Wireless PC Network Settings

This appendix provides instructions for changing the TCP/IP and radio card settings in your wireless PC. Choose the instructions appropriate for your operating system. This appendix has these sections:

- Overview, page D-2
- Windows 95 Instructions, page D-3
- Windows 98 Instructions, page D-5
- Windows NT Instructions, page D-6
- Windows 2000 Instructions, page D-7
- Windows Millennium Edition (Me) Instructions, page D-9
Overview

You can use a wireless PC with an IEEE 802.11 DSSS client radio card (hereafter referred to as the radio card) to initially set or change the base station configuration. For a wireless PC to communicate with the base station, the TCP/IP network settings and radio card settings must match the corresponding settings in the base station. How you verify or change these settings depends on the operating system in your wireless PC.

⚠️ Caution

Changing your TCP/IP properties and radio card settings for operation with the base station might impact other network programs on your wireless PC. Record your current settings for future reference; for example, these original settings might be needed for proper operation on your office enterprise network.
Windows 95 Instructions

Check or Add TCP/IP Protocol

In some versions of Windows 95, the TCP/IP protocol is not installed. Use the following instructions to verify or add the TCP/IP protocol:

Step 1  Double-click My Computer on your desktop.
Step 2  In the My Computer window, double-click Control Panel.
Step 3  In the Control Panel window, double-click Network.
Step 4  If TCP/IP is not listed, click Add, select Protocol, and click Add.
   a. Select Microsoft, select TCP/IP, and click OK.
   b. If prompted to restart your computer, click Yes.

The TCP/IP protocol is available on your PC.

Change PC and Radio Card Settings

To change the PC and radio card settings, follow these steps:

Step 1  Double-click My Computer on your desktop.
Step 2  In the My Computer window, double-click Control Panel.
Step 3  In the Control Panel window, double-click Network.
Step 4  Select a client radio card, such as the Cisco Systems wireless LAN adapter. Click Properties.
Step 5  In the Properties window, click the Advanced tab.
Step 6  Select Client Name. Verify your wireless computer’s unique client name in the Value dialog box.
Step 7  Select Data Rates. Enter Auto in the Value dialog box.
Step 8  Select Infrastructure Mode. Select Yes.
Step 9  Select SSID. Enter your base station (case sensitive) SSID in the Value dialog box, and click OK.

Step 10 Select TCP/IP -> for the Cisco Systems Wireless LAN Adapter. Click Properties.

Step 11 Perform one of the following:
   a. If you are connected to a DHCP server, select Obtain an IP address automatically. When asked if you want to enable DHCP, click Yes and OK.
   b. If you are not connected to a DHCP server, select Specify an IP address and enter the IP address, subnet mask, and default gateway address for your base station. Click OK.

Step 12 Select the Gateway tab, enter the default gateway address in the New Gateway field, and click Add.

Step 13 In the Network window, click OK.

Step 14 If prompted to restart your computer, click Yes.

Your PC configuration is complete.
Windows 98 Instructions

To change the PC and radio card settings, follow these steps:

**Step 1**  Double-click *My Computer* on your desktop.

**Step 2**  In the My Computer window, double-click *Control Panel*.

**Step 3**  In the Control Panel window, double-click *Network*.

**Step 4**  In the Network window, select a client radio card, such as the *Cisco Systems wireless LAN adapter*. Click *Properties*.

**Step 5**  In the Properties window, click the *Advanced* tab.

**Step 6**  Select *Client Name*. Verify your wireless computer’s unique client name in the Value dialog box.

**Step 7**  Select *Data Rates*. Enter *Auto* in the Value dialog box.

**Step 8**  Select *Infrastructure Mode*. Select *Yes*.

**Step 9**  Select *SSID*. Enter your base station (case sensitive) SSID in the Value dialog box.

**Step 10**  Click *OK*.

**Step 11**  Select *TCP/IP* -> for the Cisco Systems Wireless LAN Adapter. Click *Properties*.

**Step 12**  Perform one of the following:

a.  If you are connected to a DHCP server, select *Obtain an IP address automatically*. When asked if you want to enable DHCP, click *Yes* and *OK*.

b.  If you are not connected to a DHCP server, select *Specify an IP address* and enter the IP address, subnet mask, and default gateway address for your base station. Click *OK*.

**Step 13**  Select the *Gateway* tab, enter the default gateway address in the New Gateway field, and click *Add*.

**Step 14**  In the Network window, click *OK*.

**Step 15**  If prompted to restart your computer, click *Yes*.

Your PC configuration is complete.
Windows NT Instructions

To change the PC and radio card settings, follow these steps:

**Step 1** Double-click **My Computer** on your desktop.

**Step 2** In the My Computer window, double-click **Control Panel**.

**Step 3** In the Control Panel window, double-click **Network**.

**Step 4** Click the **Adapters** tab and select a client radio card, such as the *Cisco Systems wireless LAN adapter*. Click **Properties**.

**Step 5** Select **Client Name**. Verify your wireless computer’s unique client name in the Value dialog box.

**Step 6** Select **Data Rates**. Enter **Auto** in the Value dialog box.

**Step 7** Select **Infrastructure Mode**. Select **Yes** in the Value dialog box.

**Step 8** Select **SSID**. Enter your base station (case sensitive) SSID in the Value dialog box.

**Step 9** Click **OK**.

**Step 10** Click the **Protocols** tab, select **TCP/IP Protocol**, and click **Properties**.

**Step 11** Perform one of the following:

a. If you are connected to a DHCP server, select **Obtain an IP address from a DHCP server**. When asked if you want to enable DHCP, click **Yes** and **OK**.

b. If you are not connected to a DHCP server, select **Specify an IP address** and enter the IP address, subnet mask, and default gateway address of your computer. Click **OK**.

**Step 12** When prompted to restart your computer, click **Yes**.

The PC configuration is complete.
Appendix D  Wireless PC Network Settings

Overview

Windows 2000 Instructions

To change the PC and radio card settings, follow these steps:

Step 1  Double-click My Computer on your desktop.
Step 2  In the My Computer window, double-click Control Panel.
Step 3  In the Control Panel window, double-click System.
Step 4  In the System Properties window, click Hardware.
Step 5  Click Device Manager.
Step 6  In the Device Manager window, double-click Network Adapters.
Step 7  Right-click a client radio card, such as the Cisco Systems wireless LAN adapter.
Step 8  Click Properties.
Step 9  In the client adapter Properties window, click the Advanced tab.
Step 10 Select Client Name. Verify your computer’s unique client name in the Value dialog box.
Step 11 Select Data Rates. Enter Auto in the Value dialog box.
Step 12 Select Infrastructure Mode. Select Yes.
Step 13 Select SSID. Enter your base station (case sensitive) SSID in the Value dialog box, and click OK.
Step 14 Double-click My Computer, Control Panel, and Network and Dial-up Connections.

a. Right-click Local Area Connection for the Cisco Systems Wireless LAN Adapter.

b. Click Properties, select Internet Protocol (TCP/IP), and click Properties.

Step 15 Perform one of the following:

a. If you are connected to a DHCP server, select Obtain an IP address automatically. When asked if you want to enable DHCP, click Yes and OK.

b. If you are not connected to a DHCP server, select Use the following IP address and enter the IP address, subnet mask, and default gateway address of your computer. Click OK.

Step 16 In the Local Area Connection Properties window, click OK.
Step 17  Close the Network and Dial-up Connections window.

Step 18  Close the Control Panel.

Your PC configuration is complete.
# Windows Millennium Edition (Me) Instructions

To change the PC and radio card settings, follow these steps:

<table>
