CleanAir

Cisco CleanAir is a spectrum intelligence solution designed to proactively manage the challenges of a shared wireless spectrum. It allows you to see all of the users of the shared spectrum (both native devices and foreign interferers). It also enables you or your network to act upon this information. For example, you could manually remove the interfering device, or the system could automatically change the channel away from the interference. CleanAir provides spectrum management and RF visibility.

A Cisco CleanAir system consists of CleanAir-enabled access points, Cisco Wireless LAN Controllers, and Cisco Prime Infrastructure. These access points collect information about all devices that operate in the industrial, scientific, and medical (ISM) bands, identify and evaluate the information as a potential interference source, and forward it to the Cisco WLC. The Cisco WLC controls the access points, collects spectrum data, and forwards information to Cisco Prime Infrastructure or a Cisco mobility services engine (MSE) upon request.

For every device operating in the unlicensed band, Cisco CleanAir tells you what it is, where it is, how it is impacting your wireless network, and what actions you or your network should take. It simplifies RF so that you do not have to be an RF expert.

Wireless LAN systems operate in unlicensed 2.4- and 5-GHz ISM bands. Many devices, such as microwave ovens, cordless phones, and Bluetooth devices also operate in these bands and can negatively affect Wi-Fi operations.

Some of the most advanced WLAN services, such as voice over wireless and IEEE 802.11n radio communications, could be significantly impaired by the interference caused by other legal users of the ISM bands. The integration of Cisco CleanAir functionality into the Cisco Unified Wireless Network addresses this problem of radio frequency (RF) interference.

CleanAir is supported on mesh AP backhaul at a 5-GHz radio of mesh. You can enable CleanAir on backhaul radios and can provide report interference details and air quality.
Role of the Cisco Wireless LAN Controller in a Cisco CleanAir System

The Cisco WLC performs the following tasks in a Cisco CleanAir system:

- Configures Cisco CleanAir capabilities on the access point.
- Provides interfaces (GUI, CLI, and SNMP) for configuring Cisco CleanAir features and retrieving data.
- Displays spectrum data.
- Collects and processes air quality reports from the access point and stores them in the air quality database. The Air Quality Report (AQR) contains information about the total interference from all identified sources represented by the Air Quality Index (AQI) and summary for the most severe interference categories. The CleanAir system can also include unclassified interference information under per interference type reports, which enables you to take action in cases where the interference due to unclassified interfering devices is more.
- Collects and processes interference device reports (IDRs) from the access point and stores them in the interference device database.
- Forwards spectrum data to Prime Infrastructure and the MSE.

Interference Types that Cisco CleanAir Can Detect

Cisco CleanAir can detect interference, report on the location and severity of the interference, and recommend different mitigation strategies. Two such mitigation strategies are persistent device avoidance and spectrum event-driven RRM.

Wi-Fi chip-based RF management systems share these characteristics:

- Any RF energy that cannot be identified as a Wi-Fi signal is reported as noise.
- Noise measurements that are used to assign a channel plan tend to be averaged over a period of time to avoid instability or rapid changes that can be disruptive to certain client devices.
- Averaging measurements reduces the resolution of the measurement. As such, a signal that disrupts clients might not look like it needs to be mitigated after averaging.
- All RF management systems available today are reactive in nature.

Cisco CleanAir is different and can positively identify not only the source of the noise but also its location and potential impact to a WLAN. Having this information allows you to consider the noise within the context of the network and make intelligent and, where possible, proactive decisions. For CleanAir, two types of interference events are common:

- Persistent interference
- Spontaneous interference

Persistent interference events are created by devices that are stationary in nature and have intermittent but largely repeatable patterns of interference. For example, consider the case of a microwave oven located in a break room. Such a device might be active for only 1 or 2 minutes at a time. When operating, however, it can be disruptive to the performance of the wireless network and associated clients. Using Cisco CleanAir, you
can positively identify the device as a microwave oven rather than indiscriminate noise. You can also determine exactly which part of the band is affected by the device, and because you can locate it, you can understand which access points are most severely affected. You can then use this information to direct RRM in selecting a channel plan that avoids this source of interference for the access points within its range. Because this interference is not active for a large portion of the day, existing RF management applications might attempt to again change the channels of the affected access points. Persistent device avoidance is unique, however, in that it remains in effect as long as the source of interference is periodically detected to refresh the persistent status. The Cisco CleanAir system knows that the microwave oven exists and includes it in all future planning. If you move either the microwave oven or the surrounding access points, the algorithm updates RRM automatically.

---

**Note**

Spectrum event-driven RRM can be triggered only by Cisco CleanAir-enabled access points in local mode.

Spontaneous interference is interference that appears suddenly on a network, perhaps jamming a channel or a range of channels completely. The Cisco CleanAir spectrum event-driven RRM feature allows you to set a threshold for air quality (AQ) that, if exceeded, triggers an immediate channel change for the affected access point. Most RF management systems can avoid interference, but this information takes time to propagate through the system. Cisco CleanAir relies on AQ measurements to continuously evaluate the spectrum and can trigger a move within 30 seconds. For example, if an access point detects interference from a video camera, it can recover by changing channels within 30 seconds of the camera becoming active. Cisco CleanAir also identifies and locates the source of interference so that more permanent mitigation of the device can be performed at a later time.

In the case of Bluetooth devices, Cisco CleanAir-enabled access points can detect and report interferences only if the devices are actively transmitting. Bluetooth devices have extensive power save modes. For example, interference can be detected when data or voice is being streamed between the connected devices.

**Persistent Devices**

Some interference devices such as outdoor bridges and Microwave Ovens only transmit when needed. These devices can cause significant interference to the local WLAN due to short duration and periodic operation remain largely undetected by normal RF management metrics. With CleanAir the RRM DCA algorithm can detect, measure, register and remember the impact and adjust the DCA algorithm. This minimizes the use of channels affected by the persistent devices in the channel plan local to the interference source. Cisco CleanAir detects and stores the persistent device information in the Cisco WLC and this information is used to mitigate interfering channels.

**Persistent Devices Detection**

CleanAir-capable Monitor Mode access point collects information about persistent devices on all configured channels and stores the information in the Cisco WLC. Local/Bridge mode AP detects interference devices on the serving channels only.

**Persistent Devices Propagation**

Persistent device information that is detected by local or monitor mode access points is propagated to the neighboring access points connected to the same Cisco WLC to provide better chance of handling and avoiding persistent devices. Persistent device detected by the CleanAir-enabled access point is propagated to neighboring non-CleanAir access points, thus enhancing channel selection quality.
Detecting Interferers by an Access Point

When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed which results in the spectrum sensor to temporarily stop detecting the device. This device is then correctly marked as down. A down device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific devices are reported, the cluster ID is kept alive for an extended period of time to prevent possible device detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device detection history is preserved.

For example, some bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs longer and they are remerged into a single record upon detection. This process smoothenes the user records and accurately represents the device history.

Prerequisites for CleanAir

You can configure Cisco CleanAir only on CleanAir-enabled access points. Only Cisco CleanAir-enabled access points using the following access point modes can perform Cisco CleanAir spectrum monitoring:

- **Local**—In this mode, each Cisco CleanAir-enabled access point radio provides air quality and interference detection reports for the current operating channel only.

- **FlexConnect**—When a FlexConnect access point is connected to the controller, its Cisco CleanAir functionality is identical to local mode.

- **Monitor**—When Cisco CleanAir is enabled in monitor mode, the access point provides air quality and interference detection reports for all monitored channels.

The following options are available:

- **All**—All channels

- **DCA**—Channel selection governed by the DCA list

- **Country**—All channels are legal within a regulatory domain

---

**Note**

Suppose you have two APs, one in the FlexConnect mode and the other in the monitor mode. Also suppose that you have created a profile enabling EAP attack against 802.1x auth. The Airmagnet (AM) tool, which can generate different types of attacks, fails to generate any attack even if you have provided valid AP MAC and STA MAC addresses. But if the AP MAC and STA MAC addresses in the AM tool are swapped, that is, the AP MAC address is specified in the STA MAC field and the STA MAC address is specified in the AP MAC field, then the tool is able to generate attacks, which the AP in the Monitor mode is also able to detect.
The access point does not participate in AQ HeatMap in Prime Infrastructure.

Note

• SE-Connect—This mode enables a user to connect a Spectrum Expert application running on an external Microsoft Windows XP or Vista PC to a Cisco CleanAir-enabled access point in order to display and analyze detailed spectrum data. The Spectrum Expert application connects directly to the access point, bypassing the controller. An access point in SE-Connect mode does not provide any Wi-Fi, RF, or spectrum data to the controller. All CleanAir system functionality is suspended while the AP is in this mode, and no clients are served. This mode is intended for remote troubleshooting only. Up to three active Spectrum Expert connections are possible.

Restrictions for CleanAir

• Access points in monitor mode do not transmit Wi-Fi traffic or 802.11 packets. They are excluded from radio resource management (RRM) planning and are not included in the neighbor access point list. IDR clustering depends on the controller’s ability to detect neighboring in-network access points. Correlating interference device detections from multiple access points is limited between monitor-mode access points.

• Spectrum Expert (SE) Connect functionality is supported for local, FlexConnect, bridge, and monitor modes. The access point provides spectrum information to Spectrum Expert only for the current channel(s). For local, FlexConnect, and bridge modes, the spectrum data is available for the current active channel(s) and for the monitor mode, the common monitored channel list is available. The access point continues to send AQ (Air Quality) and IDR (Interference Device Reports) reports to the controller and perform normal activities according to the current mode. Sniffer and rogue detections access point modes are incompatible with all types of CleanAir spectrum monitoring.

• Monitor Mode access point in slot 2 operates at 2.4 GHz only.

• We recommend a ratio of 1 monitor-mode access point for every 5 local-mode access points; this can vary based on the network design and expert guidance for best coverage.

• Spectrum Expert (Windows XP laptop client) and AP should be pingable, otherwise; it will not work.

• CleanAir is not supported wherein the channel width is 160 MHz.

Configuring Cisco CleanAir on the Controller

Configuring Cisco CleanAir on Cisco WLC (GUI)

Procedure

Step 1  Choose Wireless > 802.11a/n/ac/ax or 802.11b/g/n/ax > CleanAir to open the 802.11a (or 802.11b) > CleanAir page.

Step 2  Check the CleanAir check box to enable Cisco CleanAir functionality on the 802.11a/n or 802.11b/g/n network, or uncheck it to prevent the Cisco WLC from detecting spectrum interference. By default, this feature is in enabled state.
Step 3  Check the **Report Interferers** check box to enable the Cisco CleanAir system to report any detected sources of interference, or uncheck it to prevent the Cisco WLC from reporting interferers. By default, this feature is in enabled state.

**Note**  Device Security alarms, Event Driven RRM, and the Persistence Device Avoidance algorithm do not work if Report Interferers are disabled.

Step 4  Check the **Persistent Device Propagation** check box to enable propagation of information about persistent devices that can be detected by CleanAir. Persistent device propagation enables you to propagate information about persistent devices to the neighboring APs connected to the same Cisco WLC. Persistent interferers are present at the location and interfere with the WLAN operations even if they are not detectable at all times.

Step 5  Ensure that any sources of interference that need to be detected and reported by the Cisco CleanAir system appear in the **Interferences to Detect** box and any that do not need to be detected appear in the **Interferences to Ignore** box. By default, all interference sources are detected, except BLE Beacon. The possible sources of interference that you can choose are as follows:

- **Bluetooth Paging Inquiry**—A Bluetooth discovery (802.11b/g/n only)
- **Bluetooth Sco Acl**—A Bluetooth link (802.11b/g/n only)
- **Generic DECT**—A digital enhanced cordless communication (DECT)-compatible phone
- **Generic TDD**—A time division duplex (TDD) transmitter
- **Generic Waveform**—A continuous transmitter
- **Jammer**—A jamming device
- **Microwave**—A microwave oven (802.11b/g/n only)
- **Canopy**—A canopy bridge device
- **Spectrum 802.11 FH**—An 802.11 frequency-hopping device (802.11b/g/n only)
- **Spectrum 802.11 inverted**—A device using spectrally inverted Wi-Fi signals
- **Spectrum 802.11 non std channel**—A device using nonstandard Wi-Fi channels
- **Spectrum 802.11 SuperG**—An 802.11 SuperAG device
- **Spectrum 802.15.4**—An 802.15.4 device (802.11b/g/n only)
- **Video Camera**—An analog video camera
- **WiMAX Fixed**—A WiMAX fixed device (802.11a/n/ac only)
- **WiMAX Mobile**—A WiMAX mobile device (802.11a/n/ac only)
- **XBox**—A Microsoft Xbox (802.11b/g/n only)

**Note**  APs that are associated to the Cisco WLC send interference reports only for the interferers that appear in the **Interferences to Detect** box. This functionality allows you to filter out interferers that you do not want as well as any that may be flooding the network and causing performance problems for the Cisco WLC or Prime Infrastructure. Filtering allows the system to resume normal performance levels.

Prior to Release 8.7, if CleanAir was enabled, by default, the BLE Beacon was included in the list of interferences to be detected. In 8.7 and later releases, the functionality is changed wherein the BLE Beacon is by default excluded from the list of interferences to be detected. This change in functionality is made to eliminate unwanted off-channel scans to improve performance. If you want the BLE Beacon to be detected, you will have to explicitly add it to the list of interferences to be detected.

Step 6  Configure Cisco CleanAir alarms as follows:

a) Check the **Enable AQI (Air Quality Index) Trap** check box to enable the triggering of air quality alarms, or uncheck the box to disable this feature. By default, this feature is in enabled state.
b) If you checked the Enable AQI Trap check box in Step a, enter a value between 1 and 100 (inclusive) in the AQI Alarm Threshold field to specify the threshold at which you want the air quality alarm to be triggered. When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.

c) Enter the AQI Alarm Threshold (1 to 100) that you want to set. An alarm is generated when the air quality reaches a threshold value. The default is 35. Valid range is from 1 and 100.

d) Check the Enable trap for Unclassified Interferences check box to enable the AQI alarm to be generated upon detection of unclassified interference beyond the severity threshold specified in the AQI Alarm Threshold field. Unclassified interferences are interferences that are detected but do not correspond to any of the identifiable interference types.

e) Enter the Threshold for Unclassified category trap (1 to 99). Enter a value from 1 and 99. The default is 20. This is the severity index threshold for an unclassified interference category.

f) Check the Enable Interference Type Trap check box to trigger interferer alarms when the Cisco WLC detects specified device types, or uncheck it to disable this feature. By default, this feature is in enabled state.

g) Ensure that any sources of interference that need to trigger interferer alarms appear in the Trap on These Types box and any that do not need to trigger interferer alarms appear in the Do Not Trap on These Types box. By default, all interference sources trigger interferer alarms.

For example, if you want the Cisco WLC to send an alarm when it detects a jamming device, check the Enable Interference Type Trap check box and move the jamming device to the Trap on These Types box.

**Step 7**
Click Apply.

**Step 8**
Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled AP detects a significant level of interference as follows:

a) Look at the EDRRM field to see the current status of spectrum event-driven RRM and, if enabled, the Sensitivity Threshold field to see the threshold level at which event-driven RRM is invoked.

b) If you want to change the current status of event-driven RRM or the sensitivity level, click Change Settings. The 802.11a (or 802.11b) > RRM > Dynamic Channel Assignment (DCA) page is displayed.

c) Check the EDRRM check box to trigger RRM to run when an AP detects a certain level of interference, or uncheck it to disable this feature. By default, this feature is in enabled state.

d) If you checked the EDRRM check box in Step c, choose Low, Medium, High, or Custom from the Sensitivity Threshold drop-down list to specify the threshold at which you want RRM to be triggered. When the interference for the AP rises above the threshold level, RRM initiates a local dynamic channel assignment (DCA) run and changes the channel of the affected AP radio if possible to improve network performance. Low represents a decreased sensitivity to changes in the environment while High represents an increased sensitivity.

If you selected the EDRRM sensitivity threshold as custom, you must set a threshold value in the Custom Sensitivity Threshold field. The default sensitivity is 35.

The EDRRM AQ threshold value for low sensitivity is 35, medium sensitivity is 50, and high sensitivity is 60.

e) To configure rogue duty cycle, check the Rogue Contribution check box and then specify the Rogue Duty-Cycle in terms of percentage. The default value of Rogue Duty-Cycle is 80%.

f) Save the configuration.
Configuring Cisco CleanAir on Cisco WLC (CLI)

Procedure

Step 1  Configure Cisco CleanAir functionality on the 802.11 network by entering this command:

```
config {802.11a | 802.11b} cleanair {enable | disable} all
```

If you disable this feature, the Cisco WLC does not receive any spectrum data. By default, this feature is in enabled state.

Step 2  Enable CleanAir on all associated access points in a network:

```
config {802.11a | 802.11b} cleanair enable network
```

You can enable CleanAir on a 5-GHz radio of mesh access points.

Step 3  Configure interference detection and specify sources of interference that need to be detected by the Cisco CleanAir system by entering this command:

```
config {802.11a | 802.11b} cleanair device {enable | disable} type
```

where you choose the type as one of the following:

- **802.11-fh**—An 802.11 frequency-hopping device (802.11b/g/n only)
- **802.11-inv**—A device using spectrally inverted Wi-Fi signals
- **802.11-nonstd**—A device using nonstandard Wi-Fi channels
- **802.15.4**—An 802.15.4 device (802.11b/g/n only)
- **all**—All interference device types (this is the default value)
- **bt-discovery**—A Bluetooth discovery (802.11b/g/n only)
- **bt-link**—A Bluetooth link (802.11b/g/n only)
- **canopy**—A Canopy device
- **cont-tx**—A continuous transmitter
- **dect-like**—A digital enhanced cordless communication (DECT)-compatible phone
- **jammer**—A jamming device
- **mw-oven**—A microwave oven (802.11b/g/n only)
- **superag**—An 802.11 SuperAG device
- **tdd-tx**—A time division duplex (TDD) transmitter
- **video camera**—An analog video camera
- **wimax-fixed**—A WiMAX fixed device
- **wimax-mobile**—A WiMAX mobile device
- **xbox**—A Microsoft Xbox (802.11b/g/n only)
Note: Access points that are associated to the Cisco WLC send interference reports only for the interference types specified in this command. This functionality allows you to filter out interferers that may be flooding the network and causing performance problems for the Cisco WLC or Prime Infrastructure. Filtering allows the system to resume normal performance levels.

Prior to Release 8.7, if CleanAir was enabled, by default, the BLE Beacon was included in the list of interferences to be detected. In 8.7 and later releases, the functionality is changed wherein the BLE Beacon is by default excluded from the list of interferences to be detected. This change in functionality is made to eliminate unwanted off-channel scans to improve performance. If you want the BLE Beacon to be detected, you will have to explicitly add it to the list of interferences to be detected.

Step 4 Configure the triggering of air quality alarms by entering this command:
```
config {802.11a | 802.11b} cleanair alarm air-quality {enable | disable}
```
The default value is enabled.

Step 5 Specify the threshold at which you want the air quality alarm to be triggered by entering this command:
```
config {802.11a | 802.11b} cleanair alarm air-quality threshold threshold
```
where `threshold` is a value between 1 and 100 (inclusive). When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.

Step 6 Enable the triggering of interferer alarms by entering this command:
```
config {802.11a | 802.11b} cleanair alarm device {enable | disable}
```
The default value is enable.

Step 7 Specify sources of interference that trigger alarms by entering this command:
```
config {802.11a | 802.11b} cleanair alarm device type {enable | disable}
```
where you choose the `type` as one of the following:
- `802.11-fh`—An 802.11 frequency-hopping device (802.11b/g/n only)
- `802.11-inv`—A device using spectrally inverted Wi-Fi signals
- `802.11-nonsd`—A device using nonstandard Wi-Fi channels
- `802.15.4`—An 802.15.4 device (802.11b/g/n only)
- `all`—All interference device types (this is the default value)
- `bt-discovery`—A Bluetooth discovery (802.11b/g/n only)
- `bt-link`—A Bluetooth link (802.11b/g/n only)
- `canopy`—A canopy device
- `cont-tx`—A continuous transmitter
- `dect-like`—A digital enhanced cordless communication (DECT)-compatible phone
- `jammer`—A jamming device
- `mw-oven`—A microwave oven (802.11b/g/n only)
Wireless Quality of Service

_cfguring Cisco CleanAir on Cisco WLC (CLI)_

- **superg**—An 802.11 SuperAG device
- **tdd-tx**—A time division duplex (TDD) transmitter
- **video camera**—An analog video camera
- **wimax-fixed**—A WiMAX fixed device
- **wimax-mobile**—A WiMAX mobile device
- **xbox**—A Microsoft Xbox (802.11b/g/n only)

**Step 8**
Configure the triggering of air quality alarms for unclassified devices by entering this command:

```
config {802.11a | 802.11b} cleanair alarm unclassified {enable | disable}
```

**Step 9**
Specify the threshold at which you want the air quality alarm to be triggered for unclassified devices by entering this command:

```
config {802.11a | 802.11b} cleanair alarm unclassified threshold threshold
```

where `threshold` is a value from 1 and 99 (inclusive). When the air quality falls below the threshold level, the alarm is triggered. A value of 1 represents the worst air quality, and 100 represents the best. The default value is 35.

**Step 10**
Trigger spectrum event-driven radio resource management (RRM) to run when a Cisco CleanAir-enabled access point detects a significant level of interference by entering these commands:

```
config advanced {802.11a | 802.11b} channel cleanair-event {enable | disable}
config advanced {802.11a | 802.11b} channel cleanair-event sensitivity {low | medium | high | custom}—Enables or disables spectrum event-driven RRM. The default value is disabled.
config advanced {802.11a | 802.11b} channel cleanair-event sensitivity threshold thresholdvalue—If you set the threshold sensitivity as custom, you must set a custom threshold value. The default is 35.
```

**Step 11**
Configure and monitor Interference Awareness by entering the following commands:

- `config advanced {802.11a | 802.11b} channel cleanair-event {enable | disable}
- `config advanced {802.11a | 802.11b} channel cleanair-event rogue-contribution {enable | disable}
- `config advanced {802.11a | 802.11b} channel cleanair-event rogue-contribution duty-cycle value
- `show {802.11a | 802.11b} cleanair config
- `debug airewave-director profile enable
- `debug airewave-director channel enable

**Step 12**
Enable persistent devices propagation by entering this command:

```
config advanced {802.11a | 802.11b} channel pda-prop {enable | disable}
```

**Step 13**
Save your changes by entering this command:

```
save config
```
Step 14
See the Cisco CleanAir configuration for the 802.11a/n or 802.11b/g/n network by entering this command:

```
show {802.11a | 802.11b} cleanair config
```

Information similar to the following appears:

```
(Cisco Controller) >show 802.11a cleanair config

```
Configuring Cisco CleanAir on an Access Point

Configuring Cisco CleanAir on an Access Point (GUI)

Procedure

Step 1  Choose Wireless > Access Points > Radios > 802.11a/n/ac/ax or 802.11b/g/n/ax to open the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page.

Step 2  Hover your cursor over the blue drop-down arrow for the desired access point and click Configure. The 802.11a/n/ac/ax (or 802.11b/g/n/ax) Cisco APs > Configure page appears.

The CleanAir Capable field shows whether this access point can support CleanAir functionality. If it can, go to the next step to enable or disable CleanAir for this access point. If the access point cannot support CleanAir functionality, you cannot enable CleanAir for this access point.

Note  By default, the Cisco CleanAir functionality is enabled on the radios.

Step 3  Enable Cisco CleanAir functionality for this access point by choosing Enable from the CleanAir Status drop-down list. To disable CleanAir functionality for this access point, choose Disable. The default value is Enable. This setting overrides the global CleanAir configuration for this access point.

The Number of Spectrum Expert Connections text box shows the number of Spectrum Expert applications that are currently connected to the access point radio. Up to three active connections are possible.

Step 4  Click Apply.

Step 5  Click Save Configuration.

Step 6  Click Back to return to the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page.

Step 7  View the Cisco CleanAir status for each access point radio by looking at the CleanAir Status text box on the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page.

The Cisco CleanAir status is one of the following:

- **UP**—The spectrum sensor for the access point radio is currently operational (error code 0).
- **DOWN**—The spectrum sensor for the access point radio is currently not operational because an error has occurred. The most likely reason for the error is that the access point radio is disabled (error code 8). To correct this error, enable the radio.
- **ERROR**—The spectrum sensor for the access point radio has crashed (error code 128), making CleanAir monitoring nonoperational for this radio. If this error occurs, reboot the access point. If the error continues to appear, you might want to disable Cisco CleanAir functionality on the radio.
- **N/A**—This access point radio is not capable of supporting Cisco CleanAir functionality.
Note: You can create a filter to make the 802.11a/n/ac/ax Radios page or the 802.11b/g/n/ac Radios page show only access point radios that have a specific Cisco CleanAir status (such as UP, DOWN, ERROR, or N/A). This feature is especially useful if your list of access point radios spans multiple pages, preventing you from viewing them all at once. To create a filter, click Change Filter to open the Search AP dialog box, select one or more of the CleanAir Status check boxes, and click Find. Only the access point radios that match your search criteria appear on the 802.11a/n/ac/ax Radios page or the 802.11b/g/n/ac Radios page, and the Current Filter parameter at the top of the page specifies the filter used to generate the list (for example, CleanAir Status: UP).

### Configuring Cisco CleanAir on an Access Point (CLI)

#### Procedure

**Step 1** Configure Cisco CleanAir functionality for a specific access point by entering this command:

```
config {802.11a | 802.11b} cleanair {enable | disable} Cisco_AP
```

**Step 2** Save your changes by entering this command:

```
save config
```

**Step 3** See the Cisco CleanAir configuration for a specific access point on the 802.11a/n/ac/ac or 802.11b/g/n/ac network by entering this command:

```
show ap config {802.11a | 802.11b} Cisco_AP
```

Information similar to the following appears:

```
Cisco AP Identifier.............................. 0
Cisco AP Name.................................... CISCO_AP3500
...
Spectrum Management Information
  Spectrum Management Capable.............. Yes
  Spectrum Management Admin State........... Enabled
  Spectrum Management Operation State..... Up
  Rapid Update Mode........................... Disabled
  Spectrum Expert connection............... Disabled
  Spectrum Sensor State...................... Configured (Error code = 0)
```

### Configuring Spectrum Intelligence

#### Information About Spectrum Intelligence

This feature scans for non-Wi-Fi radio interference on 2.4 and 5 GHz bands. The feature supports client serving mode and monitor mode.
Restrictions on Spectrum Intelligence

- Only the following Cisco APs support Spectrum Intelligence:
  - Cisco Aironet 1800 APs
  - Cisco Aironet 1810 APs
  - Cisco Aironet 1815 APs
  - Cisco Aironet 1832 APs
  - Cisco Aironet 1852 APs
  - Cisco Aironet 1542 APs

- No mitigation of interferer.
- Limited to detect three types of devices.
  - Microwave
  - Continuous wave—video recorder, baby monitor
  - SI-FHSS—BlueTooth, Frequency hopping DECT phones
- Cannot differentiate between devices of the same type.
- Does not report to the CleanAir Infrastructure - it is only reported in the WLC.
- When the AP is in Local Mode, it reports the first interference detected.
- When in Monitor Mode, it reports all three types of interference if present.
- Does not provide location as only RSSI is measured at the reporting APs.
- Does not alert through Cisco Prime Infrastructure.
- Does not send information to CMX or MSE (as CleanAir does).
- It cannot provide location of interfering device.

Configuring Spectrum Intelligence – Global (GUI)

**Procedure**

**Step 1** Choose **Wireless > 802.11a > CleanAir** to open the CleanAir page.

**Step 2** Check **Spectrum Intelligence** to enable the Spectrum Intelligence feature.

This enables Spectrum Intelligence feature on all the APs which support Spectrum Intelligence.

**Step 3** Click **Apply**.

**Step 4** To view the APs supporting Spectrum Intelligence, choose **Wireless > Access Points > Radios > 802.11a/b** to open the **802.11a/b Radio** page.
The names of the APs that are spectrum intelligence capable have $ as a suffix.

## Configuring Spectrum Intelligence per AP (GUI)

### Procedure

**Step 1** Choose **Wireless > Access Points > Radios > 802.11a/b** to open the 802.11a/b radio page.

**Step 2** The names of the APs that are spectrum intelligence capable have $ as a suffix. Hover your cursor over the blue drop-down arrow in front of the AP name with the $ sign. Click **Configure**.

The Cisco APs > Configure page is displayed.

**Step 3** Under the **Spectrum Intelligence** section, from the **Spectrum Intelligence Admin Status** drop-down list, choose **Enable** or **Disable** option.

**Step 4** Click **Apply**.

## Configuring Spectrum Intelligence (CLI)

### Procedure

- Configure spectrum intelligence globally on all spectrum intelligence capable APs or on an individual AP by entering this command:
  
  ```
  config {802.11a | 802.11b} SI {enable | disable} network | ap-name
  ```

- View the global admin status by entering this command:
  
  ```
  show {802.11a | 802.11b} SI config
  ```

- View interferences by AP by entering this command:
  
  ```
  show {802.11a | 802.11b} SI device ap ap-name
  ```

- View interferences by interferer type by entering this command:
  
  ```
  show {802.11a | 802.11b} SI device-type interferer_type_name
  ```

## Monitoring Interference Devices

### Prerequisites for Monitoring the Interference Devices

You can configure Cisco CleanAir only on CleanAir-enabled access points.
Monitoring the Interference Device (GUI)

Procedure

**Step 1** Choose Monitor > Cisco CleanAir > 802.11a/n or 802.11b/g/n > Interference Devices to open the CleanAir > Interference Devices page.

This page shows the following information:

- **AP Name**—The name of the access point where the interference device is detected.
- **Radio Slot #**—Slot where the radio is installed.
- **Interferer Type**—Type of the interferer.
- **Affected Channel**—Channel that the device affects.
- **Detected Time**—Time at which the interference was detected.
- **Severity**—Severity index of the interfering device.
- **Duty Cycle (%)**—Proportion of time during which the interfering device was active.
- **RSSI**—Receive signal strength indicator (RSSI) of the access point.
- **DevID**—Device identification number that uniquely identified the interfering device.
- **ClusterID**—Cluster identification number that uniquely identifies the type of the devices.

**Step 2** Click *Change Filter* to display the information about interference devices based on a particular criteria.

**Step 3** Click *Clear Filter* to remove the filter and display the entire access point list.

You can create a filter to display the list of interference devices that are based on the following filtering parameters:

- **Cluster ID**—To filter based on the Cluster ID, select the check box and enter the Cluster ID in the text box next to this field.
- **AP Name**—To filter based on the access point name, select the check box and enter the access point name in the text box next to this field.
- **Interferer Type**—To filter based on the type of the interference device, select the check box and select the interferer device from the options.

Select one of the interferer devices:

- **BT Link**
- **MW Oven**
- **802.11 FH**
- **BT Discovery**
- **TDD Transmit**
- **Jammer**
- **Continuous TX**
Monitoring the Interference Device (CLI)

Detecting Interferers by an Access Point

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show {802.11a \ 802.11b} cleanair device ap Cisco_AP</td>
<td>When a CleanAir-enabled access point detects interference devices, detections of the same device from multiple sensors are merged together to create clusters. Each cluster is given a unique ID. Some devices conserve power by limiting the transmit time until actually needed which results in the spectrum sensor to temporarily stop detecting the device. This</td>
</tr>
</tbody>
</table>
A down device is correctly removed from the spectrum database. In cases when all the interferer detections for a specific device are reported, the cluster ID is kept alive for an extended period of time to prevent possible device detection bouncing. If the same device is detected again, it is merged with the original cluster ID and the device detection history is preserved.

For example, some Bluetooth headsets operate on battery power. These devices employ methods to reduce power consumption, such as turning off the transmitter when not actually needed. Such devices can appear to come and go from the classification. To manage these devices, CleanAir keeps the cluster IDs longer and they are remerged into a single record upon detection. This process smoothenes the user records and accurately represents the device history.

### Detecting Interferers by Device Type

#### Procedure

### Detecting Persistent Sources of Interference

**Purpose**

- **msft-xbox** — A Microsoft Xbox device

**Note**

No more than 25 interferers can be detected by a Cisco AP.

---

### Monitoring Persistent Devices (GUI)

**Procedure**

Choose **Wireless > Access Points > Radios > 802.11a/n/ac/ax or 802.11b/g/n/ax** to open the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page. Hover your cursor over the blue drop-down arrow for the desired access point and click **Detail**. The 802.11a/n/ac/ax (or 802.11b/g/n/ax) AP Interfaces > Detail page is displayed.

This page displays the details of the access points along with the list of persistent devices detected by this access point. Details of the persistent devices is displayed under the Persistent Devices section.

The following information for each persistent device is available:

- **Class Type** — The class type of the persistent device.
- **Channel** — Channel this device is affecting.
- **DC(%)** — Duty cycle (in percentage) of the persistent device.
- **RSSI(dBm)** — RSSI indicator of the persistent device.
- **Last Seen Time** — Timestamp when the device was last active.
# Monitoring Persistent Devices (CLI)

## Procedure

<table>
<thead>

```

The following information for each persistent device is available:

- **Class Type**—The class type of the persistent device.
- **Channel**—Channel this device is affecting.
**Monitoring the Air Quality of Radio Bands**

This section describes how to monitor the air quality of the 802.11a/n/ac/ax and 802.11b/g/n/ax radio bands using both the Cisco WLC GUI and CLI.

**Monitoring the Air Quality of Radio Bands (GUI)**

**Procedure**

Choose **Monitor > Cisco CleanAir > 802.11a/n/ac/ax or 802.11b/g/n/ax > Air Quality Report** to open the **CleanAir > Air Quality Report** page.

This page shows the air quality of both the 802.11a/n/ac/ax and 802.11b/g/n/ax radio bands. Specifically, it shows the following information:

- **AP Name**—The name of the access point that reported the worst air quality for the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band.
- **Radio Slot**—The slot number where the radio is installed.
- **Channel**—The radio channel where the air quality is monitored.
- **Minimum AQ**—The minimum air quality for this radio channel.
- **Average AQ**—The average air quality for this radio channel.
- **Interferer**—The number of interferers detected by the radios on the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band.
- **DFS**—Dynamic Frequency Selection. This indicates if DFS is enabled or not.

**Monitoring the Air Quality of Radio Bands (CLI)**

**Viewing a Summary of the Air Quality**

**Procedure**

See a summary of the air quality for the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band by entering this command:
show \{802.11\text{a} | 802.11\text{b}\} cleanair air-quality summary

---

**Viewing Air Quality for all Access Points on a Radio Band**

**Procedure**

See information for the 802.11a/n/ac/ax or 802.11b/g/n/ax access point with the air quality by entering this command:

show \{802.11\text{a} | 802.11\text{b}\} cleanair air-quality

---

**Viewing Air Quality for an Access Point on a Radio Band (CLI)**

**Procedure**

See air quality information for a specific access point on the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band by entering this command:

show \{802.11\text{a} | 802.11\text{b}\} cleanair air-quality *Cisco_AP*

---

**Monitoring the Worst Air Quality of Radio Bands (GUI)**

**Procedure**

**Step 1** Choose **Monitor > Cisco CleanAir > Worst Air-Quality** to open the **CleanAir > Worst Air Quality Report** page.

This page shows the air quality of both the 802.11a/n/ac/ax and 802.11b/g/n/ax radio bands. Specifically, it shows the following information:

- **AP Name**—The name of the access point that reported the worst air quality for the 802.11 radio band.
- **Channel Number**—The radio channel with the worst reported air quality.
- **Minimum Air Quality Index (1 to 100)**—The minimum air quality for this radio channel. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
- **Average Air Quality Index (1 to 100)**—The average air quality for this radio channel. An air quality index (AQI) value of 100 is the best, and 1 is the worst.
- **Interference Device Count**—The number of interferers detected by the radios on the 802.11 radio band.

**Step 2** See a list of persistent sources of interference for a specific access point radio as follows:

a) **Choose Wireless > Access Points > Radios > 802.11a/n/ac/ax or 802.11b/g/n/ax** to open the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page.
b) Hover your cursor over the blue drop-down arrow for the desired access point radio and click **CleanAir-RRM**. The 802.11a/n/ac/ax (or 802.11b/g/n/ax) Cisco APs > Access Point Name > Persistent Devices page appears. This page lists the device types of persistent sources of interference detected by this access point radio. It also shows the channel on which the interference was detected, the percentage of time that the interferer was active (duty cycle), the received signal strength (RSSI) of the interferer, and the day and time when the interferer was last detected.

---

**Monitoring the Worst Air Quality of Radio Bands (CLI)**

This section describes the commands that you can use to monitor the air quality of the 802.11 radio band.

**Viewing a Summary of the Air Quality (CLI)**

See a summary of the air quality for the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band by entering this command:

```
show {802.11a | 802.11b} cleanair air-quality summary
```

**Viewing the Worst Air Quality Information for all Access Points on a Radio Band (CLI)**

See information for the 802.11a/n/ac/ax or 802.11b/g/n/ax access point with the worst air quality by entering this command:

```
show {802.11a | 802.11b} cleanair air-quality worst
```

**Viewing the Air Quality for an Access Point on a Radio Band (CLI)**

See the air quality information for a specific access point on the 802.11 radio band by entering this command:

```
show {802.11a | 802.11b} cleanair air-quality Cisco_AP
```

**Viewing the Air Quality for an Access Point by Device Type (CLI)**

- See information for all of the interferers detected by a specific access point on the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band by entering this command:

  ```
  show {802.11a | 802.11b} cleanair device ap Cisco_AP
  ```

- See information for all of the interferers of a specific device type on the 802.11a/n or 802.11b/g/n radio band by entering this command:

  ```
  show {802.11a | 802.11b} cleanair device type
  ```

  where you choose **type** as one of the following:

  - **802.11a**
    - **802.11-inv**—A device using spectrally inverted Wi-Fi signals
    - **802.11-nonstd**—A device using nonstandard Wi-Fi channels
    - **canopy**—A canopy bridge device
    - **cont-tx**—A continuous transmitter
    - **dect-like**—A digital enhanced cordless communication (DECT)-compatible phone
    - **jammer**—A jamming device
    - **superag**—An 802.11 SuperAG device
• **tdd-tx**—A time division duplex (TDD) transmitter
• **video**—A video device
• **wimax-fixed**—A WiMAX fixed device
• **wimax-mobile**—A WiMAX mobile device

• **802.11b**
  • **bt-link**—A bluetooth link device
  • **bt-discovery**—A bluetooth discovery device
  • **ble-beacon**—A BLE beacon device
  • **mw-oven**—A microwave oven device
  • **802.11-fh**—An 802.11 frequency-hopping device
  • **802.15.4**—An 802.15.4 device
  • **tdd-tx**—A time division duplex (TDD) transmitter
  • **jammer**—A jamming device
  • **cont-tx**—A continuous transmitter
  • **dect-like**—A digital enhanced cordless communication (DECT)-compatible phone
  • **video**—A video device
  • **802.11-inv**—A device using spectrally inverted Wi-Fi signals
  • **802.11-nonstd**—A device using nonstandard Wi-Fi channels
  • **superag**—An 802.11 SuperAG device
  • **canopy**—A canopy bridge device
  • **wimax-mobile**—A WiMAX mobile device
  • **wimax-fixed**—A WiMAX fixed device
  • **msft-xbox**—A Microsoft Xbox device

---

### Detecting Persistent Sources of Interference (CLI)

See a list of persistent sources of interference for a specific access point on the 802.11a/n/ac/ax or 802.11b/g/n/ax radio band by entering this command:

```
show ap auto-rf {802.11a | 802.11b} Cisco_AP
```

### Media and EDCA

This section contains the following subsections:
Aggressive Load Balancing

Enabling aggressive load balancing on the controller allows lightweight access points to load balance wireless clients across access points. You can enable aggressive load balancing using the controller.

---

**Note**

Clients are load balanced between access points on the same controller. Load balancing does not occur between access points on different controllers.

When a wireless client attempts to associate to a lightweight access point, association response packets are sent to the client with an 802.11 response packet including status code 17. The code 17 indicates that the AP is busy. The AP does not respond with an association response bearing 'success' if the AP threshold is not met, and with code 17 (AP busy) if the AP utilization threshold is exceeded, and another less busy AP heard the client request.

For example, if the number of clients on AP1 is more than the number of clients on AP2 plus the load-balancing window, then AP1 is considered to be busier than AP2. When a client attempts to associate to AP1, it receives an 802.11 response packet with status code 17, indicating that the access point is busy, and the client attempts to associate to a different access point.

You can configure the controller to deny client associations up to 10 times (if a client attempted to associate 11 times, it would be allowed to associate on the 11th try). You can also enable or disable load balancing on a particular WLAN, which is useful if you want to disable load balancing for a select group of clients (such as time-sensitive voice clients).

---

**Note**

Voice Client does not authenticate when delay is configured more than 300 ms. To avoid this configure a Central-Auth, Local Switching WLAN with CCKM, configure a Pagent Router between AP and WLC with a delay of 600 ms (300 ms UP and 300 ms DOWN and try associating the voice client.

Passive scanning clients will be able to associate to an AP irrespective of whether load balancing is enabled or not.

---

**Note**

With the 7.4 release, FlexConnect access points do support client load balancing.

You can configure the controller to analyze the WAN interface utilization of neighboring APs and then load balance the clients across the lightly loaded APs. You can configure this by defining a load balancing threshold. By defining the threshold, you can measure the WAN interface utilization percentage. For example, a threshold value of 50 triggers the load balancing upon detecting utilization of 50% or more on an AP-WAN interface.
For a FlexConnect AP the association is locally handled. The load-balancing decisions are taken at the Cisco WLC. A FlexConnect AP initially responds to the client before knowing the result of calculations at the Cisco WLC. Load-balancing doesn't take effect when the FlexConnect AP is in standalone mode.

FlexConnect AP does not send (re)association response with status 17 for Load-Balancing as Local mode APs do; instead, it first sends (re)association with status 0 (success) and then deauth with reason 5.

This section contains the following subsections:

**Configuring Aggressive Load Balancing (GUI)**

**Procedure**

**Step 1** Choose Wireless > Advanced > Load Balancing to open the Load Balancing page.

**Step 2** In the Client Window Size text box, enter a value between 1 and 20.

The window size becomes part of the algorithm that determines whether an access point is too heavily loaded to accept more client associations:

\[
\text{load-balancing window + client associations on AP with the lightest load} = \text{load-balancing threshold}
\]

In the group of access points accessible to a client device, each access point has a different number of client associations. The access point with the lowest number of clients has the lightest load. The client window size plus the number of clients on the access point with the lightest load forms the threshold. Access points with more client associations than this threshold is considered busy, and clients can associate only to access points with client counts lower than the threshold.

**Step 3** In the Maximum Denial Count text box, enter a value between 0 and 10.

The denial count sets the maximum number of association denials during load balancing.

**Step 4** Click Apply.

**Step 5** Click Save Configuration.

**Step 6** To enable or disable aggressive load balancing on specific WLANs, do the following:

a) Choose WLANs > WLAN ID. The WLANs > Edit page appears.

b) In the Advanced tab, select or unselect the Client Load Balancing check box.

c) Click Apply.

d) Click Save Configuration.

**Configuring Aggressive Load Balancing (CLI)**

**Procedure**

**Step 1** Set the client window for aggressive load balancing by entering this command:

```
config load-balancing window client_count
```
You can enter a value between 0 and 20 for the \textit{client\_count} parameter.

Step 2 Set the denial count for load balancing by entering this command:
\texttt{config load-balancing denial denial\_count}

You can enter a value between 1 and 10 for the \textit{denial\_count} parameter.

Step 3 Save your changes by entering this command:
\texttt{save config}

Step 4 Enable or disable aggressive load balancing on specific WLANs by entering this command:
\texttt{config wlan load-balance allow \{enable | disable\} wlan\_ID}

You can enter a value between 1 and 512 for \textit{wlan\_ID} parameter.

Step 5 Verify your settings by entering this command:
\texttt{show load-balancing}

Step 6 Save your changes by entering this command:
\texttt{save config}

Step 7 Configure the load balance mode on a WLAN by entering this command:
\texttt{config wlan load-balance mode \{client-count | uplink-usage\} wlan-id}

This feature requires the AP to upload its uplink usage statistics to the controller periodically. Check these statistics by entering this command:
\texttt{show ap stats system cisco-AP}

---

**Media Session and Snooping**

**Media Session Snooping and Reporting**

This feature enables access points to detect the establishment, termination, and failure of Session Initiation Protocol (SIP) voice calls and then report them to the controller and Cisco Prime Infrastructure. You can enable or disable Voice over IP (VoIP) snooping and reporting for each WLAN.

When you enable VoIP Media Session Aware (MSA) snooping, the access point radios that advertise this WLAN look for SIP voice packets that comply with SIP RFC 3261. They do not look for non-RFC 3261-compliant SIP voice packets or Skinny Call Control Protocol (SCCP) voice packets. Any SIP packets destined to or originating from port number 5060 (the standard SIP signaling port) are considered for further inspection. The access points track when Wi-Fi Multimedia (WMM) and non-WMM clients are establishing a call, are already on an active call, or are in the process of ending a call. Upstream packet classification for both client types occurs at the access point. Downstream packet classification occurs at the controller for WMM clients and at the access point for non-WMM clients. The access points notify the controller and Cisco Prime Infrastructure of any major call events, such as call establishment, termination, and failure.

The controller provides detailed information for VoIP MSA calls. For failed calls, the controller generates a trap log with a timestamp and the reason for failure (in the GUI) and an error code (in the CLI) to aid in troubleshooting. For successful calls, the controller shows the number and duration of calls for usage tracking purposes. Cisco Prime Infrastructure displays failed VoIP call information in the Events page.
This section contains the following subsections:

**Restrictions for Media Session Snooping and Reporting**

Controller software release 6.0 or later releases support Voice over IP (VoIP) Media Session Aware (MSA) snooping and reporting.

**Configuring Media Session Snooping (GUI)**

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose WLANs to open the WLANs page.</td>
</tr>
<tr>
<td>2</td>
<td>Click the ID number of the WLAN for which you want to configure media session snooping.</td>
</tr>
<tr>
<td>3</td>
<td>On the WLANs &gt; Edit page, click the Advanced tab.</td>
</tr>
<tr>
<td>4</td>
<td>Under Voice, select the Media Session Snooping check box to enable media session snooping or unselect it to disable this feature. The default value is unselected.</td>
</tr>
<tr>
<td>5</td>
<td>Click Apply.</td>
</tr>
<tr>
<td>6</td>
<td>Click Save Configuration.</td>
</tr>
</tbody>
</table>
| 7    | See the VoIP statistics for your access point radios as follows:  
  a) Choose Monitor > Access Points > Radios > 802.11a/n/ac/ax or 802.11b/g/n/ax to open the 802.11a/n/ac/ax (or 802.11b/g/n/ax) Radios page.  
  b) Scroll to the right and click the Detail link for the access point for which you want to view VoIP statistics. The Radio > Statistics page appears.  
    The VoIP Stats section shows the cumulative number and length of voice calls for this access point radio. Entries are added automatically when voice calls are successfully placed and deleted when the access point disassociates from the controller. |
| 8    | Choose Management > SNMP > Trap Logs to see the traps generated for failed calls. The Trap Logs page appears.  
For example, log 0 in the figure shows that a call failed. The log provides the date and time of the call, a description of the failure, and the reason why the failure occurred. |

**Configuring Media Session Snooping (CLI)**

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 1    | Enable or disable VoIP snooping for a particular WLAN by entering this command:  
  `config wlan call-snoop {enable | disable} wlan_id` |
| 2    | Save your changes by entering this command:  
  `save config` |
| 3    | See the status of media session snooping on a particular WLAN by entering this command:  
  `show wlan call-snoop wlan_id` |
show wlan wlan_id

Information similar to the following appears:

WLAN Identifier................................. 1
Profile Name........................................ wpa2-psk
Network Name (SSID)............................. wpa2-psk
Status............................................. Enabled

... FlexConnect Local Switching.................. Disabled
      FlexConnect Learn IP Address................. Enabled
      Infrastructure MFP protection................. Enabled (Global Infrastructure MFP Disabled)
Client MFP........................................ Optional
      TKip MIC Countermeasure Hold-down Timer...... 60
Call Snooping..................................... Enabled

Step 4
See the call information for an MSA client when media session snooping is enabled and the call is active by entering this command:

show call-control client callInfo client_MAC_address

Information similar to the following appears:

Uplink IP/port.................................... 192.11.1.71 / 23870
Downlink IP/port................................. 192.12.1.47 / 2070
UP.................................................. 6
Calling Party..................................... sip:1054
Called Party...................................... sip:1000
Call ID............................................ 58635b00-850161b7-14853-1501a8
Number of calls for given client is............ 1

Step 5
See the metrics for successful calls or the traps generated for failed calls by entering this command:

show call-control ap \{802.11a | 802.11b\} Cisco_AP \{metrics | traps\}

Information similar to the following appears when you enter show call-control ap \{802.11a | 802.11b\} Cisco_AP metrics:

Total Call Duration in Seconds.................. 120
Number of Calls.................................. 10

Information similar to the following appears when you enter show call-control ap \{802.11a | 802.11b\} Cisco_AP traps:

Number of traps sent in one min.............. 2
Last SIP error code............................. 404
Last sent trap timestamp...................... Jun 20 10:05:06

To aid in troubleshooting, the output of this command shows an error code for any failed calls. This table explains the possible error codes for failed calls.

Table 1: Error Codes for Failed VoIP Calls

</tbody>
</table>

**Note** If you experience any problems with media session snooping, enter the `debug call-control {all | event} {enable | disable}` command to debug all media session snooping messages or events.
The QoS Enhanced Basis Service Set (QBSS) information element (IE) enables the access points to communicate their channel usage to wireless devices. Because access points with high channel usage might not be able to handle real-time traffic effectively, the 7921 or 7920 phone uses the QBSS value to determine if they should associate to another access point. You can enable QBSS in these two modes:

- Wi-Fi Multimedia (WMM) mode, which supports devices that meet the 802.11E QBSS standard (such as Cisco 7921 IP Phones)
- 7920 support mode, which supports Cisco 7920 IP Phones on your 802.11b/g network

The 7920 support mode has two options:

- Support for 7920 phones that require call admission control (CAC) to be configured on and advertised by the client device (these are typically older 7920 phones)
- Support for 7920 phones that require CAC to be configured on and advertised by the access point (these are typically newer 7920 phones)

When access point-controlled CAC is enabled, the access point sends out a Cisco proprietary CAC Information Element (IE) and does not send out the standard QBSS IE.

This section contains the following subsections:

### Prerequisites for Using QoS Enhanced BSS on Cisco 7921 and 7920 Wireless IP Phones

Follow these guidelines to use Cisco 7921 and 7920 Wireless IP Phones with controllers:

- Aggressive load balancing must be disabled for each controller. Otherwise, the initial roam attempt by the phone may fail, causing a disruption in the audio path.

- The Dynamic Transmit Power Control (DTPC) information element (IE) must be enabled using the `config 802.11b dtpc enable` command. The DTPC IE is a beacon and probe information element that allows the access point to broadcast information on its transmit power. The 7921 or 7920 phone uses this information to automatically adjust its transmit power to the same level as the access point to which it is associated. In this manner, both devices are transmitting at the same level.

- Both the 7921 and 7920 phones and the controllers support Cisco Centralized Key Management (CCKM) fast roaming.

- When configuring WEP, there is a difference in nomenclature for the controller and the 7921 or 7920 phone. Configure the controller for 104 bits when using 128-bit WEP for the 7921 or 7920.

- For standalone 7921 phones, load-based CAC must be enabled, and the WMM Policy must be set to Required on the WLAN.

- The controller supports traffic classification (TCLAS) coming from 7921 phones using firmware version 1.1.1. This feature ensures proper classification of voice streams to the 7921 phones.

- When using a 7921 phone with the 802.11a radio of a 1242 series access point, set the 24-Mbps data rate to Supported and choose a lower Mandatory data rate (such as 12 Mbps). Otherwise, the phone might experience poor voice quality.
Restrictions for QoS Enhanced BSS

• QBSS is disabled by default.

• 7920 phones are non-WMM phones with limited CAC functionality. The phones look at the channel utilization of the access point to which they are associated and compare that to a threshold that is beaconed by the access point. If the channel utilization is less than the threshold, the 7920 places a call. In contrast, 7921 phones are full-fledged WMM phones that use traffic specifications (TSPECs) to gain access to the voice queue before placing a phone call. The 7921 phones work well with load-based CAC, which uses the percentage of the channel set aside for voice and tries to limit the calls accordingly.

Because 7921 phones support WMM and 7920 phones do not, capacity and voice quality problems can arise if you do not properly configure both phones when they are used in a mixed environment. To enable both 7921 and 7920 phones to co-exist on the same network, make sure that load-based CAC and 7920 AP CAC are both enabled on the controller and the WMM Policy is set to Allowed. These settings become particularly important if you have many more 7920 users than 7921 users.

• We recommend that aggressive load balancing always be turned off either through the controller GUI or CLI in any wireless network that is supporting voice, regardless of vendor. When aggressive load balancing is turned on, voice clients can hear an audible artifact when roaming, if the handset is refused at its first reassociation attempt.

Configuring QBSS (GUI)

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose WLANs to open the WLANs page.</td>
</tr>
<tr>
<td>2</td>
<td>Click the ID number of the WLAN for which you want to configure WMM mode.</td>
</tr>
<tr>
<td>3</td>
<td>When the WLANs &gt; Edit page appears, choose the QoS tab to open the WLANs &gt; Edit (Qos) page.</td>
</tr>
<tr>
<td>4</td>
<td>From the WMM Policy drop-down list, choose one of the following options, depending on whether you want to enable WMM mode for 7921 phones and other devices that meet the WMM standard:</td>
</tr>
<tr>
<td></td>
<td>• Disabled—Disables WMM on the WLAN. This is the default value.</td>
</tr>
<tr>
<td></td>
<td>• Allowed—Allows client devices to use WMM on the WLAN.</td>
</tr>
<tr>
<td></td>
<td>• Required—Requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.</td>
</tr>
<tr>
<td>5</td>
<td>Select the 7920 AP CAC check box if you want to enable 7920 support mode for phones that require access point-controlled CAC. The default value is unselected.</td>
</tr>
<tr>
<td>6</td>
<td>Select the 7920 Client CAC check box if you want to enable 7920 support mode for phones that require client-controlled CAC. The default value is unselected.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> You cannot enable both WMM mode and client-controlled CAC mode on the same WLAN.</td>
</tr>
<tr>
<td>7</td>
<td>Click Apply to commit your changes.</td>
</tr>
<tr>
<td>8</td>
<td>Click Save Configuration to save your changes.</td>
</tr>
</tbody>
</table>
Configuring QBSS (CLI)

**Procedure**

**Step 1**  
Determine the ID number of the WLAN to which you want to add QBSS support by entering this command:

```bash
show wlan summary
```

**Step 2**  
Disable the WLAN by entering this command:

```bash
config wlan disable wlan_id
```

**Step 3**  
Configure WMM mode for 7921 phones and other devices that meet the WMM standard by entering this command:

```bash
config wlan wmm {disabled | allowed | required} wlan_id
```

where

- `disabled` disables WMM mode on the WLAN.
- `allowed` allows client devices to use WMM on the WLAN.
- `required` requires client devices to use WMM. Devices that do not support WMM cannot join the WLAN.

**Step 4**  
Enable or disable 7920 support mode for phones that require client-controlled CAC by entering this command:

```bash
config wlan 7920-support client-cac-limit {enable | disable} wlan_id
```

**Note**  
You cannot enable both WMM mode and client-controlled CAC mode on the same WLAN.

**Step 5**  
Enable or disable 7920 support mode for phones that require access point-controlled CAC by entering this command:

```bash
config wlan 7920-support ap-cac-limit {enable | disable} wlan_id
```

**Step 6**  
Reenable the WLAN by entering this command:

```bash
config wlan enable wlan_id
```

**Step 7**  
Save your changes by entering this command:

```bash
save config
```

**Step 8**  
Verify that the WLAN is enabled and the Dot11-Phone Mode (7920) text box is configured for compact mode by entering this command:

```bash
show wlan wlan_id
```
Reanchoring of Roaming Voice Clients

Information About Reanchoring of Roaming Voice Clients
You can allow voice clients to get anchored on the best suited and nearest available controller, which is useful when intercontroller roaming occurs. By using this feature, you can avoid the use of tunnels to carry traffic between the foreign controller and the anchor controller and remove unnecessary traffic from the network.

The ongoing call during roaming is not affected and can continue without any problem. The traffic passes through proper tunnels that are established between the foreign controller and the anchor controller.

Disassociation occurs only after the call ends, and then the client then gets reassociated to a new controller.

Note
You can reanchor roaming of voice clients for each WLAN.

Restrictions for Configuring Reanchoring of Roaming Voice Clients

- The ongoing data session might be affected due to disassociation and then reassociation.
- This feature is supported for TSPEC-based calls and non-TSPEC SIP-based calls only when you enable the admission control.
- This feature is not recommended for use on Cisco 792x phones.

Configuring Reanchoring of Roaming Voice Clients (GUI)

Procedure

Step 1 Choose WLANs to open the WLANs page.
Step 2 Click the ID number of the WLAN for which you want to configure reanchoring of roaming voice clients.
Step 3 When the WLANs > Edit page appears, choose the Advanced tab to open the WLANs > Edit (Advanced) page.
Step 4 In the Voice area select the Re-anchor Roamed Clients check box.
Step 5 Click Apply to commit your changes.
Step 6 Click Save Configuration to save your changes.

Configuring Reanchoring of Roaming Voice Clients (CLI)

Procedure

Step 1 Enable or disable reanchoring of roaming voice clients for a particular WLAN by entering this command:
config wlan roamed-voice-client re-anchor {enable | disable} wlan id
Step 2 Save your changes by entering this command:
**Call Admission Control**

This section contains the following subsections:

### Voice and Video Parameters

Three parameters on the controller affect voice and/or video quality:

- Call admission control
- Expedited bandwidth requests
- Unscheduled automatic power save delivery

Each of these parameters is supported in Cisco Compatible Extensions (CCX) v4 and v5.

#### Note

Traffic stream metrics (TSM) can be used to monitor and report issues with voice quality.

**Call Admission Control**

Call admission control (CAC) enables an access point to maintain controlled quality of service (QoS) when the wireless LAN is experiencing congestion. The Wi-Fi Multimedia (WMM) protocol deployed in CCXv3 ensures sufficient QoS as long as the wireless LAN is not congested. However, in order to maintain QoS under differing network loads, CAC in CCXv4 is required. Two types of CAC are available: bandwidth-based CAC and load-based CAC.

The following restrictions apply:

- CAC is not supported in Flexconnect local auth, resulting in voice traffic not getting properly tagged.
CAC supports the following PHY rates: 6, 11, 12, 24 kilobits per second. If a controller gets an ADD TS message in any other rate that is not supported, the controller replies to the ADD TS message with the status code *Invalid Parameters*.

**Expedited Bandwidth Requests**

The expedited bandwidth request feature enables CCxv5 clients to indicate the urgency of a WMM traffic specifications (TSPEC) request (for example, an e911 call) to the WLAN. When the controller receives this request, it attempts to facilitate the urgency of the call in any way possible without potentially altering the quality of other TSPEC calls that are in progress.

You can apply expedited bandwidth requests to both bandwidth-based and load-based CAC. Expedited bandwidth requests are disabled by default. When this feature is disabled, the controller ignores all expedited requests and processes TSPEC requests as normal TSPEC requests.

This table lists examples of TSPEC request handling for normal TSPEC requests and expedited bandwidth requests.

**Table 2: TSPEC Request Handling Examples**

<table>
<thead>
<tr>
<th>CAC Mode</th>
<th>Reserved bandwidth for voice calls</th>
<th>Usage</th>
<th>Normal TSPEC Request</th>
<th>TSPEC with Expedited Bandwidth Request</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth-based</td>
<td>75% (default setting)</td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td>CAC</td>
<td></td>
<td>Between 75% and 90% (reserved bandwidth for voice calls exhausted)</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>More than 90%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
<tr>
<td>Load-based CAC</td>
<td></td>
<td>Less than 75%</td>
<td>Admitted</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Between 75% and 85% (reserved bandwidth for voice calls exhausted)</td>
<td>Rejected</td>
<td>Admitted</td>
</tr>
<tr>
<td></td>
<td></td>
<td>More than 85%</td>
<td>Rejected</td>
<td>Rejected</td>
</tr>
</tbody>
</table>

1. For bandwidth-based CAC, the voice call bandwidth usage is per access point and does not take into account co-channel access points. For load-based CAC, the voice call bandwidth usage is measured for the entire channel.

2. Bandwidth-based CAC (consumed voice and video bandwidth) or load-based CAC (channel utilization [Pb]).

---

**Note**

Admission control for TSPEC g711-40ms codec type is supported.
When video ACM is enabled, the controller rejects a video TSPEC if the non-MSDU size in the TSPEC is greater than 149 or the mean data rate is greater than 1 Kbps.

**U-APSD**

Unscheduled automatic power save delivery (U-APSD) is a QoS facility defined in IEEE 802.11e that extends the battery life of mobile clients. In addition to extending battery life, this feature reduces the latency of traffic flow delivered over the wireless media. Because U-APSD does not require the client to poll each individual packet buffered at the access point, it allows delivery of multiple downlink packets by sending a single uplink trigger packet. U-APSD is enabled automatically when WMM is enabled.

**Traffic Stream Metrics**

In a voice-over-wireless LAN (VoWLAN) deployment, traffic stream metrics (TSM) can be used to monitor voice-related metrics on the client-access point air interface. It reports both packet latency and packet loss. You can isolate poor voice quality issues by studying these reports.

The metrics consist of a collection of uplink (client side) and downlink (access point side) statistics between an access point and a client device that supports CCX v4 or later releases. If the client is not CCX v4 or CCXv5 compliant, only downlink statistics are captured. The client and access point measure these metrics. The access point also collects the measurements every 5 seconds, prepares 90-second reports, and then sends the reports to the controller. The controller organizes the uplink measurements on a client basis and the downlink measurements on an access point basis and maintains an hour’s worth of historical data. To store this data, the controller requires 32 MB of additional memory for uplink metrics and 4.8 MB for downlink metrics.

TSM can be configured through either the GUI or the CLI on a per radio-band basis (for example, all 802.11a radios). The controller saves the configuration in flash memory so that it persists across reboots. After an access point receives the configuration from the controller, it enables TSM on the specified radio band.

Access points support TSM entries in both local and FlexConnect modes.

Once the upper limit is reached, additional TSM entries cannot be stored and sent to Cisco Prime Infrastructure. If client TSM entries are full and AP TSM entries are available, then only the AP entries are stored, and vice versa. This leads to partial output. TSM cleanup occurs every one hour. Entries are removed only for those APs and clients that are not in the system.

This section contains the following subsections:
Configuring Voice Parameters

Configuring Voice Parameters (GUI)

Procedure

Step 1 Ensure that the WLAN is configured for WMM and the Platinum QoS level.

Step 2 Disable all WLANs with WMM enabled and click Apply.

Step 3 Choose Wireless and then Network under 802.11a/n/ac/ax or 802.11b/g/n/ax, unselect the 802.11a (or 802.11b/g) Network Status check box, and click Apply to disable the radio network.

Step 4 Choose Wireless > 802.11a/n/ac/ax or 802.11b/g/n/ax > Media. The 802.11a (or 802.11b) > Media page appears. The Voice tab is displayed by default.

Step 5 Select the Admission Control (ACM) check box to enable bandwidth-based CAC for this radio band. The default value is disabled.

Step 6 Select the Admission Control (ACM) you want to use by choosing from the following choices:
  • Load-based—To enable channel-based CAC. This is the default option.
  • Static—To enable radio-based CAC.

Step 7 In the Max RF Bandwidth text box, enter the percentage of the maximum bandwidth allocated to clients for voice applications on this radio band. Once the client reaches the value specified, the access point rejects new calls on this radio band.

The range is 5% to 85%. The sum of maximum bandwidth percentage of voice and video should not exceed 85%.

The default is 75%.

Step 8 In the Reserved Roaming Bandwidth text box, enter the percentage of maximum allocated bandwidth that is reserved for roaming voice clients. The controller reserves this bandwidth from the maximum allocated bandwidth for roaming voice clients.

The range is 0% to 25%.

The default is 6%.

Step 9 To enable expedited bandwidth requests, select the Expedited Bandwidth check box. By default, this text box is disabled.

Step 10 To enable SIP CAC support, select the SIP CAC Support check box. By default, SIP CAC support is disabled.

Step 11 From the SIP Codec drop-down list, choose one of the following options to set the codec name. The default value is G.711. The options are as follows:
  • User Defined
  • G.711
  • G.729

Step 12 In the SIP Bandwidth (kbps) text box, enter the bandwidth in kilobits per second.

The possible range is 8 to 64.
The default value is 64.

Note: The SIP Bandwidth (kbps) text box is highlighted only when you select the SIP codec as User-Defined. If you choose the SIP codec as G.711, the SIP Bandwidth (kbps) text box is set to 64. If you choose the SIP codec as G.729, the SIP Bandwidth (kbps) text box is set to 8.

Step 13 In the SIP Voice Sample Interval (msecs) text box, enter the value for the sample interval.

Step 14 In the Maximum Calls text box, enter the maximum number of calls that can be made to this radio. The maximum call limit includes both direct and roaming-in calls. If the maximum call limit is reached, the new or roaming-in calls result in failure.

The possible range is 0 to 25.

The default value is 0, which indicates that there is no check for maximum call limit.

Note: If SIP CAC is supported and the CAC method is static, the Maximum Possible Voice Calls and Maximum Possible Roaming Reserved Calls fields appear.

Step 15 Select the Metrics Collection check box to collect traffic stream metrics. By default, this box is unselected. That is, the traffic stream metrics is not collected by default.

Step 16 Click Apply.

Step 17 Reenable all WMM WLANs and click Apply.

Step 18 Choose Network under 802.11a/n/ac/ax or 802.11b/g/n/ax, select the 802.11a (or 802.11b/g) Network Status check box, and click Apply to reenable the radio network.

Step 19 Click Save Configuration.

Step 20 Repeat this procedure if you want to configure voice parameters for another radio band.

---

### Configuring Voice Parameters (CLI)

#### Before you begin

Ensure that you have configured SIP-based CAC.

#### Procedure

Step 1 See all of the WLANs configured on the controller by entering this command:

```
show wlan summary
```

Step 2 Make sure that the WLAN that you are planning to modify is configured for WMM and the QoS level is set to Platinum by entering this command:

```
show wlan wlan_id
```

Step 3 Disable all WLANs with WMM enabled prior to changing the voice parameters by entering the command:

```
config wlan disable wlan_id
```

Step 4 Disable the radio network by entering this command:

```
config {802.11a | 802.11b} disable network
```
Step 5  Save your settings by entering this command:
   `save config`

Step 6  Enable or disable bandwidth-based voice CAC for the 802.11a or 802.11b/g network by entering this command:
   `config {802.11a | 802.11b} cac voice acm {enable | disable}`

Step 7  Set the percentage of maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network by entering this command:
   `config {802.11a | 802.11b} cac voice max-bandwidth bandwidth`
   The `bandwidth` range is 5 to 85%, and the default value is 75%. Once the client reaches the value specified, the access point rejects new calls on this network.

Step 8  Set the percentage of maximum allocated bandwidth reserved for roaming voice clients by entering this command:
   `config {802.11a | 802.11b} cac voice roam-bandwidth bandwidth`
   The `bandwidth` range is 0 to 25%, and the default value is 6%. The controller reserves this much bandwidth from the maximum allocated bandwidth for roaming voice clients.

Step 9  Configure the codec name and sample interval as parameters and to calculate the required bandwidth per call by entering this command:
   `config {802.11a | 802.11b} cac voice sip codec {g711 | g729} sample-interval number_msecs`

Step 10 Configure the bandwidth that is required per call by entering this command:
   `config {802.11a | 802.11b} cac voice sip bandwidth bandwidth_kbps sample-interval number_msecs`

Step 11 Reenable all WLANs with WMM enabled by entering this command:
   `config wlan enable wlan_id`

Step 12 Reenable the radio network by entering this command:
   `config {802.11a | 802.11b} enable network`

Step 13 View the TSM voice metrics by entering this command:
   `show {802.11a | 802.11b} cu-metrics AP_Name`
   The command also displays the channel utilization metrics.

Step 14 Enter the `save config` command to save your settings.

Step 15 Configure voice automatically for a WLAN by entering this command:
   `config auto-configure voice cisco wlan-id radio {802.11a | 802.11b | all}`

Step 16 Enter the `save config` command to save your settings.
Configuring Video Parameters

Configuring Video Parameters (GUI)

Procedure

Step 1
Ensure that the WLAN is configured for WMM and the Gold QoS level.

Step 2
Disable all WLANs with WMM enabled and click **Apply**.

Step 3
Choose **Wireless** and then **Network** under 802.11a/n/ac/ax or 802.11b/g/n/ax, unselect the **802.11a** (or **802.11b/g**) **Network Status** check box, and click **Apply** to disable the radio network.

Step 4
Choose **Wireless > 802.11a/n/ac/ax or 802.11b/g/n/ax > Media**. The 802.11a (or 802.11b) > Media page appears.

Step 5
In the **Video** tab, select the **Admission Control (ACM)** check box to enable video CAC for this radio band. The default value is disabled.

Step 6
From the **CAC Method** drop-down list, choose between **Static** and **Load Based** methods.

The static CAC method is based on the radio and the load-based CAC method is based on the channel.

**Note**
- For TSpec and SIP based CAC for video calls, only Static method is supported.

Step 7
In the **Max RF Bandwidth** text box, enter the percentage of the maximum bandwidth allocated to clients for video applications on this radio band. When the client reaches the value specified, the access point rejects new requests on this radio band.

The range is 5% to 85%. The sum of maximum bandwidth percentage of voice and video should not exceed 85%. The default is 0%.

Step 8
In the Reserved Roaming Bandwidth text box, enter the percentage of the maximum RF bandwidth that is reserved for roaming clients for video.

Step 9
Configure the SIP CAC Support by selecting or unselecting the **SIP CAC Support** check box.

SIP CAC is supported only if SIP Snooping is enabled.

**Note**
- You cannot enable SIP CAC if you have selected the Load Based CAC method.
- SIP snooping not supported for FlexConnect local switching voice client.

Step 10
Click **Apply**.

Step 11
Reenable all WMM WLANs and click **Apply**.

Step 12
Choose **Network** under 802.11a/n/ac/ax or 802.11b/g/n/ax, select the **802.11a** (or **802.11b/g**) **Network Status** check box, and click **Apply** to reenable the radio network.

Step 13
Click **Save Configuration**.

Step 14
Repeat this procedure if you want to configure video parameters for another radio band.
Configuring Video Parameters (CLI)

Before you begin
Ensure that you have configured SIP-based CAC.

Procedure

Step 1  See all of the WLANs configured on the controller by entering this command:
        show wlan summary

Step 2  Make sure that the WLAN that you are planning to modify is configured for WMM and the QoS level is set
to Gold by entering this command:
        show wlan wlan_id

Step 3  Disable all WLANs with WMM enabled prior to changing the video parameters by entering this command:
        config wlan disable wlan_id

Step 4  Disable the radio network by entering this command:
        config {802.11a | 802.11b} disable network

Step 5  Save your settings by entering this command:
        save config

Step 6  Enable or disable video CAC for the 802.11a or 802.11b/g network by entering this command:
        config {802.11a | 802.11b} cac video acm {enable | disable}

Step 7  To configure the CAC method as either static or load-based, enter this command:
        config {802.11a | 802.11b} cac video cac-method {static | load-based}

Step 8  Set the percentage of maximum bandwidth allocated to clients for video applications on the 802.11a or
        802.11b/g network by entering this command:
        config {802.11a | 802.11b} cac video max-bandwidth bandwidth
        The bandwidth range is 5 to 85%, and the default value is 5%. However, the maximum RF bandwidth cannot
        exceed 85% for voice and video. Once the client reaches the value specified, the access point rejects new calls
        on this network.
        Note     If this parameter is set to zero (0), the controller assumes that you do not want to do any bandwidth
                  allocation and, therefore, allows all bandwidth requests.

Step 9  To configure the percentage of the maximum RF bandwidth that is reserved for roaming clients for video,
        enter this command:
        config {802.11a | 802.11b} cac video roam-bandwidth bandwidth

Step 10 To configure the CAC parameters for SIP-based video calls, enter this command:
        config {802.11a | 802.11b} cac video sip {enable | disable}
Step 11 Process or ignore the TSPEC inactivity timeout received from an access point by entering this command:
```
config {802.11a | 802.11b} cac video tspec-inactivity-timeout {enable | ignore}
```
Step 12 Reenable all WLANs with WMM enabled by entering this command:
```
config wlan enable wlan_id
```
Step 13 Reenable the radio network by entering this command:
```
config {802.11a | 802.11b} enable network
```
Step 14 Enter the `save config` command to save your settings.

---

**Viewing Voice and Video Settings**

**Viewing Voice and Video Settings (GUI)**

**Procedure**

**Step 1** Choose **Monitor > Clients** to open the Clients page.

**Step 2** Click the MAC address of the desired client to open the Clients > Detail page.

This page shows the U-APSD status (if enabled) for this client under Quality of Service Properties.

**Step 3** Click **Back** to return to the Clients page.

**Step 4** See the TSM statistics for a particular client and the access point to which this client is associated as follows:

a) Hover your cursor over the blue drop-down arrow for the desired client and choose **802.11aTSM** or **802.11b/g TSM**. The Clients > AP page appears.

b) Click the **Detail** link for the desired access point to open the Clients > AP > Traffic Stream Metrics page.

This page shows the TSM statistics for this client and the access point to which it is associated. The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.

**Step 5** See the TSM statistics for a particular access point and a particular client associated to this access point, as follows:

a) Choose **Wireless > Access Points > Radios > 802.11a/n/ac/ax** or **802.11b/g/n/ax**. The 802.11a/n/ac/ax Radios or 802.11b/g/n/ax Radios page appears.

b) Hover your cursor over the blue drop-down arrow for the desired access point and choose **802.11aTSM** or **802.11b/g TSM**. The AP > Clients page appears.

c) Click the **Detail** link for the desired client to open the AP > Clients > Traffic Stream Metrics page.

This page shows the TSM statistics for this access point and a client associated to it. The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.
Viewing Voice and Video Settings (CLI)

Procedure

**Step 1**  
See the CAC configuration for the 802.11 network by entering this command:  
```bash  
show ap stats \{802.11a \| 802.11b\}  
```

**Step 2**  
See the CAC statistics for a particular access point by entering this command:  
```bash  
show ap stats \{802.11a \| 802.11b\} ap_name  
```

Information similar to the following appears:

```
Call Admission Control (CAC) Stats
 Voice Bandwidth in use(% of config bw)........ 0
 Total channel MT free......................... 0
 Na Direct..................................... 0
 Na Roam..................................... 0
 Video Bandwidth in use(% of config bw)....... 0
 Total num of voice calls in progress......... 0
 Num of roaming voice calls in progress....... 0
 Total Num of voice calls since AP joined..... 0
 Total Num of roaming calls since AP joined... 0
 Total Num of exp bw requests received........ 5
 Total Num of exp bw requests admitted........ 2
 Num of voice calls rejected since AP joined... 0
 Num of roam calls rejected since AP joined... 0
 Num of calls rejected due to insufficient bw.. 0
 Num of calls rejected due to invalid params... 0
 Num of calls rejected due to PHY rate......... 0
 Num of calls rejected due to QoS policy...... 0
```

In the example above, “MT” is medium time, “Na” is the number of additional calls, and “exp bw” is expedited bandwidth.

**Note**  
Suppose an AP has to be rebooted when a voice client associated with the AP is on an active call. After the AP is rebooted, the client continues to maintain the call, and during the time the AP is down, the database is not refreshed by the controller. Therefore, we recommend that all active calls are ended before the AP is taken down.

**Step 3**  
See the U-APSD status for a particular client by entering this command:  
```bash  
show client detail client_mac  
```

**Step 4**  
See the TSM statistics for a particular client and the access point to which this client is associated by entering this command:  
```bash  
show client tsm \{802.11a \| 802.11b\} client_mac \{ap_mac \| all\}  
```

The optional `all` command shows all access points to which this client has associated. Information similar to the following appears:

```
Client Interface Mac: 00:01:02:03:04:05
Measurement Duration: 90 seconds
```
The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.

Clear the TSM statistics for a particular access point or all the access points to which this client is associated by entering this `clear client tsm {802.11a | 802.11b} client_mac {ap_mac | all}` command.

Step 5: View the TSM statistics for a particular access point and a particular client associated to this access point by entering this command:

```
show ap stats {802.11a | 802.11b} ap_name tsm {client_mac | all}
```

The optional `all` command shows all clients associated to this access point. Information similar to the following appears:

```
AP Interface Mac: 00:0b:85:01:02:03
Client Interface Mac: 00:01:02:03:04:05
Measurement Duration: 90 seconds
```

```
1st Jan 2006, 06:35:80
```

```bash
UpLink Stats
```

```bash
Average Delay (5sec intervals)............................35
Delay less than 10 ms.....................................20
Delay bet 10 - 20 ms......................................20
Delay bet 20 - 40 ms......................................20
Delay greater than 40 ms..................................20
Total packet Count.........................................80
Total packet lost count (5sec).............................10
Maximum Lost Packet count(5sec)............................5
Average Lost Packet count(5secs)...........................2
```

```bash
DownLink Stats
```

```bash
Average Delay (5sec intervals)............................35
Delay less than 10 ms.....................................20
Delay bet 10 - 20 ms......................................20
Delay bet 20 - 40 ms......................................20
Delay greater than 40 ms..................................20
Total packet Count.........................................80
Total packet lost count (5sec).............................10
Maximum Lost Packet count(5sec)............................5
Average Lost Packet count(5secs)...........................2
```
Delay greater than 40 ms..................................20
Total packet Count.........................................80
Total packet lost count (5sec).............................10
Maximum Lost Packet count (5sec)...........................5
Average Lost Packet count (5secs)...........................2

Note  The statistics are shown in 90-second intervals. The timestamp text box shows the specific interval when the statistics were collected.

**Step 6** Enable or disable debugging for call admission control (CAC) messages, events, or packets by entering this command:

debug cac {all | event | packet} {enable | disable}

where all configures debugging for all CAC messages, event configures debugging for all CAC events, and packet configures debugging for all CAC packets.

**Step 7** Use the following command to perform voice diagnostics and to view the debug messages between a maximum of two 802.11 clients:

debug voice-diag {enable | disable} mac-id mac-id2 [verbose]

The verbose mode is an optional argument. When the verbose option is used, all debug messages are displayed in the console. You can use this command to monitor a maximum of two 802.11 clients. If one of the clients is a non-WiFi client, only the 802.11 client is monitored for debug messages.

Note  It is implicitly assumed that the clients being monitored are on call.

Note  The debug command automatically stops after 60 minutes.

**Step 8** Use the following commands to view various voice-related parameters:

- **show client voice-diag status**

  Displays information about whether voice diagnostics is enabled or disabled. If enabled, will also displays information about the clients in the watch list and the time remaining for the diagnostics of the voice call.

  If voice diagnostics is disabled when the following commands are entered, a message indicating that voice diagnostics is disabled appears.

- **show client voice-diag tspec**

  Displays the TSPEC information sent from the clients that are enabled for voice diagnostics.

- **show client voice-diag qos-map**

  Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.

- **show client voice-diag avrg_rssi**

  Display the client’s RSSI values in the last 5 seconds when voice diagnostics is enabled.

- **show client voice-diag roam-history**

  Displays information about the last three roaming calls. The output contains the timestamp, access point associated with roaming, roaming reason, and if there is a roaming failure, the reason for the roaming-failure.
• show client calls {active | rejected} {802.11a | 802.11bg | all}

This command lists the details of active TSPEC and SIP calls on the controller.

**Step 9**

Use the following commands to troubleshoot video debug messages and statistics:

- **debug ap show stats {802.11b | 802.11a} ap-name multicast**—Displays the access point’s supported multicast rates.

- **debug ap show stats {802.11b | 802.11a} ap-name load**—Displays the access point’s QBSS and other statistics.

- **debug ap show stats {802.11b | 802.11a} ap-name tx-queue**—Displays the access point’s transmit queue traffic statistics.

- **debug ap show stats {802.11b | 802.11a} ap-name client {all | video | client-mac}**—Displays the access point’s client metrics.

- **debug ap show stats {802.11b | 802.11a} ap-name packet**—Displays the access point’s packet statistics.

- **debug ap show stats {802.11b | 802.11a} ap-name video metrics**—Displays the access point’s video metrics.

- **debug ap show stats video ap-name multicast mgid number**—Displays an access point’s Layer 2 MGID database number.

- **debug ap show stats video ap-name admission**—Displays an access point’s admission control statistics.

- **debug ap show stats video ap-name bandwidth**—Displays an access point’s video bandwidth.

---

**Configuring SIP-Based CAC**

**Restrictions for SIP-Based CAC**

- SIP CAC should only be used for phones that support status code 17 and do not support TSPEC-based admission control.

- SIP CAC will be supported only if SIP snooping is enabled.

**Configuring SIP-Based CAC (GUI)**

**Before you begin**

- Ensure that you have set the voice to the platinum QoS level.

- Ensure that you have enabled call snooping for the WLAN.

- Ensure that you have enabled the Admission Control (ACM) for this radio.
**Procedure**

**Step 1** Choose Wireless > Advanced > SIP Snooping to open the SIP Snooping page.

**Step 2** Specify the call-snooping ports by entering the starting port and the ending port.

**Step 3** Click Apply and then click Save Configuration.

---

**Configuring SIP-Based CAC (CLI)**

**Procedure**

**Step 1** Set the voice to the platinum QoS level by entering this command:

```plaintext
config wlan qos wlan-id Platinum
```

**Step 2** Enable the call-snooping feature for a particular WLAN by entering this command:

```plaintext
config wlan call-snoop enable wlan-id
```

**Step 3** Enable the ACM to this radio by entering this command:

```plaintext
config {802.11a | 802.11b} cac {voice | video} acm enable
```

**Step 4** To configure the call snooping ports, enter this command:

```plaintext
config advanced sip-snooping-ports starting-port ending-port
```

**Step 5** To troubleshoot SIP-based CAC events, enter this command:

```plaintext
debug sip event {enable | disable}
```

---

**Configuring Media Parameters (GUI)**

**Procedure**

**Step 1** Ensure that the WLAN is configured for WMM and the Gold QoS level.

**Step 2** Disable all WLANs with WMM enabled and click Apply.

**Step 3** Choose Wireless and then Network under 802.11a/n/ac/ax or 802.11b/g/n/ax, unselect the 802.11a (or 802.11b/g) Network Status check box, and click Apply to disable the radio network.

**Step 4** Choose Wireless > 802.11a/n/ac/ax or 802.11b/g/n/ax > Media. The 802.11a (or 802.11b) > Media > Parameters page appears.

**Step 5** Choose the Media tab to open the Media page.

**Step 6** Select the Unicast Video Redirect check box to enable Unicast Video Redirect. The default value is disabled.
Step 7  In the **Maximum Media Bandwidth (0-85%)** text box, enter the percentage of the maximum bandwidth to be allocated for media applications on this radio band. Once the client reaches the specified value, the access point rejects new calls on this radio band.

The default value is 85%; valid values are from 0 to 85%.

Step 8  In the **Client Phy Rate** text box, enter the value for the rate in kilobits per second at which the client operates.

Step 9  In the **Maximum Retry Percent (0-100%)** text box, enter the percentage of the maximum retry. The default value is 80.

Step 10  Select the **Multicast Direct Enable** check box to enable the **Multicast Direct Enable** text box. The default value is enabled.

Step 11  From the **Max Streams per Radio** drop-down list, choose the maximum number of allowed multicast direct streams per radio. Choose a value between 1 to 20 or **No Limit**. The default value is set to No Limit.

Step 12  From the **Max Streams per Client** drop-down list, choose the maximum number of allowed clients per radio. Choose a value between 1 to 20 or **No Limit**. The default value is set to No Limit.

Step 13  If you want to enable the best radio queue for this radio, select the **Best Effort QoS Admission** check box. The default value is disabled.

---

**Voice Prioritization Using Preferred Call Numbers**

You can configure a controller to support calls from clients that do not support TSPEC-based calls. This feature is known as voice prioritization. These calls are given priority over other clients utilizing the voice pool. Voice prioritization is available only for SIP-based calls and not for TSPEC-based calls. If the bandwidth is available, it takes the normal flow and allocates the bandwidth to those calls.

You can configure up to six preferred call numbers. When a call comes to one of the configured preferred numbers, the controller does not check on the maximum call limit. It invokes the CAC to allocate bandwidth for the preferred call. The bandwidth allocation is 85 percent of the entire bandwidth pool, not just from the maximum configured voice pool. The bandwidth allocation is the same even for roaming calls.

This section contains the following subsections:

**Prerequisites for Configuring Voice Prioritization Using Preferred Call Numbers**

You must configure the following before configuring voice prioritization:

- Set WLAN QoS to platinum.
- Enable ACM for the radio.
- Enable SIP call snooping on the WLAN.

**Configuring a Preferred Call Number (GUI)**

**Procedure**

- **Step 1**  Set the WLAN QoS profile to Platinum.
- **Step 2**  Enable ACM for the WLAN radio.
Step 3  Enable SIP call snooping for the WLAN.
Step 4  Choose Wireless > Advanced > Preferred Call to open the Preferred Call page.
       All calls configured on the controller appear.
       Note  To remove a preferred call, hover your cursor over the blue drop-down arrow and choose Remove.
Step 5  Click Add Number to add a new preferred call.
Step 6  In the Call Index text box, enter the index that you want to assign to the call. Valid values are from 1 through 6.
Step 7  In the Call Number text box, enter the number.
Step 8  Click Apply to add the new number.

Configuring a Preferred Call Number (CLI)

Procedure

Step 1  Set the voice to the platinum QoS level by entering this command:
        config wlan qos wlan-id Platinum
Step 2  Enable the ACM to this radio by entering this command:
        config {802.11a | 802.11b} cac {voice | video} acm enable
Step 3  Enable the call-snooping feature for a particular WLAN by entering this command:
        config wlan call-snoop enable wlan-id
Step 4  Add a new preferred call by entering this command:
        config advanced sip-preferred-call-no call_index {call_number | none}
Step 5  Remove a preferred call by entering this command:
        config advanced sip-preferred-call-no call_index none
Step 6  View the preferred call statistics by entering the following command:
        show ap stats {802.11{a | b} | wlan} ap_name
Step 7  Enter the following command to list the preferred call numbers:
        show advanced sip-preferred-call-no

Enhanced Distributed Channel Access Parameters

Enhanced Distributed Channel Access (EDCA) parameters are designed to provide preferential wireless channel access for voice, video, and other quality of service (QoS) traffic.

This section contains the following subsections:
Configuring EDCA Parameters (GUI)

Procedure

Step 1  Choose Wireless and then Network under 802.11a/n/ac/ax or 802.11b/g/n/ax, unselect the 802.11a (or 802.11b/g) Network Status check box, and click Apply to disable the radio network.

Step 2  Click EDCA Parameters under 802.11a/n/ac/ax or 802.11b/g/n/ax.

Step 3  The 802.11a (or 802.11b/g) > EDCA Parameters window is displayed.

Step 4  Choose one of the following options from the EDCA Profile drop-down list:

- WMM—Enables the Wi-Fi Multimedia (WMM) default parameters. This is the default value. Choose this option when voice or video services are not deployed on your network.

- Spectralink Voice Priority—Enables Spectralink voice-priority parameters. Choose this option if Spectralink phones are deployed on your network to improve the quality of calls.

- Voice Optimized—Enables Enhanced Distributed Channel Access (EDCA) voice-optimized profile parameters. Choose this option when voice services other than Spectralink are deployed on your network.

- Voice & Video Optimized—Enables EDCA voice-optimized and video-optimized profile parameters. Choose this option when both voice and video services are deployed on your network.

- Custom Voice—Enables custom voice EDCA parameters for 802.11a. The EDCA parameters under this option also match the 6.0 WMM EDCA parameters when this profile is applied.

  Note  If you deploy video services, admission control must be disabled.

- Fastlane—Enables fastlane EDCA parameters.

Step 5  To enable MAC optimization for voice, check the Enable Low Latency MAC check box. By default, this check box is not checked. This feature enhances voice performance by controlling packet retransmits and appropriately aging out voice packets on lightweight access points, which improves the number of voice calls serviced per access point.

  Note  We recommend against you enabling low latency MAC. You should enable low-latency MAC only if the WLAN allows WMM clients. If WMM is enabled, then low-latency MAC can be used with any of the EDCA profiles.

Step 6  Click Apply to commit your changes.

Step 7  To re-enable the radio network, click Network under 802.11a/n/ac/ax or 802.11b/g/n/ax, check the 802.11a (or 802.11b/g) Network Status check box, and click Apply.

Step 8  Click Save Configuration.

---

Configuring EDCA Parameters (CLI)

Procedure

Step 1  Disable the radio network by entering this command:
config {802.11a | 802.11b} disable network

Step 2  
Save your settings by entering this command:

save config

Step 3  
Enable a specific EDCA profile by entering this command:

config advanced {802.11a | 802.11b} edca-parameters {wmm-default |svp-voice | optimized-voice | optimized-video | custom-voice | fastlane}

- **wmm-default**—Enables the Wi-Fi Multimedia (WMM) default parameters. This is the default value. Choose this option if voice or video services are not deployed on your network.

- **svp-voice**—Enables SpectraLink voice-priority parameters. Choose this option if SpectraLink phones are deployed on your network to improve the quality of calls.

- **optimized-voice**—Enables EDCA voice-optimized profile parameters. Choose this option if voice services other than SpectraLink are deployed on your network.

- **optimized-video**—Enables EDCA voice-optimized and video-optimized profile parameters. Choose this option if both voice and video services are deployed on your network.

- **custom-voice**—Enables custom voice EDCA parameters for 802.11a. The EDCA parameters under this option also match the 6.0 WMM EDCA parameters when this profile is applied.

  **Note**  
  If you deploy video services, admission control (ACM) must be disabled.

- **Fastlane**—Enables Fast Lane EDCA parameters.

Step 4  
View the current status of MAC optimization for voice by entering this command:

show {802.11a | 802.11b}

Information that is similar to the following example is displayed:

Voice-mac-optimization..................Disabled

Step 5  
Enable or disable MAC optimization for voice by entering this command:

config advanced {802.11a | 802.11b} voice-mac-optimization {enable | disable}

  **Note**  
  This feature enhances voice performance by controlling packet retransmits and appropriately aging out voice packets on lightweight APs. This, in turn improves the number of voice calls serviced per AP. The default value is disabled.

Step 6  
Re-enable the radio network by entering this command:

config {802.11a | 802.11b} enable network

Step 7  
Save your settings by entering this command: save config.
Key Telephone System-Based CAC

Key Telephone System-based CAC is a protocol that is used in NEC MH240 wireless IP telephones. You can configure the controller to support CAC on KTS-based SIP clients, to process bandwidth request message from such clients, to allocate the required bandwidth on the AP radio, and to handle other messages that are part of the protocol.

When a call is initiated, the KTS-based CAC client sends a Bandwidth Request message to which the controller responds with a Bandwidth Confirm message indicating whether the bandwidth is allocated or not. The call is allowed only if the bandwidth is available. If the client roams from one AP to another, the client sends another Bandwidth Request message to the controller.

Bandwidth allocation depends on the median time calculated using the data rate from the Bandwidth Request message and the packetization interval. For KTS-based CAC clients, the G.711 codec with 20 milliseconds as the packetization interval is used to compute the medium time.

The controller releases the bandwidth after it receives the bandwidth release message from the client. When the client roams to another AP, the controller releases the bandwidth on the previous AP and allocates bandwidth on the new AP, in both intracontroller and intercontroller roaming scenarios. The controller releases the bandwidth if the client is dissociated or if there is inactivity for 120 seconds. The controller does not inform the client when the bandwidth is released for the client due to inactivity or dissociation of the client.

This section contains the following subsections:

Restrictions for Key Telephone System-Based CAC

- The controller ignores the SSID Capability Check Request message from the clients.
- Preferred call is not supported for KTS CAC clients.
- Reason code 17 is not supported in intercontroller roaming scenarios.
- To make the KTS-based CAC feature functional, ensure that you do the following:
  - Enable WMM on the WLAN
  - Enable ACM at the radio level
  - Enable processing of TSPEC inactivity timeout at the radio level
- All RLAN clients are disconnected when Call Admission Control (CAC) is enabled or disabled to apply policies.

Configuring KTS-based CAC (GUI)

Before you begin

To enable KTS-based CAC for a WLAN, ensure that you do the following:

- Set the QoS profile for the WLAN to Platinum.
- Set the WLAN in disabled state.
- Set the FlexConnect Local Switching in disabled state for the WLAN (On the WLANs > Edit page, click the Advanced tab and uncheck the FlexConnect Local Switching check box).
### Procedure

**Step 1** Choose WLANs to open the WLANs page.

**Step 2** Click the ID number of the WLAN for which you want to configure the KTS-based CAC policy.

**Step 3** On the WLANs > Edit page, click the **Advanced** tab.

**Step 4** Under Voice, check or uncheck the **KTS based CAC Policy** check box to enable or disable KTS-based CAC for the WLAN.

**Step 5** Save the configuration.

### Configuring KTS-based CAC (CLI)

#### Before you begin

To enable KTS-based CAC for a WLAN, ensure that you do the following:

- Configure the QoS profile for the WLAN to Platinum by entering the following command:
  ````
  config wlan qos wlan-id platinum
  ```

- Disable the WLAN by entering the following command:
  ````
  config wlan disable wlan-id
  ```

- Disable FlexConnect Local Switching for the WLAN by entering the following command:
  ````
  config wlan flexconnect local-switching wlan-id disable
  ```

#### Procedure

**Step 1** To enable KTS-based CAC for a WLAN, enter the following command:

````
config wlan kts-cac enable wlan-id
```  

**Step 2** To enable the functioning of the KTS-based CAC feature, ensure you do the following:

a) Enable WMM on the WLAN by entering the following command:

````
config wlan wmm allow wlan-id
```  

b) Enable ACM at the radio level by entering the following command:

````
config 802.11a cac voice acm enable
```  

**c)** Enable the processing of the TSPEC inactivity timeout at the radio level by entering the following command:

````
config 802.11a cac voice tspec-inactivity-timeout enable
```  

#### Related Commands

- To see whether the client supports KTS-based CAC, enter the following command:
show client detail client-mac-address

Information similar to the following appears:

Client MAC Address......................... 00:60:b9:0d:ef:26
Client Username ............................. N/A
AP MAC Address................................ 58:bc:27:93:79:90

QoS Level........................................ Platinum
802.1P Priority Tag............................ disabled
KTS CAC Capability............................ Yes
WMM Support.................................... Enabled
Power Save...................................... ON

• To troubleshoot issues with KTS-based CAC, enter the following command:
  
  debug cac kts enable

• To troubleshoot other issues related to CAC, enter the following commands:
  
  • debug cac event enable
  • debug call-control all enable

Application Visibility and Control

Application Visibility and Control (AVC) classifies applications using deep packet inspection techniques with the Network-Based Application Recognition (NBAR) engine, and provides application-level visibility and control (QoS) in wireless networks. After the applications are recognized, the AVC feature enables you to either drop, mark, or police the data traffic.

AVC is configured by defining a class map in a QoS client policy to match a protocol.

Using AVC, we can detect more than 1000 applications. AVC enables you to perform real-time analysis and create policies to reduce network congestion, costly network link usage, and infrastructure upgrades.

You can view list of 30 applications in Top Applications in Monitor Summary section of the UI.

AVC DSCP marks only the DSCP of the original packet in the controller in both directions (upstream and downstream). It does not affect the outer CAPWAP DSCP. AVC DSCP is applicable only when the application is classified. For example, based on the AVC profile configuration, if an application is classified as ftp or http, the corresponding DSCP marking is applied irrespective of the WLAN QoS. For downstream, the DSCP value of outer CAPWAP header and inner packet’s DSCP are taken from AVC DSCP. WLAN QoS is only applicable for all traffic from WLC to AP through CAPWAP. It does not change the DSCP of the original packet.

Traffic flows are analyzed and recognized using the NBAR2 engine at the access point. For more information about the NBAR2 Protocol Library, see [http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html](http://www.cisco.com/c/en/us/td/docs/ios-xml/ios/qos_nbar/prot_lib/config_library/nbar-prot-pack-library.html). The specific flow is marked with the recognized protocol or application, such as WebEx. This per-flow information can be used for application visibility using Flexible NetFlow (FNF).
AVC QoS actions are applied with AVC filters in both upstream and downstream directions. The QoS actions supported for upstream flow are drop, mark, and police, and for downstream flow are mark and police. AVC QoS is applicable only when the application is classified correctly and matched with the class map filter in the policy map. For example, if the policy has a filter based on an application name, and the traffic has also been classified to the same application name, then the action specified for this match in the policy will be applied.

Using AVC rule, you can limit the bandwidth of a particular application for all the clients joined on the WLAN. These bandwidth contracts coexist with per-client downstream rate limiting with per client downstream rate limits that takes precedence over the per-application rate limits.

**Note**

When you downgrade the controller from 8.0 to any earlier version, the AVC rate limit rules display the action as drop. This action is expected since the AVC rate limit rule is introduced in the controller version 8.0.

The number of concurrent flows supported for AVC classification on different controller platforms are noted in the following table.

<table>
<thead>
<tr>
<th>Cisco WLC Platform</th>
<th>Flow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 3504 WLC</td>
<td>183750</td>
</tr>
<tr>
<td>Cisco 5520 WLC</td>
<td>336,000</td>
</tr>
<tr>
<td>Cisco 8540 WLC</td>
<td>336,000</td>
</tr>
</tbody>
</table>

**Application Visibility and Control Protocol Packs**

Protocol packs are a means to distribute protocol updates outside the controller software release trains, and can be loaded on the controller without replacing the controller software.

The Application Visibility and Control Protocol Pack (AVC Protocol Pack) is a single compressed file that contains multiple Protocol Description Language (PDL) files and a manifest file. A set of required protocols can be loaded, which helps AVC to recognize additional protocols for classification on your network. The manifest file gives information about the protocol pack, such as the protocol pack name, version, and some information about the available PDLs in the protocol pack.

The AVC Protocol Packs are released to specific AVC engine versions. You can load a protocol pack if the engine version on the controller platform is the same or higher than the version required by the protocol pack.

**AAA override for AVC profiles**

The AAA attribute for client or user profile is configured on the AAA server using authentication from RADIUS server or Cisco ACS or ISE. The AAA attribute is processed during layer 2 or layer 3 authentication by the controller and the same is overridden by what is configured on the WLAN.

The AAA AVC profile is defined as a Cisco AV air. The string option is defined as `avc-profile-name` and this value has to be configured for any AVC profile available in the controller.

**Default DSCP Value for AVC Profile**

Prior to Release 8.8 with AVC enabled, you could override DSCP values for only those application flows that were configured on an AVC profile. For the application flows that were not configured, no action was performed and DSCP was left intact. The maximum number of application rules that the AVC profile can contain is 32.
For managed service, to control and rewrite DSCP values (example with DSCP 0) for all flows that are not presented on the AVC profile is not possible.

In Release 8.8, the new enhancement includes a new default-class rule that you can use to override the DSCP values for all application flows in which AVC rule is not configured. The goal of this enhancement is to protect the network for all flows with unwanted or controlled DSCP values.

This enhancement comes with the following restrictions:

- Only the start of an application flow is captured.
- Supported only for marking. Rate limit and drop are not supported.
- Default DSCP works only if AVC is in enabled state.
- An AVC profile can support up to 32 rule, including the default-class rule. If the default-rule is configured, you can configure up to 31 rules.
- Multicast and broadcast flows are not supported.
- IPv6 is not supported in AVC.
- Cascading of rules is not supported, which means that for the same flow, it is not possible to have rate limiting and marking. Therefore, if rate limiting is performed for a flow, default marking is not performed on the flow.

This section contains the following subsections:

**Restrictions for Application Visibility and Control**

- NBAR2 engine fails to recognize the HTTPS traffic, hence fails to block this traffic when configured to drop in a Flex AVC profile.
- IPv6 packet classification is not supported.
- Layer 2 roaming across controllers is not supported.
- Multicast traffic is not supported.
- Controller GUI support is not present for the AVC Protocol Pack feature.
- The number of applications that you can apply rate limit is 3.
- Each application can be configured with one rule only. An application cannot have both a rate limit and a Mark rule.
- If the standby controller has a different protocol pack version that is installed before pairing, then the active and standby controllers will have different protocol packs versions after pairing, in a HA environment. In the standby controller, the transferred protocol pack takes the preference over the default protocol pack.

For example, the controller with the software release 8.0 contains Protocol Pack version 9.0 by default. Before pairing, if one of the controllers has a Protocol Pack version 11.0 that is installed, then after pairing one controller contains Protocol Pack version 9.0 and the other controller contains Protocol Pack 11.0 installed.
Configuring Application Visibility and Control (GUI)

Procedure

Step 1
Create and configure an AVC profile by following these steps:

a) Choose Wireless > Application Visibility and Control > AVC Profiles.

b) Click New.

c) Enter the AVC profile name.

d) Click Apply.

e) On the AVC Profile Name page, click the corresponding AVC profile name. The AVC Profile > Edit page is displayed.

f) Click Add New Rule.

g) Choose the application group and the application name from the respective drop-down lists.

View the list of default AVC applications available by choosing Wireless > Application Visibility and Control > AVC Applications.

h) From the Action drop-down list, choose either of the following:

- **Drop**—Drops the upstream and downstream packets that correspond to the chosen application.

- **Mark**—Marks the upstream and downstream packets that correspond to the chosen application with the Differentiated Services Code Point (DSCP) value that you specify in the DSCP (0 to 63) drop-down list. The DSCP value helps you provide differentiated services based on the QoS levels.

  **Note** The default action is to give permission to all applications.

i) If you choose Mark from the Action drop-down list, choose a DSCP value from the DSCP (0 to 63) drop-down list.

The DSCP value is a packet header code that is used to define QoS across the Internet. The DSCP values are mapped to the following QoS levels:

- **Platinum (Voice)**—Assures a high QoS for Voice over Wireless.

- **Gold (Video)**—Supports high-quality video applications.

- **Silver (Best Effort)**—Supports normal bandwidth for clients.

- **Bronze (Background)**—Provides the lowest bandwidth for guest services.

You can also choose Custom and specify the DSCP value. The valid range is from 0 to 63.

j) Click Apply.

k) Click Save Configuration.

Step 2
Associate an AVC profile to a WLAN by following these steps:

a) Choose WLANs and click the corresponding WLAN ID.

The WLANs > Edit page is displayed.

b) Click the QoS tab.
c) Choose the AVC profile from the AVC Profile drop-down list.
d) Click Apply.
e) Click Save Configuration.

Configuring Application Visibility and Control (CLI)

- Create or delete an AVC profile by entering this command:

  ```
  config avc profile avc-profile-name {create | delete}
  ```

- Add a rule for an AVC profile by entering this command:

  ```
  config avc profile avc-profile-name rule add application application-name {drop | mark dscp-value | ratelimit AverageRatelimitvalue BurstRatelimitvalue}
  ```

- Remove a rule for an AVC profile by entering this command:

  ```
  config avc profile avc-profile-name rule remove application application-name
  ```

- Configure an AVC profile to a WLAN by entering this command:

  ```
  config wlan avc wlan-id profile avc-profile-name {enable | disable}
  ```

- Configure application visibility for a WLAN by entering this command:

  ```
  config wlan avc wlan-id visibility {enable | disable}
  ```

  **Note** Application visibility is the subset of an AVC profile. Therefore, visibility is automatically enabled when you configure an AVC profile on the WLAN.

- Download an AVC Protocol Pack to the controller by entering these commands:

  1. `transfer download datatype avc-protocol-pack`
  2. `transfer download start`

- View information about all AVC profile or a particular AVC profile by entering this command:

  ```
  show avc profile {summary | detailed avc-profile-name}
  ```

- View information about AVC applications by entering these commands:

  ```
  show avc applications [application-group] —Displays all the supported AVC applications for the application group.
  show avc statistics application application_name top-users [downstream wlan | upstream wlan | wlan] [wlan_id ] —Displays AVC statistics for the top users of an application.
  show avc statistics top-apps [upstream | downstream] —Displays the AVC statistics for the most used application.
  show avc statistics wlan wlan_id {application application_name | top-app-groups [upstream | downstream] | top-apps [upstream | downstream]} —Displays the AVC statistics of a WLAN per application or top applications or top application groups.
  show avc statistics client client_MAC {application application_name | top-apps [upstream | downstream]} —Displays the client AVC statistics per application or top applications.
You can view list of 30 applications using the `show avc applications` and `show avc statistics` commands.

- View the protocol pack that is used on the controller by entering this command:
  
  `show avc protocol-pack version`

- View the AVC engine version information by entering this command:
  
  `show avc engine version`

- Configure troubleshooting for AVC events by entering this command:
  
  `debug avc events {enable | disable}`

- Configure troubleshooting for AVC errors by entering this command:
  
  `debug avc error {enable | disable}`

**AVC-Based Reanchoring**

This feature is designed to reanchor clients when they roam from one controller to another controller. Reanchoring of Apple clients prevents depletion of IP addresses available for new clients in controller. The AVC profile-based statistics is used to decide whether the client must be reanchored or deferred. This is useful when the client is actively running voice or video application defined in the AVC rules.

The clients get deauthenticated when they are not transmitting any traffic for applications listed in the AVC rules when they are roaming between controllers.

**Restrictions in AVC Based Reanchoring**

- This feature is supported only in Central Switch mode.

- Some Apple clients roaming to another controller fails to reassociate with the new controller with the new IP address. These clients do not release the old IP address and therefore do not re-associate with the current controller.

- If the Wi-Fi calling signature in any application is changed and AVC fails to recognize this signature, this rule stops working.

- For the client to roam between controllers:
  - The controllers must be in the same mobility group.
  - Roaming is limited to within the same SSID.

- For the updated configuration to be available via CLI or GUI, we recommend that you refresh the interface. However, this is not required for the updated information to be visible on the Monitoring page in the GUI.

This section contains the following subsections:
Configuring AVC-Based Selective Reanchoring (GUI)

**Procedure**

**Step 1** Choose WLANs and click the WLAN ID.
**Step 2** Click the QoS tab.
**Step 3** Check the Application Visibility check box.
**Step 4** Click Advanced tab.
**Step 5** In the Mobility section, check the AVC Based Reanchor check box.
**Step 6** Click Apply to save the configuration.
**Step 7** (Optional) To add rules in the AVC profile:
   a) Choose Wireless > Application Visibility and Control > AVC Profiles page.
   b) Select the AVC profile AVC_BASED_REANCHOR.
      This profile by default contains Jabber-Audio, Jabber-Video, WebEx, and Wifi calling applications.
   c) Click Add New Rule.
   d) From the Application Group drop-down list, choose the application from the various options available.
   e) From the Application Name drop-down list, choose the application name from the various options available.
   f) Click Apply.

   **Note** When enabling AVC-based re-anchoring, the action function is disabled for the application profiles.

**Step 8** (Optional) To delete rules from the AVC profile
   a) Choose Wireless > Application Visibility and Control > AVC Profiles page.
   b) Hover your cursor over the blue drop-down arrow for the rule.
   c) Click Remove.

   **Note** The AVC_BASED_REANCHOR AVC profile can contain up to 32 applications as rules.

Configuring AVC-based Selective Reanchoring (CLI)

**Procedure**

**Step 1** Enable Application Visibility on a WLAN
`config wlan avc wlan-id visibility enable`
**Step 2** Enable Selective Re-anchoring feature on a WLAN
`config wlan mobility selective re-anchoring enable wlan-id`
**Step 3** Disable Selective Re-anchoring feature on a WLAN
config wlan mobility selective re-anchoring disable wlan-id

Step 4  View the status of Selective Reanchor
show wlan wlan-id

Step 5  View the Reanchor statistics
show mobility statistics

Application Visibility Control for FlexConnect

Release 8.1 introduces support for Application Visibility and Control for locally switched WLANs on FlexConnect APs. Application Visibility Control (AVC) provides application-aware control on a wireless network and enhances manageability and productivity. The support of AVC embedded within the FlexConnect AP extends as this is an end-to-end solution, which gives a complete visibility of applications in the network and allows the administrator to perform necessary actions.

Supported Hardware

• Supported Access Points—1700, 2700, 3700, 1532, 1570
• Supported WLCs—3504, 5520, 8540, and vWLC
• Supported Modes—FlexConnect and Flex+bridge mode

Restrictions on AVC for FlexConnect

• IPv6 packet classification is not supported.
• Cisco Aironet 1570 Access Points are not supported.
• Multicast traffic is not supported.
• Downloading the AVC Protocol Pack is not supported on FlexConnect APs.
• The number of applications that you can apply rate limit is 3.
• Only one rule can be configured per application. An application cannot have both a rate limit as well as a Mark rule.
• A maximum of 31 rules can be configured in a profile. You can configure a maximum of 16 profiles in the complete system.
• AAA override of AVC profiles is not supported.
• By design, WLAN-level FlexConnect AVC stats are not supported.
• When the AP is in a FlexGroup and the FlexGroup does not have FlexConnect AVC configured, then FlexConnect AVC configuration is not pushed to the AP from the WLC.
• Netflow Export from WLC is not supported.
• In the stats, DHCP information is not supported on the WLC.
Foreign anchor scenario: AVC for FlexConnect statistics can be seen only on the foreign WLC.

FlexConnect Group AVC configuration:
- WLAN AVC configuration is not inherited when the AP is part of FlexConnect group.
- It is mandatory to configure AVC for FlexConnect on a FlexConnect Group if the AP is part of the FlexConnect group, if you want to push the AVC for FlexConnect configuration to the AP.
- If a FlexConnect AP is not part of a FlexConnect group, local switching WLAN AVC configuration is pushed to the FlexConnect AP.

Upgrade to 8.1 or a later release from a previous release:
- Enabling AVC on Local Switching WLAN might have performance issues on a FlexConnect AP.
- After you upgrade to 8.1 or a later release, AVC configuration of WLAN is pushed to all FlexConnect APs that are not part of the FlexConnect Group. You can disable the AVC configuration at the WLAN level and can configure it at the FlexConnect group level based on your requirement.

Note
We recommend that you do not change any configuration directly on the AP. Doing so might result in unexpected behavior.

This section contains the following subsections:

**Configuring Application Visibility and Control for FlexConnect (GUI)**

**Procedure**

**Step 1** To create a FlexConnect AVC profile and add a rule:
- Choose **Wireless > Application Visibility and Control > FlexConnect AVC Profiles** and click **New**.
- Specify the FlexConnect profile name and click **Apply**.
- Click the profile name and click **Add New Rule**.
- Specify the **Application Group**, **Application Name**, and **Action** and click **Apply**.

**Step 2** To check the visibility globally for all WLANs on a FlexConnect Group, choose **Monitor > Applications > FlexConnect Groups** and select the FlexConnect group that you created earlier.
This page provides more granular visibility per FlexConnect group and lists the top 10 applications in the last 90 seconds, as well as cumulative stats for the top 10 applications. You can view upstream and downstream statistics individually per FlexConnect group on the same page by clicking the **Upstream** and **Downstream** tabs.
You can set the number of applications that are displayed on this page through the **Max Number of Records** drop-down list. The default value is 10.

**Step 3** To specify more granular visibility of the top 10 applications per client on a locally switched WLAN where AVC visibility is enabled, choose **Monitor > Applications > FlexConnect Groups**, select the FlexConnect group name and click the **Client** tab. Then, click any individual client MAC address entry listed on the page. This page provides further granular statistics per client associated on locally switched WLANs where AVC visibility is enabled on the WLAN itself or on the FlexConnect Group, and lists the top 10 applications in last
the 180 seconds as well as cumulative stats for top 10 applications. You can view upstream and downstream stats individually per-client from same page by clicking the Upstream and Downstream tab. You can set the number of applications that are displayed on this page through the Max Number of Records drop-down list. The default value is 10.

Configuration Example

Procedure

**Step 1** Create an open WLAN.
An open WLAN has Layer 2 security set to None.

**Step 2** Enable FlexConnect Local Switching on the WLAN and click Apply.
   a) On the WLANs page, click the WLAN ID.
   b) On the WLANs > Edit page, click the Advanced tab.
   c) In the FlexConnect area, select the FlexConnect Local Switching check box.

**Step 3** Ensure that the APs connected to this WLAN are among the list of supported access points for this feature. Set the APs in FlexConnect mode.
   a) Choose Wireless > Access Points > All APs.
   b) Click the AP name.
   c) From the AP Mode drop-down list, select FlexConnect and click Apply.

**Step 4** Create a FlexConnect group and add the AP to the FlexConnect group.
   a) Choose Wireless > FlexConnect Groups.
   b) Click New and enter the name of the FlexConnect group, and then click Apply.
   c) On the FlexConnect Groups > Edit page, in the FlexConnect APs area, click Add AP.
   d) You can either select an AP from a list of APs associated with the WLC or directly specify the Ethernet MAC address of the AP that is associated with the WLC.
   e) Click Add.

   **Note** Applications that can be identified, classified, and controlled are listed under Wireless > Application Visibility and Control > FlexConnect AVC Applications. The access points support Protocol Pack version 8.0 and NBAR engine version 16.

**Step 5** Create an AVC profile and add a rule.

   **Note** A FlexConnect AVC profile can have a maximum of 32 rules.
   a) Choose Wireless > Application Visibility and Control > FlexConnect AVC Profiles and click New.
   b) Specify the FlexConnect profile name and click Apply.
   c) Click the profile name and click Add New Rule.
   d) Specify the Application Group, Application Name, and Action and click Apply.

**Step 6** Enable AVC on the FlexConnect group and apply the FlexConnect AVC profile to the FlexConnect group.
   a) Choose Wireless > FlexConnect Group and click the FlexConnect group name.
   b) Click the WLAN AVC Mapping tab.
   c) Specify the WLAN ID and from the Application Visibility drop-down list, choose Enable.
   d) From the Flex AVC Profile drop-down list, choose the FlexConnect AVC profile, and click Add.
e) Click Apply.

**Step 7**

After Application Visibility is enabled on the FlexConnect Group, you can start different types of traffic (from the associated wireless client) using the applications (already installed) such as Cisco Jabber, Skype, Yahoo Messenger, HTTP, HTTPS/SSL, YouTube, Ping, Trace route. After traffic is initiated from the wireless client, visibility of different traffic can be observed on a per-FlexConnect Group and per-client basis. This provides a good overview to the administrator of the network bandwidth utilization and type of traffic in the network per-client and per-branch site.

**Step 8**

To check the visibility globally for all WLANs on a FlexConnect Group, choose Monitor > Applications > FlexConnect Groups and select the FlexConnect group that you created earlier. This page provides more granular visibility per FlexConnect group and lists the top 10 applications in the last 90 seconds, as well as cumulative stats for the top 10 applications. You can view upstream and downstream statistics individually per FlexConnect group on the same page by clicking the Upstream and Downstream tabs.

You can set the number of applications that are displayed on this page through the Max Number of Records drop-down list. The default value is 10.

**Step 9**

To specify more granular visibility of the top 10 applications per client on a locally switched WLAN where AVC visibility is enabled, choose Monitor > Applications > FlexConnect Groups, select the FlexConnect group name and click the Client tab. Then, click any individual client MAC address entry listed on the page. This page provides further granular statistics per client associated on locally switched WLANs where AVC visibility is enabled on the WLAN itself or on the FlexConnect Group, and lists the top 10 applications in the last 180 seconds as well as cumulative stats for top 10 applications. You can view upstream and downstream stats individually per-client from same page by clicking the Upstream and Downstream tab. You can set the number of applications that are displayed on this page through the Max Number of Records drop-down list. The default value is 10.

**Step 10**

Click Clear AVC Stats to clear all the AVC statistics for a particular client.

---

**Configuring Application Visibility and Control for FlexConnect (CLI)**

**Procedure**

- Configure a FlexConnect AVC profile by entering this command:
  ```
  config flexconnect avc profile profile-name {create | delete}
  ```
- Add a rule for a FlexConnect AVC profile by entering this command:
  ```
  config flexconnect avc profile profile-name rule add application app-name {drop | {mark dscp-value {upstream | downstream}}}
  ```
- Delete a rule for a FlexConnect AVC profile by entering this command:
  ```
  config flexconnect avc profile profile-name rule remove application app-name
  ```
- Apply rule changes to a FlexConnect AVC profile by entering this command:
  ```
  config flexconnect avc profile profile-name apply
  ```
- Apply FlexConnect group AVC profile to a WLAN by entering this command:
  ```
  config flexconnect group group-name avc wlan-id visibility wlan-specific
  ```
- See a summary of FlexConnect AVC profiles or detailed information about one FlexConnect AVC profile by entering this command:
  ```
  • show flexconnect avc profile summary
  ```
• show flexconnect avc profile detailed profile-name

**Note**
The FlexConnect AVC profile rules are pushed to the AP only when the rules are in ‘Applied’ state.

- Troubleshooting command:
  
  ```
  debug flexconnect avc {event | error | detail} {enable | disable}
  ```

- Monitoring commands to be entered on the AP console:
  
  a) Check whether the FlexConnect AVC profiles are present on the AP by entering this command:
     
     ```
     show policy-map
     ```
  
  b) See statistics for each application in the FlexConnect AVC profile by entering this command:
     
     ```
     show policy-map target
     ```
  
  c) Check the applications present in the FlexConnect AVC profiles by entering this command:
     
     ```
     show class-map
     ```
  
  d) See WLAN and FlexConnect AVC mapping on the AP by entering this command:
     
     ```
     show dot11 qos
     ```

**Configuration Example**

**Before you begin**
Ensure that you have created an open WLAN.

**Procedure**

**Step 1**
Enable FlexConnect local switching on the WLAN:

```
config wlan flexconnect local-switching wlan-id
```

**Step 2**
Ensure that the APs connected to this WLAN are among the list of supported access points for this feature. Set the APs in FlexConnect mode.

```
config ap mode flexconnect submode none
```

**Step 3**
Create a FlexConnect group and add the AP to the FlexConnect group:

a) ```
config flexconnect group group-name add
```

b) ```
config flexconnect group group-name ap add ap-mac-addr
```

**Step 4**
Create a FlexConnect AVC profile and add a rule:

**Note**  
A FlexConnect AVC profile can have a maximum of 32 rules.

a) ```
config flexconnect avc profile profile-name create
```

b) ```
config flexconnect avc profile profile-name rule add application app-name {drop | mark}
```

**Step 5**
Enable AVC on the FlexConnect group and apply the FlexConnect AVC profile to the FlexConnect group.

a) ```
config flexconnect group group-name avc wlan-id visibility enable
```

b) ```
config wlan avc wlan-id visibility enable
```

c) ```
config wlan avc wlan-id flex-profile profile-name enable
```
Step 6 Configure the FlexConnect group AVC to a WLAN in local switching mode.

```
config flexconnect group group-name avc wlan-id visibility wlan-specific
```

Step 7 After Application Visibility is enabled on the FlexConnect Group, you can start different types of traffic (from the associated wireless client) using the applications (already installed) such as Cisco Jabber, Skype, Yahoo Messenger, HTTP, HTTPS/SSL, YouTube, Ping, Trace route.

After traffic is initiated from the wireless client, visibility of different traffic can be observed on a per-FlexConnect Group and per-client basis. This provides a good overview to the administrator of the network bandwidth utilization and type of traffic in the network per-client and per-branch site.

Step 8 To check the visibility globally for all WLANs on a FlexConnect Group:

```
show flexconnect avc statistics
```

Step 9 To see a summary of AVC for FlexConnect profiles or detailed information about one AVC for FlexConnect profile:

- `show flexconnect avc profile summary`
- `show flexconnect avc profile detailed profile-name`

**Note** The AVC profile rules are pushed to the AP only when the rules are in 'Applied' state.

Step 10 To troubleshoot AVC for FlexConnect:

```
debug flexconnect avc {event | error | detail} {enable | disable}
```

Step 11 Monitoring commands to be entered on the AP console:

a) Check whether the FlexConnect AVC profiles are present on the AP by entering this command:

```
show policy-map
```

b) See statistics for each application in the FlexConnect AVC profile by entering this command:

```
show policy-map target
```

c) Check the applications present in the FlexConnect AVC profiles by entering this command:

```
show class-map
```

d) See WLAN and FlexConnect AVC mapping on the AP by entering this command:

```
show dot11 qos
```

---

**NetFlow**

NetFlow is an embedded instrumentation within the controller software to characterize wireless network flows. NetFlow monitors each IP flow and exports the aggregated flow data to the external NetFlow collectors.

The NetFlow architecture consists of the following components:

- Collector—Entity that collects all the IP traffic information from various NetFlow exporters.
- Exporter—Network entity that exports the template with the IP traffic information. The controller acts as an exporter.

**Note** Controller does not support IPv6 address format when acting as an exporter for NetFlow.
NetFlow has added an enhanced template in Release 8.2 using the Version 9 export format, which provides additional 17-field information about the flow. This report is compatible with third-party NetFlow collectors, including Lancope. The minimum supported protocol pack version is 14 with NBAR engine version 23. Currently, the enhanced template is supported on specific models, such as Cisco 5520 and Cisco 8540 WLCs. The existing template continues to export data for the following Cisco models:

- Cisco 3504 WLC
- Cisco 5520 WLC
- Cisco 8540 WLC

The following are the template enhancements in NetFlow Version 9:

- New features can be added to NetFlow quickly, without breaking existing implementations.
- NetFlow is future-proofed against new or developing protocols, because NetFlow Version 9 can be adapted to provide support for those protocols.
- NetFlow Version 9 is the IETF standard mechanism for information export.
- Third-party business partners who produce applications that provide collector or display services for NetFlow are not required to recompile their applications each time a new NetFlow feature is added.

Table 3: List of data points in a NetFlow template

<table>
<thead>
<tr>
<th>Existing Template: ipv4_client_app_flow_record</th>
<th>Enhanced template: ipv4_client_src_dst_flow_record</th>
</tr>

</tbody>
</table>
Restrictions for Using Netflow

- The enhanced template is supported only on Cisco 3504, 5520, and 8540 WLCs.
- NetFlow is not supported on Cisco Virtual Wireless Controller (vWLC).
- FlexConnect mode is not supported.
- IPv6 traffic is not supported.
- Only one collector and exporter each can be configured.

Configuring NetFlow (GUI)

Before you begin
You have to enable AVC before enabling netflow on a WLAN.

Procedure

Step 1 Configure the Exporter by performing these steps:
  a) Choose Wireless > Netflow > Exporter.
  b) Click New.
  c) Enter the Exporter name, IP address, and the port number.
     The valid range for the port number is from 1 to 65535.
  d) Click Apply.
  e) Click Save Configuration.

Step 2 Configure the NetFlow Monitor by performing these steps:
  a) Choose Wireless > Netflow > Monitor.
  b) Click New and enter a Monitor name.
  c) On the Monitor List window, click the Monitor name to open the Netflow Monitor > Edit window.
  d) Choose the exporter name and the record name from the respective drop-down lists.
     - Client App Record—Better Performance
     - Client Source and Destination Record—Higher Visibility
e) Click Apply.
f) Click Save Configuration.

**Step 3**

Associate a NetFlow Monitor to a WLAN by performing these steps:
a) Choose WLANs and click a WLAN ID to open the WLANs > Edit page.
b) In the QoS tab, choose a NetFlow monitor from the Netflow Monitor drop-down list.
c) Click Apply.
d) Click Save Configuration.

---

**Configuring NetFlow (CLI)**

- Create an Exporter by entering this command:

  ```
  config flow create exporter exporter-name ip-addr port-number
  ```

- Create a NetFlow Monitor by entering this command:

  ```
  config flow create monitor monitor-name
  ```

- Associate or dissociate a NetFlow monitor with an exporter by entering this command:

  ```
  config flow {add | delete} monitor monitor-name exporter exporter-name
  ```

- Associate or dissociate a NetFlow monitor with a record by entering this command:

  ```
  config flow {add | delete} monitor monitor-name record ipv4_client_app_flow_record
  ```

- Associate or dissociate a NetFlow monitor with a record by entering this command:

  ```
  config flow {add | delete} monitor monitor-name record ipv4_client_src_dst_flow_record
  ```

- Associate or dissociate a NetFlow monitor with a WLAN by entering this command:

  ```
  config wlan flow wlan-id monitor monitor-name {enable | disable}
  ```

- View a summary of NetFlow monitors by entering this command:

  ```
  show flow monitor summary
  ```

- View information about the Exporter by entering this command:

  ```
  show flow exporter {summary | statistics}
  ```

- Configure NetFlow debug by entering this command:

  ```
  debug flow {detail | error | info} {enable | disable}
  ```

---

**QoS Profiles**

Cisco UWN solution WLANs support four levels of QoS: Platinum/Voice, Gold/Video, Silver/Best Effort (default), and Bronze/Background. You can configure the voice traffic WLAN to use Platinum QoS, assign the low-bandwidth WLAN to use Bronze QoS, and assign all other traffic between the remaining QoS levels.

The WLAN QoS level defines a specific 802.11e user priority (UP) for over-the-air traffic. This UP is used to derive the over-the-wire priorities for non-WMM traffic, and it also acts as the ceiling when managing WMM traffic with various levels of priorities.

The wireless rate limits can be defined on both upstream and downstream traffic. Rate limits can be defined per SSID and/or specified as a maximum rate limit for all clients. These rate limits can be individually configured.
The access point uses this QoS-profile-specific UP in accordance with the values in the following table to derive the IP DSCP value that is visible on the wired LAN.

**Table 4: Access Point QoS Translation Values**

<table>
<thead>

</tr>
</tbody>
</table>

The IEEE 802.11e UP value for DSCP values that are not mentioned in the table is calculated by considering 3 MSB bits of DSCP.

For example, the IEEE 802.11e UP value for DSCP 32 (100 000 in binary), would be the decimal equivalent of the MSB (100) which is 4. The 802.11e UP value of DSCP 32 is 4.

This section contains the following subsections:

**Configuring QoS Profiles (GUI)**

**Procedure**

**Step 1** Disable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles.

To disable the radio networks, choose **Wireless > 80.11a/n/ac/ax** or **802.11b/g/n/ax > Network**, unselect the **80.11a** (or **802.11b/g**) **Network Status** check box, and click **Apply**.

**Step 2** Choose **Wireless > QoS > Profiles** to open the **QoS Profiles** page.

**Step 3** Click the name of the profile that you want to configure to open the **Edit QoS Profile** page.

**Step 4** Change the description of the profile by modifying the contents of the **Description** text box.

**Step 5** Define the data rates on a per-user basis as follows:
a) Define the average data rate for TCP traffic per user by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
b) Define the peak data rate for TCP traffic per user by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note  The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Ensure that you configure the average data rate before you configure the burst data rate.

c) Define the average real-time rate for UDP traffic per user by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note  Average Data Rate is used to measure TCP traffic while Average Real-time rate is used for UDP traffic. They are measured in kbps for all the entries. The values for Average Data Rate and Average Real-time rate can be different because they are applied to different upper layer protocols such as TCP and UDP. These different values for the rates do not impact the bandwidth.

d) Define the peak real-time rate for UDP traffic per user by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note  The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Step 6  Define the data rates on a per-SSID basis as follows:
a) Define the average data rate TCP traffic per SSID by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
b) Define the peak data rate for TCP traffic per SSID by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note  The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic in the WLANs.

c) Define the average real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.
d) Define the peak real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note  The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic in the WLANs.

Step 7  Define the maximum and default QoS levels for unicast and multicast traffic when you assign a QoS profile to a WLAN.
a) From the Maximum Priority drop-down list, choose the maximum QoS priority for any data frames transmitted by the AP to any station in the WLAN.

For example, a QoS profile named ‘gold’ targeted for video applications has the maximum priority set to video by default.
b) From the Unicast Default Priority drop-down list, choose the QoS priority for unicast data frames transmitted by the AP to non-WMM stations in the WLAN.
c) From the Multicast Default Priority drop-down list, choose the QoS priority for multicast data frames transmitted by the AP to stations in the WLAN.
The default unicast priority cannot be used for non-WMM clients in a mixed WLAN.

**Step 8**
Choose 802.1p from the Protocol Type drop-down list and enter the maximum priority value in the 802.1p Tag text box to define the maximum value (0–7) for the priority tag associated with packets that fall within the profile.

The tagged packets include CAPWAP data packets (between access points and the controller) and packets sent toward the core network.

**Note** If a QoS profile has 802.1p tagging configured and if this QoS profile is assigned to a WLAN that uses an untagged interface on the controller, the client traffic will be blocked.

**Step 9**
Click Apply.

**Step 10**
Click Save Configuration.

**Step 11**
Reenable the 802.11 networks.

To enable the radio networks, choose Wireless > 802.11a/n/ac/ax or 802.11b/g/n/ax > Network, select the 802.11a (or 802.11b/g) Network Status check box, and click Apply.

**Step 12**
Choose WLANs and select a WLAN ID to apply the new QoS profile to it.

**Step 13**
In the WLAN > Edit page, go to the QoS tab and select the QoS Profile type from the Quality of Service drop-down list. The QoS profile will add the rate limit values configured on the controller on per WLAN, per radio and per AP basis.

For example, if upstream rate limit of 5Mbps is configured for a QoS profile of type silver, then every WLAN that has silver profile will limit traffic to 5Mbps (5Mbps for each wlan) on each radio and on each AP where the WLAN is applicable.

**Step 14**
Click Apply.

**Step 15**
Click Save Configuration.

---

**Configuring QoS Profiles (CLI)**

**Procedure**

**Step 1**
Disable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles by entering these commands:

```plaintext
config 802.11 {a | b} disable network
```

**Step 2**
Change the profile description by entering this command:

```plaintext
config qos description {bronze | silver | gold | platinum} description
```

**Step 3**
Define the average data rate for TCP traffic per user or per SSID by entering this command:

```plaintext
config qos average-data-rate {bronze | silver | gold | platinum} {per-ssid | per-client} {downstream | upstream} rate
```

**Note** For the rate parameter, you can enter a value between 0 and 512,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS profile.
**Step 4** Define the peak data rate for TCP traffic per user or per SSID by entering this command:

```bash
config qos burst-data-rate \{bronze | silver | gold | platinum\} \{per-ssid \| per-client\} \{downstream \| upstream\} \{downstream \| upstream\} rate
```

**Step 5** Define the average real-time data rate for UDP traffic per user or per SSID by entering this command:

```bash
config qos average-realtime-rate \{bronze | silver | gold | platinum\} \{per-ssid \| per-client\} \{downstream \| upstream\} rate
```

**Step 6** Define the peak real-time data rate for UDP traffic per user or per SSID by entering this command:

```bash
config qos burst-realtime-rate \{bronze | silver | gold | platinum\} \{per-ssid \| per-client\} \{downstream \| upstream\} rate
```

**Step 7** Define the maximum and default QoS levels for unicast and multicast traffic when you assign a QoS profile to a WLAN by entering this command:

```bash
config qos priority \{bronze | gold | platinum | silver\} \{maximum priority\} \{default unicast priority\} \{default multicast priority\}
```

You choose from the following options for the `maximum priority`, `default unicast priority`, and `default multicast priority` parameters:

- besteffort
- background
- video
- voice

**Step 8** Define the maximum value (0–7) for the priority tag associated with packets that fall within the profile, by entering these commands:

```bash
config qos protocol-type \{bronze | silver | gold | platinum\} dot1p
config qos dot1p-tag \{bronze | silver | gold | platinum\} tag
```

The tagged packets include CAPWAP data packets (between access points and the controller) and packets sent toward the core network.

**Note** The 802.1p tagging has impact only on wired packets. Wireless packets are impacted only by the maximum priority level set for a QoS profile.

**Note** If a QoS profile has 802.1p tagging configured and if this QoS profile is assigned to a WLAN that uses an untagged interface on the controller, the client traffic will be blocked.

**Step 9** Reenable the 802.11a and 802.11b/g networks so that you can configure the QoS profiles by entering these commands:

```bash
config 802.11 \{a \| b\} enable network
```

**Step 10** Apply the new QoS profile to a WLAN, by entering these commands:

```bash
config wlan qos <WLAN ID> \{bronze | silver | gold | platinum\}
```
Assigning a QoS Profile to a WLAN (GUI)

Before you begin

If you have not already done so, configure one or more QoS profiles using the instructions in the Configuring QoS Profiles (GUI) section.

Procedure

Step 1 Choose WLANs to open the WLANs page.

Step 2 Click the ID number of the WLAN to which you want to assign a QoS profile.

Step 3 When the WLANs > Edit page appears, choose the QoS tab.

Step 4 From the Quality of Service (QoS) drop-down list, choose one of the following:

- Platinum (voice)
- Gold (video)
- Silver (best effort)
- Bronze (background)

Note Silver (best effort) is the default value.

Step 5 To define the data rates on a per-user basis, do the following:

a) Define the average data rate TCP traffic per SSID by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

b) Define the peak data rate for TCP traffic per SSID by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic in the WLANs.

c) Define the average real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

d) Define the peak real-time rate for UDP traffic per SSID by entering the rate in Kbps in the Burst Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic in the WLANs.

Step 6 To define the data rates on a per-SSID basis, do the following:

a) Define the average data rate for TCP traffic per user by entering the rate in Kbps in the Average Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

b) Define the peak data rate for TCP traffic per user by entering the rate in Kbps in the Burst Data Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Ensure that you configure the average data rate before you configure the burst data rate.
c) Define the average real-time rate for UDP traffic per user by entering the rate in Kbps in the Average Real-Time Rate text boxes. A value of 0 indicates that the value specified in the selected QoS profile will take effect.

Note Average Data Rate is used to measure TCP traffic while Average Real-time rate is used for UDP traffic. They are measured in kbps for all the entries. The values for Average Data Rate and Average Real-time rate can be different because they are applied to different upper layer protocols such as TCP and UDP. These different values for the rates do not impact the bandwidth.

Note The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

Step 7 Save the configuration.

Assigning a QoS Profile to a WLAN (CLI)

If you have not already done so, configure one or more QoS profiles using the instructions in the Configuring QoS Profiles (CLI) section.

Procedure

Step 1 Assign a QoS profile to a WLAN by entering this command:
config wlan qos wlan_id {bronze | silver | gold | platinum}
Silver is the default value.

Step 2 To override QoS profile rate limit parameters, enter this command:
config wlan override-rate-limit wlan-id {average-data-rate | average-realtime-rate | burst-data-rate | burst-realtime-rate} {per-ssid | per-client} {downstream | upstream} rate

Step 3 Enter the save config command.

Step 4 Verify that you have properly assigned the QoS profile to the WLAN by entering this command:
show wlan wlan_id
Information similar to the following appears:

WLAN Identifier.................................. 1
Profile Name.................................... test
Network Name (SSID).............................. test
Status........................................... Enabled
MAC Filtering.................................... Disabled
Broadcast SSID.................................. Enabled
AAA Policy Override............................ Disabled
Number of Active Clients....................... 0
Exclusionlist................................... Disabled
Session Timeout................................. 0
Interface....................................... management
WLAN ACL....................................... unconfigured
Cisco Air Time Fairness

Cisco Air Time Fairness (ATF) for High Density Experience (HDX) allows network administrators to group devices of a defined category and enables some groups to receive traffic from the WLAN more frequently than other groups. Therefore, some groups are entitled to more air time than other groups.

Cisco ATF has the following capabilities:

- Allocates Wi-Fi air time for user groups or device categories
- Air time fairness is defined by the network administrator and not by the network
- Provides a simplified mechanism for allocating air time
- Dynamically adapts to changing conditions in a WLAN
- Enables a more efficient fulfillment of service-level agreements
- Augments standards-based Wi-Fi QoS mechanisms

By enabling network administrators to define what fairness means within their environments with regard to the amount of on air time per client group, the amount of traffic is also controlled.

To control air time on a percentage basis, the air time, which includes both uplink and downlink transmissions of a client/SSID, is continuously measured.

Only air time in the downlink direction, that is AP to client, can be controlled accurately by the AP. Although air time in the uplink direction, that is client to AP, can be measured, it cannot be strictly controlled. Although the AP can constrain air time for packets that it sends to clients, the AP can only measure air time for packets that it hears from clients because it cannot strictly limit their air time.

Cisco ATF establishes air time limits (defined as a percentage of total air time) and to apply those limits on a per SSID basis, where the SSID is used as a parameter to define a client group. Other parameters can be used as well to define groups of clients. Furthermore, a single air time limit (defined as a percentage of total air time) can be applied to individual clients.

If the air time limit for an SSID (or client) is exceeded, the packets that are in the downlink direction are dropped. Dropping downlink packets (AP to client) frees up air time whereas dropping uplink packets (client to AP) does not do anything to free up air time because the packet has already been transmitted over the air by the client.

**Client Fair Sharing**

With Cisco Wireless Release 8.2, Cisco Air Time Fairness can be enforced on clients that are associated with an SSID/WLAN. This ensures that all clients within an SSID/WLAN are treated equally based on their utilization of the radio bandwidth. This feature is useful in scenarios where one or a few clients could use the
complete air time allocated for an SSID/WLAN, thereby depriving Wi-Fi experience for other clients associated with the same SSID/WLAN.

• The percentage of air time to be given to each client is recomputed every time a client connects or disconnects.

• Client fair sharing is applicable to only downstream traffic.

• Clients can be categorized into the following usage groups at the policy level: low, medium, and high.

• Client-based ATF metrics accumulation is performed in the transmit complete routine. This allows the air time that is unused by clients in low-usage or medium-usage groups to be accumulated to a common share pool bucket where the high-usage clients can be replenished.

**Supported Access Point Platforms**

Cisco ATF is supported on the following access points:

• Cisco Aironet 1570 Series Access Points
• Cisco Aironet 1700 Series Access Points
• Cisco Aironet 2700 Series Access Points
• Cisco Aironet 3700 Series Access Points

---

**Note**

Cisco ATF is supported only on Local and FlexConnect mode APs.

---

**Cisco ATF Modes**

Cisco ATF operates in the following modes:

• Monitor mode in which users can do the following:
  
  • View the air time
  
  • Report air time usage for all AP transmissions
  
  • View reports
    
    • per SSID/WLAN
    
    • per AP Group
    
    • per AP
    
    • per client

  
  • Report air time usage at periodic intervals
  
  • Block ACKs are not reported

  • No enforcement as part of Monitor mode

• Enforce Policy mode in which users can do the following:
• Enforce air time based on configured policy
• Enforce air time on
  • a WLAN
  • All APs connected within a controller's network
  • an AP group
  • an AP
  • a client
• An AP can have multiple WLANs with multiple policies (1:16)
• Strict Enforcement per WLAN—Air time used by the WLANs on a radio is strictly enforced up to the configured limits in the policies
• Optimal Enforcement per WLAN—Share unused air time from other SSIDs
• The sum of all policies should amount to 100 percent; there can be no oversubscription.

Restrictions on Cisco Air Time Fairness

• ATF can be implemented only on data frames that are in the downstream direction.

• When ATF is configured in per-SSID mode, all of the WLANs must be disabled before you can enter any ATF configuration commands. The WLANs can be enabled after all of the ATF commands have been entered.

Cisco Air Time Fairness (ATF) Use Cases

Public Hotspots (Stadium/Airport/Convention Center/Other)
In this instance a public network is sharing a WLAN between two (or more) service providers and the venue. Subscribers to each service provider can be grouped and each group can be allocated a certain percentage of air time.

Education
In this instance, a university is sharing a WLAN between students, faculty, and guests. The guest network can be further partitioned by service provider. Each group can be assigned a certain percentage of air time.

Enterprise/Hospitality/Retail
In this instance, the venue is sharing a WLAN between employees and guests. The guest network can be further partitioned by service provider. The guests could be sub-grouped by tier of service type with each subgroup being assigned a certain percentage of air time, for example a paid group is entitled to more air time than the free group.

Time Shared Managed Hotspot
In this instance, the business entity managing the hotspot, such as a service provider or an enterprise, can allocate and subsequently lease air time to other business entities.

The following are the high-level steps to configure Cisco ATF:
1. Enable Monitor mode to determine network usage (optional)
2. Create Cisco ATF policies
3. Add WLAN ATF policies per network, AP group, or AP. Policies set in AP or AP group override per
   network polices.
4. Determine if optimization should be enabled.
5. Periodically check Cisco ATF statistics.

This section contains the following subsections:

**Configuring Cisco Air Time Fairness (GUI)**

**Configuring Cisco ATF Monitor Mode (GUI)**

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Wireless &gt; ATF &gt; Monitor Configuration.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>On the ATF Monitor Mode Configuration page, choose an AP, AP group, or an entire network. If you choose the entire network, specify the radio type(s).</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click Enable.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Save the configuration.</td>
</tr>
</tbody>
</table>

**Configuring Cisco ATF Policy (GUI)**

**Procedure**

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Choose Wireless &gt; ATF &gt; Policy Configuration.</th>
</tr>
</thead>
</table>
| Step 2 | On the ATF Policy Configuration page, specify an ID, name, and a weight to the ATF policy, and click Create.  
Weighted ratio is used instead of percentages so that the total can exceed 100. The minimum weight that you can set is 10. |
| Step 3 | Check the Client Fair Sharing check box to apply Client Fair Sharing on the policy. |
| Step 4 | Save the configuration. |
Configuring Cisco ATF Enforcement SSID (GUI)

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose Wireless &gt; ATF &gt; Enforcement SSID Configuration.</td>
</tr>
<tr>
<td>Step 2</td>
<td>On the ATF Enforcement SSID Configuration page, apply the ATF policy created to an AP, an AP group, or the entire network with the radio type specified.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Choose the enforcement type as either Optimized or Strict.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Enable.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Enforce an ATF policy on a WLAN by selecting the WLAN and the ATF policy and clicking Add.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Save the configuration.</td>
</tr>
</tbody>
</table>

Monitoring ATF Statistics (GUI)

Procedure

To monitor per WLAN per AP ATF statistics with percentage of used time, choose Wireless > ATF > ATF Statistics. Select the AP name in the drop-down list to view the statistics.

- abs—Number of air time units being used per SSID
- Relative Time—Percentage of time used per SSID
- Total Air time—Total air time used per SSID

Configuring Cisco Air Tme Fairness (CLI)

Procedure

- Configure Cisco ATF at the network level (global) by entering these commands:
  - config atf 802.11 {a | b} mode disable
  - config atf 802.11 {a | b} mode monitor
  - config atf 802.11 {a | b} mode enforce-policy
  - config atf 802.11 {a | b} optimization {enable | disable}
- Configure Cisco ATF on a per AP group basis by entering these commands:
  - config wlan apgroup atf 802.11 {a | b} mode disable ap-group-name
  - config wlan apgroup atf 802.11 {a | b} mode monitor ap-group-name
  - config wlan apgroup atf 802.11 {a | b} mode enforce-policy ap-group-name
  - config wlan apgroup atf 802.11 {a | b} optimization {enable | disable} ap-group-name
- Configure Cisco ATF on a per AP radio basis by entering these commands:
• configure ATF policies by entering these commands:
  - `config atf policy create policy-id policy-name policy-weight`
  - `config atf policy modify {weight policy-weight policy-name} {client-sharing {enable | disable} policy-name}`
  - `config atf policy delete policy-name`

• Configure WLAN with a policy ID by entering this command:
  - `config wlan atf wlan-id policy policy-id`

• Configure AP group-level override for Cisco ATF policy on a WLAN by entering these commands:
  - `config wlan apgroup atf 802.11 {a | b} policy ap-group-name wlan-id policy-name override {enable | disable}`

• Configure AP-level override for Cisco ATF policy on a WLAN by entering these commands:
  - `config ap atf 802.11 {a | b} policy wlan-id policy-name ap-name override {enable | disable}`

• Monitor Cisco ATF configurations by entering these commands:
  - `show atf config all`
  - `show atf config ap-name ap-name`
  - `show atf config apgroup ap-group-name`
  - `show atf config 802.11 {a | b} summary`
  - `show atf statistics ap ap-name 802.11 {a | b} summary`
  - `show atf statistics ap ap-name 802.11 {a | b} wlan wlan-id`
  - `show atf statistics ap ap-name 802.11 {a | b} policy policy-name`
