Configuring Ethernet Virtual Connections

Metro-Ethernet Forum (MEF) defines Ethernet Virtual Connection (EVC) as an association between two or more user network interfaces that identifies a point-to-point or multipoint-to-multipoint path within the service provider network. An EVC is a conceptual service pipe within the service provider network. A bridge domain is a local broadcast domain that is VLAN-ID-agnostic. An ethernet flow point (EFP) service instance is a logical interface that connects a bridge domain to a physical port or to an EtherChannel group in a router.

An EVC broadcast domain is determined by a bridge domain and the EFPs connected to it. An incoming frame is matched against EFP matching criteria on the interface, learned on the matching EFP, and forwarded to one or more EFPs in the bridge domain. If there are no matching EFPs, the frame is dropped.

Note

The router does not support switch port configuration.

Finding Feature Information

Your software release may not support all the features documented in this module. For the latest feature information and caveats, see the release notes for your platform and software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the Feature Information for Configuring Ethernet Virtual Connections, on page 39.
Use Cisco Feature Navigator to find information about platform support and Cisco software image support. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

### Supported EVC Features

This section contains the following supported EVC features:

- Service instance—create, delete, and modify EFP service instances on Ethernet interfaces.
- Bridge domains—configure EFPs as members of a bridge domain (up to 64 EFPs per bridge domain).
- Rewrite (VLAN translation)
  - Pop symmetric only—the supported rewrite configuration implies egress pushing (adding a tag)
  - **pop 1** removes the outermost tag
  - **pop symmetric** adds a tag on egress for a push operation
    - QinQ with rewrite
    - Ingress rewrite is not supported
- EVC forwarding
- MAC address learning and aging
- EVCs on EtherChannels
- Split horizon
- MSTP (MST on EVC bridge domain)
- QoS aware EVC/EFP per service instance
- Pop 2 configuration supports layer 2 and layer 3 operations.

### Understanding EVC Features

This section contains the following topics:

- Ethernet Virtual Connections, on page 2
- Service Instances and EFPs, on page 3
- Encapsulation, on page 3
- Bridge Domains, on page 5
- DHCP Client on Switch Virtual Interface, on page 5
- Configuring Other Features on EFPs, on page 24
- Rewrite Operations, on page 6

### Ethernet Virtual Connections

Use the `ethernet evc evc-id` global configuration command to create an EVC. The `evc-id` or name is a text string from 1 to 100 bytes. Using this command moves the device into service configuration mode (config-srv) where you configure all parameters that are common to an EVC.

In this mode you can use these commands:

- **default**—Sets a command to its defaults
Service Instances and EFPs

Configuring a service instance on a Layer 2 port or EtherChannel creates an EFP on which you configure EVC features. Each service instance has a unique number per interface, but you can use the same number on different interfaces because service instances on different ports are not related.

If you have defined an EVC by using the `ethernet evc evc-id` global configuration command, you can associate the EVC with the service instance (optional). There is no default behavior for a service instance. You can configure a service instance on an EtherChannel group.

Use the `service instance number ethernet [name]` interface configuration command to create an EFP on a Layer 2 interface or EtherChannel and to enter service instance configuration mode. You should use service instance configuration mode to configure all management and control data plane attributes and parameters that apply to the service instance on a per-interface basis.

- The `service instance number` is the EFP identifier, an integer from 1 to 8000.
- The optional `ethernet name` is the name of a previously configured EVC. You do not need to enter an EVC name, but you must enter `ethernet`. Different EFPs can share the same name when they correspond to the same EVC. EFPs are tied to a global EVC through the common name.

When you enter service instance configuration mode, you can configure these options:

- `default`—Sets a command to its defaults
- `description`—Adds a service instance specific description
- `encapsulation`—Configures Ethernet frame match criteria
- `ethernet`—Configures Ethernet-Lmi parameters
- `exit`—Exits from service instance configuration mode
- `no`—Negates a command or sets its defaults
- `service-policy`—Attaches a policy-map to an EFP
- `shutdown`—Takes the service instance out of service

Enter the `[no] shutdown` service-instance configuration mode to shut down or bring up a service instance.

Encapsulation

Encapsulation defines the matching criteria that maps a VLAN, a range of VLANs, Ethertype, or a combination of these to a service instance. Configure encapsulation in the service instance configuration mode. You must configure one encapsulation command per EFP (service instance).

Use the `encapsulation` command in service-instance configuration mode to set the encapsulation criteria. Different types of encapsulations are dot1q, dot1ad, and untagged. Valid Ethertype is IPv4.

Note

A router does not support dot1ad encapsulation on Layer 3 service.

Encapsulation classification options also include:
• outer tag VLAN
• inner tag VLAN

After you enter an encapsulation method, these keyword options are available in service instance configuration mode:

• **bridge-domain**—Configures a bridge domain
• **rewrite**—Configures Ethernet rewrite criteria

### Table 1: Supported Encapsulation Types

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `encapsulation dot1q vlan-id [,-vlan-id]]` | Defines the matching criteria to be used to map 802.1Q frames ingress on an interface to the appropriate EFP. The options are a single VLAN, a range of VLANs, or lists of VLANs or VLAN ranges. VLAN IDs are 1 to 4094.  
  • Enter a single VLAN ID for an exact match of the outermost tag.  
  • Enter a VLAN range for a ranged outermost match.  
  **Note** VLAN IDs 4093, 4094, and 4095 are reserved for internal usage. |
| `encapsulation dot1q second-dot1q vlan-id [,-vlan-id]]` | Double-tagged 802.1Q encapsulation. Matching criteria to be used to map QinQ frames ingress on an interface to the appropriate EFP. The outer tag is unique and the inner tag can be a single VLAN, a range of VLANs or lists of VLANs or VLAN ranges.  
  • Enter a single VLAN ID in each instance for an exact match of the outermost two tags.  
  • Enter a VLAN range for *second-dot1q* for an exact outermost tag and a ranged second tag. |
| `encapsulation dot1ad vlan-id` | Defines the matching criteria to be used in order to map single-tagged 802.1ad frames ingress on an interface to the appropriate service instance. |
| `encapsulation untagged` | Matching criteria to be used to map untagged (native) Ethernet frames entering an interface to the appropriate EFP.  
Only one EFP per port can have untagged encapsulation. However, a port that hosts EFP matching untagged traffic can also host other EFPs that match tagged frames. |
| `encapsulation default` | Configures default encapsulation. |

If a packet entering or leaving a port does not match any of the encapsulations on that port, the packet is dropped, resulting in filtering on ingress. The encapsulation must match the packet on the wire to determine filtering criteria. On the wire refers to packets ingressing the router before any rewrites and to packets egressing the router after all rewrites.

### VLAN Counters

supports counters for Switch Virtual Interface (SVI) Statistics.

**Restrictions**

• Only Bytes counters are supported in SVI Statistics.
**Bridge Domains**

A service instance must be attached to a bridge domain. Flooding and communication behavior of a bridge domain is similar to that of a VLAN domain. Bridge-domain membership is determined by which service instances have joined it (based on encapsulation criteria), while VLAN domain membership is determined by the VLAN tag in the packet.

**Note**

You must configure encapsulation before you can configure the bridge domain.

Use the `bridge-domain bridge-id service-instance` command in the configuration mode to bind the EFP to a bridge domain instance. The `bridge-id` is the identifier for the bridge domain instance, a number ranging from 1 to 4094.

**DHCP Client on Switch Virtual Interface**

The DHCP client retrieves the host information from the DHCP server and configures the SVI interface of the router. If the DHCP server is unable to provide the requested configuration parameters from its database to the DHCP client, it forwards the request to one or more secondary DHCP servers defined by the network administrator. DHCP helps you to dynamically assign reusable IP addresses to clients.

Hosts are connected to secondary VLANs, and the DHCP server assigns them IP addresses from the block of addresses assigned to the primary VLAN. When new devices are added, the DHCP server assigns them the next available address from a large pool of subnet addresses. In router, the DHCP client is supported only on SVI interfaces and for IPv4 addresses.

**Split-Horizon**

The split-horizon feature allows service instances in a bridge domain to join groups. Service instances in the same bridge domain and split-horizon group cannot forward data between each other, but can forward data between other service instances that are in the same bridge domain, but not in the same split-horizon group.

Service instances do not have to be in a split-horizon group. If a service instance does not belong to a group, it can send and receive from all ports within the bridge domain. A service instance cannot join more than one split-horizon group.

Use the `bridge-domain bridge-id split-horizon group group_id service-instance` command in the configuration mode to configure a split-horizon group. The `group_id` is a number from 0 to 31. All members of the bridge-domain configured with the same `group_id` are part of the same split-horizon group. EFPs that are not configured with an explicit `group_id` do not belong to any group.

You can configure no more than 12 service instances per bridge domain. When a bridge domain contains a service instance that is part of a split-horizon group, this decreases the number of service instances allowed to be configured in that split-horizon group. The router supports up to 32 split-horizon groups plus the default (no group).

If a service instance joins split-horizon group, it can have no more than 12 members in split horizon group in the same bridge domain. We recommend that you add split horizon groups in numerical order to maximize the number of service instances that can belong to a group.
Rewrite Operations

Use the `rewrite` command to modify packet VLAN tags. You can also use this command to emulate traditional 802.1Q tagging, where packets enter a router on the native VLAN and VLAN tagging properties are added on egress. You can also use the `rewrite` command to facilitate VLAN translation and QinQ.

Use the `rewrite ingress tag pop 1 symmetric` service-instance configuration mode command to specify the encapsulation adjustment to be performed on the frame ingress to the EFP. Entering `pop 1` pops (removes) the outermost tag.

```
Note
The `symmetric` keyword is required to complete the `rewrite` configuration.
```

When you enter the `symmetric` keyword, the egress counterpart performs the inverse action and pushes (adds) the encapsulation VLAN. You can use the `symmetric` keyword only with ingress rewrites and only when single VLANs are configured in encapsulation. If you configure a list of VLANs or a VLAN range or `encapsulation default`, the `symmetric` keyword is not accepted for rewrite operations.

The router supports only the following `rewrite` commands.

- `rewrite ingress tag pop 1 symmetric`
- `rewrite ingress tag pop 2 symmetric`

The router does not support `rewrite` commands for `ingress push` and `translate` in this release. However, you can use the `rewrite ingress tag pop symmetric` command to achieve translation. Possible translation combinations are 1-to-1, 1-to-2, and 2-to-1.

The Series Aggregation Services Router does not support egress rewrite operations beyond the second VLAN that a packet carries into a router. See the Configuring Other Features on EFPs, on page 24.

DHCP Snooping with Option 82 on EVC

DHCP snooping is a DHCP security feature that determines whether traffic sources are trusted or untrusted. By intercepting all the DHCP messages bridging within the Layer 2 VLAN domain, DHCP snooping acts as `mini security firewall` between clients and the DHCP server. It provides a mechanism to differentiate untrusted port of a switch connected to an end user (client) from the trusted port of a switch connected to a server or another switch or router.

DHCP snooping is one of the features that is supported on the Routers when these routers function as Layer 2 switches.

The DHCP relay agent, which runs at Layer 3, forwards DHCP queries in subnets where DHCP servers located. DHCP relay agent would function exclusive of DHCP snooping functioning in Layer 2 switch mode.

```
Note
DHCP relay with DHCP Authentication is not supported.
```

DHCP relay with DHCP Authentication is not supported.
**DHCP Snooping Support**

The following functionalities are supported on the Series Routers as part of DHCP snooping support:

- DHCP snooping is supported on the bridge-domains in the Layer 2 mode.
- DHCP rate limit is supported per-port.

**DHCP Client FORCERENEW Message Overview**

The Cisco DHCP Client FORCERENEW Message feature provides entity authentication and message authentication, in accordance with RFC 3118, by which Dynamic Host Configuration Protocol (DHCP) clients and servers authenticate the identity of other DHCP entities and verify that the content of a DHCP message has not been changed during delivery through the network.

The message authentication mechanism allows servers to determine whether a request for DHCP information comes from a client that is authorized to use the network. It also allows clients to verify that a DHCP server can be trusted to provide valid configuration.

The Cisco DHCP Client FORCERENEW Message feature requires authentication, and all client-server exchanges must be authenticated. The `ip dhcp client authentication mode` and `key chain` commands must be configured.

When the client gets a FORCERENEW message, the client does the following:

- Authenticates the message according to the authentication mode specified in the `ip dhcp client authentication mode` command. The Cisco DHCP Client FORCERENEW Message feature supports both token-based and message digest algorithm 5 (MD5)-based authentication:
  - Token-based authentication is useful only for basic protection against inadvertently instantiated DHCP servers. Tokens are transmitted in plain text; they provide weak authentication and do not provide message authentication.
  - MD5-based authentication provides better message and entity authentication because it contains a single-use value generated by the source as a message authentication code.
- Changes its state to RENEW.
- Tries to renew its lease according to normal DHCP procedures.

The client discards any multicast FORCERENEW message or message that fails authentication.

**DHCP Forcereenew Limitations**

The following are the limitations of DHCP Forcereenew.

- DHCP Forcereenew is not supported for the IPv6.
- DHCP Forcereenew is not supported with the DHCP relay agent. ASR 901 Relay agent is not supported by the RFC 3118 Authentication.

**Configuring EFPs**

This section contains the following topics:
Default EVC Configuration

Cisco IOS Release 15.3(2)S introduces support for EVC default encapsulation on the routers. This feature matches and forwards all the ingress traffic on the port. The default service instance on a port is configured using the encapsulation default command.

All traffic coming to the interface with default encapsulation is matched and forwarded. This includes untagged, single tagged, and double tagged traffic. For example, when an untagged EFP is configured, all the traffic except the untagged traffic matches the default EFP.

All Layer 2 features are supported on the default EVC.

Note

Before Cisco IOS Release 15.3(2)S, EFPs or service instances or bridge domains were not configured.

Configuring VLAN Counters on SVI

To configure VLAN-counters on SVI, complete the following steps.

Note

SVI counters are not supported for MPLS packets.

SUMMARY STEPS

1. enable
2. configure terminal
3. interface vlan vlan-id
4. ip address ip-address [subnet mask]
5. vlan-counter [egress | ingress]
6. exit

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td></td>
</tr>
<tr>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td></td>
</tr>
<tr>
<td>interface vlan vlan-id</td>
<td>Configures the VLAN interface and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Router(config)# interface vlan 100</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td></td>
</tr>
<tr>
<td>ip address ip-address [subnet mask]</td>
<td>Assigns an IP address to the multilink interface.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip address 20.1.1.1 255.255.255.255</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td></td>
</tr>
<tr>
<td>vlan-counter [egress</td>
<td>ingress]</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# vlan-counter egress</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td></td>
</tr>
<tr>
<td>exit</td>
<td>Exits interface configuration mode and enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# exit</td>
<td></td>
</tr>
</tbody>
</table>

### Verifying VLAN Counters Configuration on SVI

To verify the VLAN Counters configuration on SVI, use the show interface vlan vlan-id command:

```
Router #show interface vlan 89 | in bytes
MTU 1500 bytes, BW 1000000 Kbit/sec, DLY 10 usec,
  24 packets input, 3243732 bytes, 0 no buffer
  36 packets output, 305561626 bytes, 0 underruns
```

### Configuration Guidelines

- You can configure up to 4000 bridge domains on the Router.
- You must configure encapsulation on a service instance before configuring bridge domain.
- ISL trunk encapsulation is not supported.
- The router does not support overlapping configurations on the same interface and same bridge domain.
- If you have configured a VLAN range encapsulation, or encapsulation default on service instance 1, you cannot configure any other encapsulations that also match previous encapsulations in the same interface and bridge domain.
- Default encapsulation is supported only on the physical interface and port channel interface.
- If default encapsulation EVC is configured on the interface, only the untagged encapsulation is accepted and all other encapsulation commands are rejected.
- Default EFP under xconnect and untagged EFP under bridge-domain on the same interface is not supported.
- The rewrite command on encapsulation default EVC is rejected.
- Supports only untagged EFPS on the port with default encapsulation.
- Egress filtering is not supported. All unlearned traffic ingresses on the default encapsulation interface is flooded to other interfaces that are part of the same bridge-domain.
- Layer 3 routing is not supported only under default encapsulation. Layer 2 VPN is supported on the default encapsulation EFP.
- QinQ configuration for Layer3 is not possible with pop1 rewrite. However pop2 configured routed QinQ is supported.
• Default xconnect MTU is 9216.
• The traffic packets more than 1522 are classified as Giant packets.
• For interoperability with other routers for an xconnect session, ensure that the MTU on both PE routers is same before the xconnect session is established.
• MPLS is not supported over routed QinQ.
• VLAN IDs 4093, 4094, and 4095 are reserved for internal usage.
• Traffic with tag protocol identifier (TPID) value of 9200 will pass through Xconnect and BD irrespective of the TPID value configured on them.
• Effective with Cisco IOS Release 15.4(3)S, you can configure both single-tag and priority-tag EFP with the rewrite option, on the same bridge domain.
• As untagged EFP does not support CoS, remember to set CoS value as 0 in IP SLA configuration.
• Xconnect over priority tagged EVC configuration is not supported.
• The **bandwidth** command on PoCH interface is not supported.
• Maximum 8 VLAN per interface and 128 VLAN per box are supported in Cisco ASR 901 Router.

### Creating Service Instances

Complete the following steps to create an EFP service instance:

**SUMMARY STEPS**

1. **configure terminal**
2. **interface [name]**
3. **service instance ethernet**
4. **encapsulation {dot1q | dot1ad | untagged | default}**
5. **bridge-domain bridge-id [split-horizon group group-id]**
6. **rewrite ingress tag pop 1 symmetric**
7. **end**
8. **show ethernet service instance**
9. **copy running-config startup-config**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><strong>interface [name]</strong></td>
</tr>
<tr>
<td>Step 3</td>
<td>Command or Action</td>
</tr>
<tr>
<td>--------</td>
<td>------------------</td>
</tr>
<tr>
<td></td>
<td>service instance ethernet</td>
</tr>
<tr>

<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>copy running-config startup-config</td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
</tbody>
</table>
What to do next

**Note** Use the no forms of the commands to remove the service instance, encapsulation type, or bridge domain or to disable the rewrite operation.

---

## Configuring DHCP Snooping with Option-82 on EVC

To enable DHCP snooping with option-82 on EVC, perform this task:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip dhcp snooping`
4. `ip dhcp snooping bridge-domain bridge-id`
5. `interface type number`
6. `ip dhcp snooping trust`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>enable</code></td>
<td></td>
</tr>
<tr>
<td>Router&gt; enable</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>configure terminal</code></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>ip dhcp snooping</code></td>
<td>Enables DHCP snooping.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>ip dhcp snooping</code></td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip dhcp snooping</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>ip dhcp snooping bridge-domain bridge-id</code></td>
<td>Enables DHCP snooping on the specified bridge domain.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>ip dhcp snooping bridge-domain</code></td>
<td></td>
</tr>
<tr>
<td>Router(config)# ip dhcp snooping bridge-domain 5</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>interface type number</code></td>
<td>Specifies the interface type and number.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>interface type number</code></td>
<td></td>
</tr>
<tr>
<td>Router(config)# interface GigabitEthernet1/1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>ip dhcp snooping trust</code></td>
<td>Configures the selected port as trusted.</td>
</tr>
<tr>
<td>Example:</td>
<td><code>ip dhcp snooping trust</code></td>
<td></td>
</tr>
<tr>
<td>Router(config-if)# ip dhcp snooping trust</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note** Use the no form of the `ip dhcp snooping trust` command to configure a port as untrusted.
Forcing a Release or Renewal of a DHCP Lease for a DHCP Client

SUMMARY STEPS
1. enable
2. release dhcp type number
3. renew dhcp type number

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>

Configuring FORCERENEW Message Handling

Perform this task to specify the type of authentication to be used in Dynamic Host Configuration Protocol (DHCP) messages on the interface, specify the key chain to be used in authenticating a request, and enable FORCERENEW message handling on the DHCP client when authentication is enabled.

SUMMARY STEPS
1. interface type number
2. ip dhcp client client-id hex-string client-id
3. ip dhcp client authentication key-chain name
4. ip dhcp client authentication mode {token|md5}
5. exit
6. key chain name-of-chain
7. key key-id
8. key-string text
9. exit
10. exit
11. ip dhcp-client forcerenew
12. end
### Detailed Steps

  **Example:**
  \[
  \text{Device(config)# interface vlan 10}
  \] | Configures an interface type and enters interface configuration mode. |
| **Step 2**
  **ip dhcp client client-id hex-string client-id**
  **Example:**
  \[
  \text{Device(config-if)# ip dhcp client client-id hex 1234}
  \] | Specifies the hex-string client-id including type octet of 00 or 01. |
| **Step 3**
  **ip dhcp client authentication key-chain name**
  **Example:**
  \[
  \text{Device(config-if)# ip dhcp client authentication key-chain dhcp1}
  \] | Specifies the key chain to be used in authenticating a request. |
| **Step 4**
  **ip dhcp client authentication mode \{token\ md5\}**
  **Example:**
  \[
  \text{Device(config-if)# ip dhcp client authentication mode token}
  \] | Specifies the type of authentication to be used in DHCP messages on the interface. |
  - **Token**: Authentication Mode token
  - **MD5**: Authentication Mode message digest algorithm 5 (MD5) |
| **Step 5**
  **exit**
  **Example:**
  \[
  \text{Device(config-if)# exit}
  \] | Exits interface configuration mode. |
| **Step 6**
  **key chain name-of-chain**
  **Example:**
  \[
  \text{Device(config)# key chain dhcp1}
  \] | Defines an authentication key chain needed to enable authentication and enters key-chain configuration mode. |
| **Step 7**
  **key key-id**
  **Example:**
  \[
  \text{Device(config-keychain)# key 1234}
  \] | Identifies an authentication key on a key chain and enters key-chain key configuration mode. |
| **Step 8**
  **key-string text**
  **Example:**
  \[
  \text{Device(config-keychain-key)# key-string secret}
  \] | Specifies the authentication string for a key. |
| **Step 9**
  **exit**
  **Example:**
  \[
  \] | Returns to key-chain configuration mode. |
### Configuring Per-Port Rate Limit

To configure per-port rate limit for DHCP snooping with Option 82 on EVC, perform this task:

**SUMMARY STEPS**

1. `enable`
2. `configure terminal`
3. `ip dhcp snooping`
4. `interface type number`
5. `ip dhcp snooping limit rate rate-limit`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td></td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables privileged EXEC mode. Enter your password if prompted.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td></td>
</tr>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router# configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td></td>
</tr>
<tr>
<td><code>ip dhcp snooping</code></td>
<td>Enables DHCP snooping.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td><code>Router(config)# ip dhcp snooping</code></td>
<td></td>
</tr>
</tbody>
</table>
### Command or Action | Purpose
--- | ---
**Step 4**  
`interface type number`  
**Example:**  
Router(config)# interface GigabitEthernet1/1 | Specifies the interface type and number.

**Step 5**  
`ip dhcp snooping limit rate rate-limit`  
**Example:**  
Router(config-if)# ip dhcp snooping limit rate 100 | Configures the per-port rate limit.

---

### Verifying DHCP Snooping with Option 82 on EVC

To verify DHCP snooping configuration with Option 82 on EVC, use the `show` commands listed in the following examples.

To display the DHCP snooping configuration, use the `show` command given in the following example:

```
Router# show ip dhcp snooping
```

- Switch DHCP snooping is enabled
- DHCP snooping is configured on following bridge-domains:
  - 5
- DHCP snooping is operational on following bridge-domains:
  - none
- DHCP snooping is configured on the following L3 Interfaces:
  - Insertion of option 82 is enabled
    - circuit-id format: bd-mod-port
    - remote-id format: MAC
- Option 82 on untrusted port is not allowed
- Verification of hwaddr field is enabled
- Verification of giaddr field is enabled
- DHCP snooping trust/rate is configured on the following Interfaces:

<table>
<thead>
<tr>
<th>Interface</th>
<th>Trusted</th>
<th>Rate limit (pps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>GigabitEthernet0/1</td>
<td>yes</td>
<td>100</td>
</tr>
</tbody>
</table>

To display the status of the DHCP snooping database agent, use the `show` command given in the following example:

```
Router# show ip dhcp snooping database detail
```

- Agent URL :
- Write delay Timer : 300 seconds
- Abort Timer : 300 seconds

- Agent Running : No
- Delay Timer Expiry : Not Running
- Abort Timer Expiry : Not Running

- Last Succeeded Time : None
- Last Failed Time : None
- Last Failed Reason : No failure recorded.

<table>
<thead>
<tr>
<th>Total Attempts</th>
<th>Startup Failures</th>
<th>Successful Transfers</th>
<th>Failed Transfers</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
Successful Reads : 0 Failed Reads : 0
Successful Writes : 0 Failed Writes : 0
Media Failures : 0

First successful access: None

Last ignored bindings counters:
- Binding Collisions : 0
- Expired leases : 0
- Invalid interfaces : 0
- Unsupported vlans : 0
- Parse failures : 0

Last Ignored Time : None

Total ignored bindings counters:
- Binding Collisions : 0
- Expired leases : 0
- Invalid interfaces : 0
- Unsupported vlans : 0
- Parse failures : 0

To display the DHCP snooping binding entries, use the the `show` command given in the following example:

```
Router# show ip dhcp snooping binding
```

<table>
<thead>
<tr>
<th>MacAddress</th>
<th>IP Address</th>
<th>Lease(seconds)</th>
<th>Type</th>
<th>VLAN</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000.0100.0201</td>
<td>10.0.0.1</td>
<td>600</td>
<td>dhcp-snooping</td>
<td>100</td>
<td>GigabitEthernet0/1</td>
</tr>
</tbody>
</table>

Configuration Examples of Supported Features

- Example: Configuring a Service Instance, on page 18
- Example: Encapsulation Using a VLAN Range, on page 18
- Example: Two Service Instances Joining the Same Bridge Domain, on page 19
- Example: Bridge Domains and VLAN Encapsulation, on page 19
- Example: Rewrite, on page 19
- Example: Split Horizon, on page 19

Example: Configuring a Service Instance

Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 22 Ethernet evc_name[name]
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# bridge-domain 10

Example: Encapsulation Using a VLAN Range

Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 22 Ethernet
Router(config-if-srv)# encapsulation dot1q 22-44
Router(config-if-srv)# bridge-domain 10

Example: Configuring VLAN Counters on SVI

Router (config)# interface gigabitethernet0/2
Router (config-if)# service instance 1 Ethernet
Router (config-if-srv)# encapsulation dot1q 10
Router (config-if-srv)# rewrite ingress tag pop 1 symmetric
Router (config-if-srv)# bridge-domain 100
Router (config)# interface vlan 100
Router (config-if)# ip address 20.1.1.1 255.255.255.255
Router (config-if)# vlan-counter egress
Router (config-if)# vlan-counter ingress
Example: Two Service Instances Joining the Same Bridge Domain

In this example, service instance 1 on interfaces Gigabit Ethernet 0/1 and 0/2 can bridge between each other.

```plaintext
Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# bridge-domain 10
Router(config)# interface gigabitethernet0/2
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# bridge-domain 10
```

Example: Bridge Domains and VLAN Encapsulation

Unlike VLANs, the bridge-domain number does not need to match the VLAN encapsulation number.

```plaintext
Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# bridge-domain 4000
Router(config)# interface gigabitethernet0/2
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# bridge-domain 4000
```

Example: Rewrite

In this example, a packet that matches the encapsulation will have one tag removed (popped off). The `symmetric` keyword allows the reverse direction to have the inverse action: a packet that egresses out this service instance will have the encapsulation (VLAN 10) added (pushed on).

```plaintext
Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# rewrite ingress tag pop 1 symmetric
Router(config-if-srv)# bridge-domain 4000
```

Example: Split Horizon

In this example, service instances 1 and 2 cannot forward and receive packets from each other. Service instance 3 can forward traffic to any service instance in bridge domain 4000 since it has not joined any split-horizon groups.

```plaintext
Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# rewrite ingress pop 1 symmetric
Router(config-if-srv)# bridge-domain 4000 split-horizon group 1
Router(config-if-srv)# exit
Router(config)# interface gigabitethernet0/2
```
Examples: Releasing a DHCP Lease

In the following example, a Dynamic Host Configuration Protocol (DHCP) release is performed on an interface that was originally assigned an IP address by the DHCP server:

Device# release dhcp vlan 10

In the following example, an attempt is made to release the DHCP lease on an interface that was not originally assigned an IP address by the DHCP server:

Device# release dhcp vlan 10
Interface does not have a DHCP originated address

In the following example, the `release dhcp` command is executed without specifying the `type` and `number` arguments:

Device# release dhcp
Incomplete command.

Examples: Renewing a DHCP Lease

In the following example, a Dynamic Host Configuration Protocol (DHCP) lease is renewed on an interface that was originally assigned an IP address by the DHCP server:

Device# renew dhcp vlan 10

In the following example, an attempt is made to renew the DHCP lease on an interface that was not originally assigned an IP address by the DHCP server:

Device# renew dhcp vlan 10
Interface does not have a DHCP originated address

In the following example, the `renew dhcp` command is executed without specifying the `type` and `number` arguments:

Device# renew dhcp
Incomplete command.
# How to Configure EVC Default Encapsulation

## Configuring EVC Default Encapsulation with Bridge-Domain

Complete the following steps to configure EVC default encapsulation for a bridge-domain.

### SUMMARY STEPS

1. `enable`
2. `configure terminal`
3. `interface type number`
4. `service instance instance-id ethernet`
5. `encapsulation default`
6. `bridge-domain bridge-id`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| **Step 1**  
  *enable*  
  **Example:**  
  Router> enable | Enables privileged EXEC mode.  
  • Enter your password if prompted. |
| **Step 2**  
  *configure terminal*  
  **Example:**  
  Router# configure terminal | Enters global configuration mode. |
| **Step 3**  
  *interface type number*  
  **Example:**  
  Router(config)# interface GigabitEthernet0/4 | Specifies an interface type and number, and enters interface configuration mode. |
| **Step 4**  
  *service instance instance-id ethernet*  
  **Example:**  
  Router(config-if)# service instance 10 ethernet | Creates a service instance on an interface and defines the matching criteria.  
  • instance-id—Integer that uniquely identifies a service instance on an interface. |
| **Step 5**  
  *encapsulation default*  
  **Example:**  
  Router(config-if-srv)# encapsulation default | Configures the default service instance. |
| **Step 6**  
  *bridge-domain bridge-id*  
  **Example:**  
  Router(config-if-srv)# encapsulation default | Binds the service instance to a bridge domain instance using an identifier. |
Configuring EVC Default Encapsulation with Xconnect

Complete the following steps to configure EVC default encapsulation for xconnect.

**Note** When default encapsulation is configured on xconnect, the router does not support untagged encapsulation on the bridge-domain of the same interface.

### SUMMARY STEPS

1. **enable**
2. **configure terminal**
3. **interface type number**
4. **service instance instance-id ethernet**
5. **encapsulation default**
6. **xconnect peer-ip-address vc-id encapsulation mpls**

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td>Example: <code>&lt;Router&gt; enable</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: <code>&lt;Router&gt; configure terminal</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> interface type number</td>
<td>Specifies an interface type and number, and enters interface configuration mode.</td>
</tr>
<tr>
<td>Example: <code>&lt;Router(config)# interface GigabitEthernet0/4</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> service instance instance-id ethernet</td>
<td>Creates a service instance on an interface and defines the matching criteria.</td>
</tr>
<tr>
<td>Example: <code>&lt;Router(config-if)# service instance 10 ethernet</code></td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> encapsulation default</td>
<td>Configures the default service instance.</td>
</tr>
<tr>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td>Command or Action</td>
<td>Purpose</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------</td>
</tr>
<tr>
<td>Router(config-if)# encapsulation default</td>
<td>Binds an attachment circuit to a pseudowire, and to configure an Any Transport over MPLS (AToM) static pseudowire.</td>
</tr>
</tbody>
</table>

**Step 6**

**xconnect** peer-ip-address vc-id encapsulation mpls

**Example:**

Router(config-if-srv)# xconnect 1.1.1.1 100 encapsulation mpls

- **peer-ip-address** — IP address of the remote provider edge (PE) peer. The remote router ID can be any IP address, as long as it is reachable.
- **vc-id** — The 32-bit identifier of the virtual circuit (VC) between the PE routers.
- **encapsulation** — Specifies the tunneling method to encapsulate the data in the pseudowire.
- **mpls** — Specifies MPLS as the tunneling method.

### Verifying EVC Default Encapsulation with Bridge-Domain

To verify the configuration of EVC default encapsulation with bridge-domain, use the `show` command shown below.

```
Router# show running-config interface gigabitEthernet 0/4
Building configuration...
Current configuration : 181 bytes
!
interface GigabitEthernet0/4
no ip address
negotiation auto
no keepalive
service instance 1 ethernet
encapsulation default
  xconnect 2.2.2.2 100 encapsulation mpls
!
end
```

### Configuration Examples for EVC Default Encapsulation

**Example: Configuring EVC Default Encapsulation with Bridge-Domain**

```
!
interface GigabitEthernet
service instance 1 ethernet
  encapsulation default
  bridge-domain 99
!
```
Example: Configuring EVC Default Encapsulation with Xconnect

```plaintext
interface GigabitEthernet0/4
    service instance 10 ethernet
        encapsulation default
        xconnect 1.1.1.1 100 encapsulation mpls
```

Configuring Other Features on EFPs

This section contains the following topics:

**EFPs and EtherChannels**

You can configure EFP service instances on EtherChannel port channels, but EtherChannels are not supported on ports configured with service instances. Load-balancing on port channels is based on the MAC address or IP address of the traffic flow on the EtherChannel interface.

Configuration Example

This example configures a service instance on an EtherChannel port channel. Configuration on the ports in the port channel are independent from the service instance configuration.

```plaintext
Router (config)# interface port-channel 4
Router (config-if)# service instance2ethernet
Router (config-if-srv)# encapsulation dot1q 20
Router (config-if-srv)# bridge-domain 2
```

**MAC Address Forwarding, Learning and Aging on EFPs**

- Layer 2 forwarding is based on the bridge domain ID and the destination MAC address. The frame is forwarded to an EFP if the binding between the bridge domain, destination MAC address, and EFP is known. Otherwise, the frame is flooded to all the EFPs or ports in the bridge domain.

- MAC address learning is based on bridge domain ID, source MAC addresses, and logical port number. MAC addresses are managed per bridge domain when the incoming packet is examined and matched against the EFPs configured on the interface.

  If there is no EFP configured, the bridge domain ID equal to the outer-most VLAN tag is used as forwarding and learning look-up key. For native VLAN frames, the bridge domain equal to the access VLAN configured in the interface is used. If there is no matching entry in the Layer 2 forwarding table for the ingress frame, the frame is flooded to all the ports within the bridge domain. Flooding within the bridge domain occurs for unknown unicast, and broadcast.

- Dynamic addresses are addresses learned from the source MAC address when the frame enters the router. All unknown source MAC addresses are sent to the CPU along with ingress logical port number and bridge domain ID for learning. Once the MAC address is learned, the subsequent frame with the destination MAC address is forwarded to the learned port. When a MAC address moves to a different port, the Layer 2 forwarding entry is updated with the corresponding port.
• Dynamic addresses are aged out if there is no frame from the host with the MAC address. If the aged-out frame is received by the router, it is flooded to the EFPs in the bridge domain and the Layer 2 forwarding entry is created again. The default for aging dynamic addresses is 5 minutes.

You can configure dynamic address aging time by entering the `mac address-table aging time [0 | 10-1000000]`. The range is in seconds. An aging time of 0 means that the address aging is disabled.

• MAC address movement is detected when the host router moves from one port to another. If a host moves to another port or EFP, the learning lookup for the installed entry fails because the ingress logical port number does not match and a new learning cache entry is created. The detection of MAC address movement is disabled for static MAC addresses where the forwarding behavior is configured by the user.

• You should configure static MAC address before configuring static ARP (configure `mac-address-table static mac-address vlan vlan-id interface number` command followed by `arp ip-address hardware-address encap-type` command). This is because the Layer 2 MAC address and interface information are required to program static ARP in hardware.

Disabling MAC Address Learning on an Interface or Bridge Domain

By default, MAC address learning is enabled on all interfaces and bridge domains or VLANs on the router. You can control MAC address learning on an interface or VLAN to manage the available MAC address table space by controlling which interfaces or VLANs can learn MAC addresses. When you disable MAC address learning for a BD/VLAN or interface, the router that receives packet from any source on the BD, VLAN or interface, the addresses are not learned. Since addresses are not learned, all IP packets floods into the Layer 2 domain.

Complete the following steps to disable MAC address learning on a VLAN:

**Before you begin**

You can disable MAC address learning on a single VLAN ID from 2 to 4092 (for example, no `mac-address-table learning vlan 10`). If the MAC address learning is disabled for a VLAN or interface, the already learnt addresses for that VLAN or interface are immediately removed from the MAC address table. However, you cannot disable MAC learning for the reserved 4093, 4094, and 4095 VLAN IDs. If the VLAN ID that you enter is a reserved VLAN, the switch generates an error message and rejects the command.

**Note**

- We recommend that you disable MAC address learning only in VLANs with two ports. If you disable MAC address learning on a VLAN with more than two ports, every packet entering the switch is flooded in that VLAN domain.

- You cannot disable MAC address learning on a VLAN that is used internally by the router. VLAN ID 1 is used internally by the router. If the VLAN ID that you enter is an internal VLAN, the switch generates an error message and rejects the command.

**SUMMARY STEPS**

1. `configure terminal`
2. `no mac-address-table learning vlan vlan-id [interface type slot/port]`
3. `end`
4. `copy running-config startup-config`
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters the global configuration mode.</td>
</tr>
<tr>
<td>configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router# configure terminal</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Disable MAC address learning on an interface or on a specified VLAN.</td>
</tr>
<tr>
<td>no mac-address-table learning vlan vlan-id</td>
<td></td>
</tr>
<tr>
<td>interface type slot/port</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td></td>
</tr>
<tr>
<td>Router(config)# no mac-address-table learning vlan 10</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Return to the privileged EXEC mode.</td>
</tr>
<tr>
<td>end</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>(Optional) Save your entries in the configuration file.</td>
</tr>
<tr>
<td>copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**What to do next**

To reenable MAC address learning, use the `mac-address-table learning` global configuration command. The command causes the configuration to appear in the `show running-config` privileged EXEC command display.

**Example: Configuring EFP and EtherChannels**

This example shows how to disable MAC address learning on VLAN 10:

```
Router(config)# no mac-address-table learning vlan 10
```

This example shows how to disable MAC-address learning for all modules on a specific routed interface:

```
Router(config)# no mac-address-table learning interface GigabitEthernet 0/5
```

This example shows how to disable MAC address learning for port-channel interface:

```
Router(config)# no mac-address-table learning interface port-channel 1
```

**Verification**

The following are the examples of the outputs using the show commands.

```
Router# show mac-address-table
Mac Address Table
------------------
Vlan   Mac Address   Type   Ports
----  --------------  ------  -----
  20   2222.2222.2222  STATIC  G10/2
  10   0000.0700.0a00  DYNAMIC G10/9
```
In the above example, the show mac-address-table command displays both the dynamically and statically learned addresses.

Following is an example for show mac-address-table dynamic command which displays only dynamically learned addresses.

Router# show mac-address-table dynamic
Mac Address Table
-------------------------------------------
Vlan  Mac Address  Type  Ports
----  -----------  -----  ------
10    0000.0700.0a00  DYNAMIC  Gi0/9
10    0000.0700.0b00  DYNAMIC  Gi0/1
Total Mac Addresses for this criterion: 2

Following is an example for show mac-address-table vlan 10 command which displays only the addresses learned on a particular VLAN/BD.

Router# show mac-address-table vlan 10
Mac Address Table
-------------------------------------------
Vlan  Mac Address  Type  Ports
----  -----------  -----  ------
10    0000.0700.0a00  DYNAMIC  Gi0/9
10    0000.0700.0b00  DYNAMIC  Gi0/1
Total Mac Addresses for this criterion: 2

Following is an example for show mac-address-table interface g0/9 command which displays only the addresses learned on a particular VLAN/BD interface.

Router# show mac-address-table interface 0/9
Mac Address Table
-------------------------------------------
Vlan  Mac Address  Type  Ports
----  -----------  -----  ------
10    0000.0700.0a00  DYNAMIC  Gi0/9
Total Mac Addresses for this criterion: 1

Following is an example for show mac-address-table interface port-channel command which displays only the addresses learned on a particular port-channel interface.

Router# show mac-address-table interface port-channel 1
Mac Address Table
-------------------------------------------
Vlan  Mac Address  Type  Ports
----  -----------  -----  ------
10    0000.0700.0b00  DYNAMIC  Po1
Total Mac Addresses for this criterion: 1

Configuring IEEE 802.1Q Tunneling using EFPs

Tunneling is a feature used by service providers whose networks carry traffic of multiple customers and who are required to maintain the VLAN and Layer 2 protocol configurations of each customer without impacting the traffic of other customers. The router uses EFPs to support QinQ and Layer 2 protocol tunneling.

This section contains the following topics:

Configuring Ethernet Virtual Connections
Restrictions

- Inner VLAN range filtering for QinQ traffic from Network-to-Network Interface (NNI) to User-to-Network Interface (UNI) is not enforced if the range is more than 1000.
- Egress VLAN range filtering for traffic coming from NNI to UNI, is not supported on UNI.
- Single-tagged EVC with VLAN range is not supported on the port channel.
- In case of vlan based REP/STP/G8032 ring, while trying to apply same encapsulation on both ring and non-ring interfaces, you must configure first ring interface. You can ignore the error message displayed on non-ring interface. It does not have any functional effect.

802.1Q Tunneling (QinQ)

Service provider customers often have specific requirements for VLAN IDs and the number of VLANs to be supported. The VLAN ranges required by different customers in the same service-provider network might overlap, and traffic of customers through the infrastructure might be mixed. Assigning a unique range of VLAN IDs to each customer would restrict customer configurations and could easily exceed the VLAN limit (4096) of the 802.1Q specification.

Using the EVCs, service providers can encapsulate packets that enter the service-provider network with multiple customer VLAN IDs (C-VLANs) and a single 0x8100 Ethertype VLAN tag with a service provider VLAN (S-VLAN). Within the service provider network, packets are switched based on the S-VLAN. When the packets egress the service provider network onto the customer network, the S-VLAN tag is decapsulated and the original customer packet is restored.

Figure 1: Original (Normal), 802.1Q, and Double-Tagged Ethernet Packet Formats, on page 28 shows the tag structures of the double-tagged packets.

In Figure 2: 802.1Q Tunnel Ports in a Service-Provider Network, on page 29, Customer A is assigned VLAN 30, and Customer B is assigned VLAN 40. Packets entering the edge routers with 802.1Q tags are double-tagged when they enter the service-provider network, with the outer tag containing VLAN ID 30 or 40, appropriately,
and the inner tag containing the original VLAN number, for example, VLAN 100. Even if both Customers A and B have VLAN 100 in their networks, the traffic remains segregated within the service-provider network because the outer tag is different. Each customer controls its own VLAN numbering space, which is independent of the VLAN numbering space used by other customers and the VLAN numbering space used by the service-provider network. At the outbound port, the original VLAN numbers on the customer’s network are recovered.

Figure 2: 802.1Q Tunnel Ports in a Service-Provider Network

You can use EFPs to configure 802.1Q tunneling in two ways:

**Example: Configuring IEEE 802.1Q Tunneling Using EFPs**

In this example, for Customer A, interface Gigabit Ethernet 0/1 is the customer-facing port, and Gigabit Ethernet 0/2 is a trunk port facing the service provider network. For Customer B, Gigabit Ethernet 0/3 is the customer-facing port, and Gigabit Ethernet 0/4 is the trunk port facing the service provider network.

Customer A

```
Router(config)# interface gigabitethernet0/1
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 1-100
Router(config-if-srv)# bridge-domain 500
Router(config)# interface gigabitethernet0/2
Router(config-if)# service instance 2 Ethernet
Router(config-if-srv)# encapsulation dot1q 30 second-dot1q 1-100
Router(config-if-srv)# rewrite ingress pop 1 symmetric
Router(config-if-srv)# bridge-domain 500
```

For Customer A, service instance 1 on Gigabit Ethernet port 0/1 is configured with the VLAN encapsulations used by the customer: C-VLANs 1–100. These are forwarded on bridge-domain 500. The service provider facing port is configured with a service instance on the same bridge-domain and with an `encapsulation dot1q` command matching the S-VLAN. The `rewrite ingress pop 1 symmetric` command also implies a push of
the configured encapsulation on egress packets. Therefore, the original packets with VLAN tags between 1 and 100 are encapsulated with another S-VLAN (VLAN 30) tag when exiting Gigabit Ethernet port 0/2.

Similarly, for double-tagged (S-VLAN = 30, C-VLAN = 1–100) packets coming from the provider network, using the **rewrite ingress pop 1 symmetric** command enables the outer S-VLAN tag and forwards the original C-VLAN tagged frame over bridge-domain 500 out to Gigabit Ethernet port 0/1.

Customer B

```plaintext
Router(config)# interface gigabitethernet0/3
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 1-200
Router(config-if-srv)# bridge-domain 500
Router(config)# interface gigabitethernet0/4
Router(config-if)# service instance 2 Ethernet
Router(config-if-srv)# encapsulation dot1q 40 second-dot1q 1-200
Router(config-if-srv)# rewrite ingress pop 1 symmetric
Router(config-if-srv)# bridge-domain 500
```

**Routed QinQ**

The router supports pop 2 configuration.

**Restrictions**

- Pop 2 is not supported for MPLS, L2VPN, and MPLS VPN deployments.
- ACL and QOS configurations for pop2 EVC scenarios are not supported.

**Configuration Examples for Routed QinQ**

This section provides the following sample configuration examples for routed QinQ on the router:

**Example: User to Network Interface**

```
Gig 0/1 (Connected to BTS)
interface GigabitEthernet0/1
service instance 1 ethernet
encapsulation dot1q 10
rewrite ingress tag pop 1 symmetric
bridge-domain 100
int vlan 100
ip address 1.1.1.1 255.255.255.0
```

**Example: Network to Network Interface/Core Router**

```
interface GigabitEthernet0/2
service instance 2 ethernet
encapsulation dot1q 20 second-dot1q 30
rewrite ingress tag pop 2 symmetric
bridge-domain 101
int vlan 101
ip address 2.2.2.2 255.255.255.0
```

In the above example:
• The traffic coming from the Base Transceiver Station (BTS) through the GigabitEthernet interface 0/1 has the VLAN tag 10, which is popped and hits the Switch Virtual Interface (SVI) 100. This gets routed to SVI 101 depending on the destination address.

• At the egress on the core interface, two tags (20 and 30) are pushed and sent out of GigabitEthernet interface 0/2, for SVI 101.

• The traffic coming from the core router through GigabitEthernet interface 0/2, is destined to the BTS and has two tags (20, 30); both tags get popped and hit SVI 101. This gets routed to SVI 100, which sends the traffic out of GigabitEthernet interface 0/1 with VLAN 10.

• GigabitEthernet interface 0/2 can have multiple service instances and the traffic egresses out of the corresponding service instance depending on the SVI it gets routed to.

**Bridge Domain Routing**

The router supports IP routing for bridge domains, including Layer 3 and Layer 2 VPNs, using the SVI model.

**Restrictions**

• You must configure SVIs for bridge-domain routing.

• The bridge domain must be in the range of 1 to 4094 to match the supported VLAN range.

• You cannot have any Layer 2 switchports in the VLAN (bridge domain) used for routing.

• You can use bridge domain routing with only native packets.

• MPLS is supported on EFP with SVI.

• Scale limit for EFPs reduces if you use the second-dot1q command. Use the second-dot1q any command to maintain this limit.

**Example: Configuring Bridge-Domain Routing**

This is an example of configuring bridge-domain routing with a single tag EFP:

```
Router(config)# interface gigabitethernet0/2
Router(config-if)# service instance 1 Ethernet
Router(config-if-srv)# encapsulation dot1q 10
Router(config-if-srv)# rewrite ingress tag pop 1 symmetric
Router(config-if-srv)# bridge-domain 100
Router(config)# interface vlan 100
Router(config-if)# ip address 20.1.1.1 255.255.255.255
```

**How to Configure DHCP Client on SVI**

This section contains the following topics:

**Configuring DHCP Client on SVI**

To configure the DHCP client, the IP address, mask, broadcast address, and default gateway address of the SVI are retrieved from the server.

Complete the following steps to configure the DHCP client on SVI.

**SUMMARY STEPS**

1. enable
2. `configure terminal`
3. `interface vlan vlan-id`
4. `ip address dhcp`
5. `interface type-number`
6. `service instance instance-id ethernet encapsulation dot1q vlan-id`
7. `rewrite ingress tag pop [1 | 2] symmetric`
8. `bridge-domain bridge-id`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables privileged EXEC mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td>• Enter your password if prompted.</td>
</tr>
<tr>
<td></td>
<td>Router&gt; enable</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 2</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router# configure terminal</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 3</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>interface vlan vlan-id</td>
<td>Configures the VLAN interface and enters interface configuration mode.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config)# interface vlan 15</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ip address dhcp</td>
<td>Specifies an IP address through DHCP.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# ip address dhcp</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 5</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>interface type-number</td>
<td>Specifies an interface type number.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# interface GigabitEthernet</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Step 6</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>service instance instance-id ethernet encapsulation dot1q vlan-id</td>
<td>Creates a service instance on an interface and defines the matching criteria to be used in order to map the ingress dot1q frames to the appropriate service instance.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Router(config-if)# service instance 10 ethernet encapsulation dot1q 15</td>
<td>• <em>instance-id</em>—Integer that uniquely identifies a service instance on an interface.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• <em>vlan-id</em>—VLAN range is between 1 to 4094. You cannot use the same VLAN ID for more than one domain at the same level.</td>
</tr>
</tbody>
</table>
### Purpose

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 7</strong></td>
<td>**rewrite ingress tag pop [1</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>Router(config-if)# rewrite ingress tag pop 1 symmetric</td>
</tr>
<tr>
<td></td>
<td>Specifies the encapsulation adjustment to be performed on the frame ingress to the EFP. The symmetric keyword is required to complete the rewrite configuration.</td>
</tr>
</tbody>
</table>

| **Step 8** | **bridge-domain bridge-id** |
| **Example:** | Router(config-if)# bridge-domain 15 |
| | Binds the service instance to a bridge domain instance using an identifier. |

### Verifying DHCP Client on SVI

To verify the configuration of DHCP client on SVI, use the `show` command described below.

```
Router# show ip-address interface brief | include vlan15

Interface IP-Address OK Method Status Protocol
Vlan15 15.0.0.2 YES DHCP up up
```

**Example: Configuring DHCP Client on SVI**

```
Router(config)# interface Vlan 15
Router(config-if)# ip address dhcp
Router(config-if)# interface GigabitEthernet
Router(config-if)# negotiation auto
Router(config-if)# service instance 10 ethernet
Router(config-if-srv)# encapsulation dot1q 15
Router(config-if-srv)# rewrite ingress tag pop 1 symmetric
Router(config-if-srv)# bridge-domain 15
```

### EFPs and MAC Addresses

To see MAC address information for VLANs 1 to 4094, use the `show mac address-table vlan` privileged EXEC command. For VLANs 4096 to 8000, use the `show mac address-table bridge-domain` privileged EXEC command. All other `show mac address-table` commands also support bridge domains as well as VLANs.

When an EFP property changes (bridge domain, rewrite, encapsulation, split-horizon, secured or unsecured, or a state change), the old dynamic MAC addresses are removed from their existing tables. This is to prevent old invalid entries from getting retained.

### EFPs and MSTP

EFP bridge domains are supported by the Multiple Spanning Tree Protocol (MSTP). These restrictions apply when running MSTP with bridge domains:

- All incoming VLANs (outer-most or single) mapped to a bridge domain must belong to the same MST instance or loops could occur.
• For all EFPs that are mapped to the same MST instance, you must configure backup EFPs on every redundant path to prevent loss of connectivity due to STP blocking a port.
• EVC only supports MSTP.

Monitoring EVC

Statistics are not available in the service instance command. To look at flow statistics, you need to configure a class default policy on the service instance.

Table 2: Supported show Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>**show ethernet service evc [id evc-id</td>
<td>interface interface-id ] [detail]**</td>
</tr>
<tr>
<td>**show ethernet service instance [id instance-id</td>
<td>interface interface-id</td>
</tr>
<tr>
<td><strong>show bridge-domain [n ]</strong></td>
<td>Displays all the members of the specified bridge-domain, if a bridge-domain with the specified number exists. If you do not enter n, the command displays all the members of all bridge-domains in the system.</td>
</tr>
<tr>
<td>**show bridge-domain [n ] split-horizon [group {group_id</td>
<td>all}]**</td>
</tr>
<tr>
<td><strong>show ethernet service instance detail</strong></td>
<td>This command displays detailed service instance information, including Layer 2 protocol information. This is an example of the output:</td>
</tr>
</tbody>
</table>

```
Router# show ethernet service instance detail
Service Instance ID: 1
Associated Interface: Ethernet0/0
Associated EVC:
L2protocol tunnel lACP
CE-Vlans:
State: Up
EFP Statistics:
     Pkts In  Bytes In  Pkts Out  Bytes Out
           0       0          0        0
```
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show mac address-table</code></td>
<td>This command displays dynamically learned or statically configured MAC security addresses.</td>
</tr>
<tr>
<td><code>show mac address-table bridge-domain bridge-domain id</code></td>
<td>This command displays MAC address table information for the specified bridge domain.</td>
</tr>
<tr>
<td><code>show mac address-table count bridge-domain bridge-domain id</code></td>
<td>This command displays the number of addresses present for the specified bridge domain.</td>
</tr>
<tr>
<td><code>show mac address-table learning bridge-domain bridge-domain id</code></td>
<td>This command displays the learning status for the specified bridge domain.</td>
</tr>
</tbody>
</table>

### Example

This is an example of output from the `show ethernet service instance detail` command:

```
Router# show ethernet service instance id 1 interface gigabitEthernet 0/1 detail
Service Instance ID: 1
Associated Interface: GigabitEthernet
Associated EVC: EVC_P2P_10
L2protocol drop
CE-Vlans:
Encapsulation: dot1q 10 vlan protocol type 0x8100
Interface Dot1q Tunnel Ethertype: 0x8100
State: Up
EFP Statistics:
   Pkts In  Bytes In  Pkts Out  Bytes Out
   214 15408 97150 6994800
EFP Microblocks:
   ****************
   Microblock type: Bridge-domain
   Bridge-domain: 10
```

This is an example of output from the `show ethernet service instance statistics` command:

```
Router# show ethernet service instance id 1 interface gigabitEthernet stats
Service Instance 1, Interface GigabitEthernet
Pkts In  Bytes In  Pkts Out  Bytes Out
   214 15408 97150 6994800
```

This is an example of output from the `show mac-address table count` command:

```
Router# show mac address-table count bridge-domain 10
Mac Entries for BD 10:
------------------------
Dynamic Address Count : 20
Static Address Count : 0
Total Mac Addresses : 20
```

### Configuring Switchport to EVC Mapping

This example illustrates EVC in a UNI layer, 802.1q tunneling towards aggregation and QoS classification with marking and policing at ingress port. A two level HQoS policy is applied on the ingress.
In this example, all the switchport configurations of the ME3400/MWR2941 have been converted into EVC based equivalent configuration for GigabitEthernet interface 0/0. This is the ingress port connected to the nodes. Therefore, instead of `switchport access vlan` there is an EVC configured using the `service instance` command under the physical interface.

The GigabitEthernet interface has the egress port configuration which has 802.1q tunneling configured. This port is connected to the aggregation device. This is the fundamental difference in configuration between the Cisco ME34xx devices and the router. All configurations can be modeled along this sample working configuration.

Example: Configuring Switchport to EVC Mapping

```
class-map match-any CELL-TRFC
    match vlan 2615 3615
!
policy-map INPUT-SUBMAP
    class CELL-TRFC
        police cir 60000000 bc 1875000
        conform-action transmit
        exceed-action drop
!
policy-map INPUT-TOPMAP
    class class-default
        police cir 90000000 conform-action transmit exceed-action drop
        service-policy INPUT-SUBMAP
!
policy-map INPUT-MAP
    class class-default
        police cir 60000000 bc 1875000
        conform-action transmit
        exceed-action drop
!

Troubleshooting DHCP Snooping with Option-82 on EVC

Use the following debug commands to troubleshoot the DHCP Snooping with Option-82 on EVC feature configuration on the router:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug ip dhcp snooping</td>
<td></td>
</tr>
</tbody>
</table>

We suggest you do not use the debug command without TAC supervision.

Feature Information for Configuring Ethernet Virtual Connections

The following table lists the features in this module and provides links to specific configuration information.

Use Cisco Feature Navigator to find information about platform support and software image support. Cisco Feature Navigator enables you to determine which software images support a specific software release, feature set, or platform. To access Cisco Feature Navigator, go to http://www.cisco.com/go/cfn. An account on Cisco.com is not required.

Note

The following table lists only the software release that introduced support for a given feature in a given software release train. Unless noted otherwise, subsequent releases of that software release train also support that feature.
