

Wireless Quality of Service

- Call Admission Control, on page 1
- Application Visibility and Control, on page 17
- NetFlow, on page 27
- QoS Profiles, on page 29

Call Admission Control

This section contains the following subsections:

Voice and Video Parameters

Three parameters on the controller affect voice and/or video quality:

- Call admission control
- Expedited bandwidth requests
- Unscheduled automatic power save delivery

Each of these parameters is supported in Cisco Compatible Extensions (CCX) v4 and v5.

This section contains the following subsections:

Configuring Voice Parameters

Configuring Voice Parameters (GUI)

Step 1	Ensure that the WLAN is configured for WMM and the Platinum QoS level.
Step 2	Choose Wireless and then Network under 802.11a/n/ac or 802.11b/g/n, uncheck the 802.11a (or 802.11b/g) Network Status check box, and click Apply to disable the radio network.
Step 3	Choose Wireless > 802.11a/n/ac or 802.11b/g/n > Media. The 802.11a (or 802.11b) > Media page appears. The Voice tab is displayed by default.

Step 4	· · · /	Check the Admission Control (ACM) check box to enable static CAC for this radio band. The lue is disabled.		
Step 5	(Optional) Select the Admission Control (ACM) you want to use by choosing from the follow			
	• Load	I-based—To enable channel-based CAC. This is the default option.		
	• Stati	c—To enable radio-based CAC.		
Step 6	voice appl	x RF Bandwidth field, enter the percentage of the maximum bandwidth allocated to clients for ications on this radio band. Once the client reaches the value specified, the access point rejects new is radio band.		
	The range 85%.	is 5% to 85%. The sum of maximum bandwidth percentage of voice and video should not exceed		
	The defau	lt is 75%.		
Step 7	In the Reserved Roaming Bandwidth field, enter the percentage of maximum allocated bandwidth that is reserved for roaming voice clients. The controller reserves this bandwidth from the maximum allocated bandwidth for roaming voice clients.			
	The range	is 0% to 25%.		
	The defau	lt is 6%.		
Step 8	To enable expedited bandwidth requests, check the Expedited Bandwidth check box. By default, this field is disabled.			
Step 9	To enable	SIP CAC support, check the SIP CAC Support check box. By default, SIP CAC support is disabled.		
Step 10 From the SIP Codec drop-down list, choose one of the following options to value is G.711. The options are as follows:		SIP Codec drop-down list, choose one of the following options to set the codec name. The default .711. The options are as follows:		
	• User	Defined		
	• G.71	1		
	• G.72	9		
Step 11	In the SIP Bandwidth (kbps) field, enter the bandwidth in kilobits per second.			
	The possible range is 8 to 64.			
	The default value is 64.			
	Note	The SIP Bandwidth (kbps) field is highlighted only when you select the SIP codec as User-Defined. If you choose the SIP codec as G.711, the SIP Bandwidth (kbps) field is set to 64. If you choose the SIP codec as G.729, the SIP Bandwidth (kbps) field is set to 8.		
Step 12	In the SIP	Voice Sample Interval (msecs) field, enter the value for the sample interval.		
Step 13	In the Maximum Calls field, enter the maximum number of calls that can be made to this radio. The maximum call limit includes both direct and roaming-in calls. If the maximum call limit is reached, the new or roaming-in calls result in failure.			
	The possil	ble range is 0 to 25.		
	The defau	It value is 0, which indicates that there is no check for maximum call limit.		

	Note	If SIP CAC is supported and the CAC method is static, the Maximum Possible Voice Calls and Maximum Possible Roaming Reserved Calls fields appear.
Step 14		Metrics Collection check box to collect traffic stream metrics. By default, this box is unselected. e traffic stream metrics is not collected by default.
Step 15	Click App	oly.
Step 16		etwork under 802.11a/n/ac or 802.11b/g/n, check the 802.11a (or 802.11b/g) Network Status check elick Apply to reenable the radio network.
Step 17	Click Sav	e Configuration.
Step 18	Repeat thi	s procedure if you want to configure voice parameters for another radio band.

Configuring Voice Parameters (CLI)

Before you begin

Ensure that you have configured SIP-based CAC.

Step 1	See all of the WLANs configured on the controller by entering this command:	
	show wlan summary	
Step 2	Make sure that the WLAN that you are planning to modify is configured for WMM and the QoS level is set to Platinum by entering this command:	
	show wlan <i>wlan_id</i>	
Step 3	Disable the radio network by entering this command:	
	config {802.11a 802.11b} disable network	
Step 4	Save your settings by entering this command:	
	save config	
Step 5	Enable or disable static CAC for the 802.11a or 802.11b/g network by entering this command:	
	config {802.11a 802.11b} cac voice acm {enable disable}	
Step 6	Set the percentage of maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network by entering this command:	
	config {802.11a 802.11b} cac voice max-bandwidth bandwidth	
	The <i>bandwidth</i> range is 5 to 85%, and the default value is 75%. Once the client reaches the value specified, the access point rejects new calls on this network.	
Step 7	Set the percentage of maximum allocated bandwidth reserved for roaming voice clients by entering this command:	
	config {802.11a 802.11b} cac voice roam-bandwidth bandwidth	

I

	The <i>bandwidth</i> range is 0 to 25%, and the default value is 6%. The controller reserves this much bandwidth from the maximum allocated bandwidth for roaming voice clients.
Step 8	Configure the codec name and sample interval as parameters and to calculate the required bandwidth per call by entering this command:
	$config \ \{802.11a \ \ 802.11b\} \ cac \ voice \ sip \ codec \ \{g711 \ \ g729\} \ sample-interval \ number_msecs$
Step 9	Configure the bandwidth that is required per call by entering this command:
	config {802.11a 802.11b} cac voice sip bandwidth bandwidth_kbps sample-interval number_msecs
Step 10	Reenable the radio network by entering this command:
	config {802.11a 802.11b} enable network
Step 11	View the TSM voice metrics by entering this command:
	show [802.11a 802.11b] cu-metrics AP_Name
	The command also displays the channel utilization metrics.
Step 12	Enter the save config command to save your settings.

Configuring Video Parameters

Configuring Video Parameters (GUI)

Step 1	Ensure that the WLAN is configured for WMM and the Platinum or Gold QoS level.			
Step 2	Choose Wireless and then Network under 802.11a/n/ac or 802.11b/g/n, uncheck the 802.11a (or 802.11b/g) Network Status check box, and click Apply to disable the radio network.			
Step 3	Choose V	Wireless > 802.11a/n/ac or 802.11b/g/n > Media. The 802.11a (or 802.11b) > Media page appears.		
Step 4	In the Video tab, check the Admission Control (ACM) check box to enable video CAC for this radio band The default value is disabled.			
Step 5	From the	CAC Method drop-down list, choose between Static and Load Based methods.		
	The static CAC method is based on the radio and the load-based CAC method is based on the channel.			
	Note	For TSpec and SIP based CAC for video calls, only Static method is supported.		
Step 6	In the Max RF Bandwidth text box, enter the percentage of the maximum bandwidth allocated to clients for video applications on this radio band. When the client reaches the value specified, the access point rejects new requests on this radio band.			
	U U	The range is 5% to 85%. The sum of maximum bandwidth percentage of voice and video should not exceed 85%. The default is 0%.		
Step 7		served Roaming Bandwidth text box, enter the percentage of the maximum RF bandwidth that is for roaming clients for video.		

Step 8	Configure the SIP CAC Support by checking or unchecking the SIP CAC Support check box. SIP CAC is supported only if SIP Snooping is enabled.		
	Note	You cannot enable SIP CAC if you have selected the Load Based CAC method.	
Step 9	Click Ap	ply.	
Step 10	Choose Network under 802.11a/n/ac or 802.11b/g/n, check the 802.11a (or 802.11b/g) Network Status check box, and click Apply to reenable the radio network.		
Step 11	Click Save Configuration.		
Step 12	2 Repeat this procedure if you want to configure video parameters for another radio band.		

Configuring Video Parameters (CLI)

Before you begin

Ensure that you have configured SIP-based CAC.

Step 1	See all of the WLANs configured on the controller by entering this command:
	show wlan summary
Step 2	Make sure that the WLAN that you are planning to modify is configured for WMM and the QoS level is set to Gold by entering this command:
	show wlan wlan_id
Step 3	Disable the radio network by entering this command:
	config {802.11a 802.11b} disable network
Step 4	Save your settings by entering this command:
	save config
Step 5	Enable or disable video CAC for the 802.11a or 802.11b/g network by entering this command:
	config $\{802.11a \mid 802.11b\}$ cac video acm $\{enable \mid disable\}$
Step 6	To configure the CAC method as either static or load-based, enter this command:
	config {802.11a 802.11b} cac video cac-method {static load-based}
Step 7	Set the percentage of maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network by entering this command:
	config {802.11a 802.11b} cac video max-bandwidth bandwidth
	The <i>bandwidth</i> range is 5 to 85%, and the default value is 5%. However, the maximum RF bandwidth cannot exceed 85% for voice and video. Once the client reaches the value specified, the access point rejects new calls on this network.

	Note	If this parameter is set to zero (0), the controller assumes that you do not want to do any bandwidth allocation and, therefore, allows all bandwidth requests.
Step 8	To configure the percentage of the maximum RF bandwidth that is reserved for roaming clients for video, enter this command:	
	config {	802.11a 802.11b} cac video roam-bandwidth bandwidth
Step 9		gure the CAC parameters for SIP-based video calls, enter this command: 802.11a 802.11b} cac video sip {enable disable}
Step 10		or ignore the TSPEC inactivity timeout received from an access point by entering this command: 802.11a 802.11b} cac video tspec-inactivity-timeout {enable ignore}
Step 11		e the radio network by entering this command: 802.11a 802.11b} enable network
Step 12	Enter the	e save config command to save your settings.

Viewing Voice and Video Settings

Viewing Voice and Video Settings (GUI)

Cl	noose Monitor > Clients to open the Clients page.		
Cl	Click the MAC address of the desired client to open the Clients > Detail page.		
Tł	is page shows the U-APSD status (if enabled) for this client under Quality of Service Properties.		
Cl	Click Back to return to the Clients page.		
Se	See the TSM statistics for a particular client and the access point to which this client is associated as follows:		
a)	Hover your cursor over the blue drop-down arrow for the desired client and choose 802.11aTSM or 802.11b/g TSM . The Clients > AP page appears.		
b)	Click the Detail link for the desired access point to open the Clients > AP > Traffic Stream Metrics page.		
	This page shows the TSM statistics for this client and the access point to which it is associated. The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.		
	e the TSM statistics for a particular access point and a particular client associated to this access point, as llows:		
a)	Choose Wireless > Access Points > Radios > 802.11a/n/ac or 802.11b/g/n. The 802.11a/n/ac Radios or 802.11b/g/n Radios page appears.		
b)	Hover your cursor over the blue drop-down arrow for the desired access point and choose 802.11aTSM or 802.11b/g TSM . The AP > Clients page appears.		
c)	Click the Detail link for the desired client to open the AP > Clients > Traffic Stream Metrics page.		

This page shows the TSM statistics for this access point and a client associated to it. The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.

Viewing Voice and Video Settings (CLI)

Procedure

Step 1	See the CAC configuration for the 802.11 network by entering this command: show ap stats {802.11a 802.11b}				
Step 2	See the CAC statistics for a particular access point by entering this command:				
	show ap stats {802.11a 802.11b} ap_name				
	Information similar to the following appears:				
	Call Admission Control (CAC) Stats Voice Bandwidth in use(% of config bw)0 Total channel MT free0 Total voice MT free0 Na Direct0 Na Roam0 Video Bandwidth in use(% of config bw)0 Total num of voice calls in progress0 Num of roaming voice calls in progress0 Total Num of voice calls since AP joined0 Total Num of roaming calls since AP joined0 Total Num of exp bw requests received5 Total Num of exp bw requests admitted2				
	Num of voice calls rejected since AP joined 0 Num of roam calls rejected since AP joined 0 Num of calls rejected due to insufficient bw0 Num of calls rejected due to invalid params 0 Num of calls rejected due to PHY rate 0 Num of calls rejected due to QoS policy 0				
	In the example above, "MT" is medium time, "Na" is the number of additional calls, and "exp bw" is expedited bandwidth.				

- **Note** Suppose an AP has to be rebooted when a voice client associated with the AP is on an active call. After the AP is rebooted, the client continues to maintain the call, and during the time the AP is down, the database is not refreshed by the controller. Therefore, we recommend that all active calls are ended before the AP is taken down.
- **Step 3** See the U-APSD status for a particular client by entering this command:

show client detail client_mac

Step 4 See the TSM statistics for a particular client and the access point to which this client is associated by entering this command:

show client tsm {**802.11a** | **802.11b**} *client_mac* {*ap_mac* | **all**}

The optional all command shows all access points to which this client has associated. Information similar to the following appears:

Client Interface Mac:	00:01:02:03:04:05
Measurement Duration:	90 seconds
Timestamp UpLink Stats	1st Jan 2006, 06:35:80
Delay less than 10 ms Delay bet 10 - 20 ms Delay bet 20 - 40 ms Delay greater than 40 ms Total packet Count Total packet lost count (5see Maximum Lost Packet count(5see	1s)
	Ls)
Delay less than 10 ms Delay bet 10 - 20 ms Delay bet 20 - 40 ms Delay greater than 40 ms Total packet Count Total packet lost count (5see Maximum Lost Packet count(5see	20 20 20 20 20 20 20 20 20 20 20 20 20 2
Average Lost Packet count(5se	ecs)2

- Note The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.
- Note Clear the TSM statistics for a particular access point or all the access points to which this client is associated by entering this clear client tsm {802.11a | 802.11b} client_mac {ap_mac | all} command.
- Step 5 See the TSM statistics for a particular access point and a particular client associated to this access point by entering this command:

show ap stats {802.11a | 802.11b} ap_name tsm {client_mac | all}

The optional **all** command shows all clients associated to this access point. Information similar to the following appears:

AP Interface Mac: Client Interface Mac: Measurement Duration:	00:0b:85:01:02:03 00:01:02:03:04:05 90 seconds
Timestamp UpLink Stats ===================================	1st Jan 2006, 06:35:80
Delay less than 10 ms Delay bet 10 - 20 ms Delay bet 20 - 40 ms	s)

Total packet Count
Average Delay (5sec intervals)

- **Note** The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.
- **Step 6** Enable or disable debugging for call admission control (CAC) messages, events, or packets by entering this command:

debug cac {all | event | packet} {enable | disable}

where **all** configures debugging for all CAC messages, **event** configures debugging for all CAC events, and **packet** configures debugging for all CAC packets.

Step 7 Use the following command to perform voice diagnostics and to view the debug messages between a maximum of two 802.11 clients:

debug voice-diag {enable | disable} mac-id mac-id2 [verbose]

The verbose mode is an optional argument. When the verbose option is used, all debug messages are displayed in the console. You can use this command to monitor a maximum of two 802.11 clients. If one of the clients is a non-WiFi client, only the 802.11 client is monitored for debug messages.

- **Note** It is implicitly assumed that the clients being monitored are on call.
- **Note** The debug command automatically stops after 60 minutes.
- **Step 8** Use the following commands to view various voice-related parameters:

show client voice-diag status

Displays information about whether voice diagnostics is enabled or disabled. If enabled, will also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call.

If voice diagnostics is disabled when the following commands are entered, a message indicating that voice diagnostics is disabled appears.

show client voice-diag tspec

Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.

· show client voice-diag qos-map

Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.

show client voice-diag avrg_rssi

Display the client's RSSI values in the last 5 seconds when voice diagnostics is enabled.

· show client voice-diag roam-history

Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, the reason for the roaming-failure.

show client calls {active | rejected} {802.11a | 802.11bg | all}

This command lists the details of active TSPEC and SIP calls on the controller.

- **Step 9** Use the following commands to troubleshoot video debug messages and statistics:
 - debug ap show stats {802.11b | 802.11a} *ap-name* multicast—Displays the access point's supported multicast rates.
 - debug ap show stats {802.11b | 802.11a} *ap-name* load—Displays the access point's QBSS and other statistics.
 - **debug ap show stats {802.11b | 802.11a}** *ap-name* **tx-queue**—Displays the access point's transmit queue traffic statistics.
 - debug ap show stats {802.11b | 802.11a} *ap-name* client {all | video | *client-mac*}—Displays the access point's client metrics.
 - debug ap show stats {802.11b | 802.11a} ap-name packet—Displays the access point's packet statistics.
 - debug ap show stats {802.11b | 802.11a} ap-name video metrics—Displays the access point's video metrics.
 - debug ap show stats video *ap-name* multicast mgid *number* —Displays an access point's Layer 2 MGID database number.
 - debug ap show stats video ap-name admission—Displays an access point's admission control statistics.
 - debug ap show stats video ap-name bandwidth—Displays an access point's video bandwidth.

Configuring SIP-Based CAC

Restrictions for SIP-Based CAC

- SIP CAC should only be used for phones that support status code 17 and do not support TSPEC-based admission control.
- SIP CAC will be supported only if SIP snooping is enabled.

Configuring SIP-Based CAC (GUI)

Before you begin

- Ensure that you have set the voice to the platinum QoS level.
- Ensure that you have enabled call snooping for the WLAN.
- Ensure that you have enabled the Admission Control (ACM) for this radio.

Procedure

Step 1	Choose Wireless > Advanced > SIP Snooping to open the SIP Snooping page.
Step 2	Specify the call-snooping ports by entering the starting port and the ending port.
Step 3	Click Apply and then click Save Configuration.

Configuring SIP-Based CAC (CLI)

Procedure

Step 1	Set the voice to the platinum QoS level by entering this command: config wlan qos <i>wlan-id</i> Platinum
Step 2	Enable the call-snooping feature for a particular WLAN by entering this command: config wlan call-snoop enable <i>wlan-id</i>
Step 3	Enable the ACM to this radio by entering this command: config {802.11a 802.11b} cac {voice video} acm enable
Step 4	To configure the call snooping ports, enter this command: config advanced sip-snooping-ports <i>starting-port ending-port</i>
Step 5	To troubleshoot SIP-based CAC events, enter this command: debug sip event {enable disable}

Voice Prioritization Using Preferred Call Numbers

You can configure a controller to support calls from clients that do not support TSPEC-based calls. This feature is known as voice prioritization. These calls are given priority over other clients utilizing the voice pool. Voice prioritization is available only for SIP-based calls and not for TSPEC-based calls. If the bandwidth is available, it takes the normal flow and allocates the bandwidth to those calls.

You can configure up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the controller does not check on the maximum call limit. It invokes the CAC to allocate bandwidth for the preferred call. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

This section contains the following subsections:

Prerequisites for Configuring Voice Prioritization Using Preferred Call Numbers

You must configure the following before configuring voice prioritization:

- Set WLAN QoS to platinum.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

Configuring a Preferred Call Number (GUI)

Procedure

Step 1 Step 2 Step 3 Step 4	Set the WLAN QoS profile to Platinum. Enable ACM for the WLAN radio. Enable SIP call snooping for the WLAN. Choose Wireless > Advanced > Preferred Call to open the Preferred Call page.
	All calls configured on the controller appear.
	Note To remove a preferred call, hover your cursor over the blue drop-down arrow and choose Remove .
Step 5	Click Add Number to add a new preferred call.
Step 6	In the Call Index text box, enter the index that you want to assign to the call. Valid values are from 1 through 6.
Step 7	In the Call Number text box, enter the number.
Step 8	Click Apply to add the new number.

Configuring a Preferred Call Number (CLI)

Step 1	Set the voice to the platinum QoS level by entering this command:
	config wlan qos wlan-id Platinum
Step 2	Enable the ACM to this radio by entering this command:
	config {802.11a 802.11b} cac {voice video} acm enable
Step 3	Enable the call-snooping feature for a particular WLAN by entering this command:

	config wlan call-snoop enable wlan-id
Step 4	Add a new preferred call by entering this command:
	config advanced sip-preferred-call-no <i>call_index</i> { <i>call_number</i> none}
Step 5	Remove a preferred call by entering this command:
	config advanced sip-preferred-call-no call_index none
Step 6	View the preferred call statistics by entering the following command:
	show ap stats {802.11{a b} wlan} <i>ap_name</i>
Step 7	Enter the following command to list the preferred call numbers:
	show advanced sip-preferred-call-no

Enhanced Distributed Channel Access Parameters

Enhanced Distributed Channel Access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality of service (QoS) traffic.

This section contains the following subsections:

Configuring EDCA Parameters (GUI)

	ss and then Network under 802.11a/n/ac or 802.11b/g/n, unselect the 802.11a (or 802.11b/g) s check box, and click Apply to disable the radio network.
Click EDCA Pa	arameters under 802.11a/n/ac or 802.11b/g/n.
The 802.11a (or	r 802.11b/g) > EDCA Parameters window is displayed.
Choose one of t	the following options from the EDCA Profile drop-down list:
	Enables the Wi-Fi Multimedia (WMM) default parameters. The WMM option is default and nend this setting if you have SpectraLink phones deployed in your network.
• Spectralin	k Voice Priority—This setting is not recommended.
-	imized —Enables Enhanced Distributed Channel Access (EDCA) voice-optimized profile s. Choose this option when 8821 phones are deployed in your network, and video services are
	Tideo Optimized —Enables EDCA voice-optimized and video-optimized profile s. Choose this option if both voice and video services are deployed on your network.
this option	foice —Enables custom voice EDCA parameters for 802.11a. The EDCA parameters under also match the 6.0 WMM EDCA parameters when this profile is applied. This setting is not ded because it is deprecated.
Note	If you deploy video services, admission control must be disabled.

Step 5	check box i appropriate	AAC optimization for voice, check the Enable Low Latency MAC check box. By default, this s not checked. This feature enhances voice performance by controlling packet retransmits and ly aging out voice packets on lightweight access points, which improves the number of voice calls r access point.
	Note	We recommend that you do not enable low latency MAC. You should enable low-latency MAC only if the WLAN allows WMM clients. If WMM is enabled, then low-latency MAC can be used with any of the EDCA profiles.
Step 6	Click Appl	y to commit your changes.
Step 7	To re-enable the radio network, click Network under 802.11a/n/ac or 802.11b/g/n, check the 802.11a (or 802.11b/g) Network Status check box, and click Apply .	
Step 8	Click Save Configuration.	

Configuring EDCA Parameters (CLI)

Disable the radio network by entering this command:
config {802.11a 802.11b} disable network
Save your settings by entering this command:
save config
Enable a specific EDCA profile by entering this command:
config advanced {802.11a 802.11b} edca-parameters {wmm-default svp-voice optimized-voice optimized-voice optimized-voice optimized-voice }
• wmm-default —Enables the Wi-Fi Multimedia (WMM) default parameters. This is the default value. Choose this option if voice or video services are not deployed on your network.
• svp-voice —Enables SpectraLink voice-priority parameters. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.
• optimized-voice —Enables EDCA voice-optimized profile parameters. Choose this option if voice services other than SpectraLink are deployed on your network.
• optimized-video-voice —Enables EDCA voice-optimized and video-optimized profile parameters. Choose this option if both voice and video services are deployed on your network.
• custom-voice —Enables custom voice EDCA parameters for 802.11a. The EDCA parameters under th option also match the 6.0 WMM EDCA parameters when this profile is applied.
Note If you deploy video services, admission control (ACM) must be disabled.
View the current status of MAC (low latency MAC) optimization for voice by entering this command:
show {802.11a 802.11b}
Information that is similar to the following example is displayed:

Wireless Quality of Service

	Voice-mac	-optimizationDisabled
Step 5	Enable or	disable MAC optimization for voice by entering this command:
	config adv	vanced {802.11a 802.11b} voice-mac-optimization {enable disable}
	Note	The low latency MAC option is not supported.
		This feature enhances voice performance by controlling packet retransmits and appropriately aging out voice packets on lightweight APs. This, in turn improves the number of voice calls serviced per AP. The default value is disabled.
Step 6	Re-enable	the radio network by entering this command:
	config {80	2.11a 802.11b} enable network
Step 7	Save your	settings by entering this command: save config.

Key Telephone System-Based CAC

Key Telephone System-based CAC is a protocol that is used in NEC MH240 wireless IP telephones. You can configure the controller to support CAC on KTS-based SIP clients, to process bandwidth request message from such clients, to allocate the required bandwidth on the AP radio, and to handle other messages that are part of the protocol.

When a call is initiated, the KTS-based CAC client sends a Bandwidth Request message to which the controller responds with a Bandwidth Confirm message indicating whether the bandwidth is allocated or not. The call is allowed only if the bandwidth is available. If the client roams from one AP to another, the client sends another Bandwidth Request message to the controller.

Bandwidth allocation depends on the median time calculated using the data rate from the Bandwidth Request message and the packetization interval. For KTS-based CAC clients, the G.711 codec with 20 milliseconds as the packetization interval is used to compute the medium time.

The controller releases the bandwidth after it receives the bandwidth release message from the client. When the client roams to another AP, the controller releases the bandwidth on the previous AP and allocates bandwidth on the new AP, in both intracontroller and intercontroller roaming scenarios. The controller releases the bandwidth if the client is dissociated or if there is inactivity for 120 seconds. The controller does not inform the client when the bandwidth is released for the client due to inactivity or dissociation of the client.

This section contains the following subsections:

Restrictions for Key Telephone System-Based CAC

- The controller ignores the SSID Capability Check Request message from the clients.
- Preferred call is not supported for KTS CAC clients.
- Reason code 17 is not supported in intercontroller roaming scenarios.
- To make the KTS-based CAC feature functional, ensure that you do the following:
 - Enable WMM on the WLAN

- · Enable ACM at the radio level
- Enable processing of TSPEC inactivity timeout at the radio level
- All RLAN clients are disconnected when Call Admission Control (CAC) is enabled or disabled to apply policies.

Configuring KTS-based CAC (GUI)

Before you begin

To enable KTS-based CAC for a WLAN, ensure that you do the following:

- Set the QoS profile for the WLAN to Platinum.
- Set the WLAN in disabled state.
- Set the FlexConnect Local Switching in disabled state for the WLAN (On the WLANs > Edit page, click the **Advanced** tab and uncheck the **FlexConnect Local Switching** check box).

Procedure

Step 1	Choose WLANs to open the WLANs page.
Step 2	Click the ID number of the WLAN for which you want to configure the KTS-based CAC policy.
Step 3	On the WLANs > Edit page, click the Advanced tab.
Step 4	Under Voice, check or uncheck the KTS based CAC Policy check box to enable or disable KTS-based CAC for the WLAN.
Step 5	Save the configuration.

Configuring KTS-based CAC (CLI)

Before you begin

To enable KTS-based CAC for a WLAN, ensure that you do the following:

- Configure the QoS profile for the WLAN to Platinum by entering the following command: config wlan qos *wlan-id* platinum
- Disable the WLAN by entering the following command: config wlan disable *wlan-id*
- Disable FlexConnect Local Switching for the WLAN by entering the following command: config wlan flexconnect local-switching *wlan-id* disable

Procedure

Step 1	To enable KTS-based CAC for a WLAN, enter the following command: config wlan kts-cac enable <i>wlan-id</i>					
Step 2	To enable the functioning of the KTS-based CAC feature, ensure you do the following: a) Enable WMM on the WLAN by entering the following command:					
	config wlan wmm allow wlan-id					
	b) Enable ACM at the radio level by entering the following command:					
	config 802.11a cac voice acm enable					
	c) Enable the processing of the TSPEC inactivity timeout at the radio level by entering the following command					
	config 802.11a cac voice tspec-inactivity-timeout enable					
elated Commands						
	• To see whether the client supports KTS-based CAC, enter the following command:					
	show client detail client-mac-address					
	Information similar to the following appears:					
	Client MAC Address					
	QoS Level					
	• To troubleshoot issues with KTS-based CAC, enter the following command:					
	debug cac kts enable					
	• To troubleshoot other issues related to CAC, enter the following commands:					

• debug call-control all enable

Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition (NBAR) engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.

Note

You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.

AVC DSCP marks only the DSCP of the original packet in the controller in both directions (upstream and downstream). It does not affect the outer CAPWAP DCSP. AVC DSCP is applicable only when the application is classified. For example, based on the AVC profile configuration, if an application is classified as ftp or http, the corresponding DSCP marking is applied irrespective of the WLAN QoS. For downstream, the DSCP value of outer CAPWAP header and inner packet's DSCP are taken from AVC DSCP. WLAN QoS is only applicable for all traffic from controller to AP through CAPWAP. It does not change the DSCP of the original packet.

Using AVC rule, you can limit the bandwidth of a particular application for all the clients joined on the WLAN. These bandwidth contracts coexist with per-client downstream rate limiting with per client downstream rate limits that takes precedence over the per-application rate limits.

AVC is supported in central switching mode on the following controller platforms: Cisco 2504 WLCs, Cisco 5508 WLCs, Cisco Flex 7510 WLCs, Cisco 8510 WLCs, and Cisco Wireless Services Module 2 (WiSM2).

The number of concurrent flows supported for AVC classification on different controller platforms are noted in the following table.

Controller Platform	Flow
Cisco 2504 Wireless Controller	26,250
Cisco 5508 Wireless Controller	183,750
Cisco WiSM2	393,750
Cisco 8510 Wireless Controller	336,000
Cisco 5520 Wireless Controller	336,000
Cisco 8540 Wireless Controller	336,000

Application Visibility and Control Protocol Packs

Protocol packs are a means to distribute protocol updates outside the controller software release trains, and can be loaded on the controller without replacing the controller software.

The Application Visibility and Control Protocol Pack (AVC Protocol Pack) is a single compressed file that contains multiple Protocol Description Language (PDL) files and a manifest file. A set of required protocols can be loaded, which helps AVC to recognize additional protocols for classification on your network. The manifest file gives information about the protocol pack, such as the protocol pack name, version, and some information about the available PDLs in the protocol pack.

The AVC Protocol Packs are released to specific AVC engine versions. You can load a protocol pack if the engine version on the controller platform is the same or higher than the version required by the protocol pack.

AAA override for AVC profiles

The AAA attribute for client or user profile is configured on the AAA server using authentication from RADIUS server or Cisco ACS or ISE. The AAA attribute is processed during layer 2 or layer 3 authentication by the controller and the same is overridden by what is configured on the WLAN.

The AAA AVC profile is defined as a Cisco AV pair. The string option is defined as **avc-profile-name** and this value has to be configured for any AVC profile available in the controller.

This section contains the following subsections:

Restrictions for Application Visibility and Control

- IPv6 packet classification is not supported.
- Layer 2 roaming across controllers is not supported.
- Multicast traffic is not supported.
- Controller GUI support is not present for the AVC Protocol Pack feature.
- Downloading the AVC Protocol Pack is not supported on the Cisco 2504 WLCs.
- You can apply rate limiting to up to 3 applications.
- Each application can be configured with one rule only. An application cannot have both a rate limit and a Mark rule.
- If the standby controller has a different protocol pack version that is installed before pairing, then the
 active and standby controllers will have different protocol packs versions after pairing, in a HA
 environment. In the standby controller, the transferred protocol pack takes the preference over the default
 protocol pack.

For example, the controller with the software release 8.0 contains Protocol Pack version 9.0 by default. Before pairing, if one of the controllers has a Protocol Pack version 11.0 that is installed, then after pairing one controller contains Protocol Pack version 9.0 and the other controller contains Protocol Pack 11.0 installed.

Cisco 2504 WLC does not support AVC rate limiting.

Configuring Application Visibility and Control (GUI)

Procedure

Step 1 Create and configure an AVC profile by following these steps:

- a) Choose Wireless > Application Visibility and Control > AVC Profiles.
- b) Click New and enter the AVC profile name.
- c) Click Apply.
- d) On the AVC Profile Name page, click the AVC profile name to open the AVC Profile > Edit page.
- e) Click Add New Rule.
- f) Choose the application group and the application name from the respective drop-down lists.

See the list of default AVC applications available by choosing **Wireless** > **Application Visibility and Control** > **AVC Applications**.

- g) From the Action drop-down list, choose either of the following:
 - **Drop**—Drops the upstream and downstream packets that correspond to the chosen application.
 - Mark—Marks the upstream and downstream packets that correspond to the chosen application with the Differentiated Services Code Point (DSCP) value that you specify in the DSCP (0 to 63) drop-down list. The DSCP value helps you provide differentiated services based on the QoS levels.

Note The default action is to permit all applications.

h) If you choose Mark from the Action drop-down list, choose a DSCP value from the DSCP (0 to 63) drop-down list.

The DSCP value is a packet header code that is used to define quality of service across the Internet. The DSCP values are mapped to the following QoS levels:

- Platinum (Voice)—Assures a high QoS for Voice over Wireless.
- Gold (Video)—Supports the high-quality video applications.
- Silver (Best Effort)—Supports the normal bandwidth for clients.
- Bronze (Background)-Provides the lowest bandwidth for guest services.

You can also choose **Custom** and specify the DSCP value. The valid range is from 0 to 63.

- i) Click Apply.
- j) Click Save Configuration.

Step 2 Associate an AVC profile to a WLAN by following these steps:

- a) Choose WLANs and click the WLAN ID to open the WLANs > Edit page.
- b) In the QoS tab, choose the AVC profile from the AVC Profile drop-down list.
- c) Click Apply.
- d) Click Save Configuration.

Configuring Application Visibility and Control (CLI)

• Create or delete an AVC profile by entering this command:

config avc profile *avc-profile-name* {**create** | **delete**}

• Add a rule for an AVC profile by entering this command:

config avc profile *avc-profile-name* **rule add application** *application-name* {**drop** | **mark** *dscp-value* | **ratelimit** *Average Ratelimit value Burst Ratelimit value*}

• Remove a rule for an AVC profile by entering this command:

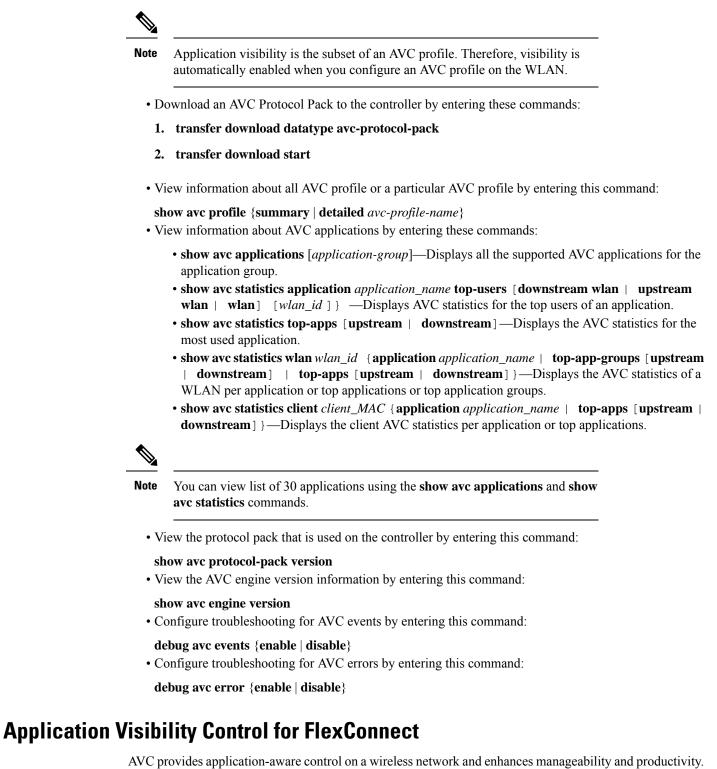

config avc profile avc-profile-name rule remove application application-name

• Configure an AVC profile to a WLAN by entering this command:

config wlan avc *wlan-id* profile *avc-profile-name* {enable | disable}

• Configure application visibility for a WLAN by entering this command:

config wlan avc *wlan-id* visibility {enable | disable}

AVC is already supported on ASR and ISR G2 and controller platforms. The support of AVC embedded

Wireless Quality of Service

within the FlexConnect AP extends as this is an end-to-end solution. This gives a complete visibility of applications in the network and allows the administrator to take some action on the application.

AVC has the following components:

- Next-generation Deep Packet Inspection (DPI) technology, called Network Based Application Recognition (NBAR2), allows for identification and classification of applications. NBAR is a deep-packet inspection technology available on Cisco IOS-based platforms, which supports stateful L4 to L7 classification. NBAR2 is based on NBAR and has extra requirements such as having a common flow table for all IOS features that use NBAR. NBAR2 recognizes application and passes this information to other features such as Quality of Service (QoS), and Access Control List (ACL), which can take action based on this classification.
- · Ability to Apply Mark using QoS, Drop and Rate-limit applications.

The important use cases for NBAR AVC are capacity planning, network usage base lining, and better understanding of the applications that are consuming bandwidth. Trending of application usage helps the network administrator to plan for network infrastructure upgrade, improve quality of experience by protecting important applications from bandwidth-hungry applications when there is congestion on the network, capability to prioritize or de-prioritize, and drop some application traffic.

Supported Hardware

- Supported Access Points-All Wave 2 and 802.11ax APs
- Supported Controllers—5508, Flex 7510, 8510, WiSM2, 5520, 8540, and vWLC
- Supported Modes-FlexConnect and Flex+Bridge mode

Restrictions for AVC for FlexConnect

- IPv6 packet classification is not supported.
- Multicast traffic is not supported.
- Downloading the AVC Protocol Pack is not supported on FlexConnect APs.
- You can apply rate limiting to up to 3 applications.
- Only one rule can be configured per application. An application cannot have both a rate limit as well as a Mark rule.
- A maximum of 31 rules can be configured in a profile. You can configure a maximum of 16 profiles in the complete system.
- AAA override of AVC profiles is not supported.
- FlexConnect AVC feature is not supported on Cisco 2504 WLC.
- By design, WLAN-level FlexConnect AVC stats are not supported.
- When the AP is in a FlexGroup and the FlexGroup does not have FlexConnect AVC configured, then FlexConnect AVC configuration is not pushed to the AP from the controller.
- Netflow Export from controller is not supported.
- In the stats, DHCP information is not supported on the controller.

- Foreign anchor scenario: AVC for FlexConnect statistics can be seen only on the foreign controller.
- FlexConnect Group AVC configuration:
 - WLAN AVC configuration is not inherited when the AP is part of FlexConnect group.
 - It is mandatory to configure AVC for FlexConnect on a FlexConnect Group if the AP is part of the FlexConnect group, if you want to push the AVC for FlexConnect configuration to the AP.
 - If a FlexConnect AP is not part of a FlexConnect group, local switching WLAN AVC configuration is pushed to the FlexConnect AP.

This section contains the following subsections:

Configuring Application Visibility and Control for FlexConnect (GUI)

Procedure

To create a FlexConnect AVC profile and add a rule:
a) Choose Wireless > Application Visibility and Control > FlexConnect AVC Profiles and click New.
b) Specify the FlexConnect profile name and click Apply .
c) Click the profile name and click Add New Rule.
d) Specify the Application Group, Application Name, and Action and click Apply.
To check the visibility globally for all WLANs on a FlexConnect Group, choose Monitor > Applications > FlexConnect Groups and select the FlexConnect group that you created earlier. This page provides more granular visibility per FlexConnect group and lists the top 10 applications in the last 90 seconds, as well as cumulative stats for the top 10 applications. You can view upstream and downstream statistics individually per FlexConnect group on the same page by clicking the Upstream and Downstream tabs.
You can set the number of applications that are displayed on this page through the Max Number of Records drop-down list. The default value is 10.
To specify more granular visibility of the top 10 applications per client on a locally switched WLAN where AVC visibility is enabled, choose Monitor > Applications > FlexConnect Groups , select the FlexConnect group name and click the Client tab. Then, click any individual client MAC address entry listed on the page. This page provides further granular statistics per client associated on locally switched WLANs where AVC visibility is enabled on the WLAN itself or on the FlexConnect Group, and lists the top 10 applications in last the 180 seconds as well as cumulative stats for top 10 applications. You can view upstream and downstream stats individually per-client from same page by clicking the Upstream and Downstream tab. You can set the number of applications that are displayed on this page through the Max Number of Records drop-down list. The default value is 10.

Configuration Example

Procedure

Step 1 Create an open WLAN.

I

	An open WLAN has Layer 2 security set to None .
Step 2	 Enable FlexConnect Local Switching on the WLAN and click Apply. a) On the WLANs page, click the WLAN ID. b) On the WLANs > Edit page, click the Advanced tab. c) In the FlexConnect area, select the FlexConnect Local Switching check box.
Step 3	Ensure that the APs connected to this WLAN are among the list of supported access points for this feature. Set the APs in FlexConnect mode.
	 a) Choose Wireless > Access Points > All APs. b) Click the AP name. c) From the AP Mode drop-down list, select FlexConnect and click Apply.
Step 4	 Create a FlexConnect group and add the AP to the FlexConnect group. a) Choose Wireless > FlexConnect Groups. b) Click New and enter the name of the FlexConnect group, and then click Apply. c) On the FlexConnect Groups > Edit page, in the FlexConnect APs area, click Add AP. d) You can either select an AP from a list of APs associated with the controller or directly specify the Ethernet MAC address of the AP that is associated with the controller. e) Click Add.
	NoteApplications that can be identified, classified, and controlled are listed under Wireless > Application Visibility and Control > FlexConnect AVC Applications. The access points support Protocol Pack version 8.0 and NBAR engine version 16.
Step 5	Create an AVC profile and add a rule.
	Note A FlexConnect AVC profile can have a maximum of 32 rules.
	 a) Choose Wireless > Application Visibility and Control > FlexConnect AVC Profiles and click New. b) Specify the FlexConnect profile name and click Apply. c) Click the profile name and click Add New Rule. d) Specify the Application Group, Application Name, and Action and click Apply.
Step 6	 Enable AVC on the FlexConnect group and apply the FlexConnect AVC profile to the FlexConnect group. a) Choose Wireless > FlexConnect Group and click the FlexConnect group name. b) Click the WLAN AVC Mapping tab. c) Specify the WLAN ID and from the Application Visibility drop-down list, choose Enable. d) From the Flex AVC Profile drop-down list, choose the FlexConnect AVC profile, and click Add. e) Click Apply.
Step 7	After Application Visibility is enabled on the FlexConnect Group, you can start different types of traffic (from the associated wireless client) using the applications (already installed) such as Cisco Jabber, Skype, Yahoo Messenger, HTTP, HTTPS/SSL, YouTube, Ping, Trace route. After traffic is initiated from the wireless client, visibility of different traffic can be observed on a per-FlexConnect Group and per-client basis. This provides a good overview to the administrator of the network bandwidth utilization and type of traffic in the network per-client and per-branch site.
Step 8	To check the visibility globally for all WLANs on a FlexConnect Group, choose Monitor > Applications > FlexConnect Groups and select the FlexConnect group that you created earlier. This page provides more granular visibility per FlexConnect group and lists the top 10 applications in the last 90 seconds, as well as cumulative stats for the top 10 applications. You can view upstream and downstream

statistics individually per FlexConnect group on the same page by clicking the **Upstream** and **Downstream** tabs.

You can set the number of applications that are displayed on this page through the **Max Number of Records** drop-down list. The default value is 10.

Step 9To specify more granular visibility of the top 10 applications per client on a locally switched WLAN where
AVC visibility is enabled, choose Monitor > Applications > FlexConnect Groups, select the FlexConnect
group name and click the Client tab. Then, click any individual client MAC address entry listed on the page.
This page provides further granular statistics per client associated on locally switched WLANs where AVC
visibility is enabled on the WLAN itself or on the FlexConnect Group, and lists the top 10 applications in last
the 180 seconds as well as cumulative stats for top 10 applications. You can view upstream and downstream
stats individually per-client from same page by clicking the Upstream and Downstream tab. You can set the
number of applications that are displayed on this page through the Max Number of Records drop-down list.
The default value is 10.

Step 10 Click **Clear AVC Stats** to clear all the AVC statistics for a particular client.

Configuring Application Visibility and Control for FlexConnect (CLI)

Procedure

- Configure a FlexConnect AVC profile by entering this command: config flexconnect avc profile *profile-name* {create | delete}
- Add a rule for a FlexConnect AVC profile by entering this command:
 config flexconnect avc profile *profile-name* rule add application *app-name* {drop | {mark *dscp-value* {upstream | downstream}}}
- Delete a rule for a FlexConnect AVC profile by entering this command: config flexconnect avc profile *profile-name* rule remove application *app-name*
- Apply rule changes to a FlexConnect AVC profile by entering this command: **config flexconnect avc profile** *profile-name* **apply**
- Apply FlexConnect group AVC profile to a WLAN by entering this command: config flexconnect group *group-name* avc *wlan-id* visibility wlan-specific
- See a summary of FlexConnect AVC profiles or detailed information about one FlexConnect AVC profile by entering this command:
 - show flexconnect avc profile summary
 - show flexconnect avc profile detailed profile-name

Note The FlexConnect AVC profile rules are pushed to the AP only when the rules are in 'Applied' state.

• Troubleshooting command:

debug flexconnect avc {event | error | detail} {enable | disable}

- Monitoring commands to be entered on the AP console:
- a) Check whether the FlexConnect AVC profiles are present on the AP by entering this command:

show policy-map

- b) See statistics for each application in the FlexConnect AVC profile by entering this command: **show policy-map target**
- c) Check the applications present in the FlexConnect AVC profiles by entering this command: **show class-map**
- d) See WLAN and FlexConnect AVC mapping on the AP by entering this command: show dot11 qos

Configuration Example

Before you begin

Ensure that you have created an open WLAN.

Step 1	Enable FlexConnect local switching on the WLAN:
	config wlan flexconnect local-switching wlan-id
Step 2	Ensure that the APs connected to this WLAN are among the list of supported access points for this feature. Set the APs in FlexConnect mode.
	config ap mode flexconnect submode none
Step 3	Create a FlexConnect group and add the AP to the FlexConnect group:
	 a) config flexconnect group group-name add b) config flexconnect group group-name ap add ap-mac-addr
Step 4	Create a FlexConnect AVC profile and add a rule:
	Note A FlexConnect AVC profile can have a maximum of 32 rules.
	 a) config flexconnect avc profile <i>profile-name</i> create b) config flexconnect avc profile <i>profile-name</i> rule add application <i>app-name</i> {drop mark}
Step 5	Enable AVC on the FlexConnect group and apply the FlexConnect AVC profile to the FlexConnect group.
-	a) config flexconnect group group-name avc wlan-id visibility enable
	b) config wlan avc <i>wlan-id</i> visibility enable
	c) config wlan avc wlan-id flex-profile profile-name enable
Step 6	Configure the FlexConnect group AVC to a WLAN in local switching mode.
	config flexconnect group group-name avc wlan-id visibility wlan-specific
Step 7	After Application Visibility is enabled on the FlexConnect Group, you can start different types of traffic (from the associated wireless client) using the applications (already installed) such as Cisco Jabber, Skype, Yahoo Messenger, HTTP, HTTPS/SSL, YouTube, Ping, Trace route.
	After traffic is initiated from the wireless client, visibility of different traffic can be observed on a per-FlexConnect Group and per-client basis. This provides a good overview to the administrator of the network bandwidth utilization and type of traffic in the network per-client and per-branch site.
Step 8	To check the visibility globally for all WLANs on a FlexConnect Group:
	show flexconnect avc statistics

Step 9	To see a summary of AVC for FlexConnect profiles or detailed information about one AVC for FlexConnect profile: • show flexconnect avc profile summary • show flexconnect avc profile detailed <i>profile-name</i>				
	Note The AVC profile rules are pushed to the AP only when the rules are in 'Applied' state.				
Step 10	To troubleshoot AVC for FlexConnect: debug flexconnect avc {event error detail} {enable disable}				
Step 11	 debug flexconnect avc {event error detail} {enable disable} Monitoring commands to be entered on the AP console: a) Check whether the FlexConnect AVC profiles are present on the AP by entering this command: show policy-map b) See statistics for each application in the FlexConnect AVC profile by entering this command: show policy-map target c) Check the applications present in the FlexConnect AVC profiles by entering this command: show class-map d) See WLAN and FlexConnect AVC mapping on the AP by entering this command: show dot11 qos 				

NetFlow

NetFlow is an embedded instrumentation within the controller software to characterize wireless network flows. NetFlow monitors each IP flow and exports the aggregated flow data to the external NetFlow collectors.

The NetFlow architecture consists of the following components:

- Collector: Entity that collects all the IP traffic information from various NetFlow exporters.
- Exporter: Network entity that exports the template with the IP traffic information. The controller acts as an exporter.

Note Controller does not support IPv6 address format when acting as an exporter for NetFlow.

Configuring NetFlow (GUI)

Procedure

Step 1

- Configure the Exporter by performing these steps:
 - a) Choose Wireless > Netflow > Exporter.
 - b) Click New.

c) Enter the Exporter name, IP address, and the port number.

The valid range for the port number is from 1 to 65535.

- d) Click Apply.
- e) Click Save Configuration.
- **Step 2** Configure the NetFlow Monitor by performing these steps:
 - a) Choose Wireless > Netflow > Monitor.
 - b) Click **New** and enter a Monitor name.
 - c) On the Monitor List window, click the Monitor name to open the **Netflow Monitor** > **Edit** window.
 - d) Choose the exporter name and the record name from the respective drop-down lists.
 - Client App Record—Better Performance
 - e) Click Apply.
 - f) Click Save Configuration.

Step 3 Associate a NetFlow Monitor to a WLAN by performing these steps:

- a) Choose WLANs and click a WLAN ID to open the WLANs > Edit page.
- b) In the QoS tab, choose a NetFlow monitor from the Netflow Monitor drop-down list.
- c) Click Apply.
- d) Click Save Configuration.

Configuring NetFlow (CLI)

• Create an Exporter by entering this command:

config flow create exporter *exporter-name ip-addr port-number*

• Create a NetFlow Monitor by entering this command:

config flow create monitor monitor-name

• Associate or dissociate a NetFlow monitor with an exporter by entering this command:

config flow {add | delete} monitor monitor-name exporter exporter-name

• Associate or dissociate a NetFlow monitor with a record by entering this command:

 $config flow \ \{add \ | \ delete\} \ monitor \ monitor \ name \ record \ ipv4_client_app_flow_record \ ipv4_client_app_flow_re$

• Associate or dissociate a NetFlow monitor with a WLAN by entering this command:

config wlan flow *wlan-id* monitor *monitor-name* {enable | disable}

View a summary of NetFlow monitors by entering this command:

show flow monitor summary

• View information about the Exporter by entering this command:

show flow exporter {summary | statistics}

• Configure NetFlow debug by entering this command:

debug flow {detail | error | info} {enable | disable}

QoS Profiles

Cisco UWN solution WLANs support four levels of QoS: Platinum/Voice, Gold/Video, Silver/Best Effort (default), and Bronze/Background. You can configure the voice traffic WLAN to use Platinum QoS, assign the low-bandwidth WLAN to use Bronze QoS, and assign all other traffic between the remaining QoS levels.

The WLAN QoS level defines a specific 802.11e user priority (UP) for over-the-air traffic. This UP is used to derive the over-the-wire priorities for non-WMM traffic, and it also acts as the ceiling when managing WMM traffic with various levels of priorities.

The wireless rate limits can be defined on both upstream and downstream traffic. Rate limits can be defined per SSID and/or specified as a maximum rate limit for all clients. These rate limits can be individually configured.

The access point uses this QoS-profile-specific UP in accordance with the values in the following table to derive the IP DSCP value that is visible on the wired LAN.

AVVID Traffic Type	AVVID IP DSCP	QoS Profile	AVVID 802.1p	IEEE 802.11e UP
Network control	56 (CS7)	Platinum	7	7
Inter-network control (CAPWAP control, 802.11 management)	48 (CS6)	Platinum	6	7
Voice	46 (EF)	Platinum	5	6
Interactive video	34 (AF41)	Gold	4	5
Mission critical	26 (AF31)	Gold	3	4
Transactional	18 (AF21)	Silver	2	3
Bulk data	10 (AF11)	Bronze	1	2
Best effort	0 (BE)	Silver	0	0
Scavenger	2	Bronze	0	1

Table 1: Access Point QoS Translation Values

Note The IEEE 802.11e UP value for DSCP values that are not mentioned in the table is calculated by considering 3 most significant bits of DSCP.

For example, the IEEE 802.11e UP value for DSCP 32 (100 000 in binary), would be the decimal equivalent of the MSB (100) which is 4. The 802.11e UP value of DSCP 32 is 4.

This section contains the following subsections:

Configuring QoS Profiles (GUI)

Procedure

Step 1	Disable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles.						
	To disable the radio networks, choose Wireless > 802.11a/n/ac or 802.11b/g/n > Network , unselect the 802.11a (or 802.11b/g) Network Status check box, and click Apply .						
Step 2	Choose Wireless > QoS > Profiles to open the QoS Profiles page.						
Step 3	Click the name of the profile that you want to configure to open the Edit QoS Profile page.						
Step 4	Change the description of the profile by modifying the contents of the Description text box.						
Step 5	Define the data rates on a per-user basis as follows:						
	 Define the average data rate for TCP traffic per user by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect Define the peak data rate for TCP traffic per user by entering the rate in Kbps in the Burst Data Rate te boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect. 						
	Note The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic to and from the wireless client.	•					
	Ensure that you configure the average data rate before you configure the burst data rate.						
	Define the average real-time rate for UDP traffic per user by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile w take effect.	rill					
	Note Average Data Rate is used to measure TCP traffic while Average Real-time rate is used for UDP traffic. They are measured in kbps for all the entries. The values for Average Data Ra and Average Real-time rate can be different because they are applied to different upper lay protocols such as TCP and UDP. These different values for the rates do not impact the bandwidth.	ate					
	Define the peak real-time rate for UDP traffic per user by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.						
	Note The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise the QoS policy may block traffic to and from the wireless client.	se,					
Step 6	Define the data rates on a per-SSID basis as follows:						
•	Define the average data rate TCP traffic per SSID by entering the rate in Kbps in the Average Data Ra	ite					
	ext boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.						
	Note The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic in the WLANs.	•					
Step 6	 Note The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise the QoS policy may block traffic to and from the wireless client. Define the data rates on a per-SSID basis as follows: Define the average data rate TCP traffic per SSID by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect. Define the peak data rate for TCP traffic per SSID by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect. Define the peak data rate for TCP traffic per SSID by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect. Mote The burst data rate should be greater than or equal to the average data rate. Otherwise, the 	se					

c) Define the average real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

- d) Define the peak real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - **Note** The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic in the WLANs.
- **Step 7** Define the maximum and default QoS levels for unicast and multicast traffic when you assign a QoS profile to a WLAN.
 - a) From the Maximum Priority drop-down list, choose the maximum QoS priority for any data frames transmitted by the AP to any station in the WLAN.

For example, a QoS profile named 'gold' targeted for video applications has the maximum priority set to video by default.

- b) From the Unicast Default Priority drop-down list, choose the QoS priority for unicast data frames transmitted by the AP to non-WMM stations in the WLAN
- c) From the Multicast Default Priority drop-down list, choose the QoS priority for multicast data frames transmitted by the AP to stations in the WLAN,

Note The default unicast priority cannot be used for non-WMM clients in a mixed WLAN.

Step 8 Choose **802.1p** from the Protocol Type drop-down list and enter the maximum priority value in the 802.1p Tag text box to define the maximum value (0–7) for the priority tag associated with packets that fall within the profile.

The tagged packets include CAPWAP data packets (between access points and the controller) and packets sent toward the core network.

Note If a QoS profile has 802.1p tagging configured and if this QoS profile is assigned to a WLAN that uses an untagged interface on the controller, the client traffic will be blocked.

- Step 9 Click Apply.
- Step 10 Click Save Configuration.
- **Step 11** Reenable the 802.11 networks.

To enable the radio networks, choose **Wireless > 802.11a/n/ac** or **802.11b/g/n > Network**, select the **802.11a** (or **802.11b/g) Network Status** check box, and click **Apply**.

- Step 12 Choose WLANs and select a WLAN ID to apply the new QoS profile to it.
- **Step 13** In the WLAN > Edit page, go to the QoS tab and select the QoS Profile type from the Quality of Service drop-down list. The QoS profile will add the rate limit values configured on the controller on per WLAN, per radio and per AP basis.

For example, if upstream rate limit of 5Mbps is configured for a QoS profile of type silver, then every WLAN that has silver profile will limit traffic to 5Mbps (5Mbps for each wlan) on each radio and on each AP where the WLAN is applicable.

- Step 14 Click Apply.
- Step 15 Click Save Configuration.

Configuring QoS Profiles (CLI)

Procedure

Step 1	Disable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles by entering these commands:					
	config 802	config 802.11{a b} disable network				
Step 2	Change th	e profile description by entering this command:				
	config qo	s description {bronze silver gold platinum } description				
Step 3	Define the	e average data rate for TCP traffic per user or per SSID by entering this command:				
	config qos average-data-rate {bronze silver gold platinum} {per-ssid per-client} {downstream upstream} <i>rate</i>					
	Note	For the <i>rate</i> parameter, you can enter a value between 0 and 512,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS profile.				
Step 4	Define the	e peak data rate for TCP traffic per user or per SSID by entering this command:				
	config qos burst-data-rate {bronze silver gold platinum} {per-ssid per-client} {downstream upstream} <i>rate</i>					
Step 5	Define the average real-time data rate for UDP traffic per user or per SSID by entering this command:					
	config qo upstrear	s average-realtime-rate {bronze silver gold platinum} {per-ssid per-client} {downstream n} rate				
Step 6	Define the peak real-time data rate for UDP traffic per user or per SSID by entering this command:					
	config qo upstream	s burst-realtime-rate {bronze silver gold platinum} {per-ssid per-client} {downstream } rate				
Step 7		e maximum and default QoS levels for unicast and multicast traffic when you assign a QoS profile N by entering this command:				
		s priority {bronze gold platinum silver} maximum-priority default-unicast-priority ulticast-priority				
		se from the following options for the <i>maximum-priority</i> , <i>default-unicast-priority</i> , and <i>ulticast-priority</i> parameters:				
	• beste	ffort				
	• back	ground				
	• video					
	• voice					
Step 8		e maximum value (0–7) for the priority tag associated with packets that fall within the profile, by hese commands:				
	oo nfi a ao	a musto col tama (huonna ailman aalid mlatimum) datta				

config qos protocol-type {bronze | silver | gold | platinum} dot1p

config qos dot1p-tag {bronze | silver | gold | platinum} tag

The tagged packets include CAPWAP data packets (between access points and the controller) and packets sent toward the core network.

- NoteThe 802.1p tagging has impact only on wired packets. Wireless packets are impacted only by the
maximum priority level set for a QoS profile.NoteIf a QoS profile has 802.1p tagging configured and if this QoS profile is assigned to a WLAN
that uses an untagged interface on the controller, the client traffic will be blocked.
- **Step 9** Reenable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles by entering these commands:

config 802.11{a | b} enable network

Assigning a QoS Profile to a WLAN (GUI)

Before you begin

If you have not already done so, configure one or more QoS profiles using the instructions in the Configuring QoS Profiles (GUI) section.

Step	1	Choose	WLANs	to open t	he WLAN	s page.
------	---	--------	-------	-----------	---------	---------

- Step 2 Click the ID number of the WLAN to which you want to assign a QoS profile.
- **Step 3** When the WLANs > Edit page appears, choose the QoS tab.
- **Step 4** From the **Quality of Service (QoS)** drop-down list, choose one of the following:
 - Platinum (voice)
 - Gold (video)
 - Silver (best effort)
 - Bronze (background)
 - **Note** Silver (best effort) is the default value.
- **Step 5** To define the data rates on a per-user basis, do the following:
 - a) Define the average data rate TCP traffic per SSID by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - b) Define the peak data rate for TCP traffic per SSID by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Step 10Apply the new QoS profile to a WLAN, by entering these commands:
config wlan qos wlan-id {bronze | silver | gold | platinum}

- **Note** The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic in the WLANs.
- c) Define the average real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
- d) Define the peak real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - **Note** The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic in the WLANs.
- **Step 6** To define the data rates on a per-SSID basis, do the following:
 - a) Define the average data rate for TCP traffic per user by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - b) Define the peak data rate for TCP traffic per user by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - **Note** The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Ensure that you configure the average data rate before you configure the burst data rate.

- c) Define the average real-time rate for UDP traffic per user by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - **Note** Average Data Rate is used to measure TCP traffic while Average Real-time rate is used for UDP traffic. They are measured in kbps for all the entries. The values for Average Data Rate and Average Real-time rate can be different because they are applied to different upper layer protocols such as TCP and UDP. These different values for the rates do not impact the bandwidth.
- d) Define the peak real-time rate for UDP traffic per user by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
 - **Note** The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Step 7 Save the configuration.

Assigning a QoS Profile to a WLAN (CLI)

If you have not already done so, configure one or more QoS profiles using the instructions in the Configuring QoS Profiles (CLI) section.

Procedure

Step 1 Assign a QoS profile to a WLAN by entering this command:

config wlan qos *wlan_id* {bronze | silver | gold | platinum}

Silver is the default value.

Step 2 To override QoS profile rate limit parameters, enter this command:

config wlan override-rate-limit *wlan-id* {average-data-rate | average-realtime-rate | burst-data-rate | burst-data-rate | burst-realtime-rate} {per-ssid | per-client} {downstream | upstream} *rate*

- **Step 3** Enter the save config command.
- **Step 4** Verify that you have properly assigned the QoS profile to the WLAN by entering this command:

show wlan wlan_id

Information similar to the following appears:

WLAN Identifier Profile Name	
Network Name (SSID)	test
Status	Enabled
MAC Filtering	Disabled
Broadcast SSID	Enabled
AAA Policy Override	Disabled
Number of Active Clients	0
Exclusionlist	Disabled
Session Timeout	0
Interface	management
WLAN ACL	unconfigured
DHCP Server	1.100.163.24
DHCP Address Assignment Required	Disabled
Quality of Service	Silver (best effort)
WMM	Disabled
