TCP Acceleration

show active-charging trigger-action name trigger_action_name

On executing the above command, the following new field(s) are displayed for this feature:

- TCP Acceleration

show active-charging trigger-condition name name

The output of this command displays the following fields for this feature:

- Post-Processing Rule-name/GOR
CHAPTER 35

IP Network Enabler

This chapter describes the StarOS IP Network Enabler (IPNE) feature. It describes how the feature works, and how to configure and monitor IPNE.

• Feature Description, on page 729
• How it Works, on page 730
• Configuring the IPNE Feature, on page 736
• Monitoring the IPNE Service, on page 737

Feature Description

This section provides a description of the IPNE feature.

IPNE (IP Network Enabler) is a MINE client component running on various network nodes within operator's network (P-GW, GGSN, HA, or HNBGW), to collect and distribute session/network information to MINE servers. The MINE cloud service provides a central portal for wireless operators and partners to share and exchange session and network information to realize intelligent services.

The information is shared between the MINE server and IPNE service in the form of XML data. The core object in the IPNE service is the XMPP protocol engine. There is one XMPP protocol engine instance for each configured MINE server peer. The engine implements the XMPP protocol using FSM.

All information that is shared is derived from the context at that instance in time. An IPNE service level scheduler is also implemented to rate-control the feed and notification activities on all the handles to avoid overload which would affect call processing and data path performance.

Relationships to Other Features

This section describes how the IPNE service is related to other features.

One of the following GW services must be configured on the StarOS before IPNE can be configured:

• GGSN
• HA
• HNBGW
• P-GW

Refer to the GGSN Administration Guide, the HA Administration Guide, the HNBGW Administration Guide and the P-GW Administration Guide for configuration procedures.
The MINE cloud service provides a central portal for wireless operators and partners to share and exchange session/network information to realize intelligent services. A MINE client component is running on various network nodes within operator’s network, e.g. PGW, HA, to collect and distribute session/network information to MINE servers. The client is IPNE.

The IPNE client runs on the StarOS as a configurable service. The Enhanced Charging Service (ECS) component interacts with the IPNE client in order to fulfill the defined requirements.

For best IPNE performance, the ECS component should provide the following functionality:

- Flow information parameters should be provided by ECS to IPNE:
  - Tuple information
  - URL
  - User Agent
  - Application protocol
  - Flow creation time

- NBR information parameters should be provided by ECS to IPNE:
  - NAT-IP address
  - Start Port
  - End Port

ECS should provide the above parameters for all active flows in a response corresponding to the query from the MINE server indexed on the subscriber’s call id.

For the subscription that is installed by the IPNE client on a subscriber’s call id, ECS should send a notification message to the IPNE client whenever a subscribed trigger is detected.

How it Works

IPNE

The following diagram describes the architecture for the IPNE interface. The session manager and IPNE will interact via the SINE interface. The information will be exchanged between the modules in the form of clp handles. For each session one IPNE handle is created. The information is stored in a local database on the IPNE client side.
The interaction takes place at the time of:

- Session setup so as to add the session information at the IPNE side
- To pass the feed messages to the MINE server
- While responding to the query request sent by the MINE server.
- Subscription notification from IPNE client to MINE server

The MINE server and IPNE client interact with each other for all procedures using the XMPP protocol over the SINE interface. The information stored at the IPNE client side is converted to XML format and then passed on to the MINE server. Upon receiving the messages (query requests) from the MINE server, IPNE decodes it and sends the corresponding clp handle to the session manager. The information that is shared is a snapshot of the session/flow/nbr context at that instance in time.

**Architecture**

The MINE IPNE client is implemented as a configurable service on P-GW, HA, GGSN or HNBGW services as illustrated below.
Limitations

Note the following limitations for the IPNE feature:

- The IPNE service implements a flow control mechanism over the XMPP interface. As a result, any messaging over this interface which exceeds the set queue thresholds would be discarded.

Flows

This section provides call flow diagrams for IPNE Query, Subscription, Feed, Addition and Deletion scenarios. Some flow diagrams use the P-GW as an example, but they also apply to GGSN, HA, and HNBGW as well.
**Figure 72: IPNE Handling of Query from MINE Server**

</tbody>
</table>
Standards Compliance

The StarOS IPNE feature complies with the following standards:

- RFC 6120; Extensible Messaging and Presence Protocol (XMPP): Core, Section 4.7 (Stream attributes)

Configuring the IPNE Feature

This section describes how to configure the IPNE feature and how to verify the configuration.

Configuring IPNE

This section describes how to configure the IPNE feature.

Configuring IPNE includes configuring the IPNE service, and then associating the IPNE service with the GGSN, HA, HNBGW or P-GW service.

Use the following example configuration to create the IPNE service.

```
config
  context context_name
  ipne ipne_service_name
  ipne-endpoint
    bind [ ipv4 ipv4_address | ipv6 ipv6_address ]
    peer [ ipv4 | ipv6 ] protocol tcp
  end
```

Notes:

- Both the `bind` and `peer` keywords support IPv4 and IPv6 addressing.
- `tcp` is the default transport protocol. SCTP is not supported at this time.
- The default XMPP protocol port is 5222.
- The `fqdn`, `priority` and `weight` keywords are not supported at this time.

HNBGW only. Usually, notify messages are sent only on subscription. However, an exception has been made for HNBGW UE Registration/Deregistration. HNBGW UE Registration/Deregistration will always be notified without any subscription. To control the sending of such unsolicited notification, enter the following command:

```
configure
  context ipne_service_name
    unsolicited-notify-trigger hnb-ue
  end
```

Notes

- If `unsolicited-notify-trigger hnb-ue` is configured, the IPNE service sends notifications for UE Register/De-register requests on receiving the requests from the HNBGW.
- If no `unsolicited-notify-trigger hnb-ue` is configured, the IPNE will not send UE Register/De-register notifications. This is the default setting.

Once the IPNE service has been created, it must be associated with the configured GGSN, HA, P-GW or HNBGW service. Use the following example to associate the IPNE service with the configured gateways service.
configure
c   context  gw_context_name
associate ipne-service  ipne_service_name
end

Notes:
• context gw_context_name is the name of the configured GGSN, HA, P-GW or HNBGW service name configured on the StarOS
• To remove the association between the IPNE service and the gateway service, use the no associate ipne-service command.

Verifying the IPNE Configuration
This section describes how to verify the IPNE configuration
From exec mode issue the following command to verify the IPNE configuration:
show ipne peers all
The output of this command provides the following information for each IPNE service instance:
  • IPNE Service Name
  • Context ID
  • Peer IP address
  • State of the TCP connections to the peer.

Monitoring the IPNE Service
This section describes how to monitor the StarOS IPNE feature.

IPNE Show Commands
This section provides information regarding show commands and/or their outputs in support of the StarOS IPNE feature.
The show commands in this section are available in support of the the StarOS IPNE feature.

show ipne peers all
This command provides a list of peers of each IPNE service and the state of the TCP connections.

show ipne statistics all
This command shows the total number of handles for each IPNE service and counter totals for queries, responses, subscriptions and feeds.

show active-charging subscribers full all
This command shows if the MINE server has currently subscribed notifications for this ACS session or not (IPNE enabled or disabled). It also indicates the number of notifications sent to the MINE server for this
ACS session. Historical notification counts across all current and deleted flows are stored. If the MINE server has not been subscribed for notifications, this field reads n/a.
L2TP Access Concentrator

This chapter describes the Layer 2 Tunneling Protocol (L2TP) Access Concentrator (LAC) functionality support on Cisco® ASR 5500 chassis and explains how it is configured.

The product Administration Guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in the respective product Administration Guide, before using the procedures in this chapter.

Important

The L2TP Access Concentrator is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

When enabled though the session license and feature use key, the system supports L2TP for encapsulation of data packets between it and one or more L2TP Network Server (LNS) nodes. In the system, this optional packet encapsulation, or tunneling, is performed by configuring L2TP Access Concentrator (LAC) services within contexts.

Important

While establishing the L2TP session from LAC to LNS, the PPP connection for the user is established. The server uses CHAP authentication protocol to authenticate the connection. While calculating the CHAP response for the CHAP challenge received by the server, the server does not consider the CHAP password.

Important

The LAC service uses UDP ports 13660 through 13668 as the source port for sending packets to the LNS.

This chapter contains the following topics:

- Applicable Products and Relevant Sections, on page 740
- Supported LAC Service Configurations for PDSN Simple IP, on page 741
- Supported LAC Service Configurations for the GGSN and P-GW, on page 746
- Supported LAC Service Configuration for Mobile IP, on page 752
- Configuring Subscriber Profiles for L2TP Support, on page 755
- Configuring LAC Services, on page 759
## Applicable Products and Relevant Sections

The LAC feature is supported for various products. The following table indicates the products on which the feature is supported and the relevant sections within the chapter that pertain to that product.

**Supported LAC Service Configurations for PDSN Simple IP**

LAC services can be applied to incoming PPP sessions using one of the following methods:

- **Attribute-based tunneling**: This method is used to encapsulate PPP packets for only specific users, identified during authentication. In this method, the LAC service parameters and allowed LNS nodes that may be communicated with are controlled by the user profile for the particular subscriber. The user profile can be configured locally on the system or remotely on a RADIUS server.

- **PDSN Service-based compulsory tunneling**: This method of tunneling is used to encapsulate all incoming PPP traffic from the R-P interface coming into a PDSN service, and tunnel it to an LNS peer for authentication. It should be noted that this method does not consider subscriber configurations, since all authentication is performed by the peer LNS.

Each LAC service is bound to a single system interface configured within the same system context. It is recommended that this context be a destination context as displayed in the following figure.
Attribute-based Tunneling

This section describes the working of attribute-based tunneling and its configuration.

How The Attribute-based L2TP Configuration Works

The following figure and the text that follows describe how Attribute-based tunneling is performed using the system.
1. A subscriber session from the PCF is received by the PDSN service over the R-P interface.
2. The PDSN service attempts to authenticate the subscriber. The subscriber could be configured either locally or remotely on a RADIUS server. Figure above shows subscriber authentication using a RADIUS AAA server.
3. The RADIUS server returns an Access-Accept message, which includes attributes indicating that session data is to be tunneled using L2TP, and the name and location of the LAC service to use. An attribute could also be provided indicating the LNS peer to connect to.
4. The PDSN service receives the information and then forwards the packets to the LAC service, configured within the Destination context.
5. The LAC service, upon receiving the packets, encapsulates the information and forwards it to the appropriate PDN interface for delivery to the LNS.
6. The encapsulated packets are sent to the peer LNS through the packet data network where they will be un-encapsulated.

**Configuring Attribute-based L2TP Support for PDSN Simple IP**

This section provides a list of the steps required to configure attribute-based L2TP support for use with PDSN Simple IP applications. Each step listed refers to a different section containing the specific instructions for completing the required procedure.
These instructions assume that the system was previously configured to support subscriber data sessions as a PDSN.

Important

Step 1 Configure the subscriber profiles according to the information and instructions located in the Configuring Subscriber Profiles for L2TP Support section of this chapter.

Step 2 Configure one or more LAC services according to the information and instructions located in the Configuring LAC Services section of this chapter.

Step 3 Configure the PDSN service(s) with the tunnel context location according to the instructions located in the Modifying PDSN Services for L2TP Support section of this chapter.

Step 4 Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

PDSN Service-based Compulsory Tunneling

This section describes the working of service-based compulsory tunneling and its configuration.

How PDSN Service-based Compulsory Tunneling Works

PDSN Service-based compulsory tunneling enables wireless operators to send all PPP traffic to remote LNS peers over an L2TP tunnel for authentication. This means that no PPP authentication is performed by the system.

Accounting start and interim accounting records are still sent to the local RADIUS server configured in the system's AAA Service configuration. When the L2TP session setup is complete, the system starts its call counters and signals the RADIUS server to begin accounting. The subscriber name for accounting records is based on the NAI-constructed name created for each session.

PDSN service-based compulsory tunneling requires the modification of one or more PDSN services and the configuration of one or more LAC services.

The following figure and the text that follows describe how PDSN service-based compulsory tunneling is performed using the system.
1. A subscriber session from the PCF is received by the PDSN service over the R-P interface.

2. The PDSN service detects its **tunnel-type** parameter is configured to L2TP and its **tunnel-context** parameter is configured to the Destination context.

3. The PDSN forwards all packets for the session to a LAC service configured in the Destination context. If multiple LAC services are configured, session traffic will be routed to each using a round-robin algorithm.

4. The LAC service initiates an L2TP tunnel to one of the LNS peers listed as part of its configuration.

5. Session packets are passed to the LNS over a packet data network for authentication.

6. The LNS authenticates the session and returns an Access-Accept to the PDSN.

7. The PDSN service initiates accounting for the session using a constructed NAI. Session data traffic is passed over the L2TP tunnel established in step 4.
Configuring L2TP Compulsory Tunneling Support for PDSN Simple IP

This section provides a list of the steps required to configure L2TP compulsory tunneling support for use with PDSN Simple IP applications. Each step listed refers to a different section containing the specific instructions for completing the required procedure.

**Important** These instructions assume that the system was previously configured to support subscriber data sessions as a PDSN.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configure one or more LAC services according to the information and instructions located in the Configuring LAC Services section of this chapter.</td>
</tr>
<tr>

</tr>
</tbody>
</table>

**Supported LAC Service Configurations for the GGSN and P-GW**

As mentioned previously, L2TP is supported through the configuration of LAC services on the system. Each LAC service is bound to a single system interface configured within the same system destination context as displayed in following figure.
LAC services are applied to incoming subscriber PDP contexts based on the configuration of attributes either in the GGSN's Access Point Name (APN) templates or in the subscriber's profile. Subscriber profiles can be configured locally on the system or remotely on a RADIUS server.

LAC service also supports domain-based L2TP tunneling with LNS. This method is used to create multiple tunnels between LAC and LNS on the basis of values received in "Tunnel-Client-Auth-ID" or "Tunnel-Server-Auth-ID" attribute received from AAA Server in Access-Accept as a key for tunnel selection and creation. When the LAC needs to establish a new L2TP session, it first checks if there is any existing L2TP tunnel with the peer LNS based on the value of key "Tunnel-Client-Auth-ID" or "Tunnel-Server-Auth-ID" attribute. If no such tunnel exists for the key, it will create a new Tunnel with the LNS.

If LAC service needs to establish a new tunnel for new L2TP session with LNS and the tunnel creation request fails because maximum tunnel creation limit is reached, LAC will try other LNS addresses received from AAA server in Access-Accept message. If all available peer-LNS are exhausted, LAC service will reject the call.

L2TP tunnel parameters are configured within the APN template and are applied to all subscribers accessing the APN. However, L2TP operation will differ depending on the subscriber's PDP context type as described below:

- **Transparent IP**: The APN template's L2TP parameter settings will be applied to the session.
- **Non-transparent IP**: Since authentication is required, L2TP parameter attributes in the subscriber profile (if configured) will take precedence over the settings in the APN template.
• **PPP**: The APN template's L2TP parameter settings will be applied and all of the subscriber's PPP packets will be forwarded to the specified LNS.

More detailed information is located in the sections that follow.

**Transparent IP PDP Context Processing with L2TP Support**

The following figure and the text that follows describe how transparent IP PDP contexts are processed when L2TP tunneling is enabled.

*Figure 81: Transparent IP PDP Context Call Processing with L2TP Tunneling*

1. A Create PDP Context Request message for a subscriber session is sent from the SGSN to the GGSN service over the Gn interface. The message contains information such as the PDP Type, APN, and charging characteristics.

2. The GGSN determines whether or not it is configured with an APN identical to the one specified in the message. If so, it determines how to process the session based on the configuration of the APN.

The APN configuration indicates such things as the IP address of the LNS, the system destination context in which a LAC service is configured, and the outbound username and password that will be used by the LNS to authenticate incoming sessions. If no outbound information is configured, the subscriber's International Mobile Subscriber Identity (IMSI) is used as the username at the peer LNS.
1. The GGSN returns an affirmative Create PDP Context Response to the SGSN over the Gn interface.
2. The GGSN passes data received from the MS to a LAC service.
3. The LAC service encapsulates the IP packets and forwards it to the appropriate Gi interface for delivery to the LNS.
4. The LNS un-encapsulates the packets and processes them as needed. The processing includes IP address allocation.

Non-transparent IP PDP Context Processing with L2TP Support

The following figure and the text that follows describe how non-transparent IP PDP contexts are processed when L2TP tunneling is enabled.

Figure 82: Non-transparent IP PDP Context Call Processing with L2TP Tunneling

1. A Create PDP Context Request message for a subscriber session is sent from the SGSN to the GGSN service over the Gn interface. The message contains information such as the PDP Type, APN, and charging characteristics.
2. The GGSN determines whether or not it is configured with an APN identical to the one specified in the message. If so, it determines how to process the session based on the configuration of the APN.

The APN configuration indicates such things as the IP address of the LNS, the system destination context in which a LAC service is configured, and the outbound username and password that will be used by the LNS to authenticate incoming sessions. If no outbound information is configured, the subscriber's username is sent to the peer LNS.

3. The GGSN service authenticates the subscriber. The subscriber could be configured either locally or remotely on a RADIUS server. Figure above shows subscriber authentication using a RADIUS AAA server.

As part of the authentication, the RADIUS server returns an Access-Accept message. The message may include attributes indicating that session data is to be tunneled using L2TP, and the name and location of the LAC service to use. An attribute could also be provided indicating the LNS peer to connect to.

If these attributes are supplied, they take precedence over those specified in the APN template.

4. The GGSN returns an affirmative Create PDP Context Response to the SGSN over the Gn interface.

5. The GGSN passes data received from the MS to a LAC service.

6. The LAC service encapsulates the IP packets and forwards it to the appropriate Gi interface for delivery to the LNS.

7. The LNS un-encapsulates the packets and processes them as needed. The processing includes authentication and IP address allocation.

**PPP PDP Context Processing with L2TP Support**

The following figure and the text that follows describe how non-transparent IP PDP contexts are processed when L2TP tunneling is enabled.
1. A Create PDP Context Request message for a subscriber session is sent from the SGSN to the GGSN service over the Gn interface. The message contains information such as the PDP Type, APN, and charging characteristics.

2. The GGSN determines whether or not it is configured with an APN identical to the one specified in the message. If so, it determines how to process the session based on the configuration of the APN. The APN configuration indicates such things as the IP address of the LNS, the system destination context in which a LAC service is configured.

Note that L2TP support could also be configured in the subscriber’s profile. If the APN is not configured for L2TP tunneling, the system will attempt to authenticate the subscriber. The tunneling parameters in the subscriber’s profile would then be used to determine the peer LNS.

3. The GGSN returns an affirmative Create PDP Context Response to the SGSN over the Gn interface.

4. The GGSN passes the PPP packets received from the MS to a LAC service.

5. The LAC service encapsulates the PPP packets and forwards it to the appropriate Gi interface for delivery to the LNS.

6. The LNS un-encapsulates the packets and processes them as needed. The processing includes PPP termination, authentication (using the username/password provided by the subscriber), and IP address allocation.
Configuring the GGSN or P-GW to Support L2TP

This section provides a list of the steps required to configure the GGSN or P-GW to support L2TP. Each step listed refers to a different section containing the specific instructions for completing the required procedure.

**Important**
These instructions assume that the system was previously configured to support subscriber data sessions as a GGSN or P-GW.

**Step 1** Configure the APN template to support L2TP tunneling according to the information and instructions located in the **Modifying APN Templates to Support L2TP** section of this chapter.

**Important** L2TP tunneling can be configured within individual subscriber profiles as opposed/or in addition to configuring support with an APN template. Subscriber profile configuration is described in the **Configuring Subscriber Profiles for L2TP Support** section of this chapter.

**Step 2** Configure one or more LAC services according to the information and instructions located in the **Configuring LAC Services** section of this chapter.

**Step 3** Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command **save configuration**. For additional information on how to verify and save configuration files, refer to the **System Administration Guide** and the **Command Line Interface Reference**.

**Supported LAC Service Configuration for Mobile IP**

LAC services can be applied to incoming MIP sessions using attribute-based tunneling. Attribute-based tunneling is used to encapsulate PPP packets for specific users, identified during authentication. In this method, the LAC service parameters and allowed LNS nodes that may be communicated with are controlled by the user profile for the particular subscriber. The user profile can be configured locally on the system or remotely on a RADIUS server.

Each LAC service is bound to a single system interface within the same system context. It is recommended that this context be a destination context as displayed in figure below.
How The Attribute-based L2TP Configuration for MIP Works

The following figure and the text that follows describe how Attribute-based tunneling for MIP is performed using the system.
1. A subscriber session from the FA is received by the HA service over the Pi interface.
2. The HA service attempts to authenticate the subscriber. The subscriber could be configured either locally or remotely on a RADIUS server. Figure above shows subscriber authentication using a RADIUS AAA server.
3. The RADIUS server returns an Access-Accept message, which includes attributes indicating that session data is to be tunneled using L2TP, and the name and location of the LAC service to use. An attribute could also be provided indicating the LNS peer to connect to.
4. The HA service receives the information and then forwards the packets to the LAC service, configured within the Destination context.
5. The LAC service, upon receiving the packets, encapsulates the information and forwards it to the appropriate PDN interface for delivery to the LNS.
6. The encapsulated packets are sent to the peer LNS through the packet data network where they will be un-encapsulated.

**Configuring Attribute-based L2TP Support for HA Mobile IP**

This section provides a list of the steps required to configure attribute-based L2TP support for use with HA Mobile IP applications. Each step listed refers to a different section containing the specific instructions for completing the required procedure.
These instructions assume that the system was previously configured to support subscriber data sessions as an HA.

---

**Important**

*Step 1* Configure the subscriber profiles according to the information and instructions located in the *Configuring Subscriber Profiles for L2TP Support* section of this chapter.

*Step 2* Configure one or more LAC services according to the information and instructions located in the *Configuring LAC Services* section of this chapter.

*Step 3* Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

---

### Configuring Subscriber Profiles for L2TP Support

This section provides information and instructions on the following procedures:

- RADIUS and Subscriber Profile Attributes Used, on page 755
- Configuring Local Subscriber Profiles for L2TP Support, on page 757
- Configuring Local Subscriber, on page 758
- Verifying the L2TP Configuration, on page 758

---

**Important**

Since the instructions for configuring subscribers differ between RADIUS server applications, this section only provides the individual attributes that can be added to the subscriber profile. Refer to the documentation that shipped with your RADIUS server for instructions on configuring subscribers.

### RADIUS and Subscriber Profile Attributes Used

Attribute-based L2TP tunneling is supported through the use of attributes configured in subscriber profiles stored either locally on the system or remotely on a RADIUS server. The following table describes the attributes used in support of LAC services. These attributes are contained in the standard and VSA dictionaries.

**Table 66: Subscriber Attributes for L2TP Support**

<table>
<thead>
<tr>
<th>RADIUS Attribute</th>
<th>Local Subscriber Attribute</th>
<th>Description</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tunnel-Type</td>
<td>tunnel l2tp</td>
<td>Specifies the type of tunnel to be used for the subscriber session</td>
<td>L2TP</td>
</tr>
<tr>
<td>Tunnel-Server-Endpoint</td>
<td>tunnel l2tp peer-address</td>
<td>Specifies the IP address of the peer LNS to connect tunnel to.</td>
<td>IPv4 address in dotted-decimal format, enclosed in quotation marks</td>
</tr>
<tr>
<td>RADIUS Attribute</td>
<td>Local Subscriber Attribute</td>
<td>Description</td>
<td>Variable</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>--------------------------------</td>
</tr>
<tr>
<td>Tunnel-Password</td>
<td>tunnel l2tp secret</td>
<td>Specifies the shared secret between the LAC and LNS.</td>
<td>Alpha and or numeric string from 1 to 63 characters, enclosed in quotation marks</td>
</tr>
<tr>
<td>Tunnel-Private-Group-ID</td>
<td>tunnel l2tp tunnel-context</td>
<td>Specifies the name of the destination context configured on the system in which the LAC service(s) to be used are located.</td>
<td>Alpha and or numeric string from 1 to 63 characters, enclosed in quotation marks</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Important</strong> If the LAC service and egress interface are configured in the same context as the core service or HA service, this attribute is not needed.</td>
<td></td>
</tr>
<tr>
<td>Tunnel-Preference</td>
<td>tunnel l2tp preference</td>
<td>Configures the priority of each peer LNS when multiple LNS nodes are configured.</td>
<td>Integer from 1 to 65535</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Important</strong> This attribute is only used when the <code>loadbalance-tunnel-peers</code> parameter or <code>SN-Tunnel-Load-Balancing</code> attribute configured to prioritized.</td>
<td></td>
</tr>
<tr>
<td>RADIUS Attribute</td>
<td>Local Subscriber Attribute</td>
<td>Description</td>
<td>Variable</td>

<tr>
<td>----------------------------------</td>
<td>----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------</td>
</tr>
</tbody>
</table>
| SN-Tunnel-Load-Balancing         | loadbalance-tunnel-peer    | A vendor-specific attribute (VSA) used to provides a selection algorithm defining how an LNS node is selected by the RADIUS server when multiple LNS peers are configured within the subscriber profile. | • Random - Random LNS selection order, the Tunnel-Preference attribute is not used in determining which LNS to select.  
• Balanced - LNS selection is sequential balancing the load across all configured LNS nodes, the Tunnel-Preference attribute is not used in determining which LNS to select.  
• Prioritized - LNS selection is made based on the priority assigned in the Tunnel-Preference attribute. |
| Client-Endpoint                  | local-address              | Specifies the IP address of a specific LAC service configured on the system that to use to facilitate the subscriber's L2TP session.  
  This attribute is used when multiple LAC services are configured. | IPv4 address in dotted decimal notation (xxx.xxx.xxx.xxx) |

**RADIUS Tagging Support**

The system supports RADIUS attribute tagging for tunnel attributes. These "tags" organize together multiple attributes into different groups when multiple LNS nodes are defined in the user profile. Tagging is useful to ensure that the system groups all the attributes used for a specific server. If attribute tagging is not supported by your specific RADIUS server, the system implicitly organizes the attributes in the order that they are listed in the access accept packet.

**Configuring Local Subscriber Profiles for L2TP Support**

This section provides information and instructions for configuring local subscriber profiles on the system to support L2TP.
The configuration of RADIUS-based subscriber profiles is not discussed in this document. Please refer to the documentation supplied with your RADIUS server for further information.

This section provides the minimum instruction set for configuring local subscriber profile for L2TP support on the system. For more information on commands that configure additional parameters and options, refer to the *LAC Service Configuration Mode Commands* chapter in the *Command Line Interface Reference*.

To configure the system to provide L2TP support to subscribers:

**Step 1** Configure the "Local" subscriber with L2TP tunnel parameters and the load balancing parameters with action by applying the example configuration in the *Configuring Local Subscriber* section.

**Step 2** Verify your L2TP configuration by following the steps in the *Verifying the L2TP Configuration* section.

**Step 3** Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command *save configuration*. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

### Configuring Local Subscriber

Use the following example to configure the Local subscriber with L2TP tunnel parameters. Optionally you can configure load balancing between multiple LNS servers:

```plaintext
configure
    context <ctxt_name> [-noconfirm]
    subscriber name <subs_name>
        tunnel l2tp peer-address <lns_ip_address> [ preference <integer> | [ encrypted ] secret <secret_string> | tunnel-context <context_name> | local-address <local_ip_address> ]
        load-balancing { random | balanced | prioritized }
    end
```

*Notes:*
- `<ctxt_name>` is the system context in which you wish to configure the subscriber profile.
- `<lns_ip_address>` is the IP address of LNS server node and `<local_ip_address>` is the IP address of system which is bound to LAC service.

### Verifying the L2TP Configuration

These instructions are used to verify the L2TP configuration.

Verify that your L2TP configurations were configured properly by entering the following command in Exec Mode in specific context:
show subscriber configuration username user_name

The output of this command is a concise listing of subscriber parameter settings as configured.

**Tunneling All Subscribers in a Specific Context Without Using RADIUS Attributes**

As with other services supported by the system, values for subscriber profile attributes not returned as part of a RADIUS Access-Accept message can be obtained using the locally configured profile for the subscriber named default. The subscriber profile for default must be configured in the AAA context (i.e. the context in which AAA functionality is configured).

As a time saving feature, L2TP support can be configured for the subscriber named default with no additional configuration for RADIUS-based subscribers. This is especially useful when you have separate source/AAA contexts for specific subscribers.

To configure the profile for the subscriber named default, follow the instructions above for configuring a local subscriber and enter the name default.

**Configuring LAC Services**

- **Important**
  Not all commands, keywords and functions may be available. Functionality is dependent on platform and license(s).

  This section provides information and instructions for configuring LAC services on the system allowing it to communicate with peer LNS nodes.

- **Important**
  This section provides the minimum instruction set for configuring LAC service support on the system. For more information on commands that configure additional parameters and options, refer to the *LAC Service Configuration Mode Commands* chapter in the *Command Line Interface Reference*.

  To configure the LAC services on system:

  1. **Step 1**
     Configure the LAC service on system and bind it to an IP address by applying the example configuration in the *Configuring LAC Service* section.

  2. **Step 2**
     *Optional.* Configure LNS peer information if the Tunnel-Service-Endpoint attribute is not configured in the subscriber profile or PDSN compulsory tunneling is supported by applying the example configuration in the *Configuring LNS Peer* section.

  3. **Step 3**
     Verify your LAC configuration by following the steps in the *Verifying the LAC Service Configuration* section.

  4. **Step 4**
     Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.
Configuring LAC Service

Use the following example to create the LAC service and bind the service to an IP address:

```
configure
  context <dst_ctxt_name> [-noconfirm]
  lac-service <service_name>
    bind address <ip_address>
  end
```

Notes:

• `<dst_ctxt_name>` is the destination context where you want to configure the LAC service.

Configuring LNS Peer

Use the following example to configure the LNS peers and load balancing between multiple LNS peers:

```
configure
  context <dst_ctxt_name> [-noconfirm]
  lac-service <service_name>
    tunnel selection-key tunnel-server-auth-id
      peer-lns <ip_address> [encrypted] secret <secret> [crypto-map <map_name>]
      { [encrypted] isakmp-secret <secret> [
        [description <text>] [ preference <integer>]
      ]}
      load-balancing | random | balanced | prioritized
  end
```

Notes:

• `<dst_ctxt_name>` is the destination context where the LAC service is configured.

Verifying the LAC Service Configuration

These instructions are used to verify the LAC service configuration.

Verify that your LAC service configurations were configured properly by entering the following command in Exec Mode in specific context:

```
show lac-service name <service_name>
```

The output given below is a concise listing of LAC service parameter settings as configured.

```
Service name: vpn1
Context: isp1
Bind: Done
Local IP Address: 192.168.2.1
First Retransmission Timeout: 1 (secs)
Max Retransmission Timeout: 8 (secs)
Max Retransmissions: 5
Max Sessions: 500000
Max Sessions Per Tunnel: 512
Max Tunnels: 32000
Max Tunnel Challenge Length: 16
Proxy LCP Authentication: Enabled
Tunnel Authentication: Enabled
Control receive window: 16
```
Modifying PDSN Services for L2TP Support

PDSN service modification is required for compulsory tunneling and optional for attribute-based tunneling. For attribute-based tunneling, a configuration error could occur such that upon successful authentication, the system determines that the subscriber session requires L2TP but cannot determine the name of the context in which the appropriate LAC service is configured from the attributes supplied. As a precautionary, a parameter has been added to the PDSN service configuration options that will dictate the name of the context to use. It is strongly recommended that this parameter be configured.

This section contains instructions for modifying the PDSN service configuration for either compulsory or attribute-based tunneling.

**Important**

This section provides the minimum instruction set for modifying PDSN service for L2TP support on the system. For more information on commands that configure additional parameters and options, refer to the *LAC Service Configuration Mode Commands* chapter in the *Command Line Interface Reference*.

To configure the LAC services on system:

**Step 1**  
Modify the PDSN service to support L2TP by associating LAC context and defining tunnel type by applying the example configuration in the *Modifying PDSN Service* section.

**Step 2**  
Verify your configuration to modify PDSN service by following the steps in the *Verifying the PDSN Service for L2TP Support* section.

**Step 3**  
Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

**Modifying PDSN Service**

Use the following example to modify the PDSN service to support L2TP by associating LAC context and defining tunnel type:

```
configure
  context <source_ctxt_name> [ -noconfirm ]
  pdsn-service <pdsn_service_name>
    ppp tunnel-context <lac_context_name>
    ppp tunnel-type { l2tp | none }
  end
```

**Notes:**
• `<source_ctx_name>` is the name of the source context containing the PDSN service, which you want to modify for L2TP support.
• `<pdsn_service_name>` is the name of the pre-configured PDSN service, which you want to modify for L2TP support.
• `<lac_context_name>` is typically the destination context where the LAC service is configured.

**Verifying the PDSN Service for L2TP Support**

These instructions are used to verify the PDSN service configuration.

Verify that your PDSN is configured properly by entering the following command in Exec Mode in specific context:

```
show pdsn-service name pdsn_service_name
```

The output of this command is a concise listing of PDSN service parameter settings as configured.

**Modifying APN Templates to Support L2TP**

This section provides instructions for adding L2TP support for APN templates configured on the system.

---

**Important**

This section provides the minimum instruction set for configuring LAC service support on the system. For more information on commands that configure additional parameters and options, refer to the *LAC Service Configuration Mode Commands* chapter in the *Command Line Interface Reference*.

To configure the LAC services on system:

**Step 1**
Modify the APN template to support L2TP with LNS server address and other parameters by applying the example configuration in the *Assigning LNS Peer Address in APN Template* section.

**Step 2**
Optional. If L2TP will be used to tunnel transparent IP PDP contexts, configure the APN's outbound username and password by applying the example configuration in the *Configuring Outbound Authentication* section.

**Step 3**
Verify your APN configuration by following the steps in the *Verifying the APN Configuration* section.

**Step 4**
Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

**Assigning LNS Peer Address in APN Template**

Use following example to assign LNS server address with APN template:

```
cconfigure
  context <dst_ctx_name> [-noconfirm]
  apn <apn_name>
```

---
tunnel l2tp [ peer-address <lns_address> [ [ encrypted ] secret <l2tp_secret> ] [ preference <integer> ] [ tunnel-context <l2tp_context_name> ] [ local-address <local_ip_address> ] [ crypto-map <map_name> { [ encrypted ] isakmp-secret <crypto_secret> } ] ]
end

Notes:
• <dst_ctxt_name> is the name of system destination context in which the APN is configured.
• <apn_name> is the name of the pre-configured APN template which you want to modify for the L2TP support.
• <lns_address> is the IP address of LNS server node and <local_ip_address> is the IP address of system which is bound to LAC service.

Configuring Outbound Authentication

Use the following example to configure the LNS peers and load balancing between multiple LNS peers:

configure
  context <dst_ctxt_name> [ -noconfirm ]
  apn <apn_name>
    outbound { [ encrypted ] password <pwd> | username <name> }
end

Notes:
• <dst_ctxt_name> is the destination context where APN template is is configured.
• <apn_name> is the name of the pre-configured APN template which you want to modify for the L2TP support.

Verifying the APN Configuration

These instructions are used to verify the APN configuration.

Verify that your APN configurations were configured properly by entering the following command in Exec Mode in specific context:

show apn name apn_name

The output is a concise listing of APN parameter settings as configured.

Feature Description

After the subscriber quota is exhausted, all the ongoing download of files must be terminated and the UE must be allowed access to only user-defined servers (Self-Care Portal).

This feature achieves the functionality of Local Break Out (LBO) restriction on Downlink and Uplink data volume transfer by CLI-controlled mechanism.

How It Works

Following is a brief overview of how the feature works:

1. User is redirected to the portal and enters an OTP. The subscriber session continues after authentication.
2. Internet rule and Default rules are installed by PCRF and quota is granted by the OCS.
3. After the subscriber quota is exhausted, the PCRF installs a Self-Care Readdress rule and removes the previously installed Internet rule.
4. After the Readdress rule is applied:
   - For UDP: The ongoing Downlink packets are discarded while all the new uplink packets are readdressed to Self-Care Portal.
   - For TCP: All the existing flows matching the Internet rule are terminated by sending FIN to UE and RST to the server.

Limitation

Post installation of readdress rule, first packet is charged but not sent to the UE. Subsequent packets are not charged or sent to the UE.

Configuring the LBO Restriction on Downlink and Uplink Data Volume Transfer

This section provides information about the CLI commands available in support of the feature.

Enabling the LBO Restriction on Downlink and Uplink Data Volume Transfer

Use the following configuration in ACS Rulebase Configuration Mode to enable the feature.

```
configure
  active-charging service service_name
  rulebase rulebase_name
    ip readdress failure-action terminate
    { default | no } ip readdress failure-action
end
```
NOTES:

• **ip readdress**: Configures the IP Readdress options.

• **failure-action**: Configures the failure action for IP Readdress.

• **terminate**: Terminates the flow

• If previously configured, use the `{ default | no } ip readdress failure-action` CLI command to disable the feature.

**Monitoring and Troubleshooting the LBO Restriction on Downlink and Uplink Data Volume Transfer**

This section describes the CLI commands available to monitor and/or troubleshoot the feature.

**Show Commands and/or Outputs**

**show active-charging rulebase statistics**

The output of this CLI command has been enhanced in support of the feature. The following existing counters will be updated when Readdressing fails for UDP:

- Total Readdressing Failures
- Dropped PktS

**show active-charging sessions full all**

The output of this CLI command has been enhanced in support of the feature. The following existing counter will be updated when Readdressing fails for TCP flow:

- Flow action Terminated Flows

**show active-charging charging-action statistics name <charging_action_name>**

The output of this CLI command has been enhanced in support of the feature. The following existing counter will be updated when Readdressing fails for TCP flow:

- Terminate Flow

**show active-charging service statistics**

The output of this CLI command has been enhanced in support of the feature. The following existing counter will be updated when Readdressing fails for UDP:

- Dropped PktS

Feature Description

When handover is initiated from LTE to Wi-Fi, the Delete Bearer Request (DBR) is sent over the LTE tunnel immediately when the Create Session Response (CSR) is sent on the Wi-Fi tunnel. This causes some packet loss because of the IPSec tunnel establishment delay at the ePDG. To address the issue of packet loss, an enhancement is introduced, in Release 21.8, that holds both the tunnels (LTE and Wi-Fi) and sends the Delete Bearer Request on LTE tunnel only when uplink data is seen on the Wi-Fi tunnel or on expiry of the configured handover timer (when there is no uplink data), whichever is earlier. As long as the LTE tunnel is active, uplink and downlink data is exchanged on the LTE tunnel. When handover is complete, uplink and downlink data is exchanged on the Wi-Fi tunnel. This prevents packet loss.

With this enhancement, the following benefits can be seen:

- Minimum packet loss during LTE to Wi-Fi (S2bGTP) handover and making the handover seamless (that is, MAKE before BREAK).
- LTE procedures are handled gracefully over the LTE tunnel when both tunnels are established with the P-GW.
- Wi-Fi procedures are handled gracefully over the Wi-Fi tunnel when both tunnels are established with the P-GW.
- When there are two tunnels (LTE and Wi-Fi) established for the same subscriber, GTP-U error indication and GTP-U path failure on the LTE or Wi-Fi tunnel (default or dedicated bearer) are handled properly during the transition period.

How It Works

The LTE to Wi-Fi (S2bGTP) Seamless Handover works as explained in the following sections.

LTE to Wi-Fi Handoff

The LTE to Wi-Fi handoff occurs as follows:

1. The P-GW delays sending the DBR to the S-GW until:
• CSR expiry is sent to the ePDG (default behavior).
• Uplink data is sent on the Wi-Fi tunnel.
• Handover timer has expired. If timer expires, the ePDG does not send the Modify Bearer Request (MBR) to notify handoff completion.

2. After CSR for LTE to Wi-Fi handoff is received, Control Plane GTPv2 (GTP-C) messages from LTE access are not handled at the P-GW. These messages are blocked at the EGTPC.

3. LTE tunnel carries GTP-U traffic during the transition period. Transition period is defined as time between CSR (for LTE to Wi-Fi handoff is received) and handover completion. MBR for handoff completion is not expected in this scenario.

4. In case of multiple outstanding CCR-Uss being supported, all requests before the handoff request are dropped. This is done at IMSA.

5. During the transition period:
   • If Modify Bearer Command (MBC) is received in Wi-Fi, it is rejected with Service-Denied message.
   • If Delete Bearer Command for dedicated bearer is received in LTE, it is discarded.
   • If PCRF sends RAR for policy change, it is processed after handover is complete.
   • New tunnel (that is, Wi-Fi) does not carry any GTP-U traffic. Any GTP-U traffic that is received on the Wi-Fi during the transition period is dropped or ignored. Similarly, any downlink traffic that is received on the Wi-Fi is sent on an older tunnel (that is, LTE tunnel) until DBR is sent on the Wi-Fi tunnel. This is true even when CSR is sent on the Wi-Fi tunnel. Any uplink traffic that is received on the Wi-Fi tunnel before timer expiry triggers the handover completion, and from then on all traffic is forwarded only through the Wi-Fi tunnel.
   • Any pending transactions on LTE access are discarded. For example, if CBR or UBR is sent for LTE access and handoff is initiated before completion of CBR or UBR transaction, then CBR or UBR is ignored at the P-GW. PCRF is not notified about failure.
   • If ASR is received, then call drop occurs and both tunnels go down.
   • If session-release occurs from PCRF, then call is dropped and CSR is sent with cause as “no-resources”.
   • GTP-U or GTP-C path failure over LTE leads to call drop for LTE access while the Wi-Fi call continues.
   • GTP-U or GTP-C path failure over Wi-Fi leads to call drop. Both tunnels are cleared.
   • If the user moves back to LTE (that is, back to back handoff from LTE to Wi-Fi to LTE) with HO-Ind set to 1 (after guard timer), then the HO is processed successfully and user session is moved to LTE again.
   • If the user moves back to LTE (that is, back to back handoff from LTE to Wi-Fi to LTE) with HO-Ind set to 0, then it leads to context replacement. Old call is cleared on Wi-Fi access with reason as context replacement and call is processed like a new call over LTE.
Session Recovery and ICSR
During the transition period, old access is considered as stable state and Full Checkpoint is triggered once handover is complete from LTE to Wi-Fi (S2bGTP). This is done for both Session Recovery and ICSR.

Configuring LTE to Wi-Fi Seamless Handover
The following section provides information about the CLI commands available to enable or disable the feature.

Configuring LTE to Wi-Fi Handover Timer
Use the following CLI commands to configure LTE to Wi-Fi handover timer.

```
configure
context context_name
  apn apn_name
    lte-s2bgtp-first-uplink timeout
    { default | no } lte-s2bgtp-first-uplink
end
```

NOTES:

• **default**: Enables the LTE to Wi-Fi handover completion to occur when the Create Session Response is sent on the Wi-Fi tunnel.

• **no**: Disables the feature and handover completion occurs on Create Session Response.

• **lte-s2bgtp-first-uplink timeout**: Configures LTE to S2bGTP handover completion timeout in multiples of 100 milliseconds. The valid range is from 100 to 3000. The recommended configuration is 1000 milliseconds.

• By default, the LTE to Wi-Fi handover completion happens when Create Session Response is sent on the Wi-Fi tunnel. However, after handover timeout is configured, the handover is delayed until timeout or on receipt of uplink data on the Wi-Fi tunnel.

Monitoring and Troubleshooting
This section provides information regarding CLI commands available in support of monitoring and troubleshooting the feature.

Show Command(s) and/or Outputs
This section provides information regarding show commands and/or their outputs in support of this feature.

```
show apn statistics name <name>
```

The output of this CLI command has been enhanced to display the following new fields for the APN:

• LTE-to-S2bGTP handover Succeeded on First Uplink Data on S2b tunnel – Specifies the number of handovers due to uplink packets.
• LTE-to-S2bGTP handover Succeeded on Timer Expiry – Specifies the number of handovers due to timer expiry.

NOTES:
The new fields, introduced as part of this feature, are also displayed for the following CLI commands:

  • `show pgw-service statistics name service_name  verbose`
  • `show pgw-service statistics all verbose`
  • `show saegw-service statistics all function pgw verbose`

**Bulk Statistics**

The following statistics are included in support of this feature.

**APN Schema**

The following bulk statistics are added for APN in the APN schema in support of the LTE to Wi-Fi Seamless Handover feature.

<table>
<thead>
<tr>
<th>Bulk Statistics</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apn-handoverstat-ltetos2bgtpsucc-timerexpiry</code></td>
<td>Number of LTE to S2bGTP handover succeeded on Timer Expiry.</td>
</tr>
<tr>
<td><code>apn-handoverstat-ltetos2bgtpsucc-uplnkdata</code></td>
<td>Number of LTE to S2bGTP handover succeeded on Uplink Data on the S2b tunnel.</td>
</tr>
</tbody>
</table>

**P-GW Schema**

The following bulk statistics are added for P-GW in the P-GW schema in support of the LTE to Wi-Fi Seamless Handover feature.

<table>
<thead>
<tr>
<th>Bulk Statistics</th>
<th>Description</th>
</tr>

Revision History

Important

Revision history details are not provided for features introduced before releases 21.2 and N5.5.
Feature Description

The GTPC Message Priority or Gx Diameter Routing Message Priority (DRMP) AVP indicate priority of a message. This addresses the purpose of deciding the message priority without having to open the complete message.

The Message Priority Indication over GTP feature provides support to set the GTPC MP flag and Message Priority value for GTPC messages and Gx DRMP AVP for Gx messages for eMPS and non-eMPS sessions.

GTPC Message Priority and DRMP AVP do not indicate that session is an Enhanced Multimedia Priority Service (eMPS).

This feature supports the following behavior of the GTPC messages:

1. **Incoming GTPC messages having MP flag set and Message Priority set as 0 for eMPS sessions are excluded from the GTP demux incoming throttling. This is CLI controlled.**
   
   Incoming GTPC messages for eMPS sessions are excluded from throttling due to Load Overload control, that is, self-overload protection (this is already supported).
   
   Therefore, overall incoming GTPC messages having MP flag set and Message Priority as 0 for eMPS sessions are excluded from:
   
   - demux incoming throttling
   - throttling due to Load Overload control (self-overload protection)

2. **In the GTPC Request messages, the GTPC MP flag is set to “1” and GTPC Message Priority value is set to “0” in the GTP header. This is applicable to the messages that the P-GW sends when network-initiated procedures (PCRF) trigger these for eMPS sessions or those leading to toggling of eMPS status of the session. (That is, eMPS upgrade or downgrade scenarios.) This is CLI controlled.**

3. **In the GTPC Request messages, the GTPC MP flag and GTPC Message Priority value is set to the same respective values in the GTP header as were received in the corresponding incoming “command” message. This is applicable to the messages that the P-GW sends when triggered because of UE initiated procedures (that is, due to an incoming command" message) for all sessions (eMPS and non-eMPS). This is not CLI-controlled.**

Note the behavior in the following two scenarios for an incoming command message.

   - **If the response from the peer for a GTPC Request message is received with cause “Temporarily rejected due to handover/TAU/RAU procedure in progress”, then reattempt to send the GTPC request message does not carry the GTPC MP flag and GTPC Message Priority value of the incoming command message. This is applicable to the messages that the P-GW sends when triggered because**
of UE initiated procedures (that is, due to an incoming command" message). Hence, behavior explained in point number 2 is applicable for such messages.

- If the incoming command message is a bearer resource command that creates or updates the bearer where the size of the TFT exceeds the maximum size that can be sent in Create or Update Bearer Request message, then it prompts two request messages to be sent. That is, either Create Bearer Request followed by Update Bearer Request or Update Bearer Request followed by Update Bearer Request message (this is the legacy P-GW behavior). In this case, the first request message is sent with the GTPC MP flag and GTPC Message Priority value of the incoming command message. However, the second request message does not carry the GTPC MP flag and GTPC Message Priority value of the incoming command message. Hence, behavior explained in point number 2 is applicable for such messages.

4. In the GTPC Response messages, the GTPC MP flag and GTPC Message Priority value is set to the same respective values in the GTP header as were received in the corresponding incoming request message. This is applicable to the messages that the P-GW sends for all sessions (eMPS and non-eMPS). This is not CLI-controlled.

5. Outgoing Gx messages (CCR-I/U/T) for eMPS sessions or those because of toggling of the eMPS status of the session (that is, eMPS upgrade or downgrade scenarios) have the DRMP AVP value set as 0. This is CLI controlled.

6. Outgoing Gx RAA messages match the DRMP value sent in RAR from PCRF, irrespective of the CLI configuration for session prioritization.

The Message Priority Indication over GTP feature can be configured using the following commands:

- **emps-profile**: This is an existing CLI command.
- **message-priority**: This is a new CLI command introduced in support of this feature.
- **gtpc overload-protection ingress**: This is an existing CLI command to which the new priority-message keyword is added.
- **diameter session-prioritization**: This is an existing CLI command whose behavior is modified in support of this feature.

The **diameter session-prioritization** CLI command populates the Gx Credit Control Request (Initial, Update, and Terminate) messages for eMPS sessions and eMPS upgrade and downgrade with DRMP AVP with value 0. This helps the intermediate nodes to route the messages with higher priority. The encoding is applied to eMPS enabled sessions and on eMPS upgrade or downgrade of the sessions.

The **diameter session-prioritization** CLI command initially controlled the prioritization of Gx messages for eMPS sessions for eMPS upgrade and downgrade transactions.

The **diameter session-prioritization** CLI command now also controls sending DRMP AVP with a value of 0 in the Credit Control Request (Initial, Update, and Terminate) messages over the Gx interface for eMPS sessions and for eMPS upgrade and downgrade transactions.
How It Works

The following section provides a brief overview of how this feature works.

GTP Incoming Throttling Bypass

GTP Incoming Throttling Bypass is applicable for incoming GTPC request messages landing on the demux Manager (egtpinmgr) at the P-GW ingress interface.

- **High Priority Messages**: Incoming GTPC messages with “MP” flag set and “Message Priority” value set as 0 on the P-GW ingress interface.

- **High Priority CSReq Messages**: Incoming CSReq messages with “MP” flag set and “Message Priority” value set as 0 on the P-GW ingress interface.

- **Low Priority Messages**: All other Incoming GTPC messages without the MP flag.

If the new `exclude priority-message` CLI keyword is configured, it applies the following behavior to bypass incoming throttling for high priority messages:

- High priority messages, the default configuration for “msg-rate” and “queue-size” of demux are applicable (even if they are configured with a different value). The default value for “msg-rate” is 0, which implies that High Priority setting is disabled. The default value for “queue-size” is 10000.

- There is no throttling applied due to the “delay-tolerance” parameter for High Priority messages.

- Also High Priority Create Session Request (CSReq) messages are prioritized over other messages. However, High Priority CSReq messages are processed in sequence.

- When a High Priority message is received and the queue is overloaded then a Low Priority message is discarded from the queue to accommodate the High Priority message.
• In a rare scenario where all the messages in the queue are High Priority and the queue is overloaded, then the new High Priority message may get dropped.

• If ingress throttling is configured using "gtpc overload-protection ingress" with "exclude priority-message" option, then for congestion control calculation for P-GW, S-GW, GGSN, and SAEGW demux manager based on the demux message queue size, the default queue size value of 10,000 is used. (This is the same behavior if exclude sgw-interface is selected.)

• If ingress throttling is configured using "gtpc overload-protection ingress" without the "exclude" option, then for congestion control calculation for P-GW, S-GW, GGSN, and SAEGW demux manager based on demux message queue size, the configured queue-size value is used.

The following table describes the behavior when the exclude priority-message is configured:

<table>
<thead>
<tr>
<th>GTPC Incoming Throttling Demux Queue-size Configuration (100 to 10000)</th>
<th>Is “exclude priority-message” configured</th>
<th>Demux Queue-size used for GTPC Incoming Throttling for S-GW/GGSN/ “Low Priority” P-GW messages</th>
<th>Demux Queue-size used for “High Priority messages” P-GW messages</th>
<th>Queue-size considered for Congestion Control Threshold for P-GW/GGSN/S-GW</th>
</tr>
</thead>
<tbody>
<tr>
<td>No configuration/Default configuration</td>
<td>No</td>
<td>10000 (default)</td>
<td>10000 (default)</td>
<td>Configured_congestion_threshold * 10000 (default)</td>
</tr>
<tr>
<td>No configuration/Default configuration</td>
<td>Yes</td>
<td>10000 (default)</td>
<td>10000 (default)</td>
<td>Configured_congestion_threshold * 10000 (default)</td>
</tr>
<tr>
<td>5000 (or any configured value from 100 to 10000)</td>
<td>No</td>
<td>5000 (or the configured value)</td>
<td>5000 (or the configured value)</td>
<td>Configured_congestion_threshold * 5000 (default)</td>
</tr>
<tr>
<td>5000 (or any configured value from 100 to 10000)</td>
<td>Yes</td>
<td>5000 (or the configured value)</td>
<td>10000 (because “exclude priority-message” is configured)</td>
<td>Configured_congestion_threshold * 10000 (this is the behavior change for congestion control, if “exclude priority-message” is configured)</td>
</tr>
</tbody>
</table>

Gx DRMP AVP Encoding

The Gx DRMP AVP is encoded when the diameter session-prioritization CLI is enabled in IMS Authorization Policy Control Configuration mode for policy control application. The following table summarizes the DRMP AVP values that are sent based on the different configurations and scenarios.

<table>
<thead>
<tr>
<th>session prioritization CLI</th>
<th>eMPS Status of Session</th>
<th>Scenario</th>
<th>DRMP Encoding/Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Any</td>
<td>CCR Messages</td>
<td>Not Encoded</td>
</tr>
</tbody>
</table>
Configuring the Message Priority over GTP Feature

The following section provides the configuration commands to enable or disable the feature.

**emps-profile**

In the eMPS Profile Configuration mode, the emps-profile command now supports the eMPS profile to identify or mark a bearer or session as an eMPS bearer or session.

To set the eMPS profile, enter the following commands:

```
configure
emps-profile emps_profile_name
  earp earp_value earp_value
end
```

**Note**

For supplemental information related to eMPS profile configuration (configuring the eMPS ARPs, which are used to identify a bearer/session as an eMPS bearer/session), and eMPS statistics, refer to the *Expanded Prioritization for VoLTE/Emergency Calls* chapter in the *P-GW Administration Guide* or the *SAEGW Administration Guide*.
**priority-message**

The gtpc overload-protection ingress CLI command is provided with a new keyword, **priority-message**. This keyword enables bypassing of demux incoming throttling for incoming GTPC request messages where the “MP” flag is set as 1 and Message Priority value set as 0 in the GTP header.

To enable the priority of a message, enter the following commands:

```plaintext
configure context context_name
gtpc overload-protection ingress { msg-rate msg_rate } delay-tolerance dur ] [ queue-size size ] [ exclude { sgw-interface [ priority-message ] } ]
end
```

**Notes:**

**priority-message**: Bypasses incoming throttling at the P-GW ingress interface for GTPC incoming messages that have the message priority flag set and message priority value as 0 in the GTP header. The message queue that is considered for the Congestion Control feature for P-GW, S-GW, and GGSN is reset to the default value of 10,000 if this keyword is configured.

This CLI is disabled by default.

The **priority-message** keyword is applicable only for the P-GW.

**message-priority**

This new command enables setting of the GTPC MP flag to “1” and GTPC Message Priority value to “0” in the GTPC header. This is applicable to GTPC Request messages that the P-GW sends because of network-initiated procedures (PCRF) for eMPS sessions or those leading to toggling of eMPS status of the session (that is, eMPS upgrade or downgrade scenarios).

To enable message priority, enter the following commands:

```plaintext
configure emps-profile profile_name
[ no ] message-priority
end
```

**Notes:**

- **no**: Disables the command.
- **message-priority**: Sets the MP flag to 1 and Message Priority value to 0 in GTPC header of all request messages sent by P-GW triggered because of network-initiated procedure (PCRF) in any of the following scenarios:
  - On an eMPS session
  - Non-eMPS session to eMPS session
  - eMPS session to non-eMPS session

- This CLI is disabled by default.
diameter session-prioritization

In the IMS Authorization Service Configuration mode, the **diameter session-prioritization** CLI command is enhanced to populate the Gx Credit Control Request (Initial, Update, and Terminate) messages for eMPS sessions and eMPS upgrade and downgrade with DRMP AVP with value 0. This helps the intermediate nodes to route the messages with higher priority. The encoding is applied to eMPS enabled sessions and on eMPS upgrade or downgrade of the sessions. Also the existing behavior of prioritization of Gx messages for eMPS sessions and eMPS upgrade and downgrade continues.

To set the DRMP AVP value in the CCR message, enter the following commands:

```sh
context context_name
ims-auth-service service_name
policy control
  [ no ] diameter session-prioritization
end
```

Notes:

- **no**: Disables prioritization of Gx messages for eMPS sessions and eMPS upgrade and downgrade. It also disables encoding of DRMP AVP (value 0) in Credit Control Request (Initial, Update, and Terminate) messages for eMPS sessions and eMPS upgrade and downgrade.
- **session-prioritization**: Prioritizes and sets the DRMP AVP values as 0 for Credit Control Request messages of eMPS sessions.
- This CLI is disabled by default.

### Monitoring and Troubleshooting

This section provides information regarding show commands and/or their outputs in support of this feature.

### Show Commands and/or Outputs

The output of the following CLI commands has been enhanced in support of the feature:

**show emps-profile**

The output of the show emps-profile name **name** and show emps-profile all CLI commands now include the message-priority field in support of this feature.

When “message-priority” is not configured or “no message-priority” is configured: show emps-profile name

```sh
show emps-profile name abcd
eMPS Profiles
-----------------------
eMPS Profile Name : abcd
earp configured : None
dscp-marking configured : None
message-priority : Disabled
```

When “message-priority” is not configured or “no message-priority” is configured: show emps-profile name all
show emps-profile name all
emPS Profiles
---------------------------------
emPS Profile Name : xyz
earp configured : 2 3
dscp-marking configured : None
message-priority : Disabled

When “message-priority” is configured: show emps-profile name

show emps-profile name abcd
emPS Profiles
---------------------------------
emPS Profile Name : abcd
earp configured : None
dscp-marking configured : None
message-priority : 0

When “message-priority” is configured: show emps-profile name all

show emps-profile name all
emPS Profiles
---------------------------------
emPS Profile Name : xyz
earp configured : 2 3
dscp-marking configured : None
message-priority : 0

show pgw-service

The output of the show pgw-service name name and show pgw-service all CLI commands now include the Priority message Excluded field in support of this feature.

Default configuration: show pgw-service name

show pgw-service name pgw_service

Service name : pgw_service

CHAPTER 40

Mobile IP Registration Revocation

This chapter describes Registration Revocation for Mobile-IP and Proxy Mobile-IP and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model and configure the required elements for that model, as described in this administration guide before using the procedures in this chapter.

This license is enabled by default; however, not all features are supported on all platforms and other licenses may be required for full functionality as described in this chapter.

This chapter includes the following topics:

- Overview, on page 787
- Configuring Registration Revocation, on page 788

Overview

Registration Revocation is a general mechanism whereby either the HA or the FA providing Mobile IP functionality to the same mobile node can notify the other mobility agent of the termination of a binding. This functionality provides the following benefits:

- Timely release of Mobile IP resources at the FA and/or HA
- Accurate accounting
- Timely notification to mobile node of change in service

Mobile IP Registration Revocation can be triggered at the FA by any of the following:

- Session terminated with mobile node for whatever reason
- Session renegotiation
- Administrative clearing of calls
- Session Manager software task outage resulting in the loss of FA sessions (sessions that could not be recovered)
Registration Revocation functionality is also supported for Proxy Mobile IP. However, only the HA can initiate the revocation for Proxy-MIP calls.

Mobile IP Registration Revocation can be triggered at the HA by any of the following:

- Administrative clearing of calls
- Inter-Access Gateway handoff. This releases the binding at the previous access gateway/FA
- Session Manager software task outage resulting in the loss of FA sessions (for sessions that could not be recovered)
- Session Idle timer expiry (when configured to send Revocation)
- Any other condition under which a binding is terminated due to local policy (duplicate IMSI detected, duplicate home address requested, etc.)

The FA and the HA negotiate Registration Revocation support when establishing a Mobile IP call. Revocation support is indicated to the Mobile Node (MN) from the FA by setting the 'X' bit in the Agent Advertisement to MN. However the MN is not involved in negotiating the Revocation for a call or in the Revocation process. It only gets notified about it. The X bit in the AgentAdvertisements is just a hint to the MN that revocation is supported at the FA but is not a guarantee that it can be negotiated with the HA.

At the FA, if revocation is enabled and a FA-HA SPI is configured, the Revocation Support extension is appended to the RRQ received from the MN and protected by the FA-HA Authentication Extension. At the HA, if the RRQ is accepted, and the HA supports revocation, the HA responds with an RRP that includes the Revocation Support extension. Revocation support is considered to be negotiated for a binding when both sides have included a Revocation Support Extension during a successful registration exchange.

The Revocation Support Extension in the RRQ or RRP must be protected by the FA-HA Authentication Extension. Therefore, an FA-HA SPI must be configured at the FA and the HA for this to succeed.

If revocation is enabled at the FA, but an FA-HA SPI is not configured at the FA for a certain HA, then FA does not send Revocation Support Extension for a call to that HA. Therefore, the call may come up without Revocation support negotiated.

If the HA receives an RRQ with Revocation Support Extension, but not protected by FA-HA Auth Extension, it will be rejected with "FA Failed Authentication" error.

If the FA receives a RRP with Revocation Support Extension, but not protected by FA-HA Auth Extension, it will be rejected with "HA Failed Authentication" error.

Also note that Revocation support extension is included in the initial, renewal or handoff RRQ/RRP messages. The Revocation extension is not included in a Deregistration RRQ from the FA and the HA will ignore them in any Deregistration RRQs received.

**Configuring Registration Revocation**

Support for MIP Registration Revocation requires the following configurations:
• **FA service(s):** Registration Revocation must be enabled and operational parameters optionally configured.

• **HA service(s):** Registration Revocation must be enabled and operational parameters optionally configured.

---

**Important**

These instructions assume that the system was previously configured to support subscriber data sessions for a core network service with FA and/or an HA according to the instructions described in the respective product Administration Guide.

---

**Important**

Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the *Command Line Interface Reference* for complete information regarding all commands.

---

### Configuring FA Services

Configure FA services to support MIP Registration Revocation by applying the following example configuration:

```bash
configure
context <context_name>
  fa-service <fa_service_name>
    revocation enable
    revocation max-retransmission <number>
    revocation retransmission-timeout <time>
end
```

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

---

### Configuring HA Services

Configure HA services to support MIP Registration Revocation by applying the following example configuration:

```bash
configure
context <context_name>
  ha-service <ha_service_name>
    revocation enable
    revocation max-retransmission <number>
    revocation retransmission-timeout <time>
end
```

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*. 
Multi-Protocol Label Switching (MPLS) Support

This chapter describes the system's support for BGP/MPLS VPN and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on specific systems. It is recommended that you select the configuration example that best meets your service model and configure the required elements for that model, as described in the respective product administration guide, before using the procedures in this chapter.

When enabled through a feature license key, the system supports MPLS to provide a VPN connectivity from the system to the corporate's network.

Important

This release provides BGP/MPLS VPN for directly connected PE routers only.

MP-BGP is used to negotiate the routes and segregate the traffic for the VPNs. The network node learns the VPN routes from the connected Provider Edge (PE), while the PE populates its routing table with the routes provided by the network functions.

- Overview, on page 791
- Supported Standards, on page 793
- Supported Networks and Platforms, on page 794
- Licenses, on page 794
- Benefits, on page 794
- Configuring BGP/MPLS VPN with Static Labels, on page 794
- Configuring BGP/MPLS VPN with Dynamic Labels, on page 797

Overview

As seen in the following scenario, the chassis can be deployed as a router while supporting BGP/MPLS-VPN in a network.

- Chassis as MPLS-Customer Edge (MPLS-CE) connecting to Provider Edge (PE)
- Chassis as MPLS-Customer Edge (MPLS-CE) connecting to Autonomous System Border Router (ASBR)
The system in this scenario uses static/dynamic MPLS labels for ingress and egress traffic. For configuration information on static label, refer to the Configuring BGP/MPLS VPN with Static Labels, on page 794 section and also refer to Configuring BGP/MPLS VPN with Static Labels, on page 794 for dynamic label configuration.

The system is in a separate autonomous system (AS) from the Provider Edge (PE). It communicates with the PE and all VPN routes are exchanged over MP-BGP. Routes belonging to different VPNs are logically separated, using separate virtual route forwarding tables (VRFs).

Routes for each VPN are advertised as VPN-IPv4 routes, where route distinguishers are prepended to regular IPv4 routes to allow them to be unique within the routing table. Route targets added to the BGP extended community attributes identify different VPN address spaces. The particular upstream BGP peer routing domain (VPN), from which a route is to be imported by the downstream peer into an appropriate VRF, is identified with an extended community in the advertised NLRI.

A unique label is also received or advertised for every VPN route.

The Customer Edge (CE) also advertises routes to the PE using NLRIIs that include route distinguishers to differentiate VPNs, an extended community to identify VRFs, and a MPLS-label, which will later be used to forward data traffic.

There is a single MPLS-capable link between the CE and the PE. MP-BGP communicates across this link as a TCP session over IP. Data packets are sent bidirectionally as MPLS encapsulated packets.

This solution does not use any MPLS protocols. The MPLS label corresponding to the immediate upstream neighbor can be statically configured on the downstream router, and similarly in the reverse direction.

When forwarding subscriber packets in the upstream direction to the PE, the CE encapsulates packets with MPLS headers that identify the upstream VRF (the label sent with the NLRI) and the immediate next hop. When the PE receives a packet it swaps the label and forward.

The CE does not run any MPLS protocol (LDP or RSVP-TE).

When receiving data packets in the downstream direction from the PE, the label is checked to identify the destination VRF. Then the packet is de-encapsulated into an IP packet and sent to the session subsystem for processing.

---

**Important**

MPLS ping/traceroute debugging facilities are not supported.
Chassis as MPLS-CE Connected to ASBR

The system in this scenario uses static/dynamic MPLS labels for ingress and egress traffic. For configuration information on static label, refer to Configuring BGP/MPLS VPN with Static Labels, on page 794 and refer to Configuring BGP/MPLS VPN with Dynamic Labels, on page 797 for dynamic label configuration.

This scenario differs from the MPLS-CE with PE scenario in terms of peer functionality even though MPLS-CE functionality does not change. Like the MPLS-CE with PE scenario, MPLS-CE system maintains VRF routes in various VRFs and exchanges route information with peer over MP-eBGP session.

The peer in this scenario is not a PE router but an Autonomous System Border Router (ASBR). The ASBR does not need to maintain any VRF configuration. The PE routers use iBGP to redistribute labeled VPN-IPv4 routes either to an ASBR or to a route reflector (of which the ASBR is a client). The ASBR then uses the eBGP to redistribute those labeled VPN-IPv4 routes to an MPLS-CE in another AS. Because of the eBGP connection, the ASBR changes the next-hop and labels the routes learned from the iBGP peers before advertising to the MPLS-CE. The MPLS-CE is directly connected to the eBGP peering and uses only the MP-eBGP to advertise and learn routes. The MPLS-CE pushes/pops a single label to/from the ASBR, which is learned over the MP-eBGP connection. This scenario avoids the configuration of VRFs on the PE, which have already been configured on the MPLS-CE.

Engineering Rules

- Up to 5,000 "host routes" spread across multiple VRFs per BGP process. Limited to 6,000 pool routes per chassis.
- Up to 2,048 VRFs per chassis.

Supported Standards

Support for the following standards and requests for comments (RFCs) have been added with this interface support:

- RFC 4364, BGP/MPLS IP VPNs
- RFC 3032, MPLS Label Stack Encoding
One or more sections of above mentioned IETF are partially supported for this feature. For more information on Statement of Compliance, contact your Cisco account representative.

---

**Supported Networks and Platforms**

This feature supports all ASR5500 platforms with StarOS Release 9.0 or later running with network function services.

---

**Licenses**

Multi-protocol label switching (MPLS) is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

---

**Benefits**

MPLS provides networks with a more efficient way to manage applications and move information between locations. MPLS prioritizes network traffic, so administrators can specify which applications should move across the network ahead of others.

---

**Configuring BGP/MPLS VPN with Static Labels**

This section describes the procedures required to configure the system as an MPLS-CE to interact with a PE with static MPLS label support.

The base configuration, as described in the Routing chapter in this guide, must be completed prior to attempt the configuration procedure described below.

---

**Important**

The feature described in this chapter is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements.

---

**Important**

Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

To configure the system for BGP/MPLS VPN:
Step 1 Create a VRF on the router and assign a VRF name by applying the example configuration in Create VRF with Route-distinguisher and Route-target, on page 795.

Step 2 Set the neighbors and address family to exchange routing information and establish BGP peering with a peer router by applying the example configuration in Set Neighbors and Enable VPNv4 Route Exchange, on page 795.

Step 3 Configure the address family and redistribute the connected routes domains into BGP by applying the example configuration in Configure Address Family and Redistributed Connected Routes, on page 796. This takes any routes from another protocol and redistributes them to BGP neighbors using the BGP protocol.

Step 4 Configure IP Pools with MPLS labels for input and output by applying the example configuration in Configure IP Pools with MPLS Labels, on page 796.

Step 5 Optional. Bind DHCP service to work with MPLS labels for input and output in corporate networks by applying the example configuration in Bind DHCP Service for Corporate Servers, on page 796.

Step 6 Optional. Bind AAA/RADIUS server group in corporate network to work with MPLS labels for input and output by applying the example configuration in Bind AAA Group for Corporate Servers, on page 796.

Step 7 Save your configuration as described in the System Administration Guide.

Create VRF with Route-distinguisher and Route-target

Use this example to first create a VRF on the router and assign a VRF name. The second `ip vrf` command creates the route-distinguisher and route-target.

```plaintext
configure
  context <context_name> -noconfirm
  ip vrf <vrf_name>
  router bgp <as_number>
    ip vrf <vrf_name>
      route-distinguisher {<as_value> | <ip_address>} <rt_value>
      route-target export {<as_value> | <ip_address>} <rt_value>
    end
end
```

Set Neighbors and Enable VPNv4 Route Exchange

Use this example to set the neighbors and address family to exchange VPNv4 routing information with a peer router.

```plaintext
configure
  context <context_name>
  router bgp <as_number>
    neighbor <ip_address> remote-as <AS_num>
    address-family vpv4
    neighbor <ip_address> activate
    neighbor <ip_address> send-community both
    exit
  interface <bind_intfc_name>
    ip address <ip_addr_mask_combo>
  end
```
Configure Address Family and Redistributed Connected Routes

Use this example to configure the address-family and to redistribute the connected routes or IP pools into BGP. This takes any routes from another protocol and redistributes them using the BGP protocol.

```shell
configure
cr_ect<context_name>
r_outer bgp<as_number>
   address-family ipv4 <type> vrf <vrf_name>
      redistribute connected
end
```

Configure IP Pools with MPLS Labels

Use this example to configure IP Pools with MPLS labels for input and output.

```shell
configure
cr_ect<context_name> -noconfirm
   ip pool <name> <ip_addr_mask_combo> private vrf <vrf_name> mpls-label input
      <in_label_value> output <out_label_value1> nexthop-forwarding-address
      <ip_addr_bgp_neighbor>
end
```

Bind DHCP Service for Corporate Servers

Use this example to bind DHCP service with MPLS labels for input and output in Corporate network.

```shell
configure
cr_ect<dest_ctxt_name>
   interface <intfc_name> loopback
      ip vrf forwarding <vrf_name>
      ip address <bind_ip_address subnet_mask>
   exit
   dhcp-service <dhcp_svc_name>
      dhcp ip vrf <vrf_name>
         bind address <bind_ip_address> | nexthop-forwarding-address
            <nexthop_ip_address> [ mpls-label input <in_mpls_label_value> output
               <out_mpls_label_value1> [ <out_mpls_label_value2> ]]]
      dhcp server <ip_address>
end
```

Notes:

- To ensure proper operation, DHCP functionality should be configured within a destination context.
- Optional keyword nexthop-forwarding-address <ip_address> mpls-label input <in_mpls_label_value> output <out_mpls_label_value1> applies DHCP over MPLS traffic.

Bind AAA Group for Corporate Servers

Use this example to bind AAA server groups with MPLS labels for input and output in Corporate network.
configure
context <dest_ctxt_name>
  aaa group <aaa_grp_name>
    radius ip vrf <vrf_name>
    radius attribute nas-ip-address address <nas_address>
  nexthop-forwarding-address <ip_address> mpls-label input <in_mpls_label_value>
  output < <out_mpls_label_value1>
    radius server <ip_address> encrypted key <encrypt_string> port <iport_num>
end

Notes:

- **aaa_grp_name** is a pre-configured AAA server group configured in Context Configuration mode. Refer [AAA Interface Administration Reference](#) for more information on AAA group configuration.

- Optional keyword **nexthop-forwarding-address** <ip_address> mpls-label input <in_mpls_label_value>
  output < <out_mpls_label_value1> associates AAA group for MPLS traffic.

## Configuring BGP/MPLS VPN with Dynamic Labels

This section describes the procedures required to configure the system as an MPLS-CE to interact with a PE with dynamic MPLS label support.

The base configuration, as described in the *Routing* chapter in this guide, must be completed prior to attempt the configuration procedure described below.

---

**Important**
The features described in this chapter is an enhanced feature and need enhanced feature license. This support is only available if you have purchased and installed particular feature support license on your chassis.

---

**Important**
Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the *Command Line Interface Reference* for complete information regarding all commands.

---

To configure the system for BGP/MPLS VPN:

### Step 1
Create a VRF on the router and assign a VRF name by applying the example configuration in Create VRF with Route-distinguisher and Route-target, on page 798.

### Step 2
Set the neighbors and address family to exchange routing information and establish BGP peering with a peer router by applying the example configuration in Set Neighbors and Enable VPNv4 Route Exchange, on page 798.

### Step 3
Configure the address family and redistribute the connected routes domains into BGP by applying the example configuration in Configure Address Family and Redistributed Connected Routes, on page 799. This takes any routes from another protocol and redistributes them to BGP neighbors using the BGP protocol.

### Step 4
Configure IP Pools with dynamic MPLS labels by applying the example configuration in Configure IP Pools with MPLS Labels, on page 799.
Step 5  *Optional.* Bind DHCP service to work with dynamic MPLS labels in corporate networks by applying the example configuration in *Bind DHCP Service for Corporate Servers, on page 799.*

Step 6  *Optional.* Bind AAA/RADIUS server group in corporate network to work with dynamic MPLS labels by applying the example configuration in *Bind AAA Group for Corporate Servers, on page 799.*

Step 7  *Optional.* Modify the configured IP VRF, which is configured to support basic MPLS functionality, for mapping between DSCP bit value and experimental (EXP) bit value in MPLS header for ingress and egress traffic by applying the example configuration in *DSCP and EXP Bit Mapping, on page 800.*

Step 8  Save your configuration as described in the *System Administration Guide.*

Create VRF with Route-distinguisher and Route-target

Use this example to first create a VRF on the router and assign a VRF name. The second `ip vrf` command creates the route-distinguisher and route-target.

```bash
configure
  context <context_name> -noconfirm
  ip vrf <vrf_name>
  router bgp <as_number>
  ip vrf <vrf_name>
    route-distinguisher {<as_value> | <ip_address>} <rt_value>
    route-target export {<as_value> | <ip_address>} <rt_value>
    route-target import {<as_value> | <ip_address>} <rt_value>
  end

Notes:

* If export and import route targets are the same, alternate command `route-target both {<as_value> | <ip_address>} <rt_value>` can be used in place of `route-target import` and `route-target export` commands.

Set Neighbors and Enable VPNv4 Route Exchange

Use this example to set the neighbors and address family to exchange VPNv4 routing information with a peer router.

```bash
configure
  context <context_name>
  mpls bgp forwarding
  router bgp <as_number>
    neighbor <ip_address> remote-as <AS_num>
    address-family vpnv4
    neighbor <ip_address> activate
    neighbor <ip_address> send-community both
    exit
  interface <bind_intfc_name>
  ip address <ip_addr_mask_combo>
  end
```
Configure Address Family and Redistributed Connected Routes

Use this example to configure the address-family and to redistribute the connected routes or IP pools into BGP. This takes any routes from another protocol and redistributes them using the BGP protocol.

```bash
configure
  context <context_name>
    router bgp <as_number>
      address-family ipv4 <type> vrf <vrf_name>
        redistribute connected
    end
end
```

Configure IP Pools with MPLS Labels

Use this example to configure IP Pools with dynamic MPLS labels.

```bash
configure
  context <context_name> -noconfirm
    ip pool <name> <ip_addr_mask_combo> private vrf <vrf_name>
end
```

Bind DHCP Service for Corporate Servers

Use this example to bind DHCP service with dynamic MPLS labels in Corporate network.

```bash
configure
  context <dest_ctxt_name>
    interface <intfc_name> loopback
      ip vrf forwarding <vrf_name>
      ip address <bind_ip_address subnet_mask>
    exit
dhcp-service <dhcp_svc_name>
    dhcp ip vrf <vrf_name>
    bind address <bind_ip_address>
    dhcp server <ip_address>
    end
```

Notes:

* To ensure proper operation, DHCP functionality should be configured within a destination context.

Bind AAA Group for Corporate Servers

Use this example to bind AAA server groups with dynamic MPLS labels in Corporate network.

```bash
configure
  context <dest_ctxt_name>
    aaa group <aaa_grp_name>
      radius ip vrf <vrf_name>
      radius attribute nas-ip-address address <nas_address>
      radius server <ip_address> encrypted key <encrypt_string> port <iport_num>
```
DSCP and EXP Bit Mapping

Use this example to modify the configured IP VRF to support QoS mapping.

```
configure
  context <context_name>
    ip vrf <vrf_name>
      mpls map-dscp-to-exp dscp <dscp_bit_value> exp <exp_bit_value>
      mpls map-exp-to-dscp exp <exp_bit_value> dscp <dscp_bit_value>
    end
```

Notes:

- `aaa_grp_name` is a pre-configured AAA server group configured in Context Configuration mode. Refer to the *AAA Interface Administration Reference* for more information on AAA group configuration.
CHAPTER 42

Multiple IP Versions Support

This chapter describes the following topics:

Feature Description

This feature enables P-GW, S-GW, and SAEGW nodes to support the control messages received on all the transport addresses exchanged during the session setup. Prior to this release P-GW, S-GW, and SAEGW did not support BRCmd, MBCmd, and DBCmd messages on transport other than the transport used for establishing session.

A new CLI command has been introduced at the egtp-service level to control the behavior of the BRCmd, MBCmd, and DBCmd messages.

How it Works

This section describes the working of this feature. Following is the sample call flow for MBCmd.

The following figure illustrates call flow when the feature is disabled:
The following figure illustrates the call flow when feature is enabled:

IPv4 transport is used for establishing a session with the peer node. IPv4 and IPv6 address are exchanged in control FTEID.

When a session is being established, P-GW, S-GW, and SAEGW node uses the IPv6 address as transport. This transport is used for establishing tunnel with peer node. If IPv4 and IPv6 addresses are exchanged in control FTEID then the node should handle MBCmd, BRCmd, and DBCmd messages on IPv4 transport by the nodes.
When a session is being established, if IPv4 address is used as a transport and is being used for establishing tunnel with peer node, and if IPv4 and IPv6 addresses are exchanged in control F-TEID, then the MBCmd, BRCmd, and DBCmd messages are also handled on the IPv6 transport by the nodes.

When a session is being established, if IPv4 and IPv6 addresses are exchanged in data F-TEID by both peers, then the GTP-U data packets get handled on both IPv6 and IPv4 transport.

When a session is being established, if IPv4 address is used as a transport, however, C-TEID does not contain IPv4 address, then that message is rejected by the node. The nodes exhibit similar behavior for IPv6 addresses.

When a session is being established, if IPv4 and IPv6 addresses are exchanged in data F-TEID by both peers, then GTP-U data packets get handled on IPv6 and IPv4 transport both.

The following table displays the message handling behavior in different session establishment scenarios:

Configuring Multiple IP Version Support

This section provides information on CLI commands available in support of this feature.
By default, this feature is enabled.

```conf
configure
  context context_name
    egtp-service service_name
      [no] gtpc command-messages dual-ip-stack-support
    end
end
```

NOTES:

- **no**: Disables the feature.
- **command-messages**: Configures MBC or DBC or BRC messages on S-GW and P-GW.
- **dual-ip-stack-support**: Enables P-GW, S-GW, SAEGW nodes to handle command messages on both IPv4/IPv6 transport, if supported.

## Monitoring and Troubleshooting

This section provides information on how to monitor and troubleshoot the Override Control Enhancement feature.

### Show Commands and Outputs

This section provides information on show commands and their corresponding outputs for the Override Control Enhancement feature.

#### show configuration

The following new fields are added to the output of this command:

- **gtpc command-messages dual-ip-stack-support** - Specifies the command messages on both IPv4/IPv6 transport if supported.

#### show egtp-service all

The following new fields are added to the output of this command:

- **GTPC Command Messages Dual IP Support** - Specifies the command messages on both IPv4/IPv6 transport if supported.
show egtp-service all
CHAPTER 43

NetLoc for WiFi EPC

This chapter describes StarOS support for the NetLoc for WiFi EPC feature on the P-GW and SAE-GW.

• Feature Description, on page 807
• How It Works, on page 807
• Configuring the NetLoc for WiFi EPC Feature, on page 809
• Monitoring and Troubleshooting the NetLoc for WiFi EPC Feature, on page 811

Feature Description

With this feature, the IMS network can retrieve location information of the UE from WLAN access network. This improves location related feature and functionality for the operator. This feature also helps in charging subscribers based on location information.

Please note that the support for LTE NetLoc already exists from prior releases. With this release, NetLoc support is extended for WLAN access. Basic implementation is already supported for passing necessary parameter to different internal modules like SM, IMSA and ECS.

How It Works

When the Application Function (AF) requests the PCRF to report the access network information, the PCRF provides the requested access network information indication (for example, user location and/or user timezone information) to the PCEF within the Required-Access-Info AVP which is included in the Charging-Rule-Definition AVP of an appropriate PCC rule.

The PCRF also provides the ACCESS_NETWORK_INFO_REPORT event trigger within the Event-Trigger AVP. If the ACCESS_NETWORK_INFO_REPORT event trigger is set, upon installation, modification and removal of any PCC rule(s) containing the Required-Access-Info AVP, the P-GW determines if it can obtain the required location information for the used IP CAN type.

During bearer deactivation or UE detach procedure, the P-GW provides the access network information to the PCRF within the TWAN-Identifier AVP. The P-GW also provides information on when the UE was last known to be in that location within the User-Location-Info-Time AVP, and/or UE-Local-IP-Address AVP as applicable for S2a/S2b interface:

• For Trusted WLAN, the User Location Information (ULI) is provided in the TWAN Identifier AVP.
• For Untrusted WLAN, the ULI contains the TWAN Identifier, the UE’s Local IP address and optionally, UDP source port number (if NAT is detected).

When the ULI is requested by the PCRF and it’s not provided to the PCEF, the PCEF provides the serving PLMN identifier within the 3GPP-SGSN-MCC-MNC AVP. And when the time zone is requested by the PCRF, the PCEF provides it within the 3GPP-MS-TimeZone AVP. Please note that the timezone is applicable only for Trusted WLAN interface. For WLAN access, the PCEF also includes the AN-Trusted AVP while reporting access network information.

During the IP-CAN session termination procedure, the PCEF will, if ACCESS_NETWORK_INFO_REPORT event trigger is set, provide the access network information to the PCRF by including the ULI (if it was provided to the PCEF), the information on when the UE was last known to be in that location within User-Location-Info-Time AVP (if it was provided to the PCEF), the PLMN identifier within the 3GPP-SGSN-MCC-MNC AVP (if the user location information was not provided to the PCEF) and the timezone information within the 3GPP-MS-TimeZone AVP.

The WLAN location information received from S2a/S2b interface is reported on all the P-GW supported interfaces (Gx, Gy, and Gz).

Accounting Requirements

As part of accounting requirements, the following Dictionaries are used:

• Gx: r8-gx-standard

• Gy:
  • S2a: custom-8 with Rel-11
  • S2b: custom-8 with Rel-13

• Gx:
  • S2a: custom-48 and custom-52
  • S2b: custom-52

The following fields in PGW-CDRs are introduced as part of Gz requirement:

• custom-52 dictionary (as part of uWANUserLocationInfo):
  • uELocalIPAddress
  • uDPSourcePort
  • sSID
  • bSSID

The custom-52 is a new standard dictionary introduced in compliance with 3GPP Release 13.

Limitations

This section identifies the known limitations/restrictions of this feature.
• The User Location Information (ULI) on S2b includes UE local IP address and optionally, UDP source port number (if NAT is detected). It also includes WLAN Location Information (and its age). Location change is considered if any of the following information changes: UE local IP address, UDP port, or WLAN Location.

• On Gz, for WLAN location change, the ULI change trigger is used.

• On Gy, for WLAN location change, the location_any trigger is used.

• The Rf and S2a RADIUS, and LI interfaces are not considered as part of this feature.

• There are no changes done over S6b interface.

• Only SSID and BSSID of TWAN/UWAN Identifier are considered as part of this feature.

• UE local IP address field is mandatory on Gz and Gy as part of UWANUserLocationInfo.

• For S2b, when the received UWANUserLocationInfo is different than the previous UWANUserLocationInfo, then below are few error case handling:
  • For Gy, if the received parameters doesn't contain IPAddress, the P-GW doesn’t generate a ULI-Change report.
  • For Gz, the container with 'ULI change' is closed only when the UWANUserLocationInfo value corresponding to the container contains the IP-Address.

• This feature is controlled by NetLoc and Wifi Integration License.

• In case of S2b interface, UE Local IP Address and Port, WLAN ID and WLAN Timestamp are reset to 0 if they are not received in CSReq/CBRsp/UBRsp/DBRsp.

• As per 3GPP TS 32.298, TWAN Identifier is present at Record level in Gz.

• The WLAN-timestamp is not sent over Gy and Gz interface.

• The UE-location-IP-Address change event trigger is not part of this feature.

• The EPC_Routed Feature (Reference 3GPP TS 29.212) is not supported.

Configuring the NetLoc for WiFi EPC Feature

The following sections provide the configuration commands to enable the feature.

Configuring the NetLoc TWAN for Gx

The commands illustrated below configures the NetLoc trusted WLAN feature over Gx interface.

```
configure
  context context_name
    ims-auth-service service_name
    policy-control
      diameter encode-supported-features netloc-trusted-wlan
  end
end
```

Notes:
Configuring the NetLoc UWAN for Gx

The commands illustrated below configures the NetLoc untrusted WLAN feature over Gx interface.

```
configure
c    context context_name
        ims-auth-service service_name
        policy-control
            diameter encode-supported-features netloc-untrusted-wlan
        end
```

Notes:

- **no diameter encode-supported-features**: Disables the feature.
- This command takes effect when Gx is enabled on S2b call.
- By default, the feature is disabled and TWAN information will not be sent over Gx.

Configuring the NetLoc UWAN for Gy

The commands illustrated below configures dictionary control of the AVPs that need to be added based on 3GPP Rel.13.

```
active-charging service service_name
credit-control
    diameter update-dictionary-avps 3gpp-rel13
end
```

Notes:

- **no diameter update-dictionary-avps**: Disables the feature.
- This command takes effect when Gy is enabled on S2b call.
- By default, the feature is disabled and UWAN information will not be sent over Gy.

Configuring the NetLoc UWAN for Gz

The commands illustrated below configures the NetLoc untrusted WLAN feature over Gz interface.

```
configure
    context context_name
        gtpp group group_name
            gtpp attribute uwanuli
        end
```

Notes:
• **no gtpp attribute uwanuli**: Disables the feature.

• This command takes effect when Gz is enabled on S2b call.

• By default, the feature is disabled and UWAN information will not be sent over Gz.

# Monitoring and Troubleshooting the NetLoc for WiFi EPC Feature

This section provides information regarding show commands and/or their outputs in support of this feature.

## Show Commands and/or Outputs

The following table lists the CLI commands that will help to monitor and/or troubleshoot this feature.

<table>
<thead>
<tr>
<th>CLI Commands</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show subscribers pgw-only full all</td>
<td>Displays the following newly introduced fields for which the values will be populated on S2a/S2b calls: TWAN User Location Information: SSID: BSSID: UWAN User Location Information: UE Local IP Address: UDP Port: SSID: BSSID:</td>
</tr>
<tr>
<td>show subscriber saegw-only full all</td>
<td></td>
</tr>
<tr>
<td>show ims-authorization service all verbose</td>
<td>Displays the following newly introduced fields for which the values will be populated when they are configured as Supported Features AVP in IMS Authorization Service Configuration mode:  • netloc-trusted-wlan  • netloc-untrusted-wlan</td>
</tr>
<tr>
<td>show gtpp group all</td>
<td>Displays the following newly introduced field for which the value will be populated when the <strong>gtpp attribute uwanuli</strong> CLI command is configured in the GTPP Server Group configuration mode:  • UWAN User Location Information present:</td>
</tr>

</table>
Network Mobility (NEMO)

This chapter describes the system's support for NEMO and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model and configure the required elements for that model, as described in the Cisco ASR 5500 Packet Data Network Gateway Administration Guide, before using the procedures in this chapter.

- NEMO Overview, on page 813
- NEMO Configuration, on page 820

NEMO Overview

When enabled through a feature license key, the system includes NEMO support for a Mobile IPv4 Network Mobility (NEMO-HA) on the P-GW platform to terminate Mobile IPv4 based NEMO connections from Mobile Routers (MRs) that attach to an Enterprise PDN. The NEMO functionality allows bi-directional communication that is application-agnostic between users behind the MR and users or resources on Fixed Network sites.

The same NEMO4G-HA service and its bound Loopback IP address supports NEMO connections whose underlying PDN connection comes through GTP S5 (4G access) or PMIPv6 S2a (eHRPD access).

The following figure shows a high-level view of LTE NEMOv4 Architecture.
Use Cases

The following use cases are supported by NEMO in LTE:

1. **Stationary** - Applications, like branch offices, with a mobile router that does not require mobility.

2. **Nomadic** - Applications that use a mobile router that does not move while in service, but that may be moved to a different location and brought back on service (e.g. a kiosk showing up in a mall one day and in a different location the next day or month).

3. **Moveable** - Applications that need to maintain Dynamic Mobile Network Routing (DMNR) service operational while moving and crossing PDSN boundaries, such as public safety vehicles. Service continuity is handled by the mobility protocols (Mobile IP in 3G and GTP in LTE).

Features and Benefits

The system supports the usage of dynamically learned, overlapping customer prefixes. These prefixes are advertised via BGP.

**MIPv4-based NEMO Control Plane**

The following figure shows a high-level view of the NEMO control plane.
NEMO includes the following features:

- **Collocated-Care-of-Address mode**
  
The Cisco NEMO MR is expected to use the Collocated-Care-of-Address mode to establish a NEMO MIPv4 session with NEMO4G-HA and as one of the IP endpoints of the NEMO GRE Tunnel for the transport of user traffic.

- **MR-HADDR**
  
  NEMO4G-HA supports a potential “dummy” MR-HADDR address that would be configured in every MR within the same Enterprise or across all served Enterprises (same IP address).

- **Dynamic advertisement of WAN-IP Pools and learned LAN prefixes**
  
  eBGP is used to advertise the Enterprise WAN-IP Pools and the LAN prefixes learned via NEMO for the associated Enterprise.

- **N-MHAE credentials**
  
  NEMO4G-HA supports local authentication for the NEMO MIPv4 RRQ based on preconfigured N-MHAE-SPI/KEY values on a per Enterprise basis (one unique set for all MRs belonging to the same Enterprise) or on a global basis (one unique set for all Enterprises).

- **LAN prefixes**
  
  - **NEMO4G-HA** accepts a minimum of zero LAN prefixes and a maximum of eight prefixes per mobile router. Anything beyond eight prefixes shall be silently discarded.
  
  - **NEMO4G-HA** supports any prefix length (including /32).
  
  - **NEMO4G-HA** supports dynamic prefix updates.
    
    - **NEMO4G-HA** removes from the associated Enterprise VRF routing table any prefixes that are not included in a scheduled or ad-hoc NEMO MIPv4 re-registration request from a given MR (assuming these were present in a previous NEMO MIPv4 RRQ). E-PGW shall update the external VRF router of the removal of such prefixes on the next eBGP update.
    
    - **NEMO4G-HA** accepts and installs any new prefixes that are included in a scheduled or ad-hoc NEMO MIPv4 re-registration request to the associated Enterprise VRF routing table, as long as it doesn't exceed the maximum number of supported prefixes per MR (up to eight). E-PGW shall update the external VRF router of the newly installed prefixes on the next eBGP update.
NEMO4G-HA shall accept NEMO MIPv4 RRQs that do not include any prefixes in the first initial RRQ and it shall accept prefixes advertised in subsequent RRQs.

- In case of a prefix whose IP address or mask is changed on the MR, the MR will remove the old IP address/mask and add the new IP address/mask prefix in a scheduled or ad-hoc NEMO MIPv4 re-registration request and NEMO4G-HA shall remove the old route and add the new route corresponding to the new prefix to the Enterprise VRF routing table.

- Overlapping IP addressing

  NEMO4G-HA supports private and overlapping IP addressing across multiple Enterprises for the WAN IP pools, MR-HADDR, and LAN prefixes.

**NEMO MR Authorization**

NEMO4G-HA authorizes a NEMO MIPv4 session only if a NEMO permission has been assigned to the underlying PDN connection. NEMO permission should be assigned to the underlying PDN connection via either local configuration (APN parameter) or based on a NEMO permission AVP assigned by the 3GPP AAA during the PDN authorization. For local configuration, a new APN parameter is supported to enable NEMO permission at the APN/PDN level within the P-GW service.

**MIPv4 NEMO Protocol**

NEMO4G-HA processes a Mobile IPv4 NEMO Registration Request (RRQ) received from the MR NEMO client.

NEMO4G-HA processes the first of three Cisco-specific MIPv4 Extensions of type Normal Vendor/Org Specific Extension (NVSE) that are included in the MIPv4 NEMO RRQ. The three Cisco-specific NVSEs are placed after the MIPv4 "Identification" field and before the mandatory MIPv4 "Mobile-Home-Authentication-Extension." NEMO4G-HA accepts the LAN prefixes (up to eight) encoded in the first Cisco-specific NVSE (vendor-type = 9). NEMO4G-HA is not expected to process the other two Cisco-specific NVSEs with vendor-type = 49, which carry the Internal Interface ID of the MR's Roaming Interface and the MR's Roaming Interface Bandwidth in Kbps, respectively.

Cisco-specific NVSEs follow RFC 3025 "Mobile IP Vendor/Organization Specific Extensions."

**GRE Encapsulation**

User traffic shall be encapsulated over a GRE tunnel between the MR NEMO client and NEMO4G-HA. The IP endpoints of the GRE tunnel shall be the IPv4 assigned to the MR modem during the Enterprise PDN connection setup and the IPv4 address of the NEMO4G-HA service on the E-PGW.

NEMO4G-HA shall remove the GRE encapsulation before it forwards the outbound traffic towards the Enterprise VPN via the associated SGi VLAN interface. Inbound traffic received through the same SGi VLAN interface shall be encapsulated into a GRE tunnel before it's passed to the E-PGW service for forwarding to the MR through the proper GTP/PMIP tunnel.

**Session Interactions**

The following session interaction scenarios are supported between NEMO and the underlying PDN connection made over eHRPD or LTE access.
In the following circumstances, NEMO4G-HA shall withdraw the associated prefix routes from the Enterprise VRF routing table, update the eBGP neighbors and free up all internal resources allocated for the underlying PDN connection and NEMO session:

- When the eHRPD terminates the underlying PDN connection (PPP-VSNCP-Term-Req sent to MR and PMIP-BU with lifetime = 0 sent to E-PGW).

- When the MR terminates the PPP/PDN connection when accessing the network via eHRPD.

- After an eUTRAN (LTE) detach procedure initiated by the MR or MME.

NEMO4G-HA shall not be able to process any NEMO MIPv4 RRQs if there's no underlying PDN connection associated to those RRQs (PMIPv6 or GTP). In other words, NEMO MIPv4 RRQs can be accepted and processed only if an Enterprise PDN connection has been established with E-PGW by the mobile router.

NEMO4G-HA shall silently ignore NEMO MIPv4 RRQs if the underlying PDN connection associated to each of those RRQs does not have the NEMO permission indication. This applies to both eHRPD and LTE access.

NEMO4G-HA shall forward (not drop) user data using MIP or GRE tunneling (UDP/434 or IP Protocol/47, respectively) to the external enterprise VRF if such data is not destined to the NEMO4G-HA IP address. This applies to PDN connections that have or do not have the NEMO Permission indication. This shall also apply to both eHRPD and LTE access.

Any failure on either the authentication or authorize of a NEMO MIPv4 session shall not affect the underlying PDN connection established between the mobile router and the E-PGW via eHRPD or LTE. For example, if the security credentials do not match between the MR NEMO client and NEMO4G-HA, NEMO4G-HA can reject the NEMO MIPv4 RRQ, but the associated PDN connection shall not be terminated.

### NEMO Session Timers

NEMO4G-HA uses the registration lifetime value locally configured, even though MR's may use the maximum possible value (65534).

NEMO4G-HA can process ad-hoc NEMO RRQ messages.

### Enterprise-wide Route Limit Control

NEMO4G-HA supports a control mechanism to limit the maximum number of prefixes/routes that a given enterprise can register, including the pools for WAN IP assignments.

When the maximum number of routes is reached, a syslog message is generated. Once the number of routes goes under the limit, a syslog message is generated for notification.

### Forced Fragmentation

E-PGW forces IP packet fragmentation even for IP packets with the DF-bit set.

### Redundancy/Reliability

The LTE NEMO solution supports intra-chassis Session Redundancy (SR) and Inter-Chassis Session Redundancy (ICSR) functionalities.
LTE NEMO Call Flow

The following figure describes the call flow of the NEMO v4 solution.

Figure 90: NEMO v4 Call Flow

1. The Cisco MR eHWIC establishes first a connection to the IMS PDN to register to the LTE Network. The eHWIC’s User Id must be properly provisioned on the HSS/SPR to be successfully authenticated.

2. After the Cisco MR eHWIC registers with the LTE network and establishes a connection to the IMS PDN, then it connects to the appropriate Enterprise PDN based on the locally configured Enterprise APN.

   - During the PDN authorization procedure using S6b, the 3GPP AAA assigns a NEMO permission via AVP. The AVP is also be available as an APN parameter on the E-PGW to allow NEMO service at the PDN/Enterprise level.

   - E-PGW assigns the MR eHWIC an IPv4 address from the Enterprise IPv4 pool assigned during PDN authentication.

   - E-PGW creates the proper flows internally to forward packets to the corresponding VRF external to the E-PGW platform using the IPv4 pool configuration on the egress context.

   - The MR eHWIC passed on the assigned IPv4 address to the NEMO application (also called WAN-IPv4 address).

3. The MR NEMO application initiates a Mobile IPv4 registration request (RRQ) using the following local configuration and the IPv4 address assigned to the eHWIC during the Enterprise PDN attach procedure (referred to as WAN-IP). The NEMO MIPv4 RRQ will be carried as a regular user packet over the mobility connection, either GTP in LTE and PPP/PMIPv6 in HRPD. The NEMO MIPv4 RRQ includes the following key parameters:
Network Mobility (NEMO)

• CCOA - IPv4 address assigned to the eHWIC modem during the Enterprise PDN connection setup (WAN-IP). The MR NEMO application will use the CCOA/WAN-IP address as the source of all NEMO packets sent to NEMO4G-HA (control and tunneled user traffic).

• MR-HADDR - Mandatory IPv4 address preconfigured in the MR NEMO application. MR-HADDR is normally used as the source of all NEMO control packets sent to the NEMO4G-HA. However, the MR NEMO application will use the CCOA as the source for all NEMO packets (control and tunneled user traffic). Therefore, NEMO4G-HA will ignore the preconfigured MR-HADDR included in the RRQ, but it will still include it in the NEMO MIPv4 RRP.

• Home Agent Address - Preconfigured IPv4 address that the MR NEMO application uses as the destination for all NEMO control and GRE tunneled user data (NEMO4G-HA's IPv4 Address).

• Explicit LAN Prefixes - Locally attached IPv4 networks preconfigured on the MR NEMO application. LAN prefixes will be encoded in the same Cisco NVSE extension currently used in the NEMO solution for 3G. The Cisco NVSE included in the NEMOv4 MIP RRQ is in the form of a TLV.

• N-MHAE - Mandatory NEMO MN-HA Authentication Extension that includes the SPI and the authenticator computed using a pre-shared Key. Both SPI and Key are preconfigured in the MR NEMO application as well.

• NEMO-Tunnel flags such as, but not limited to, "Reverse Tunnel," "Direct Termination," "Tunnel Encapsulation" = GRE.

4. NEMO4G-HA sends a MIP registration response (RRP) back to the MR after it performs the following tasks:
   • Authenticate the RRQ using the N-MHAE information included in the RRQ.
   • Authorize the NEMO service based on the NEMO permission attribute assigned to the associated Enterprise PDN connection.
   • Accept the prefixes advertised in the Cisco NVSE extension included in the NEMO MIPv4 RRQ.
     • The learned prefixes will have to adhere to the current rules of valid pool routes. The minimum valid mask length is /13 and pool routes can not include 0.0.0.0 or 255.255.255.255.
     • NEMO4G-HA will accept a minimum of 0 prefixes and a maximum of 8 prefixes. Anything beyond 8 prefixes will be silently discarded.
     • NEMO4G-HA will also check that the new resultant enterprise route count (total number of VRF routes) do not exceed the route limit potentially configured for the given enterprise. If the preconfigured route limit is exceeded, then NEMO4G-HA will reject the NEMO MIP RRQ. Otherwise, NEMO4G-HA will install the accepted prefixes in the internal VRF associated with the Enterprise PDN.
     • eBGP would then propagate the new NEMO routes to the external VRF as part of the next BGP update.

5. Upon receiving the NEMO MIP RRP, the MR will install a default route (0.0.0.0/0) in its routing table to route all traffic through the LTE connection.
   • Outbound packets are encapsulated over GRE using the CCOA/WAN-IP address as the source and the NEMO4G-HA-Service IPv4 address as the destination of the tunnel.
• Inbound packets are encapsulated over GRE as well from the NEMO4G-HA to the MR NEMO application. The source of the GRE tunnel is the NEMO4G-HA-Service IPv4 address and the destination is the CCOA/WAN-IP address.

**Engineering Rules**

• Up to 5,000 host routes spread across multiple VRFs per BGP process. Limited to 6,000 pool routes per chassis.
• Up to 2,048 VRFs per chassis.

**Supported Standards**

• IETF RFC 3025 (February 2001) "Mobile IP Vendor/Organization Specific Extensions"
• IETF RFC 1191 (November 1990) "Path MTU Discovery"

**NEMO Configuration**

Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the *Command Line Interface Reference* for complete information regarding all commands.

To configure the system for NEMO:

1. Create a VRF on the router and assign a VRF-ID by applying the example configuration in Create a VRF.

2. Set the neighbors and address family to exchange routing information with a peer router by applying the example configuration in Set Neighbors and Address Family, on page 821.

3. Redistribute connected routes between routing domains by applying the example configuration in Redistribute Connected Routes, on page 822.

4. Allow the P-GW to use the NEMO service by applying the example in Configure and Enable NEMO in APN Profile, on page 822.

5. Create a NEMO HA by applying the example in Create a NEMO HA, on page 822.

6. Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command save configuration. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*. 
Sample Configuration

```plaintext
context egress
interface corp1-outbound
    ip address 192.168.1.1 255.255.255.0
    exit
ip vrf corp1
ip pool corp1-test 10.1.1.1 255.255.255.0 private vrf corp1
nexthop-forwarding-address 192.168.1.2 overlap vlanid 50
router bgp 100
    address-family ipv4 vrf corp1
        neighbor 192.168.1.2 remote-as 300
        neighbor 192.168.1.2 allow-default-vrf-connection
        redistribute connected
    exit
exit
context pgw
apn nemo.corp1.com
    permission nemo
        ip context-name egress
        ip address pool name corp1_nemo_pool
    exit
exit
context ingress
interface corp1-inbound
    ip address 192.168.1.1 255.255.255.0
    exit
ha-service nemo
    mn-ha-spi spi-number 100 encrypted secret 01abd002c82b4a2c
    authentication mn-aaa noauth
    encapsulation allow keyless-gre
    bind address 38.0.0.2
end
```

Create a VRF

Use this example to first create a VRF on the router and assign a VRF-ID.

```plaintext
configure
    context <context_name> -noconfirm
    ip vrf <vrf_name>
    ip pool <pool_name> <pool_address> private vrf <vrf_name>
    nexthop-forwarding-address <ip_address> overlap vlanid <vlan_id>
end
```

Set Neighbors and Address Family

Use this example to set the neighbors and address family to exchange routing information with a peer router.

```plaintext
configure
    context <context_name>
```
ip vrf <vrf_name>
router bgp <as_number>
ip vrf <vrf_name>
neighbor <ip_address> remote-as <AS_num>
address-family <type>
neighbor <ip_address> activate
end

Redistribute Connected Routes

Use this example to redistribute connected routes between routing domains.

configure
context <context_name>
  ip vrf <vrf_name>
  router bgp <as_number>
  ip vrf <vrf_name>
  address-family <type> vrf <vrf_name>
  redistribute connected
  exit
  redistribute connected
end

Configure and Enable NEMO in APN Profile

Use this example to configure and enable NEMO in an APN profile.

configure
context <context_name>
  apn <apn_name>
    permission nemo
    ip context-name <name>
    ip address pool name <pool_name>
end

Create a NEMO HA

Use this example to create a NEMO HA.

configure
context <context_name>
  ha-service <ha_service_name>
    mn-ha-spi spi-number <number> encrypted secret <enc_secret>
    authentication mn-aaa noauth
    encapsulation allow keyless-gre
    bind address <ip_address>
end

Revision History

Revision history details are not provided for features introduced before release 21.2.
Feature Description

Path management mechanism through Heartbeat messages between the Mobile Router (MR) and Network Mobility-Local Mobility Anchor (NEMO-LMA) is important to know the availability of the peers, to detect failures, quickly inform peers if recovery from the node fails and allow a peer to take appropriate action.

How It Works

The MR and the LMA exchange Heartbeat messages at regular intervals to detect the status of availability between them. The NEMO-LMA initiates a Heartbeat exchange with the MR, by sending a Heartbeat Request message, to check if the MR is reachable. The NEMO-LMA records the sequence number of the last Heartbeat Request message and is used to match the corresponding Heartbeat Response. The NEMO-LMA responds to a Heartbeat Request message with a Heartbeat Response message, irrespective of whether there is PMIPv6 session with the corresponding peer.

Binding Error

When the Binding Error message, with status set to 2, is received in response to a Heartbeat Request message, the NEMO-LMA does not use Heartbeat messages further with the corresponding peer.

Failure Detection

When the LMA node does not receive the Heartbeat response for the configurable parameter `max-heartbeat-retransmission <value> exceed-action drop-session`, the NEMO-LMA concludes that the peer is not reachable. As such, the Heartbeat request to the peer is stopped and clears the NEMO-LMA session without any traps.

Restart Detection

If the restart counter value is different from the previous received value, then it assumes that the peer had crashed and recovered. And so, the existing NEMO-LMA sessions are cleared.

License Requirements

Use of NEMO requires that a valid license key be installed. Contact your Cisco account or Support representative for information on how to obtain a license.

Configuring NEMO-LMA Heartbeat

Use the following commands under LMA Service Configuration Mode to clear NEMO-LMA sessions without generating traps:
configure
context context_name
    lma-service service_name
    heartbeat retransmission max number [ exceed-action drop-session ]
end

Notes:

• **retransmission max**: The maximum number of heartbeat retransmissions allowed. The *number* must be an integer from 0 to 15. Default: 3

• **exceed-action**: Specifies the action to be taken after the maximum number of Heartbeat retransmissions is reached.

• **drop-session**: Used for dropping the session when path failure is detected.

• The **exceed-action** and **drop-session** keywords are valid only for NEMO-LMA sessions and takes effect if the Heartbeat feature is enabled.

## Monitoring and Troubleshooting the NEMO-LMA Heartbeat

The following sections describe commands available to monitor and troubleshoot the feature.

### monitor protocol

When using the **monitor protocol** command, enable option 48 to monitor the Heartbeat Request/Reply messages.

### show lma-service statistics

Use this command to see the statistics related to Heartbeat messages. The output generated appears similar to the following:

```
Total Disconnects: 1
  Lifetime expiry: 0  Deregistrations: 0
  Admin Drops: 0  Path Failure Drops: 1
  Other Reasons: 0
```

### show session disconnect-reasons

Use this command to see the call disconnected due to heartbeat path failure. The output generated appears similar to the following:

```
  mme-guti_realloc_failed-detach(615)  0  0.00000
  mme-pcsf-rest-detach(616)  0  0.00000
  Reject-ho-old-tun-path-failure(617)  0  0.00000
  mip-path-failure(618)  0  0.00000
```
Bulk Statistics

LMA Schema

The following new bulk statistics variable is added to the LMA schema in support of this feature:

- `lma-pathfailsessionscleared` – If any path failures/restarted counter value changes for the NEMO-LMA Heartbeat feature, the sessions disconnection counter is incremented.
CHAPTER 46

Network Service Headers (NSH)

This chapter describes the following topics:

- Feature Summary and Revision History, on page 827
- Feature Description, on page 828
- How It Works, on page 828
- Configuring Support for NSH Framework, on page 830
- Show Commands and Outputs, on page 836

</table>
Feature Description

Network Services Headers (NSH), a new service chaining protocol, is added to the network traffic in a packet header to create a dedicated service plane that is independent of the underlying transport protocol. In general, NSH describes a sequence of service nodes that a packet is routed through before reaching the destination address. The NSH includes meta-data information about the packet and service chain in an IP packet. The NSH protocol addresses the growing requirement to deploy various services functions external to the gateway.

This feature introduces NSH protocol support for P-GW and SAEGW products and supports the following:

- Encoding and decoding of NSH format in the P-GW/SAEGW.
- Configurable parameters to be included for encoding in the variable header.
- NSH treatment for selective traffic based on configuration.
- Configuring the tag values for parameters present in the variable header.
- Selective configuration of policies for acting on the decode parameters received in the NSH.
- Configuring the intelligence of encoding the NSH information in every packet of a flow or only once per flow.

Important

In this release, selective encryption of parameters is not supported.

How It Works

This section describes the working of NSH protocol support in Cisco's P-GW/SAEGW products.

- The Uplink Packet

For the uplink packet, P-GW/SAEGW adds the NSH, if the flow matches the specified criteria. NSH has a variable length context header also.

Following call flow shows the NSH protocol support in the Cisco PGW/SAEGW products for an uplink packet.

![Uplink Packet Diagram]
For an uplink packet, if the call flow matches the specified criteria, PGW or SAEGW adds the NSH header to the data packet. NSH header may have variable length context header, which can be encrypted if specified in the configuration.

- **The Downlink Packet**

For the downlink packet, P-GW/SAEGW processes and removes the NSH and applies policies based on the extracted NSH parameters.

Following call flow shows the NSH protocol support in the Cisco PGW/SAEGW products for a downlink packet.

For a downlink packet, PGW or SAEGW processes and removes NSH header. Then, PGW or SAEGW apply policies based on the extracted NSH parameters.

- Source and destination IP address for the outer IP packet is taken from the inner IP packet.
- By default, NSH encapsulated packets use the port number 6633.
Configuring Support for NSH Framework

This section covers configuration steps used in this feature for adding support for NSH framework.

Charging Action Association

Service chain is associated to charging action in the following way:

```
configure
  active-charging service service_name
  charging-action charging_action_name
  service-chain service_chain_name
end
```

Notes:
- **charging-action**: Defines charging action.
  - *charging_action_name*: Specifies name of the charging action. This is entered as an alphanumeric string of 1 through 64 characters.
- **service-chain**: Defines service chain association.
  - *service_chain_name*: Specifies name of the service chain. This is entered as an alphanumeric string of 1 through 64 characters.

Service Chain Association

A new CLI command `nsh-format` is added to the `service-chain` command for service-chain association.

```
configure
  service-chain <service_chain_name>
  nsh-format <nsh_format_name>
end
```

Notes:
- **service-chain**: Defines service chain association.
  - *service_chain_name*: Specifies name of the service chain. This is entered as an alphanumeric string of 1 through 64 characters.
- **nsh-format**: Associates NSH format with the service chain.

Service Scheme Association

A new CLI command `nsh-response-received` has been added to the `trigger` command to the ACS service scheme configuration mode.

```
configure
```
**active-charging service** `service_name`
**service-scheme** `service_scheme_name`
   [ no ] trigger { bearer-creation | flow-create | loc-update | nsh-response-received | sess-setup }
end

Notes:

• **service-scheme**: Enables the association of service-scheme based on subscriber class.
  
  `service_scheme_name`: Specifies name of the service scheme. This is entered as an alphanumeric string of 1 through 64 characters.

• **no**: Disables the trigger action for the service-scheme.

• **trigger**: Specifies the trigger action for service-scheme.

• **bearer-creation**: Triggers for every new bearer.

• **flow-create**: Triggers for every new flow.

• **loc-update**: Triggers whenever location changes of the subscriber.

• **nsh-response-received**: Triggers on NSH response packet.

• **sess-setup**: Triggers at session setup.

---

**NSH Configuration Mode**

The Network Service Header (NSH) configuration mode is a sub-mode of the Global Configuration mode. This NSH mode is used to encode or decode NSH.

Exec > Global Configuration > Network Service Entity - IP Configuration

```
configure
  nsh
end
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(nsh)#
```

---

**NSH Fields Configuration Mode**

The NSH Fields configuration mode is a sub-mode of the NSH Configuration mode. This NSH Fields configuration mode is used to tag value to the NSH fields.

Exec > Global Configuration > Network Service Header > Network Service Header - Fields Configuration

```
configure
  nsh
    nsh-fields `fields_name`
end
```

Entering the above command sequence results in the following prompt:
This new CLI command is added to the NSH Fields configuration mode to associate a tag value to a NSH field.

```
configure
  nsh
   nsh-fields fields_name
ead
   tag-value tag_value { content-type || imei | imsi | msisdn |
  rating-group | rulebase | tdf-app-id |
end
```

Notes:

- `nsh-fields`: Defines nsh fields tag values.
  
  `fields_name`: Specifies name of the nsh-field. This is entered as an alphanumeric string of 1 through 64 characters.

- `tag-value`: Associates a tag to a field.
  
  `tag_value`: Tag value for the NSH field.

- `content-type`: Specifies content type of payload.

- `imei`: Specifies imei of the subscriber.

- `imsi`: Specifies imsi of the subscriber.

- `imisdn`: Specifies imisdn of the subscriber.

- `rating-group`: Specifies rating-group applied for the traffic.

- `rulebase`: Specifies rule-base of the subscribers.

- `tdf-app-id`: Specifies tdf application id applied to the traffic

**NSH Format Configuration Mode**

The NSH Format Configuration mode is a sub-mode of the NSH Configuration mode. This NSH Format mode is used to encode or decode NSH.

Exec > Global Configuration> Network Service Header > Network Service Header - Format

```
configure
  nsh
   nsh-format format_name
end
```

Entering the above command sequence results in the following prompt:

```
[local]host_name(nsh-nshformat)#
```
**encode**

This new CLI command is added to the NSH Format configuration mode. This command defines the NSH encoding fields to be associated with the NSH format.

```plaintext
configure
  nsh
    nsh-format format_name
      encode nsh-fields fields_name
    end
end
```

Notes:

- **nsh-format**: Defines format in NSH header.
  - `format_name`: Specifies name of the NSH format. This is entered as an alphanumeric string of 1 through 64 characters.
- **encode**: Associates nsh-fields for encoding.
- **nsh-fields**: Defines nsh fields tag value.
  - `fields_name`: Specifies name of the fields. This is entered as an alphanumeric string of 1 through 64 characters.

**encoding-frequency**

This command defines frequency of encoding the NSH fields to be associated with the NSH format.

```plaintext
configure
  nsh
    nsh-format format_name
      encoding-frequency { always | once-per-flow }
    end
end
```

Notes:

- **encoding-frequency**: Defines frequency of encoding nsh-fields.
  - `always`: Encodes nsh fields on every hit.
  - `once-per-flow`: Encodes nsh fields once per flow.

**decode**

This command defines the NSH decoding fields to be associated with the NSH format.

```plaintext
configure
  nsh
    nsh-format format_name
      decode nsh-fields fields_name
    end
end
```

Notes:
• **nsh-format**: Defines format in NSH header.

  *format name*: Specifies name of the *NSH format*. This is entered as an alphanumeric string of 1 through 64 characters.

• **decode**: Associates nsh-fields for decoding.

• **nsh-fields**: Defines nsh fields tag value.

  *fields name*: Specifies name of the fields. This is entered as an alphanumeric string of 1 through 64 characters.

### Trigger Condition Configuration Mode Commands

#### content-type

This command specifies the content type to be matched.

```
configure
  active-charging service service_name
    trigger-condition trigger_condition_name
      content-type { operator condition }
    end
end
```

**Notes:**

• **trigger-condition**: Defines ACS trigger conditions.

  *trigger_condition_name*: Specifies name of the trigger condition. This is entered as an alphanumeric string of 1 through 64 characters.

• **content-type**: Specifies the content type.

• **operator**: Specifies how to match. Operator must be one of the following:

  • !=: not equals

  • !contains: not contains

  • !ends-with: not ends with

  • !starts-with: not starts with

  • =: equals

  • contains: contains

  • ends-with: ends with

  • starts-with: starts with

• **condition**: Specifies the condition to match. Condition must be one of the following:

  • FALSE

  • TRUE
**tdf-app-id**

This command specifies the identifier for application-based rules to be matched.

```configure
active-charging service service_name
    trigger-condition trigger_condition_name
        tdf-app-id { operator condition }
end
```

**Notes:**

- **trigger-condition**: Defines ACS trigger conditions.
  - `trigger_condition_name`: Specifies name of the trigger condition. This is entered as an alphanumeric string of 1 through 64 characters.
- **tdf-app-id**: Specifies the identifier for application based rules.
- **operator condition**: Specifies how to match. Operator must be one of the following:
  - `!=`: not equals
  - `!contains`: not contains
  - `!ends-with`: not ends with
  - `!starts-with`: not starts with
  - `=`: equals
  - `contains`: contains
  - `ends-with`: ends with
  - `starts-with`: starts with
- **condition**: Specifies the condition to match. Condition must be one of the following:
  - `FALSE`
  - `TRUE`

---

**Sample Configuration for NSH Creation**

The following is a sample configuration for this NSH service creation:

```config
config
    nsh
        nsh-fields xyz
            tag-val 1 imei
            tag-val 2 imsi
        exit
        nsh-fields abc
            tag-val 4 content-type
        exit
    nsh-format format1
        encoding frequency always
```
encode nsh-fields xyz
debug nsh-fields abc
exit
exit
traffic-steering
appliance-group firewall
nsh-format format1
ip address 1.2.3.4
#exit
#exit
service-chain sch1
sfp direction uplink service-index 1 appliance firewall
#exit
exit
config
  active-charging service ACS
  trigger-action ta1
  throttle-suppress
  exit
  trigger-condition tc1
  content-type contains text
  exit
  service-scheme sch1
  trigger nsh-response-received
  priority 1 trigger-condition tc1 trigger-action ta1
  exit
exit
subs-class class1
  any-match = TRUE
exit
subscriber-base base1
  priority 1 subs-class class1 bind service-scheme sch1
  exit
charging-action ca1
  service-chain xyz
  exit
exit
exit

Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of the feature.

show nsh statistics

This command has been newly added in this release to display the nsh statistics. Following is the output when you execute this command:

Total Encap Successful : 0
Total Decap Successful : 0
Total Encap Failed : 0
Memory Allocation : 0
Config Error : 0
Encryption Failed : 0
Total Decap Failed : 0
Config Error : 0
Base Header

show active-charging trigger-condition statistics

The output of this command includes the following field for this feature:

- NSH-Rsp-Rcvd

This field displays the matching of trigger condition based on NSH response.
show active-charging trigger-condition statistics
CHAPTER 47

Overcharging Protection Support

This chapter describes the Overcharging Protection Support feature and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model and configure the required elements for that model, as described in the P-GW Administration Guide, the S-GW Administration Guide, or the SAEGW Administration Guide before using the procedures in this chapter.

This chapter includes the following sections:

• Overcharging Protection Feature Overview, on page 839
• License, on page 840
• Configuring Overcharging Protection Feature, on page 840
• Monitoring and Troubleshooting, on page 842

Overcharging Protection Feature Overview

Overcharging Protection helps in avoiding charging the subscribers for dropped downlink packets while the UE is in idle mode. In some countries, it is a regulatory requirement to avoid such overcharging, so it becomes a mandatory feature for operators in such countries. Overall, this feature helps ensure subscriber are not overcharged while the subscriber is in idle mode.

This feature is supported on the P-GW, and S-GW. Overcharging Protection is supported on the SAEGW only if the SAEGW is configured for Pure P or Pure S functionality.

P-GW will never be aware of UE state (idle or connected mode). Charging for downlink data is applicable at P-GW, even when UE is in idle mode. Downlink data for UE may be dropped at S-GW when UE is in idle mode due to buffer overflow or delay in paging. Thus, P-GW will charge the subscriber for the dropped packets, which isn't desired. To address this problem, with Overcharging Protection feature enabled, S-GW will inform P-GW to stop or resume charging based on packets dropped at S-GW and transition of UE from idle to active state.

If the S-GW supports the Overcharging Protection feature, then it will send a CSReq with the PDN Pause Support Indication flag set to 1 in an Indication IE to the P-GW.

If the P-GW supports the Overcharging Protection feature then it will send a CSRsp with the PDN Pause Support Indication flag set to 1 in Indication IE and/or private extension IE to the S-GW.
Once the criterion to signal "stop charging" is met, S-GW will send Modify Bearer Request (MBReq) to P-GW. MBReq would be sent for the PDN to specify which packets will be dropped at S-GW. The MBReq will have an indication IE and/or a new private extension IE to send "stop charging" and "start charging" indication to P-GW. For Pause/Start Charging procedure (S-GW sends MBReq), MBRes from P-GW will have indication and/or private extension IE with Overcharging Protection information.

When the MBReq with stop charging is received from a S-GW for a PDN, P-GW will stop charging for downlink packets but will continue sending the packets to S-GW.

P-GW will resume charging downlink packets when either of these conditions is met:

• When the S-GW (which had earlier sent "stop charging" in MBReq) sends "start charging" in MBReq.
• When the S-GW changes (which indicates that maybe UE has relocated to new S-GW).

This feature aligns with the 3GPP TS 29.274: 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunneling Protocol for Control plane (GTPv2-C) specification.

Important

When Overcharging Protection feature is configured at both P-GW service and APN, configuration at APN takes priority.

License

Overcharging Protection is a license enabled feature and a new license key has been introduced for Overcharging Protection for P-GW functionality.

Important

Contact your Cisco account representative for information on how to obtain a license.

Configuring Overcharging Protection Feature

This section describes how to configure overcharging protection support on the P-GW and S-GW.

Configuring Overcharging Support on the P-GW

This command enables overcharge protection for APNs controlled by this APN profile and configures overcharging protection by temporarily not charging during loss of radio coverage. Each overcharging protection option is a standalone configuration and it does not override the previous option set, if any. Use this command to specify P-GW to pause charging on abnormal-s1-release, DDN failure notification, or if the number of packets or bytes dropped exceeds the configured limit.

Important

This configuration sequence is valid for the P-GW only.

```
configure
    apn-profile apn_profile_name
```
overcharge-protection { abnormal-s1-release | ddn-failure | drop-limit drop_limit_value { packets | bytes } }  
[ remove ] overcharge-protection { abnormal-s1-release | ddn-failure | drop-limit }  
end

Notes:

• **remove:**
  Removes the specified configuration.

• **abnormal-s1-release:**
  (for future use) If overcharging protection is enabled for abnormal-s1-release, S-GW would send MBR to pause charging at P-GW if Abnormal Release of Radio Link signal occurs from MME.

• **ddn-failure:**
  If overcharging protection is enabled for ddn-failure message, MBR would be sent to P-GW to pause charging upon receiving DDN failure from MME/S4-SGSN.

• **drop-limit drop_limit_value { packets | bytes }**
  Send MBR to pause charging at P-GW if specified number of packets/bytes is dropped for a PDN connection.
  
  *drop_limit_value* is an integer from 1 through 99999.

  • **packets:** Configures drop-limit in packets.
  • **bytes:** Configures drop-limit in bytes.

### Configuring Overcharging Support on the S-GW

The following configuration is required for overcharging support on the S-GW:

```text
configure
  context context_name
    egtp-service service_name
      gtpc private-extension overcharge-protection
end
```

Notes:

• Enabling this command indicates that the S-GW has to interact with a release 15 P-GW for the overcharging protection feature which does not support 3GPP TS 29.274 Release 12 – 3GPP Evolved Packet System (EPS); Evolved General Packet Radio Service (GPRS) Tunneling Protocol for Control plane (GTPv2-C); Stage 3.

• When the `gtpc private-extension overcharge-protection` command is configured, the S-GW includes a Private Extension in the Create Session Request (CSReq) and Modify Bearer Request (MBReq) messages.

• Whenever a P-GW receives a CSReq with an Indication IE with the PDN Pause Support Indication flag set to 1, it responds only with an Indication IE.

• When a CSReq does not have an Indication IE with the PDN Pause Support Indication flag set to 1, but the P-GW supports Overcharging Protection, then it responds with both an Indication and Private Extension IE.
Monitoring and Troubleshooting

P-GW Schema

The following bulk statistics have been added to the P-GW schema for Overcharging Protection:

For descriptions of these variables, see the Statistics and Counters Reference guide.

- sessstat-ovrchrgprtctn-uplkpktdrop
- sessstat-ovrchrgprtctn-uplkbytedrop
- sessstat-ovrchrgprtctn-dnlkpktdrop
- sessstat-ovrchrgprtctn-dnlkbytedrop

show apn statistics all

The following counters display overcharging protection stats for this APN:

- UL Ovrchrgr Prtctn byte drop
- UL Ovrchrgr Prtctn pkt drop
- DL Ovrchrgr Prtctn byte drop
- DL Ovrchrgr Prtctn pkt drop

show pgw-service all

The following field display configuration information for Overcharging Protection on this P-GW service:

- EGTP Overcharge Protection

show pgw-service statistics all

The following counters display Overcharging Protection for this P-GW node:

- Drops Due To Overcharge Protection
  - Packets
  - Bytes

show sgw-service statistics name <sgw_service_name>

The output of this command shows the total number of PDNs where charging was paused:

- PDNs Total:
  - Paused Charging: <Total number of PDNs where charging was paused>

show subscribers full

The following counters display Overcharging Protection for all subscribers:
When a session is in overcharge protection state, not all the downlink packets will be dropped; however, downlink packets will be rate limited. Current configuration allows one downlink packet per minute towards S-GW without charging it, if any downlink packets come to P-GW. P-GW will not generate any packets of its own.; separate debug stats have been added for P-GW.

**Important**

show subscribers pgw-only full all

The following field and counters display Overcharging Protection:

- Bearer State
  - in packet dropped overcharge protection
  - in bytes dropped overcharge protection
  - out packet dropped overcharge protection
  - out bytes dropped overcharge protection

show subscribers summary

The following counters display overcharging protection for all subscribers:

- in bytes dropped ovrchrgPtn
- in packet dropped ovrchrgPtn
- out bytes dropped ovrchrgPtn
- out packet dropped ovrchrgPtn

**Important**

When a session is in overcharge protection state, not all the downlink packets will be dropped; however, downlink packets will be rate limited. Current configuration allows one downlink packet per minute towards S-GW without charging it, if any downlink packets come to P-GW. P-GW will not generate any packets of its own; separate debug stats have been added for P-GW.

Feature Description

When an IoT UE is attached, they send a message, as needed, and go into Power Saving Mode (PSM) until the time they have to transmit the next message. The IoT UE does not detach (that is, session termination) after every message. By assessing the number of such messages through CDRs generated for the IoT UE session, the Operator can implement billing for IoT devices by including the packet counts in offline billing records.

Important

This feature is applicable to custom24 GTPP dictionary.

How It Works

As part of this feature, two new attributes are introduced for the packet count: datapacketsFBCDownlink and datapacketsFBCUplink. These two attributes are CLI-controlled and visible only when the CLI is enabled. The existing attributes are not modified or removed.

Configuring Packet Count in G-CDR

This section provides information about the CLI commands available in support of the feature.

Enabling Packet Count in G-CDR

Use the following commands to enable or disable sending of packet counts in G-CDR under the GTPP Server Group Configuration mode.

```plaintext
configure context context_name
gtp group group_name
[ no ] gtpp attribute packet-count
end
```

NOTES:

- **no**: Disables sending of uplink and downlink packet count in G-CDR.
- **packet-count**: Specifying this option includes the optional field of "datapacketFBCUplink" and "datapacketFBCDownlink" in the CDR.
- By default, the `gtpp attribute packet-count` CLI command is disabled.

Monitoring and Troubleshooting

This section provides information regarding CLI commands available for monitoring and troubleshooting the feature.
**Show Command(s) and/or Outputs**

This section provides information regarding show commands and/or their outputs in support of this feature.

**show configuration**

The output of this CLI command has been enhanced to display the following new field when the feature is enabled: gtpp attribute packet-count

**show gtpp group name <name>**

The output of this CLI command has been enhanced to display the following new field when the feature is enabled: Packet count present
show gtpp group name <name>
This chapter describes the Paging Policy Differentiation feature and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model and configure the required elements for that model, as described in the P-GW Administration Guide, the S-GW Administration Guide, or the SAEGW Administration Guide before using the procedures in this chapter.

This chapter includes the following sections:

- Feature Description, on page 849
- How It Works, on page 850
- Configuring Paging Policy Differentiation Feature, on page 851
- Monitoring and Troubleshooting Paging Policy Differentiation, on page 852

### Feature Description

S-GW/P-GW provide configuration control to change the DSCP value of the user-datagram packet and outer IP packet (GTP-U tunnel IP header). DSCP marking is done at various levels depending on the configuration. When the Paging Policy Differentiation (PPD) feature is enabled, however, the user-datagram packet DSCP (tunneled IP packet) marking does not change.

Currently, standards specify QCI to DSCP marking of outer GTP-U header only. All configurations present at ECS, P-GW, and S-GW to change the user-datagram packet DSCP value are non-standard. The standards-based PPD feature dictates that P-CSCF or similar Gi entity marks the DSCP of user-datagram packet. This user-datagram packet DSCP value is sent in DDN message by S-GW to MME/S4-SGSN. MME/S4-SGSN uses this DSCP value to give paging priority.

---

**Important**

P-GW and S-GW should apply the PPD feature for both Default and Dedicated bearers. As per the specifications, P-GW transparently passes the user-datagram packet towards S-GW. This means, if PPD feature is enabled, operator can't apply different behavior for Default and Dedicated bearers.

---

### Relationships

Since P-GW/S-GW support non-standard based DSCP marking, there is a conflict when both standard based PPD feature and non-standard based user-datagram packet DSCP configuration is enabled. To avoid this conflict:
• APN and service level configuration is ignored if PPD feature is enabled.

• S-GW/P-GW can alter the outer GTP-U header DSCP value, even if PPD feature is enabled.

• User-datagram packet DSCP value is unaltered by ECS, P-GW, and S-GW if PPD feature is enabled.

• At P-GW, APN-level configuration is added to enable/disable the PPD feature.

• At S-GW, service-level configuration is added to enable/disable the PPD feature. This is to send DSCP in Paging and Service Information IE of all the DDN messages triggered by either IMS-PDN or Internet-PDN, etc.

Important

It is up to MME/S4-SGSN to use the Paging and Service Information IE of DDN message.

• Separate Paging feature and PPD feature co-exist in system. That means, if both features are enabled, both Paging and Service Information IE and Separate-paging IE are sent in DDN.

• Currently on P-GW, the DSCP configuration is getting applied at sub-session level during call setup time. So, when the PPD CLI is enabled for P-GW, it is applicable for new calls.

• Currently on S-GW, the DSCP configuration is getting applied at S-GW service level. So, when PPD CLI is enabled in S-GW service, it is applicable for both new and existing calls.

• Once the PPD CLI is enabled, it exists even after Session Recovery and ICSR switch over.

• The Paging and Service Information IE is used to carry per bearer paging and service information.

License

PPD is a license enabled feature. S-GW Paging Profile license key is required to enable PPD functionality for P-GW, S-GW, and SAEGW.

Important

Contact your Cisco account representative for information on how to obtain a license.

How It Works

Architecture

S-GW

When S-GW supports the PPD feature, it shall include new Paging and Service Information IE in the Downlink Data Notification message triggered by the arrival of downlink data packets at the S-GW. The Paging Policy Indication value within this IE will contain the value of the DSCP in TOS (IPv4) or TC (IPv6) information received in the IP payload of the GTP-U packet from the P-GW.

At S-GW, service-level configuration enables/disables the PPD feature. Once the PPD is configured, the feature is enabled and applicable for both existing and new calls.
P-GW

User-datagram packet DSCP value is unaltered by P-GW for downlink data. The PPD feature is supported only for S5/S8 interface. For all Handoff scenarios from other interface to S5/S8 interface, the PPD feature will get enabled if APN had it during its call setup time at that interface.

At P-GW, APN-level configuration enables/disables the PPD feature. If PPD feature is enabled for the call and handoff happens from S5/S8 interface to any other interface, PPD feature should get disabled. Now, if handoff happens and this call will come back to S5/S8 interface, PPD feature should become enabled.

SAEGW

To support PPD feature in SAEGW, both S-GW and P-GW configuration is required.

Relationships to Other Features

- The PPD feature is license controlled under the license for S-GW Paging Profile. Once the license is enabled, both features co-exist together and work independently. That means, DDN message might carry both DSCP marking specified by PPD feature and Priority DDN value specified by S-GW Paging Profile feature.

- At S-GW, the user-datagram packet DSCP value is used to send in DDN. S-GW can't change the DSCP, as per the local configuration (APN profile or service level). At eNodeB, the scheduling of the packet is based on the QCI instead of DSCP, however, any EPC node should not change/modify the inner DSCP value.

- If the PPD feature is enabled, none of the EPS nodes should change the user-datagram packet DSCP value. Therefore, ECS should avoid overwriting DSCP value of user-datagram packet when PPD is enabled.

Standards Compliance

The PPD functionality complies with the following standards:

- 29.274, CR-1565, "Paging Policy Indication in Downlink Data Notification Message"

- 23.401, CR-2731 "Paging policy differentiation for IMS voice"

Configuring Paging Policy Differentiation Feature

For the PPD feature to work, it must be enabled for P-GW and S-GW.

Both P-GW and S-GW services apply PPD configuration independently. Therefore, for any downlink data packet from an APN, there could be a case where P-GW does not have PPD configuration but S-GW has PPD configuration. To avoid such a conflict, you must configure the PPD functionality on both P-GW (APN level granularity) and S-GW (service level granularity).

Configuration

The following CLI commands are used to manage the functionality for the PPD feature.
Enabling on P-GW
The following command enables the PPD feature on P-GW at APN level.

```
configure
c    context context_name
    apn apn_name
        paging-policy-differentiation
    end
```

Enabling on S-GW
The following command enables the PPD feature on S-GW at service level.

```
configure
c    context context_name
    sgw-service service_name
        paging-policy-differentiation
    end
```

Notes:
- This is to send DSCP in Paging and Service Information IE of all the DDN messages triggered by either IMS-PDN or Internet-PDN, etc.
- It is up to MME/S4-SGSN to use the Paging and Service Information IE of DDN message.
- If PPD feature is enabled at S-GW service, it is applicable for all calls irrespective of the APN profiles.

Disabling on P-GW
The following command disables the PPD feature on P-GW at APN level.

```
configure
c    context context_name
    apn apn_name
        no paging-policy-differentiation
    end
```

Disabling on S-GW
The following command disables the PPD feature on S-GW at service level.

```
configure
c    context context_name
    sgw-service service_name
        no paging-policy-differentiation
    end
```

Monitoring and Troubleshooting Paging Policy Differentiation

This section includes show commands in support of the PPD feature.
**P-GW Show Commands**

This section provides information regarding P-GW show commands and/or their outputs in support of the PPD feature.

`show apn name <apn_name>`

The following counter has been added to display PPD functionality.

Paging Policy Differentiation : Enabled

`show subscribers pgw-only full all`

The following counter has been added to display PPD functionality.

Paging Policy Differentiation : Enabled

**SAEGW Show Commands**

This section provides information regarding SAEGW show commands and/or their outputs in support of the PPD feature.

`show subscribers saegw-only full all`

The following counter has been added to display PPD functionality.

Paging Policy Differentiation : Enabled

**S-GW Show Commands**

This section provides information regarding S-GW show commands and/or their outputs in support of the PPD feature.

`show sgw-service name <service_name>`

The following counter has been added to display PPD functionality.

Paging Policy Differentiation : Enabled
show sgw-service name <service_name>
P-GW Handoff KPIs for VoWiFi

Feature Changes

Currently, there are no statistics to determine the number of new sessions started on a particular RAT technology and to monitor any inter-technology handovers per APN.

This feature introduces new session/handoff KPIs and P-GW VoWiFi specific KPIs to monitor the following:

- the number of new sessions started on a particular RAT technology
- the inter-technology handover per APN from and to all access technologies
- subscriber activity for network planning

The statistical information is maintained per APN and per P-GW/SAEGW service type. CLIs are applicable only for P-GW and SAEGW product. If eHRPD/PMIP/GGSN services are associated with a P-GW/SAEGW service, then counters related to these services will be reflected under P-GW/SAEGW service statistics CLI output.

Benefits

With the introduction of this feature, operators can have KPIs to monitor per RAT Initiated Sessions and Inter-technology handovers so that they can gauge 2G/3G/4G/WiFi/eHRPD coverage.

Operators can also:

- get statistics that report on:
  - new access technologies such as Wi-Fi that uses the ePDG
  - how a session has been initiated
  - how many handoffs have been done
- track subscriber activity in the network
- plan network accordingly
Limitations

- Initiated session statistics and handover statistics at APN-level are not maintained or incremented at demux due to memory and CPU constraints. During congestion scenarios, for example, some of the calls are rejected at the demux and so this count will not show up in the APN-level initiated session counter.

- Bulkstats for eHRPD and S2b-PMIP are not supported under SAEGW schema.

Monitoring and Troubleshooting P-GW Handoff KPIs for VoWiFi

The following section describes commands available to monitor P-GW Handoff KPIs for VoWiFi.

HandOff KPIs for VoWiFi Show Commands

The following section describes commands available to monitor Handoff KPIs for VoWiFi.

```
show apn statistics [ all | name apn_name | verbose ]
```

This command displays the following output.

```
Initiated Sessions per RAT Type:
   EUTRAN: 0 UTRAN: 0
   GERAN: 0 EHRPD: 0
   S2A GTP: 0 S2B GTP: 0
   S2B PMIP: 0

Inter Technology handover:
   GNGP-to-LTE handover: LTE-to-GNGP handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   GNGP-to-S4SGSN handover: S4SGSN-to-GNGP handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   S4SGSN-to-LTE handover: LTE-to-S4SGSN handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   LTE-to-eHRPD handover: eHRPD-to-LTE handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   LTE-to-S2bPMIP handover: S2bPMIP-to-LTE handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   eHRPD-to-S2bPMIP handover: S2bPMIP-to-eHRPD handover:
      Attempted: 0 Attempted: 0
      Succeeded: 0 Succeeded: 0
      Failed: 0 Failed: 0

   S2bGTP-to-LTE handover: LTE-to-S2bGTP handover:
      Attempted: 0 Attempted: 0
```
Succeeded: 0  Succeeded: 0
Failed: 0   Failed: 0

S2bGTP-to-eHRPD handover:  eHRPD-to-S2bGTP handover:
  Attempted: 0   Attempted: 0
  Succeeded: 0   Succeeded: 0
  Failed: 0   Failed: 0

S2aGTP-to-LTE handover:  LTE-to-S2aGTP handover:
  Attempted: 0   Attempted: 0
  Succeeded: 0   Succeeded: 0
  Failed: 0   Failed: 0

show pgw-service statistics { all | name service_name }

The command displays the following output:

Initiated PDNs By RAT-Type:
  EUTRAN: 0  UTRAN: 0
  GERAN: 0   EHRPD: 0
  S2A GTP: 0  S2B GTP: 0
  S2B PMIP: 0

show saegw-service statistics { all | name service_name } function pgw

The command displays the following output:

Initiated PDNs By RAT-Type:
  EUTRAN: 0  UTRAN: 0
  GERAN: 0   EHRPD: 0
  S2A GTP: 0  S2B GTP: 0
  S2B PMIP: 0

Schema for P-GW Handoff KPIs for VoWiFi

This section lists the schemas added in for the P-GW Handoff KPIs for VoWiFi Feature.

APN Schema

Initiated Sessions Statistics Information based on RAT Technology:

The following new counters have been added to display the number of Initiated Sessions per RAT type, per Service/APN in this enhancement:

  • initiated-eutran-sessions
  • initiated-utran-sessions
  • initiated-geran-sessions
  • initiated-ehrpd-sessions
  • initiated-s2a-gtp-sessions
  • initiated-s2b-gtp-sessions
  • initiated-s2b-pmip-sessions

Inter-Technology Handover Statistics:
The following new counters have been added to display the number of inter-technology handover statistics per APN/Service have been added in this enhancement:

- apn-handoverstat-gngptolteatt
- apn-handoverstat-gngptoltesucc
- apn-handoverstat-gngptoltefail

| • Statistics and Counters Reference    |
Feature Description

The Presence Reporting Area is an area defined within the 3GPP packet domain for reporting of UE presence within that area. This feature is required for policy control and in charging scenarios. In E-UTRAN, the PRA may consist in a set of neighbor or non-neighbor Tracking Areas, or eNBs or cells. There are two types of Presence Reporting Areas: "UE-dedicated Presence Reporting Areas" and "Core Network pre-configured Presence Reporting Areas" that apply to an MME pool.

- This feature supports LTE/S4-SGSN related RAT-type. For any other RAT type, P-GW ignores the PRA information received from the PCRF.
- Currently single PRA-ID is supported per session as specification compliance.
- Currently, in P-GW, core network pre-configured presence reporting area is supported.
- For ICSR to N-1 release, PRA feature is not supported.
- PRA-ID is not supported on CDR interface, that is, Gz, Gy and Rf.

How It Works

During an IP-CAN session, the PCRF determines whether the reports for change of the UE presence in the PRA are required for an IP-CAN session. This determination is made based on the subscriber's profile configuration and the supported AVP features. The parameter CNO-ULI is set for the same. If reporting is required for the IP-CAN session, the PCRF provides Presence-Reporting-Area-Information AVP, which contains the PRA identifier within the Presence-Reporting-Area-Identifier AVP, to the PCEF.

For a UE-dedicated PRA, PCRF provides the list of elements consisting of the PRA within the Presence-Reporting-Area-Elements-List AVP to the PCEF. The PCRF might activate the reporting changes of the UE presence in the PRA by subscribing to the CHANGE_OF_UE_PRESENCE_IN_PRESENCE_REPORTING_AREA_REPORT event trigger at the PCEF at any time during the entire IP-CAN session.

When the UE enters or leaves the PRA, PCEF reports the CHANGE_OF_UE_PRESENCE_IN_PRESENCE_REPORTING_AREA_REPORT event. Within the PCEF also reports the PRA status within the Presence-Reporting-Area-Status AVP and PRA identifier within Presence-Reporting-Area-Identifier AVP included in Presence-Area-Information AVP.

The following table describes the scenario and its associated behavior:
<table>
<thead>
<tr>
<th>Scenario</th>
<th>Behavior</th>
</tr>
</thead>
</table>
| When PCRF sends a new PRA ID different than the initial call setup | • P-GW receives the new PRA ID during the initial call setup and stores the PRA ID information.  
• In RAR, the PRA_EVENT_TRIGGER is registered.  
• P-GW sends PRA_ACTION PRA ID="A", ACTION=start.  
• In CCA-U, a new PRA ID is received.  
• P-GW stores new PRA ID information.  
• P-GW sends PRA_ACTION PRA ID = "B", Action=start but does not send Action=stop for the earlier PRA.  
**Important** Ideally, in the above condition, PCRF disables the event triggers first and sends a new PRA-ID=B and enables the event trigger in subsequent message. |
| When PCRF sends a new PRA ID which is same as the initial call setup | PRA ID does not send any PRA Action towards S-GW, and P-GW ignores this. |
| PRA ID Decode Behavior | If PRA ID received is "core network pre-configured presence reporting area", then, P-GW ignores the "Element List" coming from PCRF. Otherwise, if PRA ID is "UE-dedicated Presence Reporting Area", then, P-GW parses the "Element List" and forwards it toward the access side. |
| If PRA ID values from PCRF are 1 octet, 2 octets, and 3 octets | MSB of the value received from the PCRF is evaluated to find the PRA type. While encoding, GTPC side zeros are prepended to make it 3 octets.  
For example, if PRA ID = FC (1111 1100) is received from PCRF, it is considered as UE-dedicated PRA and while decoding it is decoded as 00 00 FC.  
P-GW forwards PRA information toward the roaming subscriber if it is received from the PCRF or UE.  
**Important** Change of UE presence in the Presence Reporting Area reporting does not apply to the roaming scenario. |
| Roaming Scenario | Change of UE presence in the Presence Reporting Area reporting does not apply to the roaming scenario.  
When the serving EPC node (MME, S4-SGSN) is changed, the Presence Reporting Area identifier is transferred for all PDN connections as part of the MM Context information to the target serving node during the mobility procedure. The list of Presence Reporting Area elements are also transferred if they are provided by the P-GW. |
<table>
<thead>
<tr>
<th>Scenario</th>
<th>Behavior</th>
</tr>
</thead>
<tbody>
<tr>
<td>Handover Behavior: How the PRA identifier is communicated from source MME/S4-SGSN to target MME/S4-SGSN</td>
<td>MME/S4-SGSN gets the PRA Identifier from source MME/S4-SGSN as part of MM Context information. When the serving EPC node (MME, S4-SGSN) is changed, the Presence Reporting Area identifier is transferred for all PDN connections as part of the MM Context information to the target serving node during the mobility procedure. The list of Presence Reporting Area elements are also transferred if they are provided by the P-GW.</td>
</tr>
<tr>
<td>Handoff Behavior: How PRA is disabled when the new access type is not supported PRA</td>
<td>Depending on the access type and internal configuration PCRF deactivates the PRA, if the new access PRA is not supported. During an IP-CAN session, P-GW notifies the PCRF that the UE is located in an access type, where local PCRF configuration is such that the reporting changes of the UE presence in the PRA are not supported. The PCRF unsubscribes to the change of UE presence in the PRA, if previously activated.</td>
</tr>
<tr>
<td>Behavior if for E-UTRAN some nodes do not support PRA</td>
<td>If PRA is enabled from PCRF, then EPC nodes supports it. If all nodes are not supported, then PRA PCRF activates Location Change Reporting. <strong>Important</strong> For E-UTRAN access, homogeneous support of reporting changes of UE presence in a network is assumed. When the PCRF configuration indicates that reporting changes of the UE presence in a PRA is supported for E-UTRAN, this means all P-GWs, MMEs, and S-GWs support it, including the MME and S-GW working in the network sharing mode. If the change of UE presence in the PRA reporting is not supported, the PCRF may instead activate location change reporting at the cell or serving area level.</td>
</tr>
<tr>
<td>When access side procedure failure or collision occurs (Create or Update Bearer procedure)</td>
<td>In Update or Create bearer procedure failure where the PRA action was sent in the request message and if PRA information was not received in response message, P-GW attempts to send the PRA action in next control procedure toward the remote peer. In Update or Create bearer procedure failure where PRA action was sent in the request message and if PRA information was not received in the response message, P-GW assumes it as PRA action was successfully communicated toward the remote peer. In the Update or Create bearer collision scenario where PRA action was sent in the request message and Update or Create procedure got aborted, P-GW attempts to send the PRA action in next control procedure toward the remote peer.</td>
</tr>
</tbody>
</table>
Configuring Presence Reporting Area

Configuring PRA

Use the following configuration to enable the PRA:

```
configure
c  ontext context_name
    ims-auth-service service_name
    policy-control
    diameter encode-supported-features cno-uli
    { default | no } diameter encode-supported-features
end
```

NOTES:
- `diameter encode-supported-features`: Enables or disables encoding and sending of Supported-Features AVP.
- `no`: Removes the previously configured supported features.
- `default`: Applies the default setting for this command.

Monitoring and Troubleshooting

The following sections describe the commands available to monitor the feature.

Show Commands and Outputs

This section provides information regarding show commands and their outputs in support of this feature.

```
show ims-authorization service name <service-name>
```

The output of the above command is modified to display the negotiated conditional policy features related information. The modified output is as follows:

```
Context: ha
IMS Authorization Service name: imsa-Gx

diameter Policy Control:
   Endpoint: gx.st16.starentnetworks.com
   Origin-Realm: starentnetworks.com
   Dictionary: r8-gx-standard
   Supported Features:
   mission-critical-qcis
   conditional-policy-info-default-qos
   cno-uli
Request Timeout:
   Initial Request : 100 deciseconds
```
show ims-authorization sessions full all

The output of this command includes the following fields:

- CallId: 00004e26
- Service Name: imsa-Gx
- IMSI: 123456789012349
- Session ID: gx.st16.starentnetworks.com;20006;2305;598ab8cf-102
- Bearer Type: GTP
- SGSN IP-Addr: 192.168.23.4
- APN: starent.com
- Bearer Control Mode: UE/NW
- State: Connected
- Negotiated Supported Features:
  - 3gpp-r8
  - conditional-policy-info-default-qos

Chapter 52

Proxy-Mobile IP

This chapter describes system support for Proxy Mobile IP and explains how it is configured. The product administration guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model before using the procedures in this chapter.

Proxy Mobile IP provides a mobility solution for subscribers with mobile nodes (MNs) capable of supporting only Simple IP.

This chapter includes the following sections:

- Overview, on page 869
- How Proxy Mobile IP Works in 3GPP2 Network, on page 872
- How Proxy Mobile IP Works in 3GPP Network, on page 879
- How Proxy Mobile IP Works in WiMAX Network, on page 884
- How Proxy Mobile IP Works in a WiFi Network with Multiple Authentication, on page 890
- Configuring Proxy Mobile-IP Support, on page 897

Overview

Proxy Mobile IP provides mobility for subscribers with MNs that do not support the Mobile IP protocol stack.

Important

Proxy Mobile IP is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

The Proxy Mobile IP feature is supported for various products. The following table indicates the products on which the feature is supported and the relevant sections within the chapter that pertain to that product.

*Table 68: Applicable Products and Relevant Sections*
Proxy Mobile IP in 3GPP2 Service

For subscriber sessions using Proxy Mobile IP, R-P and PPP sessions get established between the MN and the PDSN as they would for a Simple IP session. However, the PDSN/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN (i.e. the MN is only responsible for maintaining the Simple IP PPP session with PDSN).

The MN is assigned an IP address by either the PDSN/FA or the HA. Regardless of its source, the address is stored in a mobile binding record (MBR) stored on the HA. Therefore, as the MN roams through the service provider's network, each time a hand-off occurs, the MN will continue to use the same IP address stored in the MBR on the HA.
Note that unlike Mobile IP-capable MNs that can perform multiple sessions over a single PPP link, Proxy Mobile IP allows only a single session over the PPP link. In addition, simultaneous Mobile and Simple IP sessions will not be supported for an MN by the FA that is currently facilitating a Proxy Mobile IP session for the MN.

The MN is assigned an IP address by either the HA, a AAA server, or on a static-basis. The address is stored in a mobile binding record (MBR) stored on the HA. Therefore, as the MN roams through the service provider's network, each time a hand-off occurs, the MN will continue to use the same IP address stored in the MBR on the HA.

**Proxy Mobile IP in 3GPP Service**

For IP PDP contexts using Proxy Mobile IP, the MN establishes a session with the GGSN as it normally would. However, the GGSN/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN (i.e. the MN is only responsible for maintaining the IP PDP context with the GGSN, no Agent Advertisement messages are communicated with the MN).

The MN is assigned an IP address by either the HA, a AAA server, or on a static-basis. The address is stored in a mobile binding record (MBR) stored on the HA. Therefore, as the MN roams through the service provider's network, each time a hand-off occurs, the MN will continue to use the same IP address stored in the MBR on the HA.

Proxy Mobile IP can be performed on a per-subscriber basis based on information contained in their user profile, or for all subscribers facilitated by a specific APN. In the case of non-transparent IP PDP contexts, attributes returned from the subscriber's profile take precedence over the configuration of the APN.

**Proxy Mobile IP in WiMAX Service**

For subscriber sessions using Proxy Mobile subscriber sessions get established between the MN and the ASN GW as they would for a Simple IP session. However, the ASN GW/FA performs Mobile IP operations with an HA (identified by information stored in the subscriber's profile) on behalf of the MN (i.e. the MN is only responsible for maintaining the Simple IP subscriber session with ASN GW).

The MN is assigned an IP address by either the ASN GW/FA or the HA. Regardless of its source, the address is stored in a mobile binding record (MBR) stored on the HA. Therefore, as the MN roams through the service provider's network, each time a hand-off occurs, the MN will continue to use the same IP address stored in the MBR on the HA.

Note that unlike Mobile IP-capable MNs that can perform multiple sessions over a single session link, Proxy Mobile IP allows only a single session over the session link. In addition, simultaneous Mobile and Simple IP sessions will not be supported for an MN by the FA that is currently facilitating a Proxy Mobile IP session for the MN.

**How Proxy Mobile IP Works in 3GPP2 Network**

This section contains call flows displaying successful Proxy Mobile IP session setup scenarios. There are multiple scenarios that are dependant on how the MN receives an IP address. The following scenarios are described:

- **Scenario 1**: The AAA server that authenticates the MN at the PDSN allocates an IP address to the MN. Note that the PDSN does not allocate an address from its IP pools.
• **Scenario 2**: The HA assigns an IP address to the MN from one of its locally configured dynamic pools.

**Scenario 1: AAA server and PDSN/FA Allocate IP Address**

The following figure and table display and describe a call flow in which the MN receives its IP address from the AAA server and PDSN/FA.
Scenario 1: AAA server and PDSN/FA Allocate IP Address

How Proxy Mobile IP Works in 3GPP Network

This section contains call flows displaying successful Proxy Mobile IP session setup scenarios in 3GPP network.

The following figure and the text that follows describe a sample successful Proxy Mobile IP session setup call flow in 3GPP service.
Figure 93: Proxy Mobile IP Call Flow in 3GPP

Table 71: Proxy Mobile IP Call Flow in 3GPP Description

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The mobile station (MS) goes through the process of attaching itself to the GPRS/UMTS network.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>2</td>
<td>The terminal equipment (TE) aspect of the MS sends AT commands to the mobile terminal (MT) aspect of the MS to place it into PPP mode. The Link Control Protocol (LCP) is then used to configure the Maximum-Receive Unit size and the authentication protocol (Challenge-Handshake Authentication Protocol (CHAP), Password Authentication Protocol (PAP), or none). If CHAP or PAP is used, the TE will authenticate itself to the MT, which, in turn, stores the authentication information. Upon successful authentication, the TE sends an Internet Protocol Control Protocol (IPCP) Configure-Request message to the MT. The message will either contain a static IP address to use or request that one be dynamically assigned.</td>
</tr>
<tr>
<td>3</td>
<td>The MS sends an Activate PDP Context Request message that is received by an SGSN. The message contains information about the subscriber such as the Network layer Service Access Point Identifier (NSAPI), PDP Type, PDP Address, Access Point Name (APN), quality of service (QoS) requested, and PDP configuration options.</td>
</tr>
<tr>
<td>4</td>
<td>The SGSN authenticates the request message and sends a Create PDP Context Request message to a GGSN using the GPRS Tunneling Protocol (GTPC, &quot;C&quot; indicates the control signalling aspect of the protocol). The recipient GGSN is selected based on either the request of the MS or is automatically selected by the SGSN. The message consists of various information elements including: PDP Type, PDP Address, APN, charging characteristics, and tunnel endpoint identifier (TEID, if the PDP Address was static).</td>
</tr>
</tbody>
</table>
## How Proxy Mobile IP Works in 3GPP Network

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 5    | The GGSN determines if it can facilitate the session (in terms of memory or CPU resources, configuration, etc.) and creates a new entry in its PDP context list and provides a Charging ID for the session.  
From the APN specified in the message, the GGSN determines whether or not the subscriber is to be authenticated, if Proxy Mobile IP is to be supported for the subscriber, and if so, the IP address of the HA to contact.  
Note that Proxy Mobile IP support can also be determined by attributes in the user's profile. Attributes in the user's profile supersede APN settings.  
If authentication is required, the GGSN attempts to authenticate the subscriber locally against profiles stored in memory or send a RADIUS Access-Request message to a AAA server. |
<p>| 6    | If the GGSN authenticated the subscriber to a AAA server, the AAA server responds with a RADIUS Access-Accept message indicating successful authentication and any attributes for handling the subscriber PDP context. |
| 7    | If Proxy Mobile IP support was either enabled in the APN or in the subscriber's profile, the GGSN/FA forwards a Proxy Mobile IP Registration Request message to the specified HA. The message includes such things as the MS's home address, the IP address of the FA (the care-of-address), and the FA-HA extension (security parameter index (SPI)). |
| 8    | The HA responds with a Proxy Mobile IP Registration Response. The response includes an IP address from one of its locally configured pools to assign to the MS (its Home Address). The HA also creates a mobile binding record (MBR) for the subscriber session. |
| 9    | The HA sends an RADIUS Accounting Start request to the AAA server which the AAA server responds to. |
| 10   | The GGSN replies with an affirmative Create PDP Context Response using GTPC. The response will contain information elements such as the PDP Address representing either the static address requested by the MS or the address assigned by the GGSN, the TEID used to reference PDP Address, and PDP configuration options specified by the GGSN. |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>11</td>
<td>The SGSN returns an Activate PDP Context Accept message to the MS. The message includes response to the configuration parameters sent in the initial request.</td>
</tr>
<tr>
<td>12</td>
<td>The MT, will respond to the TE's IPCP Config-request with an IPCP Config-Ack message. The MS can now send and receive data to or from the PDN until the session is closed or times out. Note that for Mobile IP, only one PDP context is supported for the MS.</td>
</tr>
<tr>
<td>13</td>
<td>The FA periodically sends Proxy Mobile IP Registration Request Renewal messages to the HA. The HA sends responses for each request.</td>
</tr>
<tr>
<td>14</td>
<td>The MS can terminate the data session at any time. To terminate the session, the MS sends a Deactivate PDP Context Request message that is received by the SGSN.</td>
</tr>
<tr>
<td>15</td>
<td>The SGSN sends a Delete PDP Context Request message to the GGSN facilitating the data session. The message includes the information elements necessary to identify the PDP context (i.e., TEID, and NSAPI).</td>
</tr>
<tr>
<td>16</td>
<td>The GGSN removes the PDP context from memory and the FA sends a Proxy Mobile IP Deregistration Request message to the HA.</td>
</tr>
<tr>
<td>17</td>
<td>The GGSN returns a Delete PDP Context Response message to the SGSN.</td>
</tr>
<tr>
<td>18</td>
<td>The HA replies to the FA with a Proxy Mobile IP Deregistration Request Response.</td>
</tr>
<tr>
<td>19</td>
<td>The HA sends an RADIUS Accounting Stop request to the AAA server which the AAA server responds to.</td>
</tr>
<tr>
<td>20</td>
<td>The SGSN returns a Deactivate PDP Context Accept message to the MS.</td>
</tr>
<tr>
<td>21</td>
<td>The GGSN delivers the GGSN Charging Detail Records (G-CDRs) to a charging gateway (CG) using GTP Prime (GTPP). Note that, though not shown in this example, the GGSN could optionally be configured to send partial CDRs while the PDP context is active.</td>
</tr>
</tbody>
</table>
How Proxy Mobile IP Works in WiMAX Network

This section contains call flows displaying successful Proxy Mobile IP session setup scenarios. There are multiple scenarios that are dependant on how the MN receives an IP address. The following scenarios are described:

- **Scenario 1**: The AAA server that authenticates the MN at the ASN GW allocates an IP address to the MN. Note that the ASN GW does not allocate an address from its IP pools.
- **Scenario 2**: The HA assigns an IP address to the MN from one of its locally configured dynamic pools.

### Scenario 1: AAA server and ASN GW/FA Allocate IP Address

</tr>
</tbody>
</table>
### How Proxy Mobile IP Works in a WiFi Network with Multiple Authentication

Proxy-Mobile IP was developed as a result of networks of Mobile Subscribers (MS) that are not capable of Mobile IP operation. In this scenario a PDIF acts a mobile IP client and thus implements Proxy-MIP support.

Although not required or necessary in a Proxy-MIP network, this implementation uses a technique called Multiple Authentication. In Multi-Auth arrangements, the device is authenticated first using HSS servers. Once the device is authenticated, then the subscriber is authenticated over a RADIUS interface to AAA servers. This supports existing EV-DO servers in the network.

The MS first tries to establish an IKEv2 session with the PDIF. The MS uses the EAP-AKA authentication method for the initial device authentication using Diameter over SCTP over IPv6 to communicate with HSS servers. After the initial Diameter EAP authentication, the MS continues with EAP MD5/GTC authentication.

After successful device authentication, PDIF then uses RADIUS to communicate with AAA servers for the subscriber authentication. It is assumed that RADIUS AAA servers do not use EAP methods and hence RADIUS messages do not contain any EAP attributes.

Assuming a successful RADIUS authentication, PDIF then sets up the IPSec Child SA tunnel using a Tunnel Inner Address (TIA) for passing control traffic only. PDIF receives the MS address from the Home Agent, and passes it on to the MS through the final AUTH response in the IKEv2 exchange.

When IPSec negotiation finishes, the PDIF assigns a home address to the MS and establishes a CHILD SA to pass data. The initial TIA tunnel is torn down and the IP address returned to the address pool. The PDIF then generates a RADIUS accounting START message.

When the session is disconnected, the PDIF generates a RADIUS accounting STOP message.
The following figures describe a Proxy-MIP session setup using CHAP authentication (EAP-MD5), but also addresses a PAP authentication setup using EAP-GTC when EAP-MD5 is not supported by either PDIF or MS.

Figure 96: Proxy-MIP Call Setup using CHAP Authentication

Table 74: Proxy-MIP Call Setup using CHAP Authentication

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>On connecting to WiFi network, MS first send DNS query to get PDIF IP address</td>
</tr>
<tr>
<td>2</td>
<td>MS receives PDIF address from DNS</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>3</td>
<td>MS sets up IKEv2/IPsec tunnel by sending IKE_SA_INIT Request to PDIF. MS includes SA, KE, Ni, NAT-DETECTION Notify payloads in the IKEv2 exchange.</td>
</tr>
<tr>
<td>4</td>
<td>PDIF processes the IKE_SA_INIT Request for the appropriate PDIF service (bound by the destination IP address in the IKEv2 INIT request). PDIF responds with IKE_SA_INIT Response with SA, KE, Nr payloads and NAT-Detection Notify payloads. If multiple-authentication support is configured to be enabled in the PDIF service, PDIF will include MULTIPLE_AUTH_SUPPORTED Notify payload in the IKE_SA_INIT Response. PDIF will start the IKEv2 setup timer after sending the IKE_SA_INIT Response.</td>
</tr>
<tr>
<td>5</td>
<td>On receiving successful IKE_SA_INIT Response from PDIF, MS sends IKE_AUTH Request for the first EAP-AKA authentication. If the MS is capable of doing multiple-authentication, it will include MULTI_AUTH_SUPPORTED Notify payload in the IKE_AUTH Request. MS also includes IDi payload which contains the NAI, SA, TSi, TSR, CP (requesting IP address and DNS address) payloads. MS will not include AUTH payload to indicate that it will use EAP methods.</td>
</tr>
<tr>
<td>6</td>
<td>On receiving IKE_AUTH Request from MS, PDIF sends DER message to Diameter AAA server. AAA servers are selected based on domain profile, default subscriber template or default domain configurations. PDIF includes Multiple-Auth-Support AVP, EAP-Payload AVP with EAP-Response/Identity in the DER. Exact details are explained in the Diameter message sections. PDIF starts the session setup timer on receiving IKE_AUTH Request from MS.</td>
</tr>
<tr>
<td>7</td>
<td>PDIF receives DEA with Result-Code AVP specifying to continue EAP authentication. PDIF takes EAP-Payload AVP contents and sends IKE_AUTH Response back to MS in the EAP payload. PDIF allows IDr and CERT configurations in the PDIF service and optionally includes IDr and CERT payloads (depending upon the configuration). PDIF optionally includes AUTH payload in IKE_AUTH Response if PDIF service is configured to do so.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>8</td>
<td>MS receives the IKE_AUTH Response from PDIF. MS processes the exchange and sends a new IKE_AUTH Request with EAP payload. PDIF receives the new IKE_AUTH Request from MS and sends DER to AAA server. This DER message contains the EAP-Payload AVP with EAP-AKA challenge response and challenge received from MS.</td>
</tr>
<tr>
<td>9</td>
<td>The AAA server sends the DEA back to the PDIF with Result-Code AVP as &quot;success.&quot; The EAP-Payload AVP message also contains the EAP result code with &quot;success.&quot; The DEA also contains the IMSI for the user, which is included in the Callback-Id AVP. PDIF uses this IMSI for all subsequent session management functions such as duplicate session detection etc. PDIF also receives the MSK from AAA, which is used for further key computation.</td>
</tr>
<tr>
<td>10</td>
<td>PDIF sends the IKE_AUTH Response back to MS with the EAP payload.</td>
</tr>
<tr>
<td>11</td>
<td>MS sends the final IKE_AUTH Request for the first authentication with the AUTH payload computed from the keys. If the MS plans to do the second authentication, it will include ANOTHER_AUTH_FOLLOWS Notify payload also.</td>
</tr>
<tr>
<td>Step</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| 12   | PDIF processes the AUTH request and responds with the IKE_AUTH Response with the AUTH payload computed from the MSK. PDIF does not assign any IP address for the MS pending second authentication. Nor will the PDIF include any configuration payloads.  
  a. If PDIF service does not support Multiple-Authentication and ANOTHER_AUTH_FOLLOWS Notify payload is received, then PDIF sends IKE_AUTH Response with appropriate error and terminate the IKEv2 session by sending INFORMATIONAL (Delete) Request.  
  b. If ANOTHER_AUTH_FOLLOWS Notify payload is not present in the IKE_AUTH Request, PDIF allocates the IP address from the locally configured pools. However, if proxy-mip-required is enabled, then PDIF initiates Proxy-MIP setup to HA by sending P-MIP RRQ. When PDIF receives the Proxy-MIP RRP, it takes the Home Address (and DNS addresses if any) and sends the IKE_AUTH Response back to MS by including CP payload with Home Address and DNS addresses. In either case, IKEv2 setup will finish at this stage and IPSec tunnel gets established with a Tunnel Inner Address (TIA). |
<p>| 13   | MS does the second authentication by sending the IKE_AUTH Request with IDi payload to include the NAI. This NAI may be completely different from the NAI used in the first authentication. |</p>
<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 14   | On receiving the second authentication IKE_AUTH Request, PDIF checks the configured second authentication methods. The second authentication may be either EAP-MD5 (default) or EAP-GTC. The EAP methods may be either EAP-Passthru or EAP-Terminated.  
  a. If the configured method is EAP-MD5, PDIF sends the IKE_AUTH Response with EAP payload including challenge.  
  b. If the configured method is EAP-GTC, PDIF sends the IKE_AUTH Response with EAP-GTC.  
  c. MS processes the IKE_AUTH Response:  
    - If the MS supports EAP-MD5, and the received method is EAP-MD5, then the MS will take the challenge, compute the response and send IKE_AUTH Request with EAP payload including Challenge and Response.  
    - If the MS does not support EAP-MD5, but EAP-GTC, and the received method is EAP-MD5, the MS sends legacy-Nak with EAP-GTC. |
| 15(a) | PDIF receives the new IKE_AUTH Request from MS.  
  If the original method was EAP-MD5 and MD5 challenge and response is received, PDIF sends RADIUS Access Request with corresponding attributes (Challenge, Challenge Response, NAI, IMSI etc.). |
| 15(b) | If the original method was EAP-MD5 and legacy-Nak was received with GTC, the PDIF sends IKE_AUTH Response with EAP-GTC. |
| 16   | PDIF receives Access Accept from RADIUS and sends IKE_AUTH Response with EAP success. |
| 17   | PDIF receives the final IKE_AUTH Request with AUTH payload. |
| 18   | PDIF checks the validity of the AUTH payload and initiates Proxy-MIP setup request to the Home Agent if **proxy-mip-required** is enabled. The HA address may be received from the RADIUS server in the Access Accept (Step 16) or may be locally configured. PDIF may also remember the HA address from the first authentication received in the final DEA message. |
If `proxy-mip-required` is disabled, PDIF assigns the IP address from the local pool.

PDIF received proxy-MIP RRP and gets the IP address and DNS addresses.

PDIF sets up the IPSec tunnel with the home address. On receiving the IKE_AUTH Response MS also sets up the IPSec tunnel using the received IP address. PDIF sends the IKE_AUTH Response back to MS by including the CP payload with the IP address and optionally the DNS addresses. This completes the setup.

PDIF sends a RADIUS Accounting start message.

For Proxy-MIP call setup using PAP, the first 14 steps are the same as for CHAP authentication. However, here they deviate because the MS does not support EAP-MD5 authentication, but EAP-GTC. In response to the EAP-MD5 challenge, the MS instead responds with legacy-Nak with EAP-GTC. The diagram below picks up at this point.

**Important**

**Figure 97: Proxy-MIP Call Setup using PAP Authentication**

**Table 75: Proxy-MIP Call Setup using PAP Authentication**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>15</td>
<td>MS is not capable of CHAP authentication but PAP authentication, and the MS returns the EAP payload to indicate that it needs EAP-GTC authentication.</td>
</tr>
</tbody>
</table>
### Configuring Proxy Mobile-IP Support

Support for Proxy Mobile-IP requires that the following configurations be made:

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>16</td>
<td>PDIF then initiates EAP-GTC procedure, and requests a password from MS.</td>
</tr>
<tr>
<td>17</td>
<td>MS includes an authentication password in the EAP payload to PDIF.</td>
</tr>
<tr>
<td>18</td>
<td>Upon receipt of the password, PDIF sends a RADIUS Access Request which includes NAI in the User-Name attribute and PAP-password.</td>
</tr>
<tr>
<td>19</td>
<td>Upon successful authentication, the AAA server returns a RADIUS Access Accept message, which may include Framed-IP-Address attribute.</td>
</tr>
<tr>
<td>20</td>
<td>The attribute content in the Access Accept message is encoded as EAP payload with EAP success when PDIF sends the IKE_AUTH Response to the MS.</td>
</tr>
<tr>
<td>21</td>
<td>The MS and PDIF now have a secure IPSec tunnel for communication.</td>
</tr>
<tr>
<td>22</td>
<td>Pdif sends an Accounting START message.</td>
</tr>
</tbody>
</table>

---

**Important**

Not all commands and keywords/variables may be supported. This depends on the platform type and the installed license(s).

- **FA service(s):** Proxy Mobile IP must be enabled, operation parameters must be configured, and FA-HA security associations must be specified.

- **HA service(s):** FA-HA security associations must be specified.

- **Subscriber profile(s):** Attributes must be configured to allow the subscriber(s) to use Proxy Mobile IP. These attributes can be configured in subscriber profiles stored locally on the system or remotely on a RADIUS AAA server.

- **APN template(s):** Proxy Mobile IP can be supported for every subscriber IP PDP context facilitated by a specific APN template based on the configuration of the APN.

---

**Important** These instructions assume that the system was previously configured to support subscriber data sessions as a core network service and/or an HA according to the instructions described in the respective product administration guide.
Configuring FA Services

Use this example to configure an FA service to support Proxy Mobile IP:

```
configure
  context <context_name>
  fa-service <fa_service_name>
  proxy-mip allow
  proxy-mip max-retransmissions <integer>
  proxy-mip retransmission-timeout <seconds>
  proxy-mip renew-percent-time percentage
  fa-ha-spi remote-address { ha_ip_address | ip_addr_mask_combo } spi-number number
      { encrypted secret enc_secret | secret secret | description string }[
        hash-algorithm { hmac-md5 | md5 | rfc2002-md5 } | replay-protection { timestamp | nonce } | timestamp-tolerance tolerance ]
  authentication mn-ha allow-noauth
end
```

Notes:

- The `proxy-mip max-retransmissions` command configures the maximum number re-try attempts that the FA service is allowed to make when sending Proxy Mobile IP Registration Requests to the HA.

- `proxy-mip retransmission-timeout` configures the maximum amount of time allowed by the FA for a response from the HA before re-sending a Proxy Mobile IP Registration Request message.

- `proxy-mip renew-percent-time` configures the amount of time that must pass prior to the FA sending a Proxy Mobile IP Registration Renewal Request.

Example

If the advertisement registration lifetime configured for the FA service is 900 seconds and the renew-time is configured to 50, then the FA requests a lifetime of 900 seconds in the Proxy MIP registration request. If the HA grants a lifetime of 600 seconds, then the FA sends the Proxy Mobile IP Registration Renewal Request message after 300 seconds have passed.

- Use the `fa-ha-spi remote-address` command to modify configured FA-HA SPIs to support Proxy Mobile IP. Refer to the Command Line Interface Reference for the full command syntax.

  Important

  Note that FA-HA SPIs must be configured for the Proxy-MIP feature to work, while it is optional for regular MIP.

- Use the `authentication mn-ha allow-noauth` command to configure the FA service to allow communications from the HA without authenticating the HA.

Verify the FA Service Configuration

Use the following command to verify the configuration of the FA service:

```
show fa-service name <fa_service_name>
```
Notes:

- Repeat this example as needed to configure additional FA services to support Proxy-MIP.
- Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

Proceed to the optional Configuring Proxy MIP HA Failover, on page 899 to configure Proxy MIP HA Failover support or skip to the Configuring HA Services to configure HA service support for Proxy Mobile IP.

### Configuring Proxy MIP HA Failover

Use this example to configure Proxy Mobile IP HA Failover:

```plaintext
configure
ccontext <context_name>
fa-service <fa_service_name>
proxy-mip ha-failover [ max-attempts <max_attempts> | num-attempts-before-switching <num_attempts> | timeout <seconds> ]
```

Notes:

- Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

### Configuring Subscriber Profile RADIUS Attributes

In order for subscribers to use Proxy Mobile IP, attributes must be configured in their user profile or in an APN for 3GPP service. As mentioned previously, the subscriber profiles can be located either locally on the system or remotely on a RADIUS AAA server.

This section provides information on the RADIUS attributes that must be used and instructions for configuring locally stored profiles/APNs in support of Proxy Mobile IP.

**Important**

Instructions for configuring RADIUS-based subscriber profiles are not provided in this document. Please refer to the documentation supplied with your server for further information.
Configuring Subscriber Profile RADIUS Attributes

In order for subscribers to use Proxy Mobile IP, attributes must be configured in their user profile or in an APN for 3GPP service. As mentioned previously, the subscriber profiles can be located either locally on the system or remotely on a RADIUS AAA server.

This section provides information on the RADIUS attributes that must be used and instructions for configuring locally stored profiles/APNs in support of Proxy Mobile IP.

Important
Instructions for configuring RADIUS-based subscriber profiles are not provided in this document. Please refer to the documentation supplied with your server for further information.

RADIUS Attributes Required for Proxy Mobile IP

The following table describes the attributes that must be configured in profiles stored on RADIUS AAA servers in order for the subscriber to use Proxy Mobile IP.

Table 76: Required RADIUS Attributes for Proxy Mobile IP

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
<th>Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN-Subscriber- Permission</td>
<td>Indicates the services allowed to be delivered to the subscriber.</td>
<td>• None (0)</td>
</tr>
<tr>
<td>OR</td>
<td>For Proxy Mobile IP, this attribute <strong>must</strong> be set to Simple IP.</td>
<td>• Simple IP (0x01)</td>
</tr>
<tr>

<tr>
<td>SN-Proxy-MIP</td>
<td>Specifies if the configured service will perform compulsory Proxy-MIP tunneling for a Simple-IP subscriber.</td>
<td>• Disabled - do not perform compulsory Proxy-MIP (0)</td>
</tr>
<tr>
<td>OR</td>
<td>This attribute <strong>must</strong> be enabled to support Proxy Mobile IP.</td>
<td>• Enabled - perform compulsory Proxy-MIP (1)</td>
</tr>
<tr>
<td>SN1-Proxy-MIP</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SN-Simultaneous- SIP-MIP</td>
<td>Indicates whether or not a subscriber can simultaneously access both Simple IP and Mobile IP services.</td>
<td>• Disabled (0)</td>
</tr>
<tr>
<td>OR</td>
<td><strong>Note</strong>: Regardless of the configuration of this attribute, the FA facilitating the Proxy Mobile IP session will <strong>not</strong> allow simultaneous Simple IP and Mobile IP sessions for the MN.</td>
<td>• Enabled (1)</td>
</tr>
<tr>
<td>SN1-Simultaneous- SIP-MIP</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Attribute</td>
<td>Description</td>
<td>Values</td>
</tr>
<tr>
<td>-----------</td>
<td>-------------</td>
<td>--------</td>
</tr>
<tr>
<td>SN-PDSN-Handoff-Req-IP-Addr OR SN1-PDSN-Handoff-Req-IP-Addr</td>
<td>Specifies whether or not the system should reject and terminate the subscriber session when the proposed address in IPCP by the mobile does not match the existing address that was granted by the chassis during an Inter-chassis handoff. This can be used to disable the acceptance of 0.0.0.0 as the IP address proposed by the MN during the IPCP negotiation that occurs during an Inter-chassis handoff. This attribute is disabled (do not reject) by default.</td>
<td>• Disabled - do not reject (0) • Enabled - reject (1)</td>
</tr>
<tr>
<td>3GPP2-MIP-HA-Address</td>
<td>This attribute sent in an Access-Accept message specifies the IP Address of the HA. Multiple attributes can be sent in Access Accept. However, only the first two are considered for processing. The first one is the primary HA and the second one is the secondary (alternate) HA used for HA Failover.</td>
<td>IPv4 Address</td>
</tr>
</tbody>
</table>

**Configuring Local Subscriber Profiles for Proxy-MIP on a PDSN**

This section provides information and instructions for configuring local subscriber profiles on the system to support Proxy Mobile IP on a PDSN.

```
configure
context <context_name>
subscriber name <subscriber_name>
permission pdsn-simple-ip
proxy-mip allow
inter-pdsn-handoff require ip-address
mobile-ip home-agent <ha_address>
<optional> mobile-ip home-agent <ha_address> alternate ip context-name <context_name>
end
```

Verify that your settings for the subscriber(s) just configured are correct.

```
show subscribers configuration username <subscriber_name>
```

Notes:
• Configure the system to enforce the MN's use of its assigned IP address during IPCP negotiations resulting from inter-PDSN handoffs. Sessions re-negotiating IPCP will be rejected if they contain an address other than that which was granted by the PDSN (i.e. 0.0.0.0). This rule can be enabled by entering the `inter-pdsn-handoff require ip-address` command.

• Optional: If you have enabled the Proxy-MIP HA Failover feature, use the `mobile-ip home-agent ha_address alternate` command to specify the secondary, or alternate HA.

• Repeat this example as needed to configure additional FA services to support Proxy-MIP.

• Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

### Configuring Local Subscriber Profiles for Proxy-MIP on a PDIF

This section provides instructions for configuring local subscriber profiles on the system to support Proxy Mobile IP on a PDIF.

```bash
configure
ccontext <context-name>
subscriber name <subscriber_name>
proxy-mip require
```

**Note**

`subscriber_name` is the name of the subscriber and can be from 1 to 127 alpha and/or numeric characters and is case sensitive.

### Configuring Default Subscriber Parameters in Home Agent Context

It is very important that the subscriber default, configured in the same context as the HA service, has the name of the destination context configured. Use the configuration example below:

```bash
configure
ccontext <context_name>
ip context-name <context_name>
end
```

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

### Configuring APN Parameters

This section provides instructions for configuring the APN templates to support Proxy Mobile IP for all IP PDP contexts they facilitate.

**Important**

This is an optional configuration. In addition, attributes returned from the subscriber's profile for non-transparent IP PDP contexts take precedence over the configuration of the APN.

These instructions assume that you are at the root prompt for the Exec mode:

```
[local]host_name
```
Step 1 Enter the configuration mode by entering the following command:

```
configure
```

The following prompt appears:

```
[local]host_name(config)
```

Step 2 Enter context configuration mode by entering the following command:

```
context <context_name>
```

`context_name` is the name of the system destination context designated for APN configuration. The name must be from 1 to 79 alpha and/or numeric characters and is case sensitive. The following prompt appears:

```
[<context_name>]host_name(config-ctx)
```

Step 3 Enter the configuration mode for the desired APN by entering the following command:

```
apn <apn_name>
```

`apn_name` is the name of the APN that is being configured. The name must be from 1 to 62 alpha and/or numeric characters and is not case sensitive. It may also contain dots (.) and/or dashes (-). The following prompt appears:

```
[<context_name>]host_name(config-apn)
```

Step 4 Enable proxy Mobile IP for the APN by entering the following command:

```
proxy-mip required
```

This command causes proxy Mobile IP to be supported for all IP PDP contexts facilitated by the APN.

Step 5 Optional. GGSN/FA MN-NAI extension can be skipped in MIP Registration Request by entering following command:

```
proxy-mip null-username static-homeaddr
```

This command will enable the accepting of MIP Registration Request without NAI extensions in this APN.

Step 6 Return to the root prompt by entering the following command:

```
end
```

The following prompt appears:

```
[local]host_name
```

Step 7 Repeat step 1 through step 6 as needed to configure additional APNs.

Step 8 Verify that your APNs were configured properly by entering the following command:

```
show apn { all | name <apn_name> }
```

The output is a detailed listing of configured APN parameter settings.

Step 9 Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.
CHAPTER 53

Retrieve MDN from S6b

- Feature Changes, on page 905
- Command Changes, on page 906
- Performance Indicator Changes, on page 906

Feature Changes

As per the current implementation, during an initial attach, P-GW selects Mobile Directory Number (MDN) or Mobile Station International Subscriber Directory Number (MSISDN) from the S6b interface. Later, when the call is handed off from P-GW to other services like eHRPD/trusted WiFi/untrusted WiFi or the handoff is done from these services to the P-GW, then the MDN/MSISDN is picked from the create session (CS) request and the S6b authorized MDN/MSISDN is lost. As a result, different values of MDN/MSISDN are sent in the Rf records. Since, typically, operators use MDN to charge subscribers, this results in revenue loss.

This feature retains the MDN/MSISDN value from the S6b interface or the CS request, during the initial attach and even during handoff between P-GW and eHRPD/trusted WiFi/untrusted WiFi. The MDN/MSISDN value does not change in the call lifetime. As a result, all Rf records of a session have the same MDN/MSISDN values.

A new keyword retain-mdn has been added to the CLI command authorize-with-hss. This CLI command keyword, when configured, retains the MDN/MSISDN value. If the CLI command keyword is not configured, the MDN/MSISDN value is not received from the S6b interface. In this case, the MDN/MSISDN value received in the CS request is used.

This feature is not applicable to GnGp handoff.

Old Behavior: MSISDN value was overwritten during handoffs between P-GW and services like eHRPD/trusted/untrusted WiFi.

New Behavior: MSISDN value is retained during the lifetime of call, including handoffs between P-GW and services like eHRPD/trusted/untrusted WiFi.
Command Changes

retain-mdn

This CLI command keyword has been added to retain the MDN/MSISDN value from the S6b interface or Create Session Request.

If the CLI command is disabled in between the handoff procedure, MDN/MSISDN value is not retained. For example, if the following CLI command is configured and the MDN/MSISDN value is authorized by S6b, then the same value is used for the call. However, if the CLI command is disabled before the handoff, the MDN/MSISDN value received in Create Session Request is used. This value might be different from the one received from the S6b interface during initial attach.

If the CLI command is not configured, the MDN/MSISDN value is not received from the S6b interface. In this case, the MDN/MSISDN value received in the create session (CS) request is used.

```plaintext
configure
  context context_name
    pgw-service service_name
      authorize-with-hss retain-mdn
      { no | default } authorize-with-hss
    end
end
```

Notes:
- **no**: Disables S6b authorization after the initial attach or handoff.
- **default**: Sets default configuration for `authorize-with-hss` which does not enforce the MDN after handoffs if retrieved from S6b during initial attach.
- **authorize-with-hss**: Enables or disables subscriber session authorization via a Home Subscriber Server (HSS) over an S6b Diameter interface.
- **retain-mdn**: Enables MSISDN/MDN value to be retained as negotiated during the call setup (S6b retrieved MDN or CS Request MDN), for the lifetime of call (including handoffs).

Performance Indicator Changes

show pgw-service all

This command displays the following output:

```
S6b IPv6 Reporting: Disabled
Retain MDN : Enabled
```

show pgw-service name <service_name>

This command displays the following output:
IPv6 Reporting: Disabled
Retain MDN: Enabled

Retrieve MDN from S6b
show pgw-service name <service_name>
show pgw-service name <service_name>
Revised Marking for Subscriber Traffic

Feature Description

802.1p/MPLS EXP marking helps in providing QoS treatment by prioritizing traffic at L2 level. Currently, data traffic for different access types, such as GGSN, eHRPD, P-GW, and S-GW, refer to the QCI-QoS table and configure the appropriate 802.1p or MPLS-EXP (L2 QoS) markings based on the internal-qos value associated with particular row. However, the usage of internal-qos from the QCI-QoS table is not configurable and uses the default values. In addition, L2 QoS (802.1p/MPLS EXP) marking is not supported in GGSN, SAEGW, and GTPv1/eHRPD calls on P-GW.

With this feature, you can:

- Configure internal priority in QCI-mapping table for the GGSN, GTPv1 P-GW, and SAEGW calls.
- Mark subscriber traffic with either 802.1p or MPLS-EXP to enable or disable L2 marking. A new CLI command has been introduced to support service specific configuration to mark subscriber traffic. This L2 marking can be decided based on QCI and DSCP marking together or solely based on DSCP marking.

Limitations

- This feature does not control the behavior of the control packets. The control packets (GTP-C) continue to get L2 marked based on DSCP derived L2 marking.
- This feature is not supported on standalone GGSN. It is supported on GnGp-GGSN node.

How It Works

You can configure internal priority in QCI-mapping table for the GGSN, GTPv1 P-GW, and SAEGW calls. You can also mark subscriber traffic with either 802.1p or MPLS-EXP to enable or disable L2 marking. To do this, use the CLI command to configure service specific configuration to mark subscriber traffic. This L2 marking can be decided based on QCI and DSCP marking together or solely based on DSCP marking.
Behavior Changes for Different Services

This section describes behavior of this feature for different services. Please see the Command Changes section for more information on the CLI command options and its behavior:

**GGSN/P-GW GTPv1 Calls:**

**Previous Behavior:** Earlier, the traffic was not marked for data path. This was default behavior for GGSN.

**New Behavior:** A new CLI command has been introduced to mark the traffic based on:

- QCI-Derived
- DSCP-Derived
- None

If the no or default option of the CLI command is used, then the traffic is not marked. When the feature is not enabled, traffic is not marked.

**P-GW GTPv2, S-GW, SAEGW Calls:**

**Previous Behavior:** StarOS release 16 onward, the QCI-QoS mapping feature used internal-QoS for L2 marking, which in turn uses QCI-Derived marking for data traffic. This was the default behavior for P-GW, S-GW, and SAEGW calls.

**New Behavior:** With this feature, the traffic is marked based on:

- QCI-Derived
- DSCP-Derived
- None

If the no or default option of the CLI command is used, then the traffic is not marked and the default behavior is executed. When the feature is not enabled, traffic is not marked.

Configuring Revised Marking for Subscriber Traffic

Earlier, the traffic was not marked for data path. This was default behavior for GGSN. Now, internal priority can be configured in QCI-mapping table for the GGSN, GTPv1 P-GW, and SAEGW calls. Subscriber traffic can also be marked with either 802.1p or MPLS-EXP to enable or disable L2 marking. To do this, use the CLI command to configure service specific configuration to mark subscriber traffic. This L2 marking can be decided based on QCI and DSCP marking together or solely based on DSCP marking.

Configuring Internal Priority

To configure internal priority in the QCI-mapping table for the GGSN, GTPv1 P-GW, and SAEGW calls, use the following service specific configuration. This command in the GGSN service configuration overrides the behavior of QCI-QOS-mapping for data packets only.

```
configure
  context context_name
  ggsn-service service_name
    internal-qos data { dscp-derived | none | qci-derived } 
    { no | default } internal-qos data { dscp-derived | none | } 
```
Revised Marking for Subscriber Traffic

Notes:

- **no**: Disables the specified functionality.
- **default**: Disables the functionality.
- **dscp-derived**: Data packets are marked at Layer 2 based on DSCP configured in qci-qos mapping table, then if DSCP is not configured in the qci-qos mapping table then data packets are not marked.
- **none**: Data packets are not marked with Layer 2 (MPLS EXP/802.1P) marking.
- **qci-derived**: Data packets are marked at Layer 2 based on internal-qos-priority configured in qci-qos mapping table. If internal-qos priority is not configured in the qci-qos mapping table, then the data packets are not marked.

Verifying the Configuration

The configuration of this feature can be verified using the following commands from the `exec` mode:

- **show configuration**
- **show service-type { all | name service_name }**

Please see the *Monitoring and Troubleshooting Revised Marking for Subscriber Traffic* section for the command output.

Monitoring and Troubleshooting Revised Marking for Subscriber Traffic

The following section describes commands available to monitor Revised Marking for Subscriber Traffic.

Internal Priority Show Commands

The following section describes commands available to monitor Internal Priority.

**show configuration**

This command displays the following output:

- When **internal-qos data** is configured as **none**:
  
  internal-qos data none

- When **internal-qos data** is configured as **qci-derived**:
  
  internal-qos data qci-derived

- When **internal-qos data** is configured as **dscp-derived**:
  
  internal-qos data dscp-ds-derived

- When **internal-qos data** is not configured:
  
  no internal-qos data

**show service-type { all | name service_name }**

This command displays the following output:
• When **internal-qos data** is configured as **none**:

  Internal QOS Application: Enabled  
  Internal QoS Policy: None

• When **internal-qos data** is configured as **qci-derived**:

  Internal QOS Application: Enabled  
  Internal QoS Policy: QCI Derived

• When **internal-qos data** is configured as **dscp-derived**:

  Internal QOS Application: Enabled  
  Internal QoS Policy: DSCP Derived

• When **internal-qos data** is **not configured**:

  Internal QOS Application: Backward-compatible
Rf Interface Support

This chapter provides an overview of the Diameter Rf interface and describes how to configure the Rf interface. Rf interface support is available on the Cisco system running StarOS 10.0 or later releases for the following products:

- Gateway GPRS Support Node (GGSN)
- Proxy Call Session Control Function (P-CSCF)
- Packet Data Network Gateway (P-GW)
- Serving Call Session Control Function (S-CSCF)

In StarOS version 19 and later releases, the Rf interface is not supported on the S-GW.

It is recommended that before using the procedures in this chapter you select the configuration example that best meets your service model, and configure the required elements for that model as described in the administration guide for the product that you are deploying.

This chapter includes the following topics:

- Introduction, on page 913
- Features and Terminology, on page 916
- How it Works, on page 929
- Configuring Rf Interface Support, on page 932

Introduction

The Rf interface is the offline charging interface between the Charging Trigger Function (CTF) (for example, P-GW, P-CSCF) and the Charging Collection Function (CCF). The Rf interface specification for LTE/GPRS/eHRPD offline charging is based on 3GPP TS 32.299 V8.6.0, 3GPP TS 32.251 V8.5.0 and other 3GPP specifications. The Rf interface specification for IP Multimedia Subsystem (IMS) offline charging is based on 3GPP TS 32.260 V8.12.0 and 3GPP TS 32.299 V8.13.0.

Offline charging is used for network services that are paid for periodically. For example, a user may have a subscription for voice calls that is paid monthly. The Rf protocol allows the CTF (Diameter client) to issue offline charging events to a Charging Data Function (CDF) (Diameter server). The charging events can either be one-time events or may be session-based.
The system provides a Diameter Offline Charging Application that can be used by deployed applications to generate charging events based on the Rf protocol. The offline charging application uses the base Diameter protocol implementation, and allows any application deployed on chassis to act as CTF to a configured CDF.

In general, accounting information from core network elements is required to be gathered so that the billing system can generate a consolidated record for each rendered service.

The CCF with the CDF and Charging Gateway Function (CGF) will be implemented as part of the core network application. The CDF function collects and aggregates Rf messages from the various CTFs and creates CDRs. The CGF collects CDRs from the CDFs and generates charging data record files for the data mediation/billing system for billing.

**Offline Charging Architecture**

The following diagram provides the high level charging architecture as specified in 3GPP 32.240. The interface between CSCF, P-GW and GGSN with CCF is Rf interface. Rf interface for EPC domain is as per 3GPP standards applicable to the PS Domain (e.g. 32.240, 32.251, 32.299, etc.).

![Figure 38: Charging Architecture](Diagram)

The following figure shows the Rf interface between CTF and CDF.
The Rf offline charging architecture mainly consists of three network elements CCF, CTF and Diameter Dynamic Routing Agent (DRA).

**Charging Collection Function**

The CCF implements the CDF and CGF. The CCF will serve as the Diameter Server for the Rf interface. All network elements supporting the CTF function should establish a Diameter based Rf Interface over TCP connections to the DRA. The DRA function will establish Rf Interface connection over TCP connections to the CCF.

The CCF is primarily responsible for receipt of all accounting information over the defined interface and the generation of CDR (aka UDRs and FDRs) records that are in local storage. This data is then transferred to the billing system using other interfaces. The CCF is also responsible for ensuring that the format of such CDRs is consistent with the billing system requirements. The CDF function within the CCF generates and CGF transfers the CDRs to the billing system.

The CDF function in the CCF is responsible for collecting the charging information and passing it on to the appropriate CGF via the GTP’ based interface per 3GPP standards. The CGF passes CDR files to billing mediation via SCP.

**Charging Trigger Function**

The CTF will generate CDR records and passes it onto CCF. When a P-GW service is configured as CTF, then it will generate Flow Data Record (FDR) information as indicated via the PCRF. The P-GW generates Rf messages on a per PDN session basis. There are no per UE or per bearer charging messages generated by the P-GW.

The service data flows within IP-CAN bearer data traffic is categorized based on a combination of multiple key fields (Rating Group, Rating Group and Service-Identifier). Each Service-Data-Container captures single bi-directional flow or a group of single bidirectional flows as defined by Rating Group or Rating Group and Service-Identifier.

**Dynamic Routing Agent**

The DRA provides load distribution on a per session basis for Rf traffic from CTFs to CCFs. The DRA acts like a Diameter Server to the Gateways. The DRA acts like a Diameter client to CCF. DRA appears to be a CCF to the CTF and as a CTF to the CCF.

The DRA routes the Rf traffic on a per Diameter charging session basis. The load distribution algorithm can be configured in the DRA (Round Robin, Weighted distribution, etc). All Accounting Records (ACRs) in one
Diameter charging session will be routed by the DRA to the same CCF. Upon failure of one CCF, the DRA selects an alternate CCF from a pool of CCFs.

License Requirements

The Rf interface support is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

Supported Standards

Rf interface support is based on the following standards:

- IETF RFC 4006: Diameter Credit Control Application; August 2005
- 3GPP TS 32.299 V9.6.0 (2010-12) 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Telecommunication management; Charging management; Diameter charging applications (Release9)

Features and Terminology

This section describes features and terminology pertaining to Rf functionality.

Offline Charging Scenarios

Offline charging for both events and sessions between CTF and the CDF is performed using the Rf reference point as defined in 3GPP TS 32.240.

Basic Principles

The Diameter client and server must implement the basic functionality of Diameter accounting, as defined by the RFC 3588 Diameter Base Protocol.

For offline charging, the CTF implements the accounting state machine as described in RFC 3588. The CDF server implements the accounting state machine "SERVER, STATELESS ACCOUNTING" as specified in RFC 3588, i.e. there is no order in which the server expects to receive the accounting information.

The reporting of offline charging events to the CDF is managed through the Diameter Accounting Request (ACR) message. Rf supports the following ACR event types:

<table>
<thead>
<tr>
<th>Request</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>START</td>
<td>Starts an accounting session</td>
</tr>
<tr>
<td>INTERIM</td>
<td>Updates an accounting session</td>
</tr>
<tr>
<td>STOP</td>
<td>Stops an accounting session</td>
</tr>
</tbody>
</table>
ACR types START, INTERIM and STOP are used for accounting data related to successful sessions. In contrast, EVENT accounting data is unrelated to sessions, and is used e.g. for a simple registration or interrogation and successful service event triggered by a network element. In addition, EVENT accounting data is also used for unsuccessful session establishment attempts.

The ACR Event Type "EVENT" is supported in Rf CDRs only in the case of IMS specific Rf implementation.

The following table describes all possible ACRs that might be sent from the IMS nodes i.e. a P-CSCF and S-CSCF.

<table>
<thead>
<tr>
<th>Diameter Message</th>
<th>Triggering SIP Method/ISUP Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACR [Start]</td>
<td>SIP 200 OK acknowledging an initial SIP INVITE</td>
</tr>
<tr>
<td></td>
<td>ISUP:ANM (applicable for the MGCF)</td>
</tr>
<tr>
<td>ACR [Interim]</td>
<td>SIP 200 OK acknowledging a SIP</td>
</tr>
<tr>
<td></td>
<td>RE-INVITE or SIP UPDATE [e.g. change in media components]</td>
</tr>
<tr>
<td></td>
<td>Expiration of AVP [Acct-Interim-Interval]</td>
</tr>
<tr>
<td></td>
<td>SIP Response (4xx, 5xx or 6xx), indicating an unsuccessful SIP RE-INVITE or SIP UPDATE</td>
</tr>
<tr>
<td>ACR [Stop]</td>
<td>SIP BYE message (both normal and abnormal session termination cases)</td>
</tr>
<tr>
<td></td>
<td>ISUP:REL (applicable for the MGCF)</td>
</tr>
</tbody>
</table>
### Event Based Charging

In the case of event based charging, the network reports the usage or the service rendered where the service offering is rendered in a single operation. It is reported using the ACR EVENT.

In this scenario, CTF asks the CDF to store event related charging data.

### Session Based Charging

Session based charging is the process of reporting usage reports for a session and uses the START, INTERIM & STOP accounting data. During a session, a network element may transmit multiple ACR Interims' depending on the proceeding of the session.

In this scenario, CTF asks the CDF to store session related charging data.

### Diameter Base Protocol

The Diameter Base Protocol maintains the underlying connection between the Diameter Client and the Diameter Server. The connection between the client and server is TCP based.

In order for the application to be compliant with the specification, state machines should be implemented at some level within the implementation.
Diameter Base supports the following Rf message commands that can be used within the application.

**Table 79: Diameter Rf Messages**

<table>
<thead>
<tr>
<th>Command Name</th>
<th>Source</th>
<th>Destination</th>
<th>Abbreviation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounting-Request</td>
<td>CTF</td>
<td>CDF</td>
<td>ACR</td>
</tr>
<tr>
<td>Accounting-Answer</td>
<td>CDF</td>
<td>CTF</td>
<td>ACA</td>
</tr>
</tbody>
</table>

There are a series of other Diameter messages exchanged to check the status of the connection and the capabilities.

- **Capabilities Exchange Messages**: Capabilities Exchange Messages are exchanged between the diameter peers to know the capabilities of each other and identity of each other.
  - **Capabilities Exchange Request (CER)**: This message is sent from the client to the server to know the capabilities of the server.
  - **Capabilities Exchange Answer (CEA)**: This message is sent from the server to the client in response to the CER message.

- **Device Watchdog Request (DWR)**: After the CER/CEA messages are exchanged, if there is no more traffic between peers for a while, to monitor the health of the connection, DWR message is sent from the client. The Device Watchdog timer (Tw) is configurable and can vary from 6 through 30 seconds. A very low value will result in duplication of messages. The default value is 30 seconds. On two consecutive expiries of Tw without a DWA, the peer is considered to be down.

  - DWR is sent only after Tw expiry after the last message that came from the server. Say if there is continuous exchange of messages between the peers, DWR might not be sent if (Current Time - Last message received time from server) is less than Tw.

- **Device Watchdog Answer (DWA)**: This is the response to the DWR message from the server. This is used to monitor the connection state.

- **Disconnect Peer Request (DPR)**: This message is sent to the peer to inform to shutdown the connection. There is no capability currently to send the message to the Diameter server.

- **Disconnect Peer Answer (DPA)**: This message is the response to the DPR request from the peer. On receiving the DPR, the peer sends DPA and puts the connection state to "DO NOT WANT TO TALK TO YOU" state and there is no way to get the connection back except for reconfiguring the peer again.

A timeout value for retrying the disconnected peer must be provided.

**Timer Expiry Behavior**

Upon establishing the Diameter connection, an accounting interim timer (AII) is used to indicate the expiration of a Diameter accounting session, and is configurable at the CTF. The CTF indicates the timer value in the ACR-Start, in the Acct-Interim-Interval AVP. The CDF responds with its own AII value (through the DRA), which must be used by the CTF to start a timer upon whose expiration an ACR INTERIM message must be sent. An instance of the AII timer is started in the CCF at the beginning of the accounting session, reset on
the receipt of an ACR-Interim and stopped on the receipt of the ACR-Stop. After expiration of the AII timer, ACR INTERIM message will be generated and the timer will be reset and the accounting session will be continued.

**Rf Interface Failures/Error Conditions**

The current architecture allows for primary and secondary connections or Active-Active connections for each network element with the CDF elements.

**DRA/CCF Connection Failure**

When the connection towards one of the primary/Active DRAs in CCF becomes unavailable, the CTF picks the Secondary/Active IP address and begins to use that as a Primary.

If no DRA (and/or the CCF) is reachable, the network element must buffer the generated accounting data in non-volatile memory. Once the DRA connection is up, all accounting messages must be pulled by the CDF through offline file transfer.

**No Reply from CCF**

In case the CTF/DRA does not receive an ACA in response to an ACR, it may retransmit the ACR message. The waiting time until a retransmission is sent, and the maximum number of repetitions are both configurable by the operator. When the maximum number of retransmissions is reached and still no ACA reply has been received, the CTF/DRA sends the ACRs to the secondary/alternate DRA/CCF.

**Detection of Message Duplication**

The Diameter client marks possible duplicate request messages (e.g. retransmission due to the link failover process) with the T-flag as described in RFC 3588.

If the CDF receives a message that is marked as retransmitted and this message was already received, then it discards the duplicate message. However, if the original of the re-transmitted message was not yet received, it is the information in the marked message that is taken into account when generating the CDR. The CDRs are marked if information from duplicated message(s) is used.

**CCF Detected Failure**

The CCF closes a CDR when it detects that expected Diameter ACRs for a particular session have not been received for a period of time. The exact behavior of the CCF is operator configurable.

**Rf-Gy Synchronization Enhancements**

Both Rf (OFCS) and Gy (OCS) interfaces are used for reporting subscriber usage and billing. Since each interface independently updates the subscriber usage, there are potential scenarios where the reported information is not identical. Apart from Quota enforcement, OCS is utilized for Real Time Reporting (RTR), which provides a way to the user to track the current usage and also get notifications when a certain threshold is hit.

In scenarios where Rf (OFCS) and Gy (OCS) have different usage information for a subscriber session, it is possible that the subscriber is not aware of any potential overages until billed (scenario when Rf is more than Gy) or subscriber believes he has already used up the quota whereas his actual billing might be less (scenario when Gy is more than Rf). In an attempt to align both the Rf and Gy reported usage values, release 12.3
introduced capabilities to provide a way to get the reported values on both the interfaces to match as much as possible. However, some of the functionalities were deferred and this feature implements the additional enhancements.

In release 15.0 when time/volume quota on the Gy interface gets exhausted, Gy triggers "Service Data Volume Limit" and "Service Data Time Limit". Now in 16.0 via this feature, this behavior is CLI controlled. Based on the CLI command " trigger-type { gy-sdf-time-limit { cache | immediate } | gy-sdf-unit-limit { cache | immediate } | gy-sdf-volume-limit { cache | immediate } }" the behavior will be decided whether to send the ACR-Interim immediately or to cache the containers for future transactions. If the CLI for the event-triggers received via Gy is not configured, then those ACR-Interims will be dropped.

Releases prior to 16.0, whenever the volume/time-limit event triggers are generated, ACR-Interims were sent out immediately. In 16.0 and later releases, CLI configuration options are provided in policy accounting configuration to control the various Rf messages (ACRs) triggered for sync on this feature.

This release supports the following enhancements:

• Caches containers in scenarios when ACR-I could not be sent and reported to OFCS.

• Triggers ACR to the OFCS when the CCR to the OCS is sent instead of the current implementation of waiting for CCA from OCS.

If an ACR-I could not be sent to the OFCS, the PCEF caches the container record and sends it in the next transaction to the OFCS.

In releases prior to 16.0, once a CCR-U was sent out over Gy interface, ACR-I message was immediately triggered (or containers were cached) based on policy accounting configuration and did not wait for CCA-U. In 16.0 and later releases, the containers are closed only after receiving CCA-U successfully. That is, Rf trigger will be sent only after receiving CCA-U message.

For more information on the command associated with this feature, see the Accounting Policy Configuration Mode Commands chapter of the Command Line Interface Reference.

In 17.0 and later releases, a common timer based approach is implemented for Rf and Gy synchonization. As part of the new design, Gy and Rf will be check-pointed at the same point of time for periodic as well as for full check-pointing. Thus, the billing records will always be in sync at all times regardless of during an ICSR switchover event, internal events, session manager crashes, inactive Rf/Gy link, etc. This in turn avoids any billing discrepancies.

**Cessation of Rf Records When UE is IDLE**

Releases prior to 16.0, when the UE was identified to be in IDLE state and not sending any data, the P-GW generated Rf records. During this scenario, the generated Rf records did not include Service Data Containers (SDCs).

In 16.0 and later releases, the Rf records are not generated in this scenario. New CLI configuration command "session idle-mode suppress-interim" is provided to enable/disable the functionality at the ACR level to control the behavior of whether an ACR-I needs to be generated or not when the UE is idle and no data is transferred.

That is, this CLI configuration is used to control sending of ACR-I records when the UE is in idle mode and when there is no data to report.

For more information on the command, see the Accounting Policy Configuration Mode Commands chapter of the Command Line Interface Reference.
QoS Change Scenarios

QOS_CHANGE Trigger in Rf Records During eHRPD-LTE Handoff

In releases prior to 20, QOS_CHANGE is reported as the value for Change-Condition AVP in the Service-Data-Container (SDC) of Rf accounting records (for accounting level SDF/SDF+accounting keys QCI) when eHRPD to LTE handoff occurs. Typically, the QOS_CHANGE should not be present as the PCRF does not enforce QoS via any QoS IE in eHRPD/CDMA RAT. In 20 and later releases, the SDC in the generated Rf record does not include QOS_CHANGE trigger during handoff from eHRPD to LTE.

QoS Change for Default Bearer

Releases prior to 20, in a multi-bearer call, when an update message (CCA-U or RAR) from PCRF changes the QoS (QCI/ARP) of default bearer and in the same message installs a predefined or dynamic rule on the newly updated default bearer, spurious Normal Release (NR) Service Data Volume (SDV) containers were added to Rf interim records for the dedicated bearers. In this scenario, the system used to send Normal Release buckets for the non-default bearers even if these bearers were not changed.

In release 20 and beyond, for a change in the QoS of default bearer, NR SDV containers will not be seen unless the corresponding bearer is torn down. Only QoS change containers are closed/released for the bearer that underwent QoS Change, i.e. the default bearer.

Diameter Rf Duplicate Record Generation

This section describes the overview and implementation of Rf Duplicate Record Generation feature.

This section discusses the following topics for this feature:

- Feature Description, on page 922
- Configuring Rf Duplicate Record Generation, on page 924
- Monitoring and Troubleshooting the Rf Duplicate Record Generation, on page 926

Feature Description

This feature is introduced to support creation and communication of duplicate Rf records to secondary AAA group servers configured for the Rf interface.

To achieve this functionality, the following configurations must be enabled –

- **aaa group** CLI command under APN to configure a maximum of 2 AAA groups - primary and secondary AAA groups, or two different endpoints for Rf Diameter accounting servers
- **diameter accounting duplicate-record** under AAA group to allow Rf duplicate record creation

The **diameter accounting duplicate-record** is a new CLI command introduced in this release for duplicating the Rf START, INTERIM and STOP accounting records.

Important

This is a license-controlled CLI command. For more information, contact your Cisco account representative.
In releases prior to 21, gateway allows only one AAA group configuration per APN for Rf accounting. The AAA group is configured to load balance across multiple servers to pass the Rf traffic and also expect an accounting answer. Note that the secondary AAA group configuration is allowed currently but is restricted to only RADIUS accounting.

In release 21 and beyond, the gateway is provided with the ability to configure a secondary AAA group per APN for the Rf interface, and send the duplicate Diameter Rf accounting records to the secondary AAA group servers. The secondary AAA group is used for non-billing purposes only.

---

**Important**

The failed duplicate records will neither be written to HDD nor added to the archival list.

---

There is no change in the current behavior with the primary AAA group messages. The primary AAA group is independent of the secondary AAA group, and it has multiple Rf servers configured. When the Rf servers do not respond even after multiple retries as per the applicable configuration, the Rf records are archived and stored in HDD. This behavior continues as is irrespective of the configuration of secondary aaa-group.

Secondary aaa group has a very similar configuration as the primary aaa group except that the new CLI command `diameter accounting duplicate-record` is additionally included to configure the secondary aaa-group. It is also important to note that different Diameter endpoints and a separate set of Rf servers should be provisioned for both primary and secondary AAA groups.

If all the configured servers are down, the request message will be discarded without writing it in HDD or archiving at aaamgr.

The original and duplicate Rf messages use two different aaa-groups and two different Diameter endpoints. Hence, the values for Session-ID AVP will be different. Based on the configuration of primary and secondary endpoints the values for Origin-Host, Origin-Realm, Destination-Realm, and Destination-Host AVPs may be different. Also based on the configuration under policy accounting for inclusion of virtual/gn apn name for secondary group Called-Station-ID AVP might change. All other AVPs will have the same values as with the primary aaa group Rf message.

Also, note that the values such as Acct-Interim-Interval (AII) interval received in ACA from secondary group of AAA servers will be ignored.

**Relationships to Other Features**

This feature can be used in conjunction with Virtual APN Truncation feature to achieve the desired results. The Virtual APN Truncation feature is new in release 21. For more information on this feature, see the administration guide for the product you are deploying.

**Limitations**

The following are the limitations of this feature:

- Only one secondary AAA group can be configured per APN.
- If all the Rf peers under secondary aaa group are down and duplicate Start Record is not sent, then the duplicate Interim and Stop records will also not be sent to any of the secondary aaa group servers even though they arrived later. However if the servers are up and duplicate Start record was sent but the server did not respond, duplicate Start will be dropped after all the retries. In this case, the duplicate Interim and Stop records may be sent out to the server.
Configuring Rf Duplicate Record Generation

The following section provides the configuration commands to enable the Rf duplicate record generation.

Configuring Secondary AAA Group

Use the following configuration commands to configure the secondary AAA group for receiving the duplicate Rf records.

```bash
configure
context context_name
apn apn_name
    aaa group group_name
    aaa secondary-group group_name
exit
```

Notes:

- **aaa group group_name**: Specifies the AAA server group for the APN. group_name must be an alphanumeric string of 1 through 63 characters.
- **secondary group group_name**: Specifies the secondary AAA server group for the APN. group_name must be an alphanumeric string of 1 through 63 characters.

Configuring Duplication of Rf Records

Use the following configuration commands to configure the system to create a secondary feed of Rf records and send them to the secondary AAA group.

```bash
configure
context context_name
    aaa group group_name
        diameter accounting duplicate-record
exit
```

Notes:

- **duplicate-record**: Sends duplicate Rf records to configured secondary AAA group. This keyword is license dependent. For more information, contact your Cisco account representative.
- The default configuration is **no diameter accounting duplicate-record**. By default, this feature is disabled.
- The secondary aaa group must be configured under APN configuration mode before enabling the **diameter accounting duplicate-record** CLI command.

Verifying the Rf Duplicate Record Generation Configuration

Use the following commands to verify the configuration status of this feature.
show configuration
show aaa group all
- or -
show aaa group group_name

`group_name` must be the name of the AAA group specified during the configuration.

This command displays all the configurations that are enabled within the specified AAA group.

The following is a sample configuration of this feature.

```
configure
  context source
    apn domainname.com
      associate accounting-policy policy_accounting_name
      aaa group group1
      aaa secondary-group group2
      exit
    aaa group group1
      diameter accounting dictionary aaa-custom4
      diameter accounting endpoint rf_endpoint1
      diameter accounting server rf_server1 priority 1
      diameter accounting server rf_server2 priority 2
      exit
    aaa group group2
      diameter accounting dictionary aaa-custom4
      diameter accounting endpoint rf_endpoint2
      diameter accounting duplicate-record
      diameter accounting server rf_server3 priority 3
      diameter accounting server rf_server4 priority 4
      exit
    diameter endpoint rf-endpoint1
      use-proxy
      origin host rf-endpoint1.carrier.com address 192.50.50.3
      no watchdog-timeout
      response-timeout 20
      connection retry-timeout 5
      peer rf_server1 realm domainname.com address 192.50.50.4 port 4872
      peer rf_server2 realm domainname.com address 192.50.50.4 port 4873
      exit
    diameter endpoint rf-endpoint2
      use-proxy
      origin host rf-endpoint2.carrier.com address 192.50.50.2
      no watchdog-timeout
      response-timeout 20
      connection retry-timeout 5
      peer rf_server3 realm domainname.com address 192.50.50.5 port 4892
      peer rf_server4 realm domainname.com address 192.50.50.5 port 4893
    end
```

Notes:
• The **diameter accounting duplicate-record** CLI is license specific. So, the corresponding license must be enabled for the CLI command to be configured.

• Both primary and secondary aaa groups are preferred to have different accounting endpoint names.

**Monitoring and Troubleshooting the Rf Duplicate Record Generation**

This section provides information regarding show commands and/or their outputs in support of this feature. The following operations can be performed to troubleshoot any failure related to this feature:

• Verify if the feature is enabled using **show configuration** or **show aaa group all** CLI command. If not enabled, configure the diameter accounting duplicate-record CLI command and check if it works.

• Collect the output of **show diameter aaa statistics** command and analyze the debug statistics. Also, check the reported logs, if any. For further analysis, contact Cisco account representative.

**show diameter aaa-statistics**

The following statistics are added to the output of this show command for duplicate Rf records which were dropped because of the failure in sending the Accounting records instead of adding them to HDD or archival list.

• Duplicate Accounting Records Stats
  • ACR-Start Dropped
  • ACR-Interim Dropped
  • ACR-Stop Dropped

These statistics are maintained per aaamgr instance level. For descriptions of these statistics, see the *Statistics and Counters Reference* guide.

These statistics can also be collected per group basis/server basis for duplicate records i.e. through **show diameter aaa-statistics group <group_name>** and **show diameter aaa-statistics server <server_name>** CLI commands.

**Truncation of Virtual APN for Rf Records**

This feature enables the truncation of Virtual APN (VAPN) returned by S6b server to be sent to Gx, Gy and Rf interfaces.

**Feature Description**

Currently there is no way to quickly turn on the Rf accounting to the Data Streaming Service (DSS) server per Virtual APN (S6b-VAPN) without reaching all nodes in the network and provision the Virtual APN on each of them. This feature is implemented to truncate the virtual APN name returned by S6b server with the configured standard delimiters. In this way a single configuration per node can be utilized for all enterprises based on a virtual APN. This approach will significantly reduce the size and time to provision new enterprises with the requested feature.
To achieve this functionality, a configuration is added per APN to enable truncation of S6b-VAPN and also to configure the delimiter(s) where the APN name is to be truncated. Standard delimiters like (.) and (-) are used since APN name supports only these two characters apart from the alphanumeric ones.

If AAA server returns both hyphen and dot delimiters or the same delimiter twice or more as a virtual-apn, then the first delimiter will be considered as a separator. For example, if the AAA server returns the virtual-apn as xyz-cisco.com, then hyphen is the separator.

AAA manager performs the truncation of the Virtual APN name based on the APN configuration and provides the correct APN profile for the truncated APN name. If the truncation is successful, the full virtual APN name will be sent to Gx, Gy and Rf interfaces.

Accounting records are required to support real-time usage notification and device management functionality. So, the `apn-name-to-be-included` CLI command is extended to enable actual APN (Gn-APN) or virtual APN (S6b returned virtual APN) name to be included in Called-Station-ID AVP in the secondary Rf accounting records (secondary server group) under policy accounting configuration. Currently, policy accounting configuration supports sending the Gn-APN/S6b-VAPN in Called-Station-ID for primary Rf server. With this CLI command, this functionality is extended for the secondary Rf server.

A new AAA attribute “Secondary-Called-Station-ID” is added to support sending Gn/Virtual APN name in the Called-Station-ID AVP for duplicate Rf records sent to secondary group Rf server.

### Configuring Virtual APN Truncation for Rf Records

The following section provides the configuration commands to enable the Virtual APN Truncation feature for Rf records.

### Configuring Gn-APN/VAPN for Rf Accounting

Use the following configuration commands to configure the actual APN or Virtual APN (VAPN) for Rf accounting.

```
configure context context_name
    policy accounting policy_name
        apn-name-to-be-included { gn | virtual } [ secondary-group { gn | virtual } ]
    end
```

**Notes:**

- `apn-name-to-be-included`: Configures the APN name to be included in the Rf messages for primary server group.
- `secondary-group { gn | virtual }`: Configures the APN name to be included in the Rf messages for secondary server group.
- `gn`: Configures the Gn APN name to be included in the Rf messages.
- `virtual`: Configures the virtual APN name to be included in the Rf messages.

By default, the apn name to be included in Called-Station-ID AVP is Gn-APN for both primary and secondary Rf server groups.

If the secondary group configuration is not available, the default behavior is to have Gn APN for secondary Rf group duplicate records.
Configuring Truncation of Virtual APN

Use the following configuration commands to configure the gateway to truncate the APN name returned from S6b interface.

```
configure
  context context_name
    apn apn_name
      virtual-apn { gcdr apn-name-to-be-included { gn | virtual } |
      truncate-s6b-vapn delimiter { dot [ hyphen ] | hyphen [ dot ] } }
    end
```

Notes:
- For information on the existing keywords, see the Command Line Interface Reference guide.
- `truncate-s6b-vapn`: Allows truncation of virtual APN received from S6b at the configured delimiter character.
- `delimiter { dot [ hyphen ] | hyphen [ dot ] }`: Configures the delimiter for truncation of virtual APN received from S6b. If the CLI command is configured, the S6b returned virtual APN will be truncated at the configured delimiter.
  - `dot`: Configures the delimiter to dot (.) for truncation of S6b-VAPN
  - `hyphen`: Configures the delimiter to hyphen (-) for truncation of S6b-VAPN
- Both dot and hyphen delimiters can be configured in the same line or a new line.
- `no virtual-apn truncate-s6b-vapn`: Disables the truncation of virtual APN name. If both delimiters should be disabled at once, use the `no virtual-apn truncate-s6b-vapn` CLI command.
  - If a particular delimiter needs to disabled, it should be done explicitly. For example, if the dot delimiter should be disabled, use the `no virtual-apn truncate-s6b-vapn delimiter dot` CLI command.
  - By default this feature will be disabled and no delimiter will be configured.
- This CLI command takes effect only when S6b server returns virtual APN name in Authentication Authorization Accept (AAA) message.
- If the separator character is not present in the received S6b virtual APN name, then the whole virtual APN name will be considered for configuration look-up.

Verifying the Virtual APN Truncation Configuration

Use the following command to verify the configuration status of this feature.

```
show configuration apn apn_name
```

`apn_name` must be the name of the APN specified during the feature configuration.

This command displays all the configurations that are enabled within the specified APN name. The following is a sample output of this show command.

```
[local]st40# show configuration apn intershat
configure
  context ingress
  apn intershat
    pdp-type ipv4 ipv6
    bearer-control-mode mixed
```
Monitoring and Troubleshooting the Virtual APN Truncation

This section provides information regarding show commands and/or their outputs in support of this feature.

The following operations can be performed to troubleshoot any failure related to this feature:

• Verify if the feature is enabled using `show configuration apn apn_name` CLI command. If not enabled, configure the `virtual-apn truncate-s6b-vapn delimiter { dot | hyphen | hyphen dot } { }` CLI command and check if it works.

• Collect the output of `show apn statistics` CLI command and analyze the debug statistics. For further assistance, contact Cisco account representative.

---

**Important**

For P-GW, GGSN and SAEGW services, if the truncation of S6b returned virtual APN name fails and the virtual APN name is not configured, the call will be rejected with ‘unknown-apn-name’ cause.

---

**show apn statistics**

This show command uses the existing APN statistics to populate the truncated virtual APN name, if this feature is enabled.

**show subscribers ggsn-only full all**

The following field added newly to the output of this show command displays the S6b returned full virtual APN name, if this feature is enabled. Otherwise, it displays ‘n/a’.

• S6b Returned Virtual APN

**show subscribers pgw-only full all**

The following field added newly to the output of this show command displays the S6b returned full virtual APN name, if this feature is enabled. Otherwise, it displays ‘n/a’.

• S6b Returned Virtual APN

**show subscribers saegw-only full all**

The following field added newly to the output of this show command displays the S6b returned full virtual APN name, if this feature is enabled. Otherwise, it displays ‘n/a’.

• S6b Returned Virtual APN

---

**How it Works**

This section describes how offline charging for subscribers works with Rf interface support in GPRS/eHRPD/LTE/IMS networks.
The following figure and table explain the transactions that are required on the Diameter Rf interface in order to perform event based charging. The operation may alternatively be carried out prior to, concurrently with or after service/content delivery.

**Figure 100: Rf Call Flow for Event Based Charging**

![Diagram showing Rf Call Flow for Event Based Charging]

**Table 80: Rf Call Flow Description for Event Based Charging**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The network element (CTF) receives indication that service has been used/delivered.</td>
</tr>
<tr>
<td>2</td>
<td>The CTF (acting as Diameter client) sends Accounting-Request (ACR) with Accounting-Record-Type AVP set to EVENT_RECORD to indicate service specific information to the CDF (acting as Diameter server).</td>
</tr>
<tr>
<td>3</td>
<td>The CDF receives the relevant service charging parameters and processes accounting request.</td>
</tr>
<tr>
<td>4</td>
<td>The CDF returns Accounting-Answer (ACA) message with Accounting-Record-Type AVP set to EVENT_RECORD to the CTF in order to inform that charging information was received.</td>
</tr>
</tbody>
</table>

The following figure and table explain the simple Rf call flow for session based charging.
The CTF receives a service request. The service request may be initiated either by the user or the other network element.

In order to start accounting session, the CTF sends a Accounting-Request (ACR) with Accounting-Record-Type AVP set to START_RECORD to the CDF.

The session is initiated and the CDF opens a CDR for the current session.

The CDF returns Accounting-Answer (ACA) message with Accounting-Record-Type set to START_RECORD to the CTF and possibly Acct-Interim-Interval AVP (AII) set to non-zero value indicating the desired intermediate charging interval.
### Configuring Rf Interface Support

To configure Rf interface support:

1. Configure the core network service as described in this Administration Guide.

2. Enable Active Charging Service (ACS) and create ACS as described in the *Enhanced Charging Services Administration Guide*.

   **Important**

   The procedures in this section assume that you have installed and configured your chassis including the ECS installation and configuration as described in the *Enhanced Charging Services Administration Guide*.

3. Enable Rf accounting in ACS as described in *Enabling Rf Interface in Active Charging Service*, on page 933.

4. Configure Rf interface support as described in the relevant sections:
   - Configuring GGSN / P-GW Rf Interface Support, on page 933
   - Configuring P-CSCF/S-CSCF Rf Interface Support, on page 948

   **Important**

   In StarOS versions 19 and later, the Rf interface is not supported on the S-GW.
5. Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the `System Administration Guide` and the `Command Line Interface Reference`.

**Important**

Commands used in the configuration examples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the `Command Line Interface Reference` for complete information regarding all commands.

---

**Enabling Rf Interface in Active Charging Service**

To enable the billing record generation and Rf accounting, use the following configuration:

```
configure
  active-charging service <service_name>
    rulebase <rulebase_name>
      billing-records rf
        active-charging rf { rating-group-override | service-id-override }
      end
    end
end
```

Notes:

- Prior to creating the Active Charging Service (ACS), the `require active-charging` command should be configured to enable ACS functionality.

**Important**

After you configure this command, you must save the configuration and then reload the chassis for the command to take effect. For information on saving the configuration file and reloading the chassis, refer to the `System Administration Guide` for your deployment.

- The `billing-records rf` command configures Rf record type of billing to be performed for subscriber sessions. Rf accounting is applicable only for dynamic and predefined ACS rules.

  For more information on the rules and its configuration, refer to the `ACS Charging Action Configuration Mode Commands` chapter in the `Command Line Interface Reference`.

- The `active-charging rf` command is used to enforce a specific rating group / service identifier on all PCC rules, predefined ACS rules, and static ACS rules for Rf-based accounting. As this CLI configuration is applied at the rulebase level, all the APNs that have the current rulebase defined will inherit the configuration.

  For more information on this command, refer to the `ACS Rulebase Configuration Mode Commands` chapter in the `Command Line Interface Reference`.

---

**Configuring GGSN / P-GW Rf Interface Support**

To configure the standard Rf interface support for GGSN/P-GW, use the following configuration:
configure
  context <context_name>
    apn <apn_name>
      associate accounting-policy <policy_name>
    exit
  policy accounting <policy_name>
    accounting-event-trigger { cgi-sai-change | ecgi-change |
      flow-information-change | interim-timeout | location-change | rai-change |
      tai-change } action { interim | stop-start }
    accounting-keys qci
    accounting-level { flow | pdn | pdn-qci | qci | sdf | subscriber }
    cc profile index { buckets num | interval seconds | sdf-interval seconds | sdf-volume { downlink octets { uplink octets } | total octets |
      uplink octets { downlink octets } } | serving-nodes num | tariff time1 min hrs [ time2 min hrs...time4 min hrs ] | volume { downlink octets { uplink octets |
      total octets | uplink octets { downlink octets } } } |
      max-containers { containers | fill-buffer } }
end

Notes:

• The policy can be configured in any context.
• For information on configuring accounting levels/policies/modes/event triggers, refer to the Accounting Policy Configuration Mode Commands chapter in the Command Line Interface Reference.
• Depending on the triggers configured, the containers will either be cached or released. In the case of GGSN/P-GW, the containers will be cached when the event trigger is one of the following:
  • QOS_CHANGE
  • FLOW_INFORMATION_CHANGE
  • LOCATION_CHANGE
  • SERVING_NODE_CHANGE
  • SERVICE_IDLE
  • SERVICE_DATA_VOLUME_LIMIT
  • SERVICE_DATA_TIME_LIMIT
  • IP_FLOW_TERMINATION
  • TARIFF_CHANGE
If the event trigger is one of the following, the containers will be released:
  • VOLUME_LIMIT
  • TIME_LIMIT
  • RAT_CHANGE
  • TIMEZONE_CHANGE
  • PLMN_CHANGE

---

**Important** Currently, SDF and flow level accounting are supported in P-GW.

The following assumptions guide the behavior of P-GW, GGSN and CCF for Change-Condition triggers:
• Data in the ACR messages due to change conditions contain the snapshot of all data that is applicable to the interval of the flow/session from the previous ACR message. This includes all data that is already sent and has not changed (e.g. SGSN-Address).

• All information that is in a PDN session/flow up to the point of the Change-Condition trigger is captured (snapshot) in the ACR-Interim messages. Information about the target Time-Zone/ULI/3GPP2-BSID/QoS-Information/PLMN Change/etc will be in subsequent Rf messages.

Table 82: P-GW/GGSN and CCF Behavior for Change-Condition in ACR-Stop and ACR-Interim for LTE/e-HRPD/GGSN

<table>
<thead>

**ACR Message**
- Interim

**Change-Condition Value**
- Max Number of Changes in Charging Conditions

**CCF Response to Change-Condition Value**
- Addition of Container: YES
- Partial FDR: YES
- Final FDR: NO

**CC Level Population**
- PS-Information Level: YES
- SDC Level: YES
### ACR Message | Change-Condition Value | CCF Response to Change-Condition Value | CC Level Population | Comments
--- | --- | --- | --- | ---
 | | | | PS-Information Level | SDC Level
Addition of Container | Partial FDR | Final FDR |

This ACR[Interim] is triggered at the instant when the Max Number of changes in charging conditions takes place. Max Change Condition is applicable for QoS-Change, Service-Idled Out, ULI change, Flow Normal Release, Flow Abnormal Release, Service Data Volume Limit, Service Data Time Limit, AIITimer ACR Interim and Service Node Change CC only. The Max Number of Changes in Charging Conditions is set at 10. Example assuming 1 flow in the PDN Session: [1] Max Number of Changes in Charging Conditions
<table>
<thead>
<tr>
<th>ACR Message</th>
<th>Change-Condition Value</th>
<th>CCF Response to Change-Condition Value</th>
<th>CC Level Population</th>
<th>Comments</th>

<tr>
<td>Stop</td>
<td>Management Intervention</td>
<td>YES</td>
<td>NO</td>
<td>YES</td>
</tr>
</tbody>
</table>

set at P-GW/GGSN = 2. [2] Change Condition 1 takes place. No ACR Interim is sent. P-GW/GGSN stores the SDC. [3] Change Condition 2 takes place. An ACR Interim is sent. Now Max Number of Changes in Charging conditions is populated in the PS-Information 2 Service-Data-Containers (1 for each change condition) are populated in the ACR Interim. [4] CCF creates the partial record.
### Configuring P-CSCF/S-CSCF Rf Interface Support

To configure P-CSCF/S-CSCF Rf interface support, use the following configuration:

```bash
configure
  context vpn
    aaa group default
diameter authentication dictionary aaa-custom8
diameter accounting dictionary aaa-custom2
diameter accounting endpoint <endpoint_name>
  diameter accounting server <server_name> priority <priority>
    exit
  diameter endpoint <endpoint_name>
    origin realm <realm_name>
    use-proxy
    origin host <host_name> address <ip_address>
    peer <peer_name> address <ip_address>
    exit
  exit
end
```

**Notes:**

- For information on commands used in the basic configuration for Rf support, refer to the *Command Line Interface Reference*.

### Gathering Statistics

This section explains how to gather Rf and related statistics and configuration information.
In the following table, the first column lists what statistics to gather, and the second column lists the action to perform.

<table>
<thead>
<tr>
<th>Statistics/Information</th>
<th>Action to perform</th>
</tr>
</thead>
<tbody>
<tr>
<td>Complete statistics for Diameter Rf accounting sessions</td>
<td>show diameter aaa-statistics</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show diameter aaa-statistics` command:

```

CHAPTER 56

Routing Behind the Mobile Station on an APN

The routing behind the Mobile Station (MS) feature enables the routing of packets to IPv4 addresses that do not belong to the PDN Session (the MS), but exist behind it. The network address of the destination can be different than the Mobile Station address.

This chapter includes the following topics:

- Feature Description, on page 951
- How It Works, on page 951
- Configuring Routing Behind the Mobile Station, on page 952
- Monitoring and Troubleshooting the Routing Behind the Mobile Station, on page 956

Feature Description

The Framed-Route attribute provides routing information to be configured for the user on the network access server (NAS). The Framed-Route information is returned to the RADIUS server in the Access-Accept message. Framed-Route can work at a context level or VRF level. VRFs can be on per enterprise and each can have its own set of framed-routes. In such configuration, framed routes will be installed in VRF’s dedicated for respective enterprise. Association of Framed-Route with VRF will be done based on subscriber IP pool.

Mobile Router enables a router to create a PDN Session which the GGSN authorizes using RADIUS server. The RADIUS server authenticates this router and includes a Framed-Route attribute in the access-accept response packet. Framed-Route attribute also specifies the subnet routing information to be installed in the GGSN for the "mobile router." If the GGSN receives a packet with a destination address matching the Framed-Route, the packet is forwarded to the mobile router through the associated PDN session.

How It Works

Routing Behind the Mobile Station on an APN

The following rules apply:

- AAA interface of GGSN/P-GW supports receiving "Framed Route AVP" in Radius Access-Accept Message from the Radius Server.
- AAA interface of GGSN/P-GW supports maximum 16 "Framed Route AVP" in Radius Access-Accept Message
• GGSN/P-GW does not accept framed route with destination address as 0.0.0.0 and/or netmask as 0.0.0.0.
• GGSN/P-GW does not accept framed route where gateway address in the route is not matching with the address that would be assigned to Mobile station.
• GGSN/P-GW ignores duplicate framed routes.
• GGSN/P-GW supports controlling enabling/disabling of this feature through CLI in APN Configuration.
• GGSN/P-GW supports controlling number of framed-routes to be installed through this feature.
• GGSN/P-GW supports controlling number of hosts (addresses) supported behind the mobile station per route.
• The routing behind an MS is supported only for IPv4 PDP contexts.
• Packets routed behind the MS share the same 3GPP QoS settings of the MS.

Configuring Routing Behind the Mobile Station

The routing behind the MS feature enables the routing of packets to IPv4 addresses that do not belong to the PDN Session (the MS), but exist behind it. The network address of the destination can be different than the MS address.

Before enabling routing behind the MS, the following requirements must be met:

• The MS must use RADIUS for authentication and authorization.

• The Framed-Route (attribute 22) as defined in Internet Engineering Task Force (IETF) standard RFC 2865, must be configured in the profile of a user and contain at least one route, and up to 16 routes for each MS that is to use the routing behind the MS feature.

When configured, the Framed-Route attribute is automatically downloaded to the GGSN during the RADIUS authentication and authorization phase of the PDN Session creation. If routing behind the MS has not been enabled using the network-behind-mobile command in access-point configuration mode, the GGSN ignores the Framed-Route attribute.

When the MS session is no longer active, the routes are deleted.

• Static routes are not configured. The configuration of the routing behind the mobile station feature (Framed Route, attribute 22) and static routes at the same time is not supported.

Configuration Overview

To enable routing behind a Mobile Station perform the following steps:

Step 1  Create an APN Profile. Refer to Creating an APN Profile, on page 952.
Step 2  Enable or disable a Network behind Mobile Station for APN. Refer to Enabling Routing Behind the Mobile Station, on page 953.

Creating an APN Profile

Use the following example to create an APN profile on the P-GW/SAEGW/S-GW:
Enabling Routing Behind the Mobile Station

To enable routing behind an MS, use the following steps command in access-point configuration mode:

```
config
  network-behind-mobile { max-addresses-behind-mobile max_addrs | max-subnets max_subnets }
  { default | no } network-behind-mobile
end
```

Notes:
- **default**
  Enables the default settings for this function. It enables NBMS with max-subnets as 10 and max-addresses-behind-mobile as 16,777,214 default values.
- **no**
  Disables the network behind mobile station functionality on the APN.
- **max-addresses-behind-mobile** *max_addrs*
  Configures the maximum number of addresses that are allowed in a single Network/subnet Behind MS.
- **max-subnets** *max_subnets*
  Specifies the maximum number of subnets that can be enabled for a call in the APN.

Default: 10

Verifying the Routing Behind the Mobile Station

To verify the routing behind the mobile station configuration, use the following show commands.

1. Router show ip route vrf vpn_am2

</tr>
</tbody>
</table>
Feature Description

In this release, this feature is not fully qualified and is available only for testing purpose. For more information, please contact your Cisco Account representative.

This feature separates bulk stats by RAT type (2G, 3G, and 4G). This helps KPI monitoring and reporting per RAT type. Per APN per RAT type statistics is integrated with the existing stats-profile implementation. A new CLI command `rat-type` is added to the `stats-profile` configuration mode to configure the RAT-types in stats-profile.

Configuring RAT types in Stats Profile

A new CLI command `rat-type` has been added to the `stats-profile` configuration mode. This CLI command integrates per APN per RAT type statistics with the existing stats-profile implementation. To gather RAT level statistics, you must configure RAT type under the stats-profile for which RAT level statistics are required. Once that is done, associate stats-profile in APN for which APN per RAT level statistics is required. Only after this association, the stats are collected. Per APN per RAT level statistics are lost if stats-profile association is removed from APN and/or rat type option is removed from stats-profile.

To enable per APN per RAT types statistics collection, execute the following command:

```
configure
  stats-profile <stats_profile_name>
    [no] rat-type { [geran | utran | eutran]* }
end
```

NOTES:

- **no**: Disables statistics collection based on RAT type.
- **stats-profile**: Configures statistics profile to collect packet drop counters and/or ARP level statistics.
- **rat-type**: Configures collection of RAT level statistics.
- **geran**: Configures collection of statistics for RAT Type GERAN.
- **utran**: Configures collection of statistics for RAT Type UTRAN.
- **eutran**: Configures collection of statistics for RAT Type EUTRAN.

Sample Configuration

Sample configuration to enable stats collection based on rat type:

```
config
  stats-profile stats-info
    rat-type eutran utran
    rat-type utran geran
end
```
Sample configuration to disable stats collection based on rat type:

```plaintext
config
  stats-profile stats-info
    no rat-type eutran utran
  end
```

**Monitoring and Troubleshooting**

This section provides information on the show commands available to support the 2G/3G/4G bulkstat separation.

**Show Commands and Outputs**

This section provides information regarding show commands and their outputs in support of the feature.

```
show apn statistics all
```

The output of the above command is modified to display the following new field depending on whether the CLI command is enabled or disabled:

- Data Statistics:
  - RAT Type statistics for uplink and downlink bytes:
    - GERAN
      - UpInk DataBytes
      - DnInk DataBytes
    - UTRAN
      - UpInk DataBytes
      - DnInk DataBytes
    - EUTRAN
      - UpInk DataBytes
      - DnInk DataBytes

- IP address allocation statistics
  - RAT Type statistics for dynamic address allocation for PDN types IPv4, IPv6, IPv4v6:
    - GERAN Dynamic address allocated:
      - IPv4
      - IPv6
      - IPv4v6
    - UTRAN Dynamic address allocated:
```
show gtpc statistics

The output of the above command is modified to display the following new fields. These fields do not have any dependency on stats-profile configuration. The gtpc stats will increase irrespective of the stats profile configured with rat type.

- Total CPC Req GERAN
- Total CPC Req UTRAN

show stats profile all

The output of the above command is modified to display the following new field depending on whether the CLI is enabled or disabled:

- rat-type geran utran utran

Bulk Statistics

The following bulk statistics are added in the APN schema to support the 2G, 3G, 4G bulkstats separation feature:

<table>
<thead>
<tr>
<th>Bulk Statistics</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>att-pdp-cxt-geran</td>
<td>Indicates the total number of CPC requests received per APN for a call with a RAT type of GERAN.</td>
</tr>
<tr>
<td>att-pdp-cxt-utran</td>
<td>Indicates the total number of CPC requests received per APN for a call with a RAT type of UTRAN.</td>
</tr>
<tr>
<td>dyn-ipv4-success-geran</td>
<td>Indicates the total number of IPv4 contexts requesting dynamically assigned IP addresses that were successfully setup for a GERAN RAT type.</td>
</tr>
<tr>
<td>dyn-ipv4-success-utran</td>
<td>Indicates the total number of IPv4 contexts requesting dynamically assigned IP addresses that were successfully setup for a UTRAN RAT type.</td>
</tr>
<tr>
<td>dyn-ipv6-success-geran</td>
<td>Indicates the total number of IPv6 contexts requesting dynamically assigned IP addresses that were successfully setup for a GERAN RAT type.</td>
</tr>
<tr>
<td>dyn-ipv6-success-utran</td>
<td>Indicates the total number of IPv6 contexts requesting dynamically assigned IP addresses that were successfully setup for a UTRAN RAT type.</td>
</tr>
<tr>
<td>Bulk Statistics</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>dyn-ipv4v6-success-geran</td>
<td>Indicates the total number of IPv4v6 contexts requesting dynamically assigned IP addresses that were successfully setup for a GERAN RAT type.</td>
</tr>
<tr>
<td>dyn-ipv4v6-success-utran</td>
<td>Indicates the total number of IPv4v6 contexts requesting dynamically assigned IP addresses that were successfully setup for a UTRAN RAT type.</td>
</tr>
<tr>
<td>uplnk-bytes-geran</td>
<td>Indicates the total number of bytes sent from the APN for a GERAN RAT type towards the Internet/PDN on the Gi interface.</td>
</tr>
<tr>

Session Tracing

This chapter provides information on subscriber session trace functionality that allows an operator to trace subscriber activity at various points in the network and at various level of detail. Subscriber session tracing is supported on the following UMTS/EPC GW network elements:

- GGSN
- P-GW
- SAEGW
- S-GW

For detailed information for session tracing on the MME, refer to the MME Administration Guide.

The product Administration Guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in the respective product Administration Guide, before using the procedures in this chapter.

This chapter includes a feature description, configuration procedures, monitoring commands, and a session tracing file example.

- Session Tracing Overview, on page 963
- Configuring Session Trace Functionality, on page 967
- Monitoring the Session Trace Functionality, on page 977
- Supported SAEGW Session Trace Configurations, on page 978
- Session Trace File Example, on page 981

Session Tracing Overview

Session Trace capability enables an operator to trace subscriber activity at various points in the network and at various levels of detail. The trace can be subscriber initiated (that is, signaling based) or management initiated from the CLI (Command Line Interface) and can be propagated throughout the access cloud via the various signaling interfaces available to the UMTS/EPC network element.

Essentially, the Session Trace capability records and forwards all control activity for the monitored subscriber on the monitored interfaces. This is typically all the signaling and authentication/subscriber services messages that flow when a User Equipment (UE) connects to the access network.
All monitored activity is sent to an off-line Trace Collection Entity (TCE) using a standards-based XML format over a File Transfer Protocol (FTP) or secure FTP (sFTP) connection.

**Important**

Session tracing is a resource intensive application in terms of CPU utilization and will affect call rates and data throughput when in use. The use of this feature in a production network should be restricted to minimize the impact on existing services.

**Important**

For 19.2 and prior StarOS releases, both the FTP and SFTP options are available. In release 20.0 and higher trusted StarOS builds only the SFTP option is supported; FTP is not supported for the Session Trace function in release 20.0 and higher trusted StarOS builds.

As can be seen in the following illustration, of the three Network Elements (NEs) shown, one NE is actively tracing data on one or more interfaces. All data collected is stored as files in an XML format and then transferred to the collection entity using (S)FTP or FTP. Note that IPv4 or IPv6 connectivity is required between the NE and the TCE in order to transfer the files.

**Figure 102: Session Tracing Architecture**

- UMTS/EPC Network Element
- Traced Interface
- Traced Interface

UMTS Network Element: GGSN, HNBGW
EPS Network Element: P-GW, SAEGW, S-GW
Session Trace Types

There are three types of session trace functions available.

- **Management Trace**: The operator sends an activation request via the CLI directly to the UMTS/EPC network element where the trace is to be initiated. The network element establishes the trace session and waits for a configured trigger event to start actively tracing. When management-initiated trace activations are executed at the network element, they are never propagated to other NEs whether or not it is involved in the actual recording of the call.

- **Random Trace**: Enables or disables the subscriber session trace functionality based on a random trace on the UMTS/EPC network element. The trace control and configuration parameters are configured directly in the specified network element through the *random trace* CLI command. There is no propagation of trace parameters in random based trace activation. This NE shall not propagate the received data to any other NEs whether or not it is involved in the actual recording of the call. If enabled, the subscriber selection will be based on random logic all instances of session on the specified UMTS/EPC network element.

- **Signaling Trace**: With a signaling based activation, the trace session is indicated to the UMTS/EPC network element across a signaling interface via a trace invocation message. This message can either be piggybacked with an existing bearer setup message (in order to trace all control messages) or by sending a separate trace invocation message (if the user is already active). Signaling based activations are always propagated to neighboring NEs even if the current NE does not participate in the trace (either they not enabled by configuration or not present in the configured trace parameters).

---

**Important**

Note that the maximum number of unique International Mobile Subscriber Identification (IMSI) numbers or International Mobile Equipment Identification (IMEI) numbers cannot exceed 32; however, each NE can trace all 32 unique IMSI/IMEIs.

---

**Caution**

Session tracing is a resource intensive application in terms of CPU utilization and will affect call rates and data throughput when in use. The use of this feature in a production network should be restricted to minimize the impact on existing services.

---

**Session Trace Activation**

Activation of a trace is similar whether it be via the management interface or via a signaling interface. In both cases, a trace session state block is allocated which stores all configuration and state information for the trace session. In addition, an (S)FTP connection to the Trace Collection Entity (TCE) is established if one does not already exist. The NE will store up to 2 MB of XML data on its local disk to allow for the (S)FTP connection to be established and the files to be pushed to or pulled from the TCE.

If the session to be traced is already active, tracing may begin immediately. Otherwise, tracing activity waits until the start trigger occurs (typically when the subscriber/UE under trace initiates a connection). A failure to activate a trace (due to the maximum being exceeded or some other failure reason) results in a notification being sent to the TCE indicating the failure.
Session Trace Deactivation

Deactivation of a Trace Session is similar whether it was management or signaling activated. In either case, a deactivation request is received by the NE that contains valid trace reference results in the de-allocation of the trace session state block and a flushing of any pending trace data. In addition, if this is the last trace session to a particular TCE, the (S)FTP connection to the TCE is released after the last trace file is successfully transferred to the TCE.

Data Collection

Data collection is done inline by each of the NEs. In order to reduce the overhead on a per-control packet basis, a copy of the entire packet is made and stored into an internal database (DB) of packets.

The local internal path for the trace database is /hd-raid/trace.

This storage is done regardless of the trace depth. After xx bytes (or xx messages) have been stored or a configurable number of seconds have elapsed, all cached data is encoded in the standard XML format and written out to a file to be forwarded to/pulled from the TCE. If there is no TCE active, the UMTS/EPC network element will continue to cache data and create trace files as long as there is space available before stopping the trace recording session. Once the connection to the TCE becomes active, all cached data will be sent immediately to the TCE.

Data Forwarding

When a session is activated, the IP address of the TCE is supplied in the session activation request. Upon activation and if the push mode is used, a check is made to see if there is already an (S)FTP connection to the TCE. If so, it is used for all traffic associated with this trace session. If not, an (S)FTP connection is made to the TCE using the supplied IP address. Data is buffered locally and trace files generated until the connection is established. Once the connection is established, all previously created trace files are sent to the TCE. Note that the (S)FTP connection is established to the TCE at session activation regardless of whether or not a trace recording session has been triggered. The (S)FTP connection is maintained until the trace session is deactivated.

Note the following:

• If a default TCE IP Address is supplied when the trace capability is configured, a default (S)FTP connection is made to the remote TCE.
• The TCE can be reachable either via IPv4 or IPv6 addressing. The supplied TCE address indicates the version.
• If the push mode is not used, the files are stored on the local hard drive (/hd-raid/trace) and must be pulled off by the TCE using FTP or SFTP.

Supported Standards

Support for the following standards and requests for comments (RFCs) have been added for the Session Trace feature:

• 3GPP TS 32.421 V8.5.0 (2009-06): 3rd Generation Partnership Project; Technical Specification Group Services and System Aspects; Telecommunication management; Subscriber and equipment trace: Trace concepts and requirements (Release 8)
Configuring Session Trace Functionality

Configuring Session Trace on the UMTS/EPC network element consists of the following:

1. Enabling Session Tracing, on page 967
2. Configuring a Session Trace Template for the Management Trace Function, on page 968
3. Configuring a Management Session Trace, on page 972
4. Configuring a Signaling Session Trace, on page 973
5. Configuring a Random Trace, on page 974

The trace files can be stored locally, or pushed to a Trace Collection Entity (TCE) specified in the various trace commands.

Important

Not all combinations of Session Trace configuration types are allowed on the SAEGW. For details on the supported session trace configuration types, refer to Supported SAEGW Session Trace Configurations, on page 978 in this document.

Enabling Session Tracing

Session Tracing functionality must first be enabled before a specific management, random, or signaling session trace can be configured.

The following commands enable or disable the subscriber session trace functionality based on a specified subscriber device or ID on one or all instances of a session on a specified UMTS/EPC network element.

Use the following example to enable session tracing on the UMTS/EPC network element:

```
cfg  
  session trace network-element { all | ggsn | hnbgw | mme | pgw | saegw | sgw } [ file-type <a-type | b-type> ] tce-mode none | push transport ftp | sftp username username encrypted password password path directory_path collection timer ctimer_value end
```  

Notes:

- **session trace network-element**: Enables Session Tracing functionality on the specified network element. To enable session tracing for all supported network elements, enter all.
- **file-type { a-type | b-type }**: Specifies which type of XML file is generated by the session trace. Options include an A-type file and B-type file. When B-type XML files are used, multiple trace recording session elements will be encoded in a single XML file. Note that different trace recording sessions may be associated with different TCEs, according to the TCE IP address specified during activation. As expected, each Type-B XML file will contain traceRecSession elements that pertain only to the same target TCE.
There will be different XML Type-B files created for different TCEs and they will be placed in different tce_x directories for transmission to the target TCEs. The default is a-type.

- **tce-mode**: Specifies that trace files are stored locally and must be pulled by the TCE (none) or trace files are pushed to the TCE (push). The default is none.
- **transport**: Specifies the method by which the trace files are pushed to the TCE (either ftp or sftp). The default is sftp.
- **username**: Must be specified if the tce-mode is push.
- **password**: Must be specified if the tce-mode is push.
- **encrypted**: Specifies that the password used to push files to the TCE server will be encrypted.
- **password**: Specifies the password to use to push files to the TCE server. The user name can be from 1 to 31 alphanumeric characters.
- **collection-timer**: Specifies the amount of time, in seconds, to wait from initial activation/data collection before data is reported to TCE. The default is 10 seconds.
- **retry-timer**: Specifies the amount of time, in seconds, to wait before retrying a file transfer if the previous transfer failed. The default is 60 seconds.

**Example:**

```
session trace network-element saegw tce-mode push transport sftp path /SessionTrace username root encrypted password 5c4a38dc2ff61f72 collection-timer 5
```

**Verifying that Session Tracing is Enabled**

Use the following example to verify that session tracing functionality is enabled on the UMTS/EPC network element:

```
show session trace statistics
```

The output indicates for which NEs session tracing is enabled, and also indicates the configured trace type, where applicable. For example:

```
Network element status:
MME:   Enabled   Cell-Trace: Disabled
S-GW:  Enabled
SAEGW Enabled
PGW:   Trace-Type: None
SGW:   Trace-Type: None
```

**Disabling Session Trace Functionality**

Use the following example to disable session tracing functionality:

```
config
    no session trace network-element { all | ggsn | hnbgw | mme | pgw | saegw | sgw }
end
```

**Configuring a Session Trace Template for the Management Trace Function**

Operators must create a template for a management trace in Global Configuration Mode. Management traces executed in Exec mode will use the template. Once created, the template can be associated with different subscribers to trace the interfaces configured in the template.
Note that to activate subscriber session traces for specific IMSI/IMEI, the operator will use the Exec mode `session trace subscriber` command specifying a pre-configured template and the IMSI/IMEI, trace reference, and TCE address.

Use the following example to configure a template for use with the `session trace subscriber` command:

```bash
config
template-session-trace network-element { ggsn | hnbgw | mme | pgw | saegw | sgw } template-name template_name
```

Once this command is entered, the user is placed in `Session Trace Template Configuration Mode`. In this mode, the operator selects the interfaces to be traced for the selected network element.

---

**Important**

The options available in `Session Trace Template Configuration Mode` are dependent on the network element selected in the previous command.

For the GGSN, MME, P-GW and S-GW, enter the following command in `Session Trace Template Configuration Mode`:

```bash
interface interface_name
end
```

For the SAEGW, enter the following command in `Session Trace Template Configuration Mode`:

```bash
{ func-pgw | func-sgw } interface interface_name
end
```

• Notes: The available UMTS/EPC network elements provide various interface options for the session trace template.

**GGSN**

Available `ggsn` interfaces include:

- **all**: Specifies that all available GGSN interfaces are to be traced.
- **gi**: Specifies that the interface where the trace will be performed is the Gi interface between the GGSN and RADIUS server.
- **gmb**: Specifies that the interface where the trace will be performed is the Gmb interface between the GGSN and BM-SC.
- **gn**: Specifies that the interface where the trace will be performed is the Gn interface between the GGSN and the SGSN.
- **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.
- **gy**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.

**HNBGW**

Available `hnbgw` interfaces are:

- **all**: Specifies that all `hnbgw` interfaces are to be traced.
- **iucs**: Specifies that the interface where the trace will be performed is the iucs interface between the HNB-GW and the Mobile Switching Center (3G MSC) in a 3G UMTS Femtocell Access Network.
- **iups**: Specifies that the interface where the trace will be performed is the iups interface between the HNB-GW and the SGSN.
MME

Available **mme** interfaces include:

- **all**: Specifies that all MME interfaces are to be traced.
- **s10**: Specifies that the interface where the trace will be performed is the S10 interface between the MME and another MME.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.
- **s13**: Specifies that the interface where the trace will be performed is the S13 interface between the MME and the EIR.
- **s1mme**: Specifies that the interface where the trace will be performed is the S1-MME interface between the MME and the eNodeB.
- **s3**: Specifies that the interface where the trace will be performed is the S3 interface between the MME and an SGSN.
- **s6a**: Specifies that the interface where the trace will be performed is the S6a interface between the MME and the HSS.

P-GW

Available **pgw** interfaces are:

- **all**: Specifies that all available P-GW interfaces are to be traced.
- **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
- **gy**: Specifies that the interface where the trace will be performed is the Gy interface between the P-GW and OCS.
- **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.
- **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.
- **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between an S-GW and P-GW located within the same administrative domain (non-roaming).
- **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.
- **s8**: Specifies that the interface where the trace will be performed is the S8 interface -- an inter-PLMN reference point between the S-GW and the P-GW used during roaming scenarios.
- **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.

SAEGW

The interfaces that can be traced on the SAEGW are broken down by the interfaces available on a P-GW configured under an SAEGW (**func-pgw**), and the interfaces available on a S-GW configured under an SAEGW (**func-sgw**).

- Available **func-pgw** interface options are:
  - **all**: Specifies that all available **func-pgw** interfaces are to be traced.
  - **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
The available **func-sgw** interface options are:

- **all**: Specifies that all available **func-sgw** interfaces are to be traced.
- **gxc**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.
- **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
- **s8**: Specifies that the interface where the trace will be performed is the S8 interface between the S-GW and the P-GW.

**S-GW**

The available **sgw** interfaces are:

- **all**: Specifies that all available S-GW interfaces are to be traced.
- **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.
- **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
- **s8**: Specifies that the interface where the trace will be performed is the S8 interface between the S-GW and the P-GW.

**Verifying the Session Trace Template Configuration**

To verify the session trace configuration, enter the following command in Exec Mode.
show session trace template network-element { ggsn | hnbgw | mme | pgw | saegw | sgw } all

The output provides the template name, the NE type, and all interfaces configured for tracing.

Disabling the Session Trace Template Configuration

Use the following example to disable the session trace template configuration:

no template-session-trace network-element { ggsn | hnbgw | mme | pgw | saegw | sgw }

Disabling the Session Trace Template Configuration per Network Element and Subscriber

To disable the session trace template per network element and subscriber:

no session trace subscriber network-element { ggsn | hnbgw | mme | pgw | saegw | sgw } template-name template_name { imsi id | imei id } trace-ref trace_ref_value collection-entity ip_address

Configuring a Management Session Trace

Session tracing functionality must be enabled before a management trace can be configured. Refer to Enabling Session Tracing, on page 967 for the procedure.

To configure a management session trace on the UMTS/EPC network element from Exec Mode:

session trace subscriber network-element { ggsn | hnbgw | mme | pgw | saegw | sgw } template-name template_name { imsi id | imei id } { all | interface } } trace-ref id collection-entity ip_address

Notes:

• **template-name**: Specifies the name of the session trace template to use for this session trace. Session trace templates are configured in Global Configuration Mode using the `template-session-trace` command. Management traces executed in Exec mode will use the specified template.
• **imsi id**: Specifies the International Mobile Subscriber Identification Number for the subscriber.
• **imei id**: Specifies the International Mobile Equipment Identification number for the subscriber.
• **trace-ref**: Specifies the Trace Reference for this subscriber management trace. It must be composed of the Mobile Country Code (MCC) + the Mobile Network Code (MNC) + a 3 byte octet string Trace ID. Example: 31001212349.
• **collection-entity**: Specifies the IP address of the Trace Collection Entity (TCE) to which the trace file generated will be sent. The IP address must be in IPv4 format.

Example:

This following is a complete example showing the configuration of a subscriber management trace for all S-GW and P-GW interfaces. It consists of enabling session tracing on the SAEGW, creating the session trace template for all S-GW and P-GW interfaces, and then executing the subscriber management trace for a specific IMSI using the template.

```
config
  session trace network-element saegw
end
config
```
Verifying the Management Trace Configuration

To verify that the management trace configuration for the subscriber is enabled, enter the `show session trace statistics` command from Exec Mode. Verify that the correct NE(s) show their Network element status as Enabled. For example:

```plaintext
SAEGW Enabled
PGW: Trace-Type: M
SGW: Trace-Type: M
```

Use the following example to verify that specific parameters have been activated for the subscriber management trace:

```plaintext
show session trace subscriber network-element { ggsn | hnbgw | mme | pgw | saegw | sgw } trace-ref trace_ref_value
```

The output fields show the NE Type and the Trace Type configured for each network element. Below is sample output for an SAEGW management trace configuration:

```plaintext
NE Type: SAEGW
PGW: Trace-Type: M
SGW: Trace-Type: M
```

Traced Interfaces:
PGW: <P-GW interfaces configured for the trace.>
SGW: <S-GW interfaces configured for the trace.>

Disabling the Management Trace Configuration

To disable the management trace configuration from Exec Mode:

```plaintext
no session trace subscriber network element { ggsn | hnbgw | mme | pgw | saegw | sgw } trace ref trace_ref_value
```

Configuring a Signaling Session Trace

Session trace functionality must be enabled before a signaling session trace can be configured. Refer to Enabling Session Tracing, on page 967 for the procedure.

To configure a signaling session trace:

```plaintext
session trace signaling network-element { ggsn | hnbgw | mme | pgw | saegw [ func-pgw | func-sgw ] | sgw }
```

Notes:

- `func-pgw`: Enables tracing of the P-GW signaling under the SAEGW
- `func-sgw`: Enables tracing of the S-GW signaling under the SAEGW
• If neither func-sgw or func-pgw is specified, then the signaling trace will be performed for all P-GW and S-GW interfaces of the SAEGW.

• collection-entity: Specifies the IPv4 or IPv6 address of the Trace Collection Entity (TCE) to which the trace files are sent.

Example:

This example configures a signaling session trace for all S-GW and P-GW interfaces under an SAEGW:

```
session trace signaling network-element saegw
```

Verifying the Signaling Session Trace Configuration

To verify the signaling session trace configuration:

```
show session trace statistics
```

Look for the following fields to verify the signaling trace configuration. For example:

```
Network element status:
......
SAEGW Enabled
PGW: Trace-Type: S
SGW: Trace-Type: S
```

Disabling the Signaling Session Trace

To deactivate signaling trace on the SAEGW:

```
no session trace signaling network-element { ggsn | hnbgw | mme | pgw | saegw [ func-pgw | func-sgw ] | sgw }
```

Configuring a Random Trace

Session trace functionality first must be enabled on the UMTS/EPC network element before a random trace can be configured. Refer to Enabling Session Tracing, on page 967 in this chapter for the procedure.

The following command enables or disables the subscriber session trace functionality based on a random trace on the UMTS/EPC network element. If enabled, the subscriber selection will be based on random logic for all instances of session on a specified network element.

To configure a random session trace:

```
session trace random range network-element { ggsn | hnbgw | pgw | saegw | sgw [ func-pgw | func-sgw ] } interface [ all | interface ] collection-entity ipv4_address
```

Notes:

• session trace random range: Enables a random trace for a specified number of subscribers. Valid entries are from 1 to 1000 subscribers.

• { ggsn | hnbgw | pgw | saegw | sgw [ func-pgw | func-sgw ] }: Specifies that the random trace is enabled for the selected network element.

• func-pgw: Enables random tracing of the P-GW interfaces under the SAEGW.

• func-sgw: Enables random tracing of the S-GW interfaces under the SAEGW.

• If neither func-pgw or func-sgw are specified, random tracing will occur for both the P-GW and S-GW.
• **interface**: Specifies the network interfaces for the random trace. Interfaces available depend on the network element type selected.

**GGSN**

Available **ggsn** interfaces are:

- **all**: Specifies that all available GGSN interfaces are to be traced.
- **gi**: Specifies that the interface where the trace will be performed is the Gi interface between the GGSN and RADIUS server.
- **gmb**: Specifies that the interface where the trace will be performed is the Gmb interface between the GGSN and BM-SC.
- **gn**: Specifies that the interface where the trace will be performed is the Gn interface between the GGSN and the SGSN.
- **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.
- **gy**: Specifies that the interface where the trace will be performed is the Gx interface between the GGSN and PCRF.

**HNBGW**

Available **hnbgw** interfaces are:

- **all**: Specifies that all **hnbgw** interfaces are to be traced.
- **iucs**: Specifies that the interface where the trace will be performed is the iucs interface between the HNB-GW and the Mobile Switching Center (3G MSC) in a 3G UMTS Femtocell Access Network.
- **iups**: Specifies that the interface where the trace will be performed is the iups interface between the HNB-GW and the SGSN.

**P-GW**

Available P-GW interfaces are:

- **all**: Specifies that all interfaces are to be traced.
- **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
- **gy**: Specifies that the interface where the trace will be performed is the Gy interface between the P-GW and OCS.
- **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the P-GW and the HSGW.
- **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the P-GW and an ePDG.
- **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the P-GW and a trusted, non-3GPP access device.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between an S-GW and P-GW located within the same administrative domain (non-roaming).
- **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the P-GW and the 3GPP AAA server.
- **s8**: Specifies that the interface where the trace will be performed is the S8 interface -- an inter-PLMN reference point between the S-GW and the P-GW used during roaming scenarios.
- **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the P-GW and the PDN.

**SAEGW**
The interfaces that can be traced on the SAEGW are broken down by the interfaces available on a P-GW configured under an SAEGW (func-pgw), and the interfaces available on a S-GW configured under an SAEGW (func-sgw).

Available SAEGW **func-pgw** interface options are:

- **all**: Specifies that all **func-pgw** interfaces configured under an SAEGW are to be traced.
- **gx**: Specifies that the interface where the trace will be performed is the Gx interface between the P-GW and the PCRF.
- **s2a**: Specifies that the interface where the trace will be performed is the S2a interface between the PGW and the HSGW.
- **s2b**: Specifies that the interface where the trace will be performed is the S2b interface between the PGW and an ePDG.
- **s2c**: Specifies that the interface where the trace will be performed is the S2c interface between the PGW and a trusted, non-3GPP access device.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the P-GW and the S-GW.
- **s6b**: Specifies that the interface where the trace will be performed is the S6b interface between the PGW and the 3GPP AAA server.
- **s8**: Specifies that the interface where the trace will be performed is the S8b interface between the PGW and the S-GW.
- **sgi**: Specifies that the interface where the trace will be performed is the SGi interface between the PGW and the PDN.
- **gy**: Specifies that the interface where the trace will be performed is the GTPP based online charging interface between P-GW and online charging system.

Available SAEGW **func-sgw** interfaces are:

- **all**: Specifies that all available **func-sgw** interfaces under an SAEGW are to be traced.
- **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the P-GW and the PCRF.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the MME and the S-GW.
- **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
- **s8**: Specifies that the interface where the trace will be performed is the S8b interface between the S-GW and the P-GW.

**S-GW**: Available **sgw** interfaces are:

- **all**: Specifies that all interfaces are to be traced.
- **gxc**: Specifies that the interface where the trace will be performed is the Gxc interface between the S-GW and the PCRF.
- **s11**: Specifies that the interface where the trace will be performed is the S11 interface between the S-GW and the MME.
- **s4**: Specifies that the interface where the trace will be performed is the S4 interface between the S-GW and an SGSN.
- **s5**: Specifies that the interface where the trace will be performed is the S5 interface between the S-GW and the P-GW.
• **s8**: Specifies that the interface where the trace will be performed is the S8 interface between the S-GW and the P-GW.

• **collection-entity** specifies the IPv4 address of the Trace Collection Entity (TCE)

**Example:**

To enable random tracing on a range of 40 SAEGW subscribers on all S-GW interfaces and the s5 interface of the P-GW in the SAEGW, enter the following sample command:

```
session trace random 40 network-element saegw func-pgw interface s5 func-sgw interface all collection-entity 1.1.1.1
```

**Verifying the Random Trace Configuration**

To verify the random session trace configuration:

```
show session trace statistics
```

Look for the fields that verify that Random Session Trace has been enabled for the network element. For example:

```
Network element status:
...
SAEGW Enabled
PGW: Trace-Type: R
SGW: Trace-Type: R Configured-Random: 40
```

**Disabling the Random Trace for a Specific Network Element**

To disable random session tracing for a specific network element:

```
no session trace random network-element { ggsn | hnbgw | pgw | saegw | sgw [ func-pgw | func-sgw ] }
```

**Monitoring the Session Trace Functionality**

This section provides information on commands you can use to monitor the session trace functionality

```
show session trace statistics
```

This command provides high-level statistics on the current use of the session trace functionality, including:

- Number of current trace sessions
- Number of total trace sessions
- Total sessions activated
- Number of activation failures
- Number of sessions triggered
- Total messages traced
- Number of current TCE connections
- Total number of TCE connections
- Total number of files uploaded to all TCEs
**show session trace subscriber network-element trace-ref**

This command shows detailed information about a specific trace, based on the trace-ref value of the session and network element type. It includes activation time, IMSI, start time, number of trace messages, and total number of files created. It also lists the interfaces that this session trace is configured to trace.

**show session trace trace-summary**

This command provides the trace-ref value of all session traces, broken down by network element type.

**show session trace tce-summary**

This command provides the IP address and index information for all configured TCEs.

**show session trace tce-address**

This command provides detailed information about a specific TCE, including IP address, start time, and total number of files uploaded.

---

**Supported SAEGW Session Trace Configurations**

Different tracing configurations are supported on the SAEGW. The different combinations of session tracing types depend on Call Type, Trace Type, and whether the operator would like to configure a Func-SGW and/or a Func-PGW trace.

Note the following:

- M = Management
- R = Random
- S = Signaling

CHAPTER 59

S-GW Restoration Support

This chapter describes the S-GW Restoration support feature.

- Feature Description, on page 985
- How it Works, on page 986
- Configuring S-GW Restoration Support, on page 987
- Monitoring and Troubleshooting S-GW Restoration Support, on page 988

Feature Description

S-GW Restoration helps in handling the S-GW failure in the EPC network. It allows affected PDNs that fail due to S-GW to be restored by selecting another S-GW to serve the affected PDNs. This avoids unnecessary flooding of signaling for PDN cleanup.

The P-GW maintains the sessions in case path failure is detected or if S-GW restart is detected during recovery IE on GTP-C signaling. The P-GW will ensure that any dropped packets in this scenario are not charged. The P-GW also rejects any bearer additions or modification requests received for the PDN connection maintained after the S-GW failure detection. This occurs until the PDN is restored.

Once the session has been restored by the MME and the P-GW receives a Modify Bearer Request from the restarted S-GW or a different S-GW, then the P-GW continues forwarding any received downlink data and start charging them.

When a subscriber is in S-GW restoration phase, all RARs (expect for Session Termination) reject the PCEF. The P-GW rejects all internal updates which can trigger CCR-U towards the PCRF. The P-GW triggers a CCR-U with AN-GW changes for the PDNs that are restored if the S-GW has changed on restoration.

The MME/S4-SGSN is locally configured to know that the P-GW in the same PLMN supports the S-GW restoration feature. When this feature is enabled at the P-GW, it supports it for all S-GWs/MMEs.

**Important**

S-GW restoration detection based on GTP-U path failure shall not be considered for this release. GTP-C path failure detection should be enabled for enabling this feature.

---

Only MME/S4-SGSN triggered S-GW restoration procedure will be supported.

S-GW restoration detection based on GTP-U path failure shall not be considered for this release. GTP-C path failure detection should be enabled for enabling this feature.
The P-GW Restart Notification may also be used to signal that the peer P-GW has failed and not restarted. In this case, the P-GW Restart Notification contains a cause value: P-GW not responding. While sending the PRN, the S-GW includes the cause with this new cause value depending on the echo response.

**Relationships to Other Features**

GTP-C path failure detection should be enabled for enabling this feature.

**How it Works**

**Changes at P-GW**

If a path failure is detected at the Demux, then the path failure notification is sent to all session managers at the P-GW. Next, the session manager cleans up the ongoing transactions. Once all the transactions are deleted, the sessmgr-egtpc deletes the tunnels by adding them into the pacing queue.

The P-GW will not delete the session immediately after detecting path failure with the S-GW restoration in place. The P-GW discards downlink packets received for a maintained PDN connection and stop charging for maintained PDN connections after an S-GW failure that has not been restored.

The MME/S4-SGSN controls the pace of the S-GW relocations to avoid core network node overload. The MME/S4-SGSN prioritizes the S-GW relocation for UEs engaged in a Service Request for RAU/TAU procedures over UEs which are not engaged in any mobility product procedure and do not have a signaling connection to MME/S4-SGSN.

If a session is marked for S-GW restoration and if a new request results in context replacement, then the existing session is aborted followed by a new request indication event.

**Changes at the E-GTPC**

When the Demux informs the eGTP-C about the path failure, abort all active procedures. The abort procedure indicates to the P-GW if S-GW restoration is enabled for the session. Add all the session in the queue and start the session hold timer for S-GW. The MME restores these sessions by relocating sessions to the new or the same S-GW. When the MBReq is received at the P-GW and if the session is marked with S-GW restoration, then the S-GW flag is reset. At this point, the session hold timer expires and S-GW restoration is removed.

**Changes at the MME and SGSN**

When the MME and SGSN detects path failure towards the S-GW and the MME supports S-GW restoration, then MME relocates sessions from the failed S-GW to another S-GW. Currently, S-GW restoration is not supported in MME and SGSN.

**Demux Failure Detection**

The EGTPIN manager detects a path failure and informs all session managers about the failure. Then, the session manager gets the path failure notification and S-GW restoration is enabled so it will stop all ongoing transactions. The Sessmgr-egtpc informs the P-GW-drv about the path failure. The P-GW deletes the session.
Next, the eGTP-C starts the session hold timer. If the MME triggers the S-GW service restoration before the session hold up timer, then sessions from the old S-GW will move to the new S-GW. This ensures that no sessions are handed over and none are deleted.

Once the session hold timer expires, all the sessions with that peer are cleaned up. At this point, new sessions are not moved to the new S-GW.

Important

If the S-GW goes down and comes back up in a very short interval, then the P-GW will not detect the path failure. In this case, S-GW restoration does not occur. If the old S-GW comes up again before the hold timer expires, then there is a chance that only some partial sessions move to the new S-GW. In this case, the eGTP-C does not need to delete the remaining sessions with that peer. The eGTP-C will stop the timer.

Important

If the session manager detects the path failure, then it informs the Demux manager. The above, scenario still occurs in this case.

After detecting the path failure, the Demux will not send ECHO messages towards the S-GW. If the new session addition occurs or a new session is restored from the node, then the Demux sends the ECHO messages towards the peer.

Standards Compliance

The S-GW Restoration functionality complies with the following standards:

- 3GPP TS 23.007: Restoration procedures
- 3GPP TS 29.212: Policy and Charging Control over Gx reference point

Configuring S-GW Restoration Support

The session-hold timer is a configurable parameter. The operator can configure this parameter using the `egtpc sgw-restoration session-hold timeout seconds` CLI command.

The `sgw-restoration` keyword enables S-GW restoration functionality and configure session hold timeout on a P-GW service.

When the P-GW detects that the peer S-GW is down (detection is based on restart counter change or PATH failure due to an ECHO response failure), it moves all PDN sessions associated with the peer S-GW to the SGW-RESTORATION-STATE. Also the P-GW starts a timer with the value provided for session-hold timeout per peer S-GW. After timer expiry, the P-GW cleans up all the sessions which are in the SGW-RESTORATION-STATE.

Important

By default, S-GW restoration support will not be enabled.

Sample Configuration

Use the following example to enable S-GW Restoration Support.

```plaintext
configure
  context context_name
```
pgw-service service_name
egtpc sgw-restoration session-hold timeout seconds
{ default | no } egtpc sgw-restoration session-hold
end

Notes:

• **session-hold timeout** configures session hold timer for S-GW restoration.

• **seconds** must be an integer from 1 to 3600. Default: 0 (disabled).

• On S-GW failure indication, the P-GW checks if the S-GW restoration feature is enabled or not. If enabled, the P-GW maintains all the affected sessions for session-hold timeout. After session-hold timeout, the P-GW clears all the sessions which are not recovered yet.

### Verifying the S-GW Configuration

To verify the S-GW Restoration configuration, use the following command:

```bash
show pgw-service all
```

The following fields have been added to display configuration information for S-GW restoration.

• EGTP SGW Restoration Handling
• Session Hold Timer
• Timeout

### Monitoring and Troubleshooting S-GW Restoration Support

This section includes show commands in support of the S-GW Restoration.

### S-GW Show Commands

This section provides information regarding show commands and/or their outputs in support of the S-GW Restoration.

```bash
show ims-authorization policy-control statistics
```

The following fields have been added to display the statistics introduced in support of S-GW Restoration Support.

• SGW Restoration
• RAR Reject
• Internal Updates Dropped
• Revalidation Timeout
• Pending Updates

```bash
show pgw-service statistics all
```

The following counters have been added to display S-GW Restoration Support.
show subscribers pgw-only full all

The following fields and counters have been added to display S-GW Restoration Support.

• Bearer State
• in packet dropped sgw restoration state
• in bytes dropped sgw restoration state

Revision History

Revision history details are not provided for features introduced before releases 21.2 and N5.5.
Support for Execution-Time AVP in Override-Control AVP

Feature Description

The Override Control (OC) feature, introduced in an earlier release, allowed you to dynamically modify the parameters of static or predefined rules with parameters sent by the PCRF over the Gx interface. Any OC parameters received in RAR/CCA messages was applied immediately by the PCEF. There was no way to enforce the installation of OC at a specified time in future.

The implementation of this feature allows the overridden parameters to be specified for a rule (static or predefined), for one or all charging actions (using a wildcard), with the ability to exclude certain rules. These overrides are sent by the PCRF using the AVP construct in a CCA or RAR message.

As part of this feature, the P-GW supports the following two new AVPs within the proprietary Override-Control grouped AVP:

- Execution-Time (AVP code 132025): This AVP is of type Time. It indicates the Unix Epoch at which the provided Override-Control instance takes effect.

- Override-Control-Pending-Queue-Action (AVP code 132078): This AVP of type ENUM with allowed values FLUSH (0) and RETAIN (1). It indicates the action the gateway takes on the Pending-OC-Queue.

Both the AVPs are included in the Override-Charging-Action-Parameters grouped AVP.

How It Works

The Execution-Time AVP is an optional AVP in the Override-Control grouped AVP, sent in RAR/CCA message by the PCRF. It is valid for Rule-level, Charging-action level, and Wildcard-level OC.

Whenever Override-Control AVP is sent in RAR/CCA message from PCRF, and:

1. it does not contain the Execution-Time AVP, then the existing OC application procedure is adopted for backward compatibility. In other words, the OC parameter is applied immediately by the PCEF.

2. it contains Execution-Time AVP which is in the “Past”, then it is treated as if no Execution-Time AVP was sent and the OC parameter is applied immediately by the PCEF.

3. it contains Execution-Time AVP which is in “Future”, then the PCEF marks the OC as “Pending” and installs the OC when the Execution-Time is reached.
**Session Recovery and ICSR**

The Pending OCs are recovered on intra/inter chassis session recovery. The PCEF checkpoints Execution-Time using the existing framework that is used for check-pointing of other OC parameters. When the Session Manager restarts or ICSR switchover occurs, timer is started for each of the recovered OC with Execution-Time AVP. The value of this new timer is equal to the time left for the OC to be activated or applied on the call.

If the timer expires during the recovery, then the OC is applied immediately after the recovery.

During downgrade from N to N-1 build, the pending OCs on currently active N chassis are not check-pointed to the standby N-1 chassis.

**Flushing the Pending OCs**

The PCEF decides whether to flush or retain already pending OCs for a subscriber, based on the presence or absence of the Override-Control-Pending-Queue-Action AVP.

On receiving a new OC (with or without Execution-Time AVP) in a new RAR/CCA message, the PCEF flushes all the previous pending OCs for that subscriber. The PCEF either buffers or applies the newly received OC, based on the presence or absence of the Execution-Time AVP respectively. This behavior is the default behavior.

When the requirement is that the Pending OCs should not be flushed, the new AVP, Override-Control-Pending-Queue-Action, is sent within at least one of the Override-Control AVPs in the RAR/CCA message, as shown in the following figure.
Adding OC in the Pending Queue

The PCEF processes all the instances of Override-Control grouped AVPs received from PCRF in RAR/CCA message. If an Override-Control AVP has an Execution-Time AVP with “Future” time stamp, the PCEF marks it “Pending” for that subscriber. If an OC is received with Execution-Time AVP and there is already an OC pending with same OC identifier, then the newly received OC is merged with the pending OC. The Execution-Time of the merged OC is that of the newly received OC.

The Override-Control grouped AVP received without the Execution-Time AVP, or with Execution-Time already in “Past”, is not added in the list; in other words, it is applied immediately.

The following figure describes the adding of OC in Pending Queue.

Installing the Pending OC

The PCEF also stores the Execution-Time of all such Pending OCs so that, when the Execution-Time of an OC is reached, the OC is applied to the subscriber as described in the following figure.
Limitations

Following are the known limitations and restrictions of this feature:

- The Execution-Time AVP is supported only for OC without name.
- The maximum time for which an OC can be buffered is 44 days.
- There is no hard limit on number of OCs that can be buffered for a subscriber. However, the decision to buffer an OC depends on the availability of the system resources.
- The OCs with same identifier and different future Execution-Time is merged in the order in which PCEF processes them, and may not be same as the order of occurrence in RAR/CCA. The resultant OC has the Execution-Time of the OC which gets processed at the end.

Monitoring and Troubleshooting

This section provides information regarding commands available to monitor and troubleshoot the feature.

Show Commands and/or Outputs

This section provides information regarding show commands and their outputs in support of the feature.

show active-charging subscribers callid <call_id> override-control pending

This new show command has been introduced to check the pending OCs at subscriber-level. Following is a sample output:
show active-charging subscribers callid 00004e21 override-control pending
CALLID: 00004e21
Override Control:
  Rule Name: qci2
  Charging Parameters:
    Rating Group: 100
    Offline Enabled: TRUE
    Execution-Time: <Day Month DD HH:MM:SS GMT YYYY>
Override Control:
  Rule Name: qci1
  Charging Parameters:
    Rating Group: 100
    Offline Enabled: TRUE
Policy Parameters:
  QCI: 4
  ARP Byte: 81
  MBR UL: 25000
  MBR DL: 13000
  TOS UL: af23 (22)
  TOS DL: af23 (22)
  NEXTHDR ADDR: 10.20.10.10
  CF State: 0
  Execution-Time: <Day Month DD HH:MM:SS GMT YYYY>

show active-charging sessions full all

The output of this CLI command has been modified to show information related to pending OCs at subscriber-level. Following is a partial sample output:

show active-charging sessions full all
  
  Override Control:
    Installs Received: 2
    Installs Succeeded: 1
    Installs Failed: 0
    Install Pending:
      Total: 2
      Merged: 0
      Flushed: 0
      Failed: 0
    Disables Received: 0
    Disables Succeeded: 0
    Disables Failed: 0

No Charging ruledef(s) match the specified criteria
No Firewall ruledef(s) match the specified criteria

  Post-processing Rulestats: No Post-processing ruledef(s) match the specified criteria
Dynamic Charging Rule Name Statistics: n/a
  Total Dynamic Rules: 0
  Total L7 Dynamic Rules: 0
  Total Predefined Rules: 0
  Total ADC Rules: 0
  Total Firewall Predefined Rules: 0
  Total Override Control: 0
  Total Override Control Pending: 3

show active-charging rulebase statistics name <rulebase_name>

The output of this CLI command has been modified to show information related to pending OCs at rulebase-level. Following is a partial sample output:
show active-charging rulebase statistics name cisco

Support for One Million S1-U Peer-to-Peer Connections

This chapter describes StarOS support for the One Million S1-U Peer-to-Peer Connections feature.

- Feature Description, on page 999
- How it Works, on page 999
- Configuring the Feature, on page 1000
- Show Command Output, on page 1001

Feature Description

Due to production forecasts, support has been added to the StarOS for one million S1-U connections on a single S-GW.

The S1-U interface is the user plane interface carrying user data between an eNodeB and an S-GW received from the terminal. The StarOS now has the capability to scale the number of S1-U peers to one million per VPN context.

A CLI command enables operators to set the number of S1-U peers for which statistics should be collected. The limit is restricted to less than one million peers (128k) due to StarOS memory limitations.

How it Works

The gtpumgr uses the following guidelines while allocating peers:

- When a session installation comes from the Session Manager, a peer is created. If statistics are maintained at the Session Manager, the gtpumgr also creates the peer record with the statistics.

- Peer records are maintained per service.

- The number of peers is maintained at the gtpumgr instance level. The limit is one million S1-U peers per gtpumgr instance.

- If the limit of one million peers is exceeded, then peer creation fails. It causes a call installation failure in the gtpumgr, which leads to an audit failure if an audit is triggered.
The feature changes impact all the interfaces/services using the gtpu-service including GGSN/S4-SGSN/S-GW/P-GW/SAEGW/ePDG/SaMOG/HNB-GW/HeNB-GW for:

- The Gn and Gp interfaces of the General Packet Radio Service (GPRS)
- The Iu, Gn, and Gp interfaces of the UMTS system
- The S1-U, S2a, S2b, S4, S5, S8, and S12 interfaces of the Evolved Packet System (EPS)

**Recovery/ICSR Considerations**

- After a session manager/gtpumgr recovery or after an ICSR switchover, the same set of peers configured for statistics collection is recovered.
  - Peers with 0 sessions and without statistics are not recovered.
  - Peers with 0 sessions and with statistics are recovered.
  - Peers with Extension Header Support disabled are recovered.

- While upgrading from a previous release, ensure the newer release chassis `gtpu peer statistics threshold` is equal to or greater than the previous release. This way the GTPU peer statistics are preserved during the upgrade. For example, if you are upgrading from StarOS release 19.0 to 20.2, and the StarOS 19.0 system has 17,000 GTPU sessions, then configure the threshold on the StarOS 20.2 system to 17,000 as well.

**Configuration and Restrictions**

- Due to the large number of GTP-U entities connecting to the StarOS, Cisco recommends disabling the GTP-U Path Management feature.

- The configured threshold is not the hard upper limit for statistics allocation because of the distributed nature of system. It is possible that total GTP-U peers with statistics exceeds the configured threshold value to some extent.

- It is assumed that all 1 million peers are not connected to the node in a point-to-point manner. They are connected through routers.

- There will not be any ARP table size change for the StarOS to support this feature.

**Configuring the Feature**

This section describes how to configure support for the One Million S1-U Peer Connections feature.

`gtpu peer statistics threshold`

This new command has been added to `Context Configuration Mode` to specify the number of S1-U peers for which the StarOS will maintain statistics.

Use the following example to configure the feature:
configure
c
context  context_name
gtpu peer statistics threshold  value
end

Notes:

- value represents the number of S1-U peers for which statistics will be maintained. Valid entries are from 16000 to 128000. The default setting is 16000.
- The threshold cannot be configured to a lower value than the current value.

Show Command Output

This section describes the show command output changes made to support the One Million S1-U Peers feature.

clear gtpu statistics peer-address

The all keyword has been added to this command to enable operators to clear statistics for all S1-U peers for which statistics are being maintained.

clear gtpu statistics peer-address all

show gtpu statistics

The output of this command has been enhanced to show the total number of GTPU peers, and the total number of GTPU peers configured for statistics collection.

- Total GTPU Peers:
- Total GTPU Peers with stats:

show session subsystem facility sessmgr

The output of this command has been enhanced to provide the total number of S1-U (GTP-U) peers that are configured for statistics collection.

- Total Gtpu Peers with stats
show session subsystem facility sessmgr
Traffic Policing and Shaping

This chapter describes the support of per subscriber Traffic Policing and Shaping feature on Cisco's Chassis and explains the commands and RADIUS attributes that are used to implement this feature. The product Administration Guides provide examples and procedures for configuration of basic services on the system. It is recommended that you select the configuration example that best meets your service model, and configure the required elements for that model, as described in the respective product Administration Guide, before using the procedures in this chapter.

Traffic Policing and Shaping is a licensed Cisco feature. A separate feature license may be required. Contact your Cisco account representative for detailed information on specific licensing requirements. For information on installing and verifying licenses, refer to the Managing License Keys section of the Software Management Operations chapter in the System Administration Guide.

The following topics are included:

- Overview, on page 1003
- Traffic Policing Configuration, on page 1004
- Traffic Shaping Configuration, on page 1007
- RADIUS Attributes, on page 1010

Overview

This section describes the traffic policing and shaping feature for individual subscriber. This feature is comprises of two functions:

- Traffic Policing
- Traffic Shaping

Traffic Policing

Traffic policing enables the configuring and enforcing of bandwidth limitations on individual subscribers and/or APN of a particular traffic class in 3GPP/3GPP2 service.

Bandwidth enforcement is configured and enforced independently on the downlink and the uplink directions.
A Token Bucket Algorithm (a modified trTCM) [RFC2698] is used to implement the Traffic-Policing feature. The algorithm used measures the following criteria when determining how to mark a packet:

- **Committed Data Rate (CDR):** The guaranteed rate (in bits per second) at which packets can be transmitted/received for the subscriber during the sampling interval.
- **Peak Data Rate (PDR):** The maximum rate (in bits per second) that subscriber packets can be transmitted/received for the subscriber during the sampling interval.
- **Burst-size:** The maximum number of bytes that can be transmitted/received for the subscriber during the sampling interval for both committed (CBS) and peak (PBS) rate conditions. This represents the maximum number of tokens that can be placed in the subscriber's "bucket". Note that the committed burst size (CBS) equals the peak burst size (PBS) for each subscriber.

The system can be configured to take any of the following actions on packets that are determined to be in excess or in violation:

- **Drop:** The offending packet is discarded.
- **Transmit:** The offending packet is passed.
- **Lower the IP Precedence:** The packet's ToS bit is set to "0", thus downgrading it to Best Effort, prior to passing the packet. Note that if the packet's ToS bit was already set to "0", this action is equivalent to "Transmit".

### Traffic Shaping

Traffic Shaping is a rate limiting method similar to the Traffic Policing, but provides a buffer facility for packets exceeded the configured limit. Once the packet exceeds the data-rate, the packet queued inside the buffer to be delivered at a later time.

The bandwidth enforcement can be done in the downlink and the uplink direction independently. If there is no more buffer space available for subscriber data system can be configured to either drop the packets or kept for the next scheduled traffic session.

---

**Important**

Traffic Shaping is not supported on the GGSN, P-GW, or SAEGW.

### Traffic Policing Configuration

Traffic Policing is configured on a per-subscriber basis. The subscribers can either be locally configured subscribers on the system or subscriber profiles configured on a remote RADIUS server.

In 3GPP service Traffic policing can be configured for subscribers through APN configuration as well.

---

**Important**

In 3GPP service attributes received from the RADIUS server supersede the settings in the APN.
Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

**Important**

Instructions for configuring RADIUS-based subscriber profiles are not provided in this document. Please refer to the documentation supplied with your server for further information.

## Configuring Subscribers for Traffic Policing

**Step 1** Configure local subscriber profiles on the system to support Traffic Policing by applying the following example configurations:

a) To apply the specified limits and actions to the downlink (data to the subscriber):

```bash
configure
  context <context_name>
  subscriber name <user_name>
  qos traffic-police direction downlink
end
```

b) To apply the specified limits and actions to the uplink (data from the subscriber):

```bash
configure
  context <context_name>
  subscriber name <user_name>
  qos traffic-police direction uplink
end
```

**Notes:**

- There are numerous keyword options associated with the `qos traffic-police direction {downlink | uplink}` command.
- Repeat for each additional subscriber to be configured.

**Note** If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the `ip user-datagram-tos-copy` command in the Subscriber Configuration mode is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the `ip qos-dscp` command (also in the Subscriber Configuration mode). Therefore, it is recommended that command not be used when specifying this option.

**Step 2** Verify the subscriber profile configuration by applying the following example configuration:

```bash
context <context_name>
  show subscriber configuration username <user_name>
```
Step 3  Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command **save configuration**. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.

---

**Configuring APN for Traffic Policing in 3GPP Networks**

This section provides information and instructions for configuring APN template's QoS profile in support of Traffic Policing.

The profile information is sent to the SGSN(s) in response to GTP Create/Update PDP Context Request messages. If the QoS profile requested by the SGSN is lower than the configured QoS profile configured, the profile requested by the SGSN is used. If the QoS profile requested by the SGSN is higher, the configured rates are used.

Note that values for the committed-data-rate and peak-data-rate parameters are exchanged in the GTP messages between the GGSN and the SGSN. Therefore, the values used may be lower than the configured values. When negotiating the rate with the SGSN(s), the system convert this to a value that is permitted by GTP as shown in the table below.

**Table 84: Permitted Values for Committed and Peak Data Rates in GTP Messages**

<table>
<thead>
<tr>
<th>Value (bps)</th>
<th>Increment Granularity (bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 1000 to 63,000</td>
<td>1,000 (e.g. 1000, 2000, 3000, ... 63000)</td>
</tr>
<tr>
<td>From 64,000 to 568,000</td>
<td>8,000 (e.g. 64000, 72000, 80000, ... 568000)</td>
</tr>
<tr>
<td>From 576,000 to 8,640,000</td>
<td>64,000 (e.g. 576000, 640000, 704000, ... 8640000)</td>
</tr>
<tr>
<td>From 8,700,000 to 16,000,000</td>
<td>100,000 bps (e.g. 8700000, 8800000, 8900000, ... 16000000)</td>
</tr>
</tbody>
</table>

---

**Step 1**  Set parameters by applying the following example configurations:

a) To apply the specified limits and actions to the downlink (the Gn direction):

```
   configure
   context <context_name>
   apn <apn_name>
    qos rate-limit downlink
   end
```

b) To apply the specified limits and actions to the uplink (the Gi direction):

```
   configure
   context <context_name>
   apn <apn_name>
    qos rate-limit uplink
   end
```

**Notes:**

- There are numerous keyword options associated with **qos rate-limit { downlink | uplink }** command.
• Optionally, configure the maximum number of PDP contexts that can be facilitated by the APN to limit the APN's bandwidth consumption by entering the following command in the configuration:

```
max-contents primary <number> total <total_number>
```

• Repeat as needed to configure additional QoS Traffic Policing profiles.

**Important** If a "subscribed" traffic class is received, the system changes the class to background and sets the following:
The uplink and downlink guaranteed data rates are set to 0. If the received uplink or downlink data rates are 0 and traffic policing is disabled, the default of 64 kbps is used. When enabled, the APN configured values are used. If the configured value for downlink max data rate is larger than can fit in an R4 QoS profile, the default of 64 kbps is used. If either the received uplink or downlink max data rates is non-zero, traffic policing is employed if enabled for the background class. The received values are used for responses when traffic policing is disabled.

**Step 2** Verify that your APNs were configured properly by entering the following command:

```
show apn { all | name <apn_name> }
```

The output is a concise listing of configured APN parameter settings.

**Step 3** Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

---

**Traffic Shaping Configuration**

Traffic Shaping is configured on a per-subscriber basis. The subscribers can either be locally configured subscribers on the system or subscriber profiles configured on a remote RADIUS server.

In 3GPP service Traffic policing can be configured for subscribers through APN configuration as well.

**Important** In 3GPP, service attributes received from the RADIUS server supersede the settings in the APN.

**Important** Commands used in the configuration samples in this section provide base functionality to the extent that the most common or likely commands and/or keyword options are presented. In many cases, other optional commands and/or keyword options are available. Refer to the Command Line Interface Reference for complete information regarding all commands.

**Important** Traffic Shaping is not supported on the GGSN, P-GW, or SAEGW.
Configuring Subscribers for Traffic Shaping

This section provides information and instructions for configuring local subscriber profiles on the system to support Traffic Shaping.

---

**Important**

Instructions for configuring RADIUS-based subscriber profiles are not provided in this document. Please refer to the documentation supplied with your server for further information.

---

**Step 1**

Set parameters by applying the following example configurations:

a) To apply the specified limits and actions to the downlink (data to the subscriber):

```bash
configure
context <context_name>
subscriber name <user_name>
    qos traffic-shape direction downlink
end
```

b) To apply the specified limits and actions to the uplink (data to the subscriber):

```bash
configure
context <context_name>
subscriber name <user_name>
    qos traffic-shape direction uplink
end
```

Notes:

- There are numerous keyword options associated with `qos traffic-shape direction { downlink | uplink }` command.
- Repeat for each additional subscriber to be configured.

**Important**

If the exceed/violate action is set to "lower-ip-precedence", the TOS value for the outer packet becomes "best effort" for packets that exceed/violate the traffic limits regardless of what the `ip user-datagram-tos-copy` command in the Subscriber Configuration mode is configured to. In addition, the "lower-ip-precedence" option may also override the configuration of the `ip qos-dscp` command (also in the Subscriber Configuration mode). Therefore, it is recommended that command not be used when specifying this option.

**Step 2**

Verify the subscriber profile configuration by applying the following example configuration:

```bash
context <context_name>
    show subscriber configuration username <user_name>
```

**Step 3**

Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the *System Administration Guide* and the *Command Line Interface Reference*.
Configuring APN for Traffic Shaping in 3GPP Networks

This section provides information and instructions for configuring APN template's QoS profile in support of Traffic Shaping.

The profile information is sent to the SGSN(s) in response to GTP Create/Update PDP Context Request messages. If the QoS profile requested by the SGSN is lower than the configured QoS profile configured, the profile requested by the SGSN is used. If the QoS profile requested by the SGSN is higher, the configured rates are used.

Note that values for the committed-data-rate and peak-data-rate parameters are exchanged in the GTP messages between the GGSN and the SGSN. Therefore, the values used may be lower than the configured values. When negotiating the rate with the SGSN(s), the system convert this to a value that is permitted by GTP as shown in the following table.

<table>
<thead>
<tr>
<th>Value (bps)</th>
<th>Increment Granularity (bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>From 1000 to 63,000</td>
<td>1,000 (e.g. 1000, 2000, 3000, ... 63000)</td>
</tr>
<tr>
<td>From 64,000 to 568,000</td>
<td>8,000 (e.g. 64000, 72000, 80000, ... 568000)</td>
</tr>
<tr>
<td>From 576,000 to 8,640,000</td>
<td>64,000 (e.g. 576000, 640000, 704000, ... 86400000)</td>
</tr>
<tr>
<td>From 8,700,000 to 16,000,000</td>
<td>100,000 bps (e.g. 8700000, 8800000, 8900000, ... 16000000)</td>
</tr>
</tbody>
</table>

**Step 1**
Set parameters by applying the following example configurations.

a) To apply the specified limits and actions to the downlink (data to the subscriber):

```plaintext
configure
  context <context_name>
    subscriber name <user_name>
      qos rate-limit downlink
    end
end
```

b) To apply the specified limits and actions to the uplink (data to the subscriber):

```plaintext
configure
  context <context_name>
    apn <apn_name>
      qos rate-limit uplink
    end
end
```

**Step 2**
Verify that your APNs were configured properly by entering the following command:

```
show apn { all | name <apn_name> }
```

The output is a concise listing of configured APN parameter settings.
Step 3  Save your configuration to flash memory, an external memory device, and/or a network location using the Exec mode command `save configuration`. For additional information on how to verify and save configuration files, refer to the System Administration Guide and the Command Line Interface Reference.

### RADIUS Attributes

#### Traffic Policing for CDMA Subscribers

The RADIUS attributes listed in the following table are used to configure Traffic Policing for CDMA subscribers (PDSN, HA) configured on remote RADIUS servers. More information on these attributes can be found in the AAA Interface Administration and Reference.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SN-QoS-Tp-Dnlk (or SN1-QoS-Tp-Dnlk)</td>
<td>Enable/disable traffic policing in the downlink direction.</td>
</tr>
<tr>
<td>SN-Tp-Dnlk-Committed-Data-Rate (or SN1-Tp-Dnlk-Committed-Data-Rate)</td>
<td>Specifies the downlink committed-data-rate in bps.</td>
</tr>
<tr>
<td>SN-Tp-Dnlk-Peak-Data-Rate (or SN1-Tp-Dnlk-Committed-Data-Rate)</td>
<td>Specifies the downlink peak-data-rate in bps.</td>
</tr>
<tr>
<td>SN-Tp-Dnlk-Burst-Size (or SN1-Tp-Dnlk-Burst-Size)</td>
<td>Specifies the downlink-burst-size in bytes. <strong>NOTE:</strong> It is recommended that this parameter be configured to at least the greater of the following two values: 1) 3 times greater than packet MTU for the subscriber connection, OR 2) 3 seconds worth of token accumulation within the &quot;bucket&quot; for the configured peak-data-rate.</td>
</tr>
<tr>
<td>SN-Tp-Dnlk-Exceed-Action (or SN1-Tp-Dnlk-Exceed-Action)</td>
<td>Specifies the downlink exceed action to perform.</td>
</tr>
<tr>
<td>SN-Tp-Dnlk-Violate-Action (or SN1-Tp-Dnlk-Violate-Action)</td>
<td>Specifies the downlink violate action to perform.</td>
</tr>
<tr>
<td>SN-QoS-Tp-Uplk (or SN1-QoS-Tp-Uplk)</td>
<td>Enable/disable traffic policing in the downlink direction.</td>
</tr>
<tr>
<td>SN-Tp-Uplk-Committed-Data-Rate (or SN1-Tp-Uplk-Committed-Data-Rate)</td>
<td>Specifies the uplink committed-data-rate in bps.</td>
</tr>
</tbody>
</table>
Traffic Policing for UMTS Subscribers

The RADIUS attributes listed in the following table are used to configure Traffic Policing for UMTS subscribers configured on remote RADIUS servers. More information on these attributes can be found in the AAA Interface Administration and Reference.

Table 87: RADIUS Attributes Required for Traffic Policing Support for UMTS Subscribers

<table>
<thead>
<tr>

Feature Description

A traffic flow template (TFT) is an information element that specifies parameters and operations for a Packet Data Protocol (PDP) context. This information element may be used to transfer extra parameters to the network (for example, the Authorization Token; see 3GPP TS 24.229 [95]). The TFT may contain packet filters for the downlink direction, uplink direction, or for both directions.

The packet filters determine the traffic mapping to PDP contexts. Ideally, the network uses the downlink packet filters while the mobile stations use the uplink packet filters. This behavior is also seen for a packet filter that applies to both the directions.

The TFT is a type 4 information element with a minimum length of 3 octets. The maximum length for the IE is 257 octets.

Currently, there is a requirement for an Operator to identify and filter data traffic based on the “Type of Service (TOS)/Traffic class” information. This information needs to be configured as part of the Predefined or Dynamic rules (or both). Also, the Operator wants to send “Type of Service (TOS)/Traffic Class” information as part of TFT in the Create Bearer Request (CBR) and Update Bearer Request (UBR) messages, which can be triggered via the Local Policy or PCRF.

For Dynamic rules, the P-GW already supports "Type of Service (TOS)/Traffic class" information that is used to identify specific data traffic. However, for Predefined rules, there is no option available to configure "Type of Service(TOS)/Traffic class" information as part of packet filter configuration.

This feature introduces the ip tos-traffic-class CLI to configure Type of Service (TOS)/Traffic class information in the packet filter configured under charging action to address the Operator requirements.

How It Works

The new CLI configures the packet filter associated with the Predefined rules, with the "Type of Service (TOS)/Traffic Class" configuration. These Predefined rules can be triggered via Local Policy or as part of PCRF communication.

The CLI syntax to configure "Type of Service (TOS)/Traffic Class" information under Predefined rules is in-line with "Type of Service (TOS)/Traffic Class" AVP information that is received as part of the Dynamic rules from PCRF.

According to 3GPPP 24.008 - Section 10.5.6.12, “For "Type of service/Traffic class type", the packet filter component value field shall be encoded as a sequence of a one octet Type-of-Service/Traffic Class field and a one octet Type-of-Service/Traffic Class mask field. The Type-of-Service/Traffic Class field shall be transmitted first.”

For example:

tos/traffic class: 0x20 0xff
Also, now the P-GW includes both the "Type of Service (TOS)/Traffic class" information under TFT IE, as part of the Create Bearer Request (CBR) and Update Bearer Request (UBR) messages (which is in line with 3GPP 29.212 Section 5.3.14).

- The CLI is added in "packet-filter" configuration mode to configure TOS/Traffic class information.

- While triggering the Create or Update Bearer Request towards a peer, P-GW populates the "Type of Service (TOS)/Traffic class" information under TFT IE if the Predefined rule associated with that bearer is configured with "Type of Service (TOS)/Traffic class" information.

- There is no impact of Session Manager Recovery or ICSR on existing bearer packet filter information.

## Limitations

Following are the limitations of this feature:

- Operator should configure TOS along with mask and there are no default values for TOS value and mask.

- For any change of "Type of Service (TOS)/Traffic class" configuration under packet filter, the behavior is in line with the other packet filter parameter configuration change.

- Current PGW/GGSN/SAEGW behavior is that if the Predefined rules installed on the different bearers have ToS/Traffic class configured for uplink traffic on one bearer and downlink traffic on another bearer, then uplink and downlink packets for the same flow go through different bearers accordingly. However, if these Predefined rules with configured ToS/Traffic class are removed on the fly, still uplink and downlink packets for the same flow will go through different bearers.

- Consider the scenario where there are two dedicated bearers installed with Predefined rules such that the uplink traffic with a particular ToS/Traffic class say t1, matches first dedicated bearer and the downlink traffic with another ToS/Traffic class say t2, matches downlink traffic. If the IP ToS/Traffic class CLI is disabled in the corresponding Predefined rules followed by SESSMGR restart, the downlink packets with ToS/Traffic class "t2" will go through the first dedicated bearer instead of second if there is an uplink packet with the same flow (source IP, source port, destination IP, destination port) received before this downlink packet.

## Configuring the TOS/Traffic Class for Predefined Rules

The following section provides the configuration command to enable or disable the feature.

### Enabling or Disabling the ip tos-traffic-class Command

The modified command, `ip tos-traffic-class`, is used to configure ToS/Traffic class under charging action in the Packet filter mode.

This CLI is disabled by default.

To enable or disable the feature, enter the following commands:
configure
   active-charging service service_name
   packet-filter packet_filter
      [ no ] ip tos-traffic-class { type_of_service | traffic class } mask
         { mask_value }
   end

Notes:
• **no**: If previously configured, deletes the ToS/Traffic class under charging action.
• **tos-traffic-class** = { type_of_service | traffic class }: Specifies the Type of Service (TOS)/Traffic Class value that is used to filter the traffic. Enter an integer, ranging from 0 to 255.
• **mask** { mask_value }: Validates the dynamic rules for automatic recovery after a switchover. Enter an integer, ranging from 0 to 255.

**Monitoring and Troubleshooting**

This section provides information regarding show commands and/or their outputs in support of this feature.

**Show Commands**

This section lists all the show commands available to monitor this feature.

**show configuration**

This command has been modified to display the following output:

```
show configuration
configure
   active-charging service acs
   packet-filter PF226
      ip protocol = 6
      ip remote-port = 226
      iptos-traffic-class = 32 mask = 255
   exit
```

**show active-charging packet-filter**

This command has been modified to display the following output:

**When ToS/Traffic class is enabled/configured:**

```
show active-charging packet-filter { all | name }
Service Name: acs

Packet Filter Name: abcd
   IP Proto: 6
   Local Port: Not configured
   Remote Port: 226
   Remote IP Address: Not configured
   Direction: Bi-Directional
   Priority: None
```
Tos-traffic-class: 32
Tos-traffic-class-mask: 255

When ToS/Traffic class is disabled/not configured:
show active-charging packet-filter { all | name }

Service Name: acs
Packet Filter Name: abcd
  IP Proto: 6
  Local Port: Not configured
  Remote Port: 226
  Remote IP Address: Not configured
  Direction: Bi-Directional
  Priority: None
  Tos-traffic-class: Not configured
  Tos-traffic-class-mask: Not configured

show configuration verbose

This command has been modified to display the following output:

When ToS/Traffic class is enabled/configured:
show configuration verbose
configure
  active-charging service acs
  packet-filter PF226
    ip protocol = 6
    ip remote-port = 226
    ip  tos-traffic-class = 32 mask = 255
  ---
  exit

When ToS/Traffic class is disabled/not configured:
show configuration verbose
configure
  active-charging service acs
  packet-filter PF226
    ip protocol = 6
    ip remote-port = 226
    no ip  tos-traffic-class
  ---
  exit
show configuration verbose
P-GW Engineering Rules

This appendix provides PDN Gateway-specific engineering rules or guidelines that must be considered prior to configuring the ASR 5500 for your network deployment. General and network-specific rules are located in the appendix of the System Administration and Configuration Guide for the specific network type.

The following topics are included:

- Interface and Port Rules, on page 1019
- P-GW Context and Service Rules, on page 1020
- P-GW Subscriber Rules, on page 1020

Interface and Port Rules

The rules discussed in this section pertain to the Ethernet 10/100 line card, the Ethernet 1000 line card and the four-port Quad Gig-E line card and the type of interfaces they facilitate, regardless of the application.

S2a Interface Rules

This section describes the engineering rules for the S2a interface for communications between the Mobility Access Gateway (MAG) service residing on the HSGW and the Local Mobility Anchor (LMA) service residing on the P-GW.

LMA to MAG

The following engineering rules apply to the S2a interface from the LMA service to the MAG service residing on the HSGW:

- An S2a interface is created once the IP address of a logical interface is bound to an LMA service.
- The logical interface(s) that will be used to facilitate the S2a interface(s) must be configured within an ingress context.
- LMA services must be configured within an ingress context.
- Depending on the services offered to the subscriber, the number of sessions facilitated by the S2a interface can be limited in order to allow higher bandwidth per subscriber.
S5/S8 Interface Rules (GTP)

The following engineering rule applies to the S5/S8 interface from the P-GW to the S-GW:

- P-GW preserves an IP address between S2a interface (PMIPv6) and S5/S8 interface (GTP) when the user moves between Wi-Fi and LTE if a common P-GW is used as the anchor point between the two services.

P-GW Context and Service Rules

The following engineering rules apply to services configured within the system:

- A maximum of 256 services (regardless of type) can be configured per system.

⚠️ Caution

Large numbers of services greatly increase the complexity of management and may impact overall system performance (i.e. resulting from such things as system handoffs). Therefore, it is recommended that a large number of services only be configured if your application absolutely requires it. Please contact your local service representative for more information.

- The system supports unlimited peer HSGW/MAG addresses per P-GW.
  - The system maintains statistics for a maximum of 8192 peer HSGWs per P-GW service.
  - If more than 8192 HSGWs are attached, older statistics are identified and overwritten.
  - PMIPv6 does not support any peer level statistics (per MAG level statistics).
- The system supports 65,000 S-GW addresses per P-GW.
  - The system maintains statistics for all peer S-GWs per P-GW service.
- The system maintains statistics for a maximum of 64,000 peer P-GWs per HSGW or S-GW service.
- There are a maximum of 8 P-GW assignment tables per context and per chassis.
- The total number of entries per table and per chassis is limited to 256.

P-GW Subscriber Rules

The following engineering rule applies to subscribers configured within the system:

- Default subscriber templates may be configured on a per P-GW service.
