## PREFACE
- Preface  liii
  - Audience  liii
- Document Conventions  liii
- Related Documentation  lvi
- Obtaining Documentation and Submitting a Service Request  lvi

## PART I
### Using the Command-Line Interface  57

### CHAPTER 1
- Using the Command-Line Interface  1
  - CLI Command Keyboard Shortcuts  2
  - Using the Interactive Help Feature  4
    - Using the help Command  4
    - Using the ? command  5
    - Using the partial? command  5
    - Using the partial command:<tab>  6
    - Using the command?  6
      - command keyword ?  6

## PART II
### Clear Commands  9

### CHAPTER 2
- Clear Commands: a to l  11
  - clear advanced  12
  - clear acl counters  13
  - clear ap config  14
clear ap eventlog 15
clear ap join stats 16
clear arp 17
clear ap tsm 18
clear atf 19
clear ave statistics 20
clear client tsm 22
clear config 23
clear ext-webauth-url 24
clear location rfid 25
clear location statistics rfid 26
clear locp statistics 27
clear login-banner 28
clear lwapp private-config 29

CHAPTER 3

Clear Commands: m to z 31

clear mdns service-database 32
clear nmsp statistics 33
clear radius acct statistics 34
clear session 35
clear tacacs auth statistics 36
clear redirect-url 37
clear stats ap wlan 38
clear stats local-auth 39
clear stats mobility 40
clear stats port 41
clear stats radius 42
clear stats smart-lic 44
clear stats switch 45
clear stats tacacs 46
clear transfer 47
clear traplog 48
clear urlacl-counters 49
clear webimage 50
Config Commands: 802.11

- config 802.11-abgn
- config 802.11-rx-abgn
- config 802.11-a11acsupport
- config 802.11-a antenna extAntGain
- config 802.11-a channel ap
- config 802.11-a txpower ap
- config 802.11 antenna diversity
- config 802.11 antenna extAntGain
- config 802.11 antenna mode
- config 802.11 antenna selection
- config 802.11b 11gSupport
- config 802.11b preamble

ping 1925

CHAPTER 19

Miscellaneous Commands: 2 1927
capwap ap controller ip address 1929
Preface

This preface describes the audience, organization, and conventions of the *Cisco Wireless LAN Controller Command Reference Guide*. It also provides information on how to obtain other documentation. This chapter includes the following sections:

- Audience, on page liii
- Document Conventions, on page liii
- Related Documentation, on page lvi
- Obtaining Documentation and Submitting a Service Request, on page lvi

Audience

This publication is for experienced network administrators who configure and maintain Cisco wireless controllers (Cisco WLCs) and Cisco lightweight access points (Cisco APs).

Note

Usage of test commands may cause system disruption such as unexpected reboot of the Cisco WLC. Therefore, we recommend that you use the test commands on Cisco WLCs for debugging purposes with the help of Cisco Technical Assistance Center (TAC) personnel.

Document Conventions

This document uses the following conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Indication</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bold</strong> font</td>
<td>Commands and keywords and user-entered text appear in <strong>bold</strong> font.</td>
</tr>
<tr>
<td><em>italic</em> font</td>
<td>Document titles, new or emphasized terms, and arguments for which you supply values are in <em>italic</em> font.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>{x</td>
<td>y</td>
</tr>
</tbody>
</table>
Indication

Optional alternative keywords are grouped in brackets and separated by vertical bars.

A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.

Terminal sessions and information the system displays appear in courier font.

Nonprinting characters such as passwords are in angle brackets.<>

Default responses to system prompts are in square brackets.[ ]

An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

---

Note

Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

Tip

Means the following information will help you solve a problem.

Caution

Means reader be careful. In this situation, you might perform an action that could result in equipment damage or loss of data.

Warning

This warning symbol means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. (To see translations of the warnings that appear in this publication, refer to the appendix "Translated Safety Warnings.")

<table>
<thead>
<tr>
<th>Warning Title</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Waarschuwing</td>
<td>Dit waarschuwingssymbool betekent gevaar. U verkeert in een situatie die lichamelijk letsel kan veroorzaken. Voordat u aan enige apparatuur gaat werken, dient u zich bewust te zijn van de bij elektrische schakelingen betrokken risico's en dient u op de hoogte te zijn van standaard maatregelen om ongelukken te voorkomen. (Voor vertalingen van de waarschuwingen die in deze publicatie verschijnen, kunt u het aanhangsel &quot;Translated Safety Warnings&quot; (Vertalingen van veiligheidsvoorschriften) raadplegen.)</td>
</tr>
<tr>
<td>Varoitus</td>
<td>Tämä varoitusmerkki merkitsee vaaraa. Olet tilanteessa, joka voi johtaa ruumiinvammoa. Ennen kuin työskentelet minkään laitteiston parissa, ota selvää sähkökytkentöihin liittyvistä vaaroista ja tavanomaisista onnettomuuksien ehkäisykeinoista. (Tässä julkaisussa esiintyvien varoitusten käännökset löydet litiiteestä &quot;Translated Safety Warnings&quot; (käännetyt turvallisuutta koskevat varoitukset).)</td>
</tr>
<tr>
<td>Warning Title</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Attention</td>
<td>Ce symbole d'avertissement indique un danger. Vous vous trouvez dans une situation pouvant entraîner des blessures. Avant d'accéder à cet équipement, soyez conscient des dangers posés par les circuits électriques et familiarisez-vous avec les procédures courantes de prévention des accidents. Pour obtenir les traductions des mises en garde figurant dans cette publication, veuillez consulter l'annexe intitulée « Translated Safety Warnings » (Traduction des avis de sécurité).</td>
</tr>
<tr>
<td>Warnung</td>
<td>Dieses Warnsymbol bedeutet Gefahr. Sie befinden sich in einer Situation, die zu einer Körperverletzung führen könnte. Bevor Sie mit der Arbeit an irgendeinem Gerät beginnen, seien Sie sich der mit elektrischen Stromkreisen verbundenen Gefahren und der Standardpraktiken zur Vermeidung von Unfällen bewußt. (Übersetzungen der in dieser Veröffentlichung enthaltenen Warnhinweise finden Sie im Anhang mit dem Titel &quot;Translated Safety Warnings&quot; (Übersetzung der Warnhinweise).)</td>
</tr>
<tr>
<td>Avvertenza</td>
<td>Questo simbolo di avvertenza indica un pericolo. Si è in una situazione che può causare infortuni. Prima di lavorare su qualsiasi apparecchiatura, occorre conoscere i pericoli relativi ai circuiti elettrici ed essere al corrente delle pratiche standard per la prevenzione di incidenti. La traduzione delle avvertenze riportate in questa pubblicazione si trova nell'appendice, &quot;Translated Safety Warnings&quot; (Traduzione delle avvertenze di sicurezza).</td>
</tr>
<tr>
<td>Advarsel</td>
<td>Dette varselsymbolet betyr fare. Du befinner deg i en situasjon som kan føre til personskade. For du utfører arbeid på utstyr, må du være oppmerksom på de faremomentene som elektriske kretser innebærer, samt gjøre deg kjent med vanlig praksis når det gjelder å unngå ulykker. (Hvis du vil se oversettelser av de advarslene som finnes i denne publikasjonen, kan du se i vedlegget &quot;Translated Safety Warnings&quot; [Oversatte sikkertshetshvarsler].)</td>
</tr>
<tr>
<td>Aviso</td>
<td>Este símbolo de aviso indica perigo. Encontra-se numa situação que lhe poderá causar danos físicos. Antes de começar a trabalhar com qualquer equipamento, familiarize-se com os perigos relacionados com circuitos elétricos, e com quaisquer práticas comuns que possam prevenir possíveis acidentes. (Para ver as traduções dos avisos que constam desta publicação, consulte o apêndice &quot;Translated Safety Warnings&quot; - &quot;Traduções dos Avisos de Segurança&quot;).</td>
</tr>
<tr>
<td>¡Advertencia!</td>
<td>Este símbolo de aviso significa peligro. Existe riesgo para su integridad física. Antes de manipular cualquier equipo, considerar los riesgos que entraña la corriente eléctrica y familiarizarse con los procedimientos estándar de prevención de accidentes. (Para ver traducciones de las advertencias que aparecen en esta publicación, consultar el apéndice titulado &quot;Translated Safety Warnings.&quot; )</td>
</tr>
<tr>
<td>Warning</td>
<td>Denna varningssymbol signalerar fara. Du befinner dig i en situation som kan leda till personskada. Innan du utför arbete på någon utrustning måste du vara medveten om farorna med elkretsar och känna till vanligt förfarande för att förebygga skador. (Se förklaringar av de varningar som förekommer i denna publikation i appendix &quot;Translated Safety Warnings&quot; [Översatta säkerhetsvarningar].)</td>
</tr>

Obtaining Documentation and Submitting a Service Request

For information about obtaining documentation, submitting a service request, and gathering additional information, see the monthly *What's New in Cisco Product Documentation*, which also lists all new and revised Cisco technical documentation, at:

Subscribe to the *What's New in Cisco Product Documentation* as an RSS feed and set content to be delivered directly to your desktop using a reader application. The RSS feeds are a free service. Cisco currently supports RSS Version 2.0.
PART

Using the Command-Line Interface

• Using the Command-Line Interface, on page 1
Using the Command-Line Interface

This chapter contains the following topics:

- CLI Command Keyboard Shortcuts, on page 2
- Using the Interactive Help Feature, on page 4
# CLI Command Keyboard Shortcuts

The table below lists the CLI keyboard shortcuts to help you enter and edit command lines on the controller.

## Table 1: CLI Command Keyboard Shortcuts

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Keyboard Shortcut</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change</td>
<td>The word at the cursor to lowercase.</td>
<td>Esc I</td>
</tr>
<tr>
<td></td>
<td>The word at the cursor to uppercase.</td>
<td>Esc u</td>
</tr>
<tr>
<td>Delete</td>
<td>A character to the left of the cursor.</td>
<td>Ctrl-h, Delete, or Backspace</td>
</tr>
<tr>
<td></td>
<td>All characters from the cursor to the beginning of the line.</td>
<td>Ctrl-u</td>
</tr>
<tr>
<td></td>
<td>All characters from the cursor to the end of the line.</td>
<td>Ctrl-k</td>
</tr>
<tr>
<td></td>
<td>All characters from the cursor to the end of the word.</td>
<td>Esc d</td>
</tr>
<tr>
<td></td>
<td>The word to the left of the cursor.</td>
<td>Ctrl-w or Esc Backspace</td>
</tr>
<tr>
<td>Display MORE output</td>
<td>Exit from MORE output.</td>
<td>q, Q, or Ctrl-C</td>
</tr>
<tr>
<td></td>
<td>Next additional screen. The default is one screen. To display more than one screen, enter a number before pressing the Spacebar key.</td>
<td>Spacebar</td>
</tr>
<tr>
<td></td>
<td>Next line. The default is one line. To display more than one line, enter the number before pressing the Enter key.</td>
<td>Enter</td>
</tr>
<tr>
<td></td>
<td>Enter or Return key character.</td>
<td>Ctrl-m</td>
</tr>
<tr>
<td></td>
<td>Expand the command or abbreviation.</td>
<td>Ctrl-t or Tab</td>
</tr>
<tr>
<td></td>
<td>Move the cursor</td>
<td>Ctrl-b or Left Arrow</td>
</tr>
<tr>
<td></td>
<td>Move the cursor</td>
<td>Ctrl-f or Right Arrow</td>
</tr>
<tr>
<td></td>
<td>One word to the left (back), to the beginning of the current or previous word.</td>
<td>Esc b</td>
</tr>
<tr>
<td><strong>Action</strong></td>
<td><strong>Description</strong></td>
<td><strong>Keyboard Shortcut</strong></td>
</tr>
<tr>
<td>------------</td>
<td>----------------</td>
<td>----------------------</td>
</tr>
<tr>
<td></td>
<td>One word to the right (forward), to the end of the current or next word.</td>
<td>Esc f</td>
</tr>
<tr>
<td></td>
<td>To the beginning of the line.</td>
<td>Ctrl-a</td>
</tr>
<tr>
<td></td>
<td>To the end of the line.</td>
<td>Ctrl-e</td>
</tr>
<tr>
<td></td>
<td>Redraw the screen at the prompt.</td>
<td>Ctrl-l or Ctrl-r</td>
</tr>
<tr>
<td></td>
<td>Return to the EXEC mode from any configuration mode</td>
<td>Ctrl-z</td>
</tr>
<tr>
<td></td>
<td>Return to the previous mode or exit from the CLI from Exec mode.</td>
<td>exit command</td>
</tr>
<tr>
<td></td>
<td>Transpose a character at the cursor with a character to the left of the cursor.</td>
<td>Ctrl-t</td>
</tr>
</tbody>
</table>
Using the Interactive Help Feature

The question mark (?) character allows you to get the following type of help about the command at the command line. The table below lists the interactive help feature list.

Table 2: Interactive Help Feature List

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>help</td>
<td>Provides a brief description of the Help feature in any command mode.</td>
</tr>
<tr>
<td>? at the command prompt</td>
<td>Lists all commands available for a particular command mode.</td>
</tr>
<tr>
<td>partial command?</td>
<td>Provides a list of commands that begin with the character string.</td>
</tr>
<tr>
<td>partial command&lt;Tab&gt;</td>
<td>Completes a partial command name.</td>
</tr>
<tr>
<td>command ?</td>
<td>Lists the keywords, arguments, or both associated with a command.</td>
</tr>
<tr>
<td>command keyword ?</td>
<td>Lists the arguments that are associated with the keyword.</td>
</tr>
</tbody>
</table>

Using the help Command

Before you begin

To look up keyboard commands, use the help command at the root level.

help

Help may be requested at any point in a command by entering a question mark ‘?’. If nothing matches, the help list will be empty and you must back up until entering a ‘?’ shows the available options. Two types of help are available:

1. Full help is available when you are ready to enter a command argument (for example show ?) and describes each possible argument.
2. Partial help is provided when an abbreviated argument is entered and you want to know what arguments match the input (for example show pr?).

Example:

> help
HELP:
Special keys:
  DEL, BS... delete previous character
  Ctrl-A ..... go to beginning of line
  Ctrl-E .... go to end of line
  Ctrl-F .... go to forward one character
Using the Command-Line Interface

Ctrl-B .... go backward one character
Ctrl-D .... delete current character
Ctrl-U, X. delete to beginning of line
Ctrl-K .... delete to end of line
Ctrl-W .... delete previous word
Ctrl-T .... transpose previous character
Ctrl-P .... go to previous line in history buffer
Ctrl-N .... go to next line in history buffer
Ctrl-Z .... return to root command prompt
Tab, <SPACE> command-line completion
Exit .... go to next lower command prompt
? .... list choices

Using the ? command

Before you begin
To display all of the commands in your current level of the command tree, or to display more information about a particular command, use the ? command.

command name ?

When you enter a command information request, put a space between the command name and ?.

Examples
This command shows you all the commands and levels available from the root level.

> ?
clear Clear selected configuration elements.
config Configure switch options and settings.
debug Manages system debug options.
help Help
linktest Perform a link test to a specified MAC address.
logout Exit this session. Any unsaved changes are lost.
ping Send ICMP echo packets to a specified IP address.
reset Reset options.
save Save switch configurations.
show Display switch options and settings.
transfer Transfer a file to or from the switch.

Using the partial? command

Before you begin
To provide a list of commands that begin with the character string, use the partial command ?.

partial command?
There should be no space between the command and the question mark.

This example shows how to provide a command that begin with the character string “ad”:

> controller> config>ad?
The command that matches with the string “ad” is as follows:

```
advanced
```

## Using the partial command<tab>

**Before you begin**

To complete a partial command name, use the partial command<tab> command.

```
partial command<tab>
```

There should be no space between the command and <tab>.

This example shows how to complete a partial command name that begin with the character string “cert”:

```
Controller >config>cert<tab> certificate
```

## Using the command ?

**Examples**

To list the keywords, arguments, or both associated with the command, use the command ?.

```
command-name ?
```

There should be a space between the command and the question mark.

This example shows how to list the arguments and keyword for the command acl:

```
Controller >config acl ?
```

Information similar to the following appears:

```
apply Applies the ACL to the data path.
counter Start/Stop the ACL Counters.
create Create a new ACL.
delete Delete an ACL.
rule Configure rules in the ACL.
cpu Configure the CPU ACL Information
```

## command keyword ?

To list the arguments that are associated with the keyword, use the command keyword ?:

```
command keyword ?
```

There should be space between the keyword and the question mark.

This example shows how to display the arguments associated with the keyword cpu:

```
Controller >config acl cpu ?
```
Information similar to the following appears:

<table>
<thead>
<tr>
<th>none</th>
<th>None - Disable the CPU ACL</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name&gt;</td>
<td>&lt;name&gt; - Name of the CPU ACL</td>
</tr>
</tbody>
</table>
command keyword ?
PART II

Clear Commands

- Clear Commands: a to l, on page 11
- Clear Commands: m to z, on page 31
Clear Commands: a to l

- clear advanced, on page 12
- clear acl counters, on page 13
- clear ap config, on page 14
- clear ap eventlog, on page 15
- clear ap join stats, on page 16
- clear arp, on page 17
- clear ap tsm, on page 18
- clear ath, on page 19
- clear avc statistics, on page 20
- clear client tsm, on page 22
- clear config, on page 23
- clear ext-webauth-url, on page 24
- clear location rfid, on page 25
- clear location statistics rfid, on page 26
- clear locp statistics, on page 27
- clear login-banner, on page 28
- clear lwapp private-config, on page 29
To reset EDCA parameters, packet parameters, or optimized roaming statistics to their default values, use `clear advanced` command.

```
clear advanced (802.11a | 802.11b) (optimized-roaming stats | packet | edca-parameter)
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>802.11b</td>
<td>Specifies the 802.11b network.</td>
</tr>
<tr>
<td>optimized-roaming stats</td>
<td>Clear the 802.11a optimized roaming statistics.</td>
</tr>
<tr>
<td>packet</td>
<td>Clear the 802.11a packet parameters configuration.</td>
</tr>
<tr>
<td>edca-parameter</td>
<td>Clear the 802.11a edca-parameter configuration.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2.110.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to reset edca-parameter values to default:

```
(Cisco Controller) >clear advanced 802.11a optimized-roaming stats
(Cisco Controller) >clear advanced 802.11a packet
(Cisco Controller) >clear advanced 802.11a edca-parameter
```
To clear the current counters for an Access Control List (ACL), use the `clear acl counters` command.

**clear acl counters acl_name**

**Syntax Description**

| acl_name | ACL name. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the current counters for acl1:

```
(Cisco Controller) >clear acl counters acl1
```
## clear ap config

To clear (reset to the default values) a lightweight access point’s configuration settings, use the `clear ap config` command.

**clear ap config ap_name**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap_name</td>
<td>Access point name.</td>
</tr>
</tbody>
</table>

| Command Default    | None |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Entering this command does not clear the static IP address of the access point.

The following example shows how to clear the access point’s configuration settings for the access point named ap1240_322115:

(Cisco Controller) > clear ap config ap1240_322115
Clear ap-config will clear ap config and reboot the AP. Are you sure you want continue? (y/n)
clear ap eventlog

To delete the existing event log and create an empty event log file for a specific access point or for all access points joined to the controller, use the `clear ap eventlog` command.

```
clear ap eventlog { specific ap_name | all }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>specific</strong></td>
<td>Specifies a specific access point log file.</td>
</tr>
<tr>
<td><strong>ap_name</strong></td>
<td>Name of the access point for which the event log file is emptied.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Deletes the event log for all access points joined to the controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete the event log for all access points:

```
(Cisco Controller) > clear ap eventlog all
This will clear event log contents for all APs. Do you want continue? (y/n): y
All AP event log contents have been successfully cleared.
```
To clear the join statistics for all access points or for a specific access point, use the `clear ap join stats` command.

```plaintext
clear ap join stats { all | ap_mac }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
<tr>
<td>ap_mac</td>
<td>Access point MAC address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the join statistics of all the access points:

```
(Cisco Controller) > clear ap join stats all
```
clear arp

To clear the Address Resolution Protocol (ARP) table, use the `clear arp` command.

```
clear arp
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the ARP table:

```
(Cisco Controller) >clear arp
Are you sure you want to clear the ARP cache? (y/n) 
```

**Related Commands**

- `clear transfer`
- `clear download datatype`
- `clear download filename`
- `clear download mode`
- `clear download serverip`
- `clear download start`
- `clear upload datatype`
- `clear upload filename`
- `clear upload mode`
- `clear upload path`
- `clear upload serverip`
- `clear upload start`
- `clear stats port`
To clear the Traffic Stream Metrics (TSM) statistics of clients associated to an access point, use the `clear ap tsm` command.

```
clear ap tsm {802.11a | 802.11b} cisco_ap all
```

**Syntax Description**

- **802.11a** Clears 802.11a TSM statistics of clients associated to an access point.
- **802.11b** Clears 802.11b TSM statistics of clients associated to an access point.
- **cisco_ap** Cisco lightweight access point.
- **all** Clears TSM statistics of clients associated to the access point.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear 802.11a TSM statistics for all clients of an access point:

```
(Cisco Controller) > clear ap tsm 802.11a AP3600_1 all
```
clear atf

To clear Cisco Airtime Fairness configuration or statistics, use the clear atf command.

```
clear atf { config | statistics }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>config</td>
<td>Clears Cisco ATF configuration</td>
</tr>
<tr>
<td>statistics</td>
<td>Clears Cisco ATF statistics</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

The following is a sample output of the clear atf config command:

```
(Cisco Controller) >clear atf config
```
clear avc statistics

To clear Application Visibility and Control (AVC) statistics of a client, guest LAN, remote LAN, or a WLAN use the clear avc statistics command.

Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear avc statistics { client { all</td>
<td>client-mac }</td>
</tr>
<tr>
<td>client</td>
<td>Clears AVC statistics of all clients.</td>
</tr>
<tr>
<td>all</td>
<td>MAC address of a client.</td>
</tr>
<tr>
<td>client-mac</td>
<td>Clears AVC statistics of a guest LAN.</td>
</tr>
<tr>
<td>guest-lan</td>
<td>Clears AVC statistics of all guest LANs.</td>
</tr>
<tr>
<td>all</td>
<td>Guest LAN Identifier between 1 and 5.</td>
</tr>
<tr>
<td>guest-lan-id</td>
<td>Clears AVC statistics of a remote LAN.</td>
</tr>
<tr>
<td>remote-lan</td>
<td>Clears AVC statistics of all remote LANs.</td>
</tr>
<tr>
<td>all</td>
<td>Remote LAN Identifier between 1 and 512.</td>
</tr>
<tr>
<td>remote-lan-id</td>
<td>Clears AVC statistics of a WLAN.</td>
</tr>
<tr>
<td>wlan</td>
<td>Clears AVC statistics of all WLANs.</td>
</tr>
<tr>
<td>all</td>
<td>WLAN Identifier between 1 and 512.</td>
</tr>
<tr>
<td>wlan-id</td>
<td></td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the AVC statistics of a client:

(Cisco Controller) > clear avc statistics client 00:21:1b:ea:36:60

Related Commands

- config avc profile create
- config avc profile delete
- config avc profile rule
- config wlan avc
- show avc profile
- show avc applications
show avc statistics
debug avc error
debug avc events
clear client tsm

To clear the Traffic Stream Metrics (TSM) statistics for a particular access point or all the access points to which this client is associated, use the clear client tsm command.

```
clear client tsm (802.11a | 802.11b) client_mac (ap_mac | all)
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>802.11b</td>
<td>Specifies the 802.11b network.</td>
</tr>
<tr>
<td>client_mac</td>
<td>MAC address of the client.</td>
</tr>
<tr>
<td>ap_mac</td>
<td>MAC address of a Cisco lightweight access point.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the TSM for the MAC address 00:40:96:a8:f7:98:

```
(Cisco Controller) > clear client tsm 802.11a 00:40:96:a8:f7:98 all
```

**Related Commands**

clear upload start
clear config

To reset configuration data to factory defaults, use the clear config command.

clear config

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to reset the configuration data to factory defaults:

(Cisco Controller) >clear config
Are you sure you want to clear the configuration? (y/n) n
Configuration not cleared!

Related Commands
clear transfer
clear download datatype
clear download filename
clear download mode
clear download serverip
clear download start
clear upload datatype
clear upload filename
clear upload mode
clear upload path
clear upload serverip
clear upload start
clear stats port
clear ext-webauth-url

To clear the external web authentication URL, use the clear ext-webauth-url command.

clear ext-webauth-url

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

Release  Modification
7.6       This command was introduced in a release earlier than Release 7.6.

8.3       This command was introduced.

The following example shows how to clear the external web authentication URL:

(Cisco Controller) > clear ext-webauth-url
URL cleared.

Related Commands

clear location rfid

To clear a specific Radio Frequency Identification (RFID) tag or all of the RFID tags in the entire database, use the clear location rfid command.

clear location rfid {mac_address | all}

Syntax Description

| mac_address | Specifies the MAC address of a specific RFID tag. |
| all         | Specifies all the RFID tags in the database. |

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear all the RFID tags in the database:

(Cisco Controller) > clear location rfid all

Related Commands

clear location statistics rfid
config location
show location
show location
show location statistics rfid
clear location statistics rfid

To clear Radio Frequency Identification (RFID) statistics, use the `clear location statistics rfid` command.

```
clear location statistics rfid
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear RFID statistics:

```
(Cisco Controller) > clear location statistics rfid
```

**Related Commands**

- `config location`
- `show location`
- `show location statistics rfid`
clear locp statistics

To clear the Location Protocol (LOCP) statistics, use the clear locp statistics command.

clear locp statistics

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the statistics related to LOCP:

(Cisco Controller) > clear locp statistics

Related Commands

- clear nmsp statistics
- config nmsp notify-interval measurement
- show nmsp notify-interval summary
- show nmsp statistics
- show nmsp status
clear login-banner

To remove the login banner file from the controller, use the `clear login-banner` command.

**clear login-banner**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the login banner file:

```
(Cisco Controller) >clear login-banner
```

**Related Commands**
`transfer download datatype`
clear lwapp private-config

To clear (reset to default values) an access point’s current Lightweight Access Point Protocol (LWAPP) private configuration, which contains static IP addressing and controller IP address configurations, use the `clear lwapp private-config` command.

**clear lwapp private-config**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Enter the command on the access point console port.

Prior to changing the FlexConnect configuration on an access point using the access point’s console port, the access point must be in standalone mode (not connected to a Cisco WLC) and you must remove the current LWAPP private configuration by using the `clear lwapp private-config` command.

**Note**

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

The following example shows how to clear an access point’s current LWAPP private configuration:

```
ap_console > clear lwapp private-config
removing the reap config file flash:/lwapp_reap.cfg
```
clear lwapp private-config
Clear Commands: m to z

- clear mdns service-database, on page 32
- clear nmsp statistics, on page 33
- clear radius acct statistics, on page 34
- clear session, on page 35
- clear tacacs auth statistics, on page 36
- clear redirect-url, on page 37
- clear stats ap wlan, on page 38
- clear stats local-auth, on page 39
- clear stats mobility, on page 40
- clear stats port, on page 41
- clear stats radius, on page 42
- clear stats smart-lic, on page 44
- clear stats switch, on page 45
- clear stats tacacs, on page 46
- clear transfer, on page 47
- clear traplog, on page 48
- clear urlacl-counters, on page 49
- clear webimage, on page 50
- clear webmessage, on page 51
- clear webtitle, on page 52
clear mdns service-database

To clear the multicast DNS service database, use the `clear mdns service-database` command.

```
clear mdns service-database  { all  |  service-name }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Clears the mDNS service database.</td>
</tr>
<tr>
<td>service-name</td>
<td>Name of the mDNS service. The Cisco WLC clears the details of the mDNS service.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco WLC snoops and learns about the mDNS service advertisements only if the service is available in the Master Services database.

The following example shows how to clear the mDNS service database:

```
(Cisco Controller) > clear mdns service-database all
```

**Related Commands**

- config mdns query interval
- config mdns service
- config mdns snoop
- config interface mdns-profile
- config interface group mdns-profile
- config wlan mdns
- show mdns profile
- show mdns service
- config mdns profile
- debug mdns all
- debug mdns error
- debug mdns detail
- debug mdns message
clear nmsp statistics

To clear the Network Mobility Services Protocol (NMSP) statistics, use the `clear nmsp statistics` command.

```plaintext
Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete the NMSP statistics log file:

```plaintext
(Cisco Controller) > clear nmsp statistics
```

Related Commands
- clear locp statistics
- config nmsp notify-interval measurement
- show nmsp notify-interval summary
- show nmsp status
clear radius acct statistics

To clear the RADIUS accounting statistics on the controller, use the `clear radius acct statistics` command.

```
clear radius acct statistics [index | all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>(Optional) Specifies the index of the RADIUS accounting server.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all RADIUS accounting servers.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the RADIUS accounting statistics:

```
(Cisco Controller) > clear radius acct statistics
```

**Related Commands**

`show radius acct statistics`
clear session

To clear sessions that are created when user logs in through Telnet or SSH, use the clear session command.

**clear session session-id**

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The session ID for clearing the session should be taken from the show login-session command.

The following example shows how to clear Telnet or SSH session:

(Cisco Controller) > clear session 3
clear tacacs auth statistics

To clear the RADIUS authentication server statistics in the controller, use the `clear tacacs auth statistics` command.

```
clear tacacs auth statistics [index | all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>index</strong></td>
<td>(Optional) Specifies the index of the RADIUS authentication server.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>(Optional) Specifies all RADIUS authentication servers.</td>
</tr>
</tbody>
</table>

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the RADIUS authentication server statistics:

```
(Cisco Controller) > clear tacacs auth statistics
```

**Related Commands**

- `show tacacs auth statistics`
- `show tacacs summary`
- `config tacacs auth`
clear redirect-url

To clear the custom web authentication redirect URL on the Cisco Wireless LAN Controller, use the `clear redirect-url` command.

```
(Cisco Controller) > clear redirect-url
URL cleared.
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the custom web authentication redirect URL:

```
(Cisco Controller) > clear redirect-url
URL cleared.
```

**Related Commands**

- `clear transfer`
- `clear download datatype`
- `clear download filename`
- `clear download mode`
- `clear download path`
- `clear download start`
- `clear upload datatype`
- `clear upload filename`
- `clear upload mode`
- `clear upload path`
- `clear upload serverip`
- `clear upload start`
clear stats ap wlan

To clear the WLAN statistics, use the clear stats ap wlan command.

clear stats ap wlan cisco_ap

Syntax Description

cisco_ap

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the WLAN configuration elements of the access point cisco_ap:

(Cisco Controller) > clear stats ap wlan cisco_ap
WLAN statistics cleared.
clear stats local-auth

To clear the local Extensible Authentication Protocol (EAP) statistics, use the clear stats local-auth command.

clear stats local-auth

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3      | This command was introduced. |

The following example shows how to clear the local EAP statistics:

(Cisco Controller) > clear stats local-auth
Local EAP Authentication Stats Cleared.

**Related Commands**

- config local-auth active-timeout
- config local-auth eap-profile
- config local-auth method fast
- config local-auth user-credentials
- debug aaa local-auth
- show local-auth certificates
- show local-auth config
- show local-auth statistics
clear stats mobility

To clear mobility manager statistics, use the **clear stats mobility** command.

```plaintext
clear stats mobility
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear mobility manager statistics:

```plaintext
(Cisco Controller) > clear stats mobility
Mobility stats cleared.
```
clear stats port

To clear statistics counters for a specific port, use the `clear stats port` command.

```
clear stats port port
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>Physical interface port number.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the statistics counters for port 9:

```
(Cisco Controller) > clear stats port 9
```
clear stats radius

To clear the statistics for one or more RADIUS servers, use the **clear stats radius** command.

```
clear stats radius {auth | acct} {index | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>auth</th>
<th>acct</th>
<th>index</th>
<th>all</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Clears statistics regarding authentication.</td>
<td>Clears statistics regarding accounting.</td>
<td>Specifies the index number of the RADIUS server to be cleared.</td>
<td>Clears statistics for all RADIUS servers.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the statistics for all RADIUS authentication servers:

```
(Cisco Controller) > clear stats radius auth all
```

- **clear transfer**
- **clear download datatype**
- **clear download filename**
- **clear download mode**
- **clear download serverip**
- **clear download start**
- **clear upload datatype**
- **clear upload filename**
- **clear upload mode**
- **clear upload path**
- **clear upload serverip**
- **clear upload start**
clear stats port
clear stats smart-lic

To clear all the Cisco Smart Software statistics, use the clear stats smart-lic command.

```
clear stats smart-lic
```

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear smart licensing statistics:

```
(Cisco Controller) > clear stats smart-lic
Initiated Smart Licensing statistics clear
```
### clear stats switch

To clear all switch statistics counters on a Cisco wireless LAN controller, use the `clear stats switch` command.

```
clear stats switch
```

#### Syntax Description

This command has no arguments or keywords.

#### Command Default

None

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear all switch statistics counters:

```
(Cisco Controller) > clear stats switch
```
clear stats tacacs

To clear the TACACS+ server statistics on the controller, use the clear stats tacacs command.

clear stats tacacs [auth | athr | acct] [index | all]

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth</td>
<td>(Optional) Clears the TACACS+ authentication server statistics.</td>
</tr>
<tr>
<td>athr</td>
<td>(Optional) Clears the TACACS+ authorization server statistics.</td>
</tr>
<tr>
<td>acct</td>
<td>(Optional) Clears the TACACS+ accounting server statistics.</td>
</tr>
<tr>
<td>index</td>
<td>(Optional) Specifies index of the TACACS+ server.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all TACACS+ servers.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the TACACS+ accounting server statistics for index 1:

(Cisco Controller) > clear stats tacacs acct 1

**Related Commands**

show tacacs summary
clear transfer

To clear the transfer information, use the clear transfer command.

clear transfer

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the transfer information:

(Cisco Controller) >clear transfer
Are you sure you want to clear the transfer information? (y/n) y
Transfer Information Cleared.

Related Commands

- transfer upload datatype
- transfer upload pac
- transfer upload password
- transfer upload port
- transfer upload path
- transfer upload username
- transfer upload datatype
- transfer upload serverip
- transfer upload start
# clear traplog

To clear the trap log, use the `clear traplog` command.

```
clear traplog
```

## Syntax Description

This command has no arguments or keywords.

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to clear the trap log:

```
(Cisco Controller) > clear traplog
Are you sure you want to clear the trap log? (y/n) y
Trap Log Cleared.
```

## Related Commands

- `clear transfer`
- `clear download datatype`

- `clear upload start`
clear urlacl-counters

To clear the URL ACL counters for given acl name, use the `clear urlacl-counters` command.

```
clear urlacl-counters
```

**Syntax Description**

```
       acl_name         ACL name.
```

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to clear the URL ACL counters for acl name - test:

```
(Cisco Controller) >clear urlacl-counters test
```
clear webimage

To clear the custom web authentication image, use the clear webimage command.

```
clear webimage
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

config 802.11-abgn

To configure dual-band radio parameters on an access point, use the config 802.11-abgn command.

```
config 802.11-abgn  {cleanair {enable | disable} (cisco_ap band band) | (enable | disable) cisco_ap}
```

**Syntax Description**

- `cleanair` Configures CleanAir on the dual-band radio.
- `enable` Enables CleanAir for both 2.4-GHz and 5-GHz radios.
- `disable` Disables CleanAir for both 2.4-GHz and 5-GHz radios.
- `cisco_ap` Name of the access point to which the command applies.
- `band` Configures the radio band.
- `enable` Enables the dual-band radio on an access point.
- `disable` Disables the dual-band radio on an access point.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only Cisco CleanAir-enabled access point radios can be configured for Cisco CleanAir.

The following example shows how to enable Cisco CleanAir on an access point:

```
(Cisco Controller) > config 802.11-abgn cleanair enable AP3600 band 5
```
config 802.11-rx-abgn

To configure dual-band Rx only radio parameter on the Cisco Aironet 4800 Access Point, use the config 802.11-rx-abgn command.

```
config 802.11-rx-abgn { cleanair { enable | disable } | { enable | disable } cisco_ap }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cleanair</td>
<td>Configures CleanAir on the dual-band radio.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables cleanair management on 802.11 dual-band RX-only radio.</td>
</tr>
<tr>
<td>disable</td>
<td>Disable cleanair management on 802.11 dual-band RX-only radio.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the access point to which the command applies.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables 802.11 dual-band RX-only</td>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.7.105.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only Cisco CleanAir-enabled access point radios can be configured for Cisco CleanAir.

The following example shows how to enable 802.11 dual band Rx only on the Cisco 4800 AP:

```
(Cisco Controller) > config 802.11-rx-abgn enable
```
config 802.11a 11acsupport

To configure 802.11ac 5-GHz parameters, use the **config 802.11a 11acsupport**

```
config 802.11a 11acsupport { enable | disable | mcs tx mcs_index ss spatial_stream { enable | disable } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables 802.11ac 5-GHz mode.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables 802.11ac 5-GHz mode.</td>
</tr>
<tr>
<td><code>mcs tx</code></td>
<td>Configures 802.11ac 5-GHz Modulation and Coding Scheme (MCS) rates at which data can be transmitted between the access point and the client.</td>
</tr>
<tr>
<td><code>tx</code></td>
<td>Configures 802.11ac 5-GHz MCS transmit rates.</td>
</tr>
<tr>
<td><code>mcs_index</code></td>
<td>MCS index value of 8 or 9. MCS data rates with index 8 or 9 are specific to 802.11ac. When you enable an MCS data rate with index 9, the data rate with MCS index 8 is automatically enabled.</td>
</tr>
<tr>
<td><code>ss</code></td>
<td>Configures the 802.11ac 5-GHz MCS spatial stream (SS).</td>
</tr>
<tr>
<td><code>spatial_stream</code></td>
<td>Spatial stream within which you can enable or disable an MCS data rate.</td>
</tr>
<tr>
<td></td>
<td>Signals transmitted by the various antennae are multiplexed by using different spaces within the same spectral channel. These spaces are known as spatial streams. Three spatial streams are available within which you can enable or disable a MCS rate. The range is from 1 to 3.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Disabling the 802.11n/ac mode applies only to access radios. Backhaul radios always have 802.11n/ac mode enabled if they are 802.11n capable.

The following example shows how to configure the MCS index for spatial stream 3:

```
(Cisco Controller) > config 802.11a 11acsupport mcs tx 9 ss 3
```
**config 802.11-a antenna extAntGain**

To configure the external antenna gain for the 4.9-GHz and 5.8-GHz public safety channels on an access point, use the `config 802.11-a antenna extAntGain` commands.

```
config { 802.11-a49 | 802.11-a58 } antenna extAntGain ant_gain cisco_ap { global | channel_no }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11-a49</td>
<td>Specifies the 4.9-GHz public safety channel.</td>
</tr>
<tr>
<td>802.11-a58</td>
<td>Specifies the 5.8-GHz public safety channel.</td>
</tr>
<tr>
<td>ant_gain</td>
<td>Value in .5-dBi units (for instance, 2.5 dBi = 5).</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the access point to which the command applies.</td>
</tr>
<tr>
<td>global</td>
<td>Specifies the antenna gain value to all channels.</td>
</tr>
<tr>
<td>channel_no</td>
<td>Antenna gain value for a specific channel.</td>
</tr>
</tbody>
</table>

### Command Default

Channel properties are disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before you enter the `config 802.11-a antenna extAntGain` command, disable the 802.11 Cisco radio with the `config 802.11-a disable` command.

After you configure the external antenna gain, use the `config 802.11-a enable` command to reenable the 802.11 Cisco radio.

The following example shows how to configure an 802.11-a49 external antenna gain of 10 dBi for AP1:

```
(Cisco Controller) >config 802.11-a antenna extAntGain 10 AP1
```
config 802.11-a channel ap

To configure the channel properties for the 4.9-GHz and 5.8-GHz public safety channels on an access point, use the `config 802.11-a channel ap` command.

```bash
config {802.11-a49 | 802.11-a58} channel ap cisco_ap {global | channel_no}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11-a49</td>
<td>Specifies the 4.9-GHz public safety channel.</td>
</tr>
<tr>
<td>802.11-a58</td>
<td>Specifies the 5.8-GHz public safety channel.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the access point to which the command applies.</td>
</tr>
<tr>
<td>global</td>
<td>Enables the Dynamic Channel Assignment (DCA) on all 4.9-GHz and 5.8-GHz subband radios.</td>
</tr>
<tr>
<td>channel_no</td>
<td>Custom channel for a specific mesh access point. The range is 1 through 26, inclusive, for a 4.9-GHz band and 149 through 165, inclusive, for a 5.8-GHz band.</td>
</tr>
</tbody>
</table>

**Command Default**

Channel properties are disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the channel properties:

```bash
(Cisco Controller) > config 802.11-a channel ap
```
### config 802.11-a txpower ap

To configure the transmission power properties for the 4.9-GHz and 5.8-GHz public safety channels on an access point, use the `config 802.11-a txpower ap` command.

```plaintext
config { 802.11-a49 | 802.11-a58} txpower ap cisco_ap {global | power_level}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11-a49</td>
<td>Specifies the 4.9-GHz public safety channel.</td>
</tr>
<tr>
<td>802.11-a58</td>
<td>Specifies the 5.8-GHz public safety channel.</td>
</tr>
<tr>
<td>txpower</td>
<td>Configures transmission power properties.</td>
</tr>
<tr>
<td>ap</td>
<td>Configures access point channel settings.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the access point to which the command applies.</td>
</tr>
<tr>
<td>global</td>
<td>Applies the transmission power value to all channels.</td>
</tr>
<tr>
<td>power_level</td>
<td>Transmission power value to the designated mesh access point. The range is from 1 to 5.</td>
</tr>
</tbody>
</table>

### Command Default

The default transmission power properties for the 4.9-GHz and 5.8-GHz public safety channels on an access point is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an 802.11-a49 transmission power level of 4 for AP1:

```
(Cisco Controller) >config 802.11-a txpower ap 4 AP1
```
config 802.11 antenna diversity

To configure the diversity option for 802.11 antennas, use the `config 802.11 antenna diversity` command.

```
config 802.11 {a | b} antenna diversity {enable | sideA | sideB} cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the diversity.</td>
</tr>
<tr>
<td><code>sideA</code></td>
<td>Specifies the diversity between the internal antennas and an external antenna connected to the Cisco lightweight access point left port.</td>
</tr>
<tr>
<td><code>sideB</code></td>
<td>Specifies the diversity between the internal antennas and an external antenna connected to the Cisco lightweight access point right port.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Cisco lightweight access point name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>

<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable antenna diversity for AP01 on an 802.11b network:

```
(Cisco Controller) > config 802.11a antenna diversity enable AP01
```

The following example shows how to enable diversity for AP01 on an 802.11a network, using an external antenna connected to the Cisco lightweight access point left port (sideA):

```
(Cisco Controller) > config 802.11a antenna diversity sideA AP01
```
config 802.11 antenna extAntGain

To configure external antenna gain for an 802.11 network, use the `config 802.11 antenna extAntGain` command.

```
config 802.11 {a | b} antenna extAntGain antenna_gain cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>antenna_gain</code></td>
<td>Antenna gain in 0.5 dBm units (for example, 2.5 dBm = 5).</td>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you enter the `config 802.11 antenna extAntGain` command, disable the 802.11 Cisco radio with the `config 802.11 disable` command.

After you configure the external antenna gain, use the `config 802.11 enable` command to enable the 802.11 Cisco radio.

The following example shows how to configure an `802.11a` external antenna gain of `0.5 dBm` for `AP1`:

```
(Cisco Controller) >config 802.11 antenna extAntGain 1 AP1
```
config 802.11 antenna mode

To configure the Cisco lightweight access point to use one internal antenna for an 802.11 sectorized 180-degree coverage pattern or both internal antennas for an 802.11 360-degree omnidirectional pattern, use the **config 802.11 antenna mode** command.

```
config 802.11 {a | b} antenna mode {omni | sectorA | sectorB} cisco_ap
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **omni**
  - Specifies to use both internal antennas.

- **sectorA**
  - Specifies to use only the side A internal antenna.

- **sectorB**
  - Specifies to use only the side B internal antenna.

- **cisco_ap**
  - Cisco lightweight access point name.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure access point AP01 antennas for a 360-degree omnidirectional pattern on an 802.11b network:

```
(Cisco Controller) >config 802.11 antenna mode omni AP01
```
**config 802.11 antenna selection**

To select the internal or external antenna selection for a Cisco lightweight access point on an 802.11 network, use the **config 802.11 antenna selection** command.

```
config 802.11 (a | b) antenna selection {internal | external} cisco_ap
```

**Syntax Description**

- `a` Specifies the 802.11a network.
- `b` Specifies the 802.11b/g network.
- `internal` Specifies the internal antenna.
- `external` Specifies the external antenna.
- `cisco_ap` Cisco lightweight access point name.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure access point AP02 on an 802.11b network to use the internal antenna:

```
(Cisco Controller) > config 802.11a antenna selection internal AP02
```
config 802.11b 11gSupport

To enable or disable the Cisco wireless LAN solution 802.11g network, use the `config 802.11b 11gSupport` command.

`config 802.11b 11gSupport {enable | disable}`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the 802.11g network.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the 802.11g network.</td>
</tr>
</tbody>
</table>

**Command Default**
The default network for Cisco wireless LAN solution 802.11g is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you enter the `config 802.11b 11gSupport {enable | disable}` command, disable the 802.11 Cisco radio with the `config 802.11 disable` command.

After you configure the support for the 802.11g network, use the `config 802.11 enable` command to enable the 802.11 radio.

**Note**

To disable an 802.11a, 802.11b and/or 802.11g network for an individual wireless LAN, use the `config wlan radio` command.

The following example shows how to enable the 802.11g network:

```
(Cisco Controller) > config 802.11b 11gSupport enable
Changing the 11gSupport will cause all the APs to reboot when you enable 802.11b network.
Are you sure you want to continue? (y/n) n
11gSupport not changed!
```
config 802.11b preamble

To change the 802.11b preamble as defined in subclause 18.2.2.2 to long (slower, but more reliable) or short (faster, but less reliable), use the config 802.11b preamble command.

```
config 802.11b preamble {long | short}
```

**Syntax Description**

- **long**: Specifies the long 802.11b preamble.
- **short**: Specifies the short 802.11b preamble.

**Command Default**

The default 802.11b preamble value is short.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>

</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must reboot the Cisco Wireless LAN Controller (reset system) with save to implement this command.

This parameter must be set to **long** to optimize this Cisco wireless LAN controller for some clients, including SpectraLink NetLink telephones.

This command can be used any time that the CLI interface is active.

The following example shows how to change the 802.11b preamble to short:

```
(Cisco Controller) >config 802.11b preamble short
(Cisco Controller) >(reset system with save)
```
config 802.11h channelswitch

To configure an 802.11h channel switch announcement, use the `config 802.11h channelswitch` command.

```
config 802.11h channelswitch { enable { loud | quiet } | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the 802.11h channel switch announcement.</td>
</tr>
<tr>
<td>loud</td>
<td>Enables the 802.11h channel switch announcement in the loud mode. The 802.11h-enabled clients can send packets while switching channel.</td>
</tr>
<tr>
<td>quiet</td>
<td>Enables 802.11h-enabled clients to stop transmitting packets immediately because the AP has detected radar and client devices should also quit transmitting to reduce interference.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the 802.11h channel switch announcement.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>

### Command Default

None

### Command History

**Release** | **Modification**  
--- | ---  
7.6 | This command was introduced in a release earlier than Release 7.6.

8.3 | This command was introduced.

The following example shows how to enable the 802.11n support on an 802.11a network:

(Cisco Controller) > **config 802.11a 11nsupport enable**
To specify the aggregation method used for 802.11n packets, use the `config 802.11 11nsupport a-mpdu tx priority` command.

```
cfg 802.11 {a | b} 11nsupport a-mpdu tx priority {0-7 | all} {enable | disable}
```

**Syntax Description**

- **a** Specifies the 802.11a network.
- **b** Specifies the 802.11b/g network.
- **0-7** Specifies the aggregated MAC protocol data unit priority level between 0 through 7.
- **all** Configures all of the priority levels at once.
- **enable** Specifies the traffic associated with the priority level uses A-MPDU transmission.
- **disable** Specifies the traffic associated with the priority level uses A-MSDU transmission.

**Command Default**

Priority 0 is enabled.

**Usage Guidelines**

Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). A-MPDU is performed in the software whereas A-MSDU is performed in the hardware.

Aggregated MAC Protocol Data Unit priority levels assigned per traffic type are as follows:

- **1**—Background
- **2**—Spare
- **0**—Best effort
- **3**—Excellent effort
- **4**—Controlled load
- **5**—Video, less than 100-ms latency and jitter
- **6**—Voice, less than 10-ms latency and jitter
- **7**—Network control
- **all**—Configure all of the priority levels at once.

**Note** Configure the priority levels to match the aggregation method used by the clients.
The following example shows how to configure all the priority levels at once so that the traffic associated with the priority level uses A-MSDU transmission:

(Cisco Controller) >\texttt{config 802.11a 11nsupport a-mpdu tx priority all enable}
config 802.11 11nsupport a-mpdu tx scheduler

To configure the 802.11n-5 GHz A-MPDU transmit aggregation scheduler, use the `config 802.11 11nsupport a-mpdu tx scheduler` command.

```
config 802.11 {a | b} 11nsupport a-mpdu tx scheduler {enable | disable | timeout rt timeout-value }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the 802.11n-5 GHz A-MPDU transmit aggregation scheduler.</td>

The following example shows how to configure the A-MPDU transmit aggregation scheduler realtime traffic timeout of 100 milliseconds:

```
(Cisco Controller) > config 802.11 11nsupport a-mpdu tx scheduler timeout rt 100
```
config 802.11 11nsupport antenna

To configure an access point to use a specific antenna, use the config 802.11 11nsupport antenna command.

```
config 802.11 {a | b} 11nsupport antenna cisco_ap {A | B | C | D} {enable | disable}
```

**Syntax Description**

- **a** Specifies the 802.11a/n network.
- **b** Specifies the 802.11b/g/n network.
- **cisco_ap** Access point.
- **A/B/C/D** Specifies an antenna port.
- **enable** Enables the configuration.
- **disable** Disables the configuration.

The following example shows how to enable antenna diversity for AP01 on an 802.11b network:

```
(Cisco Controller) >config 802.11a antenna diversity enable AP01
```

The following example shows how to enable diversity for AP01 on an 802.11a network, using an external antenna connected to the Cisco lightweight access point left port (sideA):

```
(Cisco Controller) >config 802.11a antenna diversity sideA AP01
```
config 802.11 antenna extAntGain

To configure external antenna gain for an 802.11 network, use the **config 802.11 antenna extAntGain** command.

```
config 802.11 (a | b) antenna extAntGain antenna_gain cisco_ap
```

**Syntax Description**
- **a**: Specifies the 802.11a network.
- **b**: Specifies the 802.11b/g network.
- **antenna_gain**: Antenna gain in 0.5 dBm units (for example, 2.5 dBm = 5).
- **cisco_ap**: Cisco lightweight access point name.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before you enter the **config 802.11 antenna extAntGain** command, disable the 802.11 Cisco radio with the **config 802.11 disable** command.

After you configure the external antenna gain, use the **config 802.11 enable** command to enable the 802.11 Cisco radio.

The following example shows how to configure an 802.11a external antenna gain of 0.5 dBm for *AP1*:

```
(Cisco Controller) > config 802.11 antenna extAntGain 1 AP1
```
**config 802.11 antenna mode**

To configure the Cisco lightweight access point to use one internal antenna for an 802.11 sectorized 180-degree coverage pattern or both internal antennas for an 802.11 360-degree omnidirectional pattern, use the `config 802.11 antenna mode` command.

```
config 802.11 {a | b} antenna mode {omni | sectorA | sectorB} cisco_ap
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `omni`: Specifies to use both internal antennas.
- `sectorA`: Specifies to use only the side A internal antenna.
- `sectorB`: Specifies to use only the side B internal antenna.
- `cisco_ap`: Cisco lightweight access point name.

**Command Default**

None

**Command History**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When configuring 802.11 channels for a single lightweight access point, enter the `config 802.11 disable` command to disable the 802.11 network. Enter the `config 802.11 channel` command to set automatic channel selection by Radio Resource Management (RRM) or manually set the channel for the 802.11 radio, and enter the `config 802.11 enable` command to enable the 802.11 network.

### Note

See the Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points document for the channels supported by your access point. The power levels and available channels are defined by the country code setting and are regulated on a country-by-country basis.
The following example shows how to have RRM automatically configure the 802.11a channels for automatic channel configuration based on the availability and interference:

(Cisco Controller) >config 802.11a channel global auto

The following example shows how to configure the 802.11b channels one time based on the availability and interference:

(Cisco Controller) >config 802.11b channel global once

The following example shows how to turn 802.11a automatic channel configuration off:

(Cisco Controller) >config 802.11a channel global off

The following example shows how to configure the 802.11b channels in access point AP01 for automatic channel configuration:

(Cisco Controller) >config 802.11b AP01 channel global

The following example shows how to configure the 802.11a channel 36 in access point AP01 as the default channel:

(Cisco Controller) >config 802.11a channel AP01 36
config 802.11 channel ap

To set the operating radio channel for an access point, use the config 802.11 channel ap command.

```plaintext
config 802.11 {a | b} channel ap cisco_ap {global | channel_no}
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.
- **b**
  - Specifies the 802.11b/g network.
- **cisco_ap**
  - Name of the Cisco access point.
- **global**
  - Enables auto-RF on the designated access point.
- **channel_no**
  - Default channel from 1 to 26, inclusive.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This parameter can be configured only if the primary channel is statically assigned.
We recommend that you do not configure 40-MHz channels in the 2.4-GHz radio band because severe co-channel interference can occur.

Statically configuring an access point’s radio for 20-MHz or 40-MHz mode overrides the globally configured DCA channel width setting (configured by using the `config advanced 802.11 channel dca chan-width` command). If you change the static configuration back to global on the access point radio, the global DCA configuration overrides the channel width configuration that the access point was previously using.

The following example shows how to configure the channel width for access point AP01 on an 802.11 network using 40-MHz channels:

```bash
(Cisco Controller) >config 802.11a chan_width AP01 40
```
config 802.11 rx-sop threshold

To configure the threshold values for Receiver Start of Packet Detection Threshold (RxSOP) for each 802.11 band, use the **config 802.11 rx-sop threshold** command.

```
config {802.11a | 802.11b} rx-sop threshold {high | low | medium | default | custom_value} ap ap_name
```

**Syntax Description**

- **802.11a**: Configures an RxSOP threshold value for the 802.11a network.
- **802.11b**: Configures an RxSOP threshold value for the 802.11b network.
- **high**: Configures the high RxSOP threshold value for 802.11a/b networks.
- **medium**: Configures the medium RxSOP threshold value for 802.11a/b networks.
- **low**: Configures the low RxSOP threshold value for 802.11a/b networks.
- **ap ap_name**: Configures the RxSOP threshold value on an access point of an 802.11 network.
- **default**: Configures the RxSOP threshold value on all access points of an 802.11 network.
- **custom_value**: Custom configure the RxSOP threshold value on all access points of an 802.11 network.

The range is between −85 dBm and −60 dBm.

**Command Default**

The default RxSOP threshold option is default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.7</td>
<td>The RxSOP custom values can be set.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

RxSOP determines the Wi-Fi signal level in dBm at which an access point's radio demodulates and decodes a packet. Higher the level, less sensitive the radio is and smaller the receiver cell size. The table below shows the RxSOP threshold values for high, medium and low levels for each 802.11 band.

**Table 3: RxSOP Thresholds**

<table>

<td>2.4 GHz</td>
<td>−79 dBm</td>
<td>−82 dBm</td>
<td>−85 dBm</td>
<td>−80 dBm to −65 dBm</td>
</tr>
</tbody>
</table>
The following example shows how to configure a high RxSOP threshold value for all access points in the 802.11a band:

(Cisco Controller) > config 802.11a rx-sop threshold high
**config 802.11 txPower**

To configure the transmit power level for all access points or a single access point in an 802.11 network, use the `config 802.11 txPower` command.

```
config 802.11 { a | b } txPower { global { power_level | auto | max | min | once } | ap cisco_ap }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>global</td>
<td>Configures the 802.11 transmit power level for all lightweight access points.</td>
</tr>
<tr>
<td>auto</td>
<td>(Optional) Specifies the power level is automatically set by Radio Resource Management (RRM) for the 802.11 Cisco radio.</td>
</tr>
<tr>
<td>once</td>
<td>(Optional) Specifies the power level is automatically set once by RRM.</td>
</tr>
<tr>
<td>power_level</td>
<td>(Optional) Manual Transmit power level number for the access point.</td>
</tr>
<tr>
<td>ap</td>
<td>Configures the 802.11 transmit power level for a specified lightweight access point.</td>
</tr>
<tr>
<td>ap_name</td>
<td>Access point name.</td>
</tr>
</tbody>
</table>

### Command Default

The command default (`global`, `auto`) is for automatic configuration by RRM.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The supported power levels depend on the specific access point used and the regulatory region. For example, the 1240 series access point supports eight levels and the 1200 series access point supports six levels. See the Channels and Maximum Power Settings for Cisco Aironet Lightweight Access Points document for the maximum transmit power limits for your access point. The power levels and available channels are defined by the country code setting and are regulated on a country-by-country basis.

The following example shows how to automatically set the 802.11a radio transmit power level in all lightweight access points:
(Cisco Controller) > **config 802.11a txPower auto**

The following example shows how to manually set the 802.11b radio transmit power to level 5 for all lightweight access points:

(Cisco Controller) > **config 802.11b txPower global 5**

The following example shows how to automatically set the 802.11b radio transmit power for access point AP1:

(Cisco Controller) > **config 802.11b txPower AP1 global**

The following example shows how to manually set the 802.11a radio transmit power to power level 2 for access point AP1:

(Cisco Controller) > **config 802.11b txPower AP1 2**

- **show ap config 802.11a**
- **config 802.11b txPower**
config 802.11 beamforming

To enable or disable Beamforming (ClientLink) on the network or on individual radios, enter the `config 802.11 beamforming` command.

```
config 802.11 {a | b} beamforming {global | ap ap_name} {enable | disable}
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.
- **b**
  - Specifies the 802.11b/g network.
- **global**
  - Specifies all lightweight access points.
- **ap ap_name**
  - Specifies the Cisco access point name.
- **enable**
  - Enables beamforming.
- **disable**
  - Disables beamforming.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable Beamforming on the network, it is automatically enabled for all the radios applicable to that network type.

Follow these guidelines for using Beamforming:

- Beamforming is supported only for legacy orthogonal frequency-division multiplexing (OFDM) data rates (6, 9, 12, 18, 24, 36, 48, and 54 mbps).

  ![Note](image)

  Beamforming is not supported for complementary-code keying (CCK) data rates (1, 2, 5.5, and 11 Mbps).

- Beamforming is supported only on access points that support 802.11n (AP1250 and AP1140).
- Two or more antennas must be enabled for transmission.
- All three antennas must be enabled for reception.
- OFDM rates must be enabled.

  If the antenna configuration restricts operation to a single transmit antenna, or if OFDM rates are disabled, Beamforming is not used.
The following example shows how to enable Beamforming on the 802.11a network:

(Cisco Controller) > config 802.11 beamforming global enable
# config 802.11h channelswitch

To configure an 802.11h channel switch announcement, use the `config 802.11h channelswitch` command.

```
config 802.11h channelswitch  { enable { loud  |  quiet }  |  disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the 802.11h channel switch announcement.</td>
</tr>
<tr>
<td>loud</td>
<td>Enables the 802.11h channel switch announcement in the loud mode. The 802.11h-enabled clients can send packets while switching channel.</td>
</tr>
<tr>
<td>quiet</td>
<td>Enables 802.11h-enabled clients to stop transmitting packets immediately because the AP has detected radar and client devices should also quit transmitting to reduce interference.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the 802.11h channel switch announcement.</td>
</tr>

</tbody>
</table>

The following example shows how to enable the 802.11n support on an 802.11a network:

```
(Cisco Controller) > config 802.11a 11nsupport enable
```
config 802.11 11nsupport a-mpdu tx priority

To specify the aggregation method used for 802.11n packets, use the `config 802.11 11nsupport a-mpdu tx priority` command.

```
config 802.11 { a | b } 11nsupport a-mpdu tx priority { 0-7 | all } { enable | disable }
```

### Syntax Description

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **0-7**
  - Specifies the aggregated MAC protocol data unit priority level between 0 through 7.

- **all**
  - Configures all of the priority levels at once.

- **enable**
  - Specifies the traffic associated with the priority level uses A-MPDU transmission.

- **disable**
  - Specifies the traffic associated with the priority level uses A-MSDU transmission.

### Command Default

Priority 0 is enabled.

### Usage Guidelines

Aggregation is the process of grouping packet data frames together rather than transmitting them separately. Two aggregation methods are available: Aggregated MAC Protocol Data Unit (A-MPDU) and Aggregated MAC Service Data Unit (A-MSDU). A-MPDU is performed in the software whereas A-MSDU is performed in the hardware.

Aggregated MAC Protocol Data Unit priority levels assigned per traffic type are as follows:

- 1—Background
- 2—Spare
- 0—Best effort
- 3—Excellent effort
- 4—Controlled load
- 5—Video, less than 100-ms latency and jitter
- 6—Voice, less than 10-ms latency and jitter
- 7—Network control
- all—Configure all of the priority levels at once.

**Note**

Configure the priority levels to match the aggregation method used by the clients.
### Command History

<table>

The following example shows how to configure the A-MPDU transmit aggregation scheduler realtime traffic timeout of 100 milliseconds:

```
(Cisco Controller) > config 802.11 11nsupport a-mpdu tx scheduler timeout rt 100
```
config 802.11 11nsupport antenna

To configure an access point to use a specific antenna, use the **config 802.11 11nsupport antenna** command.

```
config 802.11 (a | b) 11nsupport antenna cisco_ap {A | B | C | D} {enable | disable}
```

**Syntax Description**

- **a**
  - Specifies the 802.11a/n network.

- **b**
  - Specifies the 802.11b/g/n network.

- **cisco_ap**
  - Access point.

- **A/B/C/D**
  - Specifies an antenna port.

- **enable**
  - Enables the configuration.

- **disable**
  - Disables the configuration.

**Command Default**

None

**Command History**

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to enable RIFS:

```
(Cisco Controller) >config 802.11a 11nsupport rifs enable
```
config 802.11 beacon period

To change the beacon period globally for an 802.11a, 802.11b, or other supported 802.11 network, use the `config 802.11 beacon period` command.

```
config 802.11 { a | b } beacon period time_units
```

**Note**
Disable the 802.11 network before using this command. See the “Usage Guidelines” section.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>time_units</td>
<td>Beacon interval in time units (TU). One TU is 1024 microseconds.</td>
</tr>
</tbody>
</table>

**Command Default**
None

**Usage Guidelines**

In Cisco wireless LAN solution 802.11 networks, all Cisco lightweight access point wireless LANs broadcast a beacon at regular intervals. This beacon notifies clients that the 802.11a service is available and allows the clients to synchronize with the lightweight access point.

Before you change the beacon period, make sure that you have disabled the 802.11 network by using the `config 802.11 disable` command. After changing the beacon period, enable the 802.11 network by using the `config 802.11 enable` command.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an 802.11a network for a beacon period of 120 time units:

```
(Cisco Controller) > config 802.11 beacon period 120
```

**Related Commands**

- `show 802.11a`
- `config 802.11b beacon-period`
- `config 802.11a disable`
- `config 802.11a enable`
config 802.11 cac defaults

To configure the default Call Admission Control (CAC) parameters for the 802.11a and 802.11b/g network, use the `config 802.11 cac defaults` command.

```
config 802.11 {a | b} cac defaults
```

**Syntax Description**

- `a` Specifies the 802.11a network.
- `b` Specifies the 802.11b/g network.

**Usage Guidelines**

CAC commands for video applications on the 802.11a or 802.11b/g network require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Gold.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable` or `config 802.11 {a | b} cac video acm enable` command.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

</tr>
<tr>
<td>enable</td>
<td>Enables video CAC settings.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables video CAC settings.</td>
</tr>
</tbody>
</table>

**Command Default**

The default video CAC settings for the 802.11a or 802.11b/g network is disabled.

**Usage Guidelines**

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable`, or `config 802.11 {a | b} cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

The following example shows how to enable the video CAC for the 802.11a network:

```
(Cisco Controller) > config 802.11 cac video acm enable
```

The following example shows how to disable the video CAC for the 802.11b network:

```
(Cisco Controller) > config 802.11 cac video acm disable
```
Related Commands

- `config 802.11 cac video max-bandwidth`
- `config 802.11 cac video roam-bandwidth`
- `config 802.11 cac video tspec-inactivity-timeout`
**config 802.11 cac video cac-method**

To configure the Call Admission Control (CAC) method for video applications on the 802.11a or 802.11b/g network, use the `config 802.11 cac video cac-method` command.

```
config 802.11 { a | b } cac video cac-method { static | load-based }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>

<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>static</td>
<td>Enables the static CAC method for video applications on the 802.11a or 802.11b/g network.</td>
</tr>
<tr>
<td>load-based</td>
<td>Enables the load-based CAC method for video applications on the 802.11a or 802.11b/g network.</td>
</tr>
</tbody>
</table>

**Command Default**

Static.

**Usage Guidelines**

CAC commands for video applications on the 802.11a or 802.11b/g network require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Gold.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.

- Disable the radio network you want to configure by entering the `config 802.11 { a | b } disable network` command.

- Save the new configuration by entering the `save config` command.

- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 { a | b } cac voice acm enable` or `config 802.11 { a | b } cac video acm enable` command.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.
Video CAC consists of two parts: Unicast Video-CAC and MC2UC CAC. If you need only Unicast Video-CAC, you must configure only static mode. If you need only MC2UC CAC, you must configure Static or Load-based CAC. Load-based CAC is not supported if SIP-CAC is enabled.

**config 802.11 cac video max-bandwidth**

To set the percentage of the maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network, use the `config 802.11 cac video max-bandwidth` command.

```
config 802.11 {a | b} cac video max-bandwidth bandwidth
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>bandwidth</code></td>
<td>Bandwidth percentage value from 5 to 85%.</td>
</tr>
</tbody>
</table>

**Command Default**

The default maximum bandwidth allocated to clients for video applications on the 802.11a or 802.11b/g network is 0%.

**Usage Guidelines**

The maximum radio frequency (RF) bandwidth cannot exceed 85% for voice and video. Once the client reaches the value specified, the access point rejects new calls on this network.

If this parameter is set to zero (0), the controller assumes that you do not want to allocate any bandwidth and allows all bandwidth requests.

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable` or `config 802.11 {a | b} cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

</table>
The following example shows how to specify the percentage of the maximum allocated bandwidth for video applications on the selected radio band:

```
(Cisco Controller) > config 802.11 cac video max-bandwidth 50
```

**Related Commands**

- `config 802.11 cac video acm`
- `config 802.11 cac video roam-bandwidth`
- `config 802.11 cac voice stream-size`
- `config 802.11 cac voice roam-bandwidth`
config 802.11 cac media-stream

To configure media stream Call Admission Control (CAC) voice and video quality parameters for 802.11a and 802.11b networks, use the `config 802.11 cac media-stream` command.

```
config 802.11 {a | b} cac media-stream multicast-direct {max-retry-percent retry-percentage | min-client-rate dot11-rate}
```

**Syntax Description**

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>multicast-direct</td>
<td>Configures CAC parameters for multicast-direct media streams.</td>
</tr>
<tr>
<td>max-retry-percent</td>
<td>Configures the percentage of maximum retries that are allowed for multicast-direct media streams.</td>
</tr>
<tr>
<td>retry-percentage</td>
<td>Percentage of maximum retries that are allowed for multicast-direct media streams.</td>
</tr>
<tr>
<td>min-client-rate</td>
<td>Configures the minimum transmission data rate to the client for multicast-direct media streams.</td>
</tr>
<tr>
<td>dot11-rate</td>
<td>Minimum transmission data rate to the client for multicast-direct media streams. Rate in kbps at which the client can operate.</td>
</tr>
</tbody>
</table>

If the transmission data rate is below this rate, either the video will not start or the client may be classified as a bad client. The bad client video can be demoted for better effort QoS or subject to denial. The available data rates are 6000, 9000, 12000, 18000, 24000, 36000, 48000, 54000, and 11n rates.

**Command Default**

The default value for the maximum retry percent is 80. If it exceeds 80, either the video will not start or the client might be classified as a bad client. The bad client video will be demoted for better effort QoS or is subject to denial.

**Usage Guidelines**

CAC commands for video applications on the 802.11a or 802.11b/g network require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Gold.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than</td>
</tr>
<tr>
<td></td>
<td>Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The controller reserves the specified bandwidth from the maximum allocated bandwidth for roaming video clients.

Note

If this parameter is set to zero (0), the controller assumes that you do not want to do any bandwidth allocation and, therefore, allows all bandwidth requests.

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

• Disable all WLANs with WMM enabled by entering the config wlan disable wlan_id command.

• Disable the radio network you want to configure by entering the config 802.11 {a | b} disable network command.

• Save the new configuration by entering the save config command.

• Enable voice or video CAC for the network you want to configure by entering the config 802.11 {a | b} cac voice acm enable or config 802.11 {a | b} cac video acm enable command.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the Cisco Wireless LAN Controller Configuration Guide for your release.
The following example shows how to specify the percentage of the maximum allocated bandwidth reserved for roaming video clients on the selected radio band:

(Cisco Controller) > config 802.11 cac video roam-bandwidth 10

- `config 802.11 cac video acm`
config 802.11 cac voice max-bandwidth

To set the percentage of the maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network, use the `config 802.11 cac voice max-bandwidth` command.

```
config 802.11 {a | b} cac voice max-bandwidth bandwidth
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>bandwidth</code></td>
<td>Bandwidth percentage value from 5 to 85%.</td>
</tr>
</tbody>
</table>

**Command Default**

The default maximum bandwidth allocated to clients for voice applications on the 802.11a or 802.11b/g network is 0%.

**Usage Guidelines**

The maximum radio frequency (RF) bandwidth cannot exceed 85% for voice and video. Once the client reaches the value specified, the access point rejects new calls on this network.

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable` or `config 802.11 {a | b} cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

- `config 802.11 cac voice load-based`
- `config 802.11 cac video acm`
config 802.11 cac voice roam-bandwidth

To configure the percentage of the Call Admission Control (CAC) maximum allocated bandwidth reserved for roaming voice clients on the 802.11a or 802.11b/g network, use the `config 802.11 cac voice roam-bandwidth` command.

```
config 802.11 {a | b} cac voice roam-bandwidth bandwidth
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `bandwidth`: Bandwidth percentage value from 0 to 85%.

**Command Default**

The default CAC maximum allocated bandwidth reserved for roaming voice clients on the 802.11a or 802.11b/g network is 85%.

**Usage Guidelines**

The maximum radio frequency (RF) bandwidth cannot exceed 85% for voice and video. The controller reserves the specified bandwidth from the maximum allocated bandwidth for roaming voice clients.

- **Note**
  - If this parameter is set to zero (0), the controller assumes you do not want to allocate any bandwidth and therefore allows all bandwidth requests.

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable` or `config 802.11 {a | b} cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

<td><strong>enable</strong></td>
<td>Processes the TSPEC inactivity timeout messages.</td>
<td></td>
</tr>
<tr>
<td><strong>ignore</strong></td>
<td>Ignores the TSPEC inactivity timeout messages.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**
The default WMM TSPEC inactivity timeout received from an access point is disabled (ignore).

**Usage Guidelines**
Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 { a | b } disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 { a | b } cac voice acm enable` or `config 802.11 { a | b } cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

**config 802.11 cac voice load-based**

To enable or disable load-based Call Admission Control (CAC) for the 802.11a or 802.11b/g network, use the `config 802.11 cac voice load-based` command.

```
config 802.11 {a | b} cac voice load-based {enable | disable}
```

**Syntax Description**

- **a**: Specifies the 802.11a network.
- **b**: Specifies the 802.11b/g network.
- **enable**: Enables load-based CAC.
- **disable**: Disables load-based CAC.

**Command Default**

The default load-based CAC for the 802.11a or 802.11b/g network is disabled.

**Usage Guidelines**

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 {a | b} disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 {a | b} cac voice acm enable` or `config 802.11 {a | b} cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>number</td>
<td>Number of calls to be allowed per radio.</td>
</tr>
</tbody>
</table>

**Command Default**

The default maximum number of voice call supported by the radio is 0, which means that there is no maximum limit check for the number of calls.

**Usage Guidelines**

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 { a | b } disable network` command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 { a | b } cac voice acm enable` or `config 802.11 { a | b } cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

- config 802.11 exp-bwreq
- config 802.11 cac voice tspec-inactivity-timeout
- config 802.11 cac voice load-based
- config 802.11 cac video acm
config 802.11 cac voice sip bandwidth

Note
SIP bandwidth and sample intervals are used to compute per call bandwidth for the SIP-based Call Admission Control (CAC).

To configure the bandwidth that is required per call for the 802.11a or 802.11b/g network, use the config 802.11 cac voice sip bandwidth command.

```
config 802.11 { a | b } cac voice sip bandwidth bw_kbps sample-interval number_msecs
```

Syntax Description

- `bw_kbps` Bandwidth in kbps.
- `sample-interval` Specifies the packetization interval for SIP codec.
- `number_msecs` Packetization sample interval in msecs. The sample interval for SIP codec is 20 seconds.

Command Default
None

Usage Guidelines
CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 { a | b } disable` network command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 { a | b } cac voice acm enable` or `config 802.11 { a | b } cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the Cisco Wireless LAN Controller Configuration Guide for your release.

Command History

Release Modification

| 7.6  | This command was introduced in a release earlier than Release 7.6. |

| 8.3  | This command was introduced. |
The following example shows how to configure the bandwidth and voice packetization interval for a SIP codec:

(Cisco Controller) > config 802.11 cac voice sip bandwidth 10 sample-interval 40

**Related Commands**

- `config 802.11 cac voice acm`
- `config 802.11 cac voice load-based`
- `config 802.11 cac voice max-bandwidth`
- `config 802.11 cac voice roam-bandwidth`
- `config 802.11 cac voice tspec-inactivity-timeout`
- `config 802.11 exp-bwreq`
To configure the Call Admission Control (CAC) codec name and sample interval as parameters and to calculate the required bandwidth per call for the 802.11a or 802.11b/g network, use the `config 802.11 cac voice sip codec` command.

```
config 802.11 { a | b } cac voice sip codec { g711 | g729 } sample-interval number_msecs
```

**Syntax Description**

- **a**: Specifies the 802.11a network.
- **b**: Specifies the 802.11b/g network.
- **g711**: Specifies CAC parameters for the SIP G711 codec.
- **g729**: Specifies CAC parameters for the SIP G729 codec.
- **sample-interval**: Specifies the packetization interval for SIP codec.
- **number_msecs**: Packetization interval in msecs. The sample interval for SIP codec value is 20 seconds.

**Command Default**

The default CAC codec parameter is g711.

**Usage Guidelines**

CAC commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the `config wlan disable wlan_id` command.
- Disable the radio network you want to configure by entering the `config 802.11 { a | b } disable` network command.
- Save the new configuration by entering the `save config` command.
- Enable voice or video CAC for the network you want to configure by entering the `config 802.11 { a | b } cac voice acm enable` or `config 802.11 { a | b } cac video acm enable` commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

config 802.11 cac voice stream-size

To configure the number of aggregated voice Wi-Fi Multimedia (WMM) traffic specification (TSPEC) streams at a specified data rate for the 802.11a or 802.11b/g network, use the **config 802.11 cac voice stream-size** command.

```
config 802.11 { a | b } cac voice stream-size stream_size number mean-data-rate max-streams mean-data-rate
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **stream-size**
  - Configures the maximum data rate for the stream.

- **stream_size**
  - Range of stream size is between 84000 and 92100.

- **number**
  - Number (1 to 5) of voice streams.

- **mean-data-rate**
  - Configures the mean data rate.

- **max-streams**
  - Configures the mean data rate of a voice stream.

- **mean-data-rate**
  - Mean data rate (84 to 91.2 kbps) of a voice stream.

**Command Default**

The default number of streams is 2 and the mean data rate of a stream is 84 kbps.

**Usage Guidelines**

Call Admission Control (CAC) commands require that the WLAN you are planning to modify is configured for the Wi-Fi Multimedia (WMM) protocol and the quality of service (QoS) level be set to Platinum.

Before you can configure CAC parameters on a network, you must complete the following prerequisites:

- Disable all WLANs with WMM enabled by entering the **config wlan disable wlan_id** command.

- Disable the radio network you want to configure by entering the **config 802.11 { a | b } disable** network command.

- Save the new configuration by entering the **save config** command.

- Enable voice or video CAC for the network you want to configure by entering the **config 802.11 { a | b } cac voice acm enable** or **config 802.11 { a | b } cac video acm enable** commands.

For complete instructions, see the “Configuring Voice and Video Parameters” section in the “Configuring Controller Settings” chapter of the *Cisco Wireless LAN Controller Configuration Guide* for your release.

</table>
devicetypes. The device types are as follows:

- 802.11-nonstd—Devices using nonstandard Wi-Fi channels.
- 802.11-inv—Devices using spectrally inverted Wi-Fi signals.
- superag—802.11 SuperAG devices.
- all—All interference device types.
- cont-tx—Continuous Transmitter.
- dect-like—Digital Enhanced Cordless Communication (DECT) like phone.
- tdd-tx—TDD Transmitter.
- jammer—Jammer.
- canopy—Canopy devices.
- video—Video cameras.
- wimax-mobile—WiMax Mobile.
- wimax-fixed—WiMax Fixed.

The default setting for 5-GHz air quality alarm is enabled.

The following example shows how to enable the CleanAir alarm to monitor the air quality:

(Cisco Controller) > config 802.11a cleanair alarm air-quality enable

The following example shows how to enable the CleanAir alarm for the device type video:

(Cisco Controller) > config 802.11a cleanair alarm device enable video

The following example shows how to enable alarm reporting for the CleanAir interference devices:

(Cisco Controller) > config 802.11a cleanair alarm device reporting enable
config 802.11 disable

To disable radio transmission for an entire 802.11 network or for an individual Cisco radio, use the `config 802.11 disable` command.

```
config 802.11 {a | b} disable {network | cisco_ap}
```

### Syntax Description

- **a**
  - Configures the 802.11a on slot 1 and 802.11ac radio on slot 2. radio.

- **b**
  - Specifies the 802.11b/g network.

- **network**
  - Disables transmission for the entire 802.11a network.

- **cisco_ap**
  - Individual Cisco lightweight access point radio.

### Command Default

The transmission is enabled for the entire network by default.

### Usage Guidelines

- You must use this command to disable the network before using many config 802.11 commands.
- This command can be used any time that the CLI interface is active.

The following example shows how to disable the entire 802.11a network:

```
(Cisco Controller) > config 802.11a disable network
```

The following example shows how to disable access point AP01 802.11b transmissions:

```
(Cisco Controller) > config 802.11b disable AP01
```
config 802.11 dtpc

To enable or disable the Dynamic Transmit Power Control (DTPC) setting for an 802.11 network, use the `config 802.11 dtpc` command.

```
config 802.11 {a | b} dtpc {enable | disable}
```

**Syntax Description**

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>

<td></td>
</tr>
<tr>
<td>enable</td>
<td>Enables the support for this command.</td>
<td></td>
</tr>
<tr>
<td>disable</td>
<td>Disables the support for this command.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

The default DTPC setting for an 802.11 network is enabled.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to disable DTPC for an 802.11a network:

```
(Cisco Controller) > config 802.11a dtpc disable
```
**config 802.11 enable**

To enable radio transmission for an entire 802.11 network or for an individual Cisco radio, use the `config 802.11 enable` command.

```plaintext
config 802.11 { a | b } enable { network | cisco_ap }
```

**Syntax Description**

- **a**
  - Configures the 802.11a radio on slot 1 and 802.11ac on slot 2.

- **b**
  - Specifies the 802.11b/g network.

- **network**
  - Disables transmission for the entire 802.11a network.

- **cisco_ap**
  - Individual Cisco lightweight access point radio.

**Command Default**

The transmission is enabled for the entire network by default.

**Usage Guidelines**

Use this command with the `config 802.11 disable` command when configuring 802.11 settings.

This command can be used any time that the CLI interface is active.

**Command History**

- **Release** 7.6
  - This command was introduced in a release earlier than Release 7.6.

- **Release** 8.3
  - This command was introduced.

The following example shows how to enable radio transmission for the entire 802.11a network:

(Cisco Controller) > config 802.11a enable network

The following example shows how to enable radio transmission for AP1 on an 802.11b network:

(Cisco Controller) > config 802.11b enable AP1

**Related Commands**

- `show sysinfo show 802.11a`
- `config wlan radio`
- `config 802.11a disable`
- `config 802.11b disable`
- `config 802.11b enable`
- `config 802.11b 11gSupport enable`
- `config 802.11b 11gSupport disable`
**config 802.11 exp-bwreq**

To enable or disable the Cisco Client eXtension (CCX) version 5 expedited bandwidth request feature for an 802.11 radio, use the **config 802.11 exp-bwreq** command.

```plaintext
config 802.11 {a | b} exp-bwreq {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>

</table>

The following example shows how to enable the CCX expedited bandwidth settings:

```
(Cisco Controller) > config 802.11a exp-bwreq enable
Cannot change Exp Bw Req mode while 802.11a network is operational.
```

The following example shows how to disable the CCX expedited bandwidth settings:

```
(Cisco Controller) > config 802.11a exp-bwreq disable
```

**Related Commands**
- show 802.11a
- show ap stats 802.11a
config 802.11 fragmentation

To configure the fragmentation threshold on an 802.11 network, use the config 802.11 fragmentation command.

`config 802.11 {a | b} fragmentation threshold`

**Note**

This command can only be used when the network is disabled using the config 802.11 disable command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to configure the fragmentation threshold on an 802.11a network with the threshold number of 6500 bytes:

```
(Cisco Controller) > config 802.11a fragmentation 6500
```
**Config Commands**

**config 802.11 l2roam rf-params**

To configure 802.11a or 802.11b/g Layer 2 client roaming parameters, use the **config 802.11 l2roam rf-params** command.

```plaintext
config 802.11 { a | b } l2roam rf-params { default | custom min_rssi roam_hyst scan_thresh trans_time }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>default</td>
<td>Restores Layer 2 client roaming RF parameters to default values.</td>
</tr>
<tr>
<td>custom</td>
<td>Configures custom Layer 2 client roaming RF parameters.</td>
</tr>
<tr>
<td>min_rssi</td>
<td>Minimum received signal strength indicator (RSSI) that is required for the client to associate to the access point. If the client’s average received signal power dips below this threshold, reliable communication is usually impossible. Clients must already have found and roamed to another access point with a stronger signal before the minimum RSSI value is reached. The valid range is –80 to –90 dBm, and the default value is –85 dBm.</td>
</tr>
<tr>
<td>roam_hyst</td>
<td>How much greater the signal strength of a neighboring access point must be in order for the client to roam to it. This parameter is intended to reduce the amount of roaming between access points if the client is physically located on or near the border between the two access points. The valid range is 2 to 4 dB, and the default value is 2 dB.</td>
</tr>
<tr>
<td>scan_thresh</td>
<td>Minimum RSSI that is allowed before the client should roam to a better access point. When the RSSI drops below the specified value, the client must be able to roam to a better access point within the specified transition time. This parameter also provides a power-save method to minimize the time that the client spends in active or passive scanning. For example, the client can scan slowly when the RSSI is above the threshold and scan more rapidly when the RSSI is below the threshold. The valid range is –70 to –77 dBm, and the default value is –72 dBm.</td>
</tr>
</tbody>
</table>
Maximum time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam, whenever the RSSI from the client’s associated access point is below the scan threshold. The valid range is 1 to 10 seconds, and the default value is 5 seconds.

**Note** For high-speed client roaming applications in outdoor mesh environments, we recommend that you set the transition time to 1 second.

**Command Default**
The default minimum RSSI is -85 dBm. The default signal strength of a neighboring access point is 2 dB. The default scan threshold value is -72 dBm. The default time allowed for the client to detect a suitable neighboring access point to roam to and to complete the roam is 5 seconds.

**Usage Guidelines**
For high-speed client roaming applications in outdoor mesh environments, we recommend that you set the `trans_time` to 1 second.

**Command History**

<td>Specifies the maximum number of streams allowed on a 2.4-GHz or a 5-GHz band.</td>
</tr>
<tr>
<td>value</td>
<td>Number of streams allowed on a client or on a 2.4-GHz or a 5-GHz band, between 1 to 20.</td>
</tr>
<tr>
<td>no-limit</td>
<td>Specifies the unlimited number of streams allowed on a client or on a 2.4-GHz or a 5-GHz band.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before you configure the media stream multicast-direct parameters on a 802.11 network, ensure that the network is nonoperational.

This example shows how to enable a media stream multicast-direct settings on an 802.11a network:

```
> config 802.11a media-stream multicast-direct enable
```
This example shows how to admit the media stream to the best-effort queue:

```
> config 802.11a media-stream multicast-direct admission-besteffort enable
```

This example shows how to set the maximum number of streams allowed on a client:

```
> config 802.11a media-stream multicast-direct client-maximum 10
```

**Related Commands**
- `config 802.11 media-stream video-redirect`
- `show 802.11a media-stream name`
- `show media-stream group summary`
- `show media-stream group detail`
**config 802.11 media-stream video-redirect**

To configure the media stream video-redirect for the 802.11 networks, use the **config 802.11 media-stream video-redirect** command.

```
config 802.11 {a | b} media-stream video-redirect {enable | disable}
```

**Syntax Description**

- **802.11a**
  - Specifies the 802.11a network.

- **802.11b**
  - Specifies the 802.11b/g network.

- **enable**
  - Enables traffic redirection.

- **disable**
  - Disables traffic redirection.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you configure the media stream video-redirect on a 802.11 network, ensure that the network is nonoperational.

This example shows how to enable media stream traffic redirection on an 802.11a network:

```
> config 802.11a media-stream video-redirect enable
```

**Related Commands**

- **config 802.11 media-stream multicast-redirect**
- **show 802.11a media-stream name**
- **show media-stream group summary**
- **show media-stream group detail**
config 802.11 multicast data-rate

To configure the minimum multicast data rate, use the `config 802.11 multicast data-rate` command.

```
config 802.11 {a | b} multicast data-rate data_rate [ap ap_name | default]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>data_rate</code></td>
<td>Minimum multicast data rates. The options are 6, 9, 12, 18, 24, 36, 48, 54. Enter 0 to specify that APs will dynamically adjust the number of the buffer allocated for multicast.</td>
</tr>
<tr>
<td><code>ap_name</code></td>
<td>Specific AP radio in this data rate.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Configures all APs radio in this data rate.</td>
</tr>
</tbody>
</table>

**Command Default**

The default is 0 where the configuration is disabled and the multicast rate is the lowest mandatory data rate and unicast client data rate.

**Usage Guidelines**

When you configure the data rate without the AP name or `default` keyword, you globally reset all the APs to the new value and update the controller global default with this new data rate value. If you configure the data rate with `default` keyword, you only update the controller global default value and do not reset the value of the APs that are already joined to the controller. The APs that join the controller after the new data rate value is set receives the new data rate value.

**Command History**

- **Modification**
  - Release 7.6: This command was introduced in a release earlier than Release 7.6.

**Command History**

- **Modification**
  - Release 8.3: This command was introduced.

The following example shows how to configure minimum multicast data rate settings:

```
(Cisco Controller) > config 802.11 multicast data-rate 12
```
**config 802.11 rate**

To set mandatory and supported operational data rates for an 802.11 network, use the `config 802.11 rate` command.

```
config 802.11 { a | b } rate { disabled | mandatory | supported } rate
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **disabled**
  - Disables a specific data rate.

- **mandatory**
  - Specifies that a client supports the data rate in order to use the network.

- **supported**
  - Specifies to allow any associated client that supports the data rate to use the network.

- **rate**
  - Rate value of 6, 9, 12, 18, 24, 36, 48, or 54 Mbps.

**Command Default**

None

**Usage Guidelines**

The data rates set with this command are negotiated between the client and the Cisco wireless LAN controller. If the data rate is set to **mandatory**, the client must support it in order to use the network. If a data rate is set as **supported** by the Cisco wireless LAN controller, any associated client that also supports that rate may communicate with the Cisco lightweight access point using that rate. It is not required that a client is able to use all the rates marked **supported** in order to associate.

Cisco Wireless Controller Command Reference, Release 8.8
**config 802.11 rssi-threshold**

To configure the 802.11 RSSI Low Check threshold, use the `config 802.11 rssi-threshold` command.

```
config 802.11 {a | b}  rssi-threshold  value-in-dBm
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>rssi-threshold</td>
<td>Configures the RSSI Low Check threshold value.</td>
<td></td>
</tr>
<tr>
<td>value-in-dBm</td>
<td>RSSI threshold value in dBm. The default value is –80 dBm.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

The default value of the RSSI Low Check threshold is –80 dBm.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>

</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following example shows how to configure the RSSI threshold value to –70 dBm for an 802.11a network:

```
(Cisco Controller) > config 802.11a rssi-threshold -70
```
config 802.11 SI

To configure System Intelligence (SI) on all or select SI supporting APs for the 802.11 a or 802.11 b/g network, use the `config 802.11 si` command.

APs with $ in the suffix of its name denotes support to Spectrum Intelligence feature.

```
config 802.11 {a | b} si {enable | disable} {network | ap-name}
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `enable`: Enable 5 GHz QCA Spectrum Intelligence.
- `disable`: Disables 5 GHz QCA Spectrum Intelligence.
- `network`: Configures all 5 GHz Cisco APs.
- `ap-name`: Name of the access point to which the command applies.

**Command Default**

The default SI settings for the 802.11 a or 802.11 b/g network is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.6</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the SI settings on all supporting APs in the network:

```
(Cisco Controller) > config 802.11a si enable network
```
**config 802.11 tsm**

To enable or disable the video Traffic Stream Metric (TSM) option for the 802.11a or 802.11b/g network, use the `config 802.11 tsm` command.

```
config 802.11 { a | b } tsm { enable | disable }
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `enable`: Enables the video TSM settings.
- `disable`: Disables the video TSM settings.

**Command Default**

By default, the TSM for the 802.11a or 802.11b/g network is disabled.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable the video TSM option for the 802.11b/g network:

```
(Cisco Controller) > config 802.11b tsm enable
```

The following example shows how to disable the video TSM option for the 802.11b/g network:

```
(Cisco Controller) > config 802.11b tsm disable
```

**Related Commands**

- `show ap stats`
- `show client tsm`
config 802.11b preamble

To change the 802.11b preamble as defined in subclause 18.2.2.2 to long (slower, but more reliable) or short (faster, but less reliable), use the config 802.11b preamble command.

```
config 802.11b preamble {long | short}
```

**Syntax Description**
- `long`: Specifies the long 802.11b preamble.
- `short`: Specifies the short 802.11b preamble.

**Command Default**
The default 802.11b preamble value is short.

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**
- You must reboot the Cisco Wireless LAN Controller (reset system) with save to implement this command.
- This parameter must be set to `long` to optimize this Cisco wireless LAN controller for some clients, including SpectraLink NetLink telephones.
- This command can be used any time that the CLI interface is active.

The following example shows how to change the 802.11b preamble to short:

```
(Cisco Controller) >config 802.11b preamble short
(Cisco Controller) >(reset system with save)
```
config 802.11b preamble

config aaa auth

To configure the AAA authentication search order for management users, use the config aaa auth command.

config aaa auth mgmt [aaa_server_type1 | aaa_server_type2]

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mgmt</td>
<td>Configures the AAA authentication search order for controller management users by specifying up to three AAA authentication server types. The order that the server types are entered specifies the AAA authentication search order.</td>
</tr>
<tr>
<td>aaa_server_type</td>
<td>(Optional) AAA authentication server type (local, radius, or tacacs). The local setting specifies the local database, the radius setting specifies the RADIUS server, and the tacacs setting specifies the TACACS+ server.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can enter two AAA server types as long as one of the server types is local. You cannot enter radius and tacacs together.

The following example shows how to configure the AAA authentication search order for controller management users by the authentication server type local:

(Cisco Controller) > config aaa auth radius local

Related Commands

show aaa auth
config aaa auth mgmt

To configure the order of authentication when multiple databases are configured, use the `config aaa auth mgmt` command.

```
config aaa auth mgmt [radius | tacacs]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>radius</td>
<td>(Optional) Configures the order of authentication for RADIUS servers.</td>
</tr>
<tr>
<td>tacacs</td>
<td>(Optional) Configures the order of authentication for TACACS servers.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the order of authentication for the RADIUS server:

```
(Cisco Controller) > config aaa auth mgmt radius
```

The following example shows how to configure the order of authentication for the TACACS server:

```
(Cisco Controller) > config aaa auth mgmt tacacs
```

### Related Commands

- `show aaa auth order`
**config acl apply**

To apply an access control list (ACL) to the data path, use the `config acl apply` command.

```
config acl apply rule_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to apply an ACL to the data path:

```
(Cisco Controller) > config acl apply acl01
```
config acl counter

To see if packets are hitting any of the access control lists (ACLs) configured on your controller, use the `config acl counter` command.

```
config acl counter { start | stop }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Enables ACL counters on your controller.</td>
</tr>
<tr>
<td>stop</td>
<td>Disables ACL counters on your controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

ACL counters are available only on the following controllers: 4400 series, Cisco WiSM, and Catalyst 3750G Integrated Wireless LAN Controller Switch.

The following example shows how to enable ACL counters on your controller:

```
(Cisco Controller) > config acl counter start
```

**Related Commands**

- `clear acl counters`
- `show acl detailed`
# config acl create

To create a new access control list (ACL), use the `config acl create` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td>ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For a Cisco 2100 Series Wireless LAN Controller, you must configure a preauthentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN preauthentication ACL under Web Policy. However, you do not need to configure any preauthentication ACL for Cisco 4400 Series Wireless LAN Controllers.

The following example shows how to create a new ACL:

(Cisco Controller) > `config acl create acl01`

**Related Commands**

- `show acl`
config acl cpu

To create a new access control list (ACL) rule that restricts the traffic reaching the CPU, use the `config acl cpu` command.

```
config acl cpu rule_name  { wired | wireless | both }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rule_name</code></td>
<td></td>
<td>Specifies the ACL name.</td>
</tr>
<tr>
<td><code>wired</code></td>
<td></td>
<td>Specifies an ACL on wired traffic.</td>
</tr>
<tr>
<td><code>wireless</code></td>
<td></td>
<td>Specifies an ACL on wireless traffic.</td>
</tr>
<tr>
<td><code>both</code></td>
<td></td>
<td>Specifies an ACL on both wired and wireless traffic.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to control the type of packets reaching the CPU.

The following example shows how to create an ACL named acl101 on the CPU and apply it to wired traffic:

```
(Cisco Controller) > config acl cpu acl101 wired
```

**Related Commands**

`show acl cpu`
config acl delete

To delete an access control list (ACL), use the config acl delete command.

config acl delete rule_name

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rule_name</td>
<td>ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
</tbody>
</table>

| Command Default | None |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td></td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | For a Cisco 2100 Series Wireless LAN Controller, you must configure a preauthentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN preauthentication ACL under Web Policy. However, you do not need to configure any preauthentication ACL for Cisco 4400 Series Wireless LAN Controllers. |

The following example shows how to delete an ACL named acl101 on the CPU:

(Cisco Controller) > config acl delete acl101

Related Commands
show acl
config acl layer2

To configure a Layer 2 access control list (ACL), use the `config acl layer2` command.

```
cfg acl layer2 { apply acl_name | create acl_name | delete acl_name | rule { action acl_name index { permit | deny | add acl_name index | change index acl_name old_index new_index | delete acl_name index | etherType acl_name index etherType etherTypeMask | swap index acl_name index1 index2 } }
```

**Syntax Description**

- **apply**
  - Applies a Layer 2 ACL to the data path.

- **acl_name**
  - Layer 2 ACL name. The name can be up to 32 alphanumeric characters.

- **create**
  - Creates a Layer 2 ACL.

- **delete**
  - Deletes a Layer 2 ACL.

- **rule**
  - Configures a Layer 2 ACL rule.

- **action**
  - Configures the action for the Layer 2 ACL rule.

- **index**
  - Index of the Layer 2 ACL rule.

- **permit**
  - Permits rule action.

- **deny**
  - Denies rule action.

- **add**
  - Creates a Layer 2 ACL rule.

- **change index**
  - Changes the index of the Layer 2 ACL rule.

- **old_index**
  - Old index of the Layer 2 ACL rule.

- **new_index**
  - New index of the Layer 2 ACL rule.

- **delete**
  - Deletes a Layer 2 ACL rule.

- **etherType**
  - Configures the EtherType of a Layer 2 ACL rule.

- **etherType**
  - EtherType of a Layer 2 ACL rule. EtherType is used to indicate the protocol that is encapsulated in the payload of an Ethernet frame. The range is a hexadecimal value from 0x0 to 0xffff.

- **etherTypeMask**
  - Netmask of the EtherType. The range is a hexadecimal value from 0x0 to 0xffff.

- **swap index**
  - Swaps the index values of two rules.

- **index1 index2**
  - Index values of two Layer 2 ACL rules.
The Cisco WLC does not have any Layer 2 ACLs.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can create a maximum of 16 rules for a Layer 2 ACL.

You can create a maximum of 64 Layer 2 ACLs on a Cisco WLC.

A maximum of 16 Layer 2 ACLs are supported per access point because an access point supports a maximum of 16 WLANs.

Ensure that the Layer 2 ACL names do not conflict with the FlexConnect ACL names because an access point does not support the same Layer 2 and Layer 3 ACL names.

The following example shows how to apply a Layer 2 ACL:

(Cisco Controller) > config acl layer2 apply acl_l2_1
config acl rule

To configure ACL rules, use the `config acl rule` command.

```
config acl rule { action rule_name rule_index (permit | deny) | add rule_name rule_index |
change index rule_name old_index new_index | delete rule_name rule_index |
destination address rule_name rule_index ip_address netmask |
destination port range rule_name rule_index start_port end_port |
direction rule_name rule_index { in | out | any } | dscp rule_name rule_index dscp |
protocol rule_name rule_index protocol | source address rule_name rule_index ip_address netmask |
source port range rule_name rule_index start_port end_port | swap index rule_name index_1 index_2 }
```

### Usage Guidelines
For a Cisco 2100 Series Wireless LAN Controller, you must configure a preauthentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN pre-authentication ACL under Web Policy. However, you do not need to configure any preauthentication ACL for Cisco 4400 Series Wireless LAN Controllers.

The following example shows how to configure an ACL to permit access:

(Cisco Controller) > config acl rule action lab1 4 permit

### Related Commands
- `show acl`
config acl url-acl

To configure URL Access Control Lists, use the `config acl url-acl` command.

```
config acl url-acl [apply | create | delete | disable | enable | rule]
config acl url-acl apply acl-name
config acl url-acl create acl-name
config acl url-acl delete acl-name
config acl url-acl disable
config acl url-acl enable
config acl url-acl rule
  [action | add | delete | url]
config acl url-acl rule action acl-name index {permit | deny}
config acl url-acl rule add acl-name index
config acl url-acl rule delete acl-name index
config acl url-acl rule url acl-name index url-name
```

**Syntax Description**

| 8.3     | This command was introduced.  

The following example shows how to configure the time of delay when the DCA algorithm starts:

```
(Cisco Controller) > config advanced 802.11 channel dca anchor-time 17
```

**Related Commands**

- config advanced 802.11 channel dca interval
- config advanced 802.11 channel dca sensitivity
- config advanced 802.11 channel
**config advanced 802.11 channel dca chan-width-11n**

To configure the Dynamic Channel Assignment (DCA) channel width for all 802.11n radios in the 5-GHz band, use the `config advanced 802.11 channel dca chan-width-11n` command.

```plaintext
config advanced 802.11 { a | b } channel dca chan-width-11n { 20 | 40 | 80 }
```

**Syntax Description**

- **a**: Specifies the 802.11a network.
- **b**: Specifies the 802.11b/g network.
- **20**: Sets the channel width for 802.11n radios to 20 MHz.
- **40**: Sets the channel width for 802.11n radios to 40 MHz.
- **80**: Sets the channel width for 802.11ac radios to 80-MHz.

**Command Default**

The default channel width is 20.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you choose 40, be sure to set at least two adjacent channels in the `config advanced 802.11 channel {add | delete} channel_number` command (for example, a primary channel of 36 and an extension channel of 40). If you set only one channel, that channel is not used for the 40-MHz channel width.

To override the globally configured DCA channel width setting, you can statically configure an access point’s radio for 20- or 40-MHz mode using the `config 802.11 chan_width` command. If you then change the static configuration to global on the access point radio, the global DCA configuration overrides the channel width configuration that the access point was previously using.

The following example shows how to add a channel to the 802.11a network auto channel list:

```plaintext
(Cisco Controller) >config advanced 802.11a channel dca chan-width-11n 40
```

The following example shows how to set the channel width for the 802.11ac radio as 80-MHz:

```plaintext
(Cisco Controller) >config advanced 802.11a channel dca chan-width-11n 80
```
config advanced 802.11 channel dca interval

To specify how often the Dynamic Channel Assignment (DCA) is allowed to run, use the **config advanced 802.11 channel dca interval** command.

```
config advanced 802.11 (a | b) channel dca interval value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>value</td>
<td>Valid values are 0, 1, 2, 3, 4, 6, 8, 12, or 24 hours. 0 is 10 minutes (600 seconds).</td>
</tr>
</tbody>
</table>

**Command Default**

The default DCA channel interval is 10 (10 minutes).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If your controller supports only OfficeExtend access points, we recommend that you set the DCA interval to 6 hours for optimal performance. For deployments with a combination of OfficeExtend access points and local access points, the range of 10 minutes to 24 hours can be used.

The following example shows how often the DCA algorithm is allowed to run:

```
(Cisco Controller) > config advanced 802.11 channel dca interval 8
```

**Related Commands**

- config advanced 802.11 dca anchor-time
- config advanced 802.11 dca sensitivity
- show advanced 802.11 channel
config advanced 802.11 channel dca min-metric

To configure the 5-GHz minimum RSSI energy metric for DCA, use the config advanced 802.11 channel dca min-metric command.

```
config advanced 802.11 { a | b } channel dca RSSI_value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>RSSI_value</code></td>
<td>Minimum received signal strength indicator (RSSI) that is required for the DCA to trigger a channel change. The range is from –100 to –60 dBm.</td>
</tr>
</tbody>
</table>

**Command Default**

The default minimum RSSI energy metric for DCA is –95 dBm.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the minimum 5-GHz RSSI energy metric for DCA:

```
(Cisco Controller) > config advanced 802.11 channel dca min-metric –80
```

In the above example, the RRM must detect an interference energy of at least -80 dBm in RSSI for the DCA to trigger a channel change.

**Related Commands**

- `config advanced 802.11 dca interval`
- `config advanced 802.11 dca anchor-time`
- `show advanced 802.11 channel`
**config advanced 802.11 channel dca sensitivity**

To specify how sensitive the Dynamic Channel Assignment (DCA) algorithm is to environmental changes (for example, signal, load, noise, and interference) when determining whether or not to change channels, use the `config advanced 802.11 channel dca sensitivity` command.

```plaintext
config advanced 802.11 {a | b} channel dcasensitivity {low | medium | high}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>low</td>
<td>Specifies the DCA algorithm is not particularly sensitive to environmental changes. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td>medium</td>
<td>Specifies the DCA algorithm is moderately sensitive to environmental changes. See the “Usage Guidelines” section for more information.</td>
</tr>
<tr>
<td>high</td>
<td>Specifies the DCA algorithm is highly sensitive to environmental changes. See the “Usage Guidelines” section for more information.</td>
</tr>
</tbody>
</table>

<td>Enables the foreign access point 802.11a interference avoidance in the channel assignment.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the foreign access point 802.11a interference avoidance in the channel assignment.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for the foreign access point 802.11a interference avoidance in the channel assignment is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to have RRM consider foreign 802.11a interference when making channel selection updates for all 802.11a Cisco lightweight access points:

```
(Cisco Controller) > config advanced 802.11a channel foreign enable
```

**Related Commands**

- `show advanced 802.11a channel`
- `config advanced 802.11b channel foreign`
config advanced 802.11 channel load

To have Radio Resource Management (RRM) consider or ignore the traffic load in making channel selection updates for all 802.11a Cisco lightweight access points, use the `config advanced 802.11 channel load` command.

```
config advanced 802.11 {a | b} channel load {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the Cisco lightweight access point 802.11a load avoidance in the channel assignment.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the Cisco lightweight access point 802.11a load avoidance in the channel assignment.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for Cisco lightweight access point 802.11a load avoidance in the channel assignment is disabled.

**Command History**

```
Release   Modification
7.6        This command was introduced in a release earlier than Release 7.6.
```

The following example shows how to have RRM consider the traffic load when making channel selection updates for all 802.11a Cisco lightweight access points:

```
(Cisco Controller) > config advanced 802.11 channel load enable
```

**Related Commands**

- `show advanced 802.11a channel`
- `config advanced 802.11b channel load`
config advanced 802.11 channel noise

To have Radio Resource Management (RRM) consider or ignore non-802.11a noise in making channel selection updates for all 802.11a Cisco lightweight access points, use the config advanced 802.11 channel noise command.

```
config advanced 802.11 {a | b} channel noise {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables non-802.11a noise avoidance in the channel assignment. or ignore.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the non-802.11a noise avoidance in the channel assignment.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for non-802.11a noise avoidance in the channel assignment is disabled.

**Command History**

<td>Enables 802.11 network DCA list option for outdoor access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables 802.11 network DCA list option for outdoor access point.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for 802.11 network DCA list option for outdoor access point is disabled.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

The **config advanced 802.11 {a | b} channel outdoor-ap-dca {enable | disable}** command is applicable only for deployments having outdoor access points such as 1522 and 1524.

The following example shows how to enable the 802.11a DCA list option for outdoor access point:

```
(Cisco Controller) > config advanced 802.11a channel outdoor-ap-dca enable
```

**Related Commands**

- `show advanced 802.11a channel`
- `config advanced 802.11b channel noise`
config advanced 802.11 channel pda-prop

To enable or disable propagation of persistent devices, use the `config advanced 802.11 channel pda-prop` command.

```
config advanced 802.11 {a | b} channel pda-prop {enable | disable}
```

<table>

<tr>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
</tr>
</tbody>
</table>

**Command Default**
The default coverage hole detection value is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If you enable coverage hole detection, the Cisco WLC automatically determines, based on data that is received from the access points, whether any access points have clients that are potentially located in areas with poor coverage.

If both the number and percentage of failed packets exceed the values that you entered in the `config advanced 802.11 coverage packet-count` and `config advanced 802.11 coverage fail-rate` commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the `config advanced 802.11 coverage level global` and `config advanced 802.11 coverage exception global` commands over a 90-second period. The Cisco WLC determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to enable coverage hole detection on an 802.11a network:

```
(Cisco Controller) > config advanced 802.11a coverage enable
```

**Related Commands**

- `config advanced 802.11 coverage exception global`
- `config advanced 802.11 coverage fail-rate`
- `config advanced 802.11 coverage level global`
- `config advanced 802.11 coverage packet-count`
- `config advanced 802.11 coverage rssi-threshold`
config advanced 802.11 coverage exception global

To specify the percentage of clients on an access point that are experiencing a low signal level but cannot roam to another access point, use the config advanced 802.11 coverage exception global command.

```
config advanced 802.11 {a | b} coverage exception global percent
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `percent`: Percentage of clients. Valid values are from 0 to 100%.

**Command Default**

The default percentage value for clients on an access point is 25%.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If both the number and percentage of failed packets exceed the values that you entered in the config advanced 802.11 coverage packet-count and config advanced 802.11 coverage fail-rate commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the config advanced 802.11 coverage level global and config advanced 802.11 coverage exception global commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to specify the percentage of clients for all 802.11a access points that are experiencing a low signal level:

```
(Cisco Controller) > config advanced 802.11 coverage exception global 50
```

**Related Commands**

- config advanced 802.11 coverage exception global
- config advanced 802.11 coverage fail-rate
- config advanced 802.11 coverage level global
- config advanced 802.11 coverage packet-count
- config advanced 802.11 coverage rssi-threshold
- config advanced 802.11 coverage
config advanced 802.11 coverage fail-rate

To specify the failure rate threshold for uplink data or voice packets, use the `config advanced 802.11 coverage fail-rate` command.

```
config advanced 802.11 {a | b} coverage {data | voice} fail-rate percent
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

<td>Specifies the threshold for data packets.</td>
</tr>
<tr>
<td>voice</td>
<td>Specifies the threshold for voice packets.</td>
</tr>
<tr>
<td>percent</td>
<td>Failure rate as a percentage. Valid values are from 1 to 100 percent.</td>
</tr>
</tbody>
</table>

**Command Default**

The default failure rate threshold uplink coverage fail-rate value is 20%.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If both the number and percentage of failed packets exceed the values that you entered in the `config advanced 802.11 coverage packet-count` and `config advanced 802.11 coverage fail-rate` commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the `config advanced 802.11 coverage level global` and `config advanced 802.11 coverage exception global` commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to configure the threshold count for minimum uplink failures for data packets:

```
(Cisco Controller) > config advanced 802.11 coverage fail-rate 80
```

**Related Commands**

- `config advanced 802.11 coverage exception global`
- `config advanced 802.11 coverage level global`
- `config advanced 802.11 coverage packet-count`
- `config advanced 802.11 coverage rssi-threshold`
- `config advanced 802.11 coverage`
config advanced 802.11 coverage level global

To specify the minimum number of clients on an access point with an received signal strength indication (RSSI) value at or below the data or voice RSSI threshold, use the `config advanced 802.11 coverage level global` command.

```plaintext
config advanced 802.11 { a | b } coverage level global clients
```

### Syntax Description

- **a**
  - Specifies the 802.11a network.
- **b**
  - Specifies the 802.11b/g network.
- **clients**
  - Minimum number of clients. Valid values are from 1 to 75.

### Command Default

The default minimum number of clients on an access point is 3.

### Command History

### Usage Guidelines

If both the number and percentage of failed packets exceed the values that you entered in the `config advanced 802.11 coverage packet-count` and `config advanced 802.11 coverage fail-rate` commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the `config advanced 802.11 coverage level global` and `config advanced 802.11 coverage exception global` commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to specify the minimum number of clients on all 802.11a access points with an RSSI value at or below the RSSI threshold:

```plaintext
(Cisco Controller) > config advanced 802.11 coverage level global 60
```

### Related Commands

- `config advanced 802.11 coverage exception global`
- `config advanced 802.11 coverage fail-rate`
- `config advanced 802.11 coverage packet-count`
- `config advanced 802.11 coverage rssi-threshold`
- `config advanced 802.11 coverage`
**config advanced 802.11 coverage packet-count**

To specify the minimum failure count threshold for uplink data or voice packets, use the `config advanced 802.11 coverage packet-count` command.

```
config advanced 802.11 {a | b} coverage {data | voice} packet-count packets
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **data**
  - Specifies the threshold for data packets.

- **voice**
  - Specifies the threshold for voice packets.

- **packets**
  - Minimum number of packets. Valid values are from 1 to 255 packets.

**Command Default**

The default failure count threshold for uplink data or voice packets is 10.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If both the number and percentage of failed packets exceed the values that you entered in the `config advanced 802.11 coverage packet-count` and `config advanced 802.11 coverage fail-rate` commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the `config advanced 802.11 coverage level global` and `config advanced 802.11 coverage exception global` commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to configure the failure count threshold for uplink data packets:

```
(Cisco Controller) > config advanced 802.11 coverage packet-count 100
```

**Related Commands**

- `config advanced 802.11 coverage exception global`
- `config advanced 802.11 coverage fail-rate`
- `config advanced 802.11 coverage level global`
- `config advanced 802.11 coverage rssi-threshold`
- `config advanced 802.11 coverage`
config advanced 802.11 coverage rssi-threshold

To specify the minimum receive signal strength indication (RSSI) value for packets that are received by an access point, use the `config advanced 802.11 coverage rssi-threshold` command.

```
config advanced 802.11 {a | b} coverage {data | voice} rssi-threshold rssi
```

**Syntax Description**

- **a** Specifies the 802.11a network.
- **b** Specifies the 802.11b/g network.
- **data** Specifies the threshold for data packets.
- **voice** Specifies the threshold for voice packets.
- **rssi** Valid values are from –60 to –90 dBm.

**Command Default**

- The default RSSI value for data packets is –80 dBm.
- The default RSSI value for voice packets is –75 dBm.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `rssi` value that you enter is used to identify coverage holes (or areas of poor coverage) within your network. If the access point receives a packet in the data or voice queue with an RSSI value that is below the value that you enter, a potential coverage hole has been detected.

The access point takes RSSI measurements every 5 seconds and reports them to the controller in 90-second intervals.

If both the number and percentage of failed packets exceed the values that you entered in the `config advanced 802.11 coverage packet-count` and `config advanced 802.11 coverage fail-rate` commands for a 5-second period, the client is considered to be in a pre-alarm condition. The controller uses this information to distinguish between real and false coverage holes and excludes clients with poor roaming logic. A coverage hole is detected if both the number and percentage of failed clients meet or exceed the values entered in the `config advanced 802.11 coverage level global` and `config advanced 802.11 coverage exception global` commands over a 90-second period. The controller determines whether the coverage hole can be corrected and, if appropriate, mitigates the coverage hole by increasing the transmit power level for that specific access point.

The following example shows how to configure the minimum receive signal strength indication threshold value for data packets that are received by an 802.11a access point:

```
(Cisco Controller) > config advanced 802.11a coverage rssi-threshold -60
```
Related Commands

- config advanced 802.11 coverage exception global
- config advanced 802.11 coverage fail-rate
- config advanced 802.11 coverage level global
- config advanced 802.11 coverage packet-count
- config advanced 802.11 coverage

config advanced 802.11 coverage rssi-threshold
config advanced 802.11 edca-parameters

To enable a specific Enhanced Distributed Channel Access (EDCA) profile on a 802.11a network, use the `config advanced 802.11 edca-parameters` command.

```
config advanced 802.11 {a | b} edca-parameters {wmm-default |svp-voice | optimized-voice | optimized-video-voice |custom-voice |fastlane |custom-set {QoS Profile Name} {aifs AP-value (0-16) Client value (0-16) |ecwmax AP-Value (0-10) Client value (0-10) |ecwmin AP-Value (0-10) Client value (0-10) |txop AP-Value (0-255) Client value (0-255) }}
```

The following example shows how to configure the 802.11a automatic RF group selection mode on:

(Cisco Controller) > config advanced 802.11a group-mode auto

The following example shows how to configure the 802.11a automatic RF group selection mode off:

(Cisco Controller) > config advanced 802.11a group-mode off

**Related Commands**

- `show advanced 802.11a group`
- `config advanced 802.11 group-member`
config advanced 802.11 logging channel

To turn the channel change logging mode on or off, use the `config advanced 802.11 logging channel` command.

```
config advanced 802.11 {a | b} logging channel {on | off}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

The following example shows how to turn the 802.11a transmit power change mode on:

```
(Cisco Controller) > config advanced 802.11 logging txpower off
```

**Related Commands**

- show advanced 802.11 logging
- config advanced 802.11b logging power
**config advanced 802.11 monitor channel-list**

To set the 802.11a noise, interference, and rogue monitoring channel list, use the **config advanced 802.11 monitor channel-list** command.

```plaintext
config advanced 802.11 { a | b } monitor channel-list { all | country | dca }
```

**Syntax Description**

- `a`: Specifies the 802.11a network.
- `b`: Specifies the 802.11b/g network.
- `all`: Monitors all channels.
- `country`: Monitors the channels used in the configured country code.
- `dca`: Monitors the channels used by the automatic channel assignment.

**Command Default**

The default 802.11a noise, interference, and rogue monitoring channel list is country.

**Command History**

<table>

(Cisco Controller) > config advanced 802.11 monitor load 60

Related Commands

show advanced 802.11a monitor
config advanced 802.11b monitor load
config advanced 802.11 monitor measurement

To set the signal measurement interval between 60 and 3600 seconds, use the config advanced 802.11 monitor measurement command.

config advanced 802.11 {a | b} monitor measurement seconds

Syntax Description

seconds
Signal measurement interval that you need to enter. Valid range is between 60 and 3600 seconds.

Command Default

The default signal measurement interval is 180 seconds.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>

The following example shows how to enable the 802.11a access point monitoring:

```
(Cisco Controller) > config advanced 802.11a monitor mode enable
```

**Related Commands**

- `show advanced 802.11a monitor`
- `config advanced 802.11b monitor mode`
**config advanced 802.11 monitor ndp-type**

To configure the 802.11 access point radio resource management (RRM) Neighbor Discovery Protocol (NDP) type, use the `config advanced 802.11 monitor ndp-type` command:

```
config advanced 802.11 {a | b} monitor ndp-type {protected | transparent}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>protected</td>
<td>Specifies the Tx RRM protected NDP.</td>
</tr>
<tr>
<td>transparent</td>
<td>Specifies the Tx RRM transparent NDP.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you configure the 802.11 access point RRM NDP type, ensure that you have disabled the network by entering the `config 802.11 disable network` command.

The following example shows how to enable the 802.11a access point RRM NDP type as protected:

```
(Cisco Controller) > config advanced 802.11 monitor ndp-type protected
```

**Related Commands**

- `config advanced 802.11 monitor`
- `config advanced 802.11 monitor mode`
- `config advanced 802.11 disable`
config advanced 802.11 monitor timeout-factor

To configure the 802.11 neighbor timeout factor, use the `config advanced 802.11 monitor timeout-factor` command:

```
config advanced 802.11 {a | b} monitor timeout-factor factor-value-in-minutes
```

**Syntax Description**

- `factor-value-in-minutes`: Neighbor timeout factor value that you must enter. Valid range is between 5 minutes to 60 minutes. We recommend that you set the timeout factor to 60 minutes.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you are using Release 8.1 or a later release, we recommend that you set the timeout factor to 60 minutes. If the access point radio does not receive a neighbor packet from an existing neighbor within 60 minutes, the Cisco WLC deletes the neighbor from the neighbor list.

**Note**

The Neighbor Timeout Factor was hardcoded to 60 minutes in Release 7.6, but was changed to 5 minutes in Release 8.0.100.0.
**config advanced 802.11 optimized roaming**

To configure the optimized roaming parameters for each 802.11 band, use the `config advanced 802.11 optimized roaming` command.

```
config advanced { 802.11a | 802.11b } optimized-roaming { enable | disable | interval seconds | datarate mbps }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>802.11a</th>
<th>Configures optimized roaming parameters for 802.11a network.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>802.11b</td>
<td>Configures optimized roaming parameters for 802.11b network.</td>
</tr>
<tr>
<td></td>
<td>enable</td>
<td>Enables optimized roaming.</td>
</tr>
<tr>
<td></td>
<td>disable</td>
<td>Disables optimized roaming.</td>
</tr>
<tr>
<td></td>
<td>interval</td>
<td>Configures the client coverage reporting interval for 802.11a/b networks.</td>
</tr>
<tr>
<td></td>
<td>seconds</td>
<td>Client coverage reporting interval in seconds. The range is from 5 to 90 seconds.</td>
</tr>
<tr>
<td></td>
<td>datarate</td>
<td>Configures the threshold data rate for 802.11a/b networks.</td>
</tr>
<tr>
<td></td>
<td>mbps</td>
<td>Threshold data rate in Mbps for 802.11a/b networks.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For 802.11a, the configurable data rates are 6, 9, 12, 18, 24, 36, 48, and 54.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For 802.11b, the configurable data rates are 1, 2, 5.5, 11, 6, 9, 12, 18, 24, 36, 48, and 54.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can configure 0 to disable the data rate for disassociating clients.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, optimized roaming is disabled. The default value for client coverage reporting interval is 90 seconds and threshold data rate is 0 (disabled state).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.8</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must disable the 802.11a/b network before you configure the optimized roaming reporting interval. If you configure a low value for the reporting interval, the network can get overloaded with coverage report messages.

The following example shows how to enable optimized roaming for the 802.11a network:

```
(Cisco Controller) > config advanced 802.11a optimized roaming enable
```

The following example shows how to configure the data rate interval for the 802.11a network:
(Cisco Controller) > config advanced 802.11a optimized roaming datarate 9
To configure the maximum packet retries, consecutive packet failure thresholds, and the default timeout value, use **config advanced 802.11 packet** command.

```plaintext
config advanced 802.11 (a | b) <QoS Profile Name> { max-client-count <threshold value (0-1000)> | max-packet-count <threshold value (0-1000)> | max-retry <maximum retry count> | timeout <time (in milliseconds)> }
```

**Syntax Description**

| a | Specifies the 802.11a network. |
| b | Specifies the 802.11b/g network. |

- **QoS Profile Name**
  - bronze
  - silver
  - gold
  - platinum

- **max-client-count**
  Configures the consecutive packet failure threshold before disassociating a client.

  ```plaintext
  threshold value - Enter the client count threshold value in the range 0 to 1000
  ```

- **max-packet-count**
  Configures the consecutive packet failure threshold before not retrying failure packet.

  ```plaintext
  threshold value - Enter the packet failure threshold value in the range 0 to 1000
  ```

- **max-retry**
  Configures the packet retry time for failure packet.

  ```plaintext
  maximum retry count - Enter the maximum number of retries allowed.
  ```

- **timeout**
  Configures the packet aging or discard timeout threshold.

  ```plaintext
  time - Enter the maximum time before the packet times out.
  ```

**Command Default**

The default values for parameters in **config advanced 802.11 packet** command are:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-client-count</td>
<td>500</td>
</tr>
<tr>
<td>max-packet-count</td>
<td>100</td>
</tr>
<tr>
<td>max-retry</td>
<td>3</td>
</tr>
</tbody>
</table>
### Config Commands

</table>

The following example shows how to set all Cisco lightweight access point clients thresholds to 25 clients:

```
(Cisco Controller) > config advanced 802.11 profile clients global 25
Global client count profile set.
```

The following example shows how to set the API clients threshold to 75 clients:

```
(Cisco Controller) > config advanced 802.11 profile clients API1 75
Global client count profile set.
```
config advanced 802.11 profile customize

To turn customizing on or off for an 802.11a Cisco lightweight access point performance profile, use the `config advanced 802.11 profile customize` command.

```
config advanced 802.11 { a | b } profile customize cisco_ap { on | off }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a/n network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g/n network.</td>

</tbody>
</table>

The following example shows how to turn performance profile customization on for 802.11a Cisco lightweight access point AP1:

```
(Cisco Controller) > config advanced 802.11 profile customize AP1 on
```
config advanced 802.11 profile foreign

To set the foreign 802.11a transmitter interference threshold between 0 and 100 percent, use the config advanced 802.11 profile foreign command.

```
config advanced 802.11 { a | b } profile foreign { global | cisco_ap } percent
```

**Syntax Description**

- **a**: Specifies the 802.11a network.
- **b**: Specifies the 802.11b/g network.
- **global**: Configures all 802.11a Cisco lightweight access points.
- **cisco_ap**: Cisco lightweight access point name.
- **percent**: 802.11a foreign 802.11a interference threshold between 0 and 100 percent.

**Command Default**

The default foreign 802.11a transmitter interference threshold value is 10.

**Command History**

</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the foreign 802.11a transmitter interference threshold for all Cisco lightweight access points to 50 percent:

```
(Cisco Controller) > config advanced 802.11a profile foreign global 50
```

The following example shows how to set the foreign 802.11a transmitter interference threshold for AP1 to 0 percent:

```
(Cisco Controller) > config advanced 802.11 profile foreign AP1 0
```
config advanced 802.11 profile noise

To set the 802.11a foreign noise threshold between –127 and 0 dBm, use the config advanced 802.11 profile noise command.

\[
\text{config advanced 802.11 \{a | b\} profile noise \{global | cisco\_ap\} dBm}
\]

**Syntax Description**
- **a**: Specifies the 802.11a/n network.
- **b**: Specifies the 802.11b/g/n network.
- **global**: Configures all 802.11a Cisco lightweight access point specific profiles.
- **cisco\_ap**: Cisco lightweight access point name.
- **dBm**: 802.11a foreign noise threshold between –127 and 0 dBm.

**Command Default**
The default foreign noise threshold value is –70 dBm.

**Command History**

<table>

The following example shows how to set the 802.11a foreign noise threshold for all Cisco lightweight access points to –127 dBm:

(Cisco Controller) >config advanced 802.11a profile noise global -127

The following example shows how to set the 802.11a foreign noise threshold for AP1 to 0 dBm:

(Cisco Controller) >config advanced 802.11a profile noise AP1 0
config advanced 802.11 profile throughput

To set the Cisco lightweight access point data-rate throughput threshold between 1000 and 10000000 bytes per second, use the `config advanced 802.11 profile throughput` command.

```
config advanced 802.11 {a | b} profile throughput {global | cisco_ap} value
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.

- **b**
  - Specifies the 802.11b/g network.

- **global**
  - Configures all 802.11a Cisco lightweight access point specific profiles.

- **cisco_ap**
  - Cisco lightweight access point name.

- **value**
  - 802.11a Cisco lightweight access point throughput threshold between 1000 and 10000000 bytes per second.

**Command Default**

The default Cisco lightweight access point data-rate throughput threshold value is 1,000,000 bytes per second.

**Command History**

The following example shows how to prevent changes to receiver parameters while the network is enabled:

```
(Cisco Controller) > config advanced 802.11 receiver default
```
config advanced 802.11 reporting measurement

To set the reporting measurement interval between 60 and 3600 seconds, use the config advanced 802.11 reporting measurement command.

```
config advanced 802.11 {a | b} reporting measurement seconds
```

Syntax Description

- seconds
  - Reporting measurement interval that you need to enter.
  - Valid range is between 60 and 3600 seconds.

Command Default

The default reporting measurement interval is 180 seconds.

Command History

<table>
<thead>
<tr>

The following example shows how to set the signal measurement interval to 300 seconds:

```
(Cisco Controller) > config advanced 802.11 reporting measurement 300
```
To configure the Transmit Power Control (TPC) version for a radio, use the `config advanced 802.11 tpc-version` command.

```plaintext
config advanced 802.11 {a | b} tpc-version {1 | 2}
```

**Syntax Description**

- **1**: Specifies the TPC version 1 that offers strong signal coverage and stability.
- **2**: Specifies TPC version 2 is for scenarios where voice calls are extensively used. The Tx power is dynamically adjusted with the goal of minimum interference. It is suitable for dense networks. In this mode, there could be higher roaming delays and coverage hole incidents.

**Command Default**

The default TPC version for a radio is 1.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>

<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to initiate updates of 802.11a transmit power for an 802.11a access point:

```
(Cisco Controller) > config advanced 802.11 txpower-update
```

**Related Commands**

- `config advance 802.11b txpower-update`
**config advanced capwap-message-aggregation**

To enable or disable CAPWAP message aggregation, use the `config advanced capwap-message-aggregation` command.

```
config advanced capwap-message-aggregation {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables CAPWAP message aggregation</td>
</tr>
<tr>
<td>disable</td>
<td>Disables CAPWAP message aggregation</td>
</tr>
</tbody>
</table>

**Command Default**

In Release 8.5 and earlier releases, the default setting for this command is disabled.

In Release 8.6 and later releases, the default setting is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3.121.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In some cases, the ACL and AVC settings on APs are found missing. At the time when the AP settings are missing, messages similar to the following are displayed in the controller message log:

```
Capwap Retransmission Queue Full for AP 38:ed:18:cd:f0:60
```

With the `debug capwap errors enable` in effect, errors similar to the following might be observed:

```
*spamReceiveTask: Aug 22 22:21:09.342: [PA] 00:11:0a:04:60:4d Unable to get RadId. Sending of PMK cache entry to all APs in flexconnect group failed :: bssid 00:00:00:00:00:00
```

This issue is observed especially in the following conditions:

- FlexConnect ACLs and/or AVC in use
- A large number of WLANs in use

Workaround is to upgrade (if necessary) to a release that has a fix for this issue via CSCuy75436 (8.3.121.0, 8.4.100.0, or later releases) and then enter the `config advanced capwap-message-aggregation enable` command.

This example shows how to enable CAPWAP message aggregation:

```
(Cisco Controller) >config advanced capwap-message-aggregation enable
```
### config advanced eap

To configure advanced extensible authentication protocol (EAP) settings, use the **config advanced eap** command.

```bash
config advanced eap { bcast-key-interval seconds | eapol-key-timeout timeout | eapol-key-retries retries | identity-request-timeout timeout | identity-request-retries retries | key-index index | max-login-ignore-identity-response { enable | disable } | request-timeout timeout | request-retries retries } }
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>bcast-key-interval</strong></td>
<td>Specifies the EAP-broadcast key renew interval time in seconds.</td>
</tr>
<tr>
<td><strong>seconds</strong></td>
<td>The range is from 120 to 86400 seconds.</td>
</tr>
<tr>
<td><strong>eapol-key-timeout</strong></td>
<td>Specifies the amount of time (200 to 5000 milliseconds) that the controller waits before retransmitting an EAPOL (WPA) key message to a wireless client using EAP or WPA/WPA-2 PSK.</td>
</tr>
<tr>
<td><strong>timeout</strong></td>
<td>The default value is 1000 milliseconds.</td>
</tr>
<tr>

<td>The default value is 2.</td>
</tr>
<tr>
<td><strong>key-index</strong></td>
<td>Specifies the key index (0 or 3) used for dynamic wired equivalent privacy (WEP).</td>
</tr>
<tr>
<td><strong>index</strong></td>
<td></td>
</tr>
</tbody>
</table>

---

Cisco Wireless Controller Command Reference, Release 8.8

257
When enabled, this command ignores the limit set for the number of devices that can be connected to the controller with the same username using 802.1x authentication. When disabled, this command limits the number of devices that can be connected to the controller with the same username. This option is not applicable for Web auth user.

Use the command `config netuser maxUserLogin` to set the limit of maximum number of devices per same username.

</tbody>
</table>

### Usage Guidelines

The following example shows how to configure the FRA service priority to client-aware:

```
(Cisco Controller) > config advanced fra service-priority client-aware
```

The following example shows how to configure the FRA service priority to coverage:

```
(Cisco Controller) > config advanced fra service-priority coverage
```

### Related Commands

- `config advanced fra client-aware client-select`
- `config advanced fra client-aware client-reset`
**config advanced fra client-aware client-select**

To configure the utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role, use the `config advanced fra client-aware client-select` command.

```
config advanced fra client-aware client-select percent
```

**Syntax Description**

- `percent`  
  Utilization percentage value ranges from 0 to 100.
  
  **Note**  
  The `client-select percent` value must be greater than the `client-reset percent` value. If not, you get to see the following message:
  
  Input for Client Aware FRA Client Reset Utilization Threshold is out of range.

**Command Default**

The default percent value for client-select is 50%.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>

</table>

**Usage Guidelines**

The following example shows how to configure the utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role:

```
(Cisco Controller) > config advanced fra client-aware client-select 20
```

**Related Commands**

- `config advanced fra client-aware client-reset`
config advanced fra client-aware client-reset

To configure the utilization threshold for redundant dual-band radios to switch back from 5GHz client-serving role to Monitor mode, use the **config advanced fra client-aware client-reset** command.

```plaintext
config advanced fra client-aware client-reset percent
```

**Syntax Description**

<table>
<thead>
<tr>
<th>percent</th>
<th>Utilization percentage value ranges from 0 to 100.</th>
</tr>
</thead>
</table>

**Note**

If the `client-reset percent` value is greater than the `client-select percent` value, you get to see the following message:

```
Input for ClientAwareFRA Client Reset Utilization Threshold is out of range.
```

**Command Default**

The default percent value for client-reset is 5%.

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The following example shows how to configure the utilization threshold for redundant dual-band radios to switch back from 5GHz client-serving role to Monitor mode:

```
(Cisco Controller) > config advanced fra client-aware client-reset 15
```

**Related Commands**

- `config advanced fra client-aware client-select`
To configure Cisco Hyperlocation globally on all APs that have the Cisco Hyperlocation module, use the `config advanced hyperlocation` command.

```plaintext
config advanced hyperlocation {enable | disable | ntp ipv4-addr | flag-unset ap-name | reset-threshold value | threshold value | trigger-threshold value}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables Cisco Hyperlocation globally on all Cisco APs that have the Cisco Hyperlocation module.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables Cisco Hyperlocation globally on all Cisco APs that have the Cisco Hyperlocation module.</td>
</tr>
<tr>
<td><code>ntp ipv4-addr</code></td>
<td>Sets up the NTP server for Cisco Hyperlocation. Enter the IPv4 address of the NTP server that all APs that are involved in this calculation need to synchronize to.</td>
</tr>
<tr>
<td><code>flag-unset ap-name</code></td>
<td>Configures the AP specified to accept any other level of Cisco Hyperlocation configuration.</td>
</tr>
<tr>
<td><code>reset-threshold value</code></td>
<td>Configures PRL reset threshold value below which RSSI is ignored while sending to Cisco WLC.</td>
</tr>
<tr>
<td><code>threshold value</code></td>
<td>Configures the threshold value below which RSSI is ignored while sending to Cisco WLC.</td>
</tr>
<tr>
<td><code>trigger-threshold value</code></td>
<td>Configures the number of scan cycles between PAK RSSI location trigger.</td>
</tr>
</tbody>
</table>

### Command Default

Disabled

### Usage Guidelines

- Cisco Hyperlocation in enabled state has an impact on performance where both radios of APs that do not have Cisco Hyperlocation module go off-channel for about 100 milliseconds every 3 seconds.
- We recommend that you use the same NTP server that is used by the general Cisco WLC infrastructure. The scans from multiple AP need to be synchronized for the location to be accurately calculated.

### Command History

```
(Cisco Controller) >config advanced hyperlocation apgroup myapgroup enable
```
To configure BLE beacon parameters, use the `config advanced hyperlocation ble-beacon` command.

```plaintext
config advanced hyperlocation ble-beacon {advertised-power rssi-value | interval value | ap-name ap-name | {advertised-power rssi-value | interval value | unset}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>advertised-power rssi-value</td>
<td>Configures BLE advertised transmit power for all APs. Valid range is between –40 dBm to –100 dBm</td>
</tr>
<tr>
<td>interval value</td>
<td>Configures BLE beacon interval for all APs. Valid range is between 1 to 10 seconds.</td>
</tr>
<tr>
<td>ap-name ap-name</td>
<td>Configures BLE beacon parameters for the specified AP.</td>
</tr>
<tr>
<td>unset</td>
<td>Clears AP-specific BLE configuration and sets global BLE configuration when applied.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to set the BLE beacon interval for all APs to 8 seconds:

```
(Cisco Controller) >config advanced hyperlocation ble-beacon interval 8
```
To configure BLE beacon parameters for a specific beacon, use the `config advanced hyperlocation ble-beacon beacon-id` command.

```plaintext
config advanced hyperlocation ble-beacon beacon-id id {delete | enable | disable} | add {txpwr value | uuid value} | add ap-group group-name {enable | disable | major mjr-value | minor mnr-value} | txpwr value | uuid value} | add ap-name ap-name {enable | disable | major mjr-value | minor mnr-value | txpwr value | uuid value}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>beacon-id id</td>
<td>Configures BLE parameters for the beacon ID that you enter. Valid range is between 1 to 5.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes the BLE beacon.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the BLE beacon.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the BLE beacon.</td>
</tr>
<tr>
<td>add</td>
<td>Adds a BLE beacon.</td>
</tr>
<tr>
<td>txpwr value</td>
<td>Configures the BLE attenuation level. You can choose to configure this for all APs, an AP group, or a specific AP. Valid range is between –52 dBm to 0.</td>
</tr>
<tr>
<td>uuid value</td>
<td>Configures universally unique identifier (UUID) for the beacon. You can choose to configure this for all APs, an AP group, or a specific AP. Enter a value in the xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx format.</td>
</tr>
<tr>
<td>ap-group group-name</td>
<td>Configures BLE beacon parameters for the AP group specified.</td>
</tr>
<tr>
<td>ap-name ap-name</td>
<td>Configures BLE beacon parameters for the AP specified.</td>
</tr>
<tr>
<td>major mjr-value</td>
<td>Configures major value for the BLE beacon. You can choose to configure this for an AP group or a specific AP.</td>
</tr>
<tr>
<td>minor mnr-value</td>
<td>Configures minor value for the BLE beacon. You can choose to configure this for an AP group or a specific AP.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to enable the BLE beacon with ID value as 3:

```
(Cisco Controller) >config advanced hyperlocation ble-beacon beacon-id 3 enable
```
config advanced hotspot

To configure advanced hotspot configurations, use the config advanced hotspot command.

```bash
config advanced hotspot { anqp-4way { disable | enable | threshold value } | cmbk-delay value |
garp { disable | enable } |
gas-limit { disable | enable } }
```

**Syntax Description**

- **anqp-4way** Enables, disables, or configures the Access Network Query Protocol (ANQP) four way fragment threshold.
  - **disable** Disables the ANQP four way message.
  - **enable** Enables the ANQP four way message.
  - **threshold** Configures the ANQP four way fragment threshold.
  - **value** ANQP four way fragment threshold value in bytes. The range is from 10 to 1500. The default value is 1500.

- **cmbk-delay** Configures the ANQP comeback delay in Time Units (TUs).
  - **value** ANQP comeback delay in Time Units (TUs). 1 TU is defined by 802.11 as 1024 usec. The range is from 1 millisecond to 30 seconds.

- **garp** Disables or enables the Gratuitous ARP (GARP) forwarding to wireless network.
  - **disable** Disables the Gratuitous ARP (GARP) forwarding to wireless network.
  - **enable** Enables the Gratuitous ARP (GARP) forwarding to wireless network.

- **gas-limit** Limits the number of Generic Advertisement Service (GAS) request action frames sent to the switch by an access point in a given interval.
  - **disable** Disables the GAS request action frame limit on access points.
  - **enable** Enables the GAS request action frame limit on access points.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

The following example shows how to configure the ANQP four way fragment threshold value:

```bash
(Cisco Controller) >config advanced hotspot anqp-4way threshold 200
```
**config advanced timers auth-timeout**

To configure the authentication timeout, use the `config advanced timers auth-timeout` command.

```
config advanced timers auth-timeout seconds
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>seconds</strong></td>
<td>Authentication response timeout value in seconds between 10 and 600.</td>
</tr>
</tbody>
</table>

**Command Default**

The default authentication timeout value is 10 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

The following example shows how to configure the advanced EAP identity request delay to 8 seconds:

```
(Cisco Controller) >config advanced timers eap-identity-request-delay 8
```
### config advanced timers

To configure an advanced system timer, use the **config advanced timers** command.

```plaintext
config advanced timers { ap-coverage-report seconds | ap-discovery-timeout discovery-timeout | ap-fast-heartbeat { local | flexconnect | all } { enable | disable } fast_heartbeat_seconds | ap-heartbeat-timeout heartbeat_seconds | ap-primary-discovery-timeout primary_discovery_timeout | ap-primed-join-timeout primed_join_timeout | auth-timeout auth_timeout | pkt-fwd-watchdog { enable | disable } { watchdog_timer | default } | eap-identity-request-delay eap_identity_request_delay | eap-timeout eap_timeout }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ap-coverage-report</strong></td>
<td>Configures RRM coverage report interval for all APs.</td>
</tr>
<tr>
<td><strong>seconds</strong></td>
<td>Configures the ap coverage report interval in seconds. The range is between 60 and 90 seconds. Default is 90 seconds.</td>
</tr>
<tr>
<td><strong>ap-discovery-timeout</strong></td>
<td>Configures the Cisco lightweight access point discovery timeout value.</td>
</tr>
<tr>
<td><strong>discovery-timeout</strong></td>
<td>Cisco lightweight access point discovery timeout value, in seconds. The range is from 1 to 10.</td>
</tr>
<tr>
<td><strong>ap-fast-heartbeat</strong></td>
<td>Configures the fast heartbeat timer, which reduces the amount of time it takes to detect a controller failure in access points.</td>
</tr>
<tr>
<td><strong>local</strong></td>
<td>Configures the fast heartbeat interval for access points in local mode.</td>
</tr>
<tr>
<td><strong>flexconnect</strong></td>
<td>Configures the fast heartbeat interval for access points in FlexConnect mode.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Configures the fast heartbeat interval for all the access points.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables the fast heartbeat interval.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables the fast heartbeat interval.</td>
</tr>
<tr>
<td><strong>fast_heartbeat_seconds</strong></td>
<td>Small heartbeat interval, which reduces the amount of time it takes to detect a controller failure, in seconds. The range is from 1 to 10.</td>
</tr>
<tr>
<td><strong>ap-heartbeat-timeout</strong></td>
<td>Configures Cisco lightweight access point heartbeat timeout value.</td>
</tr>
<tr>
<td><strong>heartbeat_seconds</strong></td>
<td>Cisco the Cisco lightweight access point heartbeat timeout value, in seconds. The range is from 1 to 30. This value should be at least three times larger than the fast heartbeat timer.</td>
</tr>
</tbody>
</table>
### Configuration Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ap-primary-discovery-timeout</strong></td>
<td>Configures the access point primary discovery request timer.</td>
</tr>
<tr>
<td><strong>primary_discovery_timeout</strong></td>
<td>Access point primary discovery request time, in seconds. The range is from 30 to 3600.</td>
</tr>
<tr>
<td><strong>ap-primed-join-timeout</strong></td>
<td>Configures the access point primed discovery timeout value.</td>
</tr>
<tr>
<td><strong>primed_join_timeout</strong></td>
<td>Access point primed discovery timeout value, in seconds. The range is from 120 to 43200.</td>
</tr>
<tr>
<td><strong>auth-timeout</strong></td>
<td>Configures the authentication timeout.</td>
</tr>
<tr>
<td><strong>auth_timeout</strong></td>
<td>Authentication response timeout value, in seconds. The range is from 10 to 600.</td>
</tr>
<tr>
<td><strong>pkt-fwd-watchdog</strong></td>
<td>Configures the packet forwarding watchdog timer to protect from fastpath deadlock.</td>
</tr>
<tr>
<td><strong>watchdog_timer</strong></td>
<td>Packet forwarding watchdog timer, in seconds. The range is from 60 to 300.</td>
</tr>
<tr>
<td><strong>default</strong></td>
<td>Configures the watchdog timer to the default value of 240 seconds.</td>
</tr>
<tr>
<td><strong>eap-identity-request-delay</strong></td>
<td>Configures the advanced Extensible Authentication Protocol (EAP) identity request delay, in seconds.</td>
</tr>
<tr>
<td><strong>eap_identity_request_delay</strong></td>
<td>Advanced EAP identity request delay, in seconds. The range is from 0 to 10.</td>
</tr>
<tr>
<td><strong>eap-timeout</strong></td>
<td>Configures the EAP expiration timeout.</td>
</tr>
<tr>
<td><strong>eap_timeout</strong></td>
<td>EAP timeout value, in seconds. The range is from 8 to 120.</td>
</tr>
</tbody>
</table>

#### Command Default

- The default access point discovery timeout is 10 seconds.
- The default access point heartbeat timeout is 30 seconds.
- The default access point primary discovery request timer is 120 seconds.
- The default authentication timeout is 10 seconds.
- The default packet forwarding watchdog timer is 240 seconds.

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was enhanced.</td>
</tr>
</tbody>
</table>
Modification Release

This command was enhanced with new keyword in Release 8.6. The new keyword added is `ap-coverage-report`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.6</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco lightweight access point discovery timeout indicates how often a Cisco WLC attempts to discover unconnected Cisco lightweight access points.

The Cisco lightweight access point heartbeat timeout controls how often the Cisco lightweight access point sends a heartbeat keepalive signal to the Cisco Wireless LAN Controller.

The following example shows how to configure an access point discovery timeout with a timeout value of 20:

```
(Cisco Controller) > config advanced timers ap-discovery-timeout 20
```

The following example shows how to enable the fast heartbeat interval for an access point in FlexConnect mode:

```
(Cisco Controller) > config advanced timers ap-fast-heartbeat flexconnect enable 8
```

The following example shows how to configure the authentication timeout to 20 seconds:

```
(Cisco Controller) > config advanced timers auth-timeout 20
```
**config advanced fastpath fastcache**

To configure the fastpath fast cache control, use the `config advanced fastpath fastcache` command.

```
config advanced fastpath fastcache {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the fastpath fast cache control.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the fastpath fast cache control.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the fastpath fast cache control:

```
(Cisco Controller) > config advanced fastpath fastcache enable
```

**Related Commands**

`config advanced fastpath pkt-capture`
config advanced fastpath pkt-capture

To configure the fastpath packet capture, use the `config advanced fastpath pkt-capture` command.

```
config advanced fastpath pkt-capture { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the fastpath packet capture.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the fastpath packet capture.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the fastpath packet capture:

```
(Cisco Controller) > config advanced fastpath pkt-capture enable
```

**Related Commands**

`config advanced fastpath fastcache`
config advanced sip-preferred-call-no

To configure voice prioritization, use the `config advanced sip-preferred-call-no` command.

```
config advanced sip-preferred-call-no call_index { call_number | none }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>call_index</td>
<td>Call index with valid values between 1 and 6.</td>
</tr>
<tr>
<td>call_number</td>
<td>Preferred call number that can contain up to 27 characters.</td>
</tr>
<tr>
<td>none</td>
<td>Deletes the preferred call set for the specified index.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Usage Guidelines**

Before you configure voice prioritization, you must complete the following prerequisites:

- Set the voice to the platinum QoS level by entering the `config wlan qos wlan-id platinum` command.
- Enable the admission control (ACM) to this radio by entering the `config 802.11 {a | b} cac {voice | video} acm enable` command.
- Enable the call-snooping feature for a particular WLAN by entering the `config wlan call-snoop enable wlan-id` command.

To view statistics about preferred calls, enter the `show ap stats {802.11 {a | b} | wlan} cisco_ap` command.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to add a new preferred call for index 2:

```
(Cisco Controller) > config advanced sip-preferred-call-no 2 0123456789
```

**Related Commands**

- `config wlan qos`
- `config 802.11 cac video acm`
- `config 802.11 cac voice acm`
- `config wlan call-snoop`
- `show ap stats`
config advanced sip-snooping-ports

To configure call snooping ports, use the config advanced sip-snooping-ports command.

```
config advanced sip-snooping-ports start_port end_port
```

**Syntax Description**
- `start_port` Starting port for call snooping. The range is from 0 to 65535.
- `end_port` Ending port for call snooping. The range is from 0 to 65535.

**Usage Guidelines**
If you need only a single port for call snooping, configure the start and end port with the same number. The port used by the CIUS tablet is 5060 and the port range used by Facetime is from 16384 to 16402.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the call snooping ports:

(Cisco Controller) > config advanced sip-snooping-ports 4000 4500

**Related Commands**
- show cac voice stats
- show cac voice summary
- show cac video stats
- show cac video summary
- config 802.11 cac video sip
- config 802.11 cac voice sip
- show advanced sip-preferred-call-no
- show advanced sip-snooping-ports
- debug cac
config advanced backup-controller primary

To configure a primary backup controller, use the `config advanced backup-controller primary` command.

`config advanced backup-controller primary system name IP addr`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>system name</code></td>
<td>Configures primary/secondary backup controller.</td>
</tr>
<tr>
<td><code>IP addr</code></td>
<td>IP address of the backup controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To delete a primary backup controller entry (IPv6 or IPv4), enter 0.0.0.0 for the controller IP address.

The following example shows how to configure the IPv4 primary backup controller:

(Cisco Controller) > `config advanced backup-controller primary Controller_1 10.10.10.10`

The following example shows how to configure the IPv6 primary backup controller:

(Cisco Controller) > `config advanced backup-controller primary systemname 2001:9:6:40::623`

The following example shows how to remove the IPv4 primary backup controller:

(Cisco Controller) > `config advanced backup-controller primary Controller_1 10.10.10.10`

The following example shows how to remove the IPv6 primary backup controller:

(Cisco Controller) > `config advanced backup-controller primary Controller_1 0.0.0.0`

**Related Commands**

- show advanced back-up controller
config advanced backup-controller secondary

To configure a secondary backup controller, use the `config advanced backup-controller secondary` command.

```
config advanced backup-controller secondary system name IP addr
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>system name</code></td>
<td>Configures primary/secondary backup controller.</td>
</tr>
<tr>
<td><code>IP addr</code></td>
<td>IP address of the backup controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To delete a secondary backup controller entry (IPv4 or IPv6), enter `0.0.0.0` for the controller IP address.

The following example shows how to configure an IPv4 secondary backup controller:

```
(Cisco Controller) > config advanced backup-controller secondary Controller_2 10.10.10.10
```

The following example shows how to configure an IPv6 secondary backup controller:

```
(Cisco Controller) > config advanced backup-controller secondary Controller_2 2001:9:6:40::623
```

The following example shows how to remove an IPv4 secondary backup controller:

```
(Cisco Controller) > config advanced backup-controller secondary Controller_2 0.0.0.0
```

The following example shows how to remove an IPv6 secondary backup controller:

```
(Cisco Controller) > config advanced backup-controller secondary Controller_2 0.0.0.0
```

**Related Commands**

- `show advanced back-up controller`
config advanced client-handoff

To set the client handoff to occur after a selected number of 802.11 data packet excessive retries, use the config advanced client-handoff command.

```
config advanced client-handoff num_of_retries
```

**Syntax Description**

| num_of_retries | Number of excessive retries before client handoff (from 0 to 255). |

**Command Default**

The default value for the number of 802.11 data packet excessive retries is 0.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is supported only for the 1000/1510 series access points.

This example shows how to set the client handoff to 100 excessive retries:

```
(Cisco Controller) > config advanced client-handoff 100
```
**config advanced dot11-padding**

To enable or disable over-the-air frame padding, use the `config advanced dot11-padding` command.

```
config advanced dot11-padding { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>enable</td>
<td>Enables the over-the-air frame padding.</td>
</tr>
<tr>
<td></td>
<td>disable</td>
<td>Disables the over-the-air frame padding.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>The default over-the-air frame padding is disabled.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable over-the-air frame padding:

```
(Cisco Controller) > config advanced dot11-padding enable
```

**Related Commands**

- `debug dot11`
- `debug dot11 mgmt interface`
- `debug dot11 mgmt msg`
- `debug dot11 mgmt ssid`
- `debug dot11 mgmt state-machine`
- `debug dot11 mgmt station`
- `show advanced dot11-padding`
config advanced assoc-limit

To configure the rate at which access point radios send association and authentication requests to the controller, use the `config advanced assoc-limit` command.

```
config advanced assoc-limit { enable [ number of associations per interval | interval ] | disable }
```

**Syntax Description**

- **enable**
  
  Enables the configuration of the association requests per access point.

- **disable**
  
  Disables the configuration of the association requests per access point.

- **number of associations per interval**
  
  (Optional) Number of association request per access point slot in a given interval. The range is from 1 to 100.

- **interval**
  
  (Optional) Association request limit interval. The range is from 100 to 10000 milliseconds.

**Command Default**

The default state of the command is disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When 200 or more wireless clients try to associate to a controller at the same time, the clients no longer become stuck in the DHCP_REQD state when you use the `config advanced assoc-limit` command to limit association requests from access points.

The following example shows how to configure the number of association requests per access point slot in a given interval of 20 with the association request limit interval of 250:

```
(Cisco Controller) > config advanced assoc-limit enable 20 250
```
**config advanced max-1x-sessions**

To configure the maximum number of simultaneous 802.1X sessions allowed per access point, use the `config advanced max-1x-sessions` command.

```
config advanced max-1x-sessions no_of_sessions
```

**Syntax Description**

| `no_of_sessions` | Number of maximum 802.1x session initiation per AP at a time. The range is from 0 to 255, where 0 indicates unlimited. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the maximum number of simultaneous 802.1X sessions:

```
(Cisco Controller) >config advanced max-1x-sessions 200
```
config advanced rate

To configure switch control path rate limiting, use the **config advanced rate** command.

```
config advanced rate (enable | disable)
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables the switch control path rate limiting feature.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables the switch control path rate limiting feature.</td>

</tbody>
</table>

The following example shows how to use increased backoff parameters for probe response:

(Cisco Controller) > `config advanced probe backoff enable`
To configure the filtering of probe requests forwarded from an access point to the controller, use the **config advanced probe filter** command.

```
config advanced probe filter (enable | disable)
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the filtering of probe requests.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the filtering of probe requests.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

8.3     | This command was introduced. |

The following example shows how to enable the filtering of probe requests forwarded from an access point to the controller:

```
(Cisco Controller) >config advanced probe filter enable
```
**config advanced probe limit**

To limit the number of probes sent to the WLAN controller per access point per client in a given interval, use the `config advanced probe limit` command.

`config advanced probe limit num_probes interval`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>num_probes</strong></td>
<td>Number of probe requests (from 1 to 100) forwarded to the controller per client per access point radio in a given interval.</td>
</tr>
<tr>
<td><strong>interval</strong></td>
<td>Probe limit interval (from 100 to 10000 milliseconds).</td>
</tr>
</tbody>
</table>

**Command Default**
The default number of probe requests is 2. The default interval is 500 milliseconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to set the number of probes per access point per client to 5 and the probe interval to 800 milliseconds:

```
(Cisco Controller) > config advanced probe limit 5 800
```
config advanced timers

To configure an advanced system timer, use the config advanced timers command.

```
config advanced timers { ap-coverage-report seconds | ap-discovery-timeout discovery-timeout | ap-fast-heartbeat { local | flexconnect | all } { enable | disable } fast_heartbeat_seconds | ap-heartbeat-timeout heartbeat_seconds | ap-primary-discovery-timeout primary_discovery_timeout | ap-primed-join-timeout primed_join_timeout | auth-timeout auth_timeout | pkt-fwd-watchdog { enable | disable } { watchdog_timer | default } | eap-identity-request-delay eap_identity_request_delay | eap-timeout eap_timeout }
```

**Syntax Description**

- **ap-coverage-report**: Configures RRM coverage report interval for all APs.

  ```
  seconds
  ```

  Configures the ap coverage report interval in seconds. The range is between 60 and 90 seconds. Default is 90 seconds.

- **ap-discovery-timeout**: Configures the Cisco lightweight access point discovery timeout value.

  ```
  discovery-timeout
  ```

  Cisco lightweight access point discovery timeout value, in seconds. The range is from 1 to 10.

- **ap-fast-heartbeat**: Configures the fast heartbeat timer, which reduces the amount of time it takes to detect a controller failure in access points.

  ```
  local
  ```

  Configures the fast heartbeat interval for access points in local mode.

  ```
  flexconnect
  ```

  Configures the fast heartbeat interval for access points in FlexConnect mode.

  ```
  all
  ```

  Configures the fast heartbeat interval for all the access points.

  ```
  enable
  ```

  Enables the fast heartbeat interval.

  ```
  disable
  ```

  Disables the fast heartbeat interval.

  ```
  fast_heartbeat_seconds
  ```

  Small heartbeat interval, which reduces the amount of time it takes to detect a controller failure, in seconds. The range is from 1 to 10.

- **ap-heartbeat-timeout**: Configures Cisco lightweight access point heartbeat timeout value.

  ```
  heartbeat_seconds
  ```

  Cisco the Cisco lightweight access point heartbeat timeout value, in seconds. The range is from 1 to 30. This value should be at least three times larger than the fast heartbeat timer.
<table>
<thead>
<tr>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The Cisco lightweight access point discovery timeout indicates how often a Cisco WLC attempts to discover unconnected Cisco lightweight access points.

The Cisco lightweight access point heartbeat timeout controls how often the Cisco lightweight access point sends a heartbeat keepalive signal to the Cisco Wireless LAN Controller.

The following example shows how to configure an access point discovery timeout with a timeout value of 20:

```
(Cisco Controller) > config advanced timers ap-discovery-timeout 20
```

The following example shows how to enable the fast heartbeat interval for an access point in FlexConnect mode:

```
(Cisco Controller) > config advanced timers ap-fast-heartbeat flexconnect enable 8
```

The following example shows how to configure the authentication timeout to 20 seconds:

```
(Cisco Controller) > config advanced timers auth-timeout 20
```
config ap 802.1Xuser

To configure the global authentication username and password for all access points currently associated with the controller as well as any access points that associate with the controller in the future, use the `config ap 802.1Xuser` command.

```plaintext
config ap 802.1Xuser add username ap-username password ap-password {all | cisco_ap}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add username</td>
<td>Specifies to add a username.</td>
</tr>
<tr>
<td>ap-username</td>
<td>Username on the Cisco AP.</td>
</tr>
<tr>
<td>password</td>
<td>Specifies to add a password.</td>
</tr>
<tr>
<td>ap-password</td>
<td>Password.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Specific access point.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enter a strong `password`. Strong passwords have the following characteristics:

- They are at least eight characters long.
- They contain a combination of uppercase and lowercase letters, numbers, and symbols.
- They are not a word in any language.

You can set the values for a specific access point.

This example shows how to configure the global authentication username and password for all access points:

(Cisco Controller) > `config ap 802.1Xuser add username cisco123 password cisco2020 all`
config ap 802.1Xuser delete

To force a specific access point to use the controller’s global authentication settings, use the config ap 802.1Xuser delete command.

```
config ap 802.1Xuser delete cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco_ap</td>
<td>Access point.</td>
</tr>
</tbody>
</table>

| Command Default   | None |

<table>
<thead>
<tr>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete access point AP01 to use the controller’s global authentication settings:

```
(Cisco Controller) > config ap 802.1Xuser delete AP01
```
**config ap 802.1Xuser disable**

To disable authentication for all access points or for a specific access point, use the `config ap 802.1Xuser disable` command.

`config ap 802.1Xuser disable { all | cisco_ap }`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>disable</code></td>
<td>Disables authentication.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies all access points.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can disable 802.1X authentication for a specific access point only if global 802.1X authentication is not enabled. If global 802.1X authentication is enabled, you can disable 802.1X for all access points only.

The following example shows how to disable the authentication for access point `cisco_ap1`:

```
(Cisco Controller) > config ap 802.1Xuser disable
```
# config advanced dot11-padding

To enable or disable over-the-air frame padding, use the `config advanced dot11-padding` command.

```plaintext
config advanced dot11-padding { enable | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the over-the-air frame padding.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the over-the-air frame padding.</td>
</tr>
</tbody>
</table>

## Command Default

The default over-the-air frame padding is disabled.

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

### config ap

To configure a Cisco lightweight access point or to add or delete a third-party (foreign) access point, use the `config ap` command.

```
config ap { { enable | disable } cisco_ap | { add | delete } MAC port { enable | disable } IP_address }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the Cisco lightweight access point.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the Cisco lightweight access point.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>

The following example shows how to disable lightweight access point AP1:

```
(Cisco Controller) > config ap disable AP1
```

The following example shows how to add a foreign access point with MAC address 12:12:12:12:12 and IP address 192.12.12.1 from port 2033:

```
(Cisco Controller) > config ap add 12:12:12:12:12 2033 enable 192.12.12.1
```
To configure the Cisco lightweight access point AID audit mechanism, use the `config ap aid-audit` command.

```bash
config ap aid-audit { enable | disable }
```

**Syntax Description**
- `aid-audit` configuration AID audit mechanism.
- `enable` Enables AID audit mechanism.
- `disable` Disables AID audit mechanism.

**Command Default**
Disabled.

**Command History**
- **Release**
  - 8.6: This command was introduced.

The following example shows how to enable AP aid-audit:

```bash
(Cisco Controller) > config ap aid-audit enable
```
To configure a Cisco AP antenna's band mode as either single or dual, use the `config ap antenna band-mode` command.

```
config ap antenna band-mode \{ single | dual \} cisco-ap
```

**Syntax Description**
- **single**: Configures single band antenna mode for a Cisco AP.
- **dual**: Configures dual band antenna mode for a Cisco AP.
- **cisco-ap**: Cisco AP name.

**Command Default**
None

**Command History**

**config ap atf 802.11**

Configure Cisco Airtime Fairness at an AP level by using the **config ap atf 802.11** command.

```
config ap atf 802.11 {a | b} {mode {disable | monitor | enforce-policy} ap-name} | {optimization {enable | disable}}
```

**Syntax Description**

- **a**: Specifies the 802.11a network settings
- **b**: Specifies the 802.11b/g network settings
- **mode**: Configures the granularity of Cisco ATF enforcement
  - **disable**: Disables Cisco ATF
  - **monitor**: Configures Cisco ATF in monitor mode
  - **enforce-policy**: Configures Cisco ATF in enforcement mode
- **ap-name**: AP name that you must specify
- **optimization**: Configures airtime optimization
  - **enable**: Enables airtime optimization
  - **disable**: Disables airtime optimization

**Command History**

<table>

config ap autoconvert

To automatically convert all access points to FlexConnect mode or Monitor mode upon associating with the Cisco WLC, use the config ap autoconvert command.

```
config ap autoconvert {flexconnect | monitor | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flexconnect</td>
<td>Configures all the access points automatically to FlexConnect mode.</td>
</tr>
<tr>
<td>monitor</td>
<td>Configures all the access points automatically to monitor mode.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the autoconvert option on the access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When access points in local mode connect to a Cisco 7500 Series Wireless Controller, they do not serve clients. The access point details are available in the controller. To enable access points to serve clients or perform monitoring related tasks when connected to the Cisco 7500 Series Wireless Controller, the access points must be in FlexConnect mode or Monitor mode.

The command can also be used for conversion of AP modes in Cisco 5520, 8540, and 8510 Series Wireless Controller platforms.

The following example shows how to automatically convert all access points to the FlexConnect mode:

```
(Cisco Controller) > config ap autoconvert flexconnect
```

The following example shows how to disable the autoconvert option on the APs:

```
(Cisco Controller) > config ap autoconvert disable
```
### config ap bhrate

To configure the Cisco bridge backhaul Tx rate, use the `config ap bhrate` command.

```
config ap bhrate \{rate | auto\} cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rate</code></td>
<td>Cisco bridge backhaul Tx rate in kbps. The valid values are 6000, 12000, 18000, 24000, 36000, 48000, and 54000.</td>
</tr>
<tr>
<td><code>auto</code></td>
<td>Configures the auto data rate.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

The default status of the command is set to Auto.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In previous software releases, the default value for the bridge data rate was 24000 (24 Mbps). In controller software release 6.0, the default value for the bridge data rate is `auto`. If you configured the default bridge data rate value (24000) in a previous controller software release, the bridge data rate is configured with the new default value (auto) when you upgrade to controller software release 6.0. However, if you configured a non default value (for example, 18000) in a previous controller software release, that configuration setting is preserved when you upgrade to Cisco WLC Release 6.0.

When the bridge data rate is set to `auto`, the mesh backhaul chooses the highest rate where the next higher rate cannot be used due to unsuitable conditions for that specific rate (and not because of conditions that affect all rates).

The following example shows how to configure the Cisco bridge backhaul Tx rate to 54000 kbps:

```
(Cisco Controller) >config ap bhrate 54000 AP01
```
config ap bridgegroupname

To set or delete a bridge group name on a Cisco lightweight access point, use the `config ap bridgegroupname` command.

```
config ap bridgegroupname { set groupname | delete | { strict-matching { enable | disable } } } cisco_ap
```

**Syntax Description**

- **set**
  - Sets a Cisco lightweight access point’s bridge group name.

- **groupname**
  - Bridge group name.

- **delete**
  - Deletes a Cisco lightweight access point’s bridge group name.

- **cisco_ap**
  - Name of a Cisco lightweight access point.

- **strict-matching**
  - Restricts the possible parent list, if the MAP has a non-default BGN, and the potential parent has a different BGN.

- **enable**
  - Enables a Cisco lightweight access point’s group name.

- **disable**
  - Disables a Cisco lightweight access point’s group name.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>The <code>strict-matching</code> parameter was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only access points with the same bridge group name can connect to each other. Changing the AP bridgegroupname may strand the bridge AP.

The following example shows how to delete a bridge group name on Cisco access point’s bridge group name AP02:

```
(Cisco Controller) > config ap bridgegroupname delete AP02
Changing the AP’s bridgegroupname may strand the bridge AP. Please continue with caution.
Changing the AP’s bridgegroupname will also cause the AP to reboot.
Are you sure you want to continue? (y/n)
```

---

**Cisco Wireless Controller Command Reference, Release 8.8**

302
To configure Ethernet-to-Ethernet bridging on a Cisco lightweight access point, use the **config ap bridging** command.

```
config ap bridging {enable | disable} cisco_ap
```

**Syntax Description**
- **enable**: Enables the Ethernet-to-Ethernet bridging on a Cisco lightweight access point.
- **disable**: Disables Ethernet-to-Ethernet bridging.
- **cisco_ap**: Name of a Cisco lightweight access point.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable bridging on an access point:

(Cisco Controller) >`config ap bridging enable nyc04-44-1240`

The following example shows how to disable bridging on an access point:

(Cisco Controller) >`config ap bridging disable nyc04-44-1240`
config ap cdp

To configure the Cisco Discovery Protocol (CDP) on a Cisco lightweight access point, use the config ap cdp command.

```
config ap cdp { enable | disable | interface { ethernet interface_number | slot slot_id } } { cisco_ap | all }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables CDP on an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables CDP on an access point.</td>
</tr>
<tr>
<td>interface</td>
<td>Configures CDP in a specific interface.</td>
</tr>
<tr>
<td>ethernet</td>
<td>Configures CDP for an ethernet interface.</td>
</tr>
<tr>
<td>interface_number</td>
<td>Ethernet interface number between 0 and 3.</td>
</tr>
<tr>
<td>slot</td>
<td>Configures CDP for a radio interface.</td>
</tr>
<tr>
<td>slot_id</td>
<td>Slot number between 0 and 3.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

### Note

If an AP itself is configured with the keyword **all**, the all access points case takes precedence over the AP that is with the keyword **all**.

### Command Default

Enabled on radio interfaces of mesh APs and disabled on radio interfaces of non-mesh APs. Enabled on Ethernet interfaces of all APs.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The **config ap cdp disable all** command disables CDP on all access points that are joined to the controller and all access points that join in the future. CDP remains disabled on both current and future access points even after the controller or access point reboots. To enable CDP, enter the **config ap cdp enable all** command.
CDP over Ethernet/radio interfaces is available only when CDP is enabled. After you enable CDP on all access points joined to the controller, you may disable and then reenable CDP on individual access points using the `config ap cdp {enable | disable} cisco_ap command`. After you disable CDP on all access points joined to the controller, you may not enable and then disable CDP on individual access points.

The following example shows how to enable CDP on all access points:

(Cisco Controller) >config ap cdp enable all

The following example shows how to disable CDP on ap02 access point:

(Cisco Controller) >config ap cdp disable ap02

The following example shows how to enable CDP for Ethernet interface number 2 on all access points:

(Cisco Controller) >config ap cdp ethernet 2 enable all
**config ap cert-expiry-ignore**

To configure the device certificate date validation check, use the `config ap cert-expiry-ignore` command.

```
config ap cert-expiry-ignore { mic | ssc { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>cert-expiry-ignore</strong></td>
<td>Configures certificate expiry-ignore check operation.</td>
</tr>
<tr>
<td><strong>mic</strong></td>
<td>Configures certificate expiry-ignore check operation for MIC.</td>
</tr>
<tr>
<td><strong>ssc</strong></td>
<td>Configures certificate expiry-ignore check operation for SSC.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enabling will ignore the lifetime-check.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disabling will do the lifetime-check.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.7</td>
<td>This command was enhanced to include certificate date validation check for Cisco WLC.</td>
</tr>
</tbody>
</table>

The following example shows how to ignore lifetime check on MIC certificate:

```
(Cisco Controller) > config ap cert-expiry-ignore mic enable
```
**config ap core-dump**

To configure a Cisco lightweight access point’s memory core dump, use the **config ap core-dump** command.

```plaintext
config ap core-dump {disable | enable tftp_server_ipaddress filename {compress | uncompress} {cisco_ap | all}}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables the Cisco lightweight access point’s memory core dump setting.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables the Cisco lightweight access point’s memory core dump setting.</td>
</tr>
<tr>
<td><strong>tftp_server_ipaddress</strong></td>
<td>IP address of the TFTP server to which the access point sends core dump files.</td>
</tr>
<tr>
<td><strong>filename</strong></td>
<td>Name that the access point uses to label the core file.</td>
</tr>
<tr>
<td><strong>compress</strong></td>
<td>Compresses the core dump file.</td>
</tr>
<tr>
<td><strong>uncompress</strong></td>
<td>Uncompresses the core dump file.</td>
</tr>
<tr>
<td><strong>cisco_ap</strong></td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

**Note**

If an AP itself is configured with the name ‘all’, then the ‘all access points’ case takes precedence over the AP that is named ‘all’.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The access point must be able to reach the TFTP server. This command is applicable for both IPv4 and IPv6 addresses.

The following example shows how to configure and compress the core dump file:

```
(Cisco Controller) > config ap core-dump enable 209.165.200.225 log compress AP02
```
config ap crash-file clear-all

To delete all crash and radio core dump files, use the `config ap crash-file clear-all` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete crash file 1:

```
(Cisco Controller) >config ap crash-file delete crash_file_1
```
config ap crash-file get-crash-file

To collect the latest crash data for a Cisco lightweight access point, use the `config ap crash-file get-crash-file` command.

```
config ap crash-file get-crash-file cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `transfer upload datatype` command to transfer the collected data to the Cisco wireless LAN controller.

The following example shows how to collect the latest crash data for access point AP3:

```
(Cisco Controller) >config ap crash-file get-crash-file AP3
```
config ap crash-file get-radio-core-dump

To get a Cisco lightweight access point’s radio core dump, use the config ap crash-file get-radio-core-dump command.

```
config ap crash-file get-radio-core-dump slot_id cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>slot_id</code></td>
<td>Slot ID (either 0 or 1).</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to collect the radio core dump for access point AP02 and slot 0:

```
(Cisco Controller) > config ap crash-file get-radio-core-dump 0 AP02
```
To configure DHCP release override on Cisco APs, use the `config ap dhcp release-override` command.

```
config ap dhcp release-override { enable | disable } { cisco-ap-name | all }
```

**Syntax Description**

- **enable**
  Enables DHCP release override and sets number of DHCP releases sent by AP to 1. To be used as a workaround for a few DHCP servers that mark the AP's IP address as bad. We recommend that you use this configuration only in highly reliable networks.

- **disable**
  Disables DHCP release override and sets number of DHCP releases sent by AP to 3, which is the default value. This ensures that the DHCP server receives the release message even if one of the packets is lost.

- **cisco-ap-name**
  Configuration is applied to the Cisco AP that you enter.

- **all**
  Configuration is applied to all Cisco APs

**Command Default**

Disabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command when you are using Cisco lightweight APs with Windows Server 2008 R2 or 2012 as the DHCP server.
config ap dtls-cipher-suite

To enable new cipher suites for DTLS connection between AP and controller, use the config ap dtls-cipher-suite command.

config ap dtls-cipher-suite { RSA-AES256-SHA256 | RSA-AES256-SHA | RSA-AES128-SHA }

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA-AES256-SHA256</td>
<td>Cipher suite using either RSA key exchange or authentication, using 256 bit AES and SHA 256.</td>
</tr>
<tr>
<td>RSA-AES256-SHA</td>
<td>Cipher suite using either RSA key exchange or authentication, using 256 bit AES and SHA.</td>
</tr>
<tr>
<td>RSA-AES128-SHA</td>
<td>Cipher suite using either RSA key exchange or authentication, using 128 bit AES and SHA.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable RSA cipher suites using 256 bit AES and SHA 256 for DTLS connection between AP and controller:

(Cisco Controller) > config ap dtls-cipher-suite RSA-AES256-SHA256
**config ap dtls-version**

To configure the cipher DTLS version, use the `config ap dtls-version` command.

```
config ap dtls-version { dtls1.0 | dtls1.2 | dtls_all }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Command Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>dtls1.0</td>
<td>Select DTLS 1.0 version</td>
</tr>
<tr>
<td>dtls1.2</td>
<td>Select DTLS 1.2 version</td>
</tr>
<tr>

<td>Select all DTLS versions for backward compatibility</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3.111.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to configure cipher dtls version 1.2:

```
(Cisco Controller) > config ap dtls-version dtls1.2
```
config ap ethernet duplex

To configure the Ethernet port duplex and speed settings of the lightweight access points, use the `config ap ethernet duplex` command.

```
config ap ethernet duplex [auto | half | full] speed [auto | 10 | 100 | 1000] { all | cisco_ap}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auto</td>
<td>(Optional) Specifies the Ethernet port duplex auto settings.</td>
</tr>
<tr>
<td>half</td>
<td>(Optional) Specifies the Ethernet port duplex half settings.</td>
</tr>
<tr>
<td>full</td>
<td>(Optional) Specifies the Ethernet port duplex full settings.</td>
</tr>
<tr>
<td>speed</td>
<td>Specifies the Ethernet port speed settings.</td>

<tr>
<td>10</td>
<td>(Optional) Specifies the Ethernet port speed to 10 Mbps.</td>
</tr>
<tr>
<td>100</td>
<td>(Optional) Specifies the Ethernet port speed to 100 Mbps.</td>
</tr>
<tr>
<td>1000</td>
<td>(Optional) Specifies the Ethernet port speed to 1000 Mbps.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies the Ethernet port setting for all connected access points.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Cisco access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the Ethernet port duplex half settings as 10 Mbps for all access points:

```
(Cisco Controller) >config ap ethernet duplex half speed 10 all
```
config ap ethernet tag

To configure VLAN tagging of the Control and Provisioning of Wireless Access Points protocol (CAPWAP) packets, use the `config ap ethernet tag` command.

```
config ap ethernet tag { id vlan_id | disable } { cisco_ap | all }
```

**Syntax Description**

- **id**
  - Specifies the VLAN id.

- **vlan_id**
  - ID of the trunk VLAN.

- **disable**
  - Disables the VLAN tag feature. When you disable VLAN tagging, the access point untags the CAPWAP packets.

- **cisco_ap**
  - Name of the Cisco AP.

- **all**
  - Configures VLAN tagging on all the Cisco access points.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After you configure VLAN tagging, the configuration comes into effect only after the access point reboots.

You cannot configure VLAN tagging on mesh access points.

If the access point is unable to route traffic or reach the controller using the specified trunk VLAN, it falls back to the untagged configuration. If the access point joins the controller using this fallback configuration, the controller sends a trap to a trap server such as the Cisco Prime Infrastructure, which indicates the failure of the trunk VLAN. In this scenario, the "Failover to untagged" message appears in show command output.

The following example shows how to configure VLAN tagging on a trunk VLAN:

```
(Cisco Controller) >config ap ethernet tag 6 AP1
```
config ap autoconvert

To automatically convert all access points to FlexConnect mode or Monitor mode upon associating with the Cisco WLC, use the `config ap autoconvert` command.

```
config ap autoconvert { flexconnect | monitor | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Command Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>flexconnect</td>
<td>Configures all the access points automatically to FlexConnect mode.</td>
</tr>
<tr>
<td>monitor</td>
<td>Configures all the access points automatically to monitor mode.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the autoconvert option on the access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When access points in local mode connect to a Cisco 7500 Series Wireless Controller, they do not serve clients. The access point details are available in the controller. To enable access points to serve clients or perform monitoring related tasks when connected to the Cisco 7500 Series Wireless Controller, the access points must be in FlexConnect mode or Monitor mode.

The command can also be used for conversion of AP modes in Cisco 5520, 8540, and 8510 Series Wireless Controller platforms.

The following example shows how to automatically convert all access points to the FlexConnect mode:

```
(Cisco Controller) >config ap autoconvert flexconnect
```

The following example shows how to disable the autoconvert option on the APs:

```
(Cisco Controller) >config ap autoconvert disable
```
**config ap flexconnect bridge**

To configure flexconnect bridge backhaul on a flex+bridge access point, use the `config ap flexconnect bridge` command.

```
config ap flexconnect bridge { backhaul-wlan | resilient } cisco_ap { enable | disable }
```

**Syntax Description**

- **backhaul-wlan**: Enables backhaul WLAN on the flexconnect AP.
- **resilient**: Enables standalone mode in flex+bridge AP.
- **cisco_ap**: Name of the access point.
- **enable**: Enables the selected mode on the access point.
- **disable**: Disables the selected mode on the access point.

**Command Default**

The default resilient mode is enabled on the Flex-bridge AP.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable resilient mode on an AP:

```
(Cisco Controller) >config ap flexconnect bridge resilient AP2 enable
```
config ap flexconnect central-dhcp

To enable central-DHCP on a FlexConnect access point in a WLAN, use the `config ap flexconnect central-dhcp` command.

```
config ap flexconnect central-dhcp wlan_id cisco_ap [add | delete] {enable | disable} override dns {enable | disable} nat-pat {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>

</tr>
<tr>
<td>enable</td>
<td>Enables NAT-PAT on a FlexConnect access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Deletes NAT-PAT on a FlexConnect access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in</td>
</tr>
<tr>
<td></td>
<td>a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable central-DHCP, Override DNS, and NAT-PAT on a FlexConnect access point:

```
(Cisco Controller) > config ap flexconnect central-dhcp 1 ap1250 enable override dns enable nat-pat enable
```
config ap flexconnect local-split

To configure a local-split tunnel on a FlexConnect access point, use the `config ap flexconnect local-split` command.

```
config ap flexconnect local-split wlan_id cisco_ap { enable | disable } acl acl_name
```

**Syntax Description**

- `wlan_id` Wireless LAN identifier between 1 and 512.
- `cisco_ap` Name of the FlexConnect access point.
- `enable` Enables local-split tunnel on a FlexConnect access point.
- `disable` Disables local-split tunnel feature on a FlexConnect access point.
- `acl` Configures a FlexConnect local-split access control list.
- `acl_name` Name of the FlexConnect access control list.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to configure a local-split tunnel in a centrally switched WLAN using a FlexConnect ACL. A local split tunnel supports only for unicast Layer 4 IP traffic as NAT/PAT does not support multicast IP traffic.

The following example shows how to configure a local-split tunnel using a FlexConnect ACL:

```
(Cisco Controller) >config ap flexconnect local-split 6 AP2 enable acl flex6
```
**config ap flexconnect module-vlan**

To configure VLAN tagging for Cisco USC 8x18 Dual Mode Module in FlexConnect Local Switching, use the `config ap flexconnect module-vlan` command.

```
config ap flexconnect module-vlan \{ \{ enable ap-name [vlan vlan-id] \} | \{ disable | remove \} ap-name \}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable ap-name</code></td>
<td>Enables FlexConnect local switching for the external module of the specified Cisco AP with native VLAN</td>
</tr>
<tr>
<td><code>enable ap-name vlan vlan-id</code></td>
<td>Enables FlexConnect local switching with non-native VLAN for the external module of the specified Cisco AP</td>
</tr>
<tr>
<td><code>disable ap-name</code></td>
<td>Disables FlexConnect local switching for the external module of the specified Cisco AP</td>
</tr>
<tr>
<td><code>remove ap-name</code></td>
<td>Removes the AP-specific external module VLAN configuration</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to enable FlexConnect local switching with non-native VLAN for the external module of a Cisco AP:

```
(Cisco Controller) > config ap flexconnect module-vlan enable 3600i-ap vlan4
```
To configure a policy ACL on a FlexConnect access point, use the `config ap flexconnect policy` command.

```
config ap flexconnect policy  (add | delete) acl_name
```

**Syntax Description**
- `add` Adds a policy ACL on a FlexConnect access point.
- `delete` Deletes a policy ACL on a FlexConnect access point.
- `acl_name` Name of the ACL.

**Command Default**
None

**Command History**
- **Release 7.5** This command was introduced.
- **Release 8.3** This command was introduced.

The following example shows how to add a policy ACL on a FlexConnect access point:

```
(Cisco Controller) > config ap flexconnect policy add acl1
```
config ap flexconnect radius auth set

To configure a primary or secondary RADIUS server for a specific FlexConnect access point, use the `config ap flexconnect radius auth set` command.

```
config ap flexconnect radius auth set { primary | secondary } ip_address auth_port secret
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary</td>
<td>Specifies the primary RADIUS server for a specific FlexConnect access point</td>
</tr>
<tr>
<td>secondary</td>
<td>Specifies the secondary RADIUS server for a specific FlexConnect AP</td>
</tr>
<tr>
<td>ip_address</td>
<td>IP address of the RADIUS server</td>
</tr>
<tr>
<td>auth_port</td>
<td>Name of the port</td>
</tr>
<tr>
<td>secret</td>
<td>RADIUS server secret</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a primary RADIUS server for a specific access point:

```
(Cisco Controller) > config ap flexconnect radius auth set primary 192.12.12.1
```
config ap flexconnect vlan

To enable or disable VLAN tagging for a FlexConnect access, use the `config ap flexconnect vlan` command.

```
config ap flexconnect vlan { enable | disable } cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the access point’s VLAN tagging.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the access point’s VLAN tagging.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled. Once enabled, WLANs enabled for local switching inherit the VLAN assigned at the Cisco WLC.

**Command History**

Release | Modification
---------|---------------
7.6      | This command was introduced in a release earlier than Release 7.6.

Release | Modification
---------|---------------
8.3      | This command was introduced.

This example shows how to enable the access point’s VLAN tagging for a FlexConnect access:

```
(Cisco Controller) > config ap flexconnect vlan enable AP02
```
config ap flexconnect vlan add

To add a VLAN to a FlexConnect access point, use the `config ap flexconnect vlan add` command.

```
config ap flexconnect vlan add vlan-id acl in-acl out-acl cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN identifier.</td>
</tr>
<tr>
<td><code>acl</code></td>
<td>ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><code>in-acl</code></td>
<td>Inbound ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><code>out-acl</code></td>
<td>Outbound ACL name that contains up to 32 alphanumeric characters.</td>
</tr>

<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the FlexConnect access point:

```
(Cisco Controller) >config ap flexconnect vlan add 21 acl inacl1 outacl1 ap1
```
## config ap flexconnect vlan native

To configure a native VLAN for a FlexConnect access point, use the `config ap flexconnect vlan native` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN identifier.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a native VLAN for a FlexConnect access point mode:

```bash
(Cisco Controller) > config ap flexconnect vlan native 6 AP02
```
**config ap flexconnect vlan wlan**

To assign a VLAN ID to a FlexConnect access point, use the `config ap flexconnect vlan wlan` command.

```
config ap flexconnect vlan wlan wlan-id vlan-id cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>WLAN identifier</td>
</tr>
<tr>
<td>vlan-id</td>
<td>VLAN identifier (1 - 4094).</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

VLAN ID associated to the WLAN.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to assign a VLAN ID to a FlexConnect access point:

```
(Cisco Controller) > config ap flexconnect vlan wlan 192.12.12.1 6 AP02
```
config ap flexconnect web-auth

To configure a FlexConnect ACL for external web authentication in locally switched WLANs, use the `config ap flexconnect web-auth` command.

```
config ap flexconnect web-auth wlan wlan_id cisco_ap acl_name { enable | disable }
```

**Syntax Description**

- **wlan**: Specifies the wireless LAN to be configured with a FlexConnect ACL.
- **wlan_id**: Wireless LAN identifier between 1 and 512 (inclusive).
- **cisco_ap**: Name of the FlexConnect access point.
- **acl_name**: Name of the FlexConnect ACL.
- **enable**: Enables the FlexConnect ACL on the locally switched wireless LAN.
- **disable**: Disables the FlexConnect ACL on the locally switched wireless LAN.

**Command Default**

FlexConnect ACL for external web authentication in locally switched WLANs is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The FlexConnect ACLs that are specific to an AP have the highest priority. The FlexConnect ACLs that are specific to WLANs have the lowest priority.

The following example shows how to enable FlexConnect ACL for external web authentication on WLAN 6:

```
(Cisco Controller) >config ap flexconnect web-auth wlan 6 AP2 flexacl2 enable
```
config ap flexconnect web-policy acl

To configure a Web Policy FlexConnect ACL on an access point, use the **config ap flexconnect web-policy acl** command.

```
config ap flexconnect web-policy acl { add | delete } acl_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds a Web Policy FlexConnect ACL on an access point.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes Web Policy FlexConnect ACL on an access point.</td>
</tr>
<tr>
<td>acl_name</td>
<td>Name of the Web Policy FlexConnect ACL.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to add a Web Policy FlexConnect ACL on an access point:

(Cisco Controller) > **config ap flexconnect web-policy acl add flexacl2**
config ap flexconnect wlan

To configure a FlexConnect access point in a locally switched WLAN, use the `config ap flexconnect wlan` command.

```
config ap flexconnect wlan l2acl { add wlan_id cisco_ap acl_name | delete wlan_id cisco_ap }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>add</strong></td>
<td>Adds a Layer 2 ACL to the FlexConnect access point.</td>
</tr>
<tr>
<td><strong>wlan_id</strong></td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
<tr>
<td><strong>cisco_ap</strong></td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
<tr>
<td><strong>acl_name</strong></td>
<td>Layer 2 ACL name. The name can be up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes a Layer 2 ACL from the FlexConnect access point.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- You can create a maximum of 16 rules for a Layer 2 ACL.
- You can create a maximum of 64 Layer 2 ACLs on a Cisco WLC.
- A maximum of 16 Layer 2 ACLs are supported per AP because an AP supports a maximum of 16 WLANs.
- Ensure that the Layer 2 ACL names do not conflict with the FlexConnect ACL names because an AP does not support the same Layer 2 and Layer 3 ACL names.

The following example shows how to configure a Layer 2 ACL on a FlexConnect AP.

```
(Cisco Controller) > config ap flexconnect wlan add 1 AP1600_1 acl_12_1
```
config ap group-name

To specify a descriptive group name for a Cisco lightweight access point, use the `config ap group-name` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>groupname</code></td>
<td>Descriptive name for the access point group.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco lightweight access point must be disabled before changing this parameter.

The following example shows how to configure a descriptive name for access point AP01:

(Cisco Controller) > `config ap group-name superusers AP01`
To configure hotspot parameters on an access point, use the `config ap hotspot` command.

```plaintext
config ap hotspot venue { type group_code type_code | name { add language_code venue_name | delete } }
cisco_ap
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>venue</strong></td>
<td>Configures venue information for given AP group.</td>
</tr>
<tr>
<td><strong>type</strong></td>
<td>Configures the type of venue for given AP group.</td>
</tr>
<tr>
<td><strong>group_code</strong></td>
<td>Venue group information for given AP group.</td>
</tr>
</tbody>
</table>

The following options are available:

- 9—MUSEUM
- 10—RESTAURANT
- 11—THEATER
- 12—BAR
- 13—COFFEE SHOP
- 14—ZOO OR AQUARIUM
- 15—EMERGENCY COORDINATION CENTER

For venue group 2 (BUSINESS), the following options are available:

- 0—UNSPECIFIED BUSINESS
- 1—DOCTOR OR DENTIST OFFICE
- 2—BANK
- 3—FIRE STATION
- 4—POLICE STATION
- 6—POST OFFICE
- 7—PROFESSIONAL OFFICE
- 8—RESEARCH AND DEVELOPMENT FACILITY
- 9—ATTORNEY OFFICE

For venue group 3 (EDUCATIONAL), the following options are available:

- 0—UNSPECIFIED EDUCATIONAL
- 1—PRIMARY SCHOOL
- 2—SECONDARY SCHOOL
• 3—UNIVERSITY OR COLLEGE

For venue group 4 (FACTORY-INDUSTRIAL), the following options are available:
  • 0—UNSPECIFIED FACTORY AND INDUSTRIAL
  • 1—FACTORY

For venue group 5 (INSTITUTIONAL), the following options are available:
  • 0—UNSPECIFIED INSTITUTIONAL
  • 1—HOSPITAL
  • 2—LONG-TERM CARE FACILITY
  • 3—ALCOHOL AND DRUG RE-HABILITATION CENTER
  • 4—GROUP HOME
  • 5:PRISON OR JAIL

Config Commands

config ap hotspot
config ap hotspot

  type_code
For venue group 6 (MERCANTILE), the following options are available:

- 0—UNSPECIFIED MERCANTILE
- 1—RETAIL STORE
- 2—GROCERY MARKET
- 3—AUTOMOTIVE SERVICE STATION
- 4—SHOPPING MALL
- 5—GAS STATION

For venue group 7 (RESIDENTIAL), the following options are available:

- 0—UNSPECIFIED RESIDENTIAL
- 1—PRIVATE RESIDENCE
- 2—HOTEL OR MOTEL
- 3—DORMITORY
- 4—BOARDING HOUSE

For venue group 8 (STORAGE), the option is:

- 0—UNSPECIFIED STORAGE

For venue group 9 (UTILITY-MISC), the option is:

- 0—UNSPECIFIED UTILITY AND MISCELLANEOUS

For venue group 10 (VEHICULAR), the following options are available:

- 0—UNSPECIFIED VEHICULAR
- 1—AUTOMOBILE OR TRUCK
- 2—AIRPLANE
- 3—BUS
- 4—FERRY
- 5—SHIP OR BOAT
- 6—TRAIN
- 7—MOTOR BIKE

For venue group 11 (OUTDOOR), the following options are available:

- 0—UNSPECIFIED OUTDOOR
- 1—MINI-MESH NETWORK
- 2—CITY PARK
- 3—REST AREA

- 4—TRAFFIC CONTROL
- 5—BUS STOP
- 6—KIOSK

<table>
<thead>
<tr>
<th>name</th>
<th>Configures the name of venue for this access point.</th>

</tbody>
</table>

The following example shows how to configure the venue group as educational and venue type as university:

(Cisco Controller) > **config ap hotspot venue type 3 3**
**config ap image predownload**

To configure an image on a specified access point, use the `config ap image predownload` command.

```plaintext
config ap image predownload {abort | primary | backup} {cisco_ap | all}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>abort</code></td>
<td>Aborts the predownload image process.</td>
</tr>
<tr>
<td><code>primary</code></td>
<td>Predownloads an image to a Cisco access point from the controller's primary image.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies all access points to predownload an image.</td>
</tr>
</tbody>
</table>

(Cisco Controller) >

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

**Command Default**

None

The following example shows how to predownload an image to an access point from the primary image:

(Cisco Controller) > `config ap image predownload primary all`
config ap image swap

To swap an access point’s primary and backup images, use the **config ap image swap** command.

```
config ap image swap (cisco_ap | all)
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco_ap</td>
<td>Name of a Cisco lightweight access point.</td>

</table>
# config ap led-state

To configure the LED state of an access point or to configure the flashing of LEDs, use the `config ap led-state` command.

```
config ap led-state {enable | disable} {cisco_ap | all}
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the LED state of an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the LED state of an access point.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of a Cisco lightweight access point.</td>
</tr>
<tr>
<td>flash</td>
<td>Configure the flashing of LEDs for an access point.</td>
</tr>
<tr>
<td>seconds</td>
<td>Duration that the LEDs have to flash. The range is from 1 to 3600 seconds.</td>
</tr>
<tr>
<td>indefinite</td>
<td>Configures indefinite flashing of the access point’s LED.</td>
</tr>
<tr>
<td>dual-band</td>
<td>Configures the LED state for all dual-band access points.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

LEDs on access points with dual-band radio module will flash green and blue when you execute the led state flash command.

## Command Default

None

## Command History

### Release | Modification
--- | ---
7.6 | This command was introduced in a release earlier than Release 7.6.

### Command History

### Release | Modification
--- | ---
8.3 | This command was introduced.

The following example shows how to enable the LED state for an access point:

```
(Cisco Controller) > config ap led-state enable AP02
```
The following example shows how to enable the flashing of LEDs for dual-band access points:

(Cisco Controller) >config ap led-state flash 20 dual-band
**config ap link-encryption**

To configure the Datagram Transport Layer Security (DTLS) data encryption for access points on the 5500 series controller, use the `config ap link-encryption` command.

---

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

---

```plaintext
config ap link-encryption  { enable | disable}  { cisco_ap | all }
```

**Syntax Description**

- **enable**
  - Enables the DTLS data encryption for access points.

- **disable**
  - Disables the DTLS data encryption for access points.

- **cisco_ap**
  - Name of a Cisco lightweight access point.

- **all**
  - Specifies all access points.

**Command Default**

DTLS data encryption is enabled automatically for OfficeExtend access points but disabled by default for all other access points.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only Cisco 5500 Series Controllers support DTLS data encryption. This feature is not available on other controller platforms. If an access point with data encryption enabled tries to join any other controller, the access point joins the controller, but data packets are sent unencrypted.

Only Cisco 1130, 1140, 1240, and 1250 series access points support DTLS data encryption, and data-encrypted access points can join a Cisco 5500 Series Controller only if the wplus license is installed on the controller. If the wplus license is not installed, the access points cannot join the controller.

The following example shows how to enable the data encryption for an access point:

```plaintext
(Cisco Controller) > config ap link-encryption enable AP02
```
config ap link-latency

To configure link latency for a specific access point or for all access points currently associated to the controller, use the `config ap link-latency` command:

```
config ap link-latency { enable | disable | reset } { cisco_ap | all }
```

**Syntax Description**

- `enable` Enables the link latency for an access point.
- `disable` Disables the link latency for an access point.
- `reset` Resets all link latency for all access points.
- `cisco_ap` Name of the Cisco lightweight access point.
- `all` Specifies all access points.

**Command Default**

By default, link latency is in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command enables or disables link latency only for access points that are currently joined to the controller. It does not apply to access points that join in the future.

The following example shows how to enable the link latency for all access points:

```
(Cisco Controller) > config ap link-latency enable all
```
To modify the descriptive location of a Cisco lightweight access point, use the `config ap location` command.

```
config ap location location cisco_ap
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>location</code></td>
<td>Location name of the access point (enclosed by double quotation marks).</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The Cisco lightweight access point must be disabled before changing this parameter.

The following example shows how to configure the descriptive location for access point AP1:

```
(Cisco Controller) > config ap location "Building 1" AP1
```
config ap logging syslog level

To set the severity level for filtering syslog messages for a particular access point or for all access points, use the `config ap logging syslog level` command.

`config ap logging syslog level severity_level {cisco_ap | all}`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>severity_level</code></td>
<td>Severity levels are as follows:</td>
</tr>
<tr>
<td></td>
<td>• emergencies—Severity level 0</td>
</tr>
<tr>
<td></td>
<td>• alerts—Severity level 1</td>
</tr>
<tr>
<td></td>
<td>• critical—Severity level 2</td>
</tr>
<tr>
<td></td>
<td>• errors—Severity level 3</td>
</tr>
<tr>
<td></td>
<td>• warnings—Severity level 4</td>
</tr>
<tr>
<td></td>
<td>• notifications—Severity level 5</td>
</tr>
<tr>
<td></td>
<td>• informational—Severity level 6</td>
</tr>
<tr>
<td></td>
<td>• debugging—Severity level 7</td>
</tr>
</tbody>
</table>

| `cisco_ap` | Cisco access point. |
|`all`       | Specifies all access points. |

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you set a syslog level, only those messages whose severity is equal to or less than that level are sent to the access point. For example, if you set the syslog level to Warnings (severity level 4), only those messages whose severity is between 0 and 4 are sent to the access point.

This example shows how to set the severity for filtering syslog messages to 3:

(Cisco Controller) >`config ap logging syslog level 3`
config ap logging syslog facility

To set the facility level for filtering syslog messages for a particular access point or for all access points, use the `config ap logging syslog facility` command.

```
config ap logging syslog facility facility-level { cisco_ap | all }
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>facility-level</code></th>
<th>Facility level is one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth = Authorization system.</td>
<td></td>
</tr>
<tr>
<td>cron = Cron/at facility.</td>
<td></td>
</tr>
<tr>
<td>daemon = System daemons.</td>
<td></td>
</tr>
<tr>
<td>kern = Kernel.</td>
<td></td>
</tr>
<tr>
<td>local0 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local1 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local2 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local3 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local4 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local5 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local6 = Local use.</td>
<td></td>
</tr>
<tr>
<td>local7 = Local use.</td>
<td></td>
</tr>
<tr>
<td>lpr = Line printer system.</td>
<td></td>
</tr>
<tr>
<td>mail = Mail system.</td>
<td></td>
</tr>
<tr>
<td>news = USENET news.</td>
<td></td>
</tr>
<tr>
<td>sys10 = System use.</td>
<td></td>
</tr>
<tr>
<td>sys11 = System use.</td>
<td></td>
</tr>
<tr>
<td>sys12 = System use.</td>
<td></td>
</tr>
<tr>
<td>sys13 = System use.</td>
<td></td>
</tr>
<tr>
<td>sys14 = System use.</td>
<td></td>
</tr>
<tr>
<td>syslog = Syslog itself.</td>
<td></td>
</tr>
<tr>
<td>user = User process.</td>
<td></td>
</tr>
<tr>
<td>uuecp Unix-to-Unix copy system.</td>
<td></td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Configures for a specific access point.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Configures for all access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to set the facility level for filtering syslog messages to auth for all access points:

(Cisco Controller) > `config ap logging syslog facility auth all`
To configure the maximum number of access points supported by the Cisco Wireless LAN Controller (WLC), use the `config ap max-count` command.

**Syntax Description**

`config ap max-count number`

- **number**: Number of access points supported by the Cisco WLC.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The access point count of the Cisco WLC license overrides this count if the configured value is greater than the access point count of the license. A value of 0 indicates that there is no restriction on the maximum number of access points. If high availability is configured, you must reboot both the active and the standby Cisco WLCs after you configure the maximum number of access points supported by the Cisco WLC.

The following example shows how to configure the number of access points supported by the Cisco WLC:

(Cisco Controller) > config ap max-count 100
config ap mgmtuser add

To configure username, password, and secret password for AP management, use the config ap mgmtuser add command.

```
config ap mgmtuser add username AP_username password AP_password secret secret { all | cisco_ap }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Configures the username for AP management.</td>
</tr>
<tr>
<td>AP_username</td>
<td>Management username.</td>
</tr>
<tr>
<td>password</td>
<td>Configures the password for AP management.</td>
</tr>
<tr>
<td>AP_password</td>
<td>AP management password.</td>
</tr>
<tr>
<td>secret</td>
<td>Configures the secret password for privileged AP management.</td>
</tr>
<tr>
<td>secret</td>
<td>AP management secret password.</td>
</tr>
<tr>
<td>all</td>
<td>Applies configuration to every AP that does not have a specific username.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Cisco access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</table>

**Usage Guidelines**

The following requirements are enforced on the password:

- The password should contain characters from at least three of the following classes: lowercase letters, uppercase letters, digits, and special characters.
- No character in the password can be repeated more than three times consecutively.
- The password should not contain management username or reverse of usename.
- The password should not contain words like Cisco, oscic, admin, nimda or any variant obtained by changing the capitalization of letters by substituting 1, |, or ! or substituting 0 for o or substituting $ for s.

The following requirement is enforced on the secret password:

- The secret password should contain characters from at least three of the following classes: lowercase letters, uppercase letters, digits, or special characters.
The following example shows how to add a username, password, and secret password for AP management:

(Cisco Controller) > config ap mgmtuser add username acd password Arc_1234 secret Mid_45 all
config ap mgmtuser delete

To force a specific access point to use the controller’s global credentials, use the `config ap mgmtuser delete` command.

`config ap mgmtuser delete cisco_ap`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>cisco_ap</th>
<th>Access point.</th>
</tr>
</thead>
</table>

**Command Default**

None

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete the credentials of an access point:

(Cisco Controller) > `config ap mgmtuser delete cisco_ap1`
**config ap mode**

To change a Cisco WLC communication option for an individual Cisco lightweight access point, use the `config ap mode` command.

```plaintext
config ap mode (bridge | flexconnect sensor submode \{ none | wips | pppoe-only | pppoe-wips \}) | local submode \{ none | wips \} | reap | rogue | sniffer | se-connect | monitor submode \{ none | wips \} | flex+bridge submode \{ none | wips | pppoe-only | pppoe-wips \}) cisco_ap
```

**Syntax Description**

- **bridge**
  Converts from a lightweight access point to a mesh access point (bridge mode).

- **flexconnect**
  Enables FlexConnect mode on an access point.

- **local**
  Converts from an indoor mesh access point (MAP or RAP) to a nonmesh lightweight access point (local mode).

- **reap**
  Enables remote edge access point mode on an access point.

- **rogue**
  Enables wired rogue detector mode on an access point.

- **sniffer**
  Enables wireless sniffer mode on an access point.

- **se-connect**
  Enables flex+bridge mode on an access point.

- **flex+bridge**
  Enables spectrum expert mode on an access point.

- **submode**
  (Optional) Configures wIPS submode on an access point.

- **none**
  Disables the wIPS on an access point.

- **wips**
  Enables the wIPS submode on an access point.

- **pppoe-only**
  Enables the PPPoE submode on an access point.

- **pppoe-wips**
  Enables the PPPoE-wIPS submode on an access point.

- **sensor**
  Enables sensor mode for the Cisco AP

- **cisco_ap**
  Name of the Cisco lightweight access point.

**Command Default**

Local

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>The <code>flex+bridge</code> keyword was added.</td>
</tr>
</tbody>
</table>
**Usage Guidelines**

The sniffer mode captures and forwards all the packets from the clients on that channel to a remote machine that runs AiroPeek or other supported packet analyzer software. It includes information on the timestamp, signal strength, packet size and so on.

The following example shows how to set the controller to communicate with access point AP91 in bridge mode:

(Cisco Controller) > `config ap mode bridge AP91`

The following example shows how to set the controller to communicate with access point AP01 in local mode:

(Cisco Controller) > `config ap mode local AP01`

The following example shows how to set the controller to communicate with access point AP91 in remote office (REAP) mode:

(Cisco Controller) > `config ap mode flexconnect AP91`

The following example shows how to set the controller to communicate with access point AP91 in a wired rogue access point detector mode:

(Cisco Controller) > `config ap mode rogue AP91`

The following example shows how to set the controller to communicate with access point AP02 in wireless sniffer mode:

(Cisco Controller) > `config ap mode sniffer AP02`

---

**Release** | **Modification**
---|---
8.3 | This command was modified. The `sensor` keyword was added.
To configure the Cisco Universal Small Cell (USC) 8x18 Dual Mode Module, use the `config ap module3g` command.

```
config ap module3g (enable | disable) ap-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the Cisco USC 8x18 Dual Mode Module on the specified Cisco AP.</td>
</tr>
<tr>

<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You might be prompted with a co-existence warning when Wi-Fi in 2.4-GHz and 3G/4G module are enabled.

This example shows how to enable Cisco USC 8x18 Dual Mode Module on a Cisco AP named `my-ap`:

```
(config Controller) > config ap module3g enable my-ap
```
To configure Cisco lightweight access point channel optimization, use the `config ap monitor-mode` command.

```
config ap monitor-mode {802.11b fast-channel | no-optimization | tracking-opt | wips-optimized}
cisco_ap
```

**Syntax Description**

- **802.11b fast-channel**: Configures 802.11b scanning channels for a monitor-mode access point.
- **no-optimization**: Specifies no channel scanning optimization for the access point.
- **tracking-opt**: Enables tracking optimized channel scanning for the access point.
- **wips-optimized**: Enables wIPS optimized channel scanning for the access point.
- **cisco_ap**: Name of the Cisco lightweight access point.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</table>

The following example shows how to modify the name of access point AP1 to AP2:

```
(Cisco Controller) > config ap name AP1 AP2
```
To configure the Packet Capture parameters on access points, use the `config ap packet-dump` command.

```
config ap packet-dump { buffer-size Size_in_KB | capture-time Time_in_Min | ftp serverip IP_addr 
                   path path username username password password | start MAC_address Cisco_AP | stop | truncate
                   Length_in_Bytes }

config ap packet-dump classifier { { arp | broadcast | control | data | dot1x | iapp | ip | 
             management | multicast } { enable | disable } | tcp { enable | disable | port TCP_Port { enable | 
             | disable } } | udp { enable | disable | port UDP_Port { enable | 
             | disable } } }
```

**Syntax Description**

- `buffer-size` Configures the buffer size for Packet Capture in the access point.
  - `Size_in_KB` Size of the buffer. The range is from 1024 to 4096 KB.
- `capture-time` Configures the timer value for Packet Capture.
  - `Time_in_Min` Timer value for Packet Capture. The range is from 1 to 60 minutes.
- `ftp` Configures FTP parameters for Packet Capture.
  - `serverip` Configures the FTP server.
    - `IP_addr` IP address of the FTP server.
  - `path` Path configures FTP server path.
  - `username user_ID` Configures the username for the FTP server.
  - `password password` Configures the password for the FTP server.
  - `start` Starts Packet Capture from the access point.
  - `MAC_address` Client MAC Address for Packet Capture.
  - `Cisco_AP` Name of the Cisco access point.
  - `stop` Stops Packet Capture from the access point.
  - `truncate` Truncates the packet to the specified length during Packet Capture.
<table>

</tr>
</tbody>
</table>

Usage Guidelines

Packet Capture does not work during intercontroller roaming.

The controller does not capture packets created in the radio firmware and sent out of the access point, such as a beacon or probe response. Only packets that flow through the Radio driver in the Tx path will be captured.

Use the command `config ap packet-dump start` to start the Packet Capture from the access point. When you start Packet Capture, the controller sends a Control and Provisioning of Wireless Access Points protocol (CAPWAP) message to the access point to which the client is associated and captures packets. You must configure the FTP server and ensure that the client is associated to the access point before you start Packet Capture. If the client is not associated to the access point, you must specify the name of the access point.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to start Packet Capture from an access point:

(Cisco Controller) > config ap packet-dump start 00:0d:28:f4:c0:45 AP1

The following example shows how to capture 802.11 control packets from an access point:

(Cisco Controller) > config ap packet-dump classifier control enable
config ap port

To configure the port for a foreign access point, use the config ap port command.

```
config ap port MAC port
```

**Syntax Description**

- **MAC**
  - Foreign access point MAC address.
- **port**
  - Port number for accessing the foreign access point.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the port for a foreign access point MAC address:

```
(Cisco Controller) > config ap port 12:12:12:12:12 20
```
config ap power injector

To configure the power injector state for an access point, use the `config ap power injector` command.

```
config ap power injector { enable | disable } { cisco_ap | all } { installed | override | switch_MAC }
```

**Syntax Description**

- **enable**: Enables the power injector state for an access point.
- **disable**: Disables the power injector state for an access point.
- **cisco_ap**: Name of the Cisco lightweight access point.
- **all**: Specifies all Cisco lightweight access points connected to the controller.
- **installed**: Detects the MAC address of the current switch port that has a power injector.
- **override**: Overrides the safety checks and assumes a power injector is always installed.
- **switch_MAC**: MAC address of the switch port with an installed power injector.

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

The following example shows how to enable the power injector state for all access points:

```
(Cisco Controller) > config ap power injector enable all 12:12:12:12:12:12
```
config ap power pre-standard

To enable or disable the inline power Cisco pre-standard switch state for an access point, use the `config ap power pre-standard` command.

```
config ap power pre-standard { enable | disable } cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the inline power Cisco pre-standard switch state for an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the inline power Cisco pre-standard switch state for an access point.</td>

</tbody>
</table>

**Command Default**

Disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the inline power Cisco pre-standard switch state for access point AP02:

```
(Cisco Controller) > config ap power pre-standard enable AP02
```
**config ap preferred-mode**

To configure the preferred mode, use the **config ap preferred-mode** command.

```plaintext
config ap preferred-mode {ipv4 | ipv6 | any} {AP_name | Ap-group_name | all}
```

**Syntax Description**

- **ipv4**: Configures IPv4 as the preferred mode
- **ipv6**: Configures IPv6 as the preferred mode
- **any**: Configures any as the preferred mode
- **AP_name**: Configures the preferred mode to the AP
- **Ap-group_name**: Configures the preferred mode to the AP group members
- **all**: Configures the preferred mode to all the APs

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced. It supports both IPv4 and IPv6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to configure IPv6 as the preferred mode to lightweight access point AP1

(Cisco Controller) > **config ap preferred-mode ipv6 AP1**
config ap primary-base

To set the Cisco lightweight access point primary Cisco WLC, use the **config ap primary-base** command.

```
config ap primary-base controller_name Cisco_AP [controller_ip_address]
```

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>controller_name</strong></th>
<th>Name of the Cisco WLC.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco_AP</td>
<td>Cisco lightweight access point name.</td>
</tr>
</tbody>
</table>

**controller_ip_address**

(Optional) If the backup controller is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary controller.

**Note** For OfficeExtend access points, you must enter both the name and IP address of the controller. Otherwise, the access point cannot join this controller.

---

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco lightweight access point associates with this Cisco WLC for all network operations and in the event of a hardware reset.

OfficeExtend access points do not use the generic broadcast or over-the-air (OTAP) discovery process to find a controller. You must configure one or more controllers because OfficeExtend access points try to connect only to their configured controllers.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to set an access point primary Cisco WLC IPv4 address for an Cisco AP:

```
(Cisco Controller) > config ap primary-base SW_1 AP2 10.0.0.0
```

The following example shows how to set an access point primary Cisco WLC IPv6 address for an Cisco AP:
(Cisco Controller) > config ap primary-base SW_1 AP2 2001:DB8:0:1::1

Related Commands

- show ap config general
config ap priority

To assign a priority designation to an access point that allows it to reauthenticate after a controller failure by priority rather than on a first-come-until-full basis, use the config ap priority command.

```
config ap priority { 1 | 2 | 3 | 4} cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Specifies low priority.</td>
</tr>
<tr>
<td>2</td>
<td>Specifies medium priority.</td>
</tr>
<tr>
<td>3</td>
<td>Specifies high priority.</td>
</tr>
<tr>
<td>4</td>
<td>Specifies the highest (critical) priority.</td>
</tr>
</tbody>
</table>

**Command Default**

1 - Low priority.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a failover situation, if the backup controller does not have enough ports to allow all the access points in the affected area to reauthenticate, it gives priority to higher-priority access points over lower-priority ones, even if it means replacing lower-priority access points.

The following example shows how to assign a priority designation to access point AP02 that allows it to reauthenticate after a controller failure by assigning a reauthentication priority 3:

```
(Cisco Controller) > config ap priority 3 AP02
```
**config ap reporting-period**

To reset a Cisco lightweight access point, use the `config ap reporting-period` command.

```
config ap reporting-period period
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>period</code></td>
<td>Time period in seconds between 10 and 120.</td>
</tr>
</tbody>
</table>

<table>

</tr>
</tbody>
</table>

The following example shows how to reset an access point:

```
(Cisco Controller) > config ap reset AP2
```
To configure the access point control packet retransmission interval, use the `config ap retransmit interval` command.

```
config ap retransmit interval seconds {all | cisco_ap}
```

**Syntax Description**

- `seconds` AP control packet retransmission timeout between 2 and 5 seconds.
- `all` Specifies all access points.
- `cisco_ap` Cisco lightweight access point name.

**Command Default**

None

**Command History**

- **Release** 7.6
  - **Modification** This command was introduced in a release earlier than Release 7.6.

- **Release** 8.3
  - **Modification** This command was introduced.

The following example shows how to configure the retransmission interval for all access points globally:

```
(Cisco Controller) > config ap retransmit interval 4 all
```
config ap retransmit count

To configure the access point control packet retransmission count, use the `config ap retransmit count` command.

```
config ap retransmit count count { all | cisco_ap }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

The following example shows how to configure the retransmission retry count for a specific access point:

```
(Cisco Controller) > config ap retransmit count 6 cisco_ap
```
**config ap role**

To specify the role of an access point in a mesh network, use the `config ap role` command.

```
config ap role  { rootAP  |  meshAP }  cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rootAP</td>
<td>Designates the mesh access point as a root access point (RAP).</td>
</tr>
<tr>
<td>meshAP</td>
<td>Designates the mesh access point as a mesh access point (MAP).</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

```
meshAP.
```

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `meshAP` keyword if the access point has a wireless connection to the controller, or use the `rootAP` keyword if the access point has a wired connection to the controller. If you change the role of the AP, the AP will be rebooted.

The following example shows how to designate mesh access point AP02 as a root access point:

```
(Cisco Controller) > config ap role rootAP AP02
Changing the AP's role will cause the AP to reboot.
Are you sure you want to continue? (y/n)
```
# config ap rst-button

To configure the Reset button for an access point, use the `config ap rst-button` command.

```
config ap rst-button { enable | disable } cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the Reset button for an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the Reset button for an access point.</td>

</table>

The following example shows how to configure the Reset button for access point AP03:

```
(Cisco Controller) > config ap rst-button enable AP03
```
config ap secondary-base

To set the Cisco lightweight access point secondary Cisco WLC, use the **config ap secondary-base** command.

**config ap secondary-base Controller_name Cisco_AP [Controller_IP_address]**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>controller_name</td>
<td>Name of the Cisco WLC.</td>
</tr>
<tr>
<td>Cisco_AP</td>
<td>Cisco lightweight access point name.</td>
</tr>
<tr>
<td>Controller_IP_address</td>
<td>(Optional). If the backup Cisco WLC is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary Cisco WLC.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>For OfficeExtend access points, you must enter both the name and IP address of the Cisco WLC. Otherwise, the access point cannot join this Cisco WLC.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Cisco lightweight access point associates with this Cisco WLC for all network operations and in the event of a hardware reset.

OfficeExtend access points do not use the generic broadcast or over-the-air (OTAP) discovery process to find a Cisco WLC. You must configure one or more Cisco WLCs because OfficeExtend access points try to connect only to their configured Cisco WLCs.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to set an access point secondary Cisco WLC:

```
(Cisco Controller) > config ap secondary-base SW_1 AP2 10.0.0.0
```

The following example shows how to set an access point primary Cisco WLC IPv6 address for an Cisco AP:

```
(Cisco Controller) > config ap secondary-base SW_1 AP2 2001:DB8:0:1::1
```

**Related Commands**

- show ap config general
To configure slub-debug on an access point, use the `config ap slub-debug` command.

**Syntax Description**

- `sanity`: Configures sanity slub debug mode.
- `red-zoning`: Configures red zoning slub debug mode.
- `poisoning`: Configures poisoning slub debug mode.
- `user-tracking`: Configures user-tracking slub debug mode.
- `disable`: Disables slub debug mode.
- `cisco_ap`: Cisco access point name.
- `all`: Apply to all Cisco Access Points.

**Command Default**

None

**Command History**

- **Release 8.2.160.0**: This command was introduced.

**Usage Guidelines**

The Cisco AP reboots to enable, disable or when switching between the slub-debug feature modes.

The following example shows how to disable slub-debug on all Cisco APs:

```
(Cisco Controller) > config ap slub-debug disable all
```

Changing the AP's slub debug mode will cause the AP to reboot.
Are you sure you want to continue? (y/n) n

Slub debug mode not changed!
(Cisco Controller) >
**config ap sniff**

To enable or disable sniffing on an access point, use the **config ap sniff** command.

```
config ap sniff (802.11a | 802.11b) (enable channel server_ip | disable) cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>802.11b</td>

</tr>
<tr>
<td>enable</td>
<td>Enables sniffing on an access point.</td>
</tr>
<tr>
<td>channel</td>
<td>Channel to be sniffed.</td>
</tr>
<tr>
<td>server_ip</td>
<td>IP address of the remote machine running Omnipeek, Airopeek, AirMagnet, or Wireshark software.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables sniffing on an access point.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Access point configured as the sniffer.</td>
</tr>
</tbody>
</table>

**Command Default**

Channel 36.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the sniffer feature is enabled on an access point, it starts sniffing the signal on the given channel. It captures and forwards all the packets to the remote computer that runs Omnipeek, Airopeek, AirMagnet, or Wireshark software. It includes information on the timestamp, signal strength, packet size and so on.

Before an access point can act as a sniffer, a remote computer that runs one of the listed packet analyzers must be set up so that it can receive packets sent by the access point. After the Airopeek installation, copy the following .dll files to the location where airopeek is installed:

- socket.dll file to the Plug-ins folder (for example, C:\Program Files\WildPackets\AiroPeek\Plugins)
- socketres.dll file to the PluginRes folder (for example, C:\Program Files\WildPackets\AiroPeek\1033\PluginRes)

The following example shows how to enable the sniffing on the 802.11a an access point from the primary Cisco WLC:

```
(Cisco Controller) > config ap sniff 80211a enable 23 11.22.44.55 AP01
```
To enable Secure Shell (SSH) connectivity on an access point, use the `config ap ssh` command.

```
config ap ssh { enable | disable | default } cisco_ap | all
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the SSH connectivity on an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the SSH connectivity on an access point.</td>
</tr>
<tr>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The Cisco lightweight access point associates with this Cisco wireless LAN controller for all network operation and in the event of a hardware reset.

The following example shows how to enable SSH connectivity on access point Cisco_ap2:

```
> config ap ssh enable cisco_ap2
```
**config ap static-ip**

To configure Static IP address settings on Cisco lightweight access point, use the `config ap static-ip` command.

```
config ap static-ip { enable Cisco_AP AP_IP_addr IP_netmask/prefix_length gateway | disable Cisco_AP | add { domain { Cisco_AP | all } domain_name } | nameserver { Cisco_AP | all } | delete { domain | nameserver } } { Cisco_AP | all }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables the Cisco lightweight access point static IP address.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables the Cisco lightweight access point static IP address. The access point uses DHCP to get the IP address.</td>
</tr>
<tr>
<td><strong>Cisco_AP</strong></td>
<td>Cisco lightweight access point name.</td>
</tr>
<tr>
<td><strong>AP_IP_addr</strong></td>
<td>Cisco lightweight access point IP address</td>
</tr>
<tr>
<td><strong>IP_netmask/prefix_length</strong></td>
<td>Cisco lightweight access point network mask.</td>
</tr>
<tr>
<td><strong>gateway</strong></td>
<td>IP address of the Cisco lightweight access point gateway.</td>
</tr>
<tr>
<td><strong>add</strong></td>
<td>Adds a domain or DNS server.</td>
</tr>
<tr>
<td><strong>domain</strong></td>
<td>Specifies the domain to which a specific access point or all access points belong.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Specifies all access points.</td>
</tr>
<tr>
<td><strong>domain_name</strong></td>
<td>Specifies a domain name.</td>
</tr>
<tr>
<td><strong>nameserver</strong></td>
<td>Specifies a DNS server so that a specific access point or all access points can discover the controller using DNS resolution.</td>
</tr>
<tr>
<td><strong>nameserver-ip</strong></td>
<td>DNS server IP address.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes a domain or DNS server.</td>
</tr>
</tbody>
</table>

### Note

If an AP itself is configured with the keyword **all**, the all access points case takes precedence over the AP that is with the keyword **all**.

### Command Default

None
This command was introduced in a release earlier than Release 7.6.

- **Release**: 8.0
- **Modification**: This command supports both IPv4 and IPv6 address formats.

### Usage Guidelines

An access point cannot discover the controller using Domain Name System (DNS) resolution if a static IP address is configured for the access point, unless you specify a DNS server and the domain to which the access point belongs.

After you enter the IPv6 address, Prefix-length and IPv6 gateway address, the CAPWAP tunnel will restart for access point. Changing the AP’s IP address will cause the AP to disjoin. After the access point rejoins the controller, you can enter the domain and IPv6 DNS server information.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to configure static IPv4 address on an access point:

```
(Cisco Controller) > config ap static-ip enable AP2 209.165.200.225 255.255.255.0
209.165.200.254
```

The following example shows how to configure static IPv6 address on an access point:

```
(Cisco Controller) > config ap static-ip enable AP2 2001:DB8:0:1::1
```

### Related Commands

- `show ap config general`
config ap stats-timer

To set the time in seconds that the Cisco lightweight access point sends its DOT11 statistics to the Cisco wireless LAN controller, use the **config ap stats-timer** command.

```
config ap stats-timer period cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>period</code></td>
<td>Time in seconds from 0 to 65535. A zero value disables the timer.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Cisco lightweight access point name.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value is 0 (disabled state).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A value of 0 (zero) means that the Cisco lightweight access point does not send any DOT11 statistics. The acceptable range for the timer is from 0 to 65535 seconds, and the Cisco lightweight access point must be disabled to set this value.

The following example shows how to set the stats timer to 600 seconds for access point AP2:

```
(Cisco Controller) > config ap stats-timer 600 AP2
```
To configure a global syslog server for all access points that join the controller, use the **config ap syslog host global** command.

### config ap syslog host global ip_address

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_address</td>
<td>IPv4/IPv6 address of the syslog server.</td>
</tr>
</tbody>
</table>

| Command Default        | The default value of the IPv4 address of the syslog server is 255.255.255.255. |

<table>
<thead>
<tr>
<th>Command History Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the global syslog server IP address for all access points is 255.255.255.255. Make sure that the access points can reach the subnet on which the syslog server resides before configuring the syslog server on the controller. If the access points cannot reach this subnet, the access points are unable to send out syslog messages.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to configure a global syslog server, using IPv4 address, for all access points:

```
(Cisco Controller) > config ap syslog host global 255.255.255.255
```

The following example shows how to configure a global syslog server, using IPv6 address, for all access points:

```
(Cisco Controller) > config ap syslog host global 2001:9:10:56::100
```
config ap syslog host specific

To configure a syslog server for a specific access point, use the **config ap syslog host specific** command.

```plaintext
config ap syslog host specific ap_name ip_address
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ap_name</code></td>
<td>Cisco lightweight access point.</td>
</tr>
<tr>
<td><code>ip_address</code></td>
<td>IPv4/IPv6 address of the syslog server.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value of the syslog server IP address is 0.0.0.0.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the syslog server IP address for each access point is 0.0.0.0, indicating that it is not yet set. When the default value is used, the global access point syslog server IP address is pushed to the access point.

This command supports both IPv4 and IPv6 address formats.

The following example shows how to configure a syslog server:

(Cisco Controller) > `config ap syslog host specific 0.0.0.0`

The following example shows how to configure a syslog server for a specific AP, using IPv6 address:

(Cisco Controller) > `config ap syslog host specific AP3600 2001:9:10:56::100`
config ap tcp-mss-adjust

To enable or disable the TCP maximum segment size (MSS) on a particular access point or on all access points, use the `config ap tcp-mss-adjust` command.

```
config ap tcp-mss-adjust { enable | disable } { cisco_ap | all } size
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the TCP maximum segment size on an access point.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the TCP maximum segment size on an access point.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Cisco access point name.</td>
</tr>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
<tr>
<td>size</td>
<td>Maximum segment size.</td>
</tr>
</tbody>
</table>

- **IPv4**—Specify a value between 536 and 1363.
- **IPv6**—Specify a value between 1220 and 1331.

**Note** Any TCP MSS value that is below 1220 and above 1331 will not be effective for CAPWAP v6 AP.

**Command Default** None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable this feature, the access point checks for TCP packets to and from wireless clients in its data path. If the MSS of these packets is greater than the value that you configured or greater than the default value for the CAPWAP tunnel, the access point changes the MSS to the new configured value.

This example shows how to enable the TCP MSS on access point `cisco_ap1` with a segment size of 1200 bytes:
(Cisco Controller) > config ap tcp-mss-adjust enable cisco_ap1 1200
To enable Telnet connectivity on an access point, use the `config ap telnet` command.

```
config ap telnet  { enable  | disable  | default }  cisco_ap  |  all
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the Telnet connectivity on an access point.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the Telnet connectivity on an access point.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>Replaces the specific Telnet configuration of an access point with the global Telnet configuration.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Cisco access point name.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>All access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- The Cisco lightweight access point associates with this Cisco WLC for all network operation and in the event of a hardware reset.
- Telnet is not supported on Cisco Aironet 1810 OEAP, 1810W, 1830, 1850, 2800, and 3800 Series APs.

The following example shows how to enable Telnet connectivity on access point `cisco_ap1`:

```
(Cisco Controller) > config ap telnet enable cisco_ap1
```

The following example shows how to disable Telnet connectivity on access point `cisco_ap1`:

```
(Cisco Controller) > config ap telnet disable cisco_ap1
```
# config ap tertiary-base

To set the Cisco lightweight access point tertiary Cisco WLC, use the `config ap tertiary-base` command.

```bash
config ap tertiary-base controller_name Cisco_AP [controller_ip_address]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>controller_name</code></td>
<td>Name of the Cisco WLC.</td>
</tr>
<tr>
<td><code>Cisco_AP</code></td>
<td>Cisco lightweight access point name.</td>
</tr>
<tr>
<td><code>controller_ip_address</code></td>
<td>(Optional) If the backup controller is outside the mobility group to which the access point is connected, then you need to provide the IP address of the primary, secondary, or tertiary Cisco WLC.</td>
</tr>
</tbody>
</table>

**Note** For OfficeExtend access points, you must enter both the name and IP address of the Cisco WLC. Otherwise, the access point cannot join this Cisco WLC.

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

OfficeExtend access points do not use the generic broadcast or over-the-air (OTAP) discovery process to find a Cisco WLC. You must configure one or more controllers because OfficeExtend access points try to connect only to their configured Cisco WLCs.

The Cisco lightweight access point associates with this Cisco WLC for all network operations and in the event of a hardware reset.

This command supports both IPv4 and IPv6 address formats.

This example shows how to set the access point tertiary Cisco WLC:

```
(Cisco Controller) > config ap tertiary-base SW_1 AP02 10.0.0.0
```

The following example shows how to set an access point tertiary Cisco WLC IPv6 address for an Cisco AP:

```
(Cisco Controller) > config ap tertiary-base SW_1 AP2 2001:DB8:0::1::1
```

## Related Commands

- `show ap config general`
**config ap tftp-downgrade**

To configure the settings used for downgrading a lightweight access point to an autonomous access point, use the `config ap tftp-downgrade` command.

```
config ap tftp-downgrade tftp_ip_address filename Cisco_AP
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>

To enable or disable wireless LAN override for a Cisco lightweight access point radio, use the `config ap wlan` command.

```
config ap wlan { enable | disable } { 802.11a | 802.11b } wlan_id cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the wireless LAN override on an access point.</td>
</tr>
<tr>
<td>disable</td>

The following example shows how to enable wireless LAN override on the AP03 802.11a radio:

```
(Cisco Controller) > config ap wlan 802.11a AP03
```
config atf 802.11

Configure Cisco Air Time Fairness at the network level, at an AP group level, or at an AP radio level by using the `config atf 802.11` command.

```bash
config atf 802.11 { a | b } { mode { disable | monitor | enforce-policy } { [ ap-group-name ] | [ ap-name ] } } | { optimization { enable | disable } }
```

**Syntax Description**

<table>

</tr>
</tbody>
</table>

- To configure Cisco ATF in monitor mode on an 802.11a network, enter this command:
  ```bash
  (Cisco Controller) >config atf 802.11a mode monitor
  ```

- To enable airtime optimization on an 802.11a network, enter this command:
  ```bash
  (Cisco Controller) >config atf 802.11a optimization enable
  ```
To configure Cisco Air Time Fairness (ATF) policies, use the `config atf policy` command.

```
config atf policy {{create policy-id policy-name policy-weight} | {modify {weight policy-weight policy-name} | {client-sharing {enable | disable} policy-name}} | {delete policy-name}}
```

**Syntax Description**

- **create**
  
  Creates an air time policy

- **modify**
  
  Modifies an air time policy

- **delete**
  
  Deletes an air time policy

- **client-sharing {enable | disable} policy-name**
  
  Enables or disables client fair sharing for the specified policy name

- **policy-id**
  
  Policy ID between 1 and 511

- **policy-name**
  
  Name of the Cisco ATF policy

- **policy-weight**
  
  Policy weight between 5 and 100

**Command History**

| Usage Guidelines  | |
|-------------------| |
| When you configure this command, all WLANs and radios are automatically disabled. After the completion of the configuration, the previous state of the WLANs and radios is restored. |

The following example shows how to auto-configure voice deployment for all radios in a WLAN:

```
(Cisco Controller) >config auto-configure voice cisco 2 radio all
Warning! This command will automatically disable all WLAN’s and Radio’s. It will be reverted to the previous state once configuration is complete. Are you sure you want to continue? (y/N) y

config avc profile create

To create a new Application Visibility and Control (AVC) profile, use the `config avc profile create` command.

```
config avc profile profile_name create
```

**Syntax Description**

- **profile_name**: Name of the AVC profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.
- **create**: Creates a new AVC profile.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure up to 16 AVC profiles on a controller and associate an AVC profile with multiple WLANs. You can configure only one AVC profile per WLAN and each AVC profile can have up to 32 rules. Each rule states a Mark or Drop action for an application, which allows you to configure up to 32 application actions per WLAN.

The following example shows how to create a new AVC profile:

```
(Cisco Controller) > config avc profile avcprofile1 create
```
config avc profile delete

To delete an Application Visibility and Control (AVC) profile, use the **config avc profile delete** command.

```plaintext
config avc profile profile_name delete
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>profile_name</strong></td>
<td>Name of the AVC profile.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes an AVC profile.</td>
</tr>
</tbody>
</table>

### Command Default

The AVC profile is not deleted.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete an AVC profile:

(Cisco Controller) > **config avc profile avcprofile1 delete**

### Related Commands

- `config avc profile create`
- `config avc profile rule`
- `config wlan avc`
- `show avc profile summary`
- `show avc profile detailed`
- `debug avc error`
- `debug avc events`
config avc profile rule

To configure a rule for an Application Visibility and Control (AVC) profile, use the `config avc profile rule` command.

```
config avc profile profile_name rule { add | remove } application application_name { drop | mark dscp }
```

**Syntax Description**

- **profile_name**: Name of the AVC profile.
- **rule**: Configures a rule for the AVC profile.
- **add**: Creates a rule for the AVC profile.
- **remove**: Deletes a rule for the AVC profile.
- **application**: Specifies the application that has to be dropped or marked.
- **application_name**: Name of the application. The application name can be up to 32 case-sensitive, alphanumeric characters.
- **drop**: Drops the upstream and downstream packets that correspond to the chosen application.
- **mark**: Marks the upstream and downstream packets that correspond to the chosen application with the Differentiated Services Code Point (DSCP) value that you specify in the drop-down list. The DSCP value helps you provide differentiated services based on the QoS levels.
- **dscp**: Packet header code that is used to define the QoS across the Internet. The range is from 0 to 63.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>

</table>
config band-select expire

To set the entry expire for band select, use the `config band-select expire` command.

```
config band-select expire {suppression | dual-band} seconds
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>suppression</td>
<td>Sets the suppression expire to the band select.</td>
</tr>
<tr>
<td>dual-band</td>
<td>Sets the dual band expire to the band select.</td>
</tr>
<tr>
<td>seconds</td>
<td>Value for a suppression between 10 to 200 seconds.</td>
</tr>
<tr>
<td></td>
<td>Value for a dual-band between 10 to 300 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the suppression expire to 70 seconds:

```
(Cisco Controller) > config band-select expire suppression 70
```

**Related Commands**

- `config band-select cycle-threshold`
- `config band-select client-rssi`
- `config band-select cycle-count`
**config band-select client-rssi**

To set the client received signal strength indicator (RSSI) threshold for band select, use the `config band-select client-rssi` command.

```
config band-select client-rssi rssi
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Command Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rssi</code></td>
<td>None</td>
</tr>
</tbody>
</table>

Minimum dBm of a client RSSI to respond to probe between 20 and 90.

**Command History**

<table>
<thead>
<tr>

</table>

The following example shows how to set the RSSI threshold for band select to 70:

```
(Cisco Controller) > config band-select client-rssi 70
```

**Related Commands**

- `config band-select cycle-threshold`
- `config band-select expire`
- `config band-select cycle-count`
config boot

To change a Cisco wireless LAN controller boot option, use the `config boot` command.

```plaintext
config boot {primary | backup}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary</td>
<td>Sets the primary image as active.</td>
</tr>
<tr>
<td>backup</td>
<td>Sets the backup image as active.</td>
</tr>
</tbody>
</table>

**Command Default**

The default boot option is `primary`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each Cisco wireless LAN controller can boot off the primary, last-loaded operating system image (OS) or boot off the backup, earlier-loaded OS image.

The following example shows how to set the primary image as active so that the LAN controller can boot off the primary, last loaded image:

```
(Cisco Controller) > config boot primary
```

The following example shows how to set the backup image as active so that the LAN controller can boot off the backup, earlier loaded OS image:

```
(Cisco Controller) > config boot backup
```
config call-home contact email address

To configure the call-home contact email address, use the `config call-home contact-email-addr` command.

```
config call-home contact-email-addr email-address
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>email-address</code></td>

</table>

The following example shows how to disable call home tac-profile:

(Cisco Controller) >config call-home tac-profile status disable
To configure the Cisco Discovery Protocol (CDP) on the controller, use the `config cdp` command.

```
config cdp  { enable | disable | advertise-v2 { enable | disable } | timer seconds | holdtime holdtime_interval }
```

**Syntax Description**

- **enable**
  Enables CDP on the controller.

- **disable**
  Disables CDP on the controller.

- **advertise-v2**
  Configures CDP version 2 advertisements.

- **timer**
  Configures the interval at which CDP messages are to be generated.

- **seconds**
  Time interval at which CDP messages are to be generated. The range is from 5 to 254 seconds.

- **holdtime**
  Configures the amount of time to be advertised as the time-to-live value in generated CDP packets.

- **holdtime_interval**
  Maximum hold timer value. The range is from 10 to 255 seconds.

**Command Default**

The default value for CDP timer is 60 seconds.
The default value for CDP holdtime is 180 seconds.

**Command History**

<table>
<thead>
<tr>

<td>This command was enhanced with new keywords in Release 8.3.</td>
</tr>
</tbody>
</table>

The following example shows how to generate a new web administration SSL certificate:

```
(Cisco Controller) > config certificate generate webadmin
Creating a certificate may take some time. Do you wish to continue? (y/n)
```
To configure Locally Significant Certificate (LSC) certificates, use the `config certificate lsc` command.

```
config certificate lsc { enable | disable | ca-server http://url:port/path | ca-cert { add | delete } subject-params country state city orgn dept email | other-params keys size | ap-provision { auth-list { add | delete } ap_mac | revert-cert retries }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables LSC certificates on the controller.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables LSC certificates on the controller.</td>
</tr>
<tr>
<td><code>ca-server</code></td>
<td>Specifies the Certificate Authority (CA) server settings.</td>
</tr>
<tr>
<td><code>http://url:port/path</code></td>
<td>Domain name or IP address of the CA server.</td>
</tr>
<tr>
<td><code>ca-cert</code></td>
<td>Specifies CA certificate database settings.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>Obtains a CA certificate from the CA server and adds it to the controller’s certificate database.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes a CA certificate from the controller’s certificate database.</td>
</tr>
<tr>
<td><code>subject-params</code></td>
<td>Specifies the device certificate settings.</td>
</tr>
<tr>
<td><code>country state city orgn dept email</code></td>
<td>Country, state, city, organization, department, and email of the certificate authority.</td>
</tr>
<tr>
<td><code>note</code></td>
<td>The common name (CN) is generated automatically on the access point using the current MIC/SSC format Cxxxx-MacAddr, where xxxx is the product number.</td>
</tr>
<tr>
<td><code>other-params</code></td>
<td>Specifies the device certificate key size settings.</td>
</tr>
<tr>
<td><code>keysize</code></td>
<td>Value from 384 to 2048 (in bits); the default value is 2048.</td>
</tr>
<tr>
<td><code>ap-provision</code></td>
<td>Specifies the access point provision list settings.</td>
</tr>
<tr>
<td><code>auth-list</code></td>
<td>Specifies the provision list authorization settings.</td>
</tr>
<tr>
<td><code>ap_mac</code></td>
<td>MAC address of access point to be added or deleted from the provision list.</td>
</tr>
<tr>
<td><code>revert-cert</code></td>
<td>Specifies the number of times the access point attempts to join the controller using an LSC before reverting to the default certificate.</td>
</tr>
</tbody>
</table>

---

Cisco Wireless Controller Command Reference, Release 8.8
Value from 0 to 255; the default value is 3.

Note If you set the number of retries to 0 and the access point fails to join the controller using an LSC, the access point does not attempt to join the controller using the default certificate. If you are configuring LSC for the first time, we recommend that you configure a nonzero value.

The default value of keysize is 2048 bits. The default value of retries is 3.

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You can configure only one CA server. To configure a different CA server, delete the configured CA server by using the `config certificate lsc ca-server delete` command, and then configure a different CA server.

If you configure an access point provision list, only the access points in the provision list are provisioned when you enable AP provisioning (in Step 8). If you do not configure an access point provision list, all access points with an MIC or SSC certificate that join the controller are LSC provisioned.

The following example shows how to enable the LSC settings:

(Cisco Controller) >config certificate lsc enable

This example shows how to enable the LSC settings for Certificate Authority (CA) server settings:

(Cisco Controller) >config certificate lsc ca-server http://10.0.0.1:8080/caserver

The following example shows how to add a CA certificate from the CA server and add it to the controller’s certificate database:

(Cisco Controller) >config certificate lsc ca-cert add

The following example shows how to configure an LSC certificate with the keysize of 2048 bits:

(Cisco Controller) >config certificate lsc keysize 2048
config certificate ssc

To configure Self Signed Certificates (SSC) certificates, use the config certificate ssc command.

```
config certificate ssc hash validation { enable | disable }
```

**Syntax Description**

- **hash**: Configures the SSC hash key.
- **validation**: Configures hash validation of the SSC certificate.
- **enable**: Enables hash validation of the SSC certificate.
- **disable**: Disables hash validation of the SSC certificate.

**Command Default**

The SSC certificate is enabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable the SSC hash validation, an AP validates the SSC certificate of the virtual controller. When an AP validates the SSC certificate, it checks if the hash key of the virtual controller matches the hash key stored in its flash. If a match is found, the validation passes and the AP moves to the Run state. If a match is not found, the validation fails and the AP disconnects from the controller and restarts the discovery process. By default, hash validation is enabled. Hence, an AP must have the virtual controller hash key in its flash before associating with the virtual controller. If you disable hash validation of the SSC certificate, the AP bypasses the hash validation and directly moves to the Run state.

APs can associate with a physical controller, download the hash keys and then associate with a virtual controller. If the AP is associated to a physical controller and if hash validation is disabled, it joins any virtual controller without hash validation.

The following example shows how to enable hash validation of the SSC certificate:

```
(Cisco Controller) > config certificate ssc hash validation enable
```

**Related Commands**

- show certificate ssc
- show mobility group member
- config mobility group member hash
- config certificate
- show certificate compatibility
- show certificate lsc
- show certificate summary
- show local-auth certificates
config certificate use-device-certificate webadmin

To use a device certificate for web administration, use the `config certificate use-device-certificate webadmin` command.

`config certificate use-device-certificate webadmin`

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This test does not require the client to use the diagnostic channel.

The following example shows how to send a request to the client 00:0b:85:02:0d:20 to perform the default gateway ping test:

```
(Cisco Controller) > config client ccx default-gw-ping 00:0b:85:02:0d:20
```
**config client ccx dhcp-test**

To send a request to the client to perform the DHCP test, use the `config client ccx dhcp-test` command.

```
config client ccx dhcp-test client_mac_address
```

**Syntax Description**

- `client_mac_address`  
  MAC address of the client.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This test does not require the client to use the diagnostic channel.

The following example shows how to send a request to the client 00:E0:77:31:A3:55 to perform the DHCP test:

```
(Cisco Controller) >config client ccx dhcp-test 00:E0:77:31:A3:55
```
config client ccx dns-ping

To send a request to the client to perform the Domain Name System (DNS) server IP address ping test, use the `config client ccx dns-ping` command.

```
cfg(client) > config client ccx dns-ping 00:E0:77:31:A3:55
```
config client ccx dns-resolve

To send a request to the client to perform the Domain Name System (DNS) resolution test to the specified hostname, use the **config client ccx dns-resolve** command.

**config client ccx dns-resolve client_mac_address host_name**

**Syntax Description**

<table>
<thead>
<tr>
<th>client_mac_address</th>
<th>MAC address of the client.</th>
</tr>
</thead>
<tbody>
<tr>
<td>host_name</td>
<td>Hostname of the client.</td>
</tr>
</tbody>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client 172.19.28.40 to send the manufacturer’s information:

```
(Cisco Controller) > config client ccx get-manufacturer-info 172.19.28.40
```
config client ccx get-operating-parameters

To send a request to the client to send its current operating parameters, use the config client ccx get-operating-parameters command.

config client ccx get-operating-parameters client_mac_address

**Syntax Description**

| client_mac_address | MAC address of the client. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client 172.19.28.40 to send its current operating parameters:

(Cisco Controller) > config client ccx get-operating-parameters 172.19.28.40
**config client ccx get-profiles**

To send a request to the client to send its profiles, use the `config client ccx get-profiles` command.

```
config client ccx get-profiles client_mac_address
```

**Syntax Description**

<table>
<thead>
<tr>
<th><code>client_mac_address</code></th>
<th>MAC address of the client.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client 172.19.28.40 to send its profile details:

```
(Cisco Controller) >config client ccx get-profiles 172.19.28.40
```
config client ccx log-request

To configure a Cisco client eXtension (CCX) log request for a specified client device, use the `config client ccx log-request` command.

```
config client ccx log-request { roam | rsna | syslog } client_mac_address
```

### Syntax Description

- **roam**
  - (Optional) Specifies the request to specify the client CCX roaming log.

- **rsna**
  - (Optional) Specifies the request to specify the client CCX RSNA log.

- **syslog**
  - (Optional) Specifies the request to specify the client CCX system log.

- **client_mac_address**
  - MAC address of the client.

### Command Default

None

### Command History

<table>
<thead>
<tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify the request to specify the client CCS system log:

```
(Cisco Controller) >config client ccx log-request syslog 00:40:96:a8:f7:98
Tue Oct 05 13:05:21 2006
SysLog Response LogID=1: Status=Successful
Event Timestamp=121212121212
Client SysLog = 'This is a test syslog 2'
Event Timestamp=121212121212
Client SysLog = 'This is a test syslog 1'
Tue Oct 05 13:04:04 2006
SysLog Request LogID=1
```

The following example shows how to specify the client CCX roaming log:

```
(Cisco Controller) >config client ccx log-request roam 00:40:96:a8:f7:98
Roaming Response LogID=20: Status=Successful
Event Timestamp=121212121212
Source BSSID=00:40:96:a8:f7:98, Target BSSID=00:0b:85:23:26:70,

RSNA Result: Success
config client ccx send-message

To send a message to the client, use the `config client ccx send-message` command.

```
config client ccx send-message client_mac_address message_id
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>client_mac_address</code></td>
<td>MAC address of the client.</td>
</tr>
</tbody>
</table>
config client ccx send-message

message_id
Message type that involves one of the following:

- 1—The SSID is invalid.
- 2—The network settings are invalid.
- 3—There is a WLAN credibility mismatch.
- 4—The user credentials are incorrect.
- 5—Please call support.
- 6—The problem is resolved.
- 7—The problem has not been resolved.
- 8—Please try again later.
- 9—Please correct the indicated problem.
- 10—Troubleshooting is refused by the network.
- 11—Retrieving client reports.
- 12—Retrieving client logs.
- 13—Retrieval complete.
- 14—Beginning association test.
- 15—Beginning DHCP test.
- 16—Beginning network connectivity test.
- 17—Beginning DNS ping test.
- 18—Beginning name resolution test.
- 19—Beginning 802.1X authentication test.
- 20—Redirecting client to a specific profile.
- 21—Test complete.
- 22—Test passed.
- 23—Test failed.
- 24—Cancel diagnostic channel operation or select a WLAN profile to resume normal operation.
- 25—Log retrieval refused by the client.
- 26—Client report retrieval refused by the client.
- 27—Test request refused by the client.
- 28—Invalid network (IP) setting.
- 29—There is a known outage or problem with the network.
• 30—Scheduled maintenance period.

(continued on next page)

message_type (cont.)

• 31—The WLAN security method is not correct.
• 32—The WLAN encryption method is not correct.
• 33—The WLAN authentication method is not correct.

<table>
<thead>
<tr>
<th>Command Default</th>

</tr>
</thead>
<tbody>
<tr>
<td>Command History</td>
<td></td>
</tr>
<tr>
<td><strong>Release</strong></td>
<td><strong>Modification</strong></td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a message to the client MAC address 172.19.28.40 with the message user-action-required:

(Cisco Controller) >config client ccx send-message 172.19.28.40 user-action-required
**config client ccx stats-request**

To send a request for statistics, use the `config client ccx stats-request` command.

```
config client ccx stats-request measurement_duration { dot11 | security } client_mac_address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>measurement_duration</code></td>
<td>Measurement duration in seconds.</td>
</tr>
<tr>
<td><code>dot11</code></td>
<td>(Optional) Specifies dot11 counters.</td>
</tr>
<tr>
<td><code>security</code></td>
<td>(Optional) Specifies security counters.</td>
</tr>
<tr>
<td><code>client_mac_address</code></td>
<td>MAC address of the client.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify dot11 counter settings:

```
(Cisco Controller) >config client ccx stats-request 1 dot11 00:40:96:a8:f7:98
Measurement duration = 1
dot11TransmittedFragmentCount = 1
dot11MulticastTransmittedFrameCount = 2
dot11FailedCount = 3
dot11RetryCount = 4
dot11MultipleRetryCount = 5
dot11FrameDuplicateCount = 6
dot11RTSSuccessCount = 7
dot11RTSFailureCount = 8
dot11ACKFailureCount = 9
dot11ReceivedFragmentCount = 10
dot11MulticastReceivedFrameCount = 11
dot11FCSErrorCount = 12
dot11TransmittedFrameCount = 13
```
config client ccx test-abort

To send a request to the client to abort the current test, use the `config client ccx test-abort` command.

`config client ccx test-abort client_mac_address`

**Syntax Description**

<table>
<thead>
<tr>
<th><code>client_mac_address</code></th>
<th>MAC address of the client.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Only one test can be pending at a time.

The following example shows how to send a request to a client to abort the correct test settings:

```
(Cisco Controller) >config client ccx test-abort 11:11:11:11:11
```
**config client ccx test-association**

To send a request to the client to perform the association test, use the `config client ccx test-association` command.

```
config client ccx test-association client_mac_address ssid bssid 802.11 {a | b | g} channel
```

**Syntax Description**

- `client_mac_address` : MAC address of the client.
- `ssid` : Network name.
- `bssid` : Basic SSID.
- `802.11a` : Specifies the 802.11a network.
- `802.11b` : Specifies the 802.11b network.
- `802.11g` : Specifies the 802.11g network.
- `channel` : Channel number.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client MAC address 00:0E:77:31:A3:55 to perform the basic SSID association test:

```
(Cisco Controller) >config client ccx test-association 00:E0:77:31:A3:55 ssid bssid 802.11a
```
config client ccx test-dot1x

To send a request to the client to perform the 802.1x test, use the `config client ccx test-dot1x` command.

```
config client ccx test-dot1x client_mac_address profile_id bssid 802.11 {a | b | g} channel
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client to perform the 802.11b test with the profile name `profile_01`:

```
(Cisco Controller) >config client ccx test-dot1x 172.19.28.40 profile_01 bssid 802.11b
```
config client ccx test-profile

To send a request to the client to perform the profile redirect test, use the `config client ccx test-profile` command.

```
config client ccx test-profile client_mac_address profile_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client_mac_address</td>
<td>MAC address of the client.</td>
</tr>
<tr>
<td>profile_id</td>
<td>Test profile name.</td>
</tr>
</tbody>
</table>

**Note**

The `profile_id` should be from one of the client profiles for which client reporting is enabled.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send a request to the client to perform the profile redirect test with the profile name `profile_01`:

```
(Cisco Controller) >config client ccx test-profile 11:11:11:11:11 profile_01
```
config client deauthenticate

To disconnect a client, use the **config client deauthenticate** command.

```
config client deauthenticate {MAC | IPv4/v6_address | user_name}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC</td>
<td>Client MAC address.</td>
</tr>
<tr>
<td>IPv4/v6_address</td>
<td>IPv4 or IPv6 address.</td>
</tr>
<tr>
<td>user_name</td>
<td>Client user name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to deauthenticate a client using its MAC address:

```
(Cisco Controller) > config client deauthenticate 11:11:11:11
```
# config client location-calibration

To configure link aggregation, use the `config client location-calibration` command.

```
config client location-calibration { enable mac_address interval | disable mac_address }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>(Optional) Specifies that client location calibration is enabled.</td>
</tr>
<tr>
<td>mac_address</td>
<td>MAC address of the client.</td>
</tr>
<tr>
<td>interval</td>
<td>Measurement interval in seconds.</td>
</tr>
<tr>
<td>disable</td>
<td>(Optional) Specifies that client location calibration is disabled.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the client location calibration for the client 37:15:86:2a:Bc:cf with a measurement interval of 45 seconds:

```
(Cisco Controller) > config client location-calibration enable 37:15:86:2a:Bc:cf 45
```
**config client profiling delete**

To delete client profile, use the `config client profiling` command.

```
config client profiling delete {mac_address}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac_address</td>
<td>MAC address of the client.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced in this release.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a client profile:

```
(Cisco Controller) > config client profiling delete 37:15:86:2a:Bc:cf
```

**Note**

Executing the above command changes the Device Type to "Unknown". The Client does not get deleted but instead the profiling info of the client is removed, and retains the client as it is still associated. There is no confirmation message from the CLI, due to architecture limitation of the Cisco WLC.
To enable or disable CMX Cloud Services, use the `config cloud-services cmx` command.

```
config cloud-services cmx {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the CMX Cloud Services</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the CMX Cloud Services</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to enable the CMX Cloud Services:

```
(Cisco Controller) > config cloud-services cmx enable
```
config cloud-services server url

To configure the Cloud Server URL, use the `config cloud-services server url` command.

**config cloud-services server url url**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>url</strong></td>
<td>Enter the Cloud Server URL.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Release</strong></td>
<td><strong>Modification</strong></td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure the Cloud Server URL:

(Cisco Controller) > `config cloud-services server url www.example.com`
 CONFIGURATION

config cloud-services server id-token

To configure the Cloud Server Id-Token, use the `config cloud-services server id-token` command.

```
config cloud-services server id-token id-token
```

### Syntax Description

<table>
<thead>
<tr>
<th>id-token</th>
<th>Enter the cloud server id-token.</th>
</tr>
</thead>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure the Cloud Server Id-Token:

```
(Cisco Controller) > config cloud-services server id-token dzypisQ2#bo$iAQM
```
**config coredump**

To enable or disable the controller to generate a core dump file following a crash, use the `config coredump` command.

```
config coredump {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the controller to generate a core dump file.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the controller to generate a core dump file.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the controller to generate a core dump file following a crash:

```
(Cisco Controller) > config coredump enable
```

**Related Commands**

- `config coredump ftp`
- `config coredump username`
- `show coredump summary`
To automatically upload a controller core dump file to an FTP server after experiencing a crash, use the `config coredump ftp` command.

```
config coredump ftp server_ip_address filename
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>server_ip_address</code></td>
<td>IP address of the FTP server to which the controller sends its core dump file.</td>
</tr>
<tr>
<td><code>filename</code></td>
<td>Name given to the controller core dump file.</td>
</tr>
</tbody>
</table>

**Command Default**: None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The controller must be able to reach the FTP server to use this command.

The following example shows how to configure the controller to upload a core dump file named `core_dump_controller` to an FTP server at network address `192.168.0.13`:

```
(Cisco Controller) > config coredump ftp 192.168.0.13 core_dump_controller
```

**Related Commands**

- `config coredump`
- `config coredump username`
- `show coredump summary`
**config coredump username**

To specify the FTP server username and password when uploading a controller core dump file after experiencing a crash, use the `config coredump username` command.

```
config coredump username ftp_username password ftp_password
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ftp_username</code></td>
<td>FTP server login username.</td>
</tr>
<tr>
<td><code>ftp_password</code></td>
<td>FTP server login password.</td>
</tr>
</tbody>
</table>

| Command Default               | None                            |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The controller must be able to reach the FTP server to use this command.

The following example shows how to specify a FTP server username of *admin* and password *adminpassword* for the core dump file upload:

```
(Cisco Controller) > config coredump username admin password adminpassword
```

**Related Commands**

- `config coredump ftp`
- `config coredump`
- `show coredump summary`
config country

To configure the controller’s country code, use the `config country` command.

```
config country country_code
```

**Syntax Description**

- `country_code` : Two-letter or three-letter country code.

**Command Default**

- `us` (country code of the United States of America).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Cisco WLCs must be installed by a network administrator or qualified IT professional and the installer must select the proper country code. Following installation, access to the unit should be password protected by the installer to maintain compliance with regulatory requirements and to ensure proper unit functionality. See the related product guide for the most recent country codes and regulatory domains.

You can use the `show country` command to display a list of supported countries.

The following example shows how to configure the controller’s country code to DE:

```
(Cisco Controller) > config country DE
```
To enable or disable Cisco TrustSec on Cisco WLC, use the `config cts` command.

```
config cts { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables Cisco TrustSec on the Cisco WLC</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables Cisco TrustSec on the Cisco WLC</td>
</tr>
</tbody>
</table>

**Command Default**

By default, Cisco TrustSec is in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
**config cts ap**

To configure inline tagging and security group access control list (SGACL) enforcement on APs, use the `config cts ap` command.

```
config cts ap [inline-tagging | sgacl-enforcement] {enable | disable} {ap-name | all}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline-tagging</td>
<td>Configures inline tagging on all the APs or a specific AP</td>
</tr>
<tr>
<td>sgacl-enforcement</td>
<td>Configures SGACL enforcement on all the APs or a specific AP</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the specified feature</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the specified feature</td>
</tr>
<tr>
<td>ap-name</td>
<td>Name of the AP for which the specified feature has to be configured</td>
</tr>
<tr>
<td>all</td>
<td>Configures the specified feature for all APs associated with the Cisco WLC.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, both inline tagging and SGACL enforcement are in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- Inline tagging is supported only on the APs in FlexConnect mode.
- Inline tagging is not supported on Flex+Bridge 802.11ac lightweight APs.
- Inline tagging and SGACL download or enforcement are not supported on these Cisco WLCs: 5508, WiSM2, 8510, 7510, and vWLC.
- If you enable SGACL enforcement for all the APs, the configuration is applied on all the APs except for the APs for which Cisco TrustSec override is enabled.

The following example shows how to enable inline tagging on an AP named `cisco-flex-ap`:

```
(Cisco Controller) > config cts ap inline-tagging enable cisco-flex-ap
```

The following example shows how to enable SGACL enforcement on an AP named `cisco-flex-ap`:

```
(Cisco Controller) > config cts ap sgacl-enforcement enable cisco-flex-ap
```
config cts inline-tag

To configure Cisco TrustSec inline tagging for a Cisco WLC, use the `config cts inline-tag` command.

```
config cts inline-tag { enable | disable }
```

**Syntax Description**

- `inline-tag` Configures inline tagging for the Cisco WLC
- `enable` Enables inline tagging
- `disable` Disables inline tagging

**Command Default**

By default, inline tagging is in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Inline tagging is not supported on these Cisco WLCs: 5508, WiSM2, 8510, 7510, and vWLC.
config cts ap override

To configure Cisco TrustSec override for an AP, use the `config cts ap override` command.

```
config cts ap override { enable | disable } { ap-name }
```

**Syntax Description**

- **enable**: Enables CTS override for the corresponding AP.
- **disable**: Disables CTS override for the corresponding AP.
- **ap-name**: Name of the AP for which the CTS override has to be configured.

**Command Default**

By default, CTS override for an AP is in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enable SGACL enforcement for all the APs, the configuration is applied on all the APs except the APs for which CTS override is enabled.

The following example shows how to enable CTS override on an AP named `my-cisco-ap`:

```
(Cisco Controller) > config cts ap override enable my-cisco-ap
```
**config cts device-id**

To configure a Cisco TrustSec device ID, use the `config cts device-id` command.

```
config cts device-id device-id password password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>device-id</code></td>
<td>CTS device ID</td>
</tr>
<tr>
<td><code>password</code></td>
<td>CTS device ID password</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a CTS device ID:

```
(Cisco Controller) > config cts device-id wlc-8540 password Cisco123
```
config cts refresh

To refresh Cisco TrustSec environment data or security group tag (SGT) policy, use the config cts refresh command.

```
config cts refresh {environment-data} | {policy sgt {all | sgt-tag}}
```

**Syntax Description**

- **environment-data** Refreshes CTS environment data
- **policy sgt** Refreshes SGT policy
- **all** Refreshes all SGT policies
- **sgt-tag** Enter the CTS SGT tag (an integer) to be refreshed

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to refresh the SGT policy, Default-65535:

(Cisco Controller) > config cts refresh policy sgt 65535
config cts sxp ap connection delete

To delete an SXPv4 connection peer for all the APs or a specific AP, use the `config cts sxp ap connection delete` command.

```
config cts sxp ap connection delete ip-addr {cisco-ap | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-addr</td>
<td>SXPv4 IP address of a peer</td>
</tr>
<tr>
<td>cisco-ap</td>
<td>Name of the AP.</td>
</tr>
<tr>
<td>all</td>
<td>Applies the configuration to all the APs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>

<tbody>
<tr>
<td></td>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
config cts sxp ap connection peer

To configure an SXPv4 peer connection for all the APs or a specific AP, use the `config cts sxp ap connection peer` command.

```
config cts sxp ap connection peer ip-addr password {default | none} mode {both | listener | speaker} {cisco-ap | all}
```

**Syntax Description**

- `ip-addr`  
  SXPv4 IP address of the peer

- `password`  
  Configures password for the SXPv4 peer connection

- `default`  
  Uses default password for MD5 encryption

- `none`  
  Configures SXPv4 without password encryption

- `time-in-seconds`  
  Time after which an SXPv4 connection should be tried again after a failure to connect.

- `mode`  
  Configures mode of the SXPv4 connection

- `both`  
  Configures device as both SXP speaker and listener

- `listener`  
  Configures device as SXP listener

- `speaker`  
  Configures device as SXP speaker

- `cisco-ap`  
  Name of the AP

- `all`  
  Applies the configuration to all the APs associated with the corresponding Cisco WLC

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>

</table>
config cts sxp ap reconciliation period

To configure SXPv4 connection reconciliation time period, use the **config cts sxp ap reconciliation period** command.

```
config cts sxp ap reconciliation period time-in-seconds  { cisco-ap | all }
```

**Syntax Description**

- **time-in-seconds**: Time interval until when the SXPv4 connection reconciles. Valid range is between 0 and 64000 seconds.
- **cisco-ap**: Name of the AP
- **all**: Applies the configuration to all the APs associated with the Cisco WLC

**Command Default**

None

**Command History**

<table>

| 8.4                 | This command was introduced. |
config cts sxp ap speaker

To configure SXPv4 speaker mode parameters, use the `config cts sxp ap speaker` command.

```
config cts sxp ap speaker hold-time time-in-seconds {cisco-ap | all}
```

**Syntax Description**

- `time-in-seconds`: Hold time interval, in seconds. Valid range is between 1 and 65534 seconds.
- `cisco-ap`: Name of the AP for which SXPv4 has to be configured.
- `all`: Configures SXPv4 for all APs associated with the corresponding Cisco WLC.

**Command Default**

None

</tbody>
</table>
To configure the CTS SXP connection version, use the `config cts sxp version` command.

```
config cts sxp version version-1-or-2
```

**Syntax Description**

- `version-1-or-2` Enter the SXP version. Valid values are 1 and 2.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
To configure Cisco TrustSec SXP (CTS) connections on the controller, use the `config cts sxp` command.

```
config cts sxp {enable | disable | connection {delete | peer} | default password password | retry period time-in-seconds}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables CTS connections on the controller.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables CTS connections on the controller.</td>

<td>Configures CTS connection on the controller.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes the CTS connection on the controller.</td>
</tr>
<tr>
<td>peer</td>
<td>Configures the next hop switch with which the controller is connected.</td>
</tr>
<tr>
<td>ip-address</td>
<td>Only IPv4 address of the peer.</td>
</tr>
<tr>
<td>default password</td>
<td>Configures the default password for MD5 authentication of SXP messages.</td>
</tr>
<tr>
<td>password</td>
<td>Default password for MD5 Authentication of SXP messages. The password should contain a minimum of six characters.</td>
</tr>
<tr>
<td>retry period</td>
<td>Configures the SXP retry period.</td>
</tr>
<tr>
<td>time-in-seconds</td>
<td>Time after which a CTS connection should be again tried for after a failure to connect.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

For release 8.0, only IPv4 is supported for TrustSec SXP configuration.

The following example shows how to enable CTS on the controller:

```
(Cisco Controller) > config cts sxp enable
```

The following example shows how to configure a peer for a CTS connection:

```
> config cts sxp connection peer 209.165.200.224
```

### Related Commands

`debug cts sxp`
**config custom-web ext-webauth-mode**

To configure external URL web-based client authorization for the custom-web authentication page, use the `config custom-web ext-webauth-mode` command.

```
config custom-web ext-webauth-mode  { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the external URL web-based client authorization.</td>

The following example shows how to enable the external URL web-based client authorization:

```
(Cisco Controller) > config custom-web ext-webauth-mode enable
```

**Related Commands**

- `config custom-web redirectUrl`
- `config custom-web weblogo`
- `config custom-web webmessage`
- `config custom-web webtitle`
- `config custom-web ext-webauth-url show custom-web`
config custom-web ext-webauth-url

To configure the complete external web authentication URL for the custom-web authentication page, use the `config custom-web ext-webauth-url` command.

`config custom-web ext-webauth-url URL`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>URL used for web-based client authorization.</td>
</tr>
</tbody>
</table>

| Command Default   | None |

Command History

- **Release 7.6**
  - This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the complete external web authentication URL http://www.AuthorizationURL.com/ for the web-based client authorization:

```
(Cisco Controller) > config custom-web ext-webauth-url http://www.AuthorizationURL.com/
```

Related Commands

- `config custom-web redirectUrl`
- `config custom-web weblogo`
- `config custom-web webmessage`
- `config custom-web webtitle`
- `config custom-web ext-webauth-mode show custom-web`
config custom-web ext-webserver

To configure an external web server, use the `config custom-web ext-webserver` command.

```
config custom-web ext-webserver { add index IP_address | delete index }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds an external web server.</td>
</tr>
<tr>
<td>index</td>
<td>Index of the external web server in the list of external web server. The index must be a number between 1 and 20.</td>
</tr>
<tr>
<td>IP_address</td>
<td>IP address of the external web server.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes an external web server.</td>

- `config custom-web weblogo`
- `config custom-web webmessage`
- `config custom-web webtitle`
- `config custom-web ext-webauth-mode`
- `config custom-web ext-webauth-url`
- `show custom-web`

The following example shows how to add the index of the external web server 2 to the IP address of the external web server 192.23.32.19:

```
(Cisco Controller) > config custom-web ext-webserver add 2 192.23.32.19
```
config custom-web logout-popup

To enable or disable the custom web authentication logout popup, use the `config custom-web logout-popup` command.

```
config custom-web logout-popup { enable | disable }
```

**Syntax Description**

- **enable** Enables the custom web authentication logout popup. This page appears after a successful login or a redirect of the custom web authentication page.
- **disable** Disables the custom web authentication logout popup.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the custom qrscan bypass timer to 60 and number of times to 3 before the client rejoins:

(Cisco Controller) > config custom-web qrscan-bypass-opt 60 3
config custom-web radiusauth

To configure the RADIUS web authentication method, use the config custom-web radiusauth command.

```
config custom-web radiusauth { chap | md5chap | pap }
```

**Syntax Description**

- **chap**: Configures the RADIUS web authentication method as Challenge Handshake Authentication Protocol (CHAP).
- **md5chap**: Configures the RADIUS web authentication method as Message Digest 5 CHAP (MD5-CHAP).
- **pap**: Configures the RADIUS web authentication method as Password Authentication Protocol (PAP).

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>

The following example shows how to delete a web-authenticated sleeping client:

```
(Cisco Controller) > config custom-web sleep-client delete 0:18:74:c7:c0:90
```
config custom-web webauth-type

To configure the type of web authentication, use the `config custom-web webauth-type` command.

```
config custom-web webauth-type {internal | customized | external}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>Configures the web authentication type to internal.</td>
</tr>
<tr>
<td>customized</td>
<td>Configures the web authentication type to customized.</td>
</tr>
<tr>
<td>external</td>
<td>Configures the web authentication type to external.</td>
</tr>
</tbody>
</table>

**Command Default**

The default web authentication type is `internal`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the type of the web authentication type to internal:

```
(Cisco Controller) > config custom-web webauth-type internal
```

**Related Commands**

- `config custom-web redirectUrl`
- `config custom-web webmessage`
- `config custom-web webtitle`
- `config custom-web ext-webauth-mode`
- `config custom-web ext-webauth-url`
- `show custom-web`
config custom-web weblogo

To configure the web authentication logo for the custom-web authentication page, use the `config custom-web weblogo` command.

```plaintext
config custom-web weblogo { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable</td>
<td>Enable or disable the web authentication logo settings.</td>
</tr>
</tbody>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the web authentication logo:

```plaintext
(Cisco Controller) > config custom-web weblogo enable
```

**Related Commands**

- `config custom-web redirectUrl`
- `config custom-web webmessage`
- `config custom-web webtitle`
- `config custom-web ext-webauth-mode`
- `config custom-web ext-webauth-url`
- `show custom-web`
config custom-web webmessage

To configure the custom web authentication message text for the custom-web authentication page, use the `config custom-web webmessage` command.

```
config custom-web webmessage message
```

Syntax Description

- **message**: Message text for web authentication.

Command Default

- None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the message text Thisistheplace for webauthentication:

```
(Cisco Controller) > config custom-web webmessage Thisistheplace
```

Related Commands

- `config custom-web redirectUrl`
- `config custom-web weblogo`
- `config custom-web webtitle`
- `config custom-web ext-webauth-mode`
- `config custom-web ext-webauth-url`
- `show custom-web`
config custom-web webtitle

To configure the web authentication title text for the custom-web authentication page, use the `config custom-web webtitle` command.

config custom-web webtitle \textit{title}

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{title}</td>
<td>Custom title text for web authentication.</td>

</table>

The following example shows how to set the custom title text Helpdesk for web authentication:

(Cisco Controller) > config custom-web webtitle Helpdesk

Related Commands

- `config custom-web redirectUrl`
- `config custom-web weblogo`
- `config custom-web webmessage`
- `config custom-web ext-webauth-mode`
- `config custom-web ext-webauth-url`
- `show custom-web`
config database size

To configure the local database, use the **config database size** command.

```
config database size count
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>Database size value between 512 and 2040</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the **show database** command to display local database configuration.

The following example shows how to configure the size of the local database:

```
(Cisco Controller) > config database size 1024
```

**Related Commands**

- **show database**
config dhcp

To configure the internal DHCP, use the config dhcp command.

```
config dhcp { address-pool scope start end | create-scope scope | default-router scope router_1 [router_2] [router_3] | delete-scope scope | disable scope | dns-servers scope dns1 [dns2] [dns3] | domain scope domain | enable scope | lease scope lease_duration | netbios-name-server scope wins1 [wins2] [wins3] | network scope network netmask }
config dhcpcp-82 remote-id { ap_mac | ap_mac:ssid | ap-ethmac | apname:ssid | ap-group-name | flex-group-name | ap-location | apmac-vlan_id | apname-vlan_id | ap-ethmac-ssid }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address-pool scope start end</td>
<td>Configures an address range to allocate. You must specify the scope name and the first and last addresses of the address range.</td>
</tr>
<tr>
<td>create-scope name</td>
<td>Creates a new DHCP scope. You must specify the scope name.</td>
</tr>
<tr>
<td>default-router scope router_1 [router_2] [router_3]</td>
<td>Configures the default routers for the specified scope and specify the IP address of a router. Optionally, you can specify the IP addresses of secondary and tertiary routers.</td>
</tr>
<tr>
<td>delete-scope scope</td>
<td>Deletes the specified DHCP scope.</td>
</tr>
<tr>
<td>disable scope</td>
<td>Disables the specified DHCP scope.</td>
</tr>
<tr>
<td>dns-servers scope dns1 [dns2] [dns3]</td>
<td>Configures the name servers for the given scope. You must also specify at least one name server. Optionally, you can specify secondary and tertiary name servers.</td>
</tr>
<tr>
<td>domain scope domain</td>
<td>Configures the DNS domain name. You must specify the scope and domain names.</td>
</tr>
<tr>
<td>enable scope</td>
<td>Enables the specified dhcp scope.</td>
</tr>
<tr>
<td>lease scope lease_duration</td>
<td>Configures the lease duration (in seconds) for the specified scope.</td>
</tr>
<tr>
<td>netbios-name-server scope wins1 [wins2] [wins3]</td>
<td>Configures the netbios name servers. You must specify the scope name and the IP address of a name server. Optionally, you can specify the IP addresses of secondary and tertiary name servers.</td>
</tr>
<tr>
<td>network scope network netmask</td>
<td>Configures the network and netmask. You must specify the scope name, the network address, and the network mask.</td>
</tr>
</tbody>
</table>
The controller acts as a DHCP relay agent to prevent DHCP client requests from untrusted sources. The controller adds option 82 information to DHCP requests from clients before forwarding the requests to the DHCP server.

- **ap_mac**: MAC address of the access point to the DHCP option 82 payload.
- **ap_mac:ssid**: MAC address and SSID of the access point to the DHCP option 82 payload.
- **ap-ethmac**: Remote ID format as AP Ethernet MAC address.
- **apname:ssid**: Remote ID format as AP name:SSID.
- **ap-group-name**: Remote ID format as AP group name.
- **flex-group-name**: Remote ID format as FlexConnect group name.
- **ap-location**: Remote ID format as AP location.
- **apmac-vlan_id**: Remote ID format as AP radio MAC address:VLAN_ID.
- **apname-vlan_id**: Remote ID format as AP Name:VLAN_ID.
- **ap-ethmac-ssid**: Remote ID format as AP Ethernet MAC:SSID address.

**Command Default**
The default value for ap-group-name is default-group, and for ap-location, the default value is default location. If ap-group-name and flex-group-name are null, the system MAC is sent as the remote ID field.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show dhcp` command to display the internal DHCP configuration.

The following example shows how to configure the DHCP lease for the scope 003:

```
(Cisco Controller) > config dhcp lease 003
```
config dhcp opt-82 format

To configure the DHCP option 82 format, use the `config dhcp opt-82 format` command.

`config dhcp opt-82 format {binary | ascii}

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>binary</code></td>
<td>Specifies the DHCP option 82 format as binary.</td>
</tr>
<tr>
<td><code>ascii</code></td>
<td>Specifies the DHCP option 82 format as ASCII.</td>
</tr>
</tbody>
</table>

| Command Default | None |

<table>
<thead>
<tr>

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the format of DHCP option 82 payload:

(Cisco Controller) > config dhcp opt-82 format binary
config dhcp opt-82 remote-id

To configure the format of the DHCP option 82 payload, use the `config dhcp opt-82 remote-id` command.

`config dhcp opt-82 remote-id { ap_mac | ap_mac:ssid | ap-ethmac | apname:ssid | ap-group-name | flex-group-name | ap-location | apmac-vlan-id | apname-vlan-id | ap-ethmac-ssid }`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ap_mac</code></td>
<td>Specifies the radio MAC address of the access point to the DHCP option 82 payload.</td>

<tr>
<td><code>apname:ssid</code></td>
<td>Specifies the AP name and SSID of the access point to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>ap-group-name</code></td>
<td>Specifies the AP group name to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>flex-group-name</code></td>
<td>Specifies the FlexConnect group name to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>ap-location</code></td>
<td>Specifies the AP location to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>apmac-vlan-id</code></td>
<td>Specifies the radio MAC address of the access point and the VLAN ID to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>apname-vlan-id</code></td>
<td>Specifies the AP name and its VLAN ID to the DHCP option 82 payload.</td>
</tr>
<tr>
<td><code>ap-ethmac-ssid</code></td>
<td>Specifies the Ethernet MAC address of the access point and the SSID to the DHCP option 82 payload.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the remote ID of DHCP option 82 payload:

```
(Cisco Controller) > config dhcp opt-82 remote-id apgroup1
```
**config dhcp proxy**

To specify the level at which DHCP packets are modified, use the `config dhcp proxy` command.

```
cfg dhcp proxy { enable | disable { bootp-broadcast [ enable | disable ] } }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows the controller to modify the DHCP packets without a limit.</td>
</tr>
<tr>
<td>disable</td>
<td>Reduces the DHCP packet modification to the level of a relay.</td>
</tr>
<tr>
<td>bootp-broadcast</td>
<td>Configures DHCP BootP broadcast option.</td>
</tr>
</tbody>
</table>

**Command Default**

DHCP is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `show dhcp proxy` command to display the status of DHCP proxy handling.

To enable third-party WGB support, you must enable the passive-client feature on the wireless LAN by entering the `config wlan passive-client enable` command.

The following example shows how to disable the DHCP packet modification:

```
(Cisco Controller) >config dhcp proxy disable
```

The following example shows how to enable the DHCP BootP broadcast option:

```
(Cisco Controller) >config dhcp proxy disable bootp-broadcast enable
```
config dhcp timeout

To configure a DHCP timeout value, use the config dhcp timeout command. If you have configured a WLAN to be in DHCP required state, this timer controls how long the WLC will wait for a client to get a DHCP lease through DHCP.

config dhcp timeout timeout-value

**Syntax Description**

| timeout-value | Timeout value in the range of 5 to 120 seconds. |

**Command Default**

The default timeout value is 120 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the DHCP timeout to 10 seconds:

(Cisco Controller) > config dhcp timeout 10
**config dx**

To configure data externalization on a Cisco WLC, use the **config dx** command.

```
config dx {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables data externalization on Cisco WLC.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables data externalization on Cisco WLC.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
# config exclusionlist

To create or delete an exclusion list entry, use the `config exclusionlist` command.

```
config exclusionlist { add MAC [description] | delete MAC | description MAC [description] }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>config exclusionlist</code></td>
<td>Configures the exclusion list.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>Creates a local exclusion-list entry.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes a local exclusion-list entry</td>
</tr>
<tr>
<td><code>description</code></td>
<td>Specifies the description for an exclusion-list entry.</td>
</tr>
<tr>
<td><code>MAC</code></td>
<td>MAC address of the local Excluded entry.</td>
</tr>
<tr>
<td><code>description</code></td>
<td>Optional) Description, up to 32 characters, for an excluded entry.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command History

#### Release 7.6
- This command was introduced in a release earlier than Release 7.6.

#### Release 8.3
- This command was introduced.

The following example shows how to create a local exclusion list entry for the MAC address `xx:xx:xx:xx:xx:xx`:

```
(Cisco Controller) > config exclusionlist add xx:xx:xx:xx:xx:xx lab
```

The following example shows how to delete a local exclusion list entry for the MAC address `xx:xx:xx:xx:xx:xx`:

```
(Cisco Controller) > config exclusionlist delete xx:xx:xx:xx:xx:xx lab
```

## Related Commands

- `show exclusionlist`
To enable or disable fabric, use the `config fabric` command.

```
config fabric enable disable
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables fabric.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables fabric.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to enable fabric:

```
config fabric enable
```
config fabric vnid create name

To configure the fabric Virtual Extensible LAN (VXLAN) network identifier (VNID) and subnet, use the `config fabric vnid create name` command.

```
config fabric vnid create name interface-name l2-vnid l2-vnid ip network-ip subnet subnet l3-vnid l3-vnid
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface-name</code></td>
</tr>
<tr>
<td>Name of the interface.</td>
</tr>
<tr>
<td><code>l2-vnid</code></td>
</tr>
<tr>
<td>Layer 2 VNID.</td>
</tr>
<tr>
<td><code>l2-vnid</code></td>
</tr>
<tr>
<td>Layer 2 VNID value.</td>
</tr>
<tr>
<td><code>ip</code></td>
</tr>
<tr>
<td>IP address.</td>
</tr>
<tr>
<td><code>network-ip</code></td>
</tr>
<tr>
<td>Network IP address.</td>
</tr>
<tr>
<td><code>subnet</code></td>
</tr>
<tr>
<td>Subnet address.</td>
</tr>
<tr>
<td><code>subnet</code></td>
</tr>
<tr>
<td>Subnet address of the network.</td>
</tr>
<tr>
<td><code>l3-vnid</code></td>
</tr>
<tr>
<td>Layer 3 VNID value.</td>
</tr>
<tr>
<td><code>l3-vnid</code></td>
</tr>
<tr>
<td>Layer 3 VNID.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The Subnet to VNID combination is expected to 1:1 with no-overlaps.

The VNID name can be used for Radius override or configuration of VNID on WLAN.

The guest fabric VNID or subnet should not overlap with the enterprise fabric VNID or subnet.

**Example**

The following example shows how to configure fabric VNID and its subnet:

```
config fabric vnid create name vnid1 l2-vnid l2-vnid ip 10.10.1.3 subnet 255.255.255.223 l3-vnid l3-vnid
```
config fabric control-plane enterprise-fabric

To configure IP address of the mapserver and the pre-shared key, use the config fabric control-plane enterprise-fabric ip command.

config fabric control-plane enterprise-fabric {add |delete}{primary | secondary} ip ip-address preshared-key pre-shared-key

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>IP address of the mapserver.</td>
</tr>
<tr>
<td>pre-shared-key</td>
<td>Pre-shared key.</td>
</tr>
</tbody>
</table>

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The AP should be part of the fabric on the mapserver configured using this command. You can use a maximum of 2 IP addresses, which will be in active-active mode.

Use config fabric control-plane enterprise-fabric delete ip/ip-address command to delete the associated map server.

Example

The following example shows how to configure IP address of the mapserver and the pre-shared key:

cfg fabric control-plane enterprise-fabric add primary ip 10.1.1.1 preshare-key secret
config fabric control-plane guest-fabric

To configure IP address of the guest mapserver and the pre-shared key used for the fabric WLAN, use the `config fabric control-plane guest-fabric` command.

```plaintext
config fabric control-plane guest-fabric {add | delete} {primary | secondary} ip ip-address preshared-key pre-shared-key
```

**Syntax Description**

- `ip-address`: IP address of the mapserver.
- `pre-shared-key`: Pre-shared key.

**Command Default**

Enterprise fabric mapserver is used.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use a maximum of 2 IP addresses, which will be in active-active mode.

**Example**

The following example shows how to configure IP address of the guest mapserver and the pre-shared key:

```plaintext
config fabric control-plane guest-fabric add primary ip 10.2.1.1 preshared-key guest
```
**config flexconnect [ipv6] acl**

To apply access control lists that are configured on a FlexConnect access point, use the `config flexconnect [ipv6] acl` command. Use the `ipv6` keyword to configure IPv6 FlexConnect ACLs.

```
config flexconnect [ipv6] acl {apply | create | delete} acl_name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipv6</td>
<td>Use this option to configure IPv6 FlexConnect ACLs. If you don’t use this option, then IPv4 FlexConnect ACLs will be configured.</td>
</tr>
<tr>
<td>apply</td>
<td>Applies an ACL to the data path.</td>
</tr>
<tr>
<td>create</td>
<td>Creates an ACL.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes an ACL.</td>
</tr>
<tr>
<td>acl_name</td>
<td>ACL name that contains up to 32 alphanumeric characters.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.8</td>
<td>IPv6 ACL option was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to apply the IPv4 ACL configured on a FlexConnect access point:

```
(Cisco Controller) > config flexconnect acl apply acl1
```
**config flexconnect [ipv6] acl rule**

To configure access control list (ACL) rules on a FlexConnect access point, use the `config flexconnect [ipv6] acl rule` command.

```plaintext
config flexconnect [ipv6] acl rule { action rule_name rule_index { permit | deny } | add rule_name rule_index | change index rule_name old_index new_index | delete rule_name rule_index | destination address rule_name rule_index ip_address netmask | destination port range rule_name rule_index start_port end_port | direction rule_name rule_index { in | out | any } | dscp rule_name rule_index dscp | protocol rule_name rule_index protocol | source address rule_name rule_index ip_address netmask | source port range rule_name rule_index start_port end_port | swap index rule_name index_1 index_2 }
```

</tbody>
</table>
**dscp**

Configures a rule’s DSCP.

*dscp* Number between 0 and 63, or any.

**protocol**

Configures a rule’s DSCP.

*protocol* Number between 0 and 255, or any.

**source address**

Configures a rule’s source IP address and netmask.

**source port range**

Configures a rule’s source port range.

**swap**

Swaps two rules’ indices.

*index_1* The rule first index to swap.

*index_2* The rule index to swap the first index with.

**Command Default**

None

**Command History**

<table>

</tbody>
</table>

This example shows how to configure an ACL to permit access:

(Cisco Controller) >config flexconnect acl rule action lab1 4 permit
# config flexconnect [ipv6] acl url-domain

To configure a URL domain-based rule for a FlexConnect ACL, use the `config flexconnect acl [ipv6] url-domain` command.

```plaintext
config flexconnect [ipv6] acl url-domain

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>

</table>

This example shows how to configure URL-based rule for an IPv6 FlexConnect ACL:

```plaintext
(Cisco Controller) > config flexconnect ipv6 acl url-domain action acls-to-allow 2 permit
```
**config flexconnect arp-caching**

To save an ARP entry for a client in the cache with locally switched WLAN on FlexConnect APs use `config flexconnect arp-caching` command.

```
config flexconnect arp-caching {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>arp-caching enable</th>
<th>Instructs the access point to save the ARP entry for a client in the cache and reply on its behalf of the client for locally switched WLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>arp-caching disable</td>
<td>Disables ARP caching.</td>

</table>

**Example**

The following example shows how to apply the proxy ARP with locally switched WLAN on FlexConnect APs.

```
(Cisco Controller) > config flexconnect arp-caching enable
```
## config flexconnect avc profile

To configure a Flexconnect Application Visibility and Control (AVC) profile, use the `config flexconnect avc profile` command.

```
config flexconnect avc profile profile-name { create | delete } | apply | rule { add application app-name { drop | { mark dscp-value } } | { remove application app-name }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>profile-name</td>
<td>Name of the AVC profile. The range is from 0 to 32 alphanumeric characters.</td>
</tr>

<tr>
<td>delete</td>
<td>Deletes an AVC profile.</td>
</tr>
<tr>
<td>apply</td>
<td>Applies an AVC profile.</td>
</tr>
<tr>
<td>rule</td>
<td>Configures a Rule for an AVC profile.</td>
</tr>
<tr>
<td>add application</td>
<td>Adds a rule for an AVC profile.</td>
</tr>
<tr>
<td>app-name</td>
<td>Name of the application. The range is from 0 to 32 alphanumeric characters.</td>
</tr>
<tr>
<td>drop</td>
<td>Adds a rule to drop packets.</td>
</tr>
<tr>
<td>mark</td>
<td>Adds a rule to mark packets with specific differentiated services code point (DSCP).</td>
</tr>
<tr>
<td>dscp-value</td>
<td>DSCP value for marking packets. The range is from 0 to 63.</td>
</tr>
<tr>
<td>remove application</td>
<td>Removes a rule for an AVC profile.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>

The following example shows how to create a FlexConnect profile:

```
(Cisco Controller) > config flexconnect avc profile profile1 create
```
### config flexconnect fallback-radio-shut

To configure the radio interface of an access point when the Ethernet link is not operational, use the `config flexconnect fallback-radio-shut` command.

```
config flexconnect fallback-radio-shut (disable | enable delay delay-in-sec)
```

**Syntax Description**

- **disable**: Disables the radio interface shutdown.
- **enable**: Enables the radio interface shutdown.
- **delay**: Specifies the delay for the interface after which the radio interface has to be shut down.
- **delay-in-sec**: Delay duration, in seconds.

**Command Default**

The radio interface shutdown is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can specify the delay duration only if you enable the radio interface shutdown.

The following example shows how to enable the radio interface shutdown after a delay duration of 5 seconds:

```
(Cisco Controller) >config flexconnect fallback-radio-shut enable delay 5
```
To add, delete, or configure a FlexConnect group, use the `config flexconnect group` command.

```
config flexconnect group group_name {add | delete} ap {add | delete} ap-mac | radius {ap {authority {id hex_id | info auth_info} | disable | eap-fast {enable | disable} | enable | leap {enable | disable} | pac-timeout timeout} | server-key {auto | key} | user {add {username password} | delete username}}} | server auth {add | delete} {primary | secondary} server_index IP_address auth_port secret | predownload {disable | enable} | master ap_name | slave {retry-count max_count} | ap-name cisco_ap} | start {primary backup abort} | local-split {wlan wlan_id acl acl_name {enable | disable}} | multicast overridden-interface {enable | disable} | vlan {add vlan_id acl in-aclname out-aclname} | delete vlan_id} | web-auth wlan wlan_id acl acl_name {enable | disable} | web-policy acl {add | delete} acl_name
```

```
config flexconnect group group_name radius ap {eap-cert download} | eap-tls {enable | disable} | peap {enable | disable}
```

```
config flexconnect group group_name policy acl {add | delete} acl_name
```

```
config flexconnect group group_name {add | delete} http-proxy ipaddress ip-address port port-no
```

**Syntax Description**

- `group_name`  
  - Group name.
- `add`  
  - Adds a FlexConnect group.
- `delete`  
  - Deletes a FlexConnect group.
- `ap`  
  - Adds or deletes an access point to a FlexConnect group.
- `add`  
  - Adds an access point to a FlexConnect group.
- `delete`  
  - Deletes an access point to a FlexConnect group.
- `ap-mac`  
  - MAC address of the access point.
- `radius`  
  - Configures the RADIUS server for client authentication for a FlexConnect group.
- `ap`  
  - Configures an access point based RADIUS server for client authentication for a FlexConnect group.
- `authority`  
  - Configures the Extensible Authentication Protocol-Flexible Authentication via Secure Tunneling (EAP-FAST) authority parameters.
- `id`  
  - Configures the authority identifier of the local EAP-FAST server.
<table>
<thead>
<tr>

</tbody>
</table>
### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was modified.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can add up to 100 clients.

Beginning in Release 7.4 and later releases, the supported maximum number of RADIUS servers is 100.

The following example shows how to add a FlexConnect group for MAC address 192.12.1.2:

(Cisco Controller) > config flexconnect group 192.12.1.2 add

The following example shows how to add a RADIUS server as a primary server for a FlexConnect group with the server index number 1:

(Cisco Controller) > config flexconnect group 192.12.1.2 radius server add primary 1

The following example shows how to enable a local split ACL on a FlexConnect AP group for a WLAN:

(Cisco Controller) > config flexconnect group flexgroup1 local-split wlan 1 acl flexacl1 enable
config flexconnect group vlan

To configure VLAN for a FlexConnect group, use the config flexconnect group vlan command.

```
cfg flexconnect group group_name vlan  { add vlan-id acl in-aclname out-aclname | delete vlan-id }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>group_name</td>
<td>FlexConnect group name.</td>
</tr>
<tr>
<td>add</td>
<td>Adds a VLAN for the FlexConnect group.</td>
</tr>
<tr>
<td>vlan-id</td>
<td>VLAN ID.</td>
</tr>
<tr>
<td>acl</td>
<td>Specifies an access control list.</td>
</tr>
<tr>
<td>in-aclname</td>
<td>In-bound ACL name.</td>
</tr>
<tr>
<td>out-aclname</td>
<td>Out-bound ACL name.</td>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to add VLAN ID 1 for the FlexConnect group myflexacl where the in-bound ACL name is in-acl and the out-bound ACL is out-acl:

```
(config Controller) > config flexconnect group vlan myflexacl vlan add 1 acl in-acl out-acl
```
config flexconnect group group-name dhcp overridden-interface

To enable or disable the DHCP overridden interface for a FlexConnect group, use the `config flexconnect group group-name dhcp overridden-interface` command.

```
config flexconnect group group-name dhcp overridden-interface {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>overridden-interface</td>
<td>The DHCP overridden interface for FlexConnect group.</td>
</tr>
<tr>
<td>group-name</td>
<td>Name of the FlexConnect group.</td>
</tr>
<tr>
<td>enable</td>
<td>Instructs the access point to enable DHCP broadcast for locally switched clients.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the feature.</td>
</tr>
</tbody>
</table>

**Command Default**

<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to enable DHCP broadcast for locally switched clients.

```
(Cisco Controller) >config flexconnect
group flexgroup dhcp overridden-interface enable
```
To configure Web-Auth ACL for a FlexConnect group, use the \texttt{config flexconnect group web-auth} command.

\begin{verbatim}
config flexconnect group \texttt{group\_name} web-auth wlan \texttt{wlan-id} acl \texttt{acl-name} \{enable | disable\}
\end{verbatim}

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{group_name}</td>
<td>FlexConnect group name.</td>
</tr>
<tr>
<td>\texttt{wlan-id}</td>
<td>WLAN ID.</td>
</tr>
<tr>
<td>\texttt{acl-name}</td>
<td>ACL name.</td>
</tr>
<tr>
<td>\texttt{enable}</td>
<td>Enables the Web-Auth ACL for a FlexConnect group.</td>
</tr>
<tr>
<td>\texttt{disable}</td>
<td>Disables the Web-Auth ACL for a FlexConnect group.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable Web-Auth ACL webauthacl for the FlexConnect group myflexacl on WLAN ID 1:

\begin{verbatim}
(Cisco Controller) >config flexconnect group myflexacl web-auth wlan 1 acl webauthacl enable
\end{verbatim}
To configure Web Policy ACL for a FlexConnect group, use the `config flexconnect group web-policy` command.

```
config flexconnect group group_name web-policy acl {add | delete} acl-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group_name</code></td>
<td>FlexConnect group name.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>Adds the Web Policy ACL.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes the Web Policy ACL.</td>
</tr>
<tr>
<td><code>acl-name</code></td>
<td>Name of the Web Policy ACL.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to add the Web Policy ACL `mywebpolicyacl` to the FlexConnect group `myflexacl`:

```
(Cisco Controller) >config flexconnect group myflexacl web-policy acl add mywebpolicyacl
```
config flexconnect join min-latency

To enable or disable the access point to choose the controller with the least latency when joining, use the `config flexconnect join min-latency` command.

```
config flexconnect join min-latency { enable | disable } cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the access point to choose the controller with the least latency when joining.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the access point to choose the controller with the least latency when joining.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**
The access point cannot choose the controller with the least latency when joining.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable this feature, the access point calculates the time between the discovery request and discovery response and joins the controller that responds first. This command is supported only on the following controller releases:

- Cisco 2500 Series Controller
- Cisco 5500 Series Controller
- Cisco Flex 7500 Series Controllers
- Cisco 8500 Series Controllers
- Cisco Wireless Services Module 2

This configuration overrides the HA setting on the controller, and is applicable only for OEAP access points.

The following example shows how to enable the access point to choose the controller with the least latency when joining:

```
(Cisco Controller) >config flexconnect join min-latency enable CISCO_AP
```
To configure FlexConnect mode for an OfficeExtend access point, use the `config flexconnect office-extend` command.

```
config flexconnect office-extend { { enable | disable } cisco_ap | clear-personalssid-config cisco_ap }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
</tr>
<tr>
<td>disable</td>
</tr>
<tr>
<td>clear-personalssid-config</td>
</tr>
<tr>
<td>cisco_ap</td>
</tr>
</tbody>
</table>

**Command Default**

OfficeExtend mode is enabled automatically when you enable FlexConnect mode on the access point.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Currently, only Cisco Aironet 1130 series and 1140 series access points that are joined to a Cisco 5500 Series Controller with a WPlus license can be configured to operate as OfficeExtend access points.

Rogue detection is disabled automatically when you enable the OfficeExtend mode for an access point. OfficeExtend access points, which are deployed in a home environment, are likely to detect a large number of rogue devices. You can enable or disable rogue detection for a specific access point or for all access points by using the `config rogue detection` command.

DTLS data encryption is enabled automatically when you enable the OfficeExtend mode for an access point. However, you can enable or disable DTLS data encryption for a specific access point or for all access points by using the `config ap link-encryption` command.

Telnet and SSH access are disabled automatically when you enable the OfficeExtend mode for an access point. However, you can enable or disable Telnet or SSH access for a specific access point by using the `config ap telnet` or `config ap ssh` command.

Link latency is enabled automatically when you enable the OfficeExtend mode for an access point. However, you can enable or disable link latency for a specific access point or for all access points currently associated to the controller by using the `config ap link-latency` command.

The following example shows how to enable the office-extend mode for the access point Cisco_ap:

```
(Cisco Controller) > config flexconnect office-extend enable Cisco_ap
```

The following example shows how to clear only the access point’s personal SSID for the access point Cisco_ap:

```
(Cisco Controller) > config flexconnect office-extend clear-personalssid-config Cisco_ap
```
**config flow**

To configure a NetFlow Monitor and Exporter, use the `config flow` command.

```
config flow {add | delete} monitor monitor_name {exporter exporter_name | record (ipv4_client_app_flow_record | ipv4_client_src_dst_flow_record)}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>add</code></td>
<td>Associates either a NetFlow monitor with an exporter, or a NetFlow record with a NetFlow monitor.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Dissociates either a NetFlow monitor from an exporter, or a NetFlow record from a NetFlow monitor.</td>
</tr>
<tr>
<td><code>monitor</code></td>
<td>Configures a NetFlow monitor.</td>
</tr>
<tr>
<td><code>monitor_name</code></td>
<td>Name of the NetFlow monitor. The monitor name can be up to 32 case-sensitive, alphanumeric characters. You cannot include spaces in a monitor name.</td>
</tr>
<tr>
<td><code>exporter</code></td>
<td>Configures a NetFlow exporter.</td>
</tr>
<tr>
<td><code>exporter_name</code></td>
<td>Name of the NetFlow exporter. The exporter name can be up to 32 case-sensitive, alphanumeric characters. You cannot include spaces in an exporter name.</td>
</tr>
<tr>
<td><code>record</code></td>
<td>Associates a NetFlow record to the NetFlow monitor.</td>
</tr>
<tr>
<td><code>ipv4_client_app_flow_record</code></td>
<td>Existing record template for better performance.</td>
</tr>
<tr>
<td><code>ipv4_client_src_dst_flow_record</code></td>
<td>Enhanced record template for better coverage.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

An exporter is a network entity that exports the template with IP traffic information. The Cisco WLC acts as an exporter. A NetFlow record in the Cisco WLC contains the information about the traffic in a given flow, such as client MAC address, client source IP address, WLAN ID, incoming and outgoing bytes of data, incoming and outgoing packets, and incoming and outgoing Differentiated Services Code Point (DSCP).

The following example shows how to configure a NetFlow monitor and exporter:

```
(Cisco Controller) > config flow add monitor monitor1 exporter exporter1
```
config guest-lan

To create, delete, enable or disable a wireless LAN, use the config guest-lan command.

**config guest-lan { create | delete } guest_lan_id interface_name | { enable | disable } guest_lan_id**

### Syntax Description

- **create**
  - Creates a wired LAN settings.

- **delete**
  - Deletes a wired LAN settings:

- **guest_lan_id**
  - LAN identifier between 1 and 5 (inclusive).

- **interface_name**
  - Interface name up to 32 alphanumeric characters.

- **enable**
  - Enables a wireless LAN.

- **disable**
  - Disables a wireless LAN.

### Command Default

None

<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable a wireless LAN with the LAN ID 16:

```
(Cisco Controller) > config guest-lan enable 16
```

### Related Commands

- show wlan
**config guest-lan custom-web ext-webauth-url**

To redirect guest users to an external server before accessing the web login page, use the `config guest-lan custom-web ext-webauth-url` command.

```
config guest-lan custom-web ext-webauth-url ext_web_url guest_lan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ext_web_url</code></td>
<td>URL for the external server.</td>

The following example shows how to enable a wireless LAN with the LAN ID 16:

```
(Cisco Controller) > config guest-lan custom-web ext-webauth-url http://www.AuthorizationURL.com/ 1
```

**Related Commands**

- `config guest-lan`
- `config guest-lan create`
- `config guest-lan custom-web login_page`
config guest-lan custom-web global disable

To use a guest-LAN specific custom web configuration rather than a global custom web configuration, use the `config guest-lan custom-web global disable` command.

```
config guest-lan custom-web global disable guest_lan_id
```

**Syntax Description**

| guest_lan_id | Guest LAN identifier between 1 and 5 (inclusive). |

**Command Default**

None

**Command History**

<table>
<thead>

</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enter the `config guest-lan custom-web global enable guest_lan_id` command, the custom web authentication configuration at the global level is used.

The following example shows how to disable the global web configuration for guest LAN ID 1:

```
(Cisco Controller) > config guest-lan custom-web global disable 1
```

**Related Commands**

- `config guest-lan`
- `config guest-lan create`
- `config guest-lan custom-web ext-webauth-url`
- `config guest-lan custom-web login_page`
- `config guest-lan custom-web webauth-type`
config guest-lan custom-web login_page

To enable wired guest users to log into a customized web login page, use the config guest-lan custom-web login_page command.

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

```
(Cisco Controller) > config guest-lan interface 1 guest01
```

**Related Commands**

- `config ingress-interface guest-lan`
- `config guest-lan create`
**config guest-lan mobility anchor**

To add or delete mobility anchor, use the `config guest-lan mobility anchor` command.

```
config guest-lan mobility anchor { add | delete } Guest LAN Id IP addr
```

**Syntax Description**

- **add**
  - Adds a mobility anchor to a WLAN.

- **delete**
  - Deletes a mobility anchor from a WLAN.

- **Guest LAN Id**
  - Guest LAN identifier between 1 and 5.

- **IP addr**
  - Member switch IPv4 or IPv6 address to anchor WLAN.

**Command Default**

None

**Command History**

<table>

The following example shows how to enable the NAC out-of-band support for guest LAN ID 3:

(Cisco Controller) > `config guest-lan nac enable 3`

**Related Commands**

- `show nac statistics`
- `show nac summary`
- `config wlan nac`
- `debug nac`
config guest-lan security

To configure the security policy for the wired guest LAN, use the **config guest-lan security** command.

```
config guest-lan security (web-auth (enable | disable | acl | server-precedence) guest_lan_id | web-passthrough (acl | email-input | disable | enable) guest_lan_id)
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>web-auth</td>
<td>Specifies web authentication.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the web authentication settings.</td>

</tbody>
</table>

The following example shows how to configure 3G/4G-VLAN interface:

(Cisco Controller) > config interface 3g-vlan vlan-int enable
**config interface acl**

To configure access control list of an interface, use the `config interface acl` command.

```
config interface acl { ap-manager | management | interface_name} { ACL | none }
```

**Syntax Description**

- **ap-manager**: Configures the access point manager interface.
- **management**: Configures the management interface.
- **interface_name**: Interface name.
- **ACL**: ACL name up to 32 alphanumeric characters.
- **none**: Specifies none.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For a Cisco 2100 Series Wireless LAN Controller, you must configure a preauthentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN preauthentication ACL under Web Policy. However, you do not need to configure any preauthentication ACL for Cisco 4400 Series Wireless LAN Controllers.

The following example shows how to configure an access control list with a value None:

```
(Cisco Controller) > config interface acl management none
```
config interface address

To configure address information for an interface, use the config interface address command.

```
config interface address { ap-manager IP_address netmask gateway | management IP_address netmask gateway | service-port IP_address netmask | virtual IP_address | dynamic-interface IP_address dynamic_interface netmask gateway | redundancy-management IP_address peer-redundancy-management IP_address }
```

<table>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

For Cisco 5500 Series Controllers, you are not required to configure an AP-manager interface. The management interface acts like an AP-manager interface by default. This command is applicable for IPv4 addresses only.
Ensure that the management interfaces of both controllers are in the same subnet. Ensure that the Redundant Management IP address for both controllers is the same. Likewise, ensure that the Peer Redundant Management IP address for both the controllers is the same.

The following example shows how to configure an access point manager interface with IP address 209.165.201.31, network mask 255.255.0.0, and gateway address 209.165.201.30:

```
(Cisco Controller) > config interface address ap-manager 209.165.201.31 255.255.0.0 209.165.201.30
```

The following example shows how to configure a redundancy management interface on the controller:

```
(Cisco Controller) > config interface address redundancy-management 209.4.120.5 peer-redundancy-management 209.4.120.6
```

The following example shows how to configure a virtual interface:

```
(Cisco Controller) > config interface address virtual 192.0.2.1
```

Related Commands

- `show interface`
**Config Interface Address Redundancy-Management**

To configure the management interface IP address, subnet and gateway of the controller, use the `config interface address redundancy-management` command.

`config interface address redundancy-management IP_address netmask gateway`

**Syntax Description**

- **IP_address**: Management interface IP address of the active controller.
- **netmask**: Network mask.
- **gateway**: IP address of the gateway.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command to check the Active-Standby reachability when the keep-alive fails.

The following example shows how to configure the management IP addresses of the controller:

```
(Cisco Controller) > config interface address redundancy-management 209.165.201.31 255.255.0.0 209.165.201.30
```

**Related Commands**

- `config redundancy mobilitymac`
- `config redundancy interface address peer-service-port`
- `config redundancy peer-route`
- `config redundancy unit`
- `config redundancy timer`
- `show redundancy timers`
- `show redundancy summary`
- `debug rmgr`
- `debug rsynmcmgr`
**config interface ap-manager**

To enable or disable access point manager features on the management or dynamic interface, use the `config interface ap-manager` command.

```
config interface ap-manager { management | interface_name } { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>management</td>
<td>Specifies the management interface.</td>
</tr>
<tr>
<td>interface_name</td>
<td>Dynamic interface name.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables access point manager features on a dynamic interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables access point manager features on a dynamic interface.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `management` option to enable or disable dynamic AP management for the management interface. For Cisco 5500 Series Controllers, the management interface acts like an AP-manager interface by default. If desired, you can disable the management interface as an AP-manager interface and create another dynamic interface as an AP manager.

When you enable this feature for a dynamic interface, the dynamic interface is configured as an AP-manager interface (only one AP-manager interface is allowed per physical port). A dynamic interface that is marked as an AP-manager interface cannot be used as a WLAN interface.

The following example shows how to disable an access point manager myinterface:

```
(Cisco Controller) > config interface ap-manager myinterface disable
```
**config interface create**

To create a dynamic interface (VLAN) for wired guest user access, use the `config interface create` command.

```
config interface create interface_name vlan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>interface_name</code></td>
<td>Interface name.</td>
</tr>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN identifier.</td>
</tr>
</tbody>
</table>

| Command Default             | None   |
| Command History             |        |
| **Release**                 | **Modification** |
| 7.6                         | This command was introduced in a release earlier than Release 7.6. |

The following example shows how to create a dynamic interface with the interface named `lab2` and VLAN ID 6:

```
(Cisco Controller) > config interface create lab2 6
```
**config interface delete**

To delete a dynamic interface, use the `config interface delete` command.

```
config interface delete interface-name
```

**Syntax Description**

| `interface-name` | Interface name. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a dynamic interface named VLAN501:

```
(Cisco Controller) > config interface delete VLAN501
```
To configure DHCP options on a management interface, use the `config interface dhcp management` command.

```
config interface dhcp management { option-82 { bridge-mode-insertion { enable | disable } | enable | disable | linksel { enable | disable | relaysrc interface-name } | vpnsel { enable | disable | vpnid vpn-id | vrfname vrf-name } | primary primary-dhcp_server [ secondary secondary-dhcp_server ] | proxy-mode { enable | disable | global } }

Syntax Description

option-82
- Configures DHCP Option 82 on the interface.

bridge-mode-insertion
- Configures DHCP option 82 insertion in bridge mode.

disable
- Disables the feature.

enable
- Enables the feature.

linksel
- Configures link select suboption 5 on a dynamic or management interface.

relaysrc
- Configures Link select suboption 5 on relay source.

interface-name
- Name of an existing WLC interface reachable from the DHCP server.

vpnid
- Configures VPN select suboption 151 VPN Id.

vpn-id
- VPN Id in oui:vpn-index format xxxxxx:xxxxxxxx.

vrfname
- Configures VPN select suboption 151 VRF name.

vrf-name
- VRF name as string of length 7.

primary
- Specifies the primary DHCP server.

primary-dhcp-server
- IP address of the server.

secondary
- (Optional) Specifies the secondary DHCP server.

secondary-dhcp-server
- IP address of the server.

proxy-mode
- Configures the DHCP proxy mode on the interface.

global
- Uses the global DHCP proxy mode on the interface.

disable
- (Optional) Disables the DHCP proxy mode on the interface.

global
- (Optional) Uses the global DHCP proxy mode on the interface.
```

Command Default

None
Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>The new keywords <strong>linksel</strong> and <strong>vpnsel</strong> are added. This command supports IPv6 from this release.</td>
</tr>
</tbody>
</table>

Usage Guidelines

DHCP proxy is not supported for IPv6 and it works in disabled mode.

The following example shows how to configure option 82 on a management interface.

```
(Cisco Controller) > config interface dhcp management option-82 enable
```

Related Commands

- `config dhcp`
- `config dhcp proxy`

Example

The following example shows how to configure the DHCP option 6 override on the interface to use OpenDNS server IPs:

(Cisco Controller) > config interface dhcp management option-6-opendns enable
config interface dhcp management option-6-opendns

To configure the DHCP Option 6 override on the interface in order to use OpenDNS server IPs, use the `config interface dhcp management option-6-opendns` command.

```
config interface dhcp management option-6-opendns { enable | disable }
```

**Syntax Description**
- `enable` Enables the DHCP Option 6 override on the interface, with the OpenDNS IP address as the default.
- `disable` Disables the DHCP Option 6 override on the interface, and uses the DHCP-provided DNS IPs.

**Command Default**
DHCPOption6 override is not enabled.

**Command Modes**
(Controller Configuration) >

**Command History**
- **Release** 8.4  
  - Modification This command was introduced.

**Example**
The following example shows how to configure the DHCP Option 6 override on the interface in order to use OpenDNS server IPs:

```
(Cisco Controller) > config interface dhcp management option-6-opendns enable
```
config interface address

To configure interface addresses, use the **config interface address** command.

```
config interface address {dynamic-interface dynamic_interface netmask gateway | management | redundancy-management IP_address peer-redundancy-management | service-port netmask | virtual} IP_address
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dynamic-interface</td>
<td>Configures the dynamic interface of the controller.</td>
</tr>
<tr>
<td>dynamic_interface</td>
<td>IP address of the interface.</td>
</tr>
<tr>
<td>IP_address</td>
<td>Netmask of the interface.</td>
</tr>
<tr>
<td>netmask</td>
<td>Gateway of the interface.</td>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Ensure that the management interfaces of both controllers are in the same subnet. Ensure that the redundant management IP address for both controllers is the same and that the peer redundant management IP address for both the controllers is the same.

The following example shows how to configure a redundancy management interface on the controller:

```
(Cisco Controller) >config interface address redundancy-management 209.4.120.5
peer-redundancy-management 209.4.120.6
```

The following example shows how to configure a virtual interface:
(Cisco Controller) > config interface address virtual 1.1.1.1

</table>

## Usage Guidelines

The NAS-ID configured on the controller for AP group or WLAN or interface is used for authentication. The NAS-ID is not propagated across controllers.

The following example shows how to configure the NAS-ID for the interface:

```
(Cisco Controller) > config interface nasid
```

## Related Commands

- `config wlan nasid`
- `config wlan apgroup`
config interface nat-address

To deploy your Cisco 5500 Series Controller behind a router or other gateway device that is using one-to-one mapping network address translation (NAT), use the config interface nat-address command.

```
config interface nat-address { management | dynamic-interface interface_name } { { enable | disable } | { set public_IP_address } }
```

**Syntax Description**

- **management**
  - Specifies the management interface.
- **dynamic-interface interface_name**
  - Specifies the dynamic interface name.
- **enable**
  - Enables one-to-one mapping NAT on the interface.
- **disable**
  - Disables one-to-one mapping NAT on the interface.
- **public_IP_address**
  - External NAT IP address.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

These NAT commands can be used only on Cisco 5500 Series Controllers and only if the management interface is configured for dynamic AP management.

These commands are supported for use only with one-to-one-mapping NAT, where each private client has a direct and fixed mapping to a global address. They do not support one-to-many NAT, which uses source port mapping to enable a group of clients to be represented by a single IP address.

The following example shows how to enable one-to-one mapping NAT on the management interface:

```
(Cisco Controller) > config interface nat-address management enable
```

The following example shows how to set the external NAP IP address 10.10.10.10 on the management interface:

```
(Cisco Controller) > config interface nat-address management set 10.10.10.10
```
config interface port

To map a physical port to the interface (if a link aggregation trunk is not configured), use the `config interface port` command.

```
config interface port {management | interface_name | redundancy-management} primary_port [secondary_port]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>management</td>
<td>Specifies the management interface.</td>
</tr>
<tr>
<td>interface_name</td>
<td>Interface name.</td>
</tr>
<tr>
<td>redundancy-management</td>
<td>Specifies the redundancy management interface.</td>
</tr>
<tr>
<td>primary_port</td>
<td>Primary physical port number.</td>
</tr>
<tr>
<td>secondary_port</td>
<td>(Optional) Secondary physical port number.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `management` option for all controllers except the Cisco 5500 Series Controllers.

The following example shows how to configure the primary port number of the LAB02 interface to 3:

```
(Cisco Controller) > config interface port lab02 3
```
**config interface quarantine vlan**

To configure a quarantine VLAN on any dynamic interface, use the **config interface quarantine vlan** command.

**config interface quarantine vlan interface-name vlan_id**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>interface-name</td>
<td>Interface’s name.</td>
</tr>
<tr>
<td>vlan_id</td>
<td>VLAN identifier.</td>
</tr>
</tbody>
</table>

**Note** Enter 0 to disable quarantine processing.

**Command Default** None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a quarantine VLAN on the quarantine interface with the VLAN ID 10:

```
(Cisco Controller) > config interface quarantine vlan quarantine 10
```
To configure an interface's URL Access Control List (URL ACL), use the `config interface url-acl` command.

```
config interface url-acl { management | interface_name } { acl-name | none }
```

**Syntax Description**

- `management` Configures the management interface.
- `interface_name` Interface name.
- `acl-name` ACL name up to 32 alphanumeric characters.
- `none` Disable the acl configured on the interface.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an interface's URL ACL:

```
(Cisco Controller) > config interface url-acl management test
```
config interface vlan

To configure an interface VLAN identifier, use the config interface vlan command.

```
config interface vlan (ap-manager \ management \ interface-name \ redundancy-management)
```

**Syntax Description**

- **ap-manager**
  - Configures the access point manager interface.

- **management**
  - Configures the management interface.

- **interface-name**
  - Interface name.

- **vlan**
  - VLAN identifier.

- **redundancy-management**
  - Specifies the redundancy management interface.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot change the redundancy management VLAN when the system redundancy management interface is mapped to the redundancy port. You must configure the redundancy management port first.

The following example shows how to configure VLAN ID 10 on the management interface:

```
(Cisco Controller) > config interface vlan management 10
```
config interface group mdns-profile

To configure an mDNS (multicast DNS) profile for an interface group, use the `config interface group mdns-profile` command.

```
config interface group mdns-profile { all | interface-group-name } { profile-name | none }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures an mDNS profile for all interface groups.</td>
</tr>
<tr>
<td>interface-group-name</td>
<td>Name of the interface group to which the mDNS profile has to be associated. The interface group name can be up to 32 case-sensitive, alphanumeric characters.</td>
</tr>
<tr>
<td>profile-name</td>
<td>Name of the mDNS profile.</td>
</tr>
<tr>
<td>none</td>
<td>Removes all existing mDNS profiles from the interface group. You cannot configure mDNS profiles on the interface group.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the mDNS profile is associated to a WLAN, an error appears.

The following example shows how to configure an mDNS profile for an interface group `floor1`:

```
(Cisco Controller) > config interface group mdns-profile floor1 profile1
```

**Related Commands**

- `config mdns query interval`
- `config mdns service`
- `config mdns snooping`
- `config interface mdns-profile`
- `config mdns profile`
- `config wlan mdns`
- `show mdns profile`
- `show mnds service`
- `clear mdns service-database`
- `debug mdns all`
- `debug mdns error`
- `debug mdns detail`
- `debug mdns message`
**config interface mdns-profile**

To configure an mDNS (multicast DNS) profile for an interface, use the `config interface mdns-profile` command.

```
config interface mdns-profile { management | all interface-name } { profile-name | none }
```

**Syntax Description**

- **management** Configures an mDNS profile for the management interface.
- **all** Configures an mDNS profile for all interfaces.
- **interface-name** Name of the interface on which the mDNS profile has to be configured. The interface name can be up to 32 case-sensitive, alphanumeric characters.
- **profile-name** Name of the mDNS profile.
- **none** Removes all existing mDNS profiles from the interface. You cannot configure mDNS profiles on the interface.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the mDNS profile is associated to a WLAN, an error appears.

The following example shows how to configure an mDNS profile for an interface lab1:

```
(Cisco Controller) > config interface mdns-profile lab1 profile1
```

**Related Commands**

- `config mdns query interval`
- `config mdns service`
- `config mdns snooping`
- `config mdns profile`
- `config interface group mdns-profile`
- `config wlan mdns`
- `show mdns profile`
- `show mdns service`
- `clear mdns service-database`
- `debug mdns all`
- `debug mdns error`
- `debug mdns detail`
debug mdns message
**config icons delete**

To delete an icon or icons from flash, use the `config icons delete` command in the WLAN configuration mode.

`config icons delete { filename | all }`

**Syntax Description**

- `filename` Name of the icon to be deleted.
- `all` Deletes all the icon files from the system.

**Command Default**

None

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete an icon from flash:

```
Cisco Controller > config icons delete image-1
```
To configure an icon parameter, use the `config icons file-info` command in WLAN configuration mode.

```
config icons file-info filename file-type lang-code width height
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>filename</code></td>
<td>Icon filename. It can be up to 32 characters long.</td>
</tr>
<tr>
<td><code>file-type</code></td>
<td>Icon filename type or extension. It can be up to 32 characters long.</td>
</tr>
<tr>
<td><code>lang-code</code></td>
<td>Language code of the icon. Enter 2 or 3 letters from ISO-639, for example:</td>
</tr>
<tr>
<td></td>
<td><code>eng</code> for English.</td>
</tr>
<tr>
<td><code>width</code></td>
<td>Icon width. The range is from 1 to 65535.</td>
</tr>
<tr>
<td><code>height</code></td>
<td>Icon height. The range is from 1 to 65535.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure icon parameters:

```
Cisco Controller > config icons file-info ima png eng 300 200
```
**config ipv6 disable**

To disable IPv6 globally on the Cisco WLC, use the `config ipv6 disable` command.

```
config ipv6 disable
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you use this command, the controller drops all IPv6 packets and the clients will not receive any IPv6 address.

The following example shows how to disable IPv6 on the controller:

```
(Cisco Controller) > config ipv6 disable
```
config ipv6 enable

To enable IPv6 globally on the Cisco WLC, use the config ipv6 enable command.

```
config ipv6 enable
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable IPv6 on the Cisco WLC:

```
(Cisco Controller) > config ipv6 enable
```
# config ipv6 acl

To create or delete an IPv6 ACL on the Cisco wireless LAN controller, apply ACL to data path, and configure rules in the IPv6 ACL, use the `config ipv6 acl` command.

```plaintext
config ipv6 acl [apply | cpu | create | delete | rule]
config ipv6 acl apply name
config ipv6 acl cpu {name | none}
config ipv6 acl create name
config ipv6 acl delete name
config ipv6 acl rule [action | add | change | delete | destination | direction | dscp | protocol | source | swap]
config ipv6 acl rule action name index {permit | deny}
config ipv6 acl rule add name index
config ipv6 acl rule change index name old_index new_index
config ipv6 acl rule delete name index
config ipv6 acl rule destination {address name index ip_address prefix-len | port range name index}
config ipv6 acl rule direction name index {in | out | any}
config ipv6 acl rule dscp name dscp
config ipv6 acl rule protocol name index protocol
config ipv6 acl rule source {address name index ip_address prefix-len | port range name index start_port end_port}
config ipv6 acl rule swap index name index_1index_2
```

## Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>apply name</code></td>
<td>Applies an IPv6 ACL. An IPv6 ACL can contain up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><code>cpu name</code></td>
<td>Applies the IPv6 ACL to the CPU.</td>
</tr>
<tr>
<td><code>cpu none</code></td>
<td>Configure none if you wish not to have a IPv6 ACL.</td>
</tr>
<tr>
<td><code>create</code></td>
<td>Creates an IPv6 ACL.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes an IPv6 ACL.</td>
</tr>
<tr>
<td><code>rule (action) (name)</code></td>
<td>Configures rules in the IPv6 ACL to either permit or deny access. IPv6 ACL name can contains up to 32 alphanumeric characters and IPv6 ACL rule index can be between 1 and 32.</td>
</tr>
<tr>
<td>`{ permit</td>
<td>deny }`</td>
</tr>
<tr>
<td><code>add name index</code></td>
<td>Adds a new rule and rule index.</td>
</tr>
<tr>
<td><code>change name old_index new_index</code></td>
<td>Changes a rule’s index.</td>
</tr>
<tr>
<td><code>delete name index</code></td>
<td>Deletes a rule and rule index.</td>
</tr>
<tr>
<td><code>destination address name index ip_addr prefix-len</code></td>
<td>Configures a rule’s destination IP address and prefix length (between 0 and 128).</td>
</tr>
</tbody>
</table>
**destination port name index**  Configure a rule's destination port range. Enter IPv6 ACL name and set an rule index for it.

**direction name index**  
( in | out | any )  
Configures a rule’s direction to in, out, or any.

**dscp name index dscp**  
Configures a rule’s DSCP. For rule index of DSCP, select a number between 0 and 63, or any.

**protocol name index protocol**  
Configures a rule’s protocol. Enter a name and set an index between 0 and 255 or any.

**source address name index ip_address prefix-len**  
Configures a rule’s source IP address and netmask.

**source port range name index start_port end_port**  
Configures a rule’s source port range.

**swap index name index_1 index_2**  
Swap’s two rules’ indices.

---

**Command Default**

After adding an ACL, the `config ipv6 acl cpu` is by default configured as `enabled`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command was updated by adding <code>cpu</code> and <code>none</code> keywords and the <code>ipv6_acl_name</code> variable.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For a Cisco 2100 Series Wireless LAN Controller, you must configure a preauthentication ACL on the wireless LAN for the external web server. This ACL should then be set as a wireless LAN preauthentication ACL under Web Policy. However, you do not need to configure any preauthentication ACL for Cisco 4400 Series Wireless LAN Controllers.

The following example shows how to configure an IPv6 ACL to permit access:

(Cisco Controller) > `config ipv6 acl rule action lab1 4 permit`

The following example shows how to configure an interface ACL:

(Cisco Controller) > `config ipv6 interface acl management IPv6-Acl`

**Related Commands**

- show ipv6 acl detailed
- show ipv6 acl cpu
config ipv6 capwap

To enable or disable an IPv6 CAPWAP UDPLite for CAPWAP AP on the Cisco Wireless LAN Controller, use the `config ipv6 capwap` command.

`config ipv6 capwap udplite { enable | disable } [ all | <Cisco AP> ]`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>udplite</td>
<td>Configure IPv6 for CAPWAP UDPLite.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables IPv6 CAPWAP UDPLite.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables IPv6 CAPWAP UDPLite.</td>
</tr>
<tr>
<td>all</td>
<td>Enables or disables IPv6 CAPWAP UDPLite on all Cisco APs.</td>
</tr>
<tr>
<td>&lt;Cisco AP&gt;</td>
<td>Enables or disables IPv6 CAPWAP UDPLite on the user defined Cisco AP.</td>
</tr>
</tbody>
</table>

**Command Default**
The `config ipv6 capwap udplite` command is by default configured as `enabled`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in Release 8.0</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- IPv6 CAPWAP UDPLite configuration applies only to APs that are connected to controller using IPv6 tunnel.
- For APs connected to WLC using IPv4 Tunnel, IPv6 CAPWAP UDPLite command will not apply on either global configuration or on Per AP.
- IPv6 mandates complete payload checksum for UDP and this will have performance implications. To minimize the impact, UDPLite (mandates only header checksum) will be used for data traffic and UDP for control traffic.
- Usage UDP Lite will have an impact on the firewall. Intermediate firewall must be configured to allow UDP Lite protocol (protocol ID of 136) packets.
- Turning off UDP Lite will cause performance issues on packet handling.
- Changing from UDP to UDPLite or vice-versa will enforce the AP to dis-join and re-join.

The following example shows how to configure an IPv6 CAPWAP UDPLite on All Cisco APs or on a particular Cisco AP:

```
(Cisco Controller) > config ipv6 capwap udplite enable all
Changing AP's IPv6 Capwap UDPLite mode will cause the AP to rejoin.
Are you sure you want to continue? (y/n)
```
To configure IPv6 system interfaces, use the `config ipv6 interface` command.

```
config ipv6 interface { acl | address | slaac }
```

```
config ipv6 interface acl management acl_name
```

```
config ipv6 interface address { management primary ipv6_address prefix_length ipv6_gateway_address | service-port ipv6_address prefix-length }
```

```
config ipv6 interface slacc service-port [ enable | disable ]
```

### Syntax Description

</table>

### Command Default

None.
This command was introduced in Release 8.0.

The following example shows how to configure an IPv6 ACL management interface:

\[(Cisco\ Controller) > \text{config ipv6 interface acl management Test_ACL}\]

The following example shows how to configure an IPv6 address and primary interface:

\[(Cisco\ Controller) > \text{config ipv6 interface address management primary 2001:9:10:56::44 64 fe80::aea0:16ff:fe4f:2244}\]

- **show interface detailed management**
- **show ipv6 interface summary**
config ipv6 multicast

To configure IPv6 multicast, use the config ipv6 multicast command.

```
config ipv6 multicast mode { unicast | multicast ipv6_address }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>Configure the controller to AP Multicast or Broadcast IPv6 traffic forwarding mode.</td>
</tr>
<tr>
<td>unicast</td>
<td>Multicast/Broadcasted IPv6 packets are encapsulated in unicast CAPWAP tunnel to AP.</td>
</tr>
<tr>
<td>multicast</td>
<td>Multicast/Broadcasted IPv6 packets are encapsulated in multicast CAPWAP tunnel to AP.</td>
</tr>
<tr>
<td>ipv6_address</td>
<td>Configures IPv6 multicast address.</td>
</tr>
</tbody>
</table>

**Command Default**

- By default, multicast is enabled on Cisco WLC 8500 and Cisco WLC 2500.
- By default, unicast is enabled on Cisco WLC 5500.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in Release 8.0.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

none...

The following example shows how to configure an IPv6 multicast on Cisco WLC, to permit access:

```
(Cisco Controller) >config ipv6 multicast 2001:DB8:0000:0000:0000:0000:0000:0001
```

The following example shows how to configure an IPv6 unicast on Cisco WLC, to permit access:

```
(Cisco Controller) > config ipv6 multicast mode unicast
```

**Related Commands**

- show network summary
## config ipv6 neighbor-binding

To configure the Neighbor Binding table on the Cisco wireless LAN controller, use the `config ipv6 neighbor-binding` command.

```
config ipv6 neighbor-binding { timers { down-lifetime down_time | reachable-lifetime reachable_time | stale-lifetime stale_time } | ra-throttle { allow at-least at_least_value | enable | disable | interval-option { ignore | passthrough | throttle } | max-through { no_mcast_RA | no-limit | throttle-period throttle_period } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>timers</code></td>
<td>Configures the neighbor binding table timeout timers.</td>
</tr>
<tr>
<td><code>down-lifetime</code></td>
<td>Configures the down lifetime.</td>
</tr>
<tr>
<td><code>down_time</code></td>
<td>Down lifetime in seconds. The range is from 0 to 86400. The default is 30 seconds.</td>
</tr>
<tr>
<td><code>reachable-lifetime</code></td>
<td>Configures the reachable lifetime.</td>
</tr>
<tr>
<td><code>reachable_time</code></td>
<td>Reachable lifetime in seconds. The range is from 0 to 86400. The default is 300 seconds.</td>
</tr>
<tr>
<td><code>stale-lifetime</code></td>
<td>Configures the stale lifetime.</td>
</tr>
<tr>
<td><code>stale_time</code></td>
<td>Stale lifetime in seconds. The range is from 0 to 86400. The default is 86400 seconds.</td>
</tr>
<tr>
<td><code>ra-throttle</code></td>
<td>Configures IPv6 RA throttling options.</td>
</tr>
<tr>
<td><code>allow</code></td>
<td>Specifies the number of multicast RAs per router per throttle period.</td>
</tr>
<tr>
<td><code>at_least_value</code></td>
<td>Number of multicast RAs from router before throttling. The range is from 0 to 32. The default is 1.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables IPv6 RA throttling.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables IPv6 RA throttling.</td>
</tr>
<tr>
<td><code>interval-option</code></td>
<td>Adjusts the behavior on RA with RFC3775 interval option.</td>
</tr>
<tr>
<td><code>ignore</code></td>
<td>Indicates interval option has no influence on throttling.</td>
</tr>
<tr>
<td><code>passthrough</code></td>
<td>Indicates all RAs with RFC3775 interval option will be forwarded (default).</td>
</tr>
<tr>
<td><code>throttle</code></td>
<td>Indicates all RAs with RFC3775 interval option will be throttled.</td>
</tr>
<tr>
<td><code>max-through</code></td>
<td>Specifies unthrottled multicast RAs per VLAN per throttle period.</td>
</tr>
</tbody>
</table>
**no_mcast_RA**
Number of multicast RAs on VLAN by which throttling is enforced. The default multicast RAs on vlan is 10.

**no-limit**
Configures no upper bound at the VLAN level.

**throttle-period**
Configures the throttle period.

**throttle_period**
Duration of the throttle period in seconds. The range is from 10 to 86400 seconds. The default is 600 seconds.

**Command Default**
This command is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the Neighbor Binding table:

(Cisco Controller) > `config ipv6 neighbor-binding ra-throttle enable`

**Related Commands**
`show ipv6 neighbor-binding`
config ipv6 na-mcast-fwd

To configure the Neighbor Advertisement multicast forwarding, use the config ipv6 na-mcast-fwd command.

```plaintext
config ipv6 na-mcast-fwd { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables Neighbor Advertisement multicast forwarding.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables Neighbor Advertisement multicast forwarding.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you enable Neighbor Advertisement multicast forwarding, all the unsolicited multicast Neighbor Advertisement from wired or wireless is not forwarded to wireless.

If you disable Neighbor Advertisement multicast forwarding, IPv6 Duplicate Address Detection (DAD) of the controller is affected.

The following example shows how to configure an Neighbor Advertisement multicast forwarding:

```plaintext
(Cisco Controller) > config ipv6 na-mcast-fwd enable
```
**config ipv6 ns-mcast-fwd**

To configure the nonstop multicast cache miss forwarding, use the **config ipv6 ns-mcast-fwd** command.

```
config ipv6 ns-mcast-fwd { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables nonstop multicast forwarding on a cache miss.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables nonstop multicast forwarding on a cache miss.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

</tr>
</tbody>
</table>

The following example shows how to configure an nonstop multicast forwarding:

```
(Cisco Controller) > config ipv6 ns-mcast-fwd enable
```
**config ipv6 ra-guard**

To configure the filter for Router Advertisement (RA) packets that originate from a client on an AP, use the `config ipv6 ra-guard` command.

```
config ipv6 ra-guard ap { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables RA guard on an AP.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables RA guard on an AP.</td>

</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable IPv6 RA guard:

```
(Cisco Controller) > config ipv6 ra-guard enable
```
config ipv6 route

To add or delete an IPv6 network route, use the `config ipv6 route` command.

```
config ipv6 route { add network_ipv6_addr prefix-len ipv6_gw_addr | delete network_ipv6_addr }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds an IPv6 network route.</td>
</tr>
<tr>
<td>network_ipv6_addr</td>
<td>Enter the networks IPv6 address.</td>
</tr>
<tr>
<td>prefix-len</td>
<td>Enter the prefix length for the network.</td>
</tr>
<tr>
<td>ipv6_gw_addr</td>
<td>Configures the system interfaces.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes an IPv6 network route.</td>
</tr>
<tr>
<td>network_ipv6_addr</td>
<td>Enter the networks IPv6 address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in Release 8.0.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is used to add and delete an IPv6 network route to access service interface over IPv6 from different network.

- While adding IPv6 route, IPv6 Gateway Address must be a link local scope (FE80::/64).

The following example shows how to add an IPv6 route:

```
(Cisco Controller) > config ipv6 route add 3010:1111:2222:abcd:abcd:abcd:abcd:1111 64
fe80::6616:8dff:fed3:c0cf
```

The following example shows how to delete an IPv6 route:

```
(Cisco Controller) > config ipv6 route delete 2001:9:5:90::115
```

**Related Commands**

- `show ipv6 route summary`
config ipv6 route

# config known ap

To configure a known Cisco lightweight access point, use the `config known ap` command.

```plaintext
config known ap { add | alert | delete } MAC
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>add</code></td>
<td>Adds a new known access point entry.</td>
</tr>
<tr>
<td><code>alert</code></td>
<td>Generates a trap upon detection of the access point.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes an existing known access point entry.</td>
</tr>
<tr>
<td><code>MAC</code></td>
<td>MAC address of the known Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to add a new access point entry `ac:10:02:72:2f:bf` on a known access point:

```
(Cisco Controller) > config known ap add ac:10:02:72:2f:bf 12
```
**config lag**

To enable or disable link aggregation (LAG), use the `config lag` command.

```
config lag { enable | disable }
```

**Syntax Description**

- `enable`: Enables the link aggregation (LAG) settings.
- `disable`: Disables the link aggregation (LAG) settings.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable LAG settings:

```
(Cisco Controller) > config lag enable
Enabling LAG will map your current interfaces setting to LAG interface,
All dynamic AP Manager interfaces and Untagged interfaces will be deleted
All WLANs will be disabled and mapped to Mgmt interface
Are you sure you want to continue? (y/n)
You must now reboot for the settings to take effect.
```

The following example shows how to disable LAG settings:

```
(Cisco Controller) > config lag disable
Disabling LAG will map all existing interfaces to port 1.
Are you sure you want to continue? (y/n)
You must now reboot for the settings to take effect.
```
**config ldap**

To configure the Lightweight Directory Access Protocol (LDAP) server settings, use the `config ldap` command.

```plaintext
config ldap  { add | delete | enable | disable | retransmit-timeout | retry | user | security-mode | simple-bind }  index

config ldap add  index server_ip_address port user_base user_attr user_type [ secure ]

config ldap retransmit-timeout  index retransmit-timeout

config ldap retry  attempts

config ldap user  { attr  index user-attr | base  index user-base | type index user-type }  index

config ldap security-mode  { enable | disable }  index

config ldap simple-bind  { anonymous  index | authenticated  index username password }  index
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Specifies that an LDAP server is being added.</td>
</tr>
<tr>
<td>delete</td>
<td>Specifies that an LDAP server is being deleted.</td>
</tr>
<tr>
<td>enable</td>
<td>Specifies that an LDAP server is enabled.</td>
</tr>
<tr>
<td>disable</td>
<td>Specifies that an LDAP server is disabled.</td>
</tr>
<tr>
<td>retransmit-timeout</td>
<td>Changes the default retransmit timeout for an LDAP server.</td>
</tr>
<tr>
<td>retry</td>
<td>Configures the retry attempts for an LDAP server.</td>
</tr>
<tr>
<td>user</td>
<td>Configures the user search parameters.</td>
</tr>
<tr>
<td>security-mode</td>
<td>Configures the security mode.</td>
</tr>
<tr>
<td>simple-bind</td>
<td>Configures the local authentication bind method.</td>
</tr>
<tr>
<td>anonymous</td>
<td>Allows anonymous access to the LDAP server.</td>
</tr>
<tr>
<td>authenticated</td>
<td>Specifies that a username and password be entered to secure access to the LDAP server.</td>
</tr>
<tr>
<td>index</td>
<td>LDAP server index. The range is from 1 to 17.</td>
</tr>
<tr>
<td>server_ip_address</td>
<td>IP address of the LDAP server.</td>
</tr>
<tr>
<td>port</td>
<td>Port number.</td>
</tr>
<tr>
<td>user_base</td>
<td>Distinguished name for the subtree that contains all of the users.</td>
</tr>
<tr>
<td><strong>user_attr</strong></td>
<td>Attribute that contains the username.</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------------------------------</td>
</tr>
<tr>
<td><strong>user_type</strong></td>
<td>ObjectType that identifies the user.</td>
</tr>
<tr>
<td><strong>secure</strong></td>
<td>(Optional) Specifies that Transport Layer Security (TLS) is used.</td>
</tr>
<tr>
<td><strong>retransmit-timeout</strong></td>
<td>Retransmit timeout for an LDAP server. The range is from 2 to 30.</td>
</tr>
<tr>
<td><strong>attempts</strong></td>
<td>Number of attempts that each LDAP server is retried.</td>
</tr>
<tr>
<td><strong>attr</strong></td>
<td>Configures the attribute that contains the username.</td>
</tr>
<tr>
<td><strong>base</strong></td>
<td>Configures the distinguished name of the subtree that contains all the users.</td>
</tr>
<tr>
<td><strong>type</strong></td>
<td>Configures the user type.</td>
</tr>
<tr>
<td><strong>username</strong></td>
<td>Username for the authenticated bind method.</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td>Password for the authenticated bind method.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>7.6</td>
<td>The <code>secure</code> keyword was added to support secure LDAP.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable secure LDAP, the controller does not validate the server certificate.

The following example shows how to enable LDAP server index 10:

(Cisco Controller) > config ldap enable 10

**Related Commands**

- `config ldap add`
- `config ldap simple-bind`
- `show ldap summary`
**config local-auth active-timeout**

To specify the amount of time in which the controller attempts to authenticate wireless clients using local Extensible Authentication Protocol (EAP) after any pair of configured RADIUS servers fails, use the `config local-auth active-timeout` command.

```
config local-auth active-timeout timeout
```

**Syntax Description**

- `timeout`:
  - Timeout measured in seconds. The range is from 1 to 3600.

**Command Default**

The default timeout value is 100 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to specify the active timeout to authenticate wireless clients using EAP to 500 seconds:

```
(Cisco Controller) > config local-auth active-timeout 500
```

**Related Commands**

- `clear stats local-auth`
- `config local-auth eap-profile`
- `config local-auth method fast`
- `config local-auth user-credentials`
- `debug aaa local-auth`
- `show local-auth certificates`
- `show local-auth config`
- `show local-auth statistics`
#### config local-auth cipher-option

To configure the 3des-rc4 cipher option, use the `config local-auth cipher-option` command.

`config local-auth cipher-option { enable | disable }`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>cipher-option</td>
<td>Configures the cipher option.</td>
</tr>
<tr>
<td>enable</td>
<td>Allows the 3des-rc4 cipher to be enabled.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the 3des-rc4 cipher.</td>
</tr>
</tbody>
</table>

| Command Default    | None |

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the cipher-option on the WLC:

```
(Cisco Controller) > config local-auth cipher-option 3des-rc4 disable
```
To configure local Extensible Authentication Protocol (EAP) authentication profiles, use the `config local-auth eap-profile` command.

```
config local-auth eap-profile { [add | delete] profile_name | cert-issuer {cisco | vendor} | method method local-cert {enable | disable} profile_name | method method client-cert {enable | disable} profile_name | method method peer-verify ca-issuer {enable | disable} | method method peer-verify cn-verify {enable | disable} | method method peer-verify date-valid {enable | disable} }
```

**Syntax Description**

- **add** (Optional) Specifies that an EAP profile or method is being added.
- **delete** (Optional) Specifies that an EAP profile or method is being deleted.
- **profile_name** EAP profile name (up to 63 alphanumeric characters). Do not include spaces within a profile name.
- **cert-issuer** (For use with EAP-TLS, PEAP, or EAP-FAST with certificates) Specifies the issuer of the certificates that will be sent to the client. The supported certificate issuers are Cisco or a third-party vendor.
  - **cisco** Specifies the Cisco certificate issuer.
  - **vendor** Specifies the third-party vendor.
- **method** Configures an EAP profile method.
  - **method** EAP profile method name. The supported methods are leap, fast, tls, and peap.
- **local-cert** (For use with EAP-FAST) Specifies whether the device certificate on the controller is required for authentication.
  - **enable** Specifies that the parameter is enabled.
  - **disable** Specifies that the parameter is disabled.
- **client-cert** (For use with EAP-FAST) Specifies whether wireless clients are required to send their device certificates to the controller in order to authenticate.
- **peer-verify** Configures the peer certificate verification options.
- **ca-issuer** (For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the incoming certificate from the client is to be validated against the Certificate Authority (CA) certificates on the controller.
cn-verify
(For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the common name (CN) in the incoming certificate is to be validated against the CA certificates’ CN on the controller.

date-valid
(For use with EAP-TLS or EAP-FAST with certificates) Specifies whether the controller is to verify that the incoming device certificate is still valid and has not expired.

Command Default
None

Command History
Release Modification
7.6 This command was introduced in a release earlier than Release 7.6.

8.3 This command was introduced.

The following example shows how to create a local EAP profile named FAST01:

(Cisco Controller) > config local-auth eap-profile add FAST01

The following example shows how to add the EAP-FAST method to a local EAP profile:

(Cisco Controller) > config local-auth eap-profile method add fast FAST01

The following example shows how to specify Cisco as the issuer of the certificates that will be sent to the client for an EAP-FAST profile:

(Cisco Controller) > config local-auth eap-profile method fast cert-issuer cisco

The following example shows how to specify that the incoming certificate from the client be validated against the CA certificates on the controller:

(Cisco Controller) > config local-auth eap-profile method fast peer-verify ca-issuer enable

Related Commands
config local-auth active-timeout
config local-auth method fast
config local-auth user-credentials
debug aaa local-auth
show local-auth certificates
show local-auth config
show local-auth statistics
config local-auth method fast

To configure an EAP-FAST profile, use the `config local-auth method fast` command.

```
config local-auth method fast { anon-prov [ enable | disable ] | authority-id auth_id pac-ttl days
| server-key key_value }
```

**Syntax Description**

- **anon-prov**
  - Configures the controller to allow anonymous provisioning, which allows PACs to be sent automatically to clients that do not have one during Protected Access Credentials (PAC) provisioning.
  
- **enable**
  - (Optional) Specifies that the parameter is enabled.

- **disable**
  - (Optional) Specifies that the parameter is disabled.

- **authority-id**
  - Configures the authority identifier of the local EAP-FAST server.

- **auth_id**
  - Authority identifier of the local EAP-FAST server (2 to 32 hexadecimal digits).

- **pac-ttl**
  - Configures the number of days for the Protected Access Credentials (PAC) to remain viable (also known as the time-to-live [TTL] value).

- **days**
  - Time-to-live value (TTL) value (1 to 1000 days).

- **server-key**
  - Configures the server key to encrypt or decrypt PACs.

- **key_value**
  - Encryption key value (2 to 32 hexadecimal digits).

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>

</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the controller to allows anonymous provisioning:

```
(Cisco Controller) > config local-auth method fast anon-prov disable
```

The following example shows how to configure the authority identifier 0125631177 of the local EAP-FAST server:
(Cisco Controller) > config local-auth method fast authority-id 0125631177

The following example shows how to configure the number of days to 10 for the PAC to remain viable:

(Cisco Controller) > config local-auth method fast pac-ttl 10

Related Commands

- clear stats local-auth
- config local-auth eap-profile
- config local-auth active-timeout
- config local-auth user-credentials
- debug aaa local-auth
- show local-auth certificates
- show local-auth config
- show local-auth statistics
config local-auth user-credentials

To configure the local Extensible Authentication Protocol (EAP) authentication database search order for user credentials, use the `config local-auth user credentials` command.

```
config local-auth user-credentials  (local [ldap] | ldap [local] )
```

**Syntax Description**

- **local**
  
  Specifies that the local database is searched for the user credentials.

- **ldap**

  (Optional) Specifies that the Lightweight Directory Access Protocol (LDAP) database is searched for the user credentials.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The order of the specified database parameters indicate the database search order.

The following example shows how to specify the order in which the local EAP authentication database is searched:

```
(Cisco Controller) > config local-auth user credentials local lda
```

In the above example, the local database is searched first and then the LDAP database.

**Related Commands**

- `clear stats local-auth`
- `config local-auth eap-profile`
- `config local-auth method fast`
- `config local-auth active-timeout`
- `debug aaa local-auth`
- `show local-auth certificates`
- `show local-auth config`
- `show local-auth statistics`
To configure the Lync service, use the `config lync-sdn` command.

```
config lync-sdn (port port-number) | {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>port</code></td>
<td>Configures the Lync server port number.</td>
</tr>
<tr>
<td><code>port-number</code></td>
<td>Port number of the server.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables Lync service globally.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables Lync service globally.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tbody>
</table>

The following example shows how to enable Lync service globally:

```
(Cisco Controller) >config lync-sdn enable
```
**config licensing**

To switch between Cisco Smart Software Licensing and RTU licensing platform, use the `config licensing` command.

```
config licensing {rtu | smart-license} dns-server ip address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rtu</td>
<td>Right To Use license platform.</td>
</tr>
<tr>
<td>smart-license</td>
<td>Cisco Smart Software License platform.</td>
</tr>
<tr>
<td>dns-server</td>
<td>Configures smart software licensing dns server parameters</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Command Default**

The Right To Use (RTU) is the default license mechanism in the device.

The following example shows how to activate Cisco Smart Software License on the controller:

```
(Cisco Controller) > config licensing smart-license dns-server 209.165.200.224
```

**Note**

The controller needs to be rebooted to activate the change in the license platform.
To specify the license level to be used on the next reboot of the Cisco 5500 Series Controller, use the `config license boot` command.

```
config license boot  (base | wplus | auto)
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>base</td>
<td>Specifies the base boot level.</td>
</tr>
<tr>
<td>wplus</td>
<td>Specifies the wplus boot level.</td>
</tr>
<tr>
<td>auto</td>
<td>Specifies the auto boot level.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you enter `auto`, the licensing software automatically chooses the license level to use on the next reboot. It generally chooses permanent licenses over evaluation licenses and wplus licenses over base licenses.

**Note**

If you are considering upgrading from a base license to a wplus license, you can try an evaluation wplus license before upgrading to a permanent wplus license. To activate the evaluation license, you need to set the image level to wplus in order for the controller to use the wplus evaluation license instead of the base permanent license.

**Note**

To prevent disruptions in operation, the controller does not switch licenses when an evaluation license expires. You must reboot the controller in order to return to a permanent license. Following a reboot, the controller defaults to the same feature set level as the expired evaluation license. If no permanent license at the same feature set level is installed, the controller uses a permanent license at another level or an unexpired evaluation license.

The following example shows how to set the license boot settings to wplus:

```
(Cisco Controller) > config license boot wplus
```

### Related Commands

- `license install`
- `show license in-use`
- `license modify priority`
config load-balancing

To globally configure aggressive load balancing on the controller, use the `config load-balancing` command.

```
config load-balancing { window client_count | status {enable | disable} | denial denial_count }
config load-balancing uplink-threshold traffic_threshold
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>window</code></td>
<td>Specifies the aggressive load balancing client window.</td>
</tr>
<tr>
<td><code>client_count</code></td>
<td>Aggressive load balancing client window with the number of clients from 1 to 20.</td>
</tr>
<tr>
<td><code>status</code></td>
<td>Sets the load balancing status.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables load balancing feature.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables load balancing feature.</td>
</tr>
<tr>
<td><code>denial</code></td>
<td>Specifies the number of association denials during load balancing.</td>
</tr>
<tr>
<td><code>denial_count</code></td>
<td>Maximum number of association denials during load balancing. from 0 to 10.</td>
</tr>
<tr>
<td><code>uplink-threshold</code></td>
<td>Specifies the threshold traffic for an access point to deny new associations.</td>
</tr>
<tr>
<td><code>traffic_threshold</code></td>
<td>Threshold traffic for an access point to deny new associations. This value is a percentage of the WAN utilization measured over a 90 second interval. For example, the default threshold value of 50 triggers the load balancing upon detecting an utilization of 50% or more on an access point WAN interface.</td>
</tr>
</tbody>
</table>

### Command Default

By default, the aggressive load balancing is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Load-balancing-enabled WLANs do not support time-sensitive applications like voice and video because of roaming delays.

When you use Cisco 7921 and 7920 Wireless IP Phones with controllers, make sure that aggressive load balancing is disabled on the voice WLANs for each controller. Otherwise, the initial roam attempt by the phone might fail, causing a disruption in the audio path.
Clients can only be load balanced across access points joined to the same controller. The WAN utilization is calculated as a percentage using the following formula: \( \frac{(\text{Transmitted Data Rate (per second)} + \text{Received Data Rate (per second)})}{(1000\text{Mbps TX } + 1000\text{Mbps RX})} \times 100 \)

The following example shows how to enable the aggressive load-balancing settings:

```
(Cisco Controller) > config load-balancing aggressive enable
```

**Related Commands**

- `show load-balancing`
- `config wlan load-balance`
# config location

To configure a location-based system, use the `config location` command.

```plaintext
config location { algorithm { simple | rssi-average } | { rssi-half-life | expiry } [ client | calibrating-client | tags | rogue-aps ] seconds | notify-threshold [ client | tags | rogue-aps ] threshold | interface-mapping { add | delete } location wlan_id interface_name | plm { client | enable | disable } burst_interval | calibrating { enable | disable } [ uniband | multiband ] }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>algorithm</code></td>
<td>Configures the algorithm used to average RSSI and SNR values.</td>
</tr>
<tr>
<td><code>simple</code></td>
<td>Specifies a faster algorithm that requires low CPU overhead but provides less accuracy.</td>
</tr>
<tr>
<td><code>rssi-average</code></td>
<td>Specifies a more accurate algorithm but requires more CPU overhead.</td>
</tr>
<tr>
<td><code>rssi-half-life</code></td>
<td>Configures the half-life when averaging two RSSI readings.</td>
</tr>
<tr>
<td><code>expiry</code></td>
<td>Configures the timeout for RSSI values.</td>
</tr>
<tr>
<td><code>client</code></td>
<td>(Optional) Specifies the parameter applies to client devices.</td>
</tr>
<tr>
<td><code>calibrating-client</code></td>
<td>(Optional) Specifies the parameter is used for calibrating client devices.</td>
</tr>
<tr>
<td><code>tags</code></td>
<td>(Optional) Specifies the parameter applies to radio frequency identification (RFID) tags.</td>
</tr>
<tr>
<td><code>rogue-aps</code></td>
<td>(Optional) Specifies the parameter applies to rogue access points.</td>
</tr>
</tbody>
</table>

**Note:** We recommend that you do not use or modify the `config location algorithm` command. It is set to optimal default values.

*Config Commands*
<table>
<thead>
<tr>
<th>seconds</th>
<th>Time value (0, 1, 2, 5, 10, 20, 30, 60, 90, 120, 180, 300 seconds).</th>
</tr>
</thead>
<tbody>
<tr>
<td>notify-threshold</td>
<td><strong>Note</strong> We recommend that you do not use or modify the <code>config location notify-threshold</code> command. It is set to optimal default values.</td>
</tr>
<tr>
<td>threshold</td>
<td>Threshold parameter. The range is 0 to 10 dB, and the default value is 0 dB.</td>
</tr>
<tr>
<td>interface-mapping</td>
<td>Adds or deletes a new location, wireless LAN, or interface mapping element.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>WLAN identification name.</td>
</tr>
<tr>
<td>interface_name</td>
<td>Name of interface to which mapping element applies.</td>
</tr>
<tr>
<td>plm</td>
<td>Specifies the path loss measurement (S60) request for normal clients or calibrating clients.</td>
</tr>
<tr>
<td>client</td>
<td>Specifies normal, noncalibrating clients.</td>
</tr>
<tr>
<td>burst_interval</td>
<td>Burst interval. The range is from 1 to 3600 seconds, and the default value is 60 seconds.</td>
</tr>
<tr>
<td>calibrating</td>
<td>Specifies calibrating clients.</td>
</tr>
<tr>
<td>uniband</td>
<td>Specifies the associated 802.11a or 802.11b/g radio (uniband).</td>
</tr>
<tr>
<td>multiband</td>
<td>Specifies the associated 802.11a/b/g radio (multiband).</td>
</tr>
</tbody>
</table>

**Command Default**

See the “Syntax Description” section for default values of individual arguments and keywords.

**Command History**

<table>
<thead>
<tr>

The following example shows how to set the controller buffer severity level for logging messages to 4:

```
(Cisco Controller) > config logging buffered 4
```

**Related Commands**

- `config logging syslog facility`
- `config logging syslog level`
- `show logging`
# config logging console

To set the severity level for logging messages to the controller console, use the `config logging console` command.

**Syntax**

```
config logging console security_level
```

**Syntax Description**

<table>
<thead>
<tr>
<th>security_level</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Severity level. Choose one of the following:</td>
</tr>
<tr>
<td></td>
<td>• emergencies—Severity level 0</td>

```
(Cisco Controller) > config logging traceinfo disable
```

### Related Commands

- `show logging`
**config logging syslog host**

To configure a remote host for sending syslog messages, use the `config logging syslog host` command.

```
config logging syslog host ip_addr
```

**Syntax Description**

| `ip_addr` | IP address for the remote host. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- To configure a remote host for sending syslog messages, use the `config logging syslog host ip_addr` command.

- To remove a remote host that was configured for sending syslog messages, use the `config logging syslog host ip_addr delete` command.

- To display the configured syslog servers on the controller, use the `show logging` command.

The following example shows how to configure two remote hosts 10.92.125.52 and 2001:9:6:40::623 for sending the syslog messages and displaying the configured syslog servers on the controller:

```
(Cisco Controller) > config logging syslog host 10.92.125.52
System logs will be sent to 10.92.125.52 from now on

(Cisco Controller) > config logging syslog host 2001:9:6:40::623
System logs will be sent to 2001:9:6:40::623 from now on

(Cisco Controller) > show logging
Logging to buffer :

config logging syslog facility

To set the facility for outgoing syslog messages to the remote host, use the `config logging syslog facility` command.

`config logging syslog facility facility_code`
### Syntax Description

<table>
<thead>
<tr>
<th>facility_code</th>
<th>Facility code. Choose one of the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• daemon—System daemons. Facility level—3.</td>
</tr>
<tr>
<td></td>
<td>• ftp—FTP daemon. Facility level—11.</td>
</tr>
<tr>
<td></td>
<td>• kern—Kernel. Facility level—0.</td>
</tr>
<tr>
<td></td>
<td>• local0—Local use. Facility level—16.</td>
</tr>
<tr>
<td></td>
<td>• local1—Local use. Facility level—17.</td>
</tr>
<tr>
<td></td>
<td>• local2—Local use. Facility level—18.</td>
</tr>
<tr>
<td></td>
<td>• local3—Local use. Facility level—19.</td>
</tr>
<tr>
<td></td>
<td>• local4—Local use. Facility level—20.</td>
</tr>
<tr>
<td></td>
<td>• local5—Local use. Facility level—21.</td>
</tr>
<tr>
<td></td>
<td>• local6—Local use. Facility level—22.</td>
</tr>
<tr>
<td></td>
<td>• local7—Local use. Facility level—23.</td>
</tr>
<tr>
<td></td>
<td>• lpr—Line printer system. Facility level—6.</td>
</tr>
<tr>
<td></td>
<td>• mail—Mail system. Facility level—2.</td>
</tr>
<tr>
<td></td>
<td>• news—USENET news. Facility level—7.</td>
</tr>
<tr>
<td></td>
<td>• sys12—System use. Facility level—12.</td>
</tr>
<tr>
<td></td>
<td>• sys13—System use. Facility level—13.</td>
</tr>
<tr>
<td></td>
<td>• sys14—System use. Facility level—14.</td>
</tr>
<tr>
<td></td>
<td>• syslog—The syslog itself. Facility level—5.</td>
</tr>
<tr>
<td></td>
<td>• user—User process. Facility level—1.</td>
</tr>
<tr>
<td></td>
<td>• uucp—UNIX-to-UNIX copy system. Facility level—8.</td>
</tr>
</tbody>
</table>

- `show logging`
config logging syslog facility client

To configure the syslog facility to AP, use the `config logging syslog facility client { assocfail Dot11 | associate Dot11 | authentication | authfail Dot11 | deauthenticate Dot11 | disassociate Dot11 | exclude } { enable | disable }` command.

`config logging syslog facility Client`

**Syntax Description**

**Facility Client.** Has the following functions:

- `assocfail Dot11` — Association fail syslog for clients
- `associate Dot11` — Association syslog for clients
- `authentication` — Authentication success syslog for clients
- `authfail Dot11` — Authentication fail syslog for clients
- `deauthenticate Dot11` — Deauthentication syslog for clients
- `disassociate Dot11` — Disassociation syslog for clients
- `excluded` — Excluded syslog for clients

<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to close all active Telnet sessions:

```
(Cisco Controller) > config loginsession close all
```

**Related Commands**

- `show loginsession`
config macfilter

To create or delete a MAC filter entry on the Cisco wireless LAN controller, use the `config macfilter { add | delete }` command.

```
config macfilter { add client_MAC wlan_id [interface_name] [description] [macfilter_IP] | delete client_MAC }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>add</code></td>
<td>Adds a MAC filter entry on the controller.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes a MAC filter entry on the controller.</td>
</tr>
<tr>
<td><code>MAC_addr</code></td>
<td>Client MAC address.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier with which the MAC filter entry should associate. A zero value associates the entry with any wireless LAN.</td>
</tr>
<tr>
<td><code>interface_name</code></td>
<td>(Optional) Name of the interface. Enter 0 to specify no interface.</td>
</tr>
<tr>
<td><code>description</code></td>
<td>(Optional) Short description of the interface (up to 32 characters) in double quotes.</td>
</tr>
<tr>
<td><code>Note</code></td>
<td>A description is mandatory if <code>macfilter_IP</code> is specified.</td>
</tr>
<tr>
<td><code>IP Address</code></td>
<td>(Optional) IPv4 address of the local MAC filter database.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `config macfilter add` command to add a client locally to a wireless LAN on the Cisco wireless LAN controller. This filter bypasses the RADIUS authentication process.

As on release 7.6, the optional `macfilter_IP` supports only IPv4 address.

The following example shows how to add a MAC filter entry 00:E0:77:31:A3:55 with the wireless LAN ID 1, interface name labconnect, and MAC filter IP 10.92.125.51 on the controller:

```
(Cisco Controller) > config macfilter add 00:E0:77:31:A3:55 1 lab02 "labconnect" 10.92.125.51
```

**Related Commands**

- `show macfilter`
- `config macfilter ip-address`
To add a description to a MAC filter, use the `config macfilter description` command.

```
config macfilter description MAC addr description
```

**Syntax Description**

<table>
<thead>
<tr>
<th>MAC addr</th>
<th>Client MAC address.</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>(Optional) Description within double quotes (up to 32 characters).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the description MAC filter 01 to MAC address 11:11:11:11:11:

```
(Cisco Controller) > config macfilter description 11:11:11:11:11 "MAC Filter 01"
```

**Related Commands**

- `show macfilter`
config macfilter interface

To create a MAC filter client interface, use the `config macfilter interface` command.

`config macfilter interface MAC_addr interface`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MAC_addr</td>
<td>Client MAC address.</td>
</tr>
<tr>
<td>interface</td>
<td>Interface name. A value of zero is equivalent to no name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a MAC filter interface Lab01 on client 11:11:11:11:11:

(Cisco Controller) > config macfilter interface 11:11:11:11:11 Lab01

**Related Commands**

- `show macfilter`
# config macfilter ip-address

To enter passive client IP address, use the `config macfilter ip-address` command.

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>Syntax</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>config macfilter ip-address MAC_addr IP Address</code></td>
<td>Adds an IP address for passive clients.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4.</td>
</tr>
</tbody>
</table>

The following example shows how to add an IP address for a passive client:

```
(Cisco Controller) > config macfilter ip-address aa-bb-cc-dd-ee-ff 10.92.125.51
```

**Related Commands**

- `show macfilter`
**config macfilter mac-delimiter**

To set the MAC delimiter (colon, hyphen, none, and single-hyphen) for MAC addresses sent to RADIUS servers, use the `config macfilter mac-delimiter` command.

```
config macfilter mac-delimiter { none | colon | hyphen | single-hyphen }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>none</th>
<th>colon</th>
<th>hyphen</th>
<th>single-hyphen</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Disables the delimiters (for example, xxxxxxxxxx).</td>
<td>Sets the delimiter to a colon (for example, xx:xx:xx:xx:xx:xx).</td>
<td>Sets the delimiter to a hyphen (for example, xx-xx-xx-xx-xx-xx).</td>
<td>Sets the delimiter to a single hyphen (for example, xxxxxxx-xxxxxx).</td>
</tr>
</tbody>
</table>

**Command Default**

The default delimiter is hyphen.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to have the operating system send MAC addresses to the RADIUS server in the form aa:bb:cc:dd:ee:ff:

```
(Cisco Controller) > config macfilter mac-delimiter colon
```

The following example shows how to have the operating system send MAC addresses to the RADIUS server in the form aa-bb-cc-dd-ee-ff:

```
(Cisco Controller) > config macfilter mac-delimiter hyphen
```

The following example shows how to have the operating system send MAC addresses to the RADIUS server in the form aabbccddeeff:

```
(Cisco Controller) > config macfilter mac-delimiter none
```

**Related Commands**

`show macfilter`
config macfilter radius-compat

To configure the Cisco wireless LAN controller for compatibility with selected RADIUS servers, use the config macfilter radius-compat command.

```
config macfilter radius-compat { cisco | free | other }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco</td>
<td>Configures the Cisco ACS compatibility mode (password is the MAC address of the server).</td>
</tr>
<tr>
<td>free</td>
<td>Configures the Free RADIUS server compatibility mode (password is secret).</td>
</tr>
<tr>
<td>other</td>
<td>Configures for other server behaviors (no password is necessary).</td>
</tr>
</tbody>
</table>

**Command Default**

Other

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<tr>
<td>8.0</td>
<td>This command supports only IPv4.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the Cisco ACS compatibility mode to “other”:

```
(Cisco Controller) > config macfilter radius-compat other
```

**Related Commands**

show macfilter
**config macfilter wlan-id**

To modify a wireless LAN ID for a MAC filter, use the `config macfilter wlan-id` command.

```
config macfilter wlan-id MAC_addr WLAN_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>MAC_addr</code></td>
<td>Client MAC address.</td>
</tr>
<tr>
<td><code>WLAN_id</code></td>
<td>Wireless LAN identifier to associate with. A value of zero is not allowed.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to modify client wireless LAN ID 2 for a MAC filter 11:11:11:11:11:

```
(Cisco Controller) > config macfilter wlan-id 11:11:11:11:11 2
```

**Related Commands**

- `show macfilter`
- `show wlan`
**config mdns ap**

To configure multicast Domain Name System (mDNS) snooping on an access point, use the **config mdns ap** command.

```
config mdns ap {enable (ap_name | all) [vlan vlan_id] | disable (ap_name | all) | vlan {add | delete} vlan ap_name}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables mDNS snooping on an access point.</td>
</tr>
<tr>
<td><strong>ap_name</strong></td>
<td>Name of the access point on which mDNS snooping has to be configured.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Configures mDNS snooping on all access points.</td>
</tr>
<tr>
<td><strong>vlan</strong></td>
<td>(Optional) Configures the VLAN on which the access point snoops and forwards the mDNS packets.</td>
</tr>
<tr>
<td><strong>vlan_id</strong></td>
<td>VLAN identifier.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables mDNS snooping on an access point.</td>
</tr>
<tr>
<td><strong>add</strong></td>
<td>Adds a VLAN from which the access point snoops and forwards the mDNS packets to the Cisco Wireless LAN Controller (WLC). You can configure up to 10 VLANs for an mDNS access point.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes a VLAN from which the access point snoops and forwards the mDNS packets to the Cisco WLC.</td>
</tr>
</tbody>
</table>

### Command Default

The mDNS-enabled access point snoops the access or native VLANs by default.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Enabling mDNS snooping on access points allows the access points to snoop the wired services on VLANs that are invisible to the Cisco WLC. mDNS snooping is supported only on local-mode and monitor-mode access points. The access point must be in the access mode or trunk mode. If the access point is in the trunk mode, you must configure the VLAN on the Cisco WLC on which the access point snoops and forwards the mDNS packets. You must also configure the native VLAN from the Cisco WLC for the access point to snoop and send mDNS queries on. The access point also tags the packets with the native VLAN.

Global mDNS snooping overrides mDNS access point snooping.

The following example shows how to enable mDNS snooping on an access point and the VLAN on which it must snoop for mDNS packets:

```text
(Cisco Controller) > config mdns ap enable vlan 1
```
To configure a multicast DNS (mDNS) profile and associate a service with the profile, use the `config mdns profile` command.

```
config mdns profile { create | delete | service { add | delete } service_name profile_name
```

**Syntax Description**

- **create**: Creates an mDNS profile.
- **delete**: Deletes an mDNS profile. If the profile is associated to an interface group, an interface, or a WLAN, an error appears.
- **service**: Configures an mDNS service.
- **add**: Adds an mDNS service to an mDNS profile.
- **delete**: Deletes an mDNS service from an mDNS profile.
- **service-name**: Name of the mDNS service.
- **profile_name**: Name of the mDNS profile. You can create a maximum of 16 profiles.

**Command Default**

By default, the controller has an mDNS profile, default-mdns-profile. You cannot delete this default profile.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

After creating a new profile, you must map the profile to an interface group, an interface, or a WLAN. Clients receive service advertisements only for the services associated with the profile. The controller gives the highest priority to the profiles associated to interface groups, followed by the interface profiles, and then the WLAN profiles. Each client is mapped to a profile based on the order of priority.

By default, the controller has an mDNS profile, default-mdns-profile. You cannot delete this default profile.

The following example shows how to add the Apple TV mDNS service to the mDNS profile1.

```
(Cisco Controller) > config mdns profile create profile1 Apple TV
```

**Related Commands**

- `config mdns query interval`
- `config mdns service`
- `config mdns snooping`
- `config interface mdns-profile`
- `config interface group mdns-profile`
- `config wlan mdns`
- `show mdns profile`
show mdns service
clear mdns service-database
debug mdns all
debug mdns error
debug mdns detail
debug mdns message
config mdns query interval

To configure the query interval for multicast DNS (mDNS) services, use the config mdns query interval command.

Syntax Description

```
config mdns query interval interval_value
```

- **interval_value**: mDNS query interval, in minutes, that you can set. The query interval is the frequency at which the controller sends periodic queries to all the services defined in the Master Services database. The range is from 10 to 120.

Command Default

The default query interval for an mDNS service is 15 minutes.

Command History

```
Modification Release  
This command was introduced. 7.4
```

Usage Guidelines

The controller snoops and learns about the mDNS service advertisements only if the service is available in the Master Services database. mDNS uses the multicast IP address 224.0.0.251 as the destination address and 5353 as UDP destination port.

The following example shows how to configure the query interval for mDNS services as 20 minutes.

```
(Cisco Controller) > config mdns query interval 20
```

Related Commands

- config mdns profile
- config mdns service
- config mdns snooping
- config interface mdns-profile
- config interface group mdns-profile
- config wlan mdns
- show mdns profile
- show mDNS service
- clear mdns service-database
- debug mdns all
- debug mdns error
- debug mdns detail
- debug mdns message
config mdns service

To configure multicast DNS (mDNS) services in the master services database, use the `config mdns service` command.

The following command is valid in Release 7.5 and later releases:

```
cfg mdns service { create service_name service_string origin { Wireless | Wired | All } lss { enable | disable } [ query { enable | disable } ] | lss { enable | disable } { service_name | all } | priority-mac { add | delete } priority-mac service_name { ap-group ap-group-name } | origin { Wireless | Wired | All } { service_name | all } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>create</td>
<td>Adds a new mDNS service to the Master Services database.</td>
</tr>
<tr>
<td>service_name</td>
<td>Name of the mDNS service, for example, AirTunes, iTunes Music Sharing, FTP, Apple File Sharing Protocol (AFP).</td>
</tr>
<tr>
<td>service_string</td>
<td>Unique string associated to an mDNS service, for example, _airplay._tcp.local. is the service string associated with Apple TV.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes an mDNS service from the Master Services database. Before deleting the service, the controller checks if any profile is using the service. <strong>Note</strong> You must delete the service from all profiles before deleting it.</td>
</tr>
<tr>
<td>query</td>
<td>Configures the query status for the mDNS service.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables periodic query for an mDNS service by the controller.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables periodic query for an mDNS service by the controller.</td>
</tr>
<tr>
<td>origin</td>
<td>Configures the origin of the mDNS service. You can restrict the origin of the service as wired or wireless.</td>
</tr>
<tr>
<td>Wireless</td>
<td>Configures the origin of the mDNS service as wireless.</td>
</tr>
<tr>
<td>Wired</td>
<td>Configures the origin of the mDNS service as wired.</td>
</tr>
<tr>
<td>All</td>
<td>Configures the origin of the mDNS service as wireless or wired.</td>
</tr>
<tr>
<td>lss</td>
<td>Configures Location Specific Services (LSS) for a service or all mDNS services. LSS is not applicable for registered service providers. The registered service providers are always included if the querying client corresponds to the user. You cannot configure LSS on the services configured as only wired.</td>
</tr>
<tr>
<td>all</td>
<td>Configures LSS for all mDNS services.</td>
</tr>
<tr>
<td>priority-mac</td>
<td>Configures the MAC address of a service provider device. This device gets a priority even if the service provider database is full.</td>
</tr>
<tr>
<td>add</td>
<td>Adds the MAC address of a service provider device for priority.</td>
</tr>
</tbody>
</table>

You can configure up to 50 MAC addresses for a service.
### delete
- Deletes the MAC address of a service provider device from the priority list.

### priority-mac
- MAC address of a service provider device that needs priority. The MAC address must be unique for each service.

### ap-group
- Configures the access point group for wired service providers. These service providers get priority over others. When a client mNDS query originates from this AP group, the wired entries with priority MAC addresses and access point groups are listed first in the aggregated response.

### ap-group-name
- Name of the access point group to which the service provider belongs.

---

### Command Default
By default, LSS is disabled, but it is enabled for all the discovered services.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>7.5</td>
<td>This command was modified. The <strong>origin</strong>, <strong>Wireless</strong>, <strong>Wired</strong>, <strong>All</strong>, <strong>lss</strong>, <strong>priority-mac</strong>, <strong>add</strong>, <strong>delete</strong>, <strong>ap-group</strong> keywords and <strong>priority-mac ap-group-name</strong> arguments were added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
In Release 7.5 and later releases, the maximum number of service providers for different controller models are as follows:

- Cisco 5500 Series Controller and Cisco 2500 Series Controller—6400
- Cisco Wireless Services Module 2—6400
- Cisco 8500 Series Controller and Cisco 7500 Series Controller—16000

You cannot change the services with the origin set to Wireless to Wired if LSS is enabled for the service.

The following example shows how to add the HTTP mDNS service to the Master Services database, configure the origin as wireless, and enable LSS for the service:

```plaintext
(Cisco Controller) > config mdns service create http _http._tcp.local. origin wireless lss enable
```

The following example shows how to add a priority MAC address of a HTTP service provider device:

```plaintext
(Cisco Controller) > config mdns service priority-mac add 44:03:a7:a3:04:45 http
```
**config mdns snooping**

To enable or disable global multicast DNS (mDNS) snooping on the Cisco WLC, use the `config mdns snooping` command.

```
config mdns snooping { enable | disable }
```

**Syntax Description**

- **enable**: Enables mDNS snooping on the Cisco WLC.
- **disable**: Disables mDNS snooping on the Cisco WLC.

**Command Default**

By default, mDNS snooping is enabled on the Cisco WLC.

**Command History**

- **Release 7.4**: This command was introduced.

**Usage Guidelines**

mDNS service discovery provides a way to announce and discover services on the local network. mDNS perform DNS queries over IP multicast. mDNS supports zero configuration IP networking.

The following example shows how to enable mDNS snooping:

```
(Cisco Controller) > config mdns snooping enable
```

**Related Commands**

- `config mdns query interval`
- `config mdns service`
- `config mdns profile`
- `config interface mdns-profile`

config mdns policy enable

To configure the mDNS policy use the `config mdns policy enable | disable` command.

```
config  mdnspolicyenable | disable
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>policy</code></td>
<td>Name of the mDNS policy.</td>

| Usage Guidelines  | This command is valid for 8.0 release onwards. |

Example

The following example show how to configure the mDNS policy.

```
(Cisco Controller) >config mdns
    policy enable
```
config mdns policy service-group

To create or delete mDNS policy service group use the `config mdns policy service-group` command.

```
config mdns policy service-group { create | delete} service-group-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>create</code></td>
<td>Creates the mDNS service group.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Deletes the mDNS service group.</td>
</tr>
<tr>
<td><code>service-group-name</code></td>
<td>Name of the service group.</td>
</tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to delete a mDNS service group.

```
(Cisco Controller) > config mdns policy service-group create <service-group-name>
```
config mdns policy service-group parameters

To configure the parameters of a service group, use the **config mdns policy service-group** command.

```
config mdnspolicy service-group device-mac add service-group-name mac-addr device name location-type
[AP_LOCATION | AP_NAME | AP_GROUP] device-location [location string | any | same]
```

<table>
<thead>
<tr>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to configure a location type of a service provider device.

(Cisco Controller) > config mdns policy service-group location type [AP_LOCATION | AP_NAME | AP_GROUP]
config mdns policy service-group user-name

To configure a user role for a mDNS service group, use the `config mdns policy service-group user-name add | delete <service-group-name> <user-role-name>` command.

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>user-name</code></td>
<td>Configures name of a user for mDNS service group.</td>

</tbody>
</table>

#### Example

The following example shows how to add user role details for an mDNS service group:

(Cisco Controller) > `config mdns policy service-group user-role add <service-group-name> <user-role-name>`
config media-stream multicast-direct

To configure the media-stream multicast direct, use the config media-stream multicast direct command.

```plaintext
config media-stream multicast-direct { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables a media stream.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables a media stream.</td>
</tr>
</tbody>
</table>

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Media-stream multicast-direct requires load based Call Admission Control (CAC) to run.

This example shows how to enable media-stream multicast-direct settings:

```plaintext
> config media-stream multicast-direct enable
```

This example shows how to disable media-stream multicast-direct settings:

```plaintext
> config media-stream multicast-direct disable
```

**Related Commands**

- config 802.11 media-stream video-redirect
- show 802.11a media-stream name
- show media-stream group summary
- show media-stream group detail
config media-stream message

To configure various parameters of message configuration, use the `config media-stream message` command.

```
config media-stream message {state [enable | disable] | url url | email email | phone phone_number | note note}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>Specifies the media stream message state.</td>
</tr>
<tr>
<td>enable</td>
<td>(Optional) Enables the session announcement message state.</td>
</tr>
<tr>
<td>disable</td>
<td>(Optional) Disables the session announcement message state.</td>
</tr>
<tr>
<td>url</td>
<td>Configures the URL.</td>
</tr>
<tr>
<td>email</td>
<td>Configures the email ID.</td>
</tr>
<tr>
<td>phone</td>
<td>Configures the phone number.</td>
</tr>
<tr>
<td>phone_number</td>
<td>Session announcement phone number.</td>
</tr>
<tr>
<td>note</td>
<td>Configures the notes.</td>
</tr>
<tr>
<td>note</td>
<td>Session announcement notes.</td>
</tr>
</tbody>
</table>

### Command Default

Disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Media-stream multicast-direct requires load-based Call Admission Control (CAC) to run.

This example shows how to enable the session announcement message state:

```
> config media-stream message state enable
```

This example shows how to configure the session announcement e-mail address:

```
> config media-stream message mail abc@co.com
```

### Related Commands

```
config media-stream
show 802.11a media-stream name
```
config media-stream message

show media-stream group summary
show media-stream group detail
To configure the various global media-stream configurations, use the `config media-stream add` command.

```
config media-stream add multicast-direct media_stream_name start-IP end-IP [template { very coarse | coarse | ordinary | low-resolution | med-resolution | high-resolution }] | detail { bandwidth packet-size { periodic | initial } } qos priority { drop | fallback }
```

**Syntax Description**

- **multicast-direct**: Specifies the media stream for the multicast-direct setting.
- **media_stream_name**: Media-stream name.
- **start-IP**: IP multicast destination start address.
- **end-IP**: IP multicast destination end address.
- **template**: (Optional) Configures the media stream from templates.
  - **very coarse**: Applies a very-coarse template.
  - **coarse**: Applies a coarse template.
  - **ordinary**: Applies an ordinary template.
  - **low-resolution**: Applies a low-resolution template.
  - **med-resolution**: Applies a medium-resolution template.
  - **high-resolution**: Applies a high-resolution template.
- **detail**: Configures the media stream with specific parameters.
  - **bandwidth**: Maximum expected stream bandwidth.
  - **packet-size**: Average packet size.
  - **periodic**: Specifies the periodic admission evaluation.
  - **initial**: Specifies the Initial admission evaluation.
  - **qos**: AIR QoS class (video only).
  - **priority**: Media-stream priority.
  - **drop**: Specifies that the stream is dropped on a periodic reevaluation.
  - **fallback**: Specifies if the stream is demoted to the best-effort class on a periodic reevaluation.
**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Media-stream multicast-direct requires load-based Call Admission Control (CAC) to run.

This example shows how to configure a new media stream:

```
> config media-stream add multicast-direct abc 227.8.8.8 227.9.9.9 detail 2 150 periodic video 1 drop
```

**Related Commands**

- show 802.11a media-stream name
- show media-stream group summary
- show media-stream group detail
config media-stream admit

To allow traffic for a media stream group, use the `config media-stream admit` command.

```
config media-stream admit media_stream_name
```

### Syntax Description

<table>
<thead>
<tr>
<th>media_stream_name</th>
<th>Media-stream group name.</th>
</tr>
</thead>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you try to allow traffic for the media stream group, you will be prompted that IGMP snooping will be disabled and enabled again, and all clients might observe a glitch on the multicast traffic.

This example shows how to allow traffic for a media stream group:

```
(Cisco Controller) > config media-stream admit MymediaStream
```

### Related Commands

- `show 802.11a media-stream name`
- `show media-stream group summary`
- `show media-stream group detail`
# config media-stream deny

To block traffic for a media stream group, use the `config media-stream deny` command.

## Syntax Description

```
media_stream_name
```

- `media_stream_name`: Media-stream group name.

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

When you try to block traffic for the media stream group, you will be prompted that IGMP snooping will be disabled and enabled again, and all clients might observe a glitch on the multicast traffic.

This example shows how to block traffic for a media stream group:

```
(Cisco Controller) > config media-stream deny MymediaStream
```

## Related Commands

- `show 802.11a media-stream name`
- `show media-stream group summary`
- `show media-stream group detail`
config media-stream delete

To configure the various global media-stream configurations, use the **config media-stream delete** command.

**config media-stream delete media_stream_name**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>media_stream_name</th>
<th>Media-stream name.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Media-stream multicast-direct requires load-based Call Admission Control (CAC) to run.

This example shows how to delete the media stream named abc:

```
(Cisco Controller) > config media-stream delete abc
```

**Related Commands**

- show 802.11a media-stream name
- show media-stream group summary
- show media-stream group detail
config memory monitor errors

To enable or disable monitoring for memory errors and leaks, use the `config memory monitor errors` command.

```
config memory monitor errors { enable | disable }
```

⚠️ **Caution**
The `config memory monitor` commands can be disruptive to your system and should be run only when you are advised to do so by the Cisco TAC.

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Enables the monitoring for memory settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable</td>
<td>Disables the monitoring for memory settings.</td>
</tr>
</tbody>
</table>

**Command Default**
Monitoring for memory errors and leaks is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Be cautious about changing the defaults for the `config memory monitor` command unless you know what you are doing, you have detected a problem, or you are collecting troubleshooting information.

The following example shows how to enable monitoring for memory errors and leaks for a controller:

```
(Cisco Controller) > config memory monitor errors enable
```

**Related Commands**
- `config memory monitor leaks`
- `debug memory`
- `show memory monitor`
config memory monitor leaks

To configure the controller to perform an auto-leak analysis between two memory thresholds, use the `config memory monitor leaks` command.

```
config memory monitor leaks low_thresh high_thresh
```

**Caution**
The `config memory monitor` commands can be disruptive to your system and should be run only when you are advised to do so by the Cisco TAC.

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>low_thresh</code></td>
<td>Value below which free memory cannot fall without crashing. This value cannot be set lower than 10000 KB.</td>
</tr>
<tr>
<td><code>high_thresh</code></td>
<td>Value below which the controller enters auto-leak-analysis mode. See the “Usage Guidelines” section.</td>
</tr>
</tbody>
</table>

**Command Default**
The default value for `low_thresh` is 10000 KB; the default value for `high_thresh` is 30000 KB.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Be cautious about changing the defaults for the `config memory monitor` command unless you know what you are doing, you have detected a problem, or you are collecting troubleshooting information.

Use this command if you suspect that a memory leak has occurred.

If the free memory is lower than the `low_thresh` threshold, the system crashes, generating a crash file. The default value for this parameter is 10000 KB, and you cannot set it below this value.

Set the `high_thresh` threshold to the current free memory level or higher so that the system enters auto-leak-analysis mode. After the free memory reaches a level lower than the specified `high_thresh` threshold, the process of tracking and freeing memory allocation begins. As a result, the `debug memory events enable` command shows all allocations and frees, and the `show memory monitor detail` command starts to detect any suspected memory leaks.

The following example shows how to set the threshold values for auto-leak-analysis mode to 12000 KB for the low threshold and 35000 KB for the high threshold:
(Cisco Controller) > config memory monitor leaks 12000 35000

Related Commands

- config memory monitor leaks
- debug memory
- show memory monitor
To configure alarm settings for outdoor mesh access points, use the `config mesh alarm` command.

```plaintext
config mesh alarm { max-hop | max-children | low-snr | high-snr | association | parent-change count } value
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>max-hop</td>
<td>Sets the maximum number of hops before triggering an alarm for traffic over the mesh network. The valid values are 1 to 16 (inclusive).</td>
</tr>
<tr>
<td>max-children</td>
<td>Sets the maximum number of mesh access points (MAPs) that can be assigned to a mesh router access point (RAP) before triggering an alarm. The valid values are 1 to 16 (inclusive).</td>
</tr>
<tr>
<td>low-snr</td>
<td>Sets the low-end signal-to-noise ratio (SNR) value before triggering an alarm. The valid values are 1 to 30 (inclusive).</td>
</tr>
<tr>
<td>high-snr</td>
<td>Sets the high-end SNR value before triggering an alarm. The valid values are 1 to 30 (inclusive).</td>
</tr>
<tr>
<td>association</td>
<td>Sets the mesh alarm association count value before triggering an alarm. The valid values are 1 to 30 (inclusive).</td>
</tr>
<tr>
<td>parent-change count</td>
<td>Sets the number of times a MAP can change its RAP association before triggering an alarm. The valid values are 1 to 30 (inclusive).</td>
</tr>
<tr>
<td>value</td>
<td>Value above or below which an alarm is generated. The valid values vary for each command.</td>
</tr>
</tbody>
</table>

### Command Default

See the “Syntax Description” section for command and argument value ranges.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the maximum hops threshold to 8:

(Cisco Controller) > `config mesh alarm max-hop 8`

The following example shows how to set the upper SNR threshold to 25:

(Cisco Controller) > `config mesh alarm high-snr 25`
config mesh astools

To globally enable or disable the anti-stranding feature for outdoor mesh access points, use the `config mesh astools` command.

```
config mesh astools {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables this feature for all outdoor mesh access points.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables this feature for all outdoor mesh access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 7.6     | This command was introduced in a release earlier than Release 7.6.

The following example shows how to enable anti-stranding on all outdoor mesh access points:

```
(Cisco Controller) > config mesh astools enable
```
## config mesh backhaul rate-adapt

To globally configure the backhaul Tx rate adaptation (universal access) settings for indoor and outdoor mesh access points, use the `config mesh backhaul rate-adapt` command.

```
config mesh backhaul rate-adapt [all | bronze | silver | gold | platinum] { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>(Optional) Grants universal access privileges on mesh access points.</td>
</tr>
<tr>
<td>bronze</td>
<td>(Optional) Grants background-level client access privileges on mesh access points.</td>
</tr>
<tr>
<td>silver</td>
<td>(Optional) Grants best effort-level client access privileges on mesh access points.</td>
</tr>
<tr>
<td>gold</td>
<td>(Optional) Grants video-level client access privileges on mesh access points.</td>
</tr>
<tr>
<td>platinum</td>
<td>(Optional) Grants voice-level client access privileges on mesh access points.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables this backhaul access level for mesh access points.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables this backhaul access level for mesh access points.</td>
</tr>
</tbody>
</table>

### Command Default

Backhaul access level for mesh access points is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

To use this command, mesh backhaul with client access must be enabled by using the `config mesh client-access` command.

### Note

After this feature is enabled, all mesh access points reboot.

The following example shows how to set the backhaul client access to the best-effort level:

```
(Cisco Controller) >config mesh backhaul rate-adapt silver
```
**config mesh backhaul slot**

To configure the slot radio as a downlink backhaul, use the `config mesh backhaul slot` command.

```
config mesh backhaul slot slot_id {enable | disable} cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>slot_id</code></td>
<td>Slot number between 0 and 2.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the entered slot radio as a downlink backhaul.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the entered slot radio as a downlink backhaul.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the Root AP of the sector on which the backhaul needs to be enabled or disabled.</td>
</tr>
</tbody>
</table>

**Command Default**

The entered slot radio as a downlink backhaul is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For 2.4 GHz, only slot 0 and 1 are valid. If slot 0 is enabled, slot 1 is automatically be disabled. If slot 0 is disabled, slot 1 is automatically enabled.

The following example shows how to enable slot 1 as the preferred backhaul for the root AP myrootap1:

```
(Cisco Controller) >config mesh backhaul slot 1 enable myrootap1
```
config mesh battery-state

To configure the battery state for Cisco mesh access points, use the `config mesh battery-state` command.

`config mesh battery-state disable { all | cisco_ap }`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables the battery-state for mesh access points.</td>
</tr>
<tr>
<td>all</td>
<td>Applies this command to all mesh access points.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Specific mesh access point.</td>
</tr>
</tbody>
</table>

**Command Default**

Battery state is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable battery state for all mesh APs:

(Cisco Controller) > `config mesh battery-state disable all`
# config mesh client-access

To enable or disable client access to the mesh backhaul on indoor and outdoor mesh access points, use the `config mesh client-access` command.

```
config mesh client-access { enable [ extended ] | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows wireless client association over the mesh access point backhaul 802.11a radio.</td>
</tr>
<tr>
<td>extended</td>
<td>(Optional) Enables client access over both the backhaul radios for backhaul access points.</td>
</tr>
<tr>
<td>disable</td>
<td>Restricts the 802.11a radio to backhaul traffic, and allows client association only over the 802.11b/g radio.</td>
</tr>
</tbody>
</table>

## Command Default

Client access is disabled.

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

Backhaul interfaces (802.11a radios) act as primary Ethernet interfaces. Backhauls function as trunks in the network and carry all VLAN traffic between the wireless and wired network. No configuration of primary Ethernet interfaces is required.

When this feature is enabled, the mesh access points allow wireless client association over the 802.11a radio, which implies that a 152x mesh access point can carry both backhaul traffic and 802.11a client traffic over the same 802.11a radio.

When this feature is disabled, the mesh access points carry backhaul traffic over the 802.11a radio and allows client association only over the 802.11b/g radio.

The following example shows how to enable client access extended to allow a wireless client association over the 802.11a radio:

```
(Cisco Controller) > config mesh client-access enable extended
Enabling client access on both backhaul slots
Same BSSID will be used on both slots
All Mesh AP will be rebooted
Are you sure you want to start? (y/N) Y
```

The following example shows how to restrict a wireless client association to the 802.11b/g radio:

```
(Cisco Controller) > config mesh client-access disable
All Mesh AP will be rebooted
Are you sure you want to start? (Y/N) Y
Backhaul with client access is canceled.
```
config mesh convergence

To configure mesh convergence method on all mesh access points, use the **config mesh convergence** command.

```
config mesh convergence { fast [ standard ] | very-fast } all
```

**Syntax Description**

- **fast**
  - Sets the fast convergence method.

- **standard**
  - Sets the standard convergence method.

- **very-fast**
  - Set very-fast convergence method.

- **all**
  - Sets the selected mesh convergence method on all the mesh access points.

**Command Default**

The default mesh convergence method is standard.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

The standard convergence method is available on Release 7.6 onwards. The fast and very fast convergence methods are available from Release 8.0.

This table lists the different convergence methods.

<table>
<thead>
<tr>
<th>Convergence method</th>
<th>Parent loss Timer (seconds)</th>
<th>Seek per channel Timer (seconds)</th>
<th>Parent, neighbor keep alive Timer (seconds)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard</td>
<td>21</td>
<td>3</td>
<td>3</td>
</tr>
<tr>
<td>Fast</td>
<td>7</td>
<td>2</td>
<td>3</td>
</tr>
<tr>
<td>Very Fast</td>
<td>4</td>
<td>2</td>
<td>1.5</td>
</tr>
</tbody>
</table>

The following example shows how to set mesh convergence to standard:

```
(Cisco Controller) > config mesh convergence standard all
```
config mesh ethernet-bridging allow-bpdu

To configure STP BPDUs towards wired mesh uplink, use the config mesh ethernet-bridging allow-bpdu command.

```
config mesh ethernet-bridging allow-bpdu { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Enables STP BPDUs towards wired mesh uplink.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable</td>
<td>Disables STP BPDUs towards wired mesh uplink.</td>
</tr>
</tbody>
</table>

Command Default

Disabled

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0.110.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Cisco WLC does not allow you to use this command if VLAN transparency is enabled.
config mesh ethernet-bridging vlan-transparent

To configure how a mesh access point handles VLAN tags for Ethernet bridged traffic, use the `config mesh ethernet-bridging vlan-transparent` command.

```plaintext
config mesh ethernet-bridging vlan-transparent { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Bridges packets as if they are untagged.</td>
</tr>
<tr>
<td>disable</td>
<td>Drops all tagged packets.</td>
</tr>
</tbody>
</table>

**Command Default**

Bridges packets as if they are untagged.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure Ethernet packets as untagged:

```
(Cisco Controller) >config mesh ethernet-bridging vlan-transparent enable
```

The following example shows how to drop tagged Ethernet packets:

```
(Cisco Controller) >config mesh ethernet-bridging vlan-transparent disable
```
config mesh full-sector-dfs

To globally enable or disable full-sector Dynamic Frequency Selection (DFS) on mesh access points, use the `config mesh full-sector-dfs` command.

```
config mesh full-sector-dfs { enable | disable }
```

**Syntax Description**

- **enable**: Enables DFS for mesh access points.
- **disable**: Disables DFS for mesh access points.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command instructs the mesh sector to make a coordinated channel change on the detection of a radar signal. For example, if a mesh access point (MAP) detects a radar signal, the MAP will notify the root access point (RAP), and the RAP will initiate a sector change.

All MAPs and the RAP that belong to that sector go to a new channel, which lowers the probability of MAPs stranding when radar is detected on the current backhaul channel, and no other valid parent is available as backup.

Each sector change causes the network to be silent for 60 seconds (as dictated by the DFS standard).

It is expected that after a half hour, the RAP will go back to the previously configured channel, which means that if radar is frequently observed on a RAP's channel, it is important that you configure a different channel for that RAP to exclude the radar affected channel at the controller.

This example shows to enable full-sector DFS on mesh access points:

```
(Cisco Controller) > config mesh full-sector-dfs enable
```
config mesh linkdata

To enable external MAC filtering of access points, use the `config mesh linkdata` command.

`config mesh linkdata destination_ap_name`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Destination access point name for MAC address filtering.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>destination_ap_name</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

External MAC filtering is disabled.

**Usage Guidelines**

The `config mesh linktest` and `config mesh linkdata` commands are designed to be used together to verify information between a source and a destination access point. To get this information, first execute the `config mesh linktest` command with the access point that you want link data from in the `dest_ap` argument. When the command completes, enter the `config mesh linkdata` command and list the same destination access point, to display the link data will display (see example).

MAC filtering uses the local MAC filter on the controller by default.

When external MAC filter authorization is enabled, if the MAC address is not found in the local MAC filter, then the MAC address in the external RADIUS server is used.

MAC filtering protects your network against rogue mesh access points by preventing access points that are not defined on the external server from joining.

Before employing external authentication within the mesh network, the following configuration is required:

- The RADIUS server to be used as an AAA server must be configured on the controller.
- The controller must also be configured on the RADIUS server.
- The mesh access point configured for external authorization and authentication must be added to the user list of the RADIUS server.

The following example shows how to enable external MAC address filtering on access point AP001d.710d.e300:

(Cisco Controller) > `config mesh linkdata MAP2-1-1522.7400 AP001d.710d.e300 18 100 1000 30`

LinkTest started on source AP, test ID: 0
[00:1D:71:0E:74:00]–>[00:1D:71:0D:74:00]

config mesh linktest

To verify client access between mesh access points, use the `config mesh linktest` command.

```plaintext
config mesh linktest source_ap {dest_ap | MAC addr} datarate packet_rate packet_size duration
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>source_ap</code></td>
<td>Source access point.</td>
</tr>
<tr>
<td><code>dest_ap</code></td>
<td>Destination access point.</td>
</tr>
<tr>
<td><code>MAC addr</code></td>
<td>MAC address.</td>
</tr>
<tr>
<td><code>datarate</code></td>
<td>Number of packets per second. Valid range is 1 through 3000, but the recommended default is 100.</td>
</tr>
<tr>
<td><code>packet_rate</code></td>
<td>(Optional) Packet size in bytes. If not specified, packet size defaults to 1500 bytes.</td>
</tr>
<tr>
<td><code>packet_size</code></td>
<td>(Optional) Duration of the test in seconds. Valid values are 10-300 seconds, inclusive. If not specified, duration defaults to 30 seconds.</td>
</tr>
<tr>
<td><code>duration</code></td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

100 packets per second, 1500 bytes, 30-second duration.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `config mesh linktest` and `config mesh linkdata` commands are designed to be used together to verify information between a source and a destination access point. To get this information, first enter the `config mesh linktest` command with the access point that you want link data from in the `dest_ap` argument. When the command completes, enter the `config mesh linkdata` command and list the same destination access point, to display the link data.

The following warning message appears when you run a linktest that might oversubscribe the link:

```
Warning! Data Rate (100 Mbps) is not enough to perform this link test on packet size (2000 bytes) and (1000) packets per second. This may cause AP to disconnect or reboot. Are you sure you want to continue?
```

The following example shows how to verify client access between mesh access points `SB_MAP1` and `SB_RAP2` at 36 Mbps, 20 fps, 100 frame size, and 15-second duration:
(Cisco Controller) > config mesh linktest SB_MAP1 SB_RAP1 36 20 100 15
LinkTest started on source AP, test ID: 0
[00:1D:71:0E:85:00] -> [00:1D:71:0E:D0:0F]
Test config: 100 byte packets at 20 pps for 15 seconds, a-link rate 36 Mb/s
In progress: | || || || || |
LinkTest complete

</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the advanced AP provision method:

```
(Cisco Controller) > config mesh lsc advanced ap-provision enable
```
config mesh multicast

To configure multicast mode settings to manage multicast transmissions within the mesh network, use the ```config mesh multicast``` command.

```config mesh multicast { regular | in | in-out }```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>regular</td>
<td>Multicasts the video across the entire mesh network and all its segments by bridging-enabled root access points (RAPs) and mesh access points (MAPs).</td>
</tr>
<tr>
<td>in</td>
<td>Forwards the multicast video received from the Ethernet by a MAP to the RAP’s Ethernet network. No additional forwarding occurs, which ensures that non-LWAPP multicasts received by the RAP are not sent back to the MAP Ethernet networks within the mesh network (their point of origin), and MAP-to-MAP multicasts do not occur because they are filtered out.</td>
</tr>
<tr>
<td>in-out</td>
<td>Configures the RAP and MAP to multicast, but each in a different manner: If multicast packets are received at a MAP over Ethernet, they are sent to the RAP; however, they are not sent to other MAP Ethernets, and the MAP-to-MAP packets are filtered out of the multicast. If multicast packets are received at a RAP over Ethernet, they are sent to all the MAPs and their respective Ethernet networks. See the Usage Guidelines section for more information.</td>
</tr>
</tbody>
</table>

### Command Default

In-out mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Multicast for mesh networks cannot be enabled using the controller GUI.

Mesh multicast modes determine how bridging-enabled access points mesh access points (MAPs) and root access points (RAPs) send multicasts among Ethernet LANs within a mesh network. Mesh multicast modes manage non-LWAPP multicast traffic only. LWAPP multicast traffic is governed by a different mechanism.

You can use the controller CLI to configure three mesh multicast modes to manage video camera broadcasts on all mesh access points. When enabled, these modes reduce unnecessary multicast transmissions within the mesh network and conserve backhaul bandwidth.

When using in-out mode, it is important to properly partition your network to ensure that a multicast sent by one RAP is not received by another RAP on the same Ethernet segment and then sent back into the network.
If 802.11b clients need to receive CAPWAP multicasts, then multicast must be enabled globally on the controller as well as on the mesh network (by using the `config network multicast global` command). If multicast does not need to extend to 802.11b clients beyond the mesh network, you should disable the global multicast parameter.

The following example shows how to multicast video across the entire mesh network and all its segments by bridging-enabled RAPs and MAPs:

```
(Cisco Controller) > config mesh multicast regular
```
config mesh parent preferred

To configure a preferred parent for a mesh access point, use the `config mesh parent preferred` command.

`config mesh parent preferred cisco_ap {mac_address | none}`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the child access point.</td>
</tr>
<tr>
<td><code>mac_address</code></td>
<td>MAC address of the preferred parent.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Clears the configured parent.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A child AP selects the preferred parent based on the following conditions:

- The preferred parent is the best parent.
- The preferred parent has a link SNR of at least 20 dB (other parents, however good, are ignored).
- The preferred parent has a link SNR in the range of 12 dB and 20 dB, but no other parent is significantly better (that is, the SNR is more than 20 percent better). For an SNR lower than 12 dB, the configuration is ignored.
- The preferred parent is not blacklisted.
- The preferred parent is not in silent mode because of dynamic frequency selection (DFS).
- The preferred parent is in the same bridge group name (BGN). If the configured preferred parent is not in the same BGN and no other parent is available, the child joins the parent AP using the default BGN.

The following example shows how to configure a preferred parent with the MAC address 00:21:1b:ea:36:60 for a mesh access point myap1:

```
(Cisco Controller) >config mesh parent preferred myap1 00:21:1b:ea:36:60
```

The following example shows how to clear a preferred parent with the MAC address 00:21:1b:ea:36:60 for a mesh access point myap1, by using the keyword none:

```
(Cisco Controller) >config mesh parent preferred myap1 00:21:1b:ea:36:60 none
```
config mesh public-safety

To enable or disable the 4.9-GHz public safety band for mesh access points, use the `config mesh public-safety` command.

```
config mesh public-safety { enable | disable } { all | cisco_ap }
```

**Syntax Description**
- `enable` Enables the 4.9-GHz public safety band.
- `disable` Disables the 4.9-GHz public safety band.
- `all` Applies the command to all mesh access points.
- `cisco_ap` Specific mesh access point.

**Command Default**
The 4.9-GHz public safety band is disabled.

**Command History**
- **Release**
  - 7.6 This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**
4.9 GHz is a licensed frequency band restricted to public-safety personnel.

The following example shows how to enable the 4.9-GHz public safety band for all mesh access points:

```
(Cisco Controller) >config mesh public-safety enable all
4.9GHz is a licensed frequency band in -A domain for public-safety usage
Are you sure you want to continue? (y/N) y
```
**config mesh radius-server**

To enable or disable external authentication for mesh access points, use the `config mesh radius-server` command.

```
config mesh radius-server index {enable | disable}
```

**Syntax Description**

- `index`:
  - RADIUS authentication method. Options are as follows:
    - Enter `eap` to designate Extensible Authentication Protocol (EAP) for the mesh RADIUS server setting.
    - Enter `psk` to designate Preshared Keys (PSKs) for the mesh RADIUS server setting.

- `enable`:
  - Enables the external authentication for mesh access points.

- `disable`:
  - Disables the external authentication for mesh access points.

**Command Default**

EAP is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable external authentication for mesh access points:

```
(Cisco Controller) >config mesh radius-server eap enable
```
config mesh range

To globally set the maximum range between outdoor root access points (RAPs) and mesh access points (MAPs), use the `config mesh range` command.

```
config mesh range [distance]
```

**Syntax Description**
- `distance` (Optional) Maximum operating range (150 to 132000 ft) of the mesh access point.

**Command Default**
12,000 feet.

**Command History**
- **Release**
  - **Modification**
  - 7.6 This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**
After this command is enabled, all outdoor mesh access points reboot. This command does not affect indoor access points.

The following example shows how to set the range between an outdoor mesh RAP and a MAP:

```
(Cisco Controller) > config mesh range 300
Command not applicable for indoor mesh. All outdoor Mesh APs will be rebooted
Are you sure you want to start? (y/N) y
```
config mesh secondary-backhaul

To configure a secondary backhaul on the mesh network, use the config mesh secondary-backhaul command.

```
config mesh secondary-backhaul { enable [force-same-secondary-channel] | disable [rll-retransmit | rll-transmit] }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the secondary backhaul configuration.</td>
</tr>
<tr>
<td>force-same-secondary-channel</td>
<td>(Optional) Enables secondary-backhaul mesh capability. Forces all access points rooted at the first hop node to have the same secondary channel and ignores the automatic or manual channel assignments for the mesh access points (MAPs) at the second hop and beyond.</td>
</tr>
<tr>
<td>disable</td>
<td>Specifies the secondary backhaul configuration is disabled.</td>
</tr>
<tr>
<td>rll-transmit</td>
<td>(Optional) Uses reliable link layer (RLL) at the second hop and beyond.</td>
</tr>
<tr>
<td>rll-retransmit</td>
<td>(Optional) Extends the number of RLL retry attempts in an effort to improve reliability.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command uses a secondary backhaul radio as a temporary path for traffic that cannot be sent on the primary backhaul due to intermittent interference.

The following example shows how to enable a secondary backhaul radio and force all access points rooted at the first hop node to have the same secondary channel:

```
(Cisco Controller) > config mesh secondary-backhaul enable force-same-secondary-channel
```
**config mesh security**

To configure the security settings for mesh networks, use the **config mesh security** command.

```
config mesh security { {rad-mac-filter | force-ext-auth | lsc-only-auth} {enable | disable} | {eap | psk provisioning | provisioning window} {enable | disable} | {delete_psk | key}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rad-mac-filter</td>
<td>Enables a Remote Authentication Dial-In User Service (RADIUS) MAC address filter for the mesh security setting.</td>
</tr>
<tr>
<td>force-ext-auth</td>
<td>Disables forced external authentication for the mesh security setting.</td>
</tr>
<tr>
<td>lsc-only-auth</td>
<td>Enables Locally Significant Certificate only authentication for the mesh security setting.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the mesh security setting.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the mesh security setting.</td>
</tr>
<tr>
<td>eap</td>
<td>Designates the Extensible Authentication Protocol (EAP) for the mesh security setting by default.</td>
</tr>
<tr>
<td>psk</td>
<td>Designates a preshared key (PSK) for the mesh security setting.</td>
</tr>
<tr>
<td>provisioning</td>
<td>Encrypts provisioning for the PSK in Cisco Wireless Controller (WLC).</td>
</tr>
<tr>
<td>provisioning window</td>
<td>Encrypts provisioning window for the PSK in Cisco WLC.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables provisioning of the PSK.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables provisioning of the PSK.</td>
</tr>
<tr>
<td>key</td>
<td>Specifies the key for the PSK.</td>
</tr>
</tbody>
</table>

### Command Default

The EAP is designated as default for the mesh security.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.2</td>
<td>This command was modified, the psk provisioning and psk provisioning keywords are added.</td>
</tr>
</tbody>
</table>

The following example shows how to configure EAP as the security option for all mesh access points:

```
(Cisco Controller) config mesh security eap
```

The following example shows how to configure PSK as the security option for all mesh access points:
(Cisco Controller) `config mesh security psk`

The following example shows how to enable PSK provisioning as the security option for all mesh access points:

(Cisco Controller)> `config mesh security psk provisioning enable`

The following example shows how to configure a PSK provisioning key as the security option for all mesh access points:

(Cisco Controller)> `config mesh security psk provisioning key 5`

The following example shows how to enable a PSK provisioning window as the security option for all mesh access points:

(Cisco Controller)> `config mesh security psk provisioning window enable`

The following example shows how to delete the PSK provisioning for Cisco WLC:

(Cisco Controller)> `config mesh security psk provisioning delete_psk wlc`

The following example shows how to delete the PSK provisioning for all mesh access points:

(Cisco Controller)> `config mesh security psk provisioning delete_psk ap`

The following example shows how to delete PSK provisioning for all configurations in Cisco WLC:

(Cisco Controller)> `config mesh security psk provisioning delete_psk wlc all`
config mesh slot-bias

To enable or disable slot bias for serial backhaul mesh access points, use the `config mesh slot-bias` command.

```
config mesh slot-bias { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables slot bias for serial backhaul mesh APs.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables slot bias for serial backhaul mesh APs.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, slot bias is in enabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Follow these guidelines when using this command:

- The `config mesh slot-bias` command is a global command and therefore applicable to all 1524SB APs associated with the same controller.

- Slot bias is applicable only when both slot 1 and slot 2 are available. If a slot radio does not have a channel that is available because of dynamic frequency selection (DFS), the other slot takes up both the uplink and downlink roles.

- If slot 2 is not available because of hardware issues, slot bias functions normally. Corrective action should be taken by disabling the slot bias or fixing the antenna.

The following example shows how to disable slot bias for serial backhaul mesh APs:

```
(Cisco Controller) >config mesh slot-bias disable
```
**config mgmtuser add**

To add a local management user to the controller, use the `config mgmtuser add` command.

```
config mgmtuser add username password {lobby-admin | read-write | read-only} [description]
```

**Syntax Description**

- `username`: Account username. The username can be up to 24 alphanumeric characters.
- `password`: Account password. The password can be up to 24 alphanumeric characters.
- `lobby-admin`: Creates a management user with lobby ambassador privileges.
- `read-write`: Creates a management user with read-write access.
- `read-only`: Creates a management user with read-only access.
- `description`: (Optional) Description of the account. The description can be up to 32 alphanumeric characters within double quotes.

**Command Default**

None

**Command History**

- **Release** | **Modification**
  - 7.6 | This command was introduced in a release earlier than Release 7.6.
  - 8.4 | This command creates lobby-admin user.

The following example shows how to create a management user account with read-write access.

```
(Cisco Controller) > config mgmtuser add admin admin read-write "Main account"
```

**Related Commands**

- `show mgmtuser`
config mgmtuser delete

To delete a management user from the controller, use the config mgmtuser delete command.

**Syntax Description**

```
config mgmtuser delete username
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Account username. The username can be up to 24 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

The management user is not deleted by default.

**Command History**

<table>
<thead>
<tr>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a management user account admin from the controller.

```
(Cisco Controller) > config mgmtuser delete admin
Deleted user admin
```

**Related Commands**

- show mgmtuser
config mgmtuser description

To add a description to an existing management user login to the controller, use the **config mgmtuser description** command.

```
config mgmtuser description username description
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>username</strong></td>
<td>Account username. The username can be up to 24 alphanumeric characters.</td>
<td></td>
</tr>
<tr>
<td><strong>description</strong></td>
<td>Description of the account. The description can be up to 32 alphanumeric characters within double quotes.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

No description is added to the management user.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3 This command was introduced.

The following example shows how to change the password of the management user “admin” with the new password 5rTfm:

```
(Cisco Controller) > config mgmtuser password admin 5rTfm
```

**Related Commands**

- `show mgmtuser`
config mgmtuser telnet

To enable local management users to use Telnet to connect to the Cisco Wireless LAN Controller, use the config mgmtuser telnet command.

```
config mgmtuser telnet user_name {enable | disable}
```

**Syntax Description**

- `user_name` Username of a local management user.
- `enable` Enables a local management user to use Telnet to connect to the Cisco WLC. You can enter up to 24 alphanumeric characters.
- `disable` Disables a local management user from using Telnet to connect to the Cisco WLC.

**Command Default**

Local management users can use Telnet to connect to the Cisco WLC.

**Command History**

- **Release 7.5** This command was introduced.
- **Release 8.3** This command was introduced.

**Usage Guidelines**

You must enable global Telnet to enable this command. Secure Shell (SSH) connection is not affected when you enable this option.

The following example shows how to enable a local management user to use Telnet to connect to the Cisco WLC:

```
(Cisco Controller) > config mgmtuser telnet admin1 enable
```
**config mgmtuser termination-interval**

To configure the user re-authentication terminal interval in seconds, use the `config mgmtuser termination-interval` command.

```
config mgmtuser termination-interval  {seconds }
```

### Syntax Description

- **seconds**  
  Re-authentication terminal interval in seconds for a user before being logged out. Default value is 0, the valid range is 0 to 300 seconds.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced in this release.</td>
</tr>
</tbody>
</table>

The following example shows how to set the interval in seconds before the user is logged out:

```
(Cisco Controller) > config mgmtuser termination-interval 180
```
config mobility dscp

To configure the mobility intercontroller DSCP value, use the config mobility dscp command.

```
config mobility dscp dscp_value
```

**Syntax Description**

- **dscp_value**: DSCP value ranging from 0 to 63.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the mobility intercontroller DSCP value to 40:

```
(Cisco Controller) > config mobility dscp 40
```
config mobility encryption tunnel

To configure the mobility encryption tunnel on a Cisco WLC, use the `config mobility encryption` command.

```
config mobility encryption { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables mobility encrypt tunnel on a Cisco WLC.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables mobility encrypt tunnel on a Cisco WLC.</td>

</table>

The following example shows how to enable mobility encrypt tunnel on a Cisco WLC:

```
(Cisco Controller) > config mobility encrypt tunnel enable
```
config mobility group anchor

To create a new mobility anchor for the WLAN or wired guest LAN, enter, use the **config mobility group anchor** command.

```plaintext
config mobility group anchor { add | delete } { wlan wlan_id | guest-lan guest_lan_id } anchor_ip
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds or changes a mobility anchor to a wireless LAN.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes a mobility anchor from a wireless LAN.</td>
</tr>
<tr>
<td>wlan</td>
<td>Specifies the wireless LAN anchor settings.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512 (inclusive).</td>
</tr>
<tr>
<td>guest-lan</td>
<td>Specifies the guest LAN anchor settings.</td>
</tr>
<tr>
<td>guest_lan_id</td>
<td>Guest LAN identifier between 1 and 5 (inclusive).</td>
</tr>
<tr>
<td>anchor_ip</td>
<td>IP address of the anchor controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `wlan_id` or `guest_lan_id` must exist and be disabled.

Auto-anchor mobility is enabled for the WLAN or wired guest LAN when you configure the first mobility anchor. Deleting the last anchor disables the auto-anchor mobility feature and resumes normal mobility for new associations.

The following example shows how to add a mobility anchor with the IP address 192.12.1.5 to a wireless LAN ID 2:

(Cisco Controller) >config mobility group anchor add wlan 2 192.12.1.5

The following example shows how to delete a mobility anchor with the IP address 193.13.1.15 from a wireless LAN:

(Cisco Controller) >config mobility group anchor delete wlan 5 193.13.1.15
config mobility group domain

To configure the mobility domain name, use the `config mobility group domain` command.

```plaintext
config mobility group domain domain_name
```

**Syntax Description**
- `domain_name` Domain name. The domain name can be up to 31 case-sensitive characters.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a mobility domain name `lab1`:

```plaintext
(Cisco Controller) > config mobility group domain lab1
```
### config mobility group keepalive count

To configure the Cisco WLC to detect failed mobility group members (including anchor Cisco WLCs), use the `config mobility group keepalive count` command.

```
config mobility group keepalive count count
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>count</code></td>
<td>Number of times that a ping request is sent to a mobility group member before the member is considered unreachable. The range is from 3 to 20. The default is 3.</td>
</tr>
</tbody>
</table>

**Command Default**

The default number of times that a ping request is sent to a mobility group member is 3.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify the number of times a ping request is sent to a mobility group member before the member is considered unreachable to three counts:

```
(Cisco Controller) >config mobility group keepalive count 3
```
config mobility group keepalive interval

To configure the controller to detect failed mobility group members (including anchor controllers), use the `config mobility group keepalive` command.

```
config mobility group keepalive interval
```

**Syntax Description**

| interval | Interval of time between each ping request sent to a mobility group member. The range is from 1 to 30 seconds. The default value is 10 seconds. |

**Command Default**

The default interval of time between each ping request is 10 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify the amount of time between each ping request sent to a mobility group member to 10 seconds:

```
(Cisco Controller) >config mobility group keepalive 10
```
**config mobility group member**

To add or delete users from the mobility group member list, use the `config mobility group member` command.

```plaintext
config mobility group member { add MAC-addr IP-addr [group_name] [encrypt { enable | disable }] | [data-dtls mac-addr { enable | disable } | delete MAC-addr | hash IP-addr { key | none } }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

<tr>
<td>8.8.111.0</td>
<td>This command was updated by adding encrypt, data-dtls keywords to support IRCM functionality.</td>
</tr>
</tbody>
</table>

The following example shows how to add a mobility group member with an IPv4 address to the list:

```
(Cisco Controller) >config mobility group member add 11:11:11:11:11 209.165.200.225
```

The following example shows how to add a mobility group member with an IPv6 address to the list:
The following example shows how to configure the hash key of a virtual controller in the same domain:

Note

The IP address in this example can be in either IPv4 or IPv6 format.
config mobility group multicast-address

To configure the multicast group IP address for nonlocal groups within the mobility list, use the config mobility group multicast-address command.

`config mobility group multicast-address group_name ip_address`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group_name</code></td>
<td>Member switch group name (if different from the default group name).</td>
</tr>
<tr>
<td><code>ip_address</code></td>
<td>Member switch IP address.</td>
</tr>
</tbody>
</table>

<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the multicast group IP address 10.10.10.1 for a group named test:

(Cisco Controller) >config mobility group multicast-address test 10.10.10.1

The following example shows how to configure the multicast group IP address 2001:DB8::1 for a group named test:

(Cisco Controller) >config mobility group multicast-address test 2001:DB8::1
**config mobility multicast-mode**

To enable or disable mobility multicast mode, use the `config mobility multicast-mode` command.

```
config mobility multicast-mode { enable | disable } local_group_multicast_address
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the multicast mode; the controller uses multicast mode to send Mobile Announce messages to the local group.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the multicast mode; the controller uses unicast mode to send the Mobile Announce messages to the local group.</td>
</tr>
<tr>
<td><code>local_group_multicast_address</code></td>
<td>IP address for the local mobility group.</td>
</tr>
</tbody>
</table>

**Command Default**
The mobility multicast mode is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the multicast mobility mode for the local mobility group IP address 157.168.20.0:

```
(Cisco Controller) > config mobility multicast-mode enable 157.168.20.0
```
To enable new mobility on the Cisco Wireless LAN Controller (WLC), use the `config mobility new-architecture` command.

```
config mobility new-architecture { enable | disable }
```

**Syntax Description**
- **enable** Configures the Cisco WLC to switch to the new mobility architecture.
- **disable** Configures the Cisco WLC to switch to the old flat mobility architecture.

**Command Default**
By default, new mobility is disabled.

**Command History**
- **Release** 7.3.112.0
- **Modification** This command was introduced.

**Usage Guidelines**
New mobility is supported only on Cisco WiSM2, Cisco 2500 Series Wireless Controllers, Cisco 5500 Series Wireless Controllers, and Cisco 8500 Series Wireless Controllers. New mobility enables the Cisco WLC to be compatible with Converged Access controllers with Wireless Control Module (WCM), such as Cisco Catalyst 3850 Series and the Cisco 5760 Wireless LAN Controllers.

The following example shows how to enable new mobility on the Cisco WLC:

```
(Cisco Controller) >config mobility new-architecture enable
```
config mobility oracle

To configure the Mobility Oracle (MO), use the `config mobility oracle` command.

```
config mobility oracle { enable | disable | ip ip_address }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the MO on startup.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the MO on startup.</td>
</tr>
<tr>
<td>ip</td>
<td>Specifies the IP address of the MO.</td>
</tr>
<tr>
<td>ip_address</td>
<td>IP address of the MO.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3.112</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The MO maintains the client database under one complete mobility domain. It consists of a station database, an interface to the mobility Cisco WLC, and an NTP server. There can be only one MO in the entire mobility domain.

The IPv6 address format for this command is not supported.

The following example shows how to configure the MO IP address:

```
(Cisco Controller) > config mobility oracle ip 27.0.0.1
```
config mobility secure-mode

To configure the secure mode for mobility messages between Cisco WLCs, use the `config mobility secure-mode` command.

```
config mobility secure-mode { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Enables the mobility group message security.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>disable</td>
<td>Disables mobility group message security.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the secure mode for mobility messages:

```
(Cisco Controller) > config mobility secure-mode enable
```
config mobility statistics reset

To reset the mobility statistics, use the `config mobility statistics reset` command.

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

This example shows how to reset the mobility group statistics:

```
(Cisco Controller) > config mobility statistics reset
```
config netuser add

To add a guest user on a WLAN or wired guest LAN to the local user database on the controller, use the `config netuser add` command.

```
config netuser add username password  { wlan wlan_id | guestlan guestlan_id } userType guest lifetime
lifetime description description
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>Guest username. The username can be up to 50 alphanumeric characters.</td>
</tr>
<tr>
<td><code>password</code></td>
<td>User password. The password can be up to 24 alphanumeric characters.</td>
</tr>
<tr>
<td><code>wlan</code></td>
<td>Specifies the wireless LAN identifier to associate with or zero for any wireless LAN.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier assigned to the user. A zero value associates the user with any wireless LAN.</td>
</tr>
<tr>
<td><code>guestlan</code></td>
<td>Specifies the guest LAN identifier to associate with or zero for any wireless LAN.</td>
</tr>
<tr>
<td><code>guestlan_id</code></td>
<td>Guest LAN ID.</td>
</tr>
<tr>
<td><code>userType</code></td>
<td>Specifies the user type.</td>
</tr>
<tr>
<td><code>guest</code></td>
<td>Specifies the guest for the guest user.</td>
</tr>
<tr>
<td><code>lifetime</code></td>
<td>Specifies the lifetime.</td>
</tr>
<tr>
<td><code>lifetime</code></td>
<td>Lifetime value (60 to 259200 or 0) in seconds for the guest user.</td>
</tr>
<tr>
<td><code>description</code></td>
<td>Short description of user. The description can be up to 32 characters enclosed in double-quotes.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Local network usernames must be unique because they are stored in the same database.

The following example shows how to add a permanent username Jane to the wireless network for 1 hour:

(Cisco Controller) > config netuser add jane able2 1 wlan_id 1 userType permanent

The following example shows how to add a guest username George to the wireless network for 1 hour:

(Cisco Controller) > config netuser add george able1 guestlan 1 3600

Related Commands

- show netuser
- config netuser delete
config netuser delete

To delete an existing user from the local network, use the config netuser delete command.

config netuser delete { username username | wlan-id wlan-id }

Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Network username. The username can be up to 24 alphanumeric characters.</td>
</tr>
<tr>
<td>wlan-id</td>
<td>WLAN identification number.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Local network usernames must be unique because they are stored in the same database.

Note

When a WLAN associated with network users is deleted, the system prompts to delete all network users associated with the WLAN first. After deleting the network users, you can delete the WLAN.

The following example shows how to delete an existing username named able1 from the network:

(Cisco Controller) > config netuser delete able1
Deleted user able1

Related Commands

show netuser
**config netuser description**

To add a description to an existing net user, use the `config netuser description` command.

```
config netuser description username description
```

**Syntax Description**

<table>
<thead>
<tr>
<th>username</th>
<th>Network username. The username can contain up to 24 alphanumeric characters.</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>(Optional) User description. The description can be up to 32 alphanumeric characters enclosed in double quotes.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to add a user description “HQ1 Contact” to an existing network user named able1:

```
(Cisco Controller) > config netuser description able1 "HQ1 Contact"
```

**Related Commands**

- `show netuser`
config network dns serverip

To configure the network dns server, use the `config network dns serverip` command.

```
config network dns serverip  { ipaddr }
```

**Syntax Description**

- `ipaddr` Specifies the ip-address.

**Command Default**

The default network-level web authentication value is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

The following example shows how to enable proxy redirect support for web authentication clients:

```
cisco controller config network dns serverip 198.172.202.252
```
### config netuser guest-lan-id

To configure a wired guest LAN ID for a network user, use the `config netuser guest-lan-id` command.

**Syntax**

```plaintext
config netuser guest-lan-id username lan_id
```

**Syntax Description**

- **username**: Network username. The username can be 24 alphanumeric characters.
- **lan_id**: Wired guest LAN identifier to associate with the user. A zero value associates the user with any wired LAN.

**Command Default**

None

**Command History**

Release 7.6: This command was introduced in a release earlier than Release 7.6.

Release 8.3: This command was introduced.

The following example shows how to configure a wired LAN ID 2 to associate with the user named aire1:

```plaintext
(Cisco Controller) > config netuser guest-lan-id aire1 2
```

**Related Commands**

- `show netuser`
- `show wlan summary`
**config netuser guest-role apply**

To apply a quality of service (QoS) role to a guest user, use the `config netuser guest-role apply` command.

```
config netuser guest-role apply username role_name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>Name of the user.</td>
</tr>
<tr>
<td><code>role_name</code></td>
<td>QoS guest role name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not assign a QoS role to a guest user, the Role field in the User Details shows the role as default. The bandwidth contracts for this user are defined in the QoS profile for the WLAN.

If you want to unassign a QoS role from a guest user, use the `config netuser guest-role apply username default`. This user now uses the bandwidth contracts defined in the QoS profile for the WLAN.

The following example shows how to apply a QoS role to a guest user jsmith with the QoS guest role named Contractor:

```
(Cisco Controller) > config netuser guest-role apply jsmith Contractor
```

**Related Commands**

- `config netuser guest-role create`
- `config netuser guest-role delete`
config netuser guest-role create

To create a quality of service (QoS) role for a guest user, use the `config netuser guest-role create` command.

```
config netuser guest-role create role_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>QoS guest role name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To delete a QoS role, use the `config netuser guest-role delete role-name`.

The following example shows how to create a QoS role for the guest user named guestuser1:

```
(Cisco Controller) > config netuser guest-role create guestuser1
```
**config netuser guest-role delete**

To delete a quality of service (QoS) role for a guest user, use the `config netuser guest-role delete` command.

`config netuser guest-role delete role_name`

**Syntax Description**

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>Quality of service (QoS) guest role name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a quality of service (QoS) role for guestuser1:

(Cisco Controller) > `config netuser guest-role delete guestuser1`

**Related Commands**

`config netuser guest-role create`
**config netuser guest-role qos data-rate average-data-rate**

To configure the average data rate for TCP traffic on a per user basis, use the `config netuser guest-role qos data-rate average-data-rate` command.

```
config netuser guest-role qos data-rate average-data-rate role_name rate
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>Quality of service (QoS) guest role name.</td>
</tr>
<tr>
<td>rate</td>
<td>Rate for TCP traffic on a per user basis.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Usage Guidelines**

For the `role_name` parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as contractor, vendor, and so on.). For the `rate` parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

The following example shows how to configure an average rate for the QoS guest named guestuser1:

```
(Cisco Controller) > config netuser guest-role qos data-rate average-data-rate guestuser1 0
```

**Related Commands**

- `config netuser guest-role create`
- `config netuser guest-role delete`
- `config netuser guest-role qos data-rate burst-data-rate`
**config netuser guest-role qos data-rate average-realtime-rate**

To configure the average data rate for TCP traffic on a per user basis, use the `config netuser guest-role qos data-rate average-realtime-rate` command.

```
config netuser guest-role qos data-rate average-realtime-rate role_name rate
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>role_name</td>
<td>Quality of service (QoS) guest role name.</td>
</tr>
<tr>
<td>rate</td>
<td>Rate for TCP traffic on a per user basis.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Usage Guidelines**

For the `role_name` parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as contractor, vendor, and so on.). For the `rate` parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

The following example shows how to configure an average data rate for the QoS guest user named guestuser1 with the rate for TCP traffic of 0 Kbps:

```
(Cisco Controller) > config netuser guest-role qos data-rate average-realtime-rate guestuser1 0
```

**Related Commands**

- `config netuser guest-role`
- `config netuser guest-role qos data-rate average-data-rate`
config netuser guest-role qos data-rate burst-data-rate

To configure the peak data rate for TCP traffic on a per user basis, use the `config netuser guest-role qos data-rate burst-data-rate` command.

```
config netuser guest-role qos data-rate burst-data-rate role_name rate
```

**Syntax Description**

<table>
<thead>
<tr>
<th>role_name</th>
<th>Quality of service (QoS) guest role name.</th>
</tr>
</thead>
<tbody>
<tr>
<td>rate</td>
<td>Rate for TCP traffic on a per user basis.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The burst data rate should be greater than or equal to the average data rate. Otherwise, the QoS policy may block traffic to and from the wireless client.

For the `role_name` parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as contractor, vendor, and so on.). For the `rate` parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

The following example shows how to configure the peak data rate for the QoS guest named guestuser1 with the rate for TCP traffic of 0 Kbps:

```
(Cisco Controller) > config netuser guest-role qos data-rate burst-data-rate guestuser1 0
```

**Related Commands**

- `config netuser guest-role create`
- `config netuser guest-role delete`
- `config netuser guest-role qos data-rate average-data-rate`
To configure the burst real-time data rate for UDP traffic on a per user basis, use the `config netuser guest-role qos data-rate burst-realtime-rate` command.

```bash
(Cisco Controller) > config netuser guest-role qos data-rate burst-realtime-rate guestuser1 0
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>role_name</code></td>
<td>Quality of service (QoS) guest role name.</td>
</tr>
<tr>
<td><code>rate</code></td>
<td>Rate for TCP traffic on a per user basis.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The burst real-time rate should be greater than or equal to the average real-time rate. Otherwise, the quality of service (QoS) policy may block traffic to and from the wireless client.

For the `role_name` parameter in each of these commands, enter a name for the new QoS role. The name uniquely identifies the role of the QoS user (such as contractor, vendor, and so on.). For the `rate` parameter, you can enter a value between 0 and 60,000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS role.

The following example shows how to configure a burst real-time rate for the QoS guest user named guestuser1 with the rate for TCP traffic of 0 Kbps:

```bash
(Cisco Controller) > config netuser guest-role qos data-rate burst-realtime-rate guestuser1 0
```

### Related Commands

- `config netuser guest-role`
- `config netuser guest-role qos data-rate average-data-rate`
- `config netuser guest-role qos data-rate burst-data-rate`
config netuser lifetime

To configure the lifetime for a guest network user, use the **config netuser lifetime** command.

```
config netuser lifetime username time
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>username</td>
<td>Network username. The username can be up to 50 alphanumeric characters.</td>
</tr>
<tr>
<td>time</td>
<td>Lifetime between 60 to 31536000 seconds or 0 for no limit.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure lifetime for a guest network user:

```
(Cisco Controller) > config netuser lifetime guestuser1 22450
```

**Related Commands**

- `show netuser`
- `show wlan summary`
**config netuser maxUserLogin**

To configure the maximum number of login sessions allowed for a network user, use the `config netuser maxUserLogin` command.

```
config netuser maxUserLogin count
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>count</code></td>
<td>Maximum number of login sessions for a single user. The allowed values are from 0 (unlimited) to 8.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the maximum number of login sessions for a single user is 0 (unlimited).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the maximum number of login sessions for a single user to 8:

```
(Cisco Controller) > config netuser maxUserLogin 8
```

**Related Commands**

- `show netuser`
config netuser password

To change a local network user password, use the `config netuser password` command.

`config netuser password username password`

**Syntax Description**

| username | Network username. The username can be up to 24 alphanumeric characters. |
| password | Network user password. The password can contain up to 24 alphanumeric characters. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

**Examples**

The following example shows how to configure a wireless LAN ID 2 to associate with the user named aire1:

```
(Cisco Controller) > config netuser wlan-id aire1 2
```
config network client-ip-conflict-detection

To enable or disable client DHCP address conflict detection in a network, use the config network client-ip-conflict-detection command.

config network client-ip-conflict-detection \ (enable | disable)

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax Description</td>
<td>If a wireless client receives a DHCP address, which is already registered to another client, the earlier client will be disconnected and will have to reconnect and get a new address.</td>
<td></td>
</tr>
<tr>
<td>Command Default</td>
<td>Disabled.</td>
<td></td>
</tr>
<tr>
<td>Command History</td>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
<td></td>
</tr>
</tbody>
</table>
config network http-proxy ip-address

To configure network http proxy server ip address, use the **config network http-proxy ip-address** command.

```
config network http-proxy ip-address ip-address port port-no
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-address</td>
<td>IP address for http-proxy.</td>
</tr>
<tr>
<td>port-no</td>
<td>Port number for http-proxy.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable configure network http proxy server ip address:

```
cisco controller config network http-proxy ip-address 10.10.10.11 port 8080
```

**Related Commands**

- show network summary
config network bridging-shared-secret

To configure the bridging shared secret, use the `config network bridging-shared-secret` command.

```
config network bridging-shared-secret shared_secret
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>shared_secret</code></td>
<td>Bridging shared secret string. The string can contain up to 10 bytes.</td>
</tr>
</tbody>
</table>

**Command Default**

The bridging shared secret is enabled by default.

**Command History**

`Release  Modification`

```
7.6     This command was introduced in a release earlier than Release 7.6.
```

**Usage Guidelines**

This command creates a secret that encrypts backhaul user data for the mesh access points that connect to the switch.

The zero-touch configuration must be enabled for this command to work.

The following example shows how to configure the bridging shared secret string “shhh1”:

```
(Cisco Controller) > config network bridging-shared-secret shhh1
```

**Related Commands**

- `show network summary`
**config network web-auth captive-bypass**

To configure the controller to support bypass of captive portals at the network level, use the `config network web-auth captive-bypass` command.

```
config network web-auth captive-bypass { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows the controller to support bypass of captive portals.</td>
</tr>
<tr>
<td>disable</td>
<td>Disallows the controller to support bypass of captive portals.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the controller to support bypass of captive portals:

```
(Cisco Controller) > config network web-auth captive-bypass enable
```

**Related Commands**

- `show network summary`
- `config network web-auth cmcc-support`
config network web-auth port

To configure an additional port to be redirected for web authentication at the network level, use the `config network web-auth port` command.

`config network web-auth port port`

**Syntax Description**

| Port number. The valid range is from 0 to 65535. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an additional port number 1200 to be redirected for web authentication:

```
(Cisco Controller) > config network web-auth port 1200
```

**Related Commands**

- `show network summary`
config network web-auth proxy-redirect

To configure proxy redirect support for web authentication clients, use the config network web-auth proxy-redirect command.

config network web-auth proxy-redirect  { enable | disable }

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Allows proxy redirect support for web authentication clients.</td>
<td>Disallows proxy redirect support for web authentication clients.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable proxy redirect support for web authentication clients:

(Cisco Controller) > config network web-auth proxy-redirect enable

Related Commands

show network summary
config network web-auth secureweb

To configure the secure web (https) authentication for clients, use the `config network web-auth secureweb` command.

```
config network web-auth secureweb { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>The default secure web (https) authentication for clients is enabled.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>

</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | If you configure the secure web (https) authentication for clients using the `config network web-auth secureweb disable` command, then you must reboot the Cisco WLC to implement the change. |

The following example shows how to enable the secure web (https) authentication for clients:

```
(Cisco Controller) > config network web-auth secureweb enable
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>show network summary</th>
</tr>
</thead>
</table>
config network webmode

To enable or disable the web mode, use the `config network webmode` command.

```plaintext
config network webmode {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>Enables the web interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax Description</td>
<td>disable</td>
<td>Disables the web interface.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for the web mode is `enable`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the web interface mode:

```
(Cisco Controller) > config network webmode disable
```

**Related Commands**

- `show network summary`
## config network web-auth

To configure the network-level web authentication options, use the `config network web-auth` command.

```
config network web-auth { port port-number } | { proxy-redirect { enable | disable } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>Configures additional ports for web authentication redirection.</td>
</tr>
<tr>
<td>port-number</td>
<td>Port number (between 0 and 65535).</td>
</tr>
<tr>
<td>proxy-redirect</td>
<td>Configures proxy redirect support for web authentication clients.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables proxy redirect support for web authentication clients.</td>
</tr>
</tbody>
</table>

**Note**  
Web-auth proxy redirection will be enabled for ports 80, 8080, and 3128, along with user defined port 345.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables proxy redirect support for web authentication clients.</td>
</tr>
</tbody>
</table>

### Command Default

The default network-level web authentication value is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must reset the system for the configuration to take effect.

The following example shows how to enable proxy redirect support for web authentication clients:

```
(Cisco Controller) > config network web-auth proxy-redirect enable
```

### Related Commands

- `show network summary`
- `show run-config`
- `config qos protocol-type`
config network 802.3-bridging

To enable or disable 802.3 bridging on a controller, use the config network 802.3-bridging command.

**config network 802.3-bridging  { enable  |  disable }**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the 802.3 bridging.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the 802.3 bridging.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, 802.3 bridging on the controller is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In controller software release 5.2, the software-based forwarding architecture for Cisco 2100 Series Controllers is being replaced with a new forwarding plane architecture. As a result, Cisco 2100 Series Controllers and the Cisco wireless LAN controller Network Module for Cisco Integrated Services Routers bridge 802.3 packets by default. Therefore, 802.3 bridging can now be disabled only on Cisco 4400 Series Controllers, the Cisco WiSM, and the Catalyst 3750G Wireless LAN Controller Switch.

To determine the status of 802.3 bridging, enter the `show netuser guest-roles` command.

The following example shows how to enable the 802.3 bridging:

```
(Cisco Controller) > config network 802.3-bridging enable
```

**Related Commands**

- `show netuser guest-roles`
- `show network`
config network allow-old-bridge-aps

To configure an old bridge access point’s ability to associate with a switch, use the `config network allow-old-bridge-aps` command.

```
config network allow-old-bridge-aps  { enable  |  disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the switch association.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the switch association.</td>
</tr>
</tbody>
</table>

**Command Default**

Switch association is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an old bridge access point to associate with the switch:

```
(Cisco Controller) > config network allow-old-bridge-aps enable
```
config network ap-discovery

To enable or disable NAT IP in an AP discovery response, use the `config network ap-discovery` command.

`config network ap-discovery nat-ip-only { enable | disable }

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables use of NAT IP only in discovery response.</td>
</tr>
<tr>
<td>disable</td>
<td>Enables use of both NAT IP and non NAT IP in discovery response.</td>
</tr>
</tbody>
</table>

Command Default

The use of NAT IP only in discovery response is enabled.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

- If the `config interface nat-address management` command is set, this command controls which address(es) are sent in the CAPWAP discovery responses.
- If all APs are on the outside of the NAT gateway of the controller, enter the `config network ap-discovery nat-ip-only enable` command, and only the management NAT address is sent.
- If the controller has both APs on the outside and the inside of its NAT gateway, enter the `config network ap-discovery nat-ip-only disable` command, and both the management NAT address and the management inside address are sent. Ensure that you have entered the `config ap link-latency disable all` command to avoid stranding APs.
- If you disable `nat-ip-only`, the controller sends all active AP-Manager interfaces with their non-NAT IP in discovery response to APs.
- If you enable `nat-ip-only`, the controller sends all active AP-Manager interfaces with NAT IP if configured for the interface, else non-NAT IP.

We recommend that you configure the interface as AP-Manager interface with NAT IP or non-NAT IP keeping these scenarios in mind because the AP chooses the least loaded AP-Manager interface received in the discovery response.

The following example shows how to enable NAT IP in an AP discovery response:

(Cisco Controller) > config network ap-discovery nat-ip-only enable
config network ap-easyadmin

To configure Cisco AP easyadmin feature, use the **config network ap-easyadmin** command.

```
config network ap-easyadmin { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>enable</th>
<th>disable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Enables AP EasyAdmin.</td>
<td>Disables AP EasyAdmin.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>The easyadmin is disabled by default.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
</tr>
<tr>
<td>---------</td>
</tr>
<tr>
<td>8.4</td>
</tr>
</tbody>
</table>

The following example shows how to enable the Cisco AP easyadmin:

```
(Cisco Controller) > config network ap-easyadmin enable
```
**config network ap-fallback**

To configure Cisco lightweight access point fallback, use the `config network ap-fallback` command.

```
config network ap-fallback { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the Cisco lightweight access point fallback.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the Cisco lightweight access point fallback.</td>
</tr>
</tbody>
</table>

**Command Default**

The Cisco lightweight access point fallback is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the Cisco lightweight access point fallback:

```
(Cisco Controller) > config network ap-fallback enable
```
config network ap-priority

To enable or disable the option to prioritize lightweight access points so that after a controller failure they reauthenticate by priority rather than on a first-come-until-full basis, use the config network ap-priority command.

```
config network ap-priority { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the lightweight access point priority reauthentication.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the lightweight access point priority reauthentication.</td>
</tr>
</tbody>
</table>

**Command Default**

The lightweight access point priority reauthentication is disabled.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable the lightweight access point priority reauthorization:

```
(Cisco Controller) > config network ap-priority enable
```
config network apple-talk

To configure AppleTalk bridging, use the `config network apple-talk` command.

```
config network apple-talk { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the AppleTalk bridging.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the AppleTalk bridging.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure AppleTalk bridging:

```
(Cisco Controller) > config network apple-talk enable
```
config network arptimeout

To set the Address Resolution Protocol (ARP) entry timeout value, use the `config network arptimeout` command.

```
config network arptimeout seconds
```

**Syntax Description**

| seconds | Timeout in seconds. The minimum value is 10 seconds. The default value is 300 seconds. |

**Command Default**

The default ARP entry timeout value is 300 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to set the ARP entry timeout value to 240 seconds:

```
(Cisco Controller) > config network arptimeout 240
```

**Related Commands**

- `show network summary`
config assisted-roaming

To configure assisted roaming parameters on the controller, use the `config assisted-roaming` command.

```
config assisted-roaming (denial-maximum count | floor-bias RSSI | prediction-minimum number_of_APs)
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>denial-maximum</td>
<td>Configures the maximum number of counts for association denial.</td>
</tr>
<tr>
<td>count</td>
<td>Maximum number of times that a client is denied for association when the association request that was sent to an access point does not match any access point on the prediction list. The range is from 1 to 10.</td>
</tr>
<tr>
<td>floor-bias</td>
<td>Configures the RSSI bias for access points on the same floor.</td>
</tr>
<tr>
<td>RSSI</td>
<td>RSSI bias for access points on the same floor. The range is from 5 to 25. Access points on the same floor have more preference.</td>
</tr>
<tr>
<td>prediction-minimum</td>
<td>Configures the minimum number of optimized access points for the assisted roaming feature.</td>
</tr>
<tr>
<td>number_of_APs</td>
<td>Minimum number of optimized access points for the assisted roaming feature. The range is from 1 to 6. If the number of access points in the prediction assigned to the client is smaller than this number, the assisted roaming feature does not work.</td>
</tr>
</tbody>
</table>

**Command Default**

The default RSSI bias for access points on the same floor is 15 dBm.

**Usage Guidelines**

802.11k allows a client to request a neighbor report that contains information about known neighbor access points, which can be used for a service set transition. The neighbor list reduces the need for active and passive scanning.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure the minimum number of optimized access points for the assisted roaming feature:

```
(Cisco Controller) > config assisted-roaming prediction-minimum 4
```
To configure an old bridge access point’s ability to associate with a switch, use the `config network allow-old-bridge-aps` command.

```
config network allow-old-bridge-aps {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the switch association.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the switch association.</td>
</tr>
</tbody>
</table>

**Command Default**

Switch association is enabled.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to configure an old bridge access point to associate with the switch:

```
(Cisco Controller) > config network allow-old-bridge-aps enable
```
config network ap-discovery

To enable or disable NAT IP in an AP discovery response, use the **config network ap-discovery** command.

```
config network ap-discovery nat-ip-only { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables use of NAT IP only in discovery response.</td>
</tr>
<tr>
<td>disable</td>
<td>Enables use of both NAT IP and non NAT IP in</td>
</tr>
<tr>
<td></td>
<td>discovery response.</td>
</tr>
</tbody>
</table>

**Command Default**

The use of NAT IP only in discovery response is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- If the **config interface nat-address management** command is set, this command controls which address(es) are sent in the CAPWAP discovery responses.

- If all APs are on the outside of the NAT gateway of the controller, enter the **config network ap-discovery nat-ip-only enable** command, and only the management NAT address is sent.

- If the controller has both APs on the outside and the inside of its NAT gateway, enter the **config network ap-discovery nat-ip-only disable** command, and both the management NAT address and the management inside address are sent. Ensure that you have entered the **config ap link-latency disable all** command to avoid stranding APs.

- If you disable **nat-ip-only**, the controller sends all active AP-Manager interfaces with their non-NAT IP in discovery response to APs.

  If you enable **nat-ip-only**, the controller sends all active AP-Manager interfaces with NAT IP if configured for the interface, else non-NAT IP.

  We recommend that you configure the interface as AP-Manager interface with NAT IP or non-NAT IP keeping these scenarios in mind because the AP chooses the least loaded AP-Manager interface received in the discovery response.

The following example shows how to enable NAT IP in an AP discovery response:

(Cisco Controller) > config network ap-discovery nat-ip-only enable
### config network ap-fallback

To configure Cisco lightweight access point fallback, use the `config network ap-fallback` command.

```plaintext
config network ap-fallback (enable | disable)
```

#### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>

</table>

The following example shows how to configure AppleTalk bridging:

```
(Cisco Controller) > config network apple-talk enable
```
**config network bridging-shared-secret**

To configure the bridging shared secret, use the `config network bridging-shared-secret` command.

```
config network bridging-shared-secret shared_secret
```

**Syntax Description**

- `shared_secret`  
  Bridging shared secret string. The string can contain up to 10 bytes.

**Command Default**

The bridging shared secret is enabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command creates a secret that encrypts backhaul user data for the mesh access points that connect to the switch.

The zero-touch configuration must be enabled for this command to work.

The following example shows how to configure the bridging shared secret string “shhh1”:

```
(Cisco Controller) > config network bridging-shared-secret shhh1
```

**Related Commands**

- `show network summary`
**config network bridging-shared-secret**

To configure the bridging shared secret, use the `config network bridging-shared-secret` command.

```
config network bridging-shared-secret shared_secret
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

</tbody>
</table>
config network broadcast

To enable or disable broadcast packet forwarding, use the `config network broadcast` command.

```
config network broadcast {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the broadcast packet forwarding.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the broadcast packet forwarding.</td>
</tr>
</tbody>
</table>

**Command Default**

The broadcast packet forwarding is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command allows you to enable or disable broadcasting. You must enable multicast mode before enabling broadcast forwarding. Use the `config network multicast mode command` to configure multicast mode on the controller.

**Note**

The default multicast mode is unicast in case of all controllers except for Cisco 2106 Controllers. The broadcast packets and multicast packets can be independently controlled. If multicast is off and broadcast is on, broadcast packets still reach the access points, based on the configured multicast mode.

The following example shows how to enable broadcast packet forwarding:

```
(Cisco Controller) > config network broadcast enable
```

**Related Commands**

- `show network summary`
- `config network multicast global`
- `config network multicast mode`
**config network fast-ssid-change**

To enable or disable fast Service Set Identifier (SSID) changing for mobile stations, use the `config network fast-ssid-change` command.

```
config network fast-ssid-change { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the fast SSID changing for mobile stations.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the fast SSID changing for mobile stations.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
<td></td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable the Fast SSID Change feature, the controller allows clients to move between SSIDs. When the client sends a new association for a different SSID, the client entry in the controller connection table is cleared before the client is added to the new SSID.

When you disable the FastSSID Change feature, the controller enforces a delay before clients are allowed to move to a new SSID.

The following example shows how to enable the fast SSID changing for mobile stations:

```
(Cisco Controller) > config network fast-ssid-change enable
```

**Related Commands**

- `show network summary`
# config network ip-mac-binding

To validate the source IP address and MAC address binding within client packets, use the `config network ip-mac-binding` command.

```bash
config network ip-mac-binding { enable | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the validation of the source IP address to MAC address binding in clients packets.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the validation of the source IP address to MAC address binding in clients packets.</td>
</tr>
</tbody>
</table>

## Command Default

The validation of the source IP address to MAC address binding in clients packets is enabled by default.

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

In controller software release 5.2, the controller enforces strict IP address-to-MAC address binding in client packets. The controller checks the IP address and MAC address in a packet, compares them to the addresses that are registered with the controller, and forwards the packet only if they both match. In previous releases, the controller checks only the MAC address of the client and ignores the IP address.

You might want to disable this binding check if you have a routed network behind a workgroup bridge (WGB).

The following example shows how to validate the source IP and MAC address within client packets:

```bash
(Cisco Controller) > config network ip-mac-binding enable
```
To configure bridging of link local traffic at the local site, use the `config network link-local-bridging` command.

```
config network link-local-bridging {enable | disable}
```

**Syntax Description**
- `enable` Enables bridging of link local traffic at the local site
- `disable` Disables bridging of link local traffic at the local site

**Command Default**
- Disabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>
**config network master-base**

To enable or disable the Cisco wireless LAN controller as an access point default master, use the `config network master-base` command.

```
config network master-base {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the Cisco wireless LAN controller acting as a Cisco lightweight access point default master.</td>
</tr>

<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This setting is only used upon network installation and should be disabled after the initial network configuration. Because the Master Cisco wireless LAN controller is normally not used in a deployed network, the Master Cisco wireless LAN controller setting can be saved from 6.0.199.0 or later releases.

The following example shows how to enable the Cisco wireless LAN controller as a default master:

```
(Cisco Controller) > config network master-base enable
```
config network mgmt-via-wireless

To enable Cisco wireless LAN controller management from an associated wireless client, use the `config network mgmt-via-wireless` command.

```
config network mgmt-via-wireless { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the switch management from a wireless interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the switch management from a wireless interface.</td>
</tr>
</tbody>
</table>

### Command Default

The switch management from a wireless interface is disabled by default.

### Command History

**Release** | **Modification**
--- | ---
7.6 | This command was introduced in a release earlier than Release 7.6.

### Command History

**Release** | **Modification**
--- | ---
8.3 | This command was introduced.

### Usage Guidelines

This feature allows wireless clients to manage only the Cisco wireless LAN controller associated with the client and the associated Cisco lightweight access point. That is, clients cannot manage another Cisco wireless LAN controller with which they are not associated.

This example shows how to configure switch management from a wireless interface:

```
(Cisco Controller) > config network mgmt-via-wireless enable
```

### Related Commands

- `show network summary`
**config network multicast global**

To enable or disable multicasting on the controller, use the `config network multicast global` command.

```
config network multicast global { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the multicast global support.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the multicast global support.</td>
</tr>
</tbody>
</table>

**Command Default**

Multicasting on the controller is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `config network broadcast { enable | disable }` command allows you to enable or disable broadcasting without enabling or disabling multicasting as well. This command uses the multicast mode configured on the controller (by using the `config network multicast mode` command) to operate.

The following example shows how to enable the global multicast support:

```
(Cisco Controller) > config network multicast global enable
```

**Related Commands**

- `show network summary`
- `config network broadcast`
- `config network multicast mode`
config network multicast igmp query interval

To configure the IGMP query interval, use the config network multicast igmp query interval command.

```
cfg network multicast igmp query interval value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Frequency at which controller sends IGMP query messages. The range is from 15 to 2400 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default IGMP query interval is 20 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To configure IGMP query interval, ensure that you do the following:

- Enable the global multicast by entering the config network multicast global enable command.
- Enable IGMP snooping by entering the config network multicast igmp snooping enable command.

The following example shows how to configure the IGMP query interval at 20 seconds:

```
(Cisco Controller) > config network multicast igmp query interval 20
```

**Related Commands**

- config network multicast global
- config network multicast igmp snooping
- config network multicast igmp timeout
config network multicast igmp snooping

To enable or disable IGMP snooping, use the `config network multicast igmp snooping` command.

```
config network multicast igmp snooping { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables IGMP snooping.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables IGMP snooping.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

- **Release**
  - 7.6 This command was introduced in a release earlier than Release 7.6.
  - 8.3 This command was introduced.

The following example shows how to enable internet IGMP snooping settings:

```
(Cisco Controller) > config network multicast igmp snooping enable
```

**Related Commands**

- `config network multicast global`
- `config network multicast igmp query interval`
- `config network multicast igmp timeout`
**config network multicast igmp timeout**

To set the IGMP timeout value, use the `config network multicast igmp timeout` command.

`config network multicast igmp timeout value`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>Timeout range from 30 to 7200 seconds.</td>
</tr>
</tbody>
</table>

| Command Default | None |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enter a timeout value between 30 and 7200 seconds. The controller sends three queries in one timeout value at an interval of timeout/3 to see if any clients exist for a particular multicast group. If the controller does not receive a response through an IGMP report from the client, the controller times out the client entry from the MGID table. When no clients are left for a particular multicast group, the controller waits for the IGMP timeout value to expire and then deletes the MGID entry from the controller. The controller always generates a general IGMP query (to destination address 224.0.0.1) and sends it on all WLANs with an MGID value of 1.

The following example shows how to configure the timeout value 50 for IGMP network settings:

```
(Cisco Controller) > config network multicast igmp timeout 50
```

**Related Commands**

- `config network multicast global`
- `config network igmp snooping`
- `config network multicast igmp query interval`
**config network multicast l2mcast**

To configure the Layer 2 multicast on an interface or all interfaces, use the `config network multicast l2mcast` command.

```
config network multicast l2mcast { enable | disable { all | interface-name }
```

**Syntax Description**

- **enable**: Enables Layer 2 multicast.
- **disable**: Disables Layer 2 multicast.
- **all**: Applies to all interfaces.
- **interface-name**: Interface name for which the Layer 2 multicast is to enabled or disabled.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>

The following example shows how to enable Layer 2 multicast for all interfaces:

```
(Cisco Controller) > config network multicast l2mcast enable all
```

**Related Commands**

- `config network multicast global`
- `config network multicast igmp snooping`
- `config network multicast igmp query interval`
- `config network multicast mld`
config network multicast mld

To configure the Multicast Listener Discovery (MLD) parameters, use the `config network multicast mld` command.

```
config network multicast mld { query interval interval-value | snooping { enable | disable } | timeout timeout-value }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>query interval</code></td>
<td>Configures query interval to send MLD query messages.</td>
</tr>
<tr>
<td><code>interval-value</code></td>
<td>Query interval in seconds. The range is from 15 to 2400 seconds.</td>

8.3     | This command was introduced. |

The following example shows how to configure the controller to use the unicast mode:

```
(Cisco Controller) > config network multicast mode unicast
```
**config network oeap-600 dual-rlan-ports**

To configure the Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port in addition to port 4, use the `config network oeap-600 dual-rlan-ports` command.

```plaintext
config network oeap-600 dual-rlan-ports { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port in addition to port 4.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Resets the Ethernet port 3 Cisco OfficeExtend 600 Series access points to function as a local LAN port.</td>
</tr>
</tbody>
</table>

**Command Default**

The Ethernet port 3 Cisco 600 Series OEAP is reset.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

The following example shows how to enable the Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port:

```plaintext
(Cisco Controller) > config network oeap-600 dual-rlan-ports enable
```
To configure access to the local network for the Cisco 600 Series OfficeExtend access points, use the config network oeap-600 local-network command.

```
config network oeap-600 local-network { enable | disable }
```

### Syntax Description

- **enable**
  - Enables access to the local network for the Cisco 600 Series OfficeExtend access points.
- **disable**
  - Disables access to the local network for the Cisco 600 Series OfficeExtend access points.

### Command Default

Access to the local network for the Cisco 600 Series OEAPs is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

The following example shows how to enable access to the local network for the Cisco 600 Series OfficeExtend access points:

```
(Cisco Controller) > config network oeap-600 local-network enable
```
config network otap-mode

To enable or disable over-the-air provisioning (OTAP) of Cisco lightweight access points, use the `config network otap-mode` command.

```
config network otap-mode {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables the OTAP provisioning.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables the OTAP provisioning.</td>
</tr>
</tbody>
</table>

**Command Default**

The OTAP provisioning is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

The following example shows how to set the RF-network name to travelers:

```
(Cisco Controller) > config network rf-network-name travelers
```

**Related Commands**

- `show network summary`
# config network secureweb

To change the state of the secure web (https is http and SSL) interface for management users, use the `config network secureweb` command.

```
config network secureweb { enable | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the secure web interface for management users.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the secure web interface for management users.</td>
</tr>
</tbody>
</table>

## Command Default

The secure web interface for management users is enabled by default.

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

This command allows management users to access the controller GUI using an http://ip-address. Web mode is not a secure connection.

The following example shows how to enable the secure web interface settings for management users:

```
(Cisco Controller) > config network secureweb enable
You must reboot for the change to take effect.
```

## Related Commands

- `config network secureweb cipher-option`
- `show network summary`
config network secureweb cipher-option

To enable or disable secure web mode with increased security, or to enable or disable Secure Sockets Layer (SSL v2) for web administration and web authentication, use the `config network secureweb cipher-option` command.

```
cfg> config network secureweb cipher-option { high | sslv2 | rc4-preference } { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>high</strong></td>
<td>Configures whether or not 128-bit ciphers are required for web administration and web authentication.</td>
</tr>
<tr>
<td><strong>sslv2</strong></td>
<td>Configures SSLv2 for both web administration and web authentication.</td>
</tr>
<tr>
<td><strong>rc4-preference</strong></td>
<td>Configures preference for RC4-SHA (Rivest Cipher 4-Secure Hash Algorithm) cipher suites (over CBC cipher suites) for web authentication and web administration.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables the secure web interface.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables the secure web interface.</td>
</tr>
</tbody>
</table>

### Command Default

The default is **disable** for secure web mode with increased security and **enable** for SSL v2.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Note**

The `config network secureweb cipher-option` command allows users to access the controller GUI using an http://ip-address but only from browsers that support 128-bit (or larger) ciphers.

When cipher-option sslv2 is disabled, users cannot connect using a browser configured with SSLv2 only. They must use a browser that is configured to use a more secure protocol such as SSLv3 or later.

In RC4-SHA based cipher suites, RC4 is used for encryption and SHA is used for message authentication.

The following example shows how to enable secure web mode with increased security:

```
(Cisco Controller) > config network secureweb cipher-option high enable
```

The following example shows how to disable SSL v2:
config network secureweb cipher-option

(Cisco Controller) > config network secureweb cipher-option sslv2 disable

Related Commands
- config network secureweb
- show network summary
config network ssh

To allow or disallow new Secure Shell (SSH) sessions, use the `config network ssh` command.

```
config network ssh {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows the new SSH sessions.</td>
</tr>
<tr>
<td>disable</td>
<td>Disallows the new SSH sessions.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for the new SSH session is `disable`.

The following example shows how to enable the new SSH session:

```
(Cisco Controller) > config network ssh enable
```

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Related Commands**

`show network summary`
config network telnet

To allow or disallow new Telnet sessions, use the **config network telnet** command.

```
config network telnet  { enable  |  disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows new Telnet sessions.</td>
</tr>
<tr>
<td>disable</td>
<td>Disallows new Telnet sessions.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the new Telnet session is disallowed and the value is **disable**.

**Usage Guidelines**

Telnet is not supported on Cisco Aironet 1830 and 1850 Series Access Points.

**Command History**

- **Release 7.6** This command was introduced in a release earlier than Release 7.6.
- **Release 8.3** This command was introduced.

The following example shows how to configure the new Telnet sessions:

```
(Cisco Controller) > config network telnet enable
```
config network usertimeout

To change the timeout for idle client sessions, use the config network usertimeout command.

```
config network usertimeout seconds
```

**Syntax Description**

- `seconds`  
  Timeout duration in seconds. The minimum value is 90 seconds. The default value is 300 seconds.

**Command Default**

The default timeout value for idle client session is 300 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to set the idle client session duration on the Cisco wireless LAN controller. The minimum duration is 90 seconds.

The following example shows how to configure the idle session timeout to 1200 seconds:

```
(Cisco Controller) > config network usertimeout 1200
```

**Related Commands**

- `show network summary`
config network web-auth captive-bypass

To configure the controller to support bypass of captive portals at the network level, use the `config network web-auth captive-bypass` command.

```
config network web-auth captive-bypass { enable | disable }
```

**Syntax Description**

- **enable**
  - Allows the controller to support bypass of captive portals.
- **disable**
  - Disallows the controller to support bypass of captive portals.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

The following example shows how to configure the controller to support bypass of captive portals:

```
(Cisco Controller) > config network web-auth captive-bypass enable
```

**Related Commands**

- `show network summary`
- `config network web-auth cmcc-support`
**config network web-auth cmcc-support**

To configure eWalk on the controller, use the `config network web-auth cmcc-support` command.

```
config network web-auth cmcc-support {enable | disable}
```

**Syntax Description**

- `enable` Enables eWalk on the controller.
- `disable` Disables eWalk on the controller.

**Command Default**

None

The following example shows how to enable eWalk on the controller:

```
(Cisco Controller) > config network web-auth cmcc-support enable
```

**Related Commands**

- `show network summary`
- `config network web-auth captive-bypass`
To configure an additional port to be redirected for web authentication at the network level, use the `config network web-auth port` command.

```
config network web-auth port port
```

**Syntax Description**

| **port** | Port number. The valid range is from 0 to 65535. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>

</table>

The following example shows how to enable proxy redirect support for web authentication clients:

```
(Cisco Controller) > config network web-auth proxy-redirect enable
```

Related Commands

- `show network summary`
config network web-auth secureweb

To configure the secure web (https) authentication for clients, use the `config network web-auth secureweb` command.

```
config network web-auth secureweb { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Allows secure web (https) authentication for clients.</td>
</tr>
<tr>
<td>disable</td>
<td>Disallows secure web (https) authentication for clients. Enables http web authentication for clients.</td>
</tr>
</tbody>
</table>

**Command Default**

The default secure web (https) authentication for clients is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you configure the secure web (https) authentication for clients using the `config network web-auth secureweb disable` command, then you must reboot the Cisco WLC to implement the change.

The following example shows how to enable the secure web (https) authentication for clients:

```
(Cisco Controller) > config network web-auth secureweb enable
```

**Related Commands**

`show network summary`
config network web-auth https-redirect

To configure https redirect support for web authentication clients, use the config network web-auth https-redirect command.

```bash
config network web-auth https-redirect { enable | disable }
```

**Syntax Description**

- **enable**
  - Enables the secure redirection(https) for web-authentication clients.

- **disable**
  - Disables the secure redirection(https) for web-authentication clients.

**Command Default**

This command is by default disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in Release 8.0</td>
</tr>
</tbody>
</table>

The following example shows how to enable proxy redirect support for web authentication clients:

```bash
(Cisco Controller) > config network web-auth https-redirect enable
```

**Related Commands**

- `show network summary`
config network webcolor

To configure the web color theme for the controller GUI, use the `config network webcolor` command.

```
config network webcolor {default | red}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>default</code></td>
<td></td>
<td>Specifies the default web color theme for the controller GUI.</td>
</tr>
<tr>
<td><code>red</code></td>
<td></td>
<td>Specifies the web color theme as red for the controller GUI.</td>
</tr>
</tbody>
</table>

Command Default: Default

Command History:

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines:

If you are changing the web color theme from the controller CLI, you need to reload the controller GUI to apply your changes.

The following example shows how to configure the web interface color as red for the controller GUI:

```
(Cisco Controller) > config network webcolor red
```
config network webmode

To enable or disable the web mode, use the `config network webmode` command.

```
config network webmode { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the web interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the web interface.</td>
</tr>
</tbody>
</table>

### Command Default

The default value for the web mode is `enable`.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the web interface mode:

```
(Cisco Controller) > config network webmode disable
```

### Related Commands

- `show network summary`
config network web-auth

To configure the network-level web authentication options, use the config network web-auth command.

```
config network web-auth { port port-number } | { proxy-redirect { enable | disable } }
```

**Syntax Description**

- **port**
  - Configures additional ports for web authentication redirection.

- **port-number**
  - Port number (between 0 and 65535).

- **proxy-redirect**
  - Configures proxy redirect support for web authentication clients.

- **enable**
  - Enables proxy redirect support for web authentication clients.

  **Note**
  - Web-auth proxy redirection will be enabled for ports 80, 8080, and 3128, along with user-defined port 345.

- **disable**
  - Disables proxy redirect support for web authentication clients.

**Command Default**

The default network-level web authentication value is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must reset the system for the configuration to take effect.

The following example shows how to enable proxy redirect support for web authentication clients:

```
(Cisco Controller) > config network web-auth proxy-redirect enable
```

**Related Commands**

- show network summary
- show run-config
- config qos protocol-type
To configure bridge access point ZeroConfig support, use the `config network zero-config` command.

`config network zero-config { enable | disable }`

**Syntax Description**
- **enable**: Enables the bridge access point ZeroConfig support.
- **disable**: Disables the bridge access point ZeroConfig support.

**Command Default**
The bridge access point ZeroConfig support is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the bridge access point ZeroConfig support:

```
(Cisco Controller) > config network zero-config enable
```
config network master-base

To enable or disable the Cisco wireless LAN controller as an access point default master, use the `config network master-base` command.

```
config network master-base { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the Cisco wireless LAN controller acting as a Cisco lightweight access point default master.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the Cisco wireless LAN controller acting as a Cisco lightweight access point default master.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This setting is only used upon network installation and should be disabled after the initial network configuration. Because the Master Cisco wireless LAN controller is normally not used in a deployed network, the Master Cisco wireless LAN controller setting can be saved from 6.0.199.0 or later releases.

The following example shows how to enable the Cisco wireless LAN controller as a default master:

```
(Cisco Controller) > config network master-base enable
```
### config network oeap-600 dual-rlan-ports

To configure the Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port in addition to port 4, use the `config network oeap-600 dual-rlan-ports` command.

```
config network oeap-600 dual-rlan-ports {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Enables Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port in addition to port 4.</td>
</tr>

The following example shows how to enable the Ethernet port 3 of Cisco OfficeExtend 600 Series access points to operate as a remote LAN port:

```
(Cisco Controller) > config network oeap-600 dual-rlan-ports enable
```
To configure access to the local network for the Cisco 600 Series OfficeExtend access points, use the `config network oeap-600 local-network` command.

```
config network oeap-600 local-network { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables access to the local network for the Cisco 600 Series OfficeExtend access points.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables access to the local network for the Cisco 600 Series OfficeExtend access points.</td>
</tr>
</tbody>
</table>

**Command Default**

Access to the local network for the Cisco 600 Series OEAPs is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable access to the local network for the Cisco 600 Series OfficeExtend access points:

```
(Cisco Controller) > config network oeap-600 local-network enable
```
**config network otap-mode**

To enable or disable over-the-air provisioning (OTAP) of Cisco lightweight access points, use the `config network otap-mode` command.

```
config network otap-mode {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.enable</td>
<td>Enables the OTAP provisioning.</td>
</tr>
<tr>

</table>

The following example shows how to enable the bridge access point ZeroConfig support:

```
(Cisco Controller) >config network zero-config enable
```
config nmsp cipher-option

To configure cipher option for NMSP, use the config nmsp cipher-option command.

```
config nmsp cipher-option high {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>high</td>
<td>Configures to use TLSv1.2 for NMSP.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables high cipher option on NMSP.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables high cipher option on NMSP.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.8.111.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable NMSP high cipher option:

```
(Cisco Controller) > config nmsp cipher-option high enable
```
**config nmsp notify-interval measurement**

To modify the Network Mobility Services Protocol (NMSP) notification interval value on the controller to address latency in the network, use the `config nmsp notify-interval measurement` command.

```
config nmsp notify-interval measurement { client | rfid | rogue } interval
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>client</td>
<td>Modifies the interval for clients.</td>
</tr>
<tr>
<td>rfid</td>
<td>Modifies the interval for active radio frequency identification (RFID) tags.</td>
</tr>
<tr>
<td>rogue</td>
<td>Modifies the interval for rogue access points and rogue clients.</td>
</tr>
<tr>
<td>interval</td>
<td>Time interval. The range is from 1 to 30 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The TCP port (16113) that the controller and location appliance communicate over must be open (not blocked) on any firewall that exists between the controller and the location appliance for NMSP to function.

The following example shows how to modify the NMSP notification interval for the active RFID tags to 25 seconds:

```
(Cisco Controller) > config nmsp notify-interval measurement rfid 25
```

**Related Commands**

- `clear locp statistics`
- `clear nmsp statistics`
- `show nmsp notify-interval summary`
- `show nmsp statistics`
- `show nmsp status`
**config opendns**

To enable or disable open Domain Name System (DNS) on the Cisco Wireless Controller (WLC), use the `config opendns` command.

```
config opendns { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the opendns global configuration.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the opendns global configuration.</td>
</tr>
</tbody>
</table>

**Command Default**

Open DNS is not configured.

</tr>
</tbody>
</table>

**Usage Guidelines**

None

**Example**

The following example shows how to enable OpenDNS on Cisco WLC:

(Cisco Controller) > config opendns forced enable
**config opendns profile**

To configure a profile for the OpenDNS, which can be applied to a user group, or wireless LAN (WLAN), or site, use the `config opendns profile` command.

```
config opendns profile { create | delete | refresh} profile-name
```

**Syntax Description**

- **create**: Creates an OpenDNS identity name.
- **delete**: Removes an OpenDNS identity name.
- **refresh**: Refreshes OpenDNS identity by retriggering the registration, irrespective of current state.

**Command Default**

OpenDNS profile is not created.

**Command Modes**

(Controller Configuration) >

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

None

**Example**

The following example shows how to configure a profile for OpenDNS, which can be applied to a user group:

```
(Cisco Controller) > config opendns profile create usergroup1
```
config pmipv6 domain

To configure PMIPv6 and to enable Mobile Access Gateway (MAG) functionality on Cisco WLC, use the `config pmipv6 domain` command.

`config pmipv6 domain domain_name`

**Syntax Description**

`domain_name` Name of the PMIPv6 domain. The domain name can be up to 127 case-sensitive, alphanumeric characters.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a domain name for a PMIPv6 WLAN:

(Cisco Controller) > `config pmipv6 domain floor1`
**config pmipv6 add profile**

To create a Proxy Mobility IPv6 (PMIPv6) profile for the WLAN, use the `config pmipv6 add profile` command. You can configure PMIPv6 profiles based on a realm or a service set identifier (SSID).

```
config pmipv6 add profile profile_name nai { user@realm | @realm | * } lma lma_name apn apn_name
```

### Syntax Description

- **profile_name**
  - Name of the profile. The profile name is case sensitive and can be up to 127 alphanumeric characters.

- **nai**
  - Specifies the Network Access Identifier of the client.

- **user@realm**
  - Network Access Identifier of the client in the format `user@realm`. The NAI name is case sensitive and can be up to 127 alphanumeric characters.

- **@realm**
  - Network Access Identifier of the client in the format `@realm`.

- *****
  - All Network Access Identifiers. You can have profiles based on an SSID for all users.

- **lma**
  - Specifies the Local Mobility Anchor (LMA).

- **lma_name**
  - Name of LMA. The LMA name is case sensitive and can be up to 127 alphanumeric characters.

- **apn**
  - Specifies the access point.

- **apn_name**
  - Name of the access point. The access point name is case sensitive and can be up to 127 alphanumeric characters.

### Command Default

None

### Command History

- **Release**
  - **7.6**
  - This command was introduced in a release earlier than Release 7.6.

### Usage Guidelines

This command is a prerequisite for using PMIPv6 configuration commands if the controller uses open authentication.

The following example shows how to create a PMIPv6 profile:

```
(Cisco Controller) > config pmipv6 add profile profile1 nai vodafone.com lma vodfonelma apn vodafoneapn
```
To delete a Proxy Mobility IPv6 (PMIPv6) profile, domain, or Local Mobility Anchor (LMA), use the **config pmipv6 delete** command.

```
config pmipv6 delete {profile profile_name nai { nai_id | all } | domain domain_name | lma lma_name}
```

**Syntax Description**

- **profile**: Specifies the PMIPv6 profile.
- **profile_name**: Name of the PMIPv6 profile. The profile name is case sensitive and can be up to 127 alphanumeric characters.
- **nai**: Specifies the Network Access Identifier (NAI) of a mobile client.
- **nai_id**: Network Access Identifier of a mobile client. The NAI is case sensitive and can be up to 127 alphanumeric characters.
- **all**: Specifies all NAIs. When you delete all NAIs, the profile is deleted.
- **domain**: Specifies the PMIPv6 domain.
- **domain_name**: Name of the PMIPv6 domain. The domain name is case sensitive and can be up to 127 alphanumeric characters.
- **lma**: Specifies the LMA.
- **lma_name**: Name of the LMA. The LMA name is case sensitive and can be up to 127 alphanumeric characters.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a domain:

```
(Cisco Controller) > config pmipv6 delete lab1
```
**config pmipv6 mag apn**

To configure an Access Point Name (APN) for a mobile access gateway (MAG), use the `config pmipv6 mag apn` command.

```
config pmipv6 mag apn apn-name
```

**Syntax Description**

| apn-name | Access point name for the MAG. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

By default, the MAG role is WLAN. However, for the lightweight access points, MAG role should be configured as 3GPP. If the MAG role is 3GPP, it is mandatory to specify an APN for the MAG.

To delete an APN for a MAG, use the `config pmipv6 delete mag apn apn-name` command.

The following example shows how to add an APN for a MAG:

```
(Cisco Controller) >config pmipv6 mag apn myCiscoAP
```
**config pmipv6 mag binding init-retx-time**

To configure the initial timeout between the proxy binding updates (PBUs) when the Mobile Access Gateway (MAG) does not receive the proxy binding acknowledgements (PBAs), use the `config pmipv6 mag binding init-retx-time` command.

```plaintext
config pmipv6 mag binding init-retx-time units
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>units</td>
<td>Initial timeout between the PBUs when the MAG does not receive the PBAs. The range is from 100 to 65535 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default initial timeout is 1000 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the initial timeout between the PBUs when the MAG does not receive the PBAs:

(Cisco Controller) >`config pmipv6 mag binding init-retx-time 500`
config pmipv6 mag binding lifetime

To configure the lifetime of the binding entries in the Mobile Access Gateway (MAG), use the config pmipv6 mag binding lifetime command.

config pmipv6 mag binding lifetime units

Syntax Description

units  Lifetime of the binding entries in the MAG. The binding lifetime must be a multiple of 4 seconds. The range is from 10 to 65535 seconds.

Command Default

The default lifetime of the binding entries is 65535 seconds.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You must configure a Proxy Mobility IPv6 (PMIPv6) domain before you configure the lifetime of the binding entries in the controller.

The following example shows how to configure the lifetime of the binding entries in the controller:

(Cisco Controller) > config pmipv6 mag binding lifetime 5000
config pmipv6 mag binding max-retx-time

To configure the maximum timeout between the proxy binding updates (PBUs) when the Mobility Access Gateway (MAG) does not receive the proxy binding acknowledgments (PBAs), use the `config pmipv6 mag binding max-retx-time` command.

```
config pmipv6 mag binding max-retx-time units
```

**Syntax Description**

| units       | Maximum timeout between the PBUs when the MAG does not receive the PBAs. The range is from 100 to 65535 seconds. |

**Command Default**

The default maximum timeout is 32000 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the maximum timeout between the PBUs when the MAG does not receive the PBAs:

```
(Cisco Controller) > config pmipv6 mag binding max-retx-time 50
```
config pmipv6 mag binding maximum

To configure the maximum number of binding entries in the Mobile Access Gateway (MAG), use the `config pmipv6 mag binding maximum` command.

`config pmipv6 mag binding maximum units`

**Syntax Description**

| units | Maximum number of binding entries in the MAG. This number indicates the maximum number of users connected to the MAG. The range is from 0 to 40000. |

**Command Default**

The default maximum number of binding entries in the MAG is 10000.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must configure a Proxy Mobility IPv6 (PMIPv6) domain before you configure the maximum number of binding entries in the MAG.

The following example shows how to configure the maximum number of binding entries in the MAG:

```
(Cisco Controller) >config pmipv6 mag binding maximum 20000
```
To configure the refresh time of the binding entries in the MAG, use the `config pmipv6 mag binding refresh-time` command.

```
config pmipv6 mag binding refresh-time
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>units</code></td>
<td>Refresh time of the binding entries in the MAG. The binding refresh time must be a multiple of 4. The range is from 4 to 65535 seconds.</td>
</tr>
</tbody>
</table>

### Command Default

The default refresh time of the binding entries in the MAG is 300 seconds.

### Usage Guidelines

You must configure a PMIPv6 domain before you configure the refresh time of the binding entries in the MAG.

The following example shows how to configure the refresh time of the binding entries in the MAG:

```
(Cisco Controller) >config pmipv6 mag binding refresh-time 500
```
**config pmipv6 mag bri delay**

To configure the maximum or minimum amount of time that the MAG waits before retransmitting a Binding Revocation Indication (BRI) message, use the `config pmipv6 mag bri delay` command.

```plaintext
config pmipv6 mag bri delay {min | max} time
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>min</strong></td>
<td>Specifies the minimum amount of time that the MAG waits before retransmitting a BRI message.</td>
</tr>
<tr>
<td><strong>max</strong></td>
<td>Specifies the maximum amount of time that the MAG waits before retransmitting a BRI message.</td>
</tr>
<tr>
<td><strong>time</strong></td>
<td>Maximum or minimum amount of time that the Cisco WLC waits before retransmitting a BRI message. The range is from 500 to 65535 milliseconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value of the maximum amount of time that the MAG waits before retransmitting a BRI message is 2 seconds.

The default value of the minimum amount of time that the MAG waits before retransmitting a BRI message is 1 second.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the minimum amount of time that the MAG waits before retransmitting a BRI message:

```plaintext
(Cisco Controller) >config pmipv6 mag bri delay min 500
```
**config pmipv6 mag bri retries**

To configure the maximum number of times that the MAG retransmits the Binding Revocation Indication (BRI) message before receiving the Binding Revocation Acknowledgment (BRA) message, use the `config pmipv6 mag bri retries` command.

```
config pmipv6 mag bri retries retries
```

**Syntax Description**

- `retries` Maximum number of times that the MAG retransmits the BRI message before receiving the BRA message. The range is from 1 to 10 retries.

**Command Default**

The default is 1 retry.

The following example shows how to configure the maximum number of times that the MAG retries:

```
(Cisco Controller) > config pmipv6 mag bri retries 5
```
To configure a local mobility anchor (LMA) with the mobile access gateway (MAG), use the `config pmipv6 mag lma` command.

```
config pmipv6 mag lma lma_name ipv4-address address
```

**Syntax Description**

- `lma_name` Name of the LMA. The LMA name can be a NAI or a string that uniquely identifies the LMA.
- `ipv4-address` Specifies the IP address of the LMA.
- `address` IP address of the LMA.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is a prerequisite to configure PMIPv6 parameters on the MAG.

The following example shows how to configure an LMA with the MAG:

```
(Cisco Controller) > config pmipv6 mag lma vodafoneLma ipv4-address 209.165.200.254
```
config pmipv6 mag replay-protection

To configure the maximum amount of time difference between the timestamp in the received proxy binding acknowledgment (PBA) and the current time of the day for replay protection, use the **config pmipv6 mag replay-protection** command.

```
config pmipv6 mag replay-protection {  timestamp window time |  sequence-no sequence |  mobile-node-timestamp mobile_node_timestamp }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>timestamp</strong></td>
<td>Specifies the time stamp of the PBA message.</td>
</tr>
<tr>
<td><strong>window</strong></td>
<td>Specifies the maximum time difference between the time stamp in the received PBA message and the current time of day.</td>
</tr>
<tr>
<td><strong>time</strong></td>
<td>Maximum time difference between the time stamp in the received PBA message and the current time of day. The range is from 1 to 300 milliseconds.</td>
</tr>
<tr>
<td><strong>sequence-no</strong></td>
<td>(Optional) Specifies the sequence number in a Proxy Binding Update message.</td>
</tr>
<tr>
<td><strong>sequence</strong></td>
<td>(Optional) Sequence number in the Proxy Binding Update message.</td>
</tr>
<tr>
<td><strong>mobile_node_timestamp</strong></td>
<td>(Optional) Specifies the time stamp of the mobile node.</td>
</tr>
<tr>
<td><strong>mobile_node_timestamp</strong></td>
<td>(Optional) Time stamp of the mobile node.</td>
</tr>
</tbody>
</table>

**Command Default**

The default maximum time difference is 300 milliseconds.

**Usage Guidelines**

Only the timestamp option is supported.

The following example shows how to configure the maximum amount of time difference in milliseconds between the time stamp in the received PBA message and the current time of day:

```
(Cisco Controller) >config pmipv6 mag replay-protection timestamp window 200
```
config port power

To enable or disable Power over Ethernet (PoE) for a specific controller port or for all ports, use the `config port power` command.

```
config port power { all | port } { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>Configures all ports.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Port number.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the specified ports.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the specified ports.</td>
</tr>
</tbody>
</table>

**Command Default**

Enabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable PoE on all ports:

```
(Cisco Controller) > config port power all enable
```

The following example shows how to disable PoE on port 8:

```
(Cisco Controller) > config port power 8 disable
```
config policy action opendns-profile-name

To configure an OpenDNS action to a policy, use the `config policy action opendns-profile-name` command.

```plaintext
config policy policy-name action opendns-profile-name { enable | disable }
```

**Syntax Description**

- `policy-name` : Policy name, for example, iPad, iPhone, smartphone.
- `enable` : Enables the action.
- `disable` : Disables the action.

**Command Modes**

(Controller Configuration) >

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

None

**Example**

The following example shows how to configure an OpenDNS action to a policy:

```plaintext
(Cisco Controller) > config policy ipad action opendns-profile-name enable
```
To enable or disable scrolling of the page, use the `config paging` command.

```
config paging { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the scrolling of the page.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the scrolling of the page.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, scrolling of the page is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Commands that produce a huge number of lines of output with the scrolling of the page disabled might result in the termination of SSH/Telnet connection or user session on the console.

The following example shows how to enable scrolling of the page:

```
(Cisco Controller) > config paging enable
```

**Related Commands**

- `show run-config`
config passwd-cleartext

To enable or disable temporary display of passwords in plain text, use the config passwd-cleartext command.

```
config passwd-cleartext { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the display of passwords in plain text.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the display of passwords in plain text.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, temporary display of passwords in plain text is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be enabled if you want to see user-assigned passwords displayed in clear text when using the show run-config command.

To execute this command, you must enter an admin password. This command is valid only for this particular session. It is not saved following a reboot.

The following example shows how to enable display of passwords in plain text:

```
(Cisco Controller) > config passwd-cleartext enable
The way you see your passwds will be changed
You are being warned.
Enter admin password:
```

**Related Commands**

show run-config
config policy

To configure a native profiling policy on the Cisco Wireless LAN Controller (WLC), use the config policy command.

```
cfgเน pilocy policy_name  { action { acl { enable | disable } acl_name | { average-data-rate | average-realtime-rate | burst-data-rate | burst-realtime-rate | qos | session-timeout | sleeping-client-timeout | avc-profile-name { enable acl_profile_name | disable } | vlan } { enable | disable } } } | active { add hours start_time end_time days day | delete days day | create | delete | match { device-type { add | delete } device-type | eap-type { add | delete } { eap-fast | eap-tls | leap | peap } | role { role_name | none } }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>policy_name</td>
<td>Name of a profiling policy.</td>
</tr>
<tr>
<td>action</td>
<td>Configures an action for the policy.</td>
</tr>
<tr>
<td>acl</td>
<td>Configures an ACL for the policy.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables an action for the policy.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables an action for the policy.</td>
</tr>
<tr>
<td>acl_name</td>
<td>Name of an ACL.</td>
</tr>
<tr>
<td>average-data-rate</td>
<td>Configures the QoS average data rate.</td>
</tr>
<tr>
<td>average-realtime-rate</td>
<td>Configures the QoS average real-time rate.</td>
</tr>
<tr>
<td>burst-data-rate</td>
<td>Configures the QoS burst data rate.</td>
</tr>
<tr>
<td>burst-realtime-rate</td>
<td>Configures the QoS burst real-time rate.</td>
</tr>
<tr>
<td>qos</td>
<td>Configures a QoS action for the policy.</td>
</tr>
<tr>
<td>session-timeout</td>
<td>Configures a session timeout action for the policy.</td>
</tr>
<tr>
<td>sleeping-client-timeout</td>
<td>Configures a sleeping client timeout for the policy.</td>
</tr>
<tr>
<td>avc-profile-name</td>
<td>Configures AVC profile on a policy.</td>
</tr>
<tr>
<td>vlan</td>
<td>Configures a VLAN action for the policy.</td>
</tr>
<tr>
<td>active</td>
<td>Configures the active hours and days for the policy.</td>
</tr>
<tr>
<td>add</td>
<td>Adds active hours and days.</td>
</tr>
<tr>
<td>hours</td>
<td>Configures active hours for the policy.</td>
</tr>
<tr>
<td>start_time</td>
<td>Start time for the policy.</td>
</tr>
<tr>
<td>end_time</td>
<td>End time for the policy.</td>
</tr>
<tr>
<td>days</td>
<td>Configures the day on the policy must work.</td>
</tr>
</tbody>
</table>
Day of the week, such as mon, tue, wed, thu, fri, sat, sun. You can also specify daily or weekdays for the policy to occur daily or on all weekdays.

**delete**
Deletes active hours and days.

**create**
Creates a policy.

**match**
Configures a match criteria for the policy.

**device-type**
Configures a device type match.

**device-type**
Device type on which the policy must be applied. You can configure up to 16 devices types for a policy.

**eap-type**
Configures the Extensible Authentication Protocol (EAP) type as a match criteria.

**eap-fast**
Configures the EAP type as EAP Flexible Authentication via Secure Tunneling (FAST).

**eap-tls**
Configures the EAP type as EAP Transport Layer Security (TLS).

**leap**
Configures the EAP type as Lightweight EAP (LEAP).

**peap**
Configures the EAP type as Protected EAP (PEAP).

**role**
Configures the user type or user group for the user.

**role_name**
User type or user group of the user, for example, student, employee.
You can configure only one role per policy.

**none**
Configures no user type or user group for the user.

---

**Command Default**
There is no native profiling policy on the Cisco WLC.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The maximum number of policies that you can configure is 64.

The following example shows how to configure a role for a policy:

(Cisco Controller) > config policy student_policy role student
config policy match role

To Configure a role match to a policy, use the `config policy match role` command.

```
config policy policy-name match role { role-name | none }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>policy-name</code></td>
<td>Name of the policy.</td>
</tr>
<tr>
<td><code>match</code></td>
<td>Configures a match to a policy.</td>
</tr>
<tr>
<td><code>role</code></td>
<td>Configures a role match to a policy.</td>
</tr>
<tr>
<td><code>role-name</code></td>
<td>Role name to the policy.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Name of the Cisco lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to:

```
(Cisco Controller) > config policy match role
```
**config port adminmode**

To enable or disable the administrative mode for a specific controller port or for all ports, use the `config port adminmode` command.

```
config port adminmode { all | port } { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all ports.</td>
</tr>
<tr>
<td>port</td>
<td>Number of the port.</td>

<tr>
<td>disable</td>
<td>Disables the specified ports.</td>
</tr>
</tbody>
</table>

**Command Default**

Enabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable port 8:

```
(Cisco Controller) > config port adminmode 8 disable
```

The following example shows how to enable all ports:

```
(Cisco Controller) > config port adminmode all enable
```
config port autoneg

To configure 10/100BASE-T Ethernet ports for physical port autonegotiation, use the `config port autoneg` command.

```
config port autoneg { all | port } { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all ports.</td>
</tr>
<tr>
<td>port</td>
<td>Number of the port.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the specified ports.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the specified ports.</td>
</tr>
</tbody>
</table>

**Command Default**

The default for all ports is that auto-negotiation is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to turn on physical port autonegotiation for all front-panel Ethernet ports:

```
(Cisco Controller) > config port autoneg all enable
```

The following example shows how to disable physical port autonegotiation for front-panel Ethernet port 19:

```
(Cisco Controller) > config port autoneg 19 disable
```
config port linktrap

To enable or disable the up and down link traps for a specific controller port or for all ports, use the `config port linktrap` command.

```
config port linktrap { all | port } { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all ports.</td>
</tr>
<tr>
<td>port</td>
<td>Number of the port.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the specified ports.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the specified ports.</td>
</tr>
</tbody>
</table>

**Command Default**

The default value for down link traps for a specific controller port or for all ports is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable port 8 traps:

```
(Cisco Controller) > config port linktrap 8 disable
```

The following example shows how to enable all port traps:

```
(Cisco Controller) > config port linktrap all enable
```
# config port multicast appliance

To enable or disable the multicast appliance service for a specific controller port or for all ports, use the `config port multicast appliance` commands.

```
config port multicast appliance  { all  | port }  { enable  | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Configures all ports.</td>
</tr>
<tr>
<td>port</td>
<td>Number of the port.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the specified ports.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the specified ports.</td>
</tr>
</tbody>
</table>

## Command Default

The default multicast appliance service for a specific controller port or for all ports is enabled.

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable multicast appliance service on all ports:

```
(Cisco Controller) > config port multicast appliance all enable
```

The following example shows how to disable multicast appliance service on port 8:

```
(Cisco Controller) > config port multicast appliance 8 disable
```
config prompt

To change the CLI system prompt, use the **config prompt** command.

**config prompt prompt**

**Syntax Description**

| prompt | New CLI system prompt enclosed in double quotes. The prompt can be up to 31 alphanumeric characters and is case sensitive. |

**Command Default**

The system prompt is configured using the startup wizard.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Because the system prompt is a user-defined variable, it is omitted from the rest of this documentation.

The following example shows how to change the CLI system prompt to Cisco 4400:

(Cisco Controller) > **config prompt “Cisco 4400”**
**config qos average-data-rate**

To define the average data rate in Kbps for TCP traffic per user or per service set identifier (SSID), use the *config qos average-data-rate* command.

```
config qos average-data-rate { bronze | silver | gold | platinum } { per-ssid | per-client } { downstream | upstream } rate
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies the average data rate for the queue bronze.</td>
</tr>
<tr>
<td>silver</td>
<td>Specifies the average data rate for the queue silver.</td>
</tr>
<tr>
<td>gold</td>
<td>Specifies the average data rate for the queue gold.</td>
</tr>
<tr>
<td>platinum</td>
<td>Specifies the average data rate for the queue platinum.</td>
</tr>
<tr>
<td>per-ssid</td>
<td>Configures the rate limit for an SSID per radio. The combined traffic of all clients will not exceed this limit.</td>
</tr>
<tr>
<td>per-client</td>
<td>Configures the rate limit for each client associated with the SSID.</td>
</tr>
<tr>
<td>downstream</td>
<td>Configures the rate limit for downstream traffic.</td>
</tr>
<tr>
<td>upstream</td>
<td>Configures the rate limit for upstream traffic.</td>
</tr>
<tr>
<td>rate</td>
<td>Average data rate for TCP traffic per user. A value between 0 and 51,2000 Kbps (inclusive). A value of 0 imposes no bandwidth restriction on the QoS profile.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the average data rate 0 Kbps for the queue gold per SSID:

```
(Cisco Controller) > config qos average-data-rate gold per ssid downstream 0
```

**Related Commands**

- config qos burst-data-rate
- config qos average-realtime-rate
- config qos burst-realtime-rate
- config wlan override-rate-limit
config qos average-realtime-rate

To define the average real-time data rate in Kbps for UDP traffic per user or per service set identifier (SSID), use the config qos average-realtime-rate command.

config qos average-realtime-rate  { bronze | silver | gold | platinum }  { per-ssid | per-client }  { downstream | upstream }  rate

Syntax Description

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies the average real-time data rate for the queue bronze.</td>

</table>

**Example**

The following example shows how to configure Fastlane QoS on each WLAN:

```
Controller(config)# config qos fastlane enable 1
```
**config qos fastlane disable global**

To disable the Fastlane QoS feature globally, use the `config qos fastlane disable global` command.

**Syntax Description**

This command has no keywords or arguments.

**Command Default**

None

**Command Modes**

Global configuration (config)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Fastlane QoS must be disabled on all WLANs before executing this command.

**Examples**

The following example shows how to disable Fastlane QoS globally for Apple wireless clients:

```
Controller(config)# config qos fastlane disable global
```
config qos max-rf-usage

To specify the maximum percentage of RF usage per access point, use the **config qos max-rf-usage** command.

```bash
config qos max-rf-usage { bronze | silver | gold | platinum } usage_percentage
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies the maximum percentage of RF usage for the queue bronze.</td>
</tr>
<tr>
<td>silver</td>
<td>Specifies the maximum percentage of RF usage for the queue silver.</td>
</tr>
<tr>
<td>gold</td>
<td>Specifies the maximum percentage of RF usage for the queue gold.</td>
</tr>
<tr>
<td>platinum</td>
<td>Specifies the maximum percentage of RF usage for the queue platinum.</td>
</tr>
<tr>
<td>usage_percentage</td>
<td>Maximum percentage of RF usage.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify the maximum percentage of RF usage for the queue gold:

```
(Cisco Controller) > config qos max-rf-usage gold 20
```

**Related Commands**

- show qos description
- config qos average-data-rate
- config qos burst-data-rate
- config qos average-realtime-rate
- config qos burst-realtime-rate
**config qos dot1p-tag**

To define the maximum value (0 to 7) for the priority tag associated with packets that fall within the profile, use the `config qos dot1p-tag` command.

```
config qos dot1p-tag  { bronze  |  silver  |  gold  |  platinum }  dot1p_tag
```

**Syntax Description**

- **bronze**
  Specifies the QoS 802.1p tag for the queue bronze.

- **silver**
  Specifies the QoS 802.1p tag for the queue silver.

- **gold**
  Specifies the QoS 802.1p tag for the queue gold.

- **platinum**
  Specifies the QoS 802.1p tag for the queue platinum.

- **dot1p_tag**
  Dot1p tag value between 1 and 7.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the a QoS 802.1p tag for the queue gold with the dot1p tag value of 5:

```
(Cisco Controller) > config qos dot1p-tag gold 5
```

**Related Commands**

- `show qos queue_length all`
- `config qos protocol-type`
To define the maximum and default QoS levels for unicast and multicast traffic when you assign a QoS profile to a WLAN, use the `config qos priority` command.

```
config qos priority { bronze | silver | gold | platinum } { maximum-priority | default-unicast-priority | default-multicast-priority }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies a Bronze profile of the WLAN.</td>
</tr>
<tr>
<td>silver</td>
<td>Specifies a Silver profile of the WLAN.</td>
</tr>
<tr>
<td>gold</td>
<td>Specifies a Gold profile of the WLAN.</td>
</tr>
<tr>
<td>platinum</td>
<td>Specifies a Platinum profile of the WLAN.</td>
</tr>
<tr>
<td>maximum-priority</td>
<td>Maximum QoS priority as one of the following:</td>
</tr>
<tr>
<td></td>
<td>• besteffort</td>
</tr>
<tr>
<td></td>
<td>• background</td>
</tr>
<tr>
<td></td>
<td>• video</td>
</tr>
<tr>
<td></td>
<td>• voice</td>
</tr>
<tr>
<td>default-unicast-priority</td>
<td>Default unicast priority as one of the following:</td>
</tr>
<tr>
<td></td>
<td>• besteffort</td>
</tr>
<tr>
<td></td>
<td>• background</td>
</tr>
<tr>
<td></td>
<td>• video</td>
</tr>
<tr>
<td></td>
<td>• voice</td>
</tr>
<tr>
<td>default-multicast-priority</td>
<td>Default multicast priority as one of the following:</td>
</tr>
<tr>
<td></td>
<td>• besteffort</td>
</tr>
<tr>
<td></td>
<td>• background</td>
</tr>
<tr>
<td></td>
<td>• video</td>
</tr>
<tr>
<td></td>
<td>• voice</td>
</tr>
</tbody>
</table>

**Command History**

</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

The maximum priority level should not be lower than the default unicast and multicast priority levels.

The following example shows how to configure the QoS priority for a gold profile of the WLAN with voice as the maximum priority, video as the default unicast priority, and besteffort as the default multicast priority.

(Cisco Controller) > config qos priority gold voice video besteffort

Related Commands

config qos protocol-type
**config qos protocol-type**

To define the maximum value (0 to 7) for the priority tag associated with packets that fall within the profile, use the `config qos protocol-type` command.

```
config qos protocol-type { bronze | silver | gold | platinum } { none | dot1p }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies the QoS 802.1p tag for the queue bronze.</td>

</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the QoS protocol type silver:

```
(Cisco Controller) > config qos protocol-type silver dot1p
```

**Related Commands**

- `show qos queue_length all`
- `config qos dot1p-tag`
config qos queue_length

To specify the maximum number of packets that access points keep in their queues, use the `config qos queue_length` command.

```
config qos queue_length (bronze | silver | gold | platinum) queue_length
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bronze</td>
<td>Specifies the QoS length for the queue bronze.</td>
</tr>
<tr>
<td>silver</td>
<td>Specifies the QoS length for the queue silver.</td>
</tr>
<tr>
<td>gold</td>
<td>Specifies the QoS length for the queue gold.</td>
</tr>
<tr>
<td>platinum</td>
<td>Specifies the QoS length for the queue platinum.</td>
</tr>
</tbody>
</table>

**queue_length**

Maximum queue length values (10 to 255).

**Command Default**

None

**Command History**

**Release** | **Modification**
--- | ---
7.6 | This command was introduced in a release earlier than Release 7.6.

**Command History**

**Release** | **Modification**
--- | ---
8.3 | This command was introduced.

The following example shows how to configure the QoS length for the queue “gold” with the maximum queue length value as 12:

```
(Cisco Controller) > config qos queue_length gold 12
```

**Related Commands**

`show qos`
config qos qosmap

To configure QoS map, use the `config qos qosmap` command.

```
config qos qosmap { enable | disable | default }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the QoS map feature.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the QoS map feature.</td>
</tr>
<tr>
<td>default</td>
<td>Resets to default QoS map. This resets the QoS map values to 255 (default), and also adds DSCP UP exceptions if not present previously. To clear the DSCP UP values, enter the <code>config qos qosmap clear-all</code> command.</td>
</tr>
</tbody>
</table>

**Command History**

Release | Modification
---------|--------------
8.1      | This command was introduced.

The following example shows how to enable the QoS map.

```
(Cisco Controller) > config qos qosmap enable
```
### config qos qosmap up-to-dscp-map

To configure the DSCP range for UP, use the **config qos qosmap** command.

**Syntax**: `config qos qosmap up-to-dscp-map {up dscp-default dscp-start dscp-end}`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>up-to-dscp-map</td>
<td>Sets the DSCP range for UP</td>
</tr>
<tr>
<td>up</td>
<td>Wireless UP value</td>
</tr>
<tr>
<td>dscp-default</td>
<td>Default DSCP value for this UP</td>
</tr>
<tr>
<td>dscp-start</td>
<td>The DSCP start range. Range is between 0-63</td>
</tr>
<tr>
<td>dscp-end</td>
<td>The DSCP stop range. Range is 0-63</td>
</tr>
</tbody>
</table>

#### Command History

<table>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the DSCP range for UP.

```
(Cisco Controller) > config qos qosmap up-to-dscp-map 2 3 5 20
```
**config qos qosmap dscp-to-up-exception**

To configure the DSCP exception, use the `config qos qosmap` command.

```
config qos qosmap dscp-to-up-exception {dscp up}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dscp-to-up-exception</td>
<td>Allows to configure DSCP exception.</td>
</tr>
<tr>
<td>dscp</td>
<td>Exception DSCP value for the UP value</td>
</tr>
<tr>
<td>up</td>
<td>Links to the Wireless User Priority (UP) value</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the DSCP exception:

```
(Cisco Controller) > config qos qosmap dscp-to-up-exception 3 1
```
config qos qosmap delete-dscp-exception

To delete a dscp exception, use the `config qos qosmap` command.

```
config qos qosmap delete-dscp-exception dscp
```

**Syntax Description**

<table>
<thead>
<tr>
<th>delete-dscp-exception</th>
<th>Deletes exception for DSCP</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dscp</code></td>
<td>DSCP exception for the UP</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a exception for DSCP.

```
(Cisco Controller) > config qos qosmap delete-dscp-exception 23
```
config qos qosmap clear-all

To delete all the exceptions from the QoS map, use the `config qos qosmap` command.

```
config qos qosmap clear-all
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>clear-all</th>
<th>Deletes all the exceptions</th>
</tr>
</thead>
</table>

<table>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to clear all the exceptions from the QoS map.

```
(Cisco Controller) > config qos qosmap clear-all
```
**config qos qosmap trust dscp upstream**

To mark the upstream packets using the client dscp, use the `config qos qosmap` command.

```
config qos qosmap trust-dscp-upstream { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trust-dscp-upstream</td>
<td>Based on the client's DSCP the upstream packets are marked</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the upstream packet marking using the client dscp.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the upstream packet marking using the client dscp.</td>
</tr>
</tbody>
</table>

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable client dscp based packet marking.

```
(Cisco Controller) > config qos qosmap trust-dscp-upstream enable
```

To configure settings for a RADIUS accounting server for the Cisco wireless LAN controller, use the `config radius acct` command.

```
config radius acct
    { add index IP addr port { ascii | hex } secret | delete index | disable index |
    enable index | disable index | enable index | { mac-delimiter { colon | hyphen | none |
    single-hyphen } | { network index { disable | enable } | { region { group | none | provincial } } | retransmit-timeout index seconds | realm { add | delete } index realm-string }

Syntax Description
```

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds a RADIUS accounting server (IPv4 or IPv6).</td>
</tr>
<tr>
<td>index</td>
<td>RADIUS server index (1 to 17).</td>
</tr>
<tr>
<td>IP addr</td>
<td>RADIUS server IP address (IPv4 or IPv6).</td>
</tr>
<tr>
<td>port</td>
<td>RADIUS server’s UDP port number for the interface protocols.</td>
</tr>
<tr>
<td>ascii</td>
<td>Specifies the RADIUS server’s secret type: ascii.</td>
</tr>
<tr>
<td>hex</td>
<td>Specifies the RADIUS server’s secret type: hex.</td>
</tr>
<tr>
<td>secret</td>
<td>RADIUS server’s secret.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables a RADIUS accounting server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables a RADIUS accounting server.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes a RADIUS accounting server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables IPSec support for an accounting server.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables IPSec support for an accounting server.</td>
</tr>
<tr>
<td>mac-delimiter</td>
<td>Configures MAC delimiter for caller station ID and calling station ID.</td>
</tr>
<tr>
<td>colon</td>
<td>Sets the delimiter to colon (For example: xx:xx:xx:xx:xx:xx).</td>
</tr>
<tr>
<td>hyphen</td>
<td>Sets the delimiter to hyphen (For example: xx-xx-xx-xx-xx).</td>
</tr>
<tr>
<td>none</td>
<td>Disables delimiters (For example: xxxxxxxxxx).</td>
</tr>
<tr>
<td>single-hyphen</td>
<td>Sets the delimiters to single hyphen (For example: xxxxxxx-xxxxxxx).</td>
</tr>
<tr>
<td>network</td>
<td>Configures a default RADIUS server for network users.</td>
</tr>
<tr>
<td>group</td>
<td>Specifies RADIUS server type group.</td>
</tr>
</tbody>
</table>
none
Specifies RADIUS server type none.

provincial
Specifies RADIUS server type provincial.

retransmit-timeout
Changes the default retransmit timeout for the server.

seconds
The number of seconds between retransmissions.

realm
Specifies radius acct realm.

add
Adds radius acct realm.

delete
Deletes radius acct realm.

Command Default
When adding a RADIUS server, the port number defaults to 1813 and the state is enabled.

Usage Guidelines
IPSec is not supported for IPv6.

Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a priority 1 RADIUS accounting server at 10.10.10.10 using port 1813 with a login password of admin:

(Cisco Controller) > config radius acct add 1 10.10.10.10 1813 ascii admin

The following example shows how to configure a priority 1 RADIUS accounting server at 2001:9:6:40::623 using port 1813 with a login password of admin:

(Cisco Controller) > config radius acct add 1 2001:9:6:40::623 1813 ascii admin
To configure IPsec authentication for the Cisco wireless LAN controller, use the `config radius acct ipsec authentication` command.

```
config radius acct ipsec authentication  { hmac-md5 | hmac-sha1 } index
```

**Syntax Description**

- **hmac-md5**: Enables IPsec HMAC-MD5 authentication.
- **hmac-sha1**: Enables IPsec HMAC-SHA1 authentication.
- **index**: RADIUS server index.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the IPsec hmac-md5 authentication service on the RADIUS accounting server index 1:

```
(Cisco Controller) > config radius acct ipsec authentication hmac-md5 1
```

**Related Commands**

- `show radius acct statistics`
config radius acct ipsec disable

To disable IPsec support for an accounting server for the Cisco wireless LAN controller, use the `config radius acct ipsec disable` command.

```
config radius acct ipsec disable index
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index</code></td>
<td>RADIUS server index.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the IPsec support for RADIUS accounting server index 1:

```
(Cisco Controller) > config radius acct ipsec disable 1
```

**Related Commands**

- `show radius acct statistics`
**config radius acct ipsec enable**

To enable IPsec support for an accounting server for the Cisco wireless LAN controller, use the `config radius acct ipsec enable` command.

```plaintext
config radius acct ipsec enable index
```

**Syntax Description**

| index | RADIUS server index. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Examples**

The following example shows how to enable the IPsec support for RADIUS accounting server index 1:

```
(Cisco Controller) > config radius acct ipsec enable 1
```

**Related Commands**

- `show radius acct statistics`
config radius acct ipsec encryption

To configure IPsec encryption for an accounting server for the Cisco wireless LAN controller, use the `config radius acct ipsec encryption` command.

```
config radius acct ipsec encryption { 3des | aes | des } index
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>256-aes</th>
<th>Enables IPsec AES-256 encryption.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>3des</td>
<td>Enables IPsec 3DES encryption.</td>
</tr>
<tr>
<td></td>
<td>aes</td>
<td>Enables IPsec AES encryption.</td>
</tr>
<tr>
<td></td>
<td>des</td>
<td>Enables IPsec DES encryption.</td>
</tr>
<tr>
<td>index</td>
<td></td>
<td>RADIUS server index value of between 1 and 17.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the IPsec 3DES encryption for RADIUS server index value 3:

```
(Cisco Controller) > config radius acct ipsec encryption 3des 3
```
config radius acct ipsec ike

To configure Internet Key Exchange (IKE) for the Cisco WLC, use the `config radius acct ipsec ike` command.

```plaintext
config radius acct ipsec ike dh-group {group-1 | group-2 | group-5 | group-14} | lifetime seconds | phase1 {aggressive | main} | index
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dh-group</td>
<td>Specifies the Dixie-Hellman (DH) group.</td>
</tr>
<tr>
<td>group-1</td>
<td>Configures the DH Group 1 (768 bits).</td>
</tr>
<tr>
<td>group-2</td>
<td>Configures the DH Group 2 (1024 bits).</td>
</tr>
<tr>
<td>group-5</td>
<td>Configures the DH Group 5 (1024 bits).</td>
</tr>
<tr>
<td>group-14</td>
<td>Configures the DH Group 14 (2048 bits).</td>
</tr>
<tr>
<td>lifetime</td>
<td>Configures the IKE lifetime.</td>
</tr>
<tr>
<td>seconds</td>
<td>IKE lifetime in seconds.</td>
</tr>
<tr>
<td>phase1</td>
<td>Configures the IKE phase1 node.</td>
</tr>
<tr>
<td>aggressive</td>
<td>Enables the aggressive mode.</td>
</tr>
<tr>
<td>main</td>
<td>Enables the main mode.</td>
</tr>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 7.6     | This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure an IKE lifetime of 23 seconds for RADIUS server index 1:

```
(Cisco Controller) > config radius acct ipsec ike lifetime 23 1
```

### Related Commands

- `show radius acct statistics`
**config radius acct mac-delimiter**

To specify the delimiter to be used in the MAC addresses that are sent to the RADIUS accounting server, use the *config radius acct mac-delimiter* command.

```
config radius acct mac-delimiter { colon | hyphen | single-hyphen | none }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colon</td>
<td>Sets the delimiter to a colon (for example, xx:xx:xx:xx:xx:xx).</td>
</tr>
<tr>
<td>hyphen</td>
<td>Sets the delimiter to a hyphen (for example, xx-xx-xx-xx-xx-xx).</td>
</tr>
<tr>
<td>single-hyphen</td>
<td>Sets the delimiter to a single hyphen (for example, xxxxxx-xxxxxx).</td>
</tr>
<tr>
<td>none</td>
<td>Disables the delimiter (for example, xxxxxxxxxxxx).</td>
</tr>
</tbody>
</table>

**Command Default**
The default delimiter is a hyphen.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the delimiter hyphen to be used in the MAC addresses that are sent to the RADIUS accounting server for the network users:

```
(Cisco Controller) > config radius acct mac-delimiter hyphen
```

**Related Commands**
- `show radius acct statistics`
**config radius acct network**

To configure a default RADIUS server for network users, use the `config radius acct network` command.

`config radius acct network index { enable | disable }

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index</code></td>
<td>RADIUS server index.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the server as a network user’s default RADIUS server.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the server as a network user’s default RADIUS server.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3  

This command was introduced.

The following example shows how to configure a default RADIUS accounting server for the network users with RADIUS server index 1:

```
(Cisco Controller) > config radius acct network 1 enable
```

**Related Commands**

- `show radius acct statistics`
**config radius acct realm**

To configure realm on RADIUS accounting server, use the `config radius acct realm` command.

```
config radius acct realm {add | delete} radius_index realm_string
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>radius_server</code></td>
<td>Radius server index. The range is from 1 to 17.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>Add realm to RADIUS accounting server.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Delete realm from RADIUS accounting server.</td>
</tr>
<tr>
<td><code>realm_string</code></td>
<td>Unique string associated to RADIUS accounting realm.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how add realm to the RADIUS accounting server:

```
(Cisco Controller) > config radius acct realm add 3 test
```
**config radius acct retransmit-timeout**

To change the default transmission timeout for a RADIUS accounting server for the Cisco wireless LAN controller, use the `config radius acct retransmit-timeout` command.

```plaintext
config radius acct retransmit-timeout index timeout
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds (from 2 to 30) between retransmissions.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure retransmission timeout value 5 seconds between the retransmission:

```plaintext
(Cisco Controller) > config radius acct retransmit-timeout 5
```

**Related Commands**

- `show radius acct statistics`
config radius auth

To configure settings for a RADIUS authentication server for the Cisco wireless LAN controller, use the config radius auth command.

```
config radius auth { add index IP addr port ascii/hex secret } | delete index | enable index | disable index | framed-mtu mtu | ipsec { hmac-md5 index | hmac-sha1 index | encryption { 256-aes | 3des | aes | des } index | ike { auth-mode { pre-shared-key index ascii/hex shared_secret | certificate index } | dh-group { 2048bit-group-14 | group-1 | group-2 | group-5 } index | lifetime seconds index | phase1 { aggressive | main } index } | { keywrap { add ascii/hex kek mack index } | delete index | disable | enable } } | { mac-delimiter { colon | hyphen | none | single-hyphen } } | { management index { enable | disable } } | { mgmt-retransmit-timeout index Retransmit Timeout } | { network index { enable | disable } } | { realm { add | delete } radius-index realm-string } | { retransmit-timeout index Retransmit Timeout } | { rfc3576 { enable | disable } index } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables a RADIUS authentication server.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables a RADIUS authentication server.</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes a RADIUS authentication server.</td>
</tr>
<tr>
<td>index</td>
<td>RADIUS server index. The controller begins the search with 1. The server index range is from 1 to 17.</td>
</tr>
<tr>
<td>add IP addr</td>
<td>IP address (IPv4 or IPv6) of the RADIUS server.</td>
</tr>
<tr>
<td>add port</td>
<td>RADIUS server’s UDP port number for the interface protocols.</td>
</tr>

<td>add ascii/hex</td>
<td>Specifies RADIUS server’s secret type: ascii or hex.</td>
</tr>
<tr>
<td>add secret</td>
<td>RADIUS server’s secret.</td>
</tr>
<tr>
<td>add callStationIdType</td>
<td>Configures Called Station Id information sent in RADIUS authentication messages.</td>
</tr>
<tr>
<td>add framed-mtu</td>
<td>Configures the Framed-MTU for all the RADIUS servers. The framed-mtu range is from 64 to 1300 bytes.</td>
</tr>
<tr>
<td>add ipsec</td>
<td>Enables or disables IPSEC support for an authentication server. IPsec is not supported for IPv6.</td>
</tr>
<tr>
<td>add keywrap</td>
<td>Configures RADIUS keywrap.</td>
</tr>
</tbody>
</table>
### Command Default

When adding a RADIUS server, the port number defaults to 1812 and the state is **enabled**.

### Usage Guidelines

IPSec is not supported for IPv6.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a priority 3 RADIUS authentication server at 10.10.10.10 using port 1812 with a login password of **admin**:

```
(Cisco Controller) > config radius auth add 3 10.10.10.10 1812 ascii admin
```

The following example shows how to configure a priority 3 RADIUS authentication server at 2001:9:6:40::623 using port 1812 with a login password of **admin**:

```
(Cisco Controller) > config radius auth add 3 2001:9:6:40::623 1812 ascii admin
```
### config radius auth callStationIdType

To configure the RADIUS authentication server, use the `config radius auth callStationIdType` command.

```plaintext
config radius auth callStationIdType { ap-ethmac-only | ap-ethmac-ssid | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-mac-ssid-ap-group | ap-macaddr-only | ap-macaddr-ssid | ap-name | ap-name-ssid | flex-group-name | ipaddr | macaddr | vlan-id }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ipaddr</td>
<td>Configures the Call Station ID type to use the IP address (only Layer 3).</td>
</tr>
<tr>
<td>macaddr</td>
<td>Configures the Call Station ID type to use the system’s MAC address (Layers 2 and 3).</td>
</tr>
<tr>
<td>ap-macaddr-only</td>
<td>Configures the Call Station ID type to use the access point’s MAC address (Layers 2 and 3).</td>
</tr>
<tr>
<td>ap-macaddr-ssid</td>
<td>Configures the Call Station ID type to use the access point’s MAC address (Layers 2 and 3) in the format <code>AP MAC address:SSID</code>.</td>
</tr>
<tr>
<td>ap-ethmac-only</td>
<td>Configures the Called Station ID type to use the access point’s Ethernet MAC address.</td>
</tr>
<tr>
<td>ap-ethmac-ssid</td>
<td>Configures the Called Station ID type to use the access point’s Ethernet MAC address in the format <code>AP Ethernet MAC address:SSID</code>.</td>
</tr>
<tr>
<td>ap-group-name</td>
<td>Configures the Call Station ID type to use the AP group name. If the AP is not part of any AP group, default-group is taken as the AP group name.</td>
</tr>
<tr>
<td>flex-group-name</td>
<td>Configures the Call Station ID type to use the FlexConnect group name. If the FlexConnect AP is not part of any FlexConnect group, the system MAC address is taken as the Call Station ID.</td>

<tr>
<td><strong>ap-label-address</strong></td>
<td>Configures the Call Station ID type to the AP MAC address that is printed on the AP label, for the accounting messages.</td>
</tr>
<tr>
<td><strong>ap-label-address-ssid</strong></td>
<td>Configures the Call Station ID type to the AP MAC address:SSID format.</td>
</tr>
</tbody>
</table>

**Command Default**
The MAC address of the system.

**Usage Guidelines**
The controller sends the Called Station ID attribute to the RADIUS server in all authentication and accounting packets. The Called Station ID attribute can be used to classify users to different groups based on the attribute value. The command is applicable only for the Called Station and not for the Calling Station.

You cannot send only the SSID as the Called-Station-ID, you can only combine the SSID with either the access point MAC address or the access point name.

The following example shows how to configure the call station ID type to use the IP address:

```
(Cisco Controller) > config radius auth callStationIdType ipAddr
```

The following example shows how to configure the call station ID type to use the system’s MAC address:

```
(Cisco Controller) > config radius auth callStationIdType macAddr
```

The following example shows how to configure the call station ID type to use the access point’s MAC address:

```
(Cisco Controller) > config radius auth callStationIdType ap-macAddr
```
config radius auth framed-mtu

To configure the framed-mtu value for all RADIUS servers, use the `config radius auth framed-mtu` command.

```
config radius auth framed-mtu mtu
```

**Syntax Description**

| mtu | Framed-MTU value range between 64 and 1300 bytes |

**Command Default**

None

**Command History**

<table>

The following example shows how to set the framed-mtu value for a RADIUS authentication server:

```
(Cisco Controller) > config radius auth framed-mtu 500
```
To configure IPsec support for an authentication server for the Cisco wireless LAN controller, use the `config radius auth IPsec authentication` command.

```
config radius auth IPsec authentication { hmac-md5 | hmac-sha1 } index
```

**Syntax Description**
- **hmac-md5**: Enables IPsec HMAC-MD5 authentication.
- **hmac-sha1**: Enables IPsec HMAC-SHA1 authentication.
- **index**: RADIUS server index.

**Command Default**
None

**Command History**
- **Release**: 7.6
- **Modification**: This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the IPsec hmac-md5 support for RADIUS authentication server index 1:

```
(Cisco Controller) > config radius auth IPsec authentication hmac-md5 1
```

**Related Commands**
- `show radius acct statistics`
config radius auth ipsec disable

To disable IPsec support for an authentication server for the Cisco wireless LAN controller, use the `config radius auth IPsec disable` command.

```
config radius auth ipsec {enable | disable} index
```

**Syntax Description**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables the IPsec support for an authentication server.</th>

This example shows how to enable the IPsec support for RADIUS authentication server index 1:

```
(Cisco Controller) > config radius auth ipsec enable 1
```

This example shows how to disable the IPsec support for RADIUS authentication server index 1:

```
(Cisco Controller) > config radius auth ipsec disable 1
```

**Related Commands**

- `show radius acct statistics`
To configure IPsec encryption support for an authentication server for the Cisco wireless LAN controller, use the `config radius auth ipsec encryption` command.

```
config radius auth IPsec encryption { 256-aes | 3des | aes | des } index
```

**Syntax Description**

- **256-aes**: Enables the IPsec 256 AES encryption.
- **3des**: Enables the IPsec 3DES encryption.
- **aes**: Enables the IPsec AES encryption.
- **des**: Enables the IPsec DES encryption.
- **index**: RADIUS server index.

**Command Default**

None

**Command History**

<table>

The following example shows how to configure IPsec 3des encryption RADIUS authentication server index 3:

```
(Cisco Controller) > config radius auth ipsec encryption 3des 3
```

**Related Commands**

- `show radius acct statistics`
config radius auth ipsec ike

To configure Internet Key Exchange (IKE) for the Cisco wireless LAN controller, use the `config radius auth IPsec ike` command.

```
config radius auth ipsec ike { auth-mode { pre-shared-key index { ascii | hex shared-secret } | certificate index } dh-group { 2048bit-group-14 | group-1 | group-2 | group-5 } | lifetime seconds | phase1 { aggressive | main } } index
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>auth-mode</td>
<td>Configures the IKE authentication method.</td>
</tr>
<tr>
<td>pre-shared-key</td>
<td>Configures the preshared key for IKE authentication method.</td>
</tr>
<tr>
<td>index</td>
<td>RADIUS server index between 1 and 17.</td>
</tr>
<tr>
<td>ascii</td>
<td>Configures RADIUS IPsec IKE secret in an ASCII format.</td>
</tr>
<tr>
<td>hex</td>
<td>Configures RADIUS IPsec IKE secret in a hexadecimal format.</td>
</tr>
<tr>
<td>shared-secret</td>
<td>Configures the shared RADIUS IPsec secret.</td>
</tr>
<tr>
<td>certificate</td>
<td>Configures the certificate for IKE authentication.</td>
</tr>
<tr>
<td>dh-group</td>
<td>Configures the IKE Diffie-Hellman group.</td>
</tr>
<tr>
<td>2048bit-group-14</td>
<td>Configures the DH Group 14 (2048 bits).</td>
</tr>
<tr>
<td>group-1</td>
<td>Configures the DH Group 1 (768 bits).</td>
</tr>
<tr>
<td>group-2</td>
<td>Configures the DH Group 2 (1024 bits).</td>
</tr>
<tr>
<td>group-5</td>
<td>Configures the DH Group 2 (1024 bits).</td>
</tr>
<tr>
<td>lifetime</td>
<td>Configures the IKE lifetime.</td>
</tr>
<tr>
<td>seconds</td>
<td>IKE lifetime in seconds. The range is from 1800 to 57600 seconds.</td>
</tr>
<tr>
<td>phase1</td>
<td>Configures the IKE phase1 mode.</td>
</tr>
<tr>
<td>aggressive</td>
<td>Enables the aggressive mode.</td>
</tr>
<tr>
<td>main</td>
<td>Enables the main mode.</td>
</tr>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
</tbody>
</table>

### Command Default

By default, preshared key is used for IPsec sessions and IKE lifetime is 28800 seconds.
This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure IKE lifetime of 23 seconds for RADIUS authentication server index 1:

(Cisco Controller) > config radius auth ipsec ike lifetime 23 1

show radius acct statistics
**config radius auth keywrap**

To enable and configure Advanced Encryption Standard (AES) key wrap, which makes the shared secret between the controller and the RADIUS server more secure, use the `config radius auth keywrap` command.

`config radius auth keywrap { enable | disable | add { ascii | hex } kek mack | delete } index`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables AES key wrap.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables AES key wrap.</td>
</tr>
<tr>
<td>add</td>
<td>Configures AES key wrap attributes.</td>
</tr>
<tr>
<td>ascii</td>
<td>Configures key wrap in an ASCII format.</td>
</tr>
<tr>
<td>hex</td>
<td>Configures key wrap in a hexadecimal format.</td>
</tr>
<tr>
<td>kek</td>
<td>16-byte Key Encryption Key (KEK).</td>
</tr>
<tr>
<td>mack</td>
<td>20-byte Message Authentication Code Key (MACK).</td>
</tr>
<tr>
<td>delete</td>
<td>Deletes AES key wrap attributes.</td>
</tr>
<tr>
<td>index</td>
<td>Index of the RADIUS authentication server on which to configure the AES key wrap.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

The following example shows how to enable the AES key wrap for a RADIUS authentication server:

```
(Cisco Controller) > config radius auth keywrap enable
```

**Related Commands**

- `show radius auth statistics`
**config radius auth mac-delimiter**

To specify a delimiter to be used in the MAC addresses that are sent to the RADIUS authentication server, use the `config radius auth mac-delimiter` command.

```
config radius auth mac-delimiter { colon | hyphen | single-hyphen | none }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>colon</td>
<td>Sets a delimiter to a colon (for example, <code>xx:xx:xx:xx:xx:xx</code>).</td>
</tr>
<tr>
<td>hyphen</td>
<td>Sets a delimiter to a hyphen (for example, <code>xx-xx-xx-xx-xx-xx</code>).</td>
</tr>
<tr>
<td>single-hyphen</td>
<td>Sets a delimiter to a single hyphen (for example, <code>xxxxxx-xxxxxx</code>).</td>
</tr>
<tr>
<td>none</td>
<td>Disables the delimiter (for example, <code>xxxxxxxxxxxx</code>).</td>
</tr>
</tbody>
</table>

**Command Default**
The default delimiter is a hyphen.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

The following example shows how to specify a delimiter hyphen to be used for a RADIUS authentication server:

```
(Cisco Controller) > config radius auth mac-delimiter hyphen
```

**Related Commands**
- `show radius auth statistics`
config radius auth management

To configure a default RADIUS server for management users, use the `config radius auth management` command.

```
config radius auth management index { enable | disable }
```

**Syntax Description**

- **index**: RADIUS server index.
- **enable**: Enables the server as a management user’s default RADIUS server.
- **disable**: Disables the server as a management user’s default RADIUS server.

**Command Default**

None

**Command History**

- **Release 7.6**: This command was introduced in a release earlier than Release 7.6.
- **Release 8.3**: This command was introduced.

The following example shows how to configure a RADIUS server for management users:

```
(Cisco Controller) > config radius auth management 1 enable
```

**Related Commands**

- `show radius acct statistics`
- `config radius acct network`
- `config radius auth mgmt-retransmit-timeout`
**config radius auth mgmt-retransmit-timeout**

To configure a default RADIUS server retransmission timeout for management users, use the `config radius auth mgmt-retransmit-timeout` command.

`config radius auth mgmt-retransmit-timeout index retransmit-timeout`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>index</code></td>
<td>RADIUS server index.</td>

The following example shows how to configure a retransmission timeout of 5 seconds for a RADIUS authentication server:

```
(Cisco Controller) > config radius auth retransmit-timeout 5
```

**Related Commands**

- `show radius auth statistics`
config radius auth rfc3576

To configure RADIUS RFC-3576 support for the authentication server for the Cisco WLC, use the config radius auth rfc3576 command.

config radius auth rfc3576 (enable | disable) index

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Command Default</th>
<th>Command History</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Disabled</td>
<td>Release 7.6</td>
</tr>
<tr>

<td>RADIUS server index.</td>
<td>Command History</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Release 8.7</td>
</tr>
<tr>
<td></td>
<td>This command was introduced.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Guidelines

RFC 3576, which is an extension to the RADIUS protocol, allows dynamic changes to a user session. RFC 3576 includes support for disconnecting users and changing authorizations applicable to a user session. Disconnect messages cause a user session to be terminated immediately; CoA messages modify session authorization attributes such as data filters.

The following example shows how to enable the RADIUS RFC-3576 support for a RADIUS authentication server:

(Cisco Controller) > config radius auth rfc3576 enable 2

### Related Commands

- show radius auth statistics
- show radius summary
- show radius rfc3576
config radius auth retransmit-timeout

To configure a retransmission timeout value for a RADIUS accounting server, use the `config radius auth server-timeout` command.

```
config radius auth retransmit-timeout index timeout
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout value. The range is from 2 to 30 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default timeout is 2 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a server timeout value of 2 seconds for RADIUS authentication server index 10:

```
(Cisco Controller) > config radius auth retransmit-timeout 2 10
```

**Related Commands**

- `show radius auth statistics`
- `show radius summary`
**config radius aggressive-failover disabled**

To configure the controller to mark a RADIUS server as down (not responding) after the server does not reply to three consecutive clients, use the `config radius aggressive-failover disabled` command.

**config radius aggressive-failover disabled**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

The following example shows how to configure the controller to mark a RADIUS server as down:

```
(Cisco Controller) > config radius aggressive-failover disabled
```

**Related Commands**

- `show radius summary`
To configure RADIUS backward compatibility for the Cisco wireless LAN controller, use the **config radius backward compatibility** command.

```plaintext
config radius backward compatibility { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables RADIUS vendor ID backward compatibility.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables RADIUS vendor ID backward compatibility.</td>
</tr>
</tbody>
</table>

### Command Default

Enabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>

</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the RADIUS backward compatibility settings:

```
(Cisco Controller) > config radius backward compatibility disable
```

### Related Commands

- `show radius summary`
config radius callStationIdCase

To configure callStationIdCase information sent in RADIUS messages for the Cisco WLC, use the config radius callStationIdCase command.

```
config radius callStationIdCase {legacy | lower | upper}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>legacy</td>
<td></td>
<td>Configures Call Station IDs for Layer 2 authentication to RADIUS in uppercase.</td>
</tr>
<tr>
<td>lower</td>
<td></td>
<td>Configures all Call Station IDs to RADIUS in lowercase.</td>
</tr>
<tr>
<td>upper</td>
<td></td>
<td>Configures all Call Station IDs to RADIUS in uppercase.</td>
</tr>
</tbody>
</table>

**Command Default**

Enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to send the call station ID in lowercase:

```
(Cisco Controller) > config radius callStationIdCase lower
```

**Related Commands**

show radius summary
**config radius callStationIdType**

To configure the Called Station ID type information sent in RADIUS accounting messages for the Cisco wireless LAN controller, use the `config radius callStationIdType` command.

```
config radius callStationIdType { ap-ethmac-only | ap-ethmac-ssid | ap-group-name |
ap-label-address | ap-label-address-ssid | ap-location | ap-mac-ssid-ap-group | ap-macaddr-only |
ap-macaddr-ssid | ap-name | ap-name-ssid | flex-group-name | ipaddr | macaddr | vlan-id }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ipaddr</code></td>
<td>Configures the Call Station ID type to use the IP address (only Layer 3).</td>
</tr>
<tr>
<td><code>macaddr</code></td>
<td>Configures the Call Station ID type to use the system’s MAC address (Layers 2 and 3).</td>
</tr>
<tr>
<td><code>ap-macaddr-only</code></td>
<td>Configures the Call Station ID type to use the access point’s MAC address (Layers 2 and 3).</td>
</tr>
<tr>
<td><code>ap-macaddr-ssid</code></td>
<td>Configures the Call Station ID type to use the access point’s MAC address (Layers 2 and 3) in the format <code>AP MAC address:SSID</code>.</td>
</tr>
<tr>
<td><code>ap-ethmac-only</code></td>
<td>Configures the Called Station ID type to use the access point’s Ethernet MAC address.</td>
</tr>
<tr>
<td><code>ap-ethmac-ssid</code></td>
<td>Configures the Called Station ID type to use the access point’s Ethernet MAC address in the format <code>AP Ethernet MAC address:SSID</code>.</td>
</tr>
<tr>
<td><code>ap-group-name</code></td>
<td>Configures the Call Station ID type to use the AP group name. If the AP is not part of any AP group, default-group is taken as the AP group name.</td>
</tr>
<tr>
<td><code>flex-group-name</code></td>
<td>Configures the Call Station ID type to use the FlexConnect group name. If the FlexConnect AP is not part of any FlexConnect group, the system MAC address is taken as the Call Station ID.</td>
</tr>
<tr>
<td><code>ap-name</code></td>
<td>Configures the Call Station ID type to use the access point’s name.</td>
</tr>
<tr>
<td><code>ap-name-ssid</code></td>
<td>Configures the Call Station ID type to use the access point’s name in the format <code>AP name:SSID</code>.</td>
</tr>
<tr>
<td><code>ap-location</code></td>
<td>Configures the Call Station ID type to use the access point’s location.</td>
</tr>
<tr>
<td><code>ap-mac-ssid-ap-group</code></td>
<td>Sets Called Station ID type to the format <code>&lt;AP MAC address&gt;:&lt;SSID&gt;:&lt;AP Group&gt;</code></td>
</tr>
<tr>
<td><code>vlan-id</code></td>
<td>Configures the Call Station ID type to use the system’s VLAN-ID.</td>
</tr>
</tbody>
</table>
**Command Default**

The IP address of the system.

**Usage Guidelines**

The controller sends the Called Station ID attribute to the RADIUS server in all authentication and accounting packets. The Called Station ID attribute can be used to classify users to different groups based on the attribute value. The command is applicable only for the Called Station and not for the Calling Station.

You cannot send only the SSID as the Called-Station-ID, you can only combine the SSID with either the access point MAC address or the access point name.

**Command History**

<table>
<thead>

(Cisco Controller) > config radius callStationIdType ipaddr
```

The following example shows how to configure the call station ID type to use the system’s MAC address:

```plaintext
(Cisco Controller) > config radius callStationIdType macaddr
```

The following example shows how to configure the call station ID type to use the access point’s MAC address:

```plaintext
(Cisco Controller) > config radius callStationIdType ap-macaddr-only
```
**config radius dns**

To retrieve the RADIUS IP information from a DNS server, use the `config radius dns` command.

```
config radius dns { global port { ascii | hex } secret | query url timeout | serverip ip_address | disable | enable }
```

**Syntax Description**

- **global** Configures the global port and secret to retrieve the RADIUS IP information from a DNS server.
- **port** Port number for authentication. The range is from 1 to 65535. All the DNS servers should use the same authentication port.
- **ascii** Format of the shared secret that you should set to ASCII.
- **hex** Format of the shared secret that you should set to hexadecimal.
- **secret** RADIUS server login secret.
- **query** Configures the fully qualified domain name (FQDN) of the RADIUS server and DNS timeout.
- **url** FQDN of the RADIUS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.
- **timeout** Maximum time that the Cisco WLC waits for, in days, before timing out the request and resending it. The range is from 1 to 180.
- **serverip** Configures the DNS server IP address.
- **ip_address** DNS server IP address.
- **disable** Disables the RADIUS DNS feature. By default, this feature is disabled.
- **enable** Enables the Cisco WLC to retrieve the RADIUS IP information from a DNS server. When you enable a DNS query, the static configurations are overridden, that is, the DNS list overrides the static AAA list.

**Command Default**

You cannot configure the global port and secret to retrieve the RADIUS IP information.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>

</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The accounting port is derived from the authentication port. All the DNS servers should use the same secret.

The following example shows how to enable the RADIUS DNS feature on the Cisco WLC:
(Cisco Controller) > `config radius dns enable`
config radius fallback-test

To configure the RADIUS server fallback behavior, use the `config radius fallback-test` command.

```plaintext
config radius fallback-test mode { off | passive | active } | username username | { interval interval }
```

**Syntax Description**

- **mode**
  - Specifies the mode.
  - **off** Disables RADIUS server fallback.
  - **passive** Causes the controller to revert to a preferable server (with a lower server index) from the available backup servers without using extraneous probe messages. The controller ignores all inactive servers for a time period and retries later when a RADIUS message needs to be sent.
  - **active** Causes the controller to revert to a preferable server (with a lower server index) from the available backup servers by using RADIUS probe messages to proactively determine whether a server that has been marked inactive is back online. The controller ignores all inactive servers for all active RADIUS requests.

- **username**
  - Specifies the username.
  - **username** Username. The username can be up to 16 alphanumeric characters.

- **interval**
  - Specifies the probe interval value.
  - **interval** Probe interval. The range is 180 to 3600.

**Command Default**

The default probe interval is 300.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>

The following example shows how to disable the RADIUS accounting server fallback behavior:

```
(Cisco Controller) > config radius fallback-test mode off
```
The following examples show how to configure the controller to revert to a preferable server from the available backup servers without using the extraneous probe messages:

(Cisco Controller) > config radius fallback-test mode passive

The following example shows how to configure the controller to revert to a preferable server from the available backup servers by using RADIUS probe messages:

(Cisco Controller) > config radius fallback-test mode active

Related Commands

- config advanced probe filter
- config advanced probe limit
- show advanced probe
- show radius acct statistics
**config radius ext-source-ports**

To configure support for extended source ports in the RADIUS servers, use the `config radius ext-source-ports` command.

```plaintext
config radius ext-source-ports { enable | disable }
```

**Syntax Description**

- `enable` Enables Radius source port support.
- `disable` Disables Radius source port support.

**Command Default**

None

**Command Modes**

Config

**Command History**

</tbody>
</table>

The following example shows how to configure a default RADIUS server retransmission timeout for management users:

```
(Cisco Controller) > config radius auth mgmt-retransmit-timeout 1 10
```

**Related Commands**

- `config radius auth management`
config radius auth retransmit-timeout

To change a default transmission timeout for a RADIUS authentication server for the Cisco wireless LAN controller, use the `config radius auth retransmit-timeout` command.

`config radius auth retransmit-timeout index timeout`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
<tr>
<td>timeout</td>
<td>Number of seconds (from 2 to 30) between retransmissions.</td>

<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a retransmission timeout of 5 seconds for a RADIUS authentication server:

```plaintext
(Cisco Controller) > config radius auth retransmit-timeout 5
```

**Related Commands**

- `show radius auth statistics`
config radius auth retransmit-timeout

To configure a retransmission timeout value for a RADIUS accounting server, use the config radius auth
server-timeout command.

config radius auth retransmit-timeout index timeout

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>RADIUS server index.</td>
</tr>
<tr>
<td>timeout</td>
<td>Timeout value. The range is from 2 to 30 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default timeout is 2 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a server timeout value of 2 seconds for RADIUS authentication server index 10:

(Cisco Controller) > config radius auth retransmit-timeout 2 10

**Related Commands**

- show radius auth statistics
- show radius summary
To configure the service port IP and netmask of the peer or standby controller, use the `config redundancy interface address peer-service-port` command.

**Syntax Description**

- `ip_address` IP address of the peer service port.
- `netmask` Netmask of the peer service port.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure this command only from the Active controller. For the HA feature, the service port configurations are made per controller. You will loose these configurations if you change the mode from HA to non-HA and vice-versa.

The following example shows how to configure the service port IP and netmask of the peer or standby controller:

```
(Cisco Controller) > config redundancy interface address peer-service-port 11.22.44.55
```
To configure the HA mobility MAC address to be used as an identifier, use the `config redundancy mobilitymac` command.

```
config redundancy mobilitymac mac_address
```

**Syntax Description**

- `mac_address` MAC address that is an identifier for the active and standby controller pair.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you upgrade from Release 8.0.110.0 to a later release, the command’s setting is removed. You must manually reconfigure the mobility MAC address after the upgrade.

The following example shows how to configure the HA mobility MAC address:

```
(Cisco Controller) > config redundancy mobilitymac ff:ff:ff:ff:ff:ff
```
config redundancy mode

To enable or disable redundancy or High Availability (HA), use the `config redundancy mode` command.

```
config redundancy mode { sso | none }
```

**Syntax Description**

- **sso** Enables a stateful switch over (SSO) or hot standby redundancy mode.
- **none** Disables redundancy mode.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must configure local and peer redundancy management IP addresses before you configure redundancy.

The following example shows how to enable redundancy:

```
(Cisco Controller) > config redundancy mode sso
```
To configure the route configurations of the peer or standby controller, use the `config redundancy peer-route` command.

```
config redundancy peer-route { add | delete } network_ip_address netmask gateway
```

**Syntax Description**

- **add**: Adds a network route.
- **delete**: Deletes a network route specific to standby controller.
- **network_ip_address**: Network IP address.
- **netmask**: Subnet mask of the network.
- **gateway**: IP address of the gateway for the route network.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure this command only from the Active controller. For the HA feature, the service port configurations are made per controller. You will lose these configurations if you change the mode from HA to non-HA and vice-versa.

The following example shows how to configure route configurations of a peer or standby controller.

```
(Cisco Controller) > config redundancy peer-route add 10.1.1.0 255.255.255.0 10.1.1.1
```
config redundancy timer keep-alive-timer

To configure the keep-alive timeout value, use the `config redundancy timer keep-alive-timer` command.

```
config redundancy timer keep-alive-timer milliseconds
```

**Syntax Description**

- `milliseconds` Keep-alive timeout value in milliseconds. The range is from 100 to 400 milliseconds.

**Command Default**

The default keep-alive timeout value is 100 milliseconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the keep-alive timeout value:

```
(Cisco Controller) > config redundancy timer keep-alive-timer 200
```
config redundancy timer peer-search-timer

To configure the peer search timer, use the `config redundancy timer peer-search-timer` command.

```
cfg redundancy timer peer-search-timer seconds
```

### Syntax Description

- `seconds` Value of the peer search timer in seconds. The range is from 60 to 180 secs.

### Command Default

The default value of the peer search timer is 120 seconds.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can use this command to configure the boot up role negotiation timeout value in seconds.

The following example shows how to configure the redundancy peer search timer:

```
(Cisco Controller) > config redundancy timer peer-search-timer 100
```
**config redundancy unit**

To configure a Cisco WLC as a primary or secondary WLC, use the `config redundancy unit` command.

```
config redundancy unit {primary | secondary}
```

**Syntax Description**

- `primary` Configures the Cisco WLC as the primary WLC.
- `secondary` Configures the Cisco WLC as the secondary WLC.

**Command Default**

The default state is as the primary WLC.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure a Cisco WLC as the secondary WLC, it becomes the HA Stakable Unit (SKU) without any valid AP licenses.

The following example shows how to configure a Cisco WLC as the primary WLC:

```
(Cisco Controller) > config redundancy unit primary
```
config remote-lan

To configure a remote LAN, use the `config remote-lan` command.

`config remote-lan { enable | disable } { remote-lan-id | all }`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables a remote LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables a remote LAN.</td>
</tr>
<tr>
<td>remote-lan-id</td>
<td>Remote LAN identifier. Valid values are between 1 and 512.</td>
</tr>
<tr>
<td>all</td>
<td>Configures all wireless LANs.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable a remote LAN with ID 2:

(Cisco Controller)  > `config remote-lan enable 2`
To configure user policy override through AAA on a remote LAN, use the **config remote-lan aaa-override** command.

```
config remote-lan aaa-override { enable | disable } remote-lan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables user policy override through AAA on a remote LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables user policy override through AAA on a remote LAN.</td>
</tr>
<tr>
<td>remote-lan-id</td>
<td>Remote LAN identifier. Valid values are between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable user policy override through AAA on a remote LAN where the remote LAN ID is 2:

```
(Cisco Controller) > config remote-lan aaa-override enable 2
```
config remote-lan acl

To specify an access control list (ACL) for a remote LAN, use the `config remote-lan acl` command.

```
config remote-lan acl remote-lan-id acl_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>remote-lan-id</th>
<th>Remote LAN identifier. Valid values are between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl_name</td>
<td>ACL name.</td>
</tr>
</tbody>
</table>

**Note**

Use the `show acl summary` command to know the ACLs available.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify ACL1 for a remote LAN whose ID is 2:

```
(Cisco Controller) >config remote-lan acl 2 ACL1
```
To add an access point (AP) group to remote LAN IEEE 802.1X, use the `config remote-lan apgroup` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>add</code></td>
<td>Creates a new AP group.</td>
</tr>
<tr>
<td><code>apgroup-name</code></td>

</table>

**Usage Guidelines**

**Example**

The following example shows how to add an AP group to remote LAN IEEE 802.1X:

```
(Cisco Controller) > config remote-lan apgroup add testap
```
config remote-lan create

To configure a new remote LAN connection, use the **config remote-lan create** command.

```
config remote-lan create remote-lan-id name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>remote-lan-id</td>
<td>Remote LAN identifier. Valid values are between 1 and 512.</td>
</tr>
<tr>
<td>name</td>
<td>Remote LAN name. Valid values are up to 32 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a new remote LAN, MyRemoteLAN, with the LAN ID as 3:

```
(Cisco Controller) > config remote-lan create 3 MyRemoteLAN
```
config remote-lan custom-web

To configure web authentication for a remote LAN, use the `config remote-lan custom-web` command.

```
config remote-lan custom-web { ext-webauth-url URL | global { enable | disable } | login-page page-name | loginfailure-page { page-name | none } | logout-page { page-name | none } | webauth-type { internal | customized | external } } remote-lan-id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

</tbody>
</table>

### Usage Guidelines

Follow these guidelines when you use the `config remote-lan custom-web` command:

- When you configure the external Web-Auth URL, do the following:
- Ensure that Web-Auth or Web-Passthrough Security is in enabled state. To enable Web-Auth, use the `config remote-lan security web-auth enable` command. To enable Web-Passthrough, use the `config remote-lan security web-passthrough enable` command.

- Ensure that the global status of the remote LAN is in disabled state. To enable the global status of the remote LAN, use the `config remote-lan custom-web global disable` command.

- Ensure that the remote LAN is in disabled state. To disable a remote LAN, use the `config remote-lan disable` command.

- When you configure the Web-Auth type for the remote LAN, do the following:
  - When you configure a customized login page, ensure that you have a login page configured. To configure a login page, use the `config remote-lan custom-web login-page` command.
  - When you configure an external login page, ensure that you have configured preauthentication ACL for external web authentication to function.

The following example shows how to configure an external web authentication URL for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web ext-webauth-url http://www.AuthorizationURL.com/ 3

The following example shows how to enable the global status of a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web global enable 3

The following example shows how to configure the login page for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web login-page custompage1 3

The following example shows how to configure a web authentication type with the default login page for a remote LAN with ID 3:

(Cisco Controller) >config remote-lan custom-web webauth-type internal 3
To delete a remote LAN connection, use the `config remote-lan delete` command.

```
config remote-lan delete remote-lan-id
```

**Syntax Description**

- `remote-lan-id`  
  Remote LAN identifier. Valid values are between 1 and 512.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a remote LAN with ID 3:

```
(Cisco Controller) >config remote-lan delete 3
```
**config remote-lan dhcp_server**

To configure a dynamic host configuration protocol (DHCP) server for a remote LAN, use the config remote-lan dhcp_server command.

```
config remote-lan dhcp_server 3 209.165.200.225
```

### Syntax Description

- **remote-lan-id**
  - Remote LAN identifier. Valid values are between 1 and 512.
- **ip_addr**
  - IPv4 address of the override DHCP server.

### Command Default

0.0.0.0 is set as the default interface value.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a DHCP server for a remote LAN with ID 3:

```
(Cisco Controller) >config remote-lan dhcp_server 3 209.165.200.225
```

### Related Commands

- show remote-lan
config remote-lan exclusionlist

To configure the exclusion list timeout on a remote LAN, use the `config remote-lan exclusionlist` command.

```
config remote-lan exclusionlist remote-lan-id {seconds | disabled | enabled}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>remote-lan-id</th>
<th>Remote LAN identifier. Valid values are between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Exclusion list timeout in seconds. A value of 0 requires an administrator override.</td>
</tr>
<tr>
<td>disabled</td>
<td>Disables exclusion listing.</td>
</tr>
<tr>
<td>enabled</td>
<td>Enables exclusion listing.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

The following example shows how to configure the exclusion list timeout to 20 seconds on a remote LAN with ID 3:

```
(Cisco Controller) > config remote-lan exclusionlist 3 20
```
**config remote-lan host-mode**

To configure a host mode for remote LAN IEEE 802.1X, use the `config remote-lan host-mode` command.

```
config remote-lan host-mode (singlehost | multihost ) remote-lan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>singlehost</td>
<td>Configures the remote LAN single-host mode.</td>
</tr>
<tr>
<td>multihost</td>
<td>Configures the remote LAN multi-host mode.</td>
</tr>
<tr>
<td>remote-lan-id</td>
<td>WLAN identifier. The range is from 1 to 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Controller Configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Example**

The following example shows how to configure the host mode as single for remote LAN IEEE 802.1X:

```
(Cisco Controller) > config remote-lan host-mode singlehost 1
```
config remote-lan interface

To configure an interface for a remote LAN, use the `config remote-lan interface` command.

```
config remote-lan interface remote-lan-id interface_name
```

**Syntax Description**

<table>
<thead>

</table>

**Example**

The following example shows how to enable preauthentication VLAN for remote LAN IEEE 802.1X:

```
(Cisco Controller) > config remote-lan pre-auth enable 1 vlan vlan1
```
To configure the RADIUS servers on a remote LAN, use the **config remote-lan radius_server** command.

```plaintext
config remote-lan radius_server { acct { { add | delete } server-index | { enable | disable } | interim-update { interval | enable | disable } | auth { { add | delete } server-index | { enable | disable } } | overwrite-interface { enable | disable } } remote-lan-id
```

### Syntax Description

- **acct**
  - Configures a RADIUS accounting server.
- **add**
  - Adds a link to a configured RADIUS server.
- **delete**
  - Deletes a link to a configured RADIUS server.
- **remote-lan-id**
  - Remote LAN identifier. Valid values are between 1 and 512.
- **server-index**
  - RADIUS server index.
- **enable**
  - Enables RADIUS accounting for this remote LAN.
- **disable**
  - Disables RADIUS accounting for this remote LAN.
- **interim-update**
  - Enables RADIUS accounting for this remote LAN.
- **interval**
  - Accounting interim interval. The range is from 180 to 3600 seconds.
- **enable**
  - Enables accounting interim update.
- **disable**
  - Disables accounting interim update.
- **auth**
  - Configures a RADIUS authentication server.
- **enable**
  - Enables RADIUS authentication for this remote LAN.
- **disable**
  - Disables RADIUS authentication for this remote LAN.
- **overwrite-interface**
  - Configures a RADIUS dynamic interface for the remote LAN.
- **enable**
  - Enables a RADIUS dynamic interface for the remote LAN.
- **disable**
  - Disables a RADIUS dynamic interface for the remote LAN.

### Command Default

The interim update interval is set to 600 seconds.

**Example**

The following example shows how to configure the violation mode as protect for remote LAN IEEE 802.1X:

```
(Cisco Controller) > config remote-lan violation-mode protect 1
```
config remote-lan webauth-exclude

To configure web authentication exclusion on a remote LAN, use the `config remote-lan webauth-exclude` command.

```
config remote-lan webauth-exclude remote-lan-id  { enable | disable }
```

**Syntax Description**

**remote-lan-id**
Remote LAN identifier. Valid values are between 1 and 512.

**enable**
Enables web authentication exclusion on the remote LAN.

**disable**
Disables web authentication exclusion on the remote LAN.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

The following example shows how to enable web authentication exclusion on a remote LAN with ID 1:

```
(Cisco Controller) > config remote-lan webauth-exclude 1 enable
```
config rf-profile band-select

To configure the RF profile band selection parameters, use the `config rf-profile band-select` command.

```
config rf-profile band-select { client-rssi rssi | cycle-count cycles | cycle-threshold value | expire
  { dual-band value | suppression value } | probe-response { enable | disable } } profile_name
```

### Syntax Description

- **client-rssi**: Configures the client Received Signal Strength Indicator (RSSI) threshold for the RF profile.

- **rssi**: Minimum RSSI for a client to respond to a probe. The range is from -20 to -90 dBm.

- **cycle-count**: Configures the probe cycle count for the RF profile. The cycle count sets the number of suppression cycles for a new client.

- **cycles**: Value of the cycle count. The range is from 1 to 10.

- **cycle-threshold**: Configures the time threshold for a new scanning RF Profile band select cycle period. This setting determines the time threshold during which new probe requests from a client come in a new scanning cycle.

- **value**: Value of the cycle threshold for the RF profile. The range is from 1 to 1000 milliseconds.

- **expire**: Configures the expiration time of clients for band select.

- **dual-band**: Configures the expiration time for pruning previously known dual-band clients. After this time elapses, clients become new and are subject to probe response suppression.

- **value**: Value for a dual band. The range is from 10 to 300 seconds.

- **suppression**: Configures the expiration time for pruning previously known 802.11b/g clients. After this time elapses, clients become new and are subject to probe response suppression.

- **value**: Value for suppression. The range is from 10 to 200 seconds.

- **probe-response**: Configures the probe response for a RF profile.

- **enable**: Enables probe response suppression on clients operating in the 2.4-GHz band for a RF profile.

- **disable**: Disables probe response suppression on clients operating in the 2.4-GHz band for a RF profile.

- **profile name**: Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.

### Command Default

The default value for client RSSI is –80 dBm.

The default cycle count is 2.

The default cycle threshold is 200 milliseconds.

The default value for dual-band expiration is 60 seconds.
The default value for suppression expiration is 20 seconds.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you enable band select on a WLAN, the access point suppresses client probes on 2.4-GHz and moves the dual band clients to the 5-GHz spectrum. The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running. Band selection can be used only with Cisco Aironet 1040, 1140, and 1250 Series and the 3500 series access points.

The following example shows how to configure the client RSSI:

(Cisco Controller) > config rf-profile band-select client-rssi -70
## config rf-profile channel

To configure the RF profile DCA settings, use the `config rf-profile channel` command.

```
config rf-profile channel { add chan profile name | delete chan profile name | foreign { enable | disable } profile name | chan-width { 20 | 40 | 80 } profile name }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>add</code></td>
<td>Adds channel to the RF profile DCA channel list.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Removes channel from the RF profile DCA channel list.</td>
</tr>
<tr>
<td><code>foreign</code></td>
<td>Configures the RF profile DCA foreign AP contribution.</td>
</tr>
<tr>
<td><code>chan-width</code></td>
<td>Configures the RF profile DCA channel width.</td>
</tr>
<tr>
<td><code>chan</code></td>
<td>Specifies channel number.</td>
</tr>
<tr>
<td><code>profile name</code></td>
<td>Specifies the name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.</td>

</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to add a channel to the RF profile DCA channel list:

```
(Cisco Controller) > config rf-profile channel add 40 admin1
```

The following example shows how to configure the RF profile DCA channel width:

```
(Cisco Controller) > config rf-profile channel chan-width 40 admin1
```
config rf-profile client-trap-threshold

To configure the threshold value of the number of clients that associate with an access point, after which an SNMP trap is sent to the controller, use the `config rf-profile client-trap-threshold` command.

```
config rf-profile client-trap-threshold threshold profile_name
```

**Syntax Description**

- **threshold**: Threshold value of the number of clients that associate with an access point, after which an SNMP trap is sent to the controller. The range is from 0 to 200. Traps are disabled if the threshold value is configured as zero.
- **profile_name**: Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.

**Command Default**

None

**Command History**

- **Release 7.6**: This command was introduced in a release earlier than Release 7.6.
- **Release 8.3**: This command was introduced.

The following example shows how to configure the threshold value of the number of clients that associate with an access point:

```
(Cisco Controller) >config rf-profile client-trap-threshold 150
```
config rf-profile create

To create a RF profile, use the config rf-profile create command.

```
config rf-profile create {802.11a | 802.11b/g} profile-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

The following example shows how to create a new RF profile:

```
(Cisco Controller) >config rf-profile create 802.11a RFtestgroup1
```
**config rf-profile fra client-aware**

To configure the RF profile client-aware FRA feature, use the `config rf-profile fra client-aware` command.

```
config rf-profile fra client-aware { client-reset percent rf-profile-name | client-select percent rf-profile-name | disable rf-profile-name | enable rf-profile-name }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>client-reset</code></td>
<td>Configures the RF profile AP utilization threshold for radio to switch back to Monitor mode.</td>
</tr>
<tr>

<td>Utilization percentage value ranges from 0 to 100. The default is 50%.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the RF profile client-aware FRA feature.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the RF profile client-aware FRA feature.</td>
</tr>
</tbody>
</table>

### Command Default

The default percent value for client-select and client-reset is 50% and 5% respectively.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch back from 5GHz client-serving role to Monitor mode:

(Cisco Controller) >config rf-profile fra client-aware client-reset 15 profile1

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role:

(Cisco Controller) >config rf-profile fra client-aware client-select 20 profile1

The following example shows how to disable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware disable profile1

The following example shows how to enable the RF profile client-aware FRA feature:

(Cisco Controller) >config rf-profile fra client-aware enable profile1
**config rf-profile data-rates**

To configure the data rate on a RF profile, use the `config rf-profile data-rates` command.

```
config rf-profile data-rates {802.11a | 802.11b} {disabled | mandatory | supported} data-rate profile-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Specifies 802.11a as the radio policy of the RF profile.</td>
</tr>
<tr>
<td>802.11b</td>
<td>Specifies 802.11b as the radio policy of the RF profile.</td>
</tr>
<tr>
<td>disabled</td>
<td>Disables a rate.</td>
</tr>
<tr>
<td>mandatory</td>
<td>Sets a rate to mandatory.</td>
</tr>
<tr>
<td>supported</td>
<td>Sets a rate to supported.</td>
</tr>
<tr>
<td>data-rate</td>
<td>802.11 operational rates, which are 1*, 2*, 5.5*, 6, 9, 11*, 12, 18, 24, 36, 48 and 54, where * denotes 802.11b only rates.</td>
</tr>
<tr>
<td>profile-name</td>
<td>Name of the RF profile.</td>
</tr>
</tbody>
</table>

**Command Default**

Default data rates for RF profiles are derived from the controller system defaults, the global data rate configurations. For example, if the RF profile's radio policy is mapped to 802.11a then the global 802.11a data rates are copied into the RF profiles at the time of creation.

The data rates set with this command are negotiated between the client and the Cisco wireless LAN controller. If the data rate is set to mandatory, the client must support it in order to use the network. If a data rate is set as supported by the Cisco wireless LAN controller, any associated client that also supports that rate may communicate with the Cisco lightweight access point using that rate. It is not required that a client is able to use all the rates marked supported in order to associate.

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch back from 5GHz client-serving role to Monitor mode:

```
(Cisco Controller) >config rf-profile fra client-aware client-reset 15 profile1
```

The following example shows how to configure the RF profile utilization threshold for redundant dual-band radios to switch from Monitor mode to 5GHz client-serving role:

```
(Cisco Controller) >config rf-profile fra client-aware client-select 20 profile1
```

The following example shows how to disable the RF profile client-aware FRA feature:

```
(Cisco Controller) >config rf-profile fra client-aware disable profile1
```

The following example shows how to enable the RF profile client-aware FRA feature:

```
(Cisco Controller) >config rf-profile fra client-aware enable profile1
```
**config rf-profile load-balancing**

To configure load balancing on an RF profile, use the `config rf-profile load-balancing` command.

```plaintext
config rf-profile load-balancing { window clients | denial value} profile_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>window</code></td>
<td>Configures the client window for load balancing of an RF profile.</td>
</tr>
<tr>
<td><code>clients</code></td>
<td>Client window size that limits the number of client associations with an access point. The range is from 0 to 20. The default value is 5. The window size is part of the algorithm that determines whether an access point is too heavily loaded to accept more client associations: load-balancing window + client associations on AP with lightest load = load-balancing threshold. Access points with more client associations than this threshold are considered busy, and clients can associate only to access points with client counts lower than the threshold. This window also helps to disassociate sticky clients.</td>
</tr>
<tr>
<td><code>denial</code></td>
<td>Configures the client denial count for load balancing of an RF profile.</td>
</tr>
<tr>
<td><code>value</code></td>
<td>Maximum number of association denials during load balancing. The range is from 1 to 10. The default value is 3. When a client tries to associate on a wireless network, it sends an association request to the access point. If the access point is overloaded and load balancing is enabled on the controller, the access point sends a denial to the association request. If there are no other access points in the range of the client, the client tries to associate the same access point again. After the maximum denial count is reached, the client is able to associate. Association attempts on an access point from any client before associating any AP is called a sequence of association. The default is 3.</td>
</tr>
<tr>
<td><code>profile_name</code></td>
<td>Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>

The following example shows how to configure the client window size for an RF profile:

(Cisco Controller) > config rf-profile load-balancing window 15
**config rf-profile max-clients**

To configure the maximum number of client connections per access point of an RF profile, use the `config rf-profile max-clients` commands.

```
config rf-profile max-clients clients
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>clients</th>
<th>Maximum number of client connections per access point of an RF profile. The range is from 1 to 200.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

- **Release 7.6**
  - This command was introduced in a release earlier than Release 7.6.

**Command History**

- **Release 8.3**
  - This command was introduced.

**Usage Guidelines**

You can use this command to configure the maximum number of clients on access points that are in client dense areas, or serving high bandwidth video or mission critical voice applications.

The following example shows how to set the maximum number of clients at 50:

```
(Cisco Controller) >config rf-profile max-clients 50
```
To configure the minimum RF profile multicast data rate, use the `config rf-profile multicast data-rate` command.

```
config rf-profile multicast data-rate value profile_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>value</code></td>
<td>Minimum RF profile multicast data rate. The options are 6, 9, 12, 18, 24, 36, 48, 54. Enter 0 to specify that access points will dynamically adjust the data rate.</td>
</tr>
<tr>
<td><code>profile_name</code></td>
<td>Name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

The minimum RF profile multicast data rate is 0.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to set the multicast data rate for an RF profile:

```
(Cisco Controller) >config rf-profile multicast data-rate 24
```
config rf-profile out-of-box

To create an out-of-box AP group consisting of newly installed access points, use the `config rf-profile out-of-box` command.

`config rf-profile out-of-box { enable | disable }`

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| enable  | Enables the creation of an out-of-box AP group. When you enable this command, the following occurs:  
  - Newly installed access points that are part of the default AP group will be part of the out-of-box AP group and their radios will be switched off, which eliminates any RF instability caused by the new access points.  
  - All access points that do not have a group name become part of the out-of-box AP group.  
  - Special RF profiles are created per 802.11 band. These RF profiles have default-settings for all the existing RF parameters and additional new configurations. |
| disable | Disables the out-of-box AP group. When you disable this feature, only the subscription of new APs to the out-of-box AP group stops. All APs that are subscribed to the out-of-box AP group remain in this AP group. You can move APs to the default group or a custom AP group upon network convergence. |

**Command Default**: None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When an out-of-box AP associates with the controller for the first time, it will be redirected to a special AP group and the RF profiles applicable to this AP Group will control the radio admin state configuration of the AP. You can move APs to the default group or a custom group upon network convergence.

The following example shows how to enable the creation of an out-of-box AP group:

```
(Cisco Controller) > config rf-profile out-of-box enable
```
**config rf-profile rx-sop threshold**

To configure high, medium or low Rx SOP threshold values for each 802.11 band, use the `config rf-profile rx-sop threshold` command.

```
config rf-profile rx-sop threshold { high | medium | low | auto } profile_name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>high</code></td>
<td>Configures the high Rx SOP threshold value for an RF profile.</td>
</tr>
<tr>
<td><code>medium</code></td>
<td>Configures the medium Rx SOP threshold value for an RF profile.</td>
</tr>
<tr>
<td><code>low</code></td>
<td>Configures the low Rx SOP threshold value for an RF profile.</td>
</tr>
<tr>
<td><code>auto</code></td>
<td>Configures an auto Rx SOP threshold value for an RF profile. When you choose auto, the access point determines the best Rx SOP threshold value.</td>
</tr>
</tbody>
</table>

`profile_name` RF profile on which the Rx SOP threshold value will be configured.

**Command Default**

The default Rx SOP threshold option is auto.

**Command History**

```
Release  Modification
8.0      This command was introduced.
```

The following example shows how to configure the high Rx SOP threshold value on an RF profile:

```
(Cisco Controller) > config 802.11 rx-sop threshold high T1a
```
**config rf-profile trap-threshold**

To configure the RF profile trap threshold, use the `config rf-profile trap-threshold` command.

```plaintext
config rf-profile trap-threshold { clients clients profile name | interference percent profile name | noise dBm profile name | utilization percent profile name }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clients</td>
<td>Configures the RF profile trap threshold for clients.</td>
</tr>
<tr>
<td>clients</td>
<td>The number of clients on an access point's radio for the trap is between 1 and 200. The default is 12 clients.</td>
</tr>
<tr>
<td>profile name</td>
<td>Specifies the name of the RF profile. The profile name can be up to 32 case-sensitive, alphanumeric characters.</td>
</tr>
<tr>
<td>interference</td>
<td>Configures the RF profile trap threshold for interference.</td>
</tr>
<tr>
<td>percent</td>
<td>The percentage of interference threshold for the trap is from 0 to 100%. The default is 10%.</td>
</tr>
<tr>
<td>noise</td>
<td>Configures the RF profile trap threshold for noise.</td>
</tr>
<tr>
<td>dBm</td>
<td>The level of noise threshold for the trap is from -127 to 0 dBm. The default is -17 dBm.</td>
</tr>
<tr>
<td>utilization</td>
<td>Configures the RF profile trap threshold for utilization.</td>
</tr>
<tr>
<td>percent</td>
<td>The percentage of bandwidth being used by an access point threshold for the trap is from 0 to 100%. The default is 80%.</td>
</tr>
</tbody>
</table>

The following example shows how to configure tx-power-min on an RF profile:

```
(Cisco Controller) >config rf-profile tx-power-min RFGroup1
```
**config rogue ap timeout**

To specify the number of seconds after which the rogue access point and client entries expire and are removed from the list, use the `config rogue ap timeout` command.

```
config rogue ap timeout seconds
```

**Syntax Description**

| seconds | Value of 240 to 3600 seconds (inclusive), with a default value of 1200 seconds. |

**Command Default**

The default number of seconds after which the rogue access point and client entries expire is 1200 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

### config rogue adhoc

To globally or individually configure the status of an Independent Basic Service Set (IBSS or ad-hoc) rogue access point, use the `config rogue adhoc` command.

```plaintext
config rogue adhoc { enable | disable | external rogue_MAC | alert { rogue_MAC | all } | auto-contain [ monitor_ap ] | contain rogue_MAC 1234_aps | }

disable

classify { friendly state { external | internal } mac-address | malicious state { alert | contain } mac-address | unclassified state { alert | contain } mac-address }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>enable</strong></td>
<td>Globally enables detection and reporting of ad-hoc rogues.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Globally disables detection and reporting of ad-hoc rogues.</td>
</tr>
<tr>
<td><strong>external</strong></td>
<td>Configure external state on the rogue access point that is outside the network and poses no threat to WLAN security. The controller acknowledges the presence of this rogue access point.</td>
</tr>
<tr>
<td><strong>rogue_MAC</strong></td>
<td>MAC address of the ad-hoc rogue access point.</td>
</tr>
<tr>
<td><strong>alert</strong></td>
<td>Generates an SMNP trap upon detection of the ad-hoc rogue, and generates an immediate alert to the system administrator for further action.</td>
</tr>
<tr>
<td><strong>all</strong></td>
<td>Enables alerts for all ad-hoc rogue access points.</td>
</tr>
<tr>
<td><strong>auto-contain</strong></td>
<td>Contains all wired ad-hoc rogues detected by the controller.</td>
</tr>
<tr>
<td><strong>monitor_ap</strong></td>
<td>(Optional) IP address of the ad-hoc rogue access point.</td>
</tr>
<tr>
<td><strong>contain</strong></td>
<td>Contains the offending device so that its signals no longer interfere with authorized clients.</td>
</tr>
<tr>
<td><strong>1234_aps</strong></td>
<td>Maximum number of Cisco access points assigned to actively contain the ad-hoc rogue access point (1 through 4, inclusive).</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes ad-hoc rogue access points.</td>

<tr>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>friendly state</td>
<td>Classifies ad-hoc rogue access points as friendly.</td>
</tr>
<tr>
<td>internal</td>
<td>Configures alert state on rogue access point that is inside the network and poses no threat to WLAN security. The controller trusts this rogue access point.</td>
</tr>
<tr>
<td>malicious state</td>
<td>Classifies ad-hoc rogue access points as malicious.</td>
</tr>
<tr>
<td>alert</td>
<td>Configures alert state on the rogue access point that is not in the neighbor list or in the user configured friendly MAC list. The controller forwards an immediate alert to the system administrator for further action.</td>
</tr>
<tr>
<td>contain</td>
<td>Configures contain state on the rogue access point. Controller contains the offending device so that its signals no longer interfere with authorized clients.</td>
</tr>
<tr>
<td>unclassified state</td>
<td>Classifies ad-hoc rogue access points as unclassified.</td>
</tr>
</tbody>
</table>

**Command Default**

The default for this command is **enabled** and is set to **alert**. The default for auto-containment is **disabled**.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The controller continuously monitors all nearby access points and automatically discovers and collects information on rogue access points and clients. When the controller discovers a rogue access point, it uses RLDP to determine if the rogue is attached to your wired network.

**Note**

RLDP is not supported for use with Cisco autonomous rogue access points. These access points drop the DHCP Discover request sent by the RLDP client. Also, RLDP is not supported if the rogue access point channel requires dynamic frequency selection (DFS).

When you enter any of the containment commands, the following warning appears:

*Using this feature may have legal consequences. Do you want to continue? (y/n)*

The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.
Enter the **auto-contain** command with the `monitor_ap` argument to monitor the rogue access point without containing it. Enter the **auto-contain** command without the optional `monitor_ap` to automatically contain all wired ad-hoc rogues detected by the controller.

The following example shows how to enable the detection and reporting of ad-hoc rogues:

```bash
(Cisco Controller) > config rogue adhoc enable
```

The following example shows how to enable alerts for all ad-hoc rogue access points:

```bash
(Cisco Controller) > config rogue adhoc alert all
```

The following example shows how to classify an ad-hoc rogue access point as friendly and configure external state on it:

```bash
(Cisco Controller) > config rogue adhoc classify friendly state internal \*\*\*\*\*\*\*\*\*
```

**Related Commands**

- `config rogue auto-contain level`
- `show rogue ignore-list`
- `show rogue rule detailed`
- `show rogue rule summary`
config rogue ap classify

To classify the status of a rogue access point, use the `config rogue ap classify` command.

```plaintext
config rogue ap classify { friendly state { internal | external } ap_mac }
config rogue ap classify { malicious | unclassified } state { alert | contain } ap_mac
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>friendly</td>
<td>Classifies a rogue access point as friendly.</td>
</tr>
<tr>
<td>state</td>
<td>Specifies a response to classification.</td>
</tr>
<tr>
<td>internal</td>
<td>Configures the controller to trust this rogue access point.</td>
</tr>
<tr>
<td>external</td>
<td>Configures the controller to acknowledge the presence of this access point.</td>
</tr>
<tr>
<td>ap_mac</td>
<td>MAC address of the rogue access point.</td>
</tr>
<tr>
<td>malicious</td>
<td>Classifies a rogue access point as potentially malicious.</td>
</tr>
<tr>
<td>unclassified</td>
<td>Classifies a rogue access point as unknown.</td>
</tr>
<tr>
<td>alert</td>
<td>Configures the controller to forward an immediate alert to the system administrator for further action.</td>
</tr>
<tr>
<td>contain</td>
<td>Configures the controller to contain the offending device so that its signals no longer interfere with authorized clients.</td>
</tr>
</tbody>
</table>

### Command Default

These commands are disabled by default. Therefore, all unknown access points are categorized as `unclassified` by default.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

A rogue access point cannot be moved to the unclassified class if its current state is contain.

When you enter any of the containment commands, the following warning appears: “Using this feature may have legal consequences. Do you want to continue?” The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.
The following example shows how to classify a rogue access point as friendly and can be trusted:

(Cisco Controller) > config rogue ap classify friendly state internal 11:11:11:11:11:11

The following example shows how to classify a rogue access point as malicious and to send an alert:

(Cisco Controller) > config rogue ap classify malicious state alert 11:11:11:11:11:11

The following example shows how to classify a rogue access point as unclassified and to contain it:

(Cisco Controller) > config rogue ap classify unclassified state contain 11:11:11:11:11:11

- show rogue rule summary
config rogue ap ssid

To generate an alarm only, or to automatically contain a rogue access point that is advertising your network’s service set identifier (SSID), use the `config rogue ap ssid` command.

```
config rogue ap ssid  { alarm  |  auto-contain }
```

**Syntax Description**

- **alarm**
  Generates only an alarm when a rogue access point is discovered to be advertising your network’s SSID.

- **auto-contain**
  Automatically contains the rogue access point that is advertising your network’s SSID.

**Command Default**
None

**Command History**

<table>

<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter any of the containment commands, the following warning appears: “Using this feature may have legal consequences. Do you want to continue?” The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.

The following example shows how to automatically contain a rogue access point that is advertising your network’s SSID:

```
(Cisco Controller) > config rogue ap ssid auto-contain
```

**Related Commands**

config rogue auto-contain level

To configure rogue the auto-containment level, use the `config rogue auto-contain level` command.

`config rogue auto-contain level level [ monitor_ap_only ]`

**Syntax Description**

- **level**: Rogue auto-containment level in the range of 1 to 4. You can enter a value of 0 to enable the Cisco WLC to automatically select the number of APs used for auto containment. The controller chooses the required number of APs based on the RSSI for effective containment.

- **monitor_ap_only**: (Optional) Configures auto-containment using only monitor AP mode.

**Note**

Up to four APs can be used to auto-contain when a rogue AP is moved to contained state through any of the auto-containment policies.

**Command Default**

The default auto-containment level is 1.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The controller continuously monitors all nearby access points and automatically discovers and collects information on rogue access points and clients. When the controller discovers a rogue access point, it uses any of the configured auto-containment policies to start autocontainment. The policies for initiating autocontainment are rogue on wire (detected through RLDP or rogue detector AP), rogue using managed SSID, Valid client on Rogue AP, and AdHoc Rogue.

This table lists the RSSI value associated with each containment level.

**Table 7: RSSI Associated with Each Containment Level**

<table>
<thead>
<tr>
<th>Auto-containment Level</th>
<th>RSSI</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>0 to −55 dBm</td>

</tr>
<tr>
<td>3</td>
<td>−85 to −75 dBm</td>
</tr>
<tr>
<td>4</td>
<td>Less than −85 dBm</td>
</tr>
</tbody>
</table>
RLDP is not supported for use with Cisco autonomous rogue access points. These access points drop the DHCP Discover request sent by the RLDP client. Also, RLDP is not supported if the rogue access point channel requires dynamic frequency selection (DFS).

When you enter any of the containment commands, the following warning appears:

Using this feature may have legal consequences. Do you want to continue? (y/n) :

The 2.4-GHz and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.

The following example shows how to configure the auto-contain level to 3:

(Cisco Controller) > config rogue auto-contain level 3

**Related Commands**

- config rogue adhoc
- show rogue adhoc summary
- show rogue client summary
- show rogue ignore-list
- show rogue rule summary
config rogue ap valid-client

To generate an alarm only, or to automatically contain a rogue access point to which a trusted client is associated, use the `config rogue ap valid-client` command.

```
config rogue ap valid-client { alarm | auto-contain }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alarm</td>
<td>Generates only an alarm when a rogue access point is discovered to be associated with a valid client.</td>
</tr>
<tr>
<td>auto-contain</td>
<td>Automatically contains a rogue access point to which a trusted client is associated.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enter any of the containment commands, the following warning appears: “Using this feature may have legal consequences. Do you want to continue?” The 2.4- and 5-GHz frequencies in the Industrial, Scientific, and Medical (ISM) band are open to the public and can be used without a license. As such, containing devices on another party’s network could have legal consequences.

The following example shows how to automatically contain a rogue access point that is associated with a valid client:

```
(Cisco Controller) > config rogue ap valid-client auto-contain
```

**Related Commands**

- `config rogue ap classify`
- `config rogue ap friendly`
- `config rogue ap rldp`
- `config rogue ap timeout`
- `config rogue ap ssid`

show rogue rule summary
config rogue client

To configure rogue clients, use the **config rogue client** command.

```plaintext
config rogue client { aaa { enable | disable } | alert ap_mac | contain client_mac | delete { state { alert | any | contained | contained-pending } | all | mac-address client_mac } | mse { enable | disable } }
```

**Syntax Description**

- **aaa**
  - Configures AAA server or local database to validate whether rogue clients are valid clients. The default is disabled.

- **enable**
  - Enables the AAA server or local database to check rogue client MAC addresses for validity.

- **disable**
  - Disables the AAA server or local database to check rogue client MAC addresses for validity.

- **alert**
  - Configures the controller to forward an immediate alert to the system administrator for further action.

- **ap_mac**
  - Access point MAC address.

- **contain**
  - Configures the controller to contain the offending device so that its signals no longer interfere with authorized clients.

- **client_mac**
  - MAC address of the rogue client.

- **delete**
  - Deletes the rogue client.

- **state**
  - Deletes the rogue clients according to their state.

- **alert**
  - Deletes the rogue clients in alert state.

- **any**
  - Deletes the rogue clients in any state.

- **contained**
  - Deletes all rogue clients that are in contained state.

- **contained-pending**
  - Deletes all rogue clients that are in contained pending state.

- **all**
  - Deletes all rogue clients.

- **mac-address**
  - Deletes a rogue client with the configured MAC address.

- **mse**
  - Validates if the rogue clients are valid clients using MSE. The default is disabled.

**Command Default**

None
### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You cannot validate rogue clients against MSE and AAA at the same time.

The following example shows how to enable the AAA server or local database to check MAC addresses:

```
(Cisco Controller) > config rogue client aaa enable
```

The following example shows how to disable the AAA server or local database from checking MAC addresses:

```
(Cisco Controller) > config rogue client aaa disable
```

### Related Commands

- `config rogue rule`
- `config trapflags rogueap`
- `show rogue ap clients`
- `show rogue ap detailed`
- `show rogue client summary`
- `show rogue ignore-list`
- `show rogue rule detailed`
- `show rogue rule summary`
config rogue containment

To configure rogue containment, use the `config rogue containment` command.

```
config rogue containment { flexconnect | auto-rate } { enable | disable }
```

### Syntax Description

- **flexconnect**: Configures rogue containment for standalone FlexConnect APs.
- **auto-rate**: Configures automatic rate selection for rogue containment.
- **enable**: Enables the rogue containment.
- **disable**: Disables the rogue containment.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The following table lists the rogue containment automatic rate selection details.

<table>
<thead>
<tr>
<th>RSSI (dBm)</th>
<th>802.11b/g Tx Rate (Mbps)</th>
<th>802.11a Tx Rate (Mbps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>−74</td>
<td>1</td>
<td>6</td>
</tr>
<tr>
<td>−70</td>
<td>2</td>
<td>12</td>
</tr>
<tr>
<td>−55</td>
<td>5.5</td>
<td>12</td>
</tr>
<tr>
<td>&lt; −40</td>
<td>5.5</td>
<td>18</td>
</tr>
</tbody>
</table>

The following example shows how to enable automatic rate selection for rogue containment:

```
(Cisco Controller) > config rogue containment auto-rate enable
```
config rogue detection

To enable or disable rogue detection, use the `config rogue detection` command.

Note

If an AP itself is configured with the keyword `all`, the **all access points** case takes precedence over the AP that is with the keyword `all`.

Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables rogue detection on this access point.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables rogue detection on this access point.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Cisco access point.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

Command Default

The default rogue detection value is enabled.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Rogue detection is enabled by default for all access points joined to the controller except for OfficeExtend access points. OfficeExtend access points are deployed in a home environment and are likely to detect a large number of rogue devices.

The following example shows how to enable rogue detection on the access point Cisco_AP:

```
(Cisco Controller) > config rogue detection enable Cisco_AP
```

Related Commands

- `config rogue rule`
- `config trapflags rogueap`
- `show rogue client detailed`
- `show rogue client summary`
- `show rogue ignore-list`
- `show rogue rule detailed`
- `show rogue rule summary`
config rogue detection client-threshold

To configure the rogue client threshold for access points, use the config rogue detection client-threshold command.

config rogue detection client-threshold value

Syntax Description

| value | Threshold rogue client count on an access point after which a trap is sent from the Cisco Wireless LAN Controller (WLC). The range is from 1 to 256. Enter 0 to disable the feature. |

Command Default

The default rogue client threshold is 0.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the rogue client threshold:

(Cisco Controller) >config rogue detection client-threshold 200
config rogue detection min-rssi

To configure the minimum Received Signal Strength Indicator (RSSI) value at which APs can detect rogues and create a rogue entry in the controller, use the `config rogue detection min-rssi` command.

```
config rogue detection min-rssi rssi-in-dBm
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>rssi-in-dBm</th>
<th>Minimum RSSI value. The valid range is from –70 dBm to –128 dBm, and the default value is –128 dBm.</th>
</tr>
</thead>
</table>

**Command Default**
The default RSSI value to detect rogues in APs is -128 dBm.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This feature is applicable to all the AP modes.

There can be many rogues with very weak RSSI values that do not provide any valuable information in rogue analysis. Therefore, you can use this option to filter rogues by specifying the minimum RSSI value at which APs should detect rogues.

The following example shows how to configure the minimum RSSI value:

```
(Cisco Controller) > config rogue detection min-rssi -80
```

**Related Commands**
- `config rogue detection`
- `show rogue ap clients`
- `config rogue rule`
- `config trapflags rogueap`
- `show rogue client detailed`
- `show rogue client summary`
- `show rogue ignore-list`
- `show rogue rule detailed`
- `show rogue rule summary`
config rogue detection monitor-ap

To configure the rogue report interval for all monitor mode Cisco APs, use the config rogue detection monitor-ap command.

```
config rogue detection monitor-ap { report-interval | transient-rogue-interval } time-in-seconds
```

**Syntax Description**

- **report-interval**: Specifies the interval at which rogue reports are sent.
- **transient-rogue-interval**: Specifies the interval at which rogues are consistently scanned for by APs after the first time the rogues are scanned.
- **time-in-seconds**: Time in seconds. The valid range is as follows:
  - 10 to 300 for report-interval
  - 120 to 1800 for transient-rogue-interval

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This feature is applicable to APs that are in monitor mode only.

Using the transient interval values, you can control the time interval at which APs should scan for rogues. APs can also filter the rogues based on their transient interval values.

This feature has the following advantages:

- Rogue reports from APs to the controller are shorter.
- Transient rogue entries are avoided in the controller.
- Unnecessary memory allocation for transient rogues are avoided.

The following example shows how to configure the rogue report interval to 60 seconds:

(Cisco Controller) > config rogue detection monitor-ap report-interval 60

The following example shows how to configure the transient rogue interval to 300 seconds:

(Cisco Controller) > config rogue detection monitor-ap transient-rogue-interval 300

**Related Commands**

- config rogue detection
config rogue detection min-rssi
config rogue rule
config trapflags rogueap
show rogue ap clients
show rogue client detailed
show rogue client summary
show rogue ignore-list
show rogue rule detailed
show rogue rule summary
config rogue detection report-interval

To configure the rogue detection report interval, use the config rogue detection report-interval command.

config rogue detection report-interval time

### Syntax Description

| time      | Time interval, in seconds, at which the access points send the rogue detection report to the controller. The range is from 10 to 300. |

### Command Default

The default rogue detection report interval is 10 seconds.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This feature is applicable only to the access points that are in the monitor mode.

The following example shows how to configure the rogue detection report interval:

(Cisco Controller) > config rogue detection report-interval 60
**config rogue detection security-level**

To configure the rogue detection security level, use the `config rogue detection security-level` command.

```plaintext
config rogue detection security-level { critical | custom | high | low }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>critical</td>
<td>Configures the rogue detection security level to critical.</td>
</tr>
<tr>
<td>custom</td>
<td>Configures the rogue detection security level to custom, and allows you to configure the rogue policy parameters.</td>
</tr>
<tr>
<td>high</td>
<td>Configures the rogue detection security level to high. This security level configures basic rogue detection and auto containment for medium-scale or less critical deployments. The Rogue Location Discovery Protocol (RLDP) is disabled for this security level.</td>
</tr>
<tr>
<td>low</td>
<td>Configures the rogue detection security level to low. This security level configures basic rogue detection for small-scale deployments. Auto containment is not supported for this security level.</td>
</tr>
</tbody>
</table>

**Command Default**

The default rogue detection security level is custom.

**Command History**

- **Release 7.5** This command was introduced.
- **Release 8.3** This command was introduced.

The following example shows how to configure the rogue detection security level to high:

```plaintext
(Cisco Controller) > config rogue detection security-level high
```
**config rogue detection transient-rogue-interval**

To configure the rogue-detection transient interval, use the `config rogue detection transient-rogue-interval` command.

```
config rogue detection transient-rogue-interval time
```

**Syntax Description**

- `time` Time interval, in seconds, at which a rogue should be consistently scanned by the access point after the rogue is scanned for the first time. The range is from 120 to 1800.

**Command Default**

The default rogue-detection transient interval for each security level is as follows:

- Low—120 seconds
- High—300 seconds
- Critical—600 seconds

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This feature applies only to the access points that are in the monitor mode.

After the rogue is scanned consistently, updates are sent periodically to the Cisco Wireless LAN Controller (WLC). The access points filter the active transient rogues for a very short period and are then silent.

The following example shows how to configure the rogue detection transient interval:

```
(Cisco Controller) > config rogue detection transient-rogue-interval 200
```
**config rogue rule**

To add and configure rogue classification rules, use the `config rogue rule` command.

```
config rogue rule { add ap priority priority classify { custom severity-score classification-name | friendly | malicious } notify { all | global | none | local } state { alert | contain | delete | internal | external } rule_name | classify { custom severity-score classification-name | friendly | malicious } rule_name | condition ap { set | delete } condition_type condition_value rule_name | { enable | delete | disable } { all | rule_name } | match { all | any } | priority priority | notify { all | global | none | local } rule_name | state { alert | contain | internal | external } rule_name }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>

<td>Notifies only a trap receiver such as Cisco Prime Infrastructure.</td>
</tr>
<tr>
<td><strong>local</strong></td>
<td>Notifies only the controller.</td>
</tr>
<tr>
<td><strong>none</strong></td>
<td>Notifies neither the controller nor a trap receiver such as Cisco Prime Infrastructure.</td>
</tr>
<tr>
<td><strong>state</strong></td>
<td>Configures state of the rogue access point after a rule match.</td>
</tr>
<tr>
<td><strong>alert</strong></td>
<td>Configures alert state on the rogue access point that is not in the neighbor list or in the user configured friendly MAC list. The controller forwards an immediate alert to the system administrator for further action.</td>
</tr>
<tr>
<td>contain</td>
<td>Configures contain state on the rogue access point. Controller contains the offending device so that its signals no longer interfere with authorized clients.</td>
</tr>
<tr>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>delete</td>
<td>Configures delete state on the rogue access point.</td>
</tr>
<tr>
<td>external</td>
<td>Configures external state on the rogue access point that is outside the network and poses no threat to WLAN security. The controller acknowledges the presence of this rogue access point.</td>
</tr>
<tr>
<td>internal</td>
<td>Configures alert state on rogue access point that is inside the network and poses no threat to WLAN security. The controller trusts this rogue access point.</td>
</tr>
</tbody>
</table>

**rule_name**

Rule to which the command applies, or the name of a new rule.

**condition ap**

Specifies the conditions for a rule that the rogue access point must meet.

**set**

Adds conditions to a rule that the rogue access point must meet.

**delete**

Removes conditions to a rule that the rogue access point must meet.

**condition_type**

Type of the condition to be configured. The condition types are listed below:

- **client-count**—Requires that a minimum number of clients be associated to a rogue access point. The valid range is 1 to 10 (inclusive).
- **duration**—Requires that a rogue access point be detected for a minimum period of time. The valid range is 0 to 3600 seconds (inclusive).
- **managed-ssid**—Requires that a rogue access point’s SSID be known to the controller.
- **no-encryption**—Requires that a rogue access point’s advertised WLAN does not have encryption enabled.
- **rssi**—Requires that a rogue access point have a minimum RSSI value. The range is from –95 to –50 dBm (inclusive).
- **ssid**—Requires that a rogue access point have a specific SSID.
- **substring-ssid**—Requires that a rogue access point have a substring of a user-configured SSID.
```
condition_value
Value of the condition. This value is dependent upon the condition_type. For instance, if the condition type is ssid, then the condition value is either the SSID name or all.

enable
Enables all rules or a single specific rule.

delete
Deletes all rules or a single specific rule.

disable
Deletes all rules or a single specific rule.

match
Specifies whether a detected rogue access point must meet all or any of the conditions specified by the rule in order for the rule to be matched and the rogue access point to adopt the classification type of the rule.

all
Specifies all rules defined.

any
Specifies any rule meeting certain criteria.

priority
Changes the priority of a specific rule and shifts others in the list accordingly.
```

Command Default
No rogue rules are configured.

Command History

</table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

For your changes to be effective, you must enable the rule. You can configure up to 64 rules.

Reclassification of rogue APs according to the RSSI condition of the rogue rule occurs only when the RSSI changes more than +/- 2 dBm of the configured RSSI value. Manual and automatic classification override custom rogue rules. Rules are applied to manually changed rogues if their class type changes to unclassified and state changes to alert. Adhoc rogues are classified and do not go to the pending state. You can have up to 50 classification types.

The following example shows how to create a rule called rule_1 with a priority of 1 and a classification as friendly.

```
(Cisco Controller) > config rogue rule add ap priority 1 classify friendly rule_1
```

The following example shows how to enable rule_1.

```
(Cisco Controller) > config rogue rule enable rule_1
```
The following example shows how to change the priority of the last command.

(Cisco Controller) > config rogue rule priority 2 rule_1

The following example shows how to change the classification of the last command.

(Cisco Controller) > config rogue rule classify malicious rule_1

The following example shows how to disable the last command.

(Cisco Controller) > config rogue rule disable rule_1

The following example shows how to delete SSID_2 from the user-configured SSID list in rule-5.

(Cisco Controller) > config rogue rule condition ap delete ssid ssid_2 rule-5

The following example shows how to create a custom rogue rule.

(Cisco Controller) > config rogue rule classify custom 1 VeryMalicious rule6
# config rogue rule condition ap

To configure a condition of a rogue rule for rogue access points, use the `config rogue rule condition ap` command.

```plaintext
config rogue rule condition ap { set { client-count count | duration time | managed-ssid | no-encryption | rssi rssi | ssid ssid | substring-ssid substring-ssid } | delete { all | client-count | duration | managed-ssid | no-encryption | rssi | ssid | substring-ssid } rule_name
```

## Syntax Description

<table>
<thead>
<tr>
<th>Config Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>set</code></td>
<td>Configures conditions to a rule that the rogue access point must meet.</td>
</tr>
<tr>
<td><code>client-count</code></td>
<td>Enables a minimum number of clients to be associated to the rogue access point.</td>
</tr>
<tr>
<td><code>count</code></td>
<td>Minimum number of clients to be associated to the rogue access point. The range is from 1 to 10 (inclusive). For example, if the number of clients associated to a rogue access point is greater than or equal to the configured value, the access point is classified as malicious.</td>
</tr>
<tr>
<td><code>duration</code></td>
<td>Enables a rogue access point to be detected for a minimum period of time.</td>
</tr>
<tr>
<td><code>time</code></td>
<td>Minimum time period, in seconds, to detect the rogue access point. The range is from 0 to 3600.</td>
</tr>
<tr>
<td><code>managed-ssid</code></td>
<td>Enables a rogue access point’s SSID to be known to the controller.</td>
</tr>
<tr>
<td><code>no-encryption</code></td>
<td>Enables a rogue access point’s advertised WLAN to not have encryption enabled. If a rogue access point has encryption disabled, it is likely that more clients will try to associate to it.</td>
</tr>
<tr>
<td><code>rssi</code></td>
<td>Enables a rogue access point to have a minimum Received Signal Strength Indicator (RSSI) value.</td>
</tr>
<tr>
<td><code>rssi</code></td>
<td>Minimum RSSI value, in dBm, required for the access point. The range is from –95 to –50 (inclusive). For example, if the rogue access point has an RSSI that is greater than the configured value, the access point is classified as malicious.</td>
</tr>
<tr>
<td><code>ssid</code></td>
<td>Enables a rogue access point have a specific SSID.</td>
</tr>
<tr>
<td><code>ssid</code></td>
<td>SSID of the rogue access point.</td>
</tr>
<tr>
<td><code>substring-ssid</code></td>
<td>Enables a rogue access point to have a substring of a user-configured SSID.</td>
</tr>
<tr>
<td><code>substring-ssid</code></td>
<td>Substring of a user-configured SSID. For example, if you have an SSID as ABCDE, you can specify the substring as ABCD or ABC. You can classify multiple SSIDs with matching patterns.</td>
</tr>
<tr>
<td><code>delete</code></td>
<td>Removes the conditions to a rule that a rogue access point must comply with.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Deletes all the rogue rule conditions.</td>
</tr>
<tr>
<td><code>rule_name</code></td>
<td>Rogue rule to which the command applies.</td>
</tr>
</tbody>
</table>

## Command Default

The default value for RSSI is 0 dBm.
The default value for duration is 0 seconds.
The default value for client count is 0.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can configure up to 25 SSIDs per rogue rule. You can configure up to 25 SSID substrings per rogue rule.

The following example shows how to configure the RSSI rogue rule condition:

(Cisco Controller) > config rogue rule condition ap set rssi -50
**config remote-lan session-timeout**

To configure client session timeout, use the `config remote-lan session-timeout` command.

```
config remote-lan session-timeout remote-lan-id seconds
```

**Syntax Description**

<table>
<thead>
<tr>
<th>RemoteLANidentifier</th>
<th>Remote LAN identifier. Valid values are between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Timeout or session duration in seconds. A value of zero is equivalent to no timeout.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the client session timeout to 6000 seconds for a remote LAN with ID 1:

```
(Cisco Controller) > config remote-lan session-timeout 1 6000
```
**config rfid auto-timeout**

To configure an automatic timeout of radio frequency identification (RFID) tags, use the `config rfid auto-timeout` command.

```
config rfid auto-timeout { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables an automatic timeout.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables an automatic timeout.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable an automatic timeout of RFID tags:

```
(Cisco Controller) > config rfid auto-timeout enable
```

**Related Commands**

- `show rfid summary`
- `config rfid status`
- `config rfid timeout`
**config rfid status**

To configure radio frequency identification (RFID) tag data tracking, use the **config rfid status** command.

```
config rfid status {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables RFID tag tracking.</td>
</tr>
<tr>
<td>disable</td>
<td>Enables RFID tag tracking.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure RFID tag tracking settings:

```
(Cisco Controller) > config rfid status enable
```

**Related Commands**

- show rfid summary
- config rfid auto-timeout
- config rfid timeout
**config rfid timeout**

To configure a static radio frequency identification (RFID) tag data timeout, use the `config rfid timeout` command.

```
config rfid timeout seconds
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>seconds</td>
<td>Timeout in seconds (from 60 to 7200).</td>
</tr>
</tbody>
</table>

| Command Default    | None                                             |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a static RFID tag data timeout of 60 seconds:

```
(Cisco Controller) > config rfid timeout 60
```

**Related Commands**

- `show rfid summary`
- `config rfid statistics`
**config rogue ap timeout**

To specify the number of seconds after which the rogue access point and client entries expire and are removed from the list, use the `config rogue ap timeout` command.

```
config rogue ap timeout seconds
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>Value of 240 to 3600 seconds (inclusive), with a default value of 1200 seconds.</td>
</tr>
</tbody>
</table>

**Command Default**

The default number of seconds after which the rogue access point and client entries expire is 1200 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set an expiration time for entries in the rogue access point and client list to 2400 seconds:

```
(Cisco Controller) > config rogue ap timeout 2400
```
config route add

To configure a network route from the service port to a dedicated workstation IP address range, use the **config route add** command.

**config route add ip_address netmask gateway**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ip_address</td>
<td>Network IP address.</td>
</tr>
<tr>
<td>netmask</td>
<td>Subnet mask for the network.</td>
</tr>
<tr>
<td>gateway</td>
<td>IP address of the gateway for the route network.</td>
</tr>
</tbody>
</table>

**Command Default**: None

**Usage Guidelines**: As on release 7.6, **IP_address** supports only IPv4 addresses.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6. This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a network route to a dedicated workstation IP address 10.1.1.0, subnet mask 255.255.255.0, and gateway 10.1.1.1:

```
(Cisco Controller) > config route add 10.1.1.0 255.255.255.0 10.1.1.1
```
**config route delete**

To remove a network route from the service port, use the *config route delete* command.

**Syntax Description**

```
config route delete ip_address
```

**ip_address**

Network IP address.

**Command Default**

None

**Usage Guidelines**

As on release 7.6, *IP_address* supports only IPv4 addresses.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv6 address format.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a route from the network IP address 10.1.1.0:

```
(Cisco Controller) > config route delete 10.1.1.0
```
**config serial baudrate**

To set the serial port baud rate, use the `config serial baudrate` command.

```
config serial baudrate { 1200 | 2400 | 4800 | 9600 | 19200 | 38400 | 57600 }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1200</td>
<td>Specifies the supported connection speeds to 1200.</td>
</tr>
<tr>
<td>2400</td>
<td>Specifies the supported connection speeds to 2400.</td>
</tr>
<tr>
<td>4800</td>
<td>Specifies the supported connection speeds to 4800.</td>
</tr>
<tr>
<td>9600</td>
<td>Specifies the supported connection speeds to 9600.</td>
</tr>
<tr>
<td>19200</td>
<td>Specifies the supported connection speeds to 19200.</td>
</tr>
<tr>
<td>38400</td>
<td>Specifies the supported connection speeds to 38400.</td>
</tr>
<tr>
<td>57600</td>
<td>Specifies the supported connection speeds to 57600.</td>
</tr>
</tbody>
</table>

**Command Default**

The default serial port baud rate is 9600.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a serial baud rate with the default connection speed of 9600:

```
(Cisco Controller) > config serial baudrate 9600
```
config serial timeout

To set the timeout of a serial port session, use the `config serial timeout` command.

```
config serial timeout minutes
```

**Syntax Description**

| minutes | Timeout in minutes from 0 to 160. A value of 0 indicates no timeout. |

**Command Default**

0 (no timeout)

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to set the timeout for a serial connection to the front of the Cisco wireless LAN controller from 0 to 160 minutes where 0 is no timeout.

The following example shows how to configure the timeout of a serial port session to 10 minutes:

```
(Cisco Controller) > config serial timeout 10
```
config service timestamps

To enable or disable time stamps in message logs, use the `config service timestamps` command.

```
config service timestamps  {debug | log} {datetime | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>debug</td>
<td>Configures time stamps in debug messages.</td>
</tr>
<tr>
<td>log</td>
<td>Configures time stamps in log messages.</td>
</tr>
<tr>
<td>datetime</td>
<td>Specifies to time-stamp message logs with the standard date and time.</td>
</tr>
<tr>
<td>disable</td>
<td>Specifies to prevent message logs being time-stamped.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the time stamps in message logs are disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

The following example shows how to enable slot 3 for the access point abc:

(Cisco Controller) > config slot 3 enable abc

The following example shows how to configure RTS for the access point abc:

(Cisco Controller) > config slot 2 rts abc
### config switchconfig boot-break

To enable or disable the breaking into boot prompt by pressing the Esc key at system startup, use the `config switchconfig boot-break` command.

```
config switchconfig boot-break  { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the breaking into boot prompt by pressing the Esc key at system startup.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the breaking into boot prompt by pressing the Esc key at system startup.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the breaking into boot prompt by pressing the Esc key at system startup is disabled.

**Usage Guidelines**

You must enable the features that are prerequisites for the Federal Information Processing Standard (FIPS) mode before enabling or disabling the breaking into boot prompt.

The following example shows how to enable the breaking into boot prompt by pressing the Esc key at system startup:

```
(Cisco Controller) > config switchconfig boot-break enable
```

**Related Commands**

- `show switchconfig`
- `config switchconfig flowcontrol`
- `config switchconfig mode`
- `config switchconfig secret-obfuscation`
- `config switchconfig fips-prerequisite`
- `config switchconfig strong-pwd`
config switchconfig fips-prerequisite

To enable or disable the features that are prerequisites for the Federal Information Processing Standard (FIPS) mode, use the `config switchconfig fips-prerequisite` command.

```
config switchconfig fips-prerequisite { enable | disable }
```

**Syntax Description**

- **enable**
  - Enables the features that are prerequisites for the FIPS mode.

- **disable**
  - Disables the features that are prerequisites for the FIPS mode.

**Command Default**

By default, the features that are prerequisites for the FIPS mode are disabled.

**Usage Guidelines**

You must configure the FIPS authorization secret before you can enable or disable the FIPS prerequisite features.

The following example shows how to enable the features that are prerequisites for the FIPS mode:

```
(Cisco Controller) > config switchconfig fips-prerequisite enable
```

**Related Commands**

- `show switchconfig`
- `config switchconfig flowcontrol`
- `config switchconfig mode`
- `config switchconfig secret-obfuscation`
- `config switchconfig boot-break`
- `config switchconfig strong-pwd`
config switchconfig ucapl

To configure US Department of Defense (DoD) Unified Capabilities Approved Product List (APL) certification on the controller, use the `config switchconfig wlancc` command.

```
config switchconfig ucapl {enable | disable}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>

The following example shows how to enable the Strong Password Check feature:

(Cisco Controller) > `config switchconfig strong-pwd case-check enable`

**Related Commands**

- `show switchconfig`
- `config switchconfig flowcontrol`
- `config switchconfig mode`
- `config switchconfig secret-obfuscation`
- `config switchconfig fips-prerequisite`
- `config switchconfig boot-break`
config switchconfig flowcontrol

To enable or disable 802.3x flow control, use the config switchconfig flowcontrol command.

```
config switchconfig flowcontrol { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables 802.3x flow control.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables 802.3x flow control.</td>
</tr>
</tbody>
</table>

### Command Default

By default, 802.3x flow control is disabled.

The following example shows how to enable 802.3x flow control on Cisco wireless LAN controller parameters:

```
(Cisco Controller) > config switchconfig flowcontrol enable
```

### Related Commands

show switchconfig
**config switchconfig mode**

To configure Lightweight Access Port Protocol (LWAPP) transport mode for Layer 2 or Layer 3, use the `config switchconfig mode` command.

```
config switchconfig mode (L2 | L3)
```

**Syntax Description**
- **L2**: Specifies Layer 2 as the transport mode.
- **L3**: Specifies Layer 3 as the transport mode.

**Command Default**
The default transport mode is L3.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to configure LWAPP transport mode to Layer 3:

```
(Cisco Controller) > config switchconfig mode L3
```

**Related Commands**
- `show switchconfig`
**config switchconfig secret-obfuscation**

To enable or disable secret obfuscation, use the `config switchconfig secret-obfuscation` command.

```
config switchconfig secret-obfuscation { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables secret obfuscation.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables secret obfuscation.</td>
</tr>
</tbody>
</table>

**Command Default**

Secrets and user passwords are obfuscated in the exported XML configuration file.

**Command History**

```
Release  Modification
7.6      This command was introduced in a release earlier than Release 7.6.
```

**Usage Guidelines**

To keep the secret contents of your configuration file secure, do not disable secret obfuscation. To further enhance the security of the configuration file, enable configuration file encryption.

The following example shows how to enable secret obfuscation:

```
(Cisco Controller) > config switchconfig secret-obfuscation enable
```

**Related Commands**

- `show switchconfig`
config sysname

To set the Cisco wireless LAN controller system name, use the `config sysname` command.

```plaintext
config sysname name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>name</th>
<th>System name. The name can contain up to 31 alphanumeric characters.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the system named Ent_01:

(Cisco Controller) > ```config sysname Ent_01```

**Related Commands**

- `show sysinfo`
**config snmp community accessmode**

To modify the access mode (read only or read/write) of an SNMP community, use the `config snmp community accessmode` command.

```
config snmp community accessmode { ro | rw } name
```

**Syntax Description**

- **ro**  
  Specifies a read-only mode.

- **rw**  
  Specifies a read/write mode.

- **name**  
  SNMP community name.

**Command Default**

Two communities are provided by default with the following settings:

<table>
<thead>
<tr>
<th>SNMP Community Name</th>
<th>Client IP Address</th>
<th>Client IP Mask</th>
<th>Access Mode</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>public</td>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>Read Only</td>
<td>Enable</td>
</tr>
<tr>
<td>private</td>
<td>0.0.0.0</td>
<td>0.0.0.0</td>
<td>Read/Write</td>
<td>Enable</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure read/write access mode for SNMP community:

```
(Cisco Controller) > config snmp community accessmode rw private
```

**Related Commands**

- `show snmp community`
- `config snmp community mode`
- `config snmp community create`
- `config snmp community delete`
- `config snmp community ipaddr`
To create a new SNMP community, use the `config snmp community create` command.

```
config snmp community create name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>SNMP community name of up to 16 characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to create a new community with the default configuration.

The following example shows how to create a new SNMP community named test:

```
(Cisco Controller) > config snmp community create test
```

**Related Commands**

- `show snmp community`
- `config snmp community mode`
- `config snmp community accessmode`
- `config snmp community delete`
- `config snmp community ipaddr`
config snmp community delete

To delete an SNMP community, use the config snmp community delete command.

```
config snmp community delete name
```

**Syntax Description**

| name | SNMP community name. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to delete an SNMP community named test:

```
(Cisco Controller) > config snmp community delete test
```

**Related Commands**

- show snmp community
- config snmp community mode
- config snmp community accessmode
- config snmp community create
- config snmp community ipaddr
config snmp community ipaddr

To configure the IPv4 or IPv6 address of an SNMP community, use the **config snmp community ipaddr** command.

```
config snmp community ipaddr IP addr IPv4 mask/IPv6 Prefix length name
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IP addr</strong></td>
<td>SNMP community IPv4 or IPv6 address.</td>
</tr>
<tr>
<td><strong>IPv4 mask/IPv6 Prefix length</strong></td>
<td>SNMP community IP mask (IPv4 mask or IPv6 Prefix length). The IPv6 prefix length is from 0 to 128.</td>
</tr>
<tr>
<td><strong>name</strong></td>
<td>SNMP community name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- This command is applicable for both IPv4 and IPv6 addresses.
- This command is not applicable for default SNMP community (public, private).

The following example shows how to configure an SNMP community with the IPv4 address 10.10.10.10, IPv4 mask 255.255.255.0, and SNMP community named comaccess:

```
(Cisco Controller) > config snmp community ipaddr 10.10.10.10 255.255.255.0 comaccess
```

The following example shows how to configure an SNMP community with the IPv6 address 2001:9:2:16::1, IPv6 prefix length 64, and SNMP community named comaccess:

```
(Cisco Controller) > config snmp community ipaddr 2001:9:2:16::1 64 comaccess
```
config snmp community mode

To enable or disable an SNMP community, use the `config snmp community mode` command.

```
config snmp community mode { enable | disable } name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the community.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the community.</td>
</tr>
<tr>
<td>name</td>
<td>SNMP community name.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the SNMP community named public:

```
(cisco controller) > config snmp community mode enable public
```

### Related Commands

- `show snmp community`
- `config snmp community delete`
- `config snmp community accessmode`
- `config snmp community create`
- `config snmp community ipaddr`
### config snmp engineID

To configure the SNMP engine ID, use the **config snmp engineID** command.

**config snmp engineID {engine_id | default}**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>engine_id</strong></td>
<td>Engine ID in hexadecimal characters (a minimum of 10 and a maximum of 24 characters are allowed).</td>
</tr>
<tr>
<td><strong>default</strong></td>
<td>Restores the default engine ID.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

**Release** | **Modification**
---|---
7.6 | This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**

The SNMP engine ID is a unique string used to identify the device for administration purposes. You do need to specify an engine ID for the device because a default string is automatically generated using Cisco’s enterprise number and the MAC address of the first interface on the device.

If you change the engine ID, then a reboot is required for the change to take effect.

**Caution** If you change the value of the SNMP engine ID, then the password of the user entered on the command line is converted to an MD5 (Message-Digest algorithm 5) or SHA (Secure Hash Algorithm) security digest. This digest is based on both the password and the local engine ID. The command line password is then deleted. Because of this deletion, if the local value of the engine ID changes, the security digests of the SNMP users will become invalid, and the users will have to be reconfigured.

The following example shows how to configure the SNMP engine ID with the value `fffffff`

(Cisco Controller) > config snmp engineID `fffffff`

**Related Commands**

- show snmpengineID
config snmp syscontact

To set the SNMP system contact name, use the `config snmp syscontact` command.

```
config snmp syscontact contact
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>contact</code></td>
<td>SNMP system contact name. Valid value can be up to 255 printable characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Release</strong></td>
</tr>
<tr>
<td>8.3</td>
</tr>
</tbody>
</table>

The following example shows how to set the SMNP system contact named Cisco WLAN Solution_administrator:

```
(Cisco Controller) > config snmp syscontact Cisco WLAN Solution_administrator
```
config snmp syslocation

To configure the SNMP system location name, use the `config snmp syslocation` command.

```
config snmp syslocation location
```

Syntax Description

| location | SNMP system location name. Valid value can be up to 255 printable characters. |

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the SNMP system location name to Building_2a:

```
(Cisco Controller) > config snmp syslocation Building_2a
```
To configure a server to receive SNMP traps, use the `config snmp trapreceiver create` command.

```
config snmp trapreceiver create name IP addr
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>SNMP community name. The name contain up to 31 characters.</td>
</tr>
<tr>
<td><code>IP addr</code></td>
<td>Configure the IPv4 or IPv6 address of where to send SNMP traps.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The IPv4 or IPv6 address must be valid for the command to add the new server.

The following example shows how to add a new SNMP trap receiver with the SNMP trap receiver named test and IP address 10.1.1.1:

```
(Cisco Controller) > config snmp trapreceiver create test 10.1.1.1
```

The following example shows how to add a new SNMP trap receiver with the SNMP trap receiver named test and IP address 2001:10:1:1::1:

```
(Cisco Controller) > config snmp trapreceiver create test 2001:10:1:1::1
```
config snmp trapreceiver delete

To delete a server from the trap receiver list, use the `config snmp trapreceiver delete` command.

`config snmp trapreceiver delete name`

**Syntax Description**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>SNMP community name. The name can contain up to 16 characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to delete a server named test from the SNMP trap receiver list:

(Cisco Controller) > `config snmp trapreceiver delete test`

**Related Commands**

`show snmp trap`
**config snmp trapreceiver mode**

To send or disable sending traps to a selected server, use the `config snmp trapreceiver mode` command.

```
config snmp trapreceiver mode (enable | disable) name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables an SNMP trap receiver.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables an SNMP trap receiver.</td>
</tr>
<tr>
<td>name</td>
<td>SNMP community name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
Release  Modification
7.6       This command was introduced in a release earlier than Release 7.6.
8.3       This command was introduced.
```

**Usage Guidelines**

This command enables or disables the Cisco wireless LAN controller from sending the traps to the selected server.

The following example shows how to disable an SNMP trap receiver from sending traps to a server named server1:

```
(Cisco Controller) > config snmp trapreceiver mode disable server1
```

**Related Commands**

`show snmp trap`
To create a version 3 SNMP user, use the `config snmp v3user create` command.

```
config snmp v3user create username { ro | rw } { none | hmacmd5 | hmacsha } { none | des | aescfb128 } [ auth_key ] [ encrypt_key ]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>Version 3 SNMP username.</td>
</tr>
<tr>
<td><code>ro</code></td>
<td>Specifies a read-only user privilege.</td>
</tr>
<tr>
<td><code>rw</code></td>
<td>Specifies a read-write user privilege.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Specifies if no authentication is required.</td>
</tr>
<tr>
<td><code>hmacmd5</code></td>
<td>Specifies Hashed Message Authentication Coding Message Digest 5 (HMAC-MD5) for authentication.</td>
</tr>
<tr>
<td><code>hmacsha</code></td>
<td>Specifies Hashed Message Authentication Coding-Secure Hashing Algorithm (HMAC-SHA) for authentication.</td>
</tr>
<tr>
<td><code>none</code></td>
<td>Specifies if no encryption is required.</td>
</tr>
<tr>
<td><code>des</code></td>
<td>Specifies to use Cipher Block Chaining-Digital Encryption Standard (CBC-DES) encryption.</td>
</tr>
<tr>
<td><code>auth_key</code></td>
<td>(Optional) Authentication key for the HMAC-MD5 or HMAC-SHA authentication protocol.</td>
</tr>
<tr>
<td><code>encrypt_key</code></td>
<td>(Optional) Encryption key for the CBC-DES or CFB-AES-128 encryption protocol.</td>
</tr>
</tbody>
</table>

**Command Default**

```
SNMP v3 username AccessMode Authentication Encryption
```

<table>
<thead>
<tr>
<th>default</th>
<th>Read/Write</th>
<th>HMAC-SHA</th>
<th>CFB-AES</th>
</tr>
</thead>
</table>

**Command History**

```
Release  Modification
7.6       This command was introduced in a release earlier than Release 7.6.
```

```
Release  Modification
8.3       This command was introduced.
```

Cisco Wireless Controller Command Reference, Release 8.8
The following example shows how to add an SNMP username named test with read-only privileges and no encryption or authentication:

(Cisco Controller) > config snmp v3user create test ro none none

Related Commands

show snmpv3user
config snmp v3user delete

To delete a version 3 SNMP user, use the `config snmp v3user delete` command.

`config snmp v3user delete username`

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>

</tbody>
</table>

The following example shows how to enable SNMP version v1:

```
(Cisco Controller) > config snmp version v1 enable
```

**Related Commands**
- show snmpversion
## config tacacs acct

To configure TACACS+ accounting server settings, use the `config tacacs acct` command.

```
config tacacs acct { add 1-3 IP addr port ascii/hex secret | delete 1-3 | disable 1-3 | enable 1-3 | server-timeout 1-3 seconds }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>add</strong></td>
<td>Adds a new TACACS+ accounting server.</td>
</tr>
<tr>
<td><strong>1-3</strong></td>
<td>Specifies TACACS+ accounting server index from 1 to 3.</td>
</tr>
<tr>
<td><strong>IP addr</strong></td>
<td>Specifies IPv4 or IPv6 address of the TACACS+ accounting server.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Specifies TACACS+ Server's TCP port.</td>
</tr>
<tr>
<td><strong>ascii/hex</strong></td>
<td>Specifies type of TACACS+ server's secret being used (ASCII or HEX).</td>
</tr>
<tr>
<td><strong>secret</strong></td>
<td>Specifies secret key in ASCII or hexadecimal characters.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes a TACACS+ server.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables a TACACS+ server.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables a TACACS+ server.</td>
</tr>
<tr>
<td><strong>server-timeout</strong></td>
<td>Changes the default server timeout for the TACACS+ server.</td>
</tr>
<tr>
<td><strong>seconds</strong></td>
<td>Specifies the number of seconds before the TACACS+ server times out. The server timeout range is from 5 to 30 seconds.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>

</tr>
</tbody>
</table>

```
The following example shows how to add a new TACACS+ accounting server index 1 with the IPv4 address 10.0.0.0, port number 49, and secret key 12345678 in ASCII:

(Cisco Controller) > config tacacs acct add 1 10.0.0.0 10 ascii 12345678

The following example shows how to add a new TACACS+ accounting server index 1 with the IPv6 address 2001:9:6:40::623, port number 49, and secret key 12345678 in ASCII:

(Cisco Controller) > config tacacs acct add 1 2001:9:6:40::623 10 ascii 12345678

The following example shows how to configure the server timeout of 5 seconds for the TACACS+ accounting server:

(Cisco Controller) > config tacacs acct server-timeout 1 5
**config tacacs auth**

To configure TACACS+ authentication server settings, use the *config tacacs auth* command.

```plaintext
config tacacs auth { add 1-3 IP addr port ascii/hex secret | delete 1-3 | disable 1-3 | enable 1-3 | mgmt-server-timeout 1-3 seconds | server-timeout 1-3 seconds }
```

**Syntax Description**

- **add**
  
  Adds a new TACACS+ accounting server.

- **1-3**
  
  TACACS+ accounting server index from 1 to 3.

- **IP addr**
  
  IP address for the TACACS+ accounting server.

- **port**
  
  Controller port used for the TACACS+ accounting server.

- **ascii/hex**
  
  Type of secret key being used (ASCII or HEX).

- **secret**
  
  Secret key in ASCII or hexadecimal characters.

- **delete**
  
  Deletes a TACACS+ server.

- **disable**
  
  Disables a TACACS+ server.

- **enable**
  
  Enables a TACACS+ server.

- **mgmt-server-timeout 1-3 seconds**
  
  Changes the default management login server timeout for the server. The number of seconds before server times out is from 1 to 30 seconds.

- **server-timeout 1-3 seconds**
  
  Changes the default network login server timeout for the server. The number of seconds before server times out is from 5 to 30 seconds.

**Command Default**

None

**Command History**

<table>

</tbody>
</table>

The following example shows how to configure a default TACACS+ authentication server timeout for management users:

```
(Cisco Controller) > config tacacs auth mgmt-server-timeout 1 10
```

**Related Commands**

`config tacacs auth`
To retrieve the TACACS IP information from a DNS server, use the `config radius dns` command.

```
config radius dns { global port { ascii | hex } secret | query url timeout | serverip ip_address | disable | enable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>global</code></td>
<td>Configures the global port and secret to retrieve the TACACS IP information from a DNS server.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Port number for authentication. The range is from 1 to 65535. All the DNS servers should use the same authentication port.</td>
</tr>
<tr>
<td><code>ascii</code></td>
<td>Format of the shared secret that you should set to ASCII.</td>
</tr>
<tr>
<td><code>hex</code></td>
<td>Format of the shared secret that you should set to hexadecimal.</td>
</tr>
<tr>
<td><code>secret</code></td>
<td>TACACS server login secret.</td>
</tr>
<tr>
<td><code>query</code></td>
<td>Configures the fully qualified domain name (FQDN) of the TACACS server and DNS timeout.</td>
</tr>
<tr>
<td><code>url</code></td>
<td>FQDN of the TACACS server. The FQDN can be up to 63 case-sensitive, alphanumeric characters.</td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>Maximum time that the Cisco Wireless LAN Controller (WLC) waits for, in days, before timing out a request and resending it. The range is from 1 to 180.</td>
</tr>
<tr>
<td><code>serverip</code></td>
<td>Configures the DNS server IP address.</td>
</tr>
<tr>
<td><code>ip_address</code></td>
<td>DNS server IP address.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the TACACS DNS feature. The default is disabled.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables the Cisco WLC to retrieve the TACACS IP information from a DNS server.</td>
</tr>
</tbody>
</table>

**Command Default**

You cannot retrieve the TACACS IP information from a DNS server.

**Command History**

```
Release | Modification
---------|-----------------|
7.6      | This command was introduced in a release earlier than Release 7.6.
```

**Usage Guidelines**

The accounting port is derived from the authentication port. All the DNS servers should use the same secret. When you enable a DNS query, the static configurations will be overridden. The DNS list overrides the static AAA list.

The following example shows how to enable the TACACS DNS feature on the Cisco WLC:
(Cisco Controller) > config tacacs dns enable
config tacacs fallback-test interval

To configure TACACS+ probing interval, use the `config tacacs fallback-test interval` command.

```
config tacacs fallback-test interval { seconds }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>seconds</code></td>
<td>TACACS+ probing interval in seconds. Disable is 0, Range from 180 to 3600 seconds.</td>
</tr>
</tbody>
</table>

<table>

The following example shows how to configure TACACS+ probing interval:

```
(Cisco Controller) > config tacacs fallback-test interval 200
```
config time manual

To set the system time, use the `config time manual` command.

```
config time manual MM | DD | YY HH:MM:SS
```

### Syntax Description

<table>
<thead>
<tr>
<th>MM/DD/YY</th>
<th>Date.</th>
</tr>

The following example shows how to configure the system date to 04/04/2010 and time to 15:29:00:

```
(Cisco Controller) > config time manual 04/04/2010 15:29:00
```

### Related Commands

- `show time`
config time ntp

To set the Network Time Protocol (NTP), use the `config time ntp` command.

```bash
config time ntp { auth { enable server-index key-index | disable server-index } | interval interval |
key-auth { add key-index md5 { ascii | hex } key | delete key-index } | pollinterval maxpoll 
minpoll server-index | server index IP Address}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>auth</strong></td>
<td>Configures the NTP authentication.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables the NTP authentication.</td>

<td>The NTP server delete option is available with <code>config time ntp delete server-index</code></td>
</tr>
</tbody>
</table>

Usage Guidelines

- To add the NTP server to the controller, use the `config time ntp server index IP Address` command.
- To display configured NTP server on the controller, use the `show time` command.

The following example shows how to configure the NTP polling interval to 7000 seconds:

(Cisco Controller) > `config time ntp interval 7000`

The following example shows how to enable NTP authentication where the server index is 4 and the key index is 1:

(Cisco Controller) > `config time ntp auth enable 4 1`

The following example shows how to add an NTP authentication key of value ff where the key format is in hexadecimal characters and the key index is 1:

(Cisco Controller) > `config time ntp key-auth add 1 md5 hex ff`

The following example shows how to add an NTP authentication key of value ff where the key format is in ASCII characters and the key index is 1:

(Cisco Controller) > `config time ntp key-auth add 1 md5 ascii ciscokey`

The following example shows how to add NTP servers and display the servers configured to controllers:

(Cisco Controller) > `config time ntp server 1 10.92.125.52`
(Cisco Controller) > `config time ntp server 2 2001:9:6:40::623`
(Cisco Controller) > `show time`

Time............................................. Fri May 23 12:04:18 2014
Timezone delta.............................. 0:0
Timezone location........................... (GMT +5:30) Colombo, New Delhi, Chennai, Kolkata
NTP Servers
NTP Polling Interval......................... 3600

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

The following example shows how to delete an NTP server:

(Cisco Controller) > config time ntp delete 1
config time ntp version

To configure the Network Time Protocol (NTP) version on the Cisco WLC, use the `config time ntp version` command.

Note

During the NTP protocol version change, existing server(s) and keys on the Cisco WLC are deleted.

```
config time ntp version version-number
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

The following example shows how to configure NTP version 4 on a Cisco WLC:

```
(Cisco Controller) > config time ntp version 4
```
**config time timezone**

To configure the system time zone, use the `config time timezone` command.

```plaintext
config time timezone  { enable | disable}  delta_hours delta_mins
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables daylight saving time.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables daylight saving time.</td>

The following example shows how to enable the daylight saving time:

```
(Cisco Controller) > config time timezone enable 2 0
```
**config time timezone location**

To set the location of the time zone in order to have daylight saving time set automatically when it occurs, use the `config time timezone location` command.

```
cfg-timezone loc location_index
```
Syntax Description

location_index
Number representing the time zone required. The time zones are as follows:

- (GMT-12:00) International Date Line West
- (GMT-11:00) Samoa
- (GMT-10:00) Hawaii
- (GMT-9:00) Alaska
- (GMT-8:00) Pacific Time (US and Canada)
- (GMT-7:00) Mountain Time (US and Canada)
- (GMT-6:00) Central Time (US and Canada)
- (GMT-5:00) Eastern Time (US and Canada)
- (GMT-4:00) Atlantic Time (Canada)
- (GMT-3:00) Buenos Aires (Argentina)
- (GMT-2:00) Mid-Atlantic
- (GMT-1:00) Azores
- (GMT) London, Lisbon, Dublin, Edinburgh (default value)
- (GMT+1:00) Amsterdam, Berlin, Rome, Vienna
- (GMT+2:00) Jerusalem
- (GMT+3:00) Baghdad
- (GMT+4:00) Muscat, Abu Dhabi
- (GMT+4:30) Kabul
- (GMT+5:00) Karachi, Islamabad, Tashkent

The following example shows how to enable the sending of Dot11 disassociation trap to clients:

```
(Cisco Controller) > config trapflags client 802.11-disassociate enable
```

**Related Commands**

show trapflags
**config trapflags client max-warning-threshold**

To configure the threshold value of the number of clients that associate with the controller, after which an SNMP trap and a syslog message is sent to the controller, use the `config trapflags client max-warning-threshold` command.

```
config trapflags client max-warning-threshold  (threshold | enable | disable)
```

**Syntax Description**

- **threshold**: Configures the threshold percentage value of the number of clients that associate with the controller, after which an SNMP trap and a syslog message is sent to the controller. The range is from 80 to 100.
  - The minimum interval between two warnings is 10 mins. You cannot configure this interval.
- **enable**: Enables the generation of the traps and syslog messages.
- **disable**: Disables the generation of the traps and syslog messages.

**Command Default**

The default threshold value of the number of clients that associate with the controller is 90 %.

**Command History**

- **Release**
  - 8.3: This command was introduced.
  - 7.6: This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**

This table lists the maximum number of clients for different controllers.

<table>
<thead>
<tr>
<th>Controller</th>
<th>Maximum Number of Supported Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 5500 Series Controllers</td>
<td>7000</td>

The following example shows how to enable the sending of IPsec traps when ESP authentication failure occurs:

```
(Cisco Controller) > config trapflags IPsec esp-auth enable
```

**Related Commands**

`show trapflags`
config trapflags linkmode

To enable or disable Cisco wireless LAN controller level link up/down trap flags, use the `config trapflags linkmode` command.

```
config trapflags linkmode {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables Cisco wireless LAN controller level link up/down trap flags.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables Cisco wireless LAN controller level link up/down trap flags.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the Cisco WLC level link up/down trap flags are enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the Cisco wireless LAN controller level link up/down trap:

```
(Cisco Controller) > config trapflags linkmode disable
```

**Related Commands**

- `show trapflags`
config trapflags mesh

To configure trap notifications when a mesh access point is detected, use the config trapflags mesh command.

```
config trapflags mesh { enable | disable }
```

**Syntax Description**

- **enable**: Enables trap notifications when a mesh access point is detected.
- **disable**: Disables trap notifications when a mesh access point is detected.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable trap notifications when a mesh access point is detected:

```
(Cisco Controller) > config trapflags mesh enable
```

**Related Commands**

- config trapflags 802.11-Security
- config trapflags aaa
- config trapflags ap
- config trapflags adjchannel-rogueap
- config trapflags authentication
- config trapflags client
- config trapflags configsave
- config trapflags IPsec
- config trapflags linkmode
- config trapflags multiusers
- config trapflags strong-pwdcheck
- config trapflags rfid
- config trapflags rogueap
- show trapflags
To enable or disable the sending of traps when multiple logins are active, use the `config trapflags multiusers` command.

```plaintext
config trapflags multiusers { enable | disable }
```

**Syntax Description**
- **enable**
  - Enables the sending of traps when multiple logins are active.
- **disable**
  - Disables the sending of traps when multiple logins are active.

**Command Default**
By default, the sending of traps when multiple logins are active is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the sending of traps when multiple logins are active:

```plaintext
(Cisco Controller) > config trapflags multiusers disable
```

**Related Commands**
- `show trapflags`
To configure the threshold value of the maximum number of radio frequency identification (RFID) tags, after which an SNMP trap and a syslog message is sent to the controller, use the `config trapflags rfid` command.

```
config trapflags rfid { threshold | enable | disable }
```

**Syntax Description**
- **threshold**: Configures the threshold percentage value of the maximum number of RFID tags, after which an SNMP trap and a syslog message is sent to the controller. The range is from 80 to 100. The traps and syslog messages are generated every 10 minutes. You cannot configure this interval.
- **enable**: Enables the generation of the traps and syslog messages.
- **disable**: Disables the generation of the traps and syslog messages.

**Command Default**
The default threshold value of the maximum number of RFID tags is 90%.

**Command History**
- **Release 7.6**: This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**
The following table shows the maximum number of RFID tags supported on different controllers:

<table>
<thead>
<tr>
<th>Controller</th>
<th>Maximum Number of Supported Clients</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco 5500 Series Controllers</td>
<td>5000</td>
</tr>
<tr>
<td>Cisco 2500 Series Controllers</td>
<td>500</td>
</tr>
<tr>
<td>Cisco Wireless Services Module 2</td>
<td>10000</td>
</tr>
<tr>
<td>Cisco Flex 7500 Series Controllers</td>
<td>50000</td>
</tr>
<tr>
<td>Cisco 8500 Series Controllers</td>
<td>50000</td>
</tr>
<tr>
<td>Cisco Virtual Wireless LAN Controllers</td>
<td>3000</td>
</tr>
</tbody>
</table>

The following example shows how to configure the threshold value of the maximum number of RFID tags:

```
(Cisco Controller) > config trapflags rfid 80
```

**Related Commands**

## config trapflags rrm-params

To enable or disable the sending of Radio Resource Management (RRM) parameters traps, use the `config trapflags rrm-params` command.

```plaintext
config trapflags rrm-params { tx-power | channel | antenna } { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tx-power</td>
<td>Enables trap sending when the RF manager automatically changes the tx-power level for the Cisco lightweight access point interface.</td>
</tr>
<tr>
<td>channel</td>
<td>Enables trap sending when the RF manager automatically changes the channel for the Cisco lightweight access point interface.</td>
</tr>
<tr>
<td>antenna</td>
<td>Enables trap sending when the RF manager automatically changes the antenna for the Cisco lightweight access point interface.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the sending of RRM parameter-related traps.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the sending of RRM parameter-related traps.</td>
</tr>
</tbody>
</table>

### Command Default

By default, the sending of RRM parameters traps is enabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>

</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the sending of RRM parameter-related traps:

```
(Cisco Controller) > config trapflags rrm-params tx-power enable
```

### Related Commands

- `show trapflags`
**config trapflags rrm-profile**

To enable or disable the sending of Radio Resource Management (RRM) profile-related traps, use the `config trapflags rrm-profile` command.

```
config trapflags rrm-profile {load | noise | interference | coverage} {enable | disable}
```

**Syntax Description**

- **load**
  - Enables trap sending when the load profile maintained by the RF manager fails.

- **noise**
  - Enables trap sending when the noise profile maintained by the RF manager fails.

- **interference**
  - Enables trap sending when the interference profile maintained by the RF manager fails.

- **coverage**
  - Enables trap sending when the coverage profile maintained by the RF manager fails.

- **enable**
  - Enables the sending of RRM profile-related traps.

- **disable**
  - Disables the sending of RRM profile-related traps.

**Command Default**

By default, the sending of RRM profile-related traps is enabled.

**Command History**

- **Release 7.6**
  - This command was introduced in a release earlier than Release 7.6.

The following example shows how to disable the sending of RRM profile-related traps:

```
(Cisco Controller) > config trapflags rrm-profile load disable
```

**Related Commands**

- `show trapflags`
**config trapflags stpmode**

To enable or disable the sending of spanning tree traps, use the `config trapflags stpmode` command.

```
config trapflags stpmode  { enable  |  disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the sending of spanning tree traps.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the sending of spanning tree traps.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the sending of spanning tree traps is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

The following example shows how to disable the sending of spanning tree traps:

```
(Cisco Controller) > config trapflags stpmode disable
```

**Related Commands**

`show trapflags`
To configure trap notifications for strong password checks, use the `config trapflags strong-pwdcheck` command.

```
config trapflags strong-pwdcheck { enable | disable }
```

**Syntax Description**

- `enable` Enables trap notifications for strong password checks.
- `disable` Disables trap notifications for strong password checks.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable trap notifications for strong password checks:

```
(Cisco Controller) > config trapflags strong-pwdcheck enable
```
**config trapflags wps**

To enable or disable Wireless Protection System (WPS) trap sending, use the `config trapflags wps` command.

```plaintext
config trapflags wps { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables WPS trap sending.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables WPS trap sending.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, the WPS trap sending is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to disable the WPS traps sending:

```plaintext
(Cisco Controller) > config trapflags wps disable
```

**Related Commands**

`show trapflags`
config tunnel eogre heart-beat

To configure the keep alive ping interval duration, use the **config tunnel eogre** command.

```
config tunnel eogre heart-beat {interval | max-skip-count} number-value
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>interval number-value</td>
<td>Time interval between echo request message in seconds.</td>
<td></td>
</tr>
<tr>
<td>max-skip-count number-value</td>
<td>Maximum number of retries before the member is considered non functional.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>The default value of heart-beat interval is 60 seconds. Range is between 10 to 600 seconds.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The default value of heart-beat max-skip-count is 3 retries. Range is between 3 to 10 retries.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to set the heart-beat interval value '45 seconds':

```
config tunnel eogre heart-beat interval 45
```
To configure the Ethernet over GRE gateway IPv4 address, use the `config tunnel eogre gateway` command.

```
config tunnel eogre gateway ( { { add | modify } gateway-name { ipv4-address | ipv6-address } gateway-ip-address } | { delete gateway-name } )
```

**Syntax Description**
- **add** Adds new gateway.
- **delete** Removes a gateway.
- **modify** Modifies an existing gateway.
- **ipv4-address** To enter the IPv4 address of the gateway.
- **ipv6-address** To enter the IPv6 address of the gateway.
- **gateway-ip-address** IPv4 or IPv6 address of the gateway.
- **gateway-name** Tunnel gateway name.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.3</td>
<td>The IPv6 address format option for the tunnel gateway was added.</td>
</tr>
</tbody>
</table>

- IPv4 address example
  
  ```
  config tunnel eogre gateway add hurricane ipv4 192.168.10.1
  ```

- IPv6 address example
  
  ```
  config tunnel eogre gateway add hurricane ipv6 2001:DB8::1
  ```
config tunnel eogre domain

To perform tunnel gateway domain configuration, use the `config tunnel eogre domain` command.

```
config tunnel eogre domain { { create | delete } domain-name } { add | remove } domain-name

create             Creates new gateway domain name.
delete             Deletes gateway domain.
add                Add gateway name to domain
remove             Remove gateway name from domain

domain-name       Domain name

gateway-name      Gateway name
```

The following example shows how to create new gateway domain name:

```
config tunnel eogre domain create web.com data
```
config tunnel eogre domain primary

To add primary or secondary gateway name to a domain, use the `config tunnel eogre domain primary` command.

```
config tunnel eogre domain primary  domain-name  gateway-name
```

**Syntax Description**
- `domain-name` Enter the domain name
- `gateway-name` Enter the gateway name to be added to the domain

**Usage Guidelines**
In a domain, the primary gateway is active by default. When the primary gateway is not operational, the secondary gateway becomes the active gateway. Clients will have to associate again with the secondary gateway. During and after failover, Cisco WLC continues to ping the primary gateway. When the primary gateway is operational again, the primary gateway becomes the active gateway. Clients then fall back to the primary gateway. The same option is available for the TGW from FlexConnect in local switched mode. EoGRE tunnels can be DTLS encrypted CAPWAP IPv4 or IPv6. This feature is supported on all Wave 1 and Wave 2 APs that are supported in this release.

**Command History**

The following example shows how to disable the client watchlist:

```
(Cisco Controller) > config watchlist disable
```
config watchlist enable

To enable a watchlist entry for a wireless LAN, use the **config watchlist enable** command.

**config watchlist enable**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>

<tr>
<td>ssid</td>
<td>SSID (network name) up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td>all</td>
<td>(Optional) Specifies all wireless LANs.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

- **Release 7.6**: This command was introduced in a release earlier than Release 7.6.
- **Release 8.3**: This command was introduced.

**Usage Guidelines**

When you create a new WLAN using the `config wlan create` command, it is created in disabled mode. Leave it disabled until you have finished configuring it.

If you do not specify an SSID, the profile `name` parameter is used for both the profile name and the SSID.

If the management and AP-manager interfaces are mapped to the same port and are members of the same VLAN, you must disable the WLAN before making a port-mapping change to either interface. If the management and AP-manager interfaces are assigned to different VLANs, you do not need to disable the WLAN.

An error message appears if you try to delete a WLAN that is assigned to an access point group. If you proceed, the WLAN is removed from the access point group and from the access point’s radio.

The following example shows how to enable wireless LAN identifier 16:
(Cisco Controller) >config wlan enable 16
config wlan 7920-support

To configure support for phones, use the `config wlan 7920-support` command.

```
config wlan 7920-support  { client-cac-limit | ap-cac-limit } { enable | disable } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

802.11e provides quality of service (QoS) support for LAN applications, which are critical for delay sensitive applications such as Voice over Wireless IP (VoWIP).

802.11e enhances the 802.11 Media Access Control layer (MAC layer) with a coordinated time division multiple access (TDMA) construct, and adds error-correcting mechanisms for delay sensitive applications such as voice and video. The 802.11e specification provides seamless interoperability and is especially well suited for use in networks that include a multimedia capability.

The following example shows how to allow 802.11e on the wireless LAN with LAN ID 1:

(Cisco Controller) >**config wlan 802.11e allow 1**
config wlan aaa-override

To configure a user policy override via AAA on a wireless LAN, use the `config wlan aaa-override` command.

```
config wlan aaa-override  { enable | disable } { wlan_id | foreignAp }
```

**Syntax Description**

- **enable**: Enables a policy override.
- **disable**: Disables a policy override.
- **wlan_id**: Wireless LAN identifier between 1 and 512.
- **foreignAp**: Specifies third-party access points.

**Command Default**

AAA is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When AAA override is enabled and a client has conflicting AAA and Cisco wireless LAN controller wireless LAN authentication parameters, client authentication is performed by the AAA server. As part of this authentication, the operating system will move clients from the default Cisco wireless LAN VLAN to a VLAN returned by the AAA server and predefined in the controller interface configuration (only when configured for MAC filtering, 802.1X, and/or WPA operation). In all cases, the operating system will also use QoS, DSCP, 802.1p priority tag values, and ACLs provided by the AAA server, as long as they are predefined in the controller interface configuration. (This VLAN switching by AAA override is also referred to as Identity Networking.)

If the corporate wireless LAN uses a management interface assigned to VLAN 2, and if AAA override returns a redirect to VLAN 100, the operating system redirects all client transmissions to VLAN 100, regardless of the physical port to which VLAN 100 is assigned.

When AAA override is disabled, all client authentication defaults to the controller authentication parameter settings, and authentication is performed by the AAA server if the controller wireless LAN does not contain any client-specific authentication parameters.

The AAA override values might come from a RADIUS server.

The following example shows how to configure user policy override via AAA on WLAN ID 1:

```
(Cisco Controller) >config wlan aaa-override enable 1
```
**config wlan acl**

To configure a wireless LAN access control list (ACL), use the `config wlan acl` command.

```
config wlan acl [acl_name | none]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
<tr>
<td>acl_name</td>
<td>(Optional) ACL name.</td>
</tr>
<tr>
<td>none</td>
<td>(Optional) Clears the ACL settings for the specified wireless LAN.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure a WLAN access control list with WLAN ID 1 and ACL named `office_1`:

```
(Cisco Controller) > config wlan acl 1 office_1
```
To manage access point group VLAN features, use the `config wlan apgroup` command.

```plaintext
config wlan apgroup { add apgroup_name [description] | delete apgroup_name | description apgroup_name description | interface-mapping { add | delete } apgroup_name wlan_id interface_name | nac-snmp { enable | disable } apgroup_name wlan_id | nasid NAS-ID apgroup_name | profile-mapping { add | delete } apgroup_name profile_name | wlan-radio-policy apgroup_name wlan-id { 802.11a-only | 802.11bg | 802.11g-only | all } | hotspot { venue { type apgroup_name group_codetype_code | name apgroup_name language_codevenue_name } | operating-class { add | delete } apgroup_name operating_class_value } }
```

- 1: AUTOMOBILE OR TRUCK
- 2: AIRPLANE
- 3: BUS
- 4: FERRY
- 5: SHIP OR BOAT
- 6: TRAIN
- 7: MOTOR BIKE

For venue group 11 (OUTDOOR), the following options are available:

- 0: UNSPECIFIED OUTDOOR
- 1: MINI-MESH NETWORK
- 2: CITY PARK
- 3: REST AREA
- 4: TRAFFIC CONTROL
- 5: BUS STOP
- 6: KIOSK
### name
Configures the name of venue for an AP group.

### language_code
An ISO-639 encoded string defining the language used at the venue. This string is a three character language code. For example, you can enter ENG for English.

### venue_name
Venue name for this AP group. This name is associated with the basic service set (BSS) and is used in cases where the SSID does not provide enough information about the venue. The venue name is case-sensitive and can be up to 252 alphanumeric characters.

### add
Adds an operating class for an AP group.

### delete
Deletes an operating class for an AP group.

### operating_class_value
Operating class for an AP group. The available operating classes are 81, 83, 84, 112, 113, 115, 116, 117, 118, 119, 120, 121, 122, 123, 124, 125, 126, 127.

### Command Default
AP Group VLAN is disabled.

### Command History
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
An error message appears if you try to delete an access point group that is used by at least one access point. Before you can delete an AP group in controller software release 6.0, move all APs in this group to another group. The access points are not moved to the default-group access point group as in previous releases. To see the APs, enter the `show wlan apgroups` command. To move APs, enter the `config ap group-name groupname cisco_ap` command.

The NAS-ID configured on the controller for AP group or WLAN or interface is used for authentication. The NAS-ID is not propagated across controllers.

The following example shows how to enable the NAC out-of-band support on access point group 4:

```
(Cisco Controller) > config wlan apgroup nac enable apgroup 4
```
config wlan apgroup atf 802.11

Configure Cisco Airtime Fairness at an AP group level by using the config wlan apgroup atf 802.11 command.

```
config wlan apgroups atf 802.11 { a | b } { mode { disable | monitor | enforce-policy } ap-group-name } | { optimization { enable | disable } }
```

**Syntax Description**

- **a**: Specifies the 802.11a network settings
- **b**: Specifies the 802.11b/g network settings
- **mode**: Configures the granularity of Cisco ATF enforcement
  - **disable**: Disables Cisco ATF
  - **monitor**: Configures Cisco ATF in monitor mode
  - **enforce-policy**: Configures Cisco ATF in enforcement mode
- **ap-group-name**: AP group name that you must specify
- **optimization**: Configures airtime optimization
  - **enable**: Enables airtime optimization
  - **disable**: Disabled airtime optimization

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

To configure Cisco ATF in enforcement mode on an 802.11a network, for an AP group `my-ap-group`, enter the following command:

```
(Cisco Controller) > config wlan apgroup atf 802.11a mode enforce-policy my-ap-group
```
**config wlan apgroup atf 802.11 policy**

To configure AP group-level override for Cisco ATF policy on a WLAN by using this command:

```
config wlan apgroup atf 802.11 \{ a \| b \} policy ap-group-name wlan-id policy-name override \{ enable \| disable \}
```

### Syntax Description

- **a** Specifies the 802.11a network settings
- **b** Specifies the 802.11b network settings
- **policy** Specifies the Cisco ATF policy
- **ap-group-name** Name of the AP group that you must specify
- **wlan-id** WLAN ID or Remote LAN ID that you must specify
- **policy-name** Cisco ATF policy name that you must specify
- **override** Configures ATF policy override for a WLAN in the AP group
- **enable** Enables ATF policy override for a WLAN in the AP group
- **disable** Disables ATF policy override for a WLAN in the AP group

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
None

**Example**
The following example shows how to configure an openDNS profile to an AP group WLAN:

```
(Cisco Controller) > config wlan apgroup opendns-profile wlan1 site1 user1
```
To configure 802.1Q-in-Q VLAN tagging of traffic for an AP group, use the `config wlan apgroup qinq` command.

```plaintext
config wlan apgroup qinq {tagging {client-traffic | dhcp-v4 | eap-sim-aka} apgroup_name {enable | disable} | service-vlan apgroup_name vlan_id}
```

**Syntax Description**
- **tagging**: Configures 802.1Q-in-Q VLAN tagging of traffic.
- **client-traffic**: Configures 802.1Q-in-Q tagging of client traffic for an AP group.
- **dhcp-v4**: Configures 802.1Q-in-Q tagging of DHCPv4 traffic for an AP group.
- **eap-sim-aka**: Configures 802.1Q-in-Q tagging of Extensible Authentication Protocol for Authentication and Key Agreement (EAP-AKA) and EAP for Global System for Mobile Communications Subscriber Identity Module (EAP-SIM) traffic for an AP group.
- **enable**: Enables 802.1Q-in-Q tagging of traffic.
- **disable**: Disables 802.1Q-in-Q tagging of traffic.
- **service-vlan**: Configures service VLAN for an AP group.
- **apgroup_name**: Name of the access point group.
- **vlan_id**: VLAN identifier.

**Command Default**
By default, 802.1Q-in-Q tagging of client and DHCPv4 traffic for an AP group is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Note**
You must enable 802.1Q-in-Q tagging of client traffic before you enable 802.1Q-in-Q tagging of DHCPv4 traffic.

When you enable 802.1Q-in-Q tagging of client traffic, the 802.1Q-in-Q tagging of EAP-AKA and EAP-SIM traffic is also enabled.

The following example shows how to enable 802.1Q-in-Q tagging of client traffic for an AP group:

```
(Cisco Controller) > config wlan apgroup qinq tagging client-traffic APg1 enable
```

The following example shows how to configure the service VLAN for an AP group:

```
(Cisco Controller) > config wlan apgroup qinq service-vlan APg1 10
```
To configure assisted roaming on a WLAN, use the `config wlan assisted-roaming` command.

```
config wlan assisted-roaming { neighbor-list | dual-list | prediction } { enable | disable } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>neighbor-list</td>
<td>Configures an 802.11k neighbor list for a WLAN.</td>
</tr>
<tr>
<td>dual-list</td>
<td>Configures a dual band 802.11k neighbor list for a WLAN. The default is the</td>
</tr>
<tr>
<td></td>
<td>client is currently associated with.</td>
</tr>
<tr>
<td>prediction</td>
<td>Configures an assisted roaming optimization prediction for a WLAN.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the configuration on the WLAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the configuration on the WLAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512 (inclusive).</td>
</tr>
</tbody>
</table>

**Command Default**

The 802.11k neighbor list is enabled for all WLANs.

By default, dual band list is enabled if the neighbor list feature is enabled for the WLAN.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a</td>
</tr>
<tr>
<td></td>
<td>release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable the assisted roaming prediction list, a warning appears and load balancing is disabled for the WLAN, if load balancing is already enabled on the WLAN.

The following example shows how to enable an 802.11k neighbor list for a WLAN:

```
(Cisco Controller) > config wlan assisted-roaming neighbor-list enable 1
```
config wlan atf

Map a WLAN to a Cisco ATF policy using the `config wlan atf` command.

```
config wlan atf wlan-id policy policy-id
```

**Syntax Description**

- `wlan-id` WLAN ID that you must specify to which the Cisco ATF policy has to be mapped.
- `policy` Specifies the Cisco ATF policy
- `policy-id` Cisco ATF policy ID that you must specify

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<tr>
<td><code>visibility</code></td>
<td>Configures application visibility on a WLAN.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables application visibility on a WLAN. You can view the classification of applications based on the Network Based Application Recognition (NBAR) deep packet inspection technology. Use the <code>show avc statistics client</code> command to view the client AVC statistics.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables application visibility on a WLAN.</td>
</tr>
</tbody>
</table>

#### Command Default

None

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

You can configure only one AVC profile per WLAN and each AVC profile can have up to 32 rules. Each rule states a Mark or Drop action for an application, which allows you to configure up to 32 application actions per WLAN. You can configure up to 16 AVC profiles on a controller and associate an AVC profile with multiple WLANs.

The following example shows how to associate an AVC profile with a WLAN:

```
(Cisco Controller) > config wlan avc 5 profile profile1 enable
```
config wlan band-select allow

To configure band selection on a WLAN, use the config wlan band-select allow command.

```
config wlan band-select allow { enable | disable } wlan_id
```

**Syntax Description**

- **enable** Enables band selection on a WLAN.
- **disable** Disables band selection on a WLAN.
- **wlan_id** Wireless LAN identifier between 1 and 512.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable band select on a WLAN, the access point suppresses client probes on 2.4-GHz and moves the dual band clients to the 5-GHz spectrum. The band-selection algorithm directs dual-band clients only from the 2.4-GHz radio to the 5-GHz radio of the same access point, and it only runs on an access point when both the 2.4-GHz and 5-GHz radios are up and running. Band selection can be used only with Cisco Aironet 1040, 1140, and 1250 Series and the 3500 series access points.

The following example shows how to enable band selection on a WLAN:

```
(Cisco Controller) >config wlan band-select allow enable 6
```
**config wlan broadcast-ssid**

To configure an Service Set Identifier (SSID) broadcast on a wireless LAN, use the `config wlan broadcast-ssid` command.

```
config wlan broadcast-ssid { enable | disable } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables SSID broadcasts on a wireless LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables SSID broadcasts on a wireless LAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

Broadcasting of SSID is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an SSID broadcast on wireless LAN ID 1:

(Cisco Controller) > `config wlan broadcast-ssid enable 1`
To enable or disable Voice-over-IP (VoIP) snooping for a particular WLAN, use the `config wlan call-snoop` command.

```
config wlan call-snoop { enable | disable } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables VoIP snooping on a wireless LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables VoIP snooping on a wireless LAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

- **Release 7.6**
  - This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**

WLAN should be with Platinum QoS and it needs to be disabled while invoking this CLI.

The following example shows how to enable VoIP snooping for WLAN 3:

```
(Cisco Controller) > config wlan call-snoop 3 enable
```
config wlan chd

To enable or disable Coverage Hole Detection (CHD) for a wireless LAN, use the `config wlan chd` command.

```plaintext
config wlan chd wlan_id {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>wlan_id</th>
<th>Wireless LAN identifier between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables SSID broadcasts on a wireless LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables SSID broadcasts on a wireless LAN.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable CHD for WLAN 3:

(Cisco Controller) > config wlan chd 3 enable
**config wlan ccx aironet-ie**

To enable or disable Aironet information elements (IEs) for a WLAN, use the `config wlan ccx aironet-ie` command.

```
config wlan ccx aironet-ie { enable | disable }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the Aironet information elements.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the Aironet information elements.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable Aironet information elements for a WLAN:

```
(Cisco Controller) > config wlan ccx aironet-ie enable
```
config wlan channel-scan defer-priority

To configure the controller to defer priority markings for packets that can defer off channel scanning, use the `config wlan channel-scan defer-priority` command.

```
config wlan channel-scan defer-priority priority [enable | disable] wlan_id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>priority</code></td>
<td>User priority value (0 to 7).</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>(Optional) Enables packet at given priority to defer off channel scanning.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>(Optional) Disables packet at given priority to defer off channel scanning.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The priority value should be set to 6 on the client and on the WLAN.

The following example shows how to enable the controller to defer priority markings that can defer off channel scanning with user priority value 6 and WLAN id 30:

```
(Cisco Controller) >config wlan channel-scan defer-priority 6 enable 30
```
**config wlan channel-scan defer-time**

To assign the channel scan defer time in milliseconds, use the `config wlan channel-scan defer-time` command.

```
config wlan channel-scan defer-time msecs wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>msecs</code></td>
<td>Deferral time in milliseconds (0 to 60000 milliseconds).</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The time value in milliseconds should match the requirements of the equipment on your WLAN.

The following example shows how to assign the scan defer time to 40 milliseconds for WLAN with ID 50:

```
(Cisco Controller) > config wlan channel-scan defer-time 40 50
```
## config wlan custom-web

To configure the web authentication page for a WLAN, use the `config wlan custom-web` command.

```
config wlan custom-web { 
  ext-webauth-url ext-webauth-url wlan_id |
  global { enable | disable }
  | ms-open { enable | disable | url }
  | login-page page-name |
  loginfailure-page { page-name | none }
  | logout-page { page-name | none }
  | sleep-client { enable | disable }
  authenticate-without-trigger { enable | disable }
  wlan_id timeout duration
  | webauth-type { internal | customized | external }
}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ext-webauth-url</td>
<td>Configures an external web authentication URL.</td>
</tr>
<tr>
<td>ext-webauth-url</td>
<td>External web authentication URL.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>WLAN identifier. Default range is from 1 to 512.</td>
</tr>
<tr>
<td>global</td>
<td>Configures the global status for a WLAN.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the global status for a WLAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the global status for a WLAN.</td>
</tr>
<tr>
<td>authenticate-without-trigger</td>
<td>Configures Sleep Client auto authentication feature on the WLAN.</td>
</tr>
<tr>
<td>ms-open</td>
<td>Configures the ms-open feature on the WLAN.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the ms-open feature on the WLAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the ms-open feature on the WLAN.</td>
</tr>
<tr>
<td>url</td>
<td>Configures ms-open URL.</td>
</tr>
<tr>
<td>login-page</td>
<td>Configures the name of the login page for an external web authentication URL.</td>
</tr>
<tr>
<td>page-name</td>
<td>Login page name for an external web authentication URL.</td>
</tr>
<tr>
<td>loginfailure-page</td>
<td>Configures the name of the login failure page for an external web authentication URL.</td>
</tr>
<tr>
<td>none</td>
<td>Does not configure a login failure page for an external web authentication URL.</td>
</tr>
<tr>
<td>logout-page</td>
<td>Configures the name of the logout page for an external web authentication URL.</td>
</tr>
<tr>
<td>sleep-client</td>
<td>Configures the sleep client feature on the WLAN.</td>
</tr>
<tr>
<td>timeout</td>
<td>Configures the sleep client timeout on the WLAN.</td>
</tr>
</tbody>
</table>
### duration
Maximum amount of time after the idle timeout, in hours, before a sleeping client is forced to reauthenticate. The range is from 1 to 720. The default is 12. When the sleep client feature is enabled, the clients need not provide the login credentials when they move from one Cisco WLC to another (if the Cisco WLCs are in the same mobility group) between the sleep and wake-up times.

<table>
<thead>
<tr>
<th>webauth-type</th>
<th>Configures the type of web authentication for the WLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>internal</td>
<td>Displays the default login page.</td>
</tr>
<tr>
<td>customized</td>
<td>Displays a customized login page.</td>
</tr>
<tr>
<td>external</td>
<td>Displays a login page on an external web server.</td>
</tr>
</tbody>
</table>

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.2</td>
<td>This command was modified and the ms-open parameters were added.</td>
</tr>
<tr>
<td>8.8</td>
<td>This command was modified and the authenticate-without-trigger parameters were added.</td>
</tr>
</tbody>
</table>

The following example shows how to configure web authentication type in the WLAN.

**Cisco Controller**

```bash
config wlan custom-web webauth-type external
```
**config wlan dhcp_server**

To configure the internal DHCP server for a wireless LAN, use the `config wlan dhcp_server` command.

```
config wlan dhcp_server {wlan_id | foreignAp} ip_address [required]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
<tr>
<td>foreignAp</td>
<td>Specifies third-party access points.</td>
</tr>
<tr>
<td>ip_address</td>
<td>IP address of the internal DHCP server (this parameter is required).</td>
</tr>
<tr>
<td>required</td>
<td>(Optional) Specifies whether DHCP address assignment is required.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The preferred method for configuring DHCP is to use the primary DHCP address assigned to a particular interface instead of the DHCP server override. If you enable the override, you can use the `show wlan` command to verify that the DHCP server has been assigned to the WLAN.

The following example shows how to configure an IP address 10.10.2.1 of the internal DHCP server for wireless LAN ID 16:

```
(Cisco Controller) > config wlan dhcp_server 16 10.10.2.1
```
**config wlan diag-channel**

To enable the diagnostic channel troubleshooting on a particular WLAN, use the `config wlan diag-channel` command.

```
config wlan diag-channel [enable | disable] wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>(Optional) Enables the wireless LAN diagnostic channel.</td>
</tr>
<tr>
<td>disable</td>
<td>(Optional) Disables the wireless LAN diagnostic channel.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the wireless LAN diagnostic channel for WLAN ID 1:

```
(Cisco Controller) > config wlan diag-channel enable 1
```
config wlan dtim

To configure a Delivery Traffic Indicator Message (DTIM) for 802.11 radio network `config wlan dtim` command.

```
config wlan dtim  {802.11a  |  802.11b}  dtim wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>802.11a</th>
<th>802.11b</th>
<th>dtim</th>
<th>wlan_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configures DTIM for the 802.11a radio network.</td>
<td>Configures DTIM for the 802.11b radio network.</td>
<td>Value for DTIM (between 1 to 255 inclusive).</td>
<td>Number of the WLAN to be configured.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

The default is DTIM 1.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure DTIM for 802.11a radio network with DTIM value 128 and WLAN ID 1:

```
(Cisco Controller) >config wlan dtim 802.11a 128 1
```
# config wlan exclusionlist

To configure the wireless LAN exclusion list, use the `config wlan exclusionlist` command.

```plaintext
config wlan exclusionlist { wlan_id [ enabled | disabled | time ] | foreignAp [ enabled | disabled | time ] }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
<tr>
<td><code>enabled</code></td>
<td>(Optional) Enables the exclusion list for the specified wireless LAN or foreign access point.</td>
</tr>
<tr>
<td><code>disabled</code></td>
<td>(Optional) Disables the exclusion list for the specified wireless LAN or a foreign access point.</td>
</tr>
<tr>
<td><code>time</code></td>
<td>(Optional) Exclusion list timeout in seconds. A value of zero (0) specifies infinite time.</td>
</tr>
<tr>
<td><code>foreignAp</code></td>
<td>Specifies a third-party access point.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

This command replaces the `config wlan blacklist` command.

The following example shows how to enable the exclusion list for WLAN ID 1:

```plaintext
(Cisco Controller) > config wlan exclusionlist 1 enabled
```
**config wlan fabric**

To enable or disable fabric on a WLAN, use the `config wlan fabric` command.

```
config wlan fabric {enable | disable} wlan-id
```

**Syntax Description**
- `enable` Enables fabric on a WLAN.
- `disable` Disables fabric on a WLAN.
- `wlan-id` WLAN identifier.

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Non-fabric APs are not configured with fabric WLAN.

**Example**

The following example shows how to enable fabric on a WLAN:

```
config wlan fabric enable wlan1
```
To configure access control list (ACL) name for the fabric WLAN, use the `config wlan fabric acl` command.

```
config wlan fabric acl flex-acl-name wlan-id
```

**Syntax Description**

- `flex-acl-name`: ACL name.
- `wlan-id`: WLAN identifier.

**Command Default**

- No default.

**Command Modes**

- Configuration mode.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The ACL to be used comes from the Flex ACL table.

**Example**

The following example shows how to configure an ACL name for the fabric WLAN:

```
config wlan fabric acl flexACL wlan1
```
**config wlan fabric avc-policy**

To configure an Application Visibility and Control (AVC) profile name for the fabric WLAN, use the `config wlan fabric avc-policy` command.

```
config wlan fabric avc-policy flex-avc-policy-name wlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>flex-avc-policy-name</code></td>
<td>AVC policy name.</td>
</tr>
<tr>
<td><code>wlan-id</code></td>
<td>WLAN identifier.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

- **Configuration Mode**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- None

**Example**

The following example shows how to configure an AVC profile name for the fabric WLAN:

```plaintext
config wlan fabric acl AVCpolicy wlan1
```
**config wlan fabric encap vxlan**

To map a Virtual Extensible LAN (VXLAN) network identifier (VNID) to a WLAN, use the `config wlan fabric encap vxlan` command.

`config wlan fabric encap vxlan wlan-id`

**Syntax Description**

<table>
<thead>
<tr>
<th>wlan-id</th>
<th>WLAN identifier.</th>
</tr>
</thead>
</table>

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Example**

The following example shows how to map a VNID to a WLAN:

`config wlan fabric encap vxlan wlan1`
**config wlan fabric switch-ip**

To configure the IP address of the Fabric Switch that is used for the AP VXLAN tunnel, use the `config wlan fabric switch-ip` command.

```
config wlan fabric switch-ip ip-address wlan-id
```

**Syntax Description**
- `ip-address`  IP address of the switch.
- `wlan-id`  WLAN identifier.

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command is optional for the fabric configuration, and is mainly used for guest AP tunnel. If fabric is enabled, the Switch IP where AP is connected is searched by default. You can set IP as 0.0.0.0 to disable the configuration and revert to the default configuration.

**Example**

The following example shows how to configure the IP address of the Fabric Switch that is used for the AP VXLAN tunnel:

```
config wlan fabric switch-ip 10.1.1.1 wlan1
```
**config wlan fabric tag**

To configure security group tag (SGT) on a WLAN, use the `config wlan fabric tag` command.

```
config wlan fabric tag  sgt  wlan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>sgt</td>
<td>Security group tag.</td>
</tr>
<tr>
<td>wlan-id</td>
<td>WLAN identifier.</td>
</tr>
</tbody>
</table>

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To disable SGT on a WLAN, use zero at the `sgt` variable. Ideally SGT should be acquired during authentication from the RADIUS server. For guests, this value can be configured. The default value is 0.

**Example**

The following example shows how to configure SGT on a WLAN:

```
config wlan fabric tag sgt1 wlan1
```

The following example shows how to disable SGT from a WLAN:

```
config wlan fabric tag 0 wlan1
```
**config wlan fabric vnid**

To configure Virtual Extensible LAN (VXLAN) network identifier (VNID) on a fabric WLAN, use the `config wlan fabric vnid` command.

```plaintext
config wlan fabric vnid  vnid  wlan-id
```

**Syntax Description**

- `vnid`  VXLAN network identifier.
- `wlan-id`  WLAN identifier.

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>16.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To remove VXLAN mapping from a WLAN, use zero at the `vnid` variable. The interface or VLAN mapping on the WLAN will be done on the switch.

**Example**

The following example shows how to config VNID on a fabric WLAN:

```plaintext
config wlan fabric vnid1 wlan1
```

The following example shows how to remove VNID mapping from a fabric WLAN:

```plaintext
config wlan fabric 0 wlan1
```
**config wlan fabric avc-policy**

To configure an Application Visibility and Control (AVC) profile name for the fabric WLAN, use the `config wlan fabric avc-policy` command.

```
config wlan fabric avc-policy  flex-avc-policy-name  wlan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>flex-avc-policy-name</code></td>
<td>AVC policy name.</td>
</tr>
<tr>
<td><code>wlan-id</code></td>
<td>WLAN identifier.</td>
</tr>
</tbody>
</table>

**Command Default**

**Command Modes**

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

**Example**

The following example shows how to configure an AVC profile name for the fabric WLAN:

```
config wlan fabric acl AVCpolicy wlan1
```
config wlan flexconnect ap-auth

To configure local authentication of clients associated with FlexConnect on a locally switched WLAN, use the config wlan flexconnect ap-auth command.

```
config wlan flexconnect ap-auth wlan_id { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-auth</td>
<td>Configures local authentication of clients associated with an FlexConnect on a locally switched WLAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables AP authentication on a WLAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables AP authentication on a WLAN.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Local switching must be enabled on the WLAN where you want to configure local authentication of clients associated with FlexConnect.

The following example shows how to enable authentication of clients associated with FlexConnect on a specified WLAN:

```
(Cisco Controller) > config wlan flexconnect ap-auth 6 enable
```
config wlan flexconnect central-assoc

To configure client reassociation and security key caching on the Cisco WLC, use the **config wlan flexconnect central-assoc** command.

```
config wlan flexconnect central-assoc  wlan-id { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>ID of the WLAN</td>
</tr>
<tr>
<td>enable</td>
<td>Enables client reassociation and security key caching on the Cisco WLC</td>
</tr>
<tr>
<td>disable</td>
<td>Disables client reassociation and security key caching on the Cisco WLC</td>
</tr>
</tbody>
</table>

**Command Default**

Client reassociation and security key caching on the Cisco WLC is in disabled state.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A use case for this configuration is a large-scale deployment with fast roaming.

Configuration of central association with local authentication is not supported for the WLAN. After the PMIPv6 tunnel is set up, all data traffic from the PMIPv6 clients are forwarded from the Cisco AP to the local mobility anchor (LMA) in the Generic Routing Encapsulation (GRE) tunnel. If the connectivity between the Cisco AP and the Cisco WLC is lost, the data traffic for the existing PMIPv6 clients continue to flow until the connectivity between the Cisco AP and the client is lost. When the AP is in stand-alone mode, no new client associations are accepted on the PMIPv6 enabled WLAN.

The following example shows how to enable client reassociation and security key caching on the Cisco WLC for a WLAN whose ID is 2:

```
(Cisco Controller) > config wlan flexconnect central-assoc 2 enable
```
**config wlan flexconnect learn-ipaddr**

To enable or disable client IP address learning for the Cisco WLAN controller, use the `config wlan flexconnect learn-ipaddr` command.

```
config wlan flexconnect learn-ipaddr wlan_id { enable | disable }
```

**Syntax Description**

- `wlan_id` Wireless LAN identifier between 1 and 512.
- `enable` Enables client IPv4 address learning on a wireless LAN.
- `disable` Disables client IPv4 address learning on a wireless LAN.

**Command Default**

Disabled when the `config wlan flexconnect local-switching` command is disabled. Enabled when the `config wlan flexconnect local-switching` command is enabled.

**Command History**

- **Release 7.6** This command was introduced in a release earlier than Release 7.6.
- **Release 8.0** This command supports only IPv4 address format.

**Usage Guidelines**

If the client is configured with Layer 2 encryption, the controller cannot learn the client IP address, and the controller will periodically drop the client. Disable this option to keep the client connection without waiting to learn the client IP address.

- **Note**
  
  This command is valid only for IPv4.

- **Note**
  
  The ability to disable IP address learning is not supported with FlexConnect central switching.

The following example shows how to disable client IP address learning for WLAN 6:

```
(Cisco Controller) > config wlan flexconnect learn-ipaddr disable 6
```

**Related Commands**

- `show wlan`
To configure local switching, central DHCP, NAT-PAT, or the override DNS option on a FlexConnect WLAN, use the `config wlan flexconnect local-switching` command.

```
config wlan flexconnect local-switching wlan_id { enable | disable } { central-dhcp { enable | disable } nat-pat { enable | disable } } { override option dns { enable | disable } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>

</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable the `config wlan flexconnect local-switching` command, the `config wlan flexconnect learn-ipaddr` command is enabled by default.

**Note**

This command is valid only for IPv4.

**Note**

The ability to disable IP address learning is not supported with FlexConnect central switching.

The following example shows how to enable WLAN 6 for local switching and enable central DHCP and NAT-PAT:

```
(Cisco Controller) > config wlan flexconnect local-switching 6 enable central-dhcp enable nat-pat enable
```

The following example shows how to enable the override DNS option on WLAN 6:

```
(Cisco Controller) > config wlan flexconnect local-switching 6 override option dns enable
```
config wlan flexconnect post-auth

To configure post-auth ACL policies on flexconnect local switching WLAN, use the `config wlan flexconnect post-auth` command.

```
config wlan flexconnect post-auth (acl | ipv6 acl) acl-name wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>post-auth</code></td>
<td>Configures post-auth policies (ex:ACL) on flexconnect local switching WLAN.</td>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an IPv4 ACL on a specified WLAN:

```
(Cisco Controller) >config wlan flexconnect post-auth acl doc-test 2
```
**config wlan flexconnect vlan-central-switching**

To configure central switching on a locally switched WLAN, use the `config wlan flexconnect vlan-central-switching` command.

```plaintext
config wlan flexconnect vlan-central-switching wlan_id (enable | disable)
```

**Syntax Description**

- **wlan_id**: Wireless LAN identifier between 1 and 512.
- **enable**: Enables central switching on a locally switched wireless LAN.
- **disable**: Disables central switching on a locally switched wireless LAN.

**Command Default**

Central switching is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable Flexconnect local switching to enable VLAN central switching. When you enable WLAN central switching, the access point bridges the traffic locally if the WLAN is configured on the local IEEE 802.1Q link. If the VLAN is not configured on the access point, the AP tunnels the traffic back to the controller and the controller bridges the traffic to the corresponding VLAN.

WLAN central switching does not support:

- FlexConnect local authentication.
- Layer 3 roaming of local switching client.

The following example shows how to enable WLAN 6 for central switching:

```
(Cisco Controller) > config wlan flexconnect vlan-central-switching 6 enable
```
config wlan flow

To associate a NetFlow monitor with a WLAN, use the `config wlan flow` command.

```
config wlan flow wlan_id monitor monitor_name {enable | disable}
```

**Syntax Description**

- **wlan_id**: Wireless LAN identifier from 1 to 512 (inclusive).
- **monitor**: Configures a NetFlow monitor.
- **monitor_name**: Name of the NetFlow monitor. The monitor name can be up to 32 case-sensitive, alphanumeric characters. You cannot include spaces for a monitor name.
- **enable**: Associates a NetFlow monitor with a WLAN.
- **disable**: Dissociates a NetFlow monitor from a WLAN.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

<th>Modification</th>
</tr>
</thead>
</table>
| 7.6     | This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**

You can use the `config flow` command to create a new NetFlow monitor. The following example shows how to associate a NetFlow monitor with a WLAN:

```
(Cisco Controller) > config wlan flow 5 monitor monitor1 enable
```
config wlan hotspot

To configure a HotSpot on a WLAN, use the config wlan hotspot command.

```
config wlan hotspot clear-all wlan_id | dot11u | hs2 | msap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear-all</td>
<td>Clears the HotSpot configurations on a WLAN.</td>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure up to 32 HotSpot WLANs.

The following example shows how to configure HotSpot2 for a WLAN:

```
(Cisco Controller) >config wlan hotspot hs2 enable 2
```
To configure an 802.11u HotSpot on a WLAN, use the `config wlan hotspot dot11u` command.

```
config wlan hotspot dot11u {3gpp-info | auth-type | enable | disable | domain | hessid | ipaddr-type | nai-realm | network-type | roam-oi}
```

**Syntax Description**
- **3gpp-info**: Configures 3GPP cellular network information.
- **auth-type**: Configures the network authentication type.
- **disable**: Disables 802.11u on the HotSpot profile.
- **domain**: Configures a domain.
- **enable**: Enables 802.11u on the HotSpot profile. IEEE 802.11u enables automatic WLAN offload for 802.1X devices at the HotSpot of mobile or roaming partners.
- **hessid**: Configures the Homogenous Extended Service Set Identifier (HESSID). The HESSID is a 6-octet MAC address that uniquely identifies the network.
- **ipaddr-type**: Configures the IPv4 address availability type.
- **nai-realm**: Configures a realm for 802.11u enabled WLANs.
- **network-type**: Configures the 802.11u network type and Internet access.
- **roam-oi**: Configures the roaming consortium Organizational Identifier (OI) list.

**Command Default**
None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

The following example shows how to enable 802.11u on a HotSpot profile:

```
(Cisco Controller) >config wlan hotspot dot11u enable 6
```
config wlan hotspot dot11u 3gpp-info

To configure 3GPP cellular network information on an 802.11u HotSpot WLAN, use the `config wlan hotspot dot11u 3gpp-info` command.

```
config wlan hotspot dot11u 3gpp-info { add | delete } index country_code network_code wlan_id
```

**Syntax Description**

- **add**: Adds mobile cellular network information.
- **delete**: Deletes mobile cellular network information.
- **index**: Cellular index. The range is from 1 to 32.
- **country_code**: Mobile Country Code (MCC) in Binary Coded Decimal (BCD) format. The country code can be up to 3 characters. For example, the MCC for USA is 310.
- **network_code**: Mobile Network Code (MNC) in BCD format. An MNC is used in combination with a Mobile Country Code (MCC) to uniquely identify a mobile phone operator or carrier. The network code can be up to 3 characters. For example, the MNC for T-Mobile is 026.
- **wlan_id**: Wireless LAN identifier between 1 and 512.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Number of mobile network codes supported is 32 per WLAN.

The following example shows how to configure 3GPP cellular network information on a WLAN:

```
(Cisco Controller) > config wlan hotspot dot11u 3gpp-info add
```
To configure the network authentication type on an 802.11u HotSpot WLAN, use the `config wlan hotspot dot11u auth-type` command.

```
config wlan hotspot dot11u auth-type network-auth wlan_id
```

**Syntax Description**

- `network-auth`: Network authentication that you would like to configure on the WLAN. The available values are as follows:
  - 0 — Acceptance of terms and conditions
  - 1 — On-line enrollment
  - 2 — HTTP/HTTPS redirection
  - 3 — DNS Redirection
  - 4 — Not Applicable

- `wlan_id`: Wireless LAN identifier between 1 and 512.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The DNS redirection option is not supported in Release 7.3.

The following example shows how to configure HTTP/HTTPS redirection as the network authentication type on an 802.11u HotSpot WLAN:

```
(Cisco Controller) > config wlan hotspot dot11u auth-type 2 1
```
**config wlan hotspot dot11u disable**

To disable an 802.11u HotSpot on a WLAN, use the `config wlan hotspot dot11u disable` command.

```
config wlan hotspot dot11u disable wlan_id
```

**Syntax Description**

- `wlan_id` Wireless LAN identifier between 1 and 512.

**Command Default**

None

**Command History**

```
(Cisco Controller) > config wlan hotspot dot11u disable 6
```
config wlan hotspot dot11u domain

To configure a domain operating in the 802.11 access network, use the config wlan hotspot dot11u domain command.

config wlan hotspot dot11u domain { add wlan_id domain-index domain_name | delete wlan_id domain-index | modify wlan_id domain-index domain_name }

Syntax Description

- **add**: Adds a domain.
- **wlan_id**: Wireless LAN identifier between 1 and 512.
- **domain-index**: Domain index in the range 1 to 32.
- **domain_name**: Domain name. The domain name is case sensitive and can be up to 255 alphanumeric characters.
- **delete**: Deletes a domain.
- **modify**: Modifies a domain.

Command Default

None

```
(Cisco Controller) > config wlan hotspot dot11u enable 6
```
To configure a Homogenous Extended Service Set Identifier (HESSID) on an 802.11u HotSpot WLAN, use the `config wlan hotspot dot11u hessid` command.

```
config wlan hotspot dot11u hessid hessid wlan_id
```

**Syntax Description**
- `hessid`  MAC address that can be configured as an HESSID. The HESSID is a 6-octet MAC address that uniquely identifies the network. For example, Basic Service Set Identification (BSSID) of the WLAN can be used as the HESSID.
- `wlan_id`  Wireless LAN identifier between 1 and 512.

```
(Cisco Controller) >config wlan hotspot dot11u hessid 00:21:1b:ea:36:60 6
```
config wlan hotspot dot11u ipaddr-type

To configure the type of IP address available on an 802.11u HotSpot WLAN, use the config wlan hotspot dot11u ipaddr-type command.

```
config wlan hotspot dot11u ipaddr-type IPv4Type (0 - 7) IPv6Type (0 - 2) wlan_id
```

**Syntax Description**
- **IPv4Type**: IPv4 type address. Enter one of the following values:
  - 0—IPv4 address not available.
  - 1—Public IPv4 address available.
  - 2—Port restricted IPv4 address available.
  - 3—Single NAT enabled private IPv4 address available.
  - 4—Double NAT enabled private IPv4 address available.
  - 5—Port restricted IPv4 address and single NAT enabled IPv4 address available.
  - 6—Port restricted IPv4 address and double NAT enabled IPv4 address available.
  - 7—Availability of the IPv4 address is not known.

- **IPv6Type**: IPv6 type address. Enter one of the following values:
  - 0—IPv6 address not available.
  - 1—IPv6 address available.
  - 2—Availability of the IPv6 address is not known.

- **wlan_id**: Wireless LAN identifier between 1 and 512.

**Command Default**
The default values for IPv4 type address is 1.

```
(Cisco Controller) > config wlan hotspot dot11u network-type 2 1
```
config wlan hotspot dot11u roam-oi

To configure a roaming consortium Organizational Identifier (OI) list on a 802.11u HotSpot WLAN, use the `config wlan hotspot dot11u roam-oi` command.

```
config wlan hotspot dot11u roam-oi {add wlan_id oi-index oi is-beacon | modify wlan_id oi-index oi is-beacon | delete wlan_id oi-index}
```

**Syntax Description**

- **add** Adds an OI.
- **wlan-id** Wireless LAN identifier from 1 to 512.
- **oi-index** Index in the range 1 to 32.
- **oi** Number that must be a valid 6 digit hexadecimal number and 6 bytes in length. For example, 004096 or AABBD.
- **is-beacon** Beacon flag used to add an OI to the beacon. 0 indicates disable and 1 indicates enable. You can add a maximum of 3 OIs for a WLAN with this flag set.

- **modify** Modifies an OI.
- **delete** Deletes an OI.

**Command Default**

None.

```
(Cisco Controller) >config wlan hotspot dot11u roam-oi add 4 10 004096 1
```
## config wlan hotspot hs2

To configure the HotSpot2 parameters, use the `config wlan hotspot hs2` command.

```
config wlan hotspot hs2 { disable wlan_id | enable wlan_id | operator-name { add wlan_id index operator_name language-code | delete wlan_id index | modify wlan_id index operator-name language-code } | port-config { add wlan_id port-config_index ip-protocol port-number status | delete wlan_id port-config-index | modify wlan_id port-config-index ip-protocol port-number status } | wan-metrics wlan_id link-status symet-link downlink-speed uplink-speed }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>disable</strong></td>
<td>Disables HotSpot2.</td>
</tr>
<tr>
<td><strong>wlan-id</strong></td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables HotSpot2.</td>
</tr>
<tr>
<td><strong>operator-name</strong></td>
<td>Specifies the name of the 802.11 operator.</td>
</tr>
<tr>
<td><strong>add</strong></td>
<td>Adds the operator name, port configuration, or WAN metrics parameters to the WLAN configuration.</td>
</tr>
<tr>
<td><strong>index</strong></td>
<td>Index of the operator. The range is from 1 to 32.</td>
</tr>
<tr>
<td><strong>operator-name</strong></td>
<td>Name of the operator.</td>
</tr>
<tr>
<td><strong>language-code</strong></td>
<td>Language used. An ISO-14962-1997 encoded string that defines the language. This string is a three character language code. Enter the first three letters of the language in English. For example, eng for English.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes the operator name, port configuration, or WAN metrics parameters from the WLAN.</td>
</tr>
<tr>
<td><strong>modify</strong></td>
<td>Modifies the operator name, port configuration, or WAN metrics parameters of the WLAN.</td>
</tr>
<tr>
<td><strong>port-config</strong></td>
<td>Configures the port configuration values.</td>
</tr>
<tr>
<td><strong>port_config_index</strong></td>
<td>Port configuration index. The range is from 1 to 32. The default value is 1.</td>
</tr>
<tr>
<td><strong>ip-protocol</strong></td>
<td>Protocol to use. This parameter provides information on the connection status of the most commonly used communication protocols and ports. The following options are available: 1—ICMP 6—FTP/SSH/TLS/PPTP-VPN/VoIP 17—IKEv2 (IPSec-VPN/VoIP/ESP) 50—ESP (IPSec-VPN)</td>
</tr>
<tr>
<td>Portnumber</td>
<td>Port number. The following options are available:</td>
</tr>
<tr>

</table>
The following example shows how to configure the WAN metrics parameters:

(Cisco Controller) >config wlan hotspot hs2 wan-metrics add 345 1 0 3333
**config wlan hotspot hs2 domain-id**

To configure a domain ID, use the `config wlan hotspot hs2 domain-id` command in WLAN configuration mode.

```plaintext
config wlan hotspot hs2 domain-id  wlan-id  domain-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan-id</code></td>
</tr>
<tr>
<td><code>domain-id</code></td>
</tr>
</tbody>
</table>

**Command Default**

The domain ID is not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure a domain ID:

```
Cisco Controller > config wlan hotspot hs2 domain-id 12 2
```
config wlan hotspot hs2 osu legacy-ssid

To configure Online Sign Up (OSU) Service Set Identifier (SSID) name, use the `config wlan hotspot hs2 osu legacy-ssid` command in WLAN configuration mode.

```plaintext
config wlan hotspot hs2 osu legacy-ssid  wlan-id  ssid-name
```

**Syntax Description**

- **wlan-id** WLAN identification number. Enter a value between 1 and 512.
- **ssid-name** SSID name.

**Command Default**

OSU SSID name is not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an OSU SSID name:

```plaintext
Cisco Controller > config wlan hotspot hs2 osu legacy-ssid 12 cisco
```
To create the Online Sign Up (OSU) service provider name, use the `config wlan hotspot hs2 osu sp create` command in WLAN configuration node.

```
config wlan hotspot hs2 osu sp create wlan-id osu-index lang-code ascii/hex friendly-name [description ]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan-id</code></td>
</tr>
<tr>
<td><code>osu-index</code></td>
</tr>
<tr>
<td><code>lang-code</code></td>
</tr>
<tr>
<td><code>ascii/hex</code></td>
</tr>
<tr>
<td><code>friendly-name</code></td>
</tr>
<tr>
<td><code>description</code></td>
</tr>
</tbody>
</table>

**Command Default**

The OSU service provider name is not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an OSU service provider name:

```
Cisco Controller > config wlan hotspot hs2 osu sp create 12 2 eng ascii cisco server-1
```
config wlan hotspot hs2 osu sp delete

To delete the Online Sign Up (OSU) service provider, use the config wlan hotspot hs2 osu sp delete command.

\[
\text{config wlan hotspot hs2 osu sp delete } \text{wlan-id} \text{ osu-index} \text{ lang-code}
\]

**Syntax Description**

- **wlan-id**  WLAN identification number. Enter a value between 1 and 512.
- **osu-index**  OSU index. Enter a value between 1 and 16.
- **lang-code**  Language code. Enter 2 or 3 letters from ISO-639, for example, eng for English.

**Command Default**

The OSU service provider is configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to delete an OSU service provider:

```
Cisco Controller > config wlan hotspot hs2 osu sp delete 12 2 eng
```
config wlan hotspot hs2 osu sp icon-file add

To configure an Online Sign Up (OSU) icon file on a particular WLAN, use the `config wlan hotspot hs2 osu sp icon-file add` command in WLAN configuration mode.

```
config wlan hotspot hs2 osu sp icon-file add  wlan-id <index>  osu-index <index>  icon-filename <filename>
```

**Syntax Description**

- **wlan-id**: WLAN identification number. Enter a value between 1 and 512.
- **osu-index**: OSU index. Enter a value between 1 and 16.
- **icon-filename**: Filename of the icon.

**Command Default**

The OSU icon file is not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before using this command, configure icon parameters using the `config icon file-info` command.

This example shows how to configure an OSU icon file on a WLAN:

```
Cisco Controller > config wlan hotspot hs2 osu sp icon-file add 12 2 test-icon
```
config wlan hotspot hs2 osu sp icon-file delete

To delete an Online Sign Up (OSU) icon file from a WLAN, use the `config wlan hotspot hs2 osu sp icon-file delete` command in WLAN configuration mode.

```
config wlan hotspot hs2 osu sp icon-file delete wlan-id osu-index icon-filename
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>WLAN identification number. Enter a value between 1 and 512.</td>
</tr>
<tr>
<td>osu-index</td>
<td>OSU index. Enter a value between 1 and 16.</td>
</tr>
<tr>
<td>icon-filename</td>
<td>Filename of the icon.</td>
</tr>
</tbody>
</table>

**Command Default**
The OSU icon file is configured.

**Command Modes**
WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to delete an OSU icon file from a WLAN:

```
Cisco Controller > config wlan hotspot hs2 osu sp icon-file delete 12 2 test-icon
```
To configure an Online Sign Up (OSU) method list, use the `config wlan hotspot hs2 osu sp method add` command in WLAN configuration mode.

```
config wlan hotspot hs2 osu sp method add wlan-id osu-index method-primary method-secondary
```

### Syntax Description

- **wlan-id**: WLAN identification number. Enter a value between 1 and 512.
- **osu-index**: OSU index. Enter a value between 1 and 16.
- **method-primary**: Primary OSU encoding method. Valid values are: `oma-dm` or `soap-xml`.
- **method-secondary**: (Optional) Secondary OSU encoding method. Valid values are: `oma-dm` or `soap-xml`.

### Command Default

The OSU method list is not configured.

### Command Modes

WLAN configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an OSU method list:

```
Cisco Controller > config wlan hotspot hs2 osu sp method add 12 2 oma-dm oma-dm
```
config wlan hotspot hs2 osu sp method delete

To delete an Online Sign Up (OSU) method list, use the config wlan hotspot hs2 osu sp method delete command in WLAN configuration mode.

```
config wlan hotspot hs2 osu sp method delete  wlan-id  osu-index  method
```

**Syntax Description**

- `wlan-id` WLAN identification number. Enter a value between 1 and 512.
- `osu-index` OSU index. Enter a value between 1 and 16.
- `method` The OSU encoding method. Valid values are **oma-dm** or **soap-xml**.

**Command Default**

The OSU method list is configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to delete an OSU method list:

```
Cisco Controller > config wlan hotspot hs2 osu sp method delete 12 2 oma-dm
```
**config wlan hotspot hs2 osu sp nai add**

To create an Online Sign Up (OSU) Network Access Identifier (NAI), use the `config wlan hotspot hs2 osu sp nai add` command in WLAN configuration mode.

```
config wlan hotspot hs2 osu sp nai add
```

**Syntax Description**

- `wlan-id` WLAN identification number. Enter a value between 1 and 512.
- `osu-index` OSU index. Enter a value between 1 and 16.
- `nai` OSU Server NAI. Enter a name within a maximum limit of 255 characters.

**Command Default**

The OSU NAI is not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure an OSU NAI:

```
Cisco Controller > config wlan hotspot hs2 osu sp nai add 12 2 nai-1
```
**config wlan hotspot hs2 osu sp nai delete**

To delete an Online Sign Up (OSU) Network Access Identifier (NAI), use the `config wlan hotspot hs2 osu sp nai delete` command in WLAN configuration mode.

```plaintext
config wlan hotspot hs2 osu sp nai delete wlan-id osu-index
```

**Syntax Description**

- `wlan-id`  WLAN identification number. Enter a value between 1 and 512.
- `osu-index` OSU index. Enter a value between 1 and 16.

**Command Default**

The OSU NAI is configured.

**Command Modes**

WLAN configuration

**Command History**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to delete an OSU NAI:

```plaintext
Cisco Controller > config wlan hotspot hs2 osu sp nai delete 12 2
```
To create an Online Sign Up (OSU) URI, use the `config wlan hotspot hs2 osu sp uri add` command in WLAN configuration mode.

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan-id</code></td>
<td>WLAN identification number. Enter a value between 1 and 512.</td>
</tr>
<tr>
<td><code>osu-index</code></td>
<td>OSU index. Enter a value between 1 and 16.</td>
</tr>
<tr>
<td><code>uri</code></td>
<td>OSU server name. Enter a Uniform Resource Identifier (URI) with a maximum of 255 characters.</td>
</tr>
</tbody>
</table>

### Command Default

The OSU URI is not configured.

### Command Modes

WLAN configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tbody>
<tr>
<td>Release 8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to create an OSU URI:

```
Cisco Controller > config wlan hotspot hs2 osu sp uri add 12 2 server
```
config wlan hotspot hs2 osu sp uri delete

To delete an Online Sign Up (OSU) URI, use the `config wlan hotspot hs2 osu sp uri delete` command.

```
config wlan hotspot hs2 osu sp uri delete wlan-id osu-index
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>WLAN identification number. Enter a value between 1 and 512.</td>
</tr>
<tr>
<td>osu-index</td>
<td>OSU index. Enter a value between 1 and 16.</td>
</tr>
</tbody>
</table>

**Command Default**

The OSU URI is configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to delete an OSU URI:

```
Cisco Controller > config wlan hotspot hs2 osu sp uri delete 12 2
```
**config wlan hotspot hs2 wan-metrics downlink**

To configure the downlink WAN metrics, use the **config wlan hotspot hs2 wan-metrics downlink** command in WLAN configuration mode.

```
config wlan hotspot hs2 wan-metrics downlink  wlan-id  dlink-speed  dlink-load
```

**Syntax Description**

- `wlan-id`: WLAN identification number. Enter a value between 1 and 512.
- `dlink-speed`: WAN backhaul link speed, in Kbps. The range is from 0 to 4,294,967,295.
- `dlink-load`: WAN backhaul link load. The range is from 0 to 100.

**Command Default**

The downlink WAN metrics are not configured.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure downlink WAN metrics:

```
Cisco Controller > config wlan hotspot hs2 wan-metrics downlink 12 2468 10
```
config wlan hotspot hs2 wan-metrics link-status

To configure the link status of WAN metrics, use the `config wlan hotspot hs2 wan-metrics link-status` command in WLAN configuration mode.

```
config wlan hotspot hs2 wan-metrics link-status
```

## Syntax Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>WLAN identification number. Enter a value between 1 and 512.</td>
</tr>
<tr>
<td>link-status</td>
<td>Link status. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• 0—Unknown</td>
</tr>
<tr>
<td></td>
<td>• 1—Up</td>
</tr>
<tr>
<td></td>
<td>• 2—Down</td>
</tr>
<tr>
<td></td>
<td>• 3—Test</td>
</tr>
</tbody>
</table>

## Command Default

The link status is not configured.

## Command Modes

WLAN configuration

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure the link status of WAN metrics:

```
Cisco Controller > config wlan hotspot hs2 wan-metrics link-status 12 1
```
To configure the load measurement duration of WAN metrics, use the `config wlan hotspot hs2 wan-metrics lmd` command in WLAN configuration mode.

```
config wlan hotspot hs2 wan-metrics lmd

Syntax Description

<table>
<thead>
<tr>
<th>wlan-id</th>
<th>WLAN identification number. Enter a value between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>lmd-value</td>
<td>Load measurement duration of WAN. The range is from 0 to 65535.</td>
</tr>
</tbody>
</table>

Command Default

Load measurement duration of WAN is not configured.

Command Modes

WLAN configuration

Command History

<table>
<thead>
<tr>
<th>Release</th>

This example shows how to configure load measurement duration of WAN metrics:

```
Cisco Controller > config wlan hotspot hs2 wan-metrics lmd 1 2456
```
config wlan hotspot hs2 wan-metrics uplink

To configure the uplink WAN metrics, use the `config wlan hotspot hs2 wan-metrics uplink` command in WLAN configuration mode.

```
config wlan hotspot hs2 wan-metrics uplink  wlan-id  ulink-speed  ulink-load
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan-id</td>
<td>WLAN identification number. Enter a value between 1 and 512.</td>
</tr>
<tr>
<td>ulink-speed</td>
<td>WAN backhaul link speed, in Kbps. The range is from 0 to 4,294,967,295.</td>
</tr>
<tr>
<td>ulink-load</td>
<td>WAN backhaul link load. The range is from 0 to 100.</td>
</tr>
</tbody>
</table>

**Command Default**
The uplink WAN metrics are not configured.

**Command Modes**
WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure the uplink WAN metrics:

```
Cisco Controller > config wlan hotspot hs2 wan-metrics uplink 12 2468 10
```
config wlan hotspot msap

To configure the Mobility Service Advertisement Protocol (MSAP) parameters on a WLAN, use the `config wlan hotspot msap` command.

```
config wlan hotspot msap { enable | disable | server-id server_id } wlan_id
```

### Syntax Description

- **enable**: Enables MSAP on the WLAN.
- **disable**: Disables MSAP on the WLAN.
- **server-id**: Specifies the MSAP server id.
  - **server_id**: MSAP server ID. The range is from 1 to 10.
  - **wlan_id**: Wireless LAN identifier from 1 to 512.

### Command Default
None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable MSAP on a WLAN:

```
(Cisco Controller) > config wlan hotspot msap enable 4
```
config wlan interface

To configure a wireless LAN interface or an interface group, use the `config wlan interface` command.

```
config wlan interface {wlan_id | foreignAp} {interface-name | interface-group-name}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>(Optional) Wireless LAN identifier (1 to 512).</td>
</tr>
<tr>
<td>foreignAp</td>
<td>Specifies third-party access points.</td>
</tr>
<tr>
<td>interface-name</td>
<td>Interface name.</td>
</tr>
<tr>
<td>interface-group-name</td>
<td>Interface group name.</td>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an interface named VLAN901:

```
(Cisco Controller) > config wlan interface 16 VLAN901
```
To configure IPv6 access control list (ACL) on a wireless LAN, use the `config wlan ipv6 acl` command.

```
config wlan ipv6 acl wlan_id acl_name
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
<tr>
<td><code>acl_name</code></td>
<td>IPv6 ACL name.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure an IPv6 ACL for local switching:

```
(Cisco Controller) >config wlan ipv6 acl 22 acl_sample
```
config wlan kts-cac

To configure the Key Telephone System-based CAC policy for a WLAN, use the **config wlan kts-cac** command.

```
config wlan kts-cac {enable | disable} wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the KTS-based CAC policy.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the KTS-based CAC policy.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enable the KTS-based CAC policy for a WLAN, ensure that you do the following:

- Configure the QoS profile for the WLAN to Platinum by entering the following command:
  ```
  config wlan qos wlan-id platinum
  ```
- Disable the WLAN by entering the following command:
  ```
  config wlan disable wlan-id
  ```
- Disable FlexConnect local switching for the WLAN by entering the following command:
  ```
  config wlan flexconnect local-switching wlan-id disable
  ```

The following example shows how to enable the KTS-based CAC policy for a WLAN with the ID 4:

```
(Cisco Controller) >config wlan kts-cac enable 4
```
config wlan layer2 acl

To configure a Layer 2 access control list (ACL) on a centrally switched WLAN, use the `config wlan acl layer2` command.

```
config wlan layer2 acl wlan_id { acl_name  | none }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier. The range is from 1 to 512.</td>
</tr>
<tr>
<td>acl_name</td>
<td>Layer2 ACL name. The name can be up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td>none</td>
<td>Clears any Layer2 ACL mapped to the WLAN.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can create a maximum of 16 rules for a Layer 2 ACL.

You can create a maximum of 64 Layer 2 ACLs on a Cisco WLC.

A maximum of 16 Layer 2 ACLs are supported per access point because an access point supports a maximum of 16 WLANs.

Ensure that the Layer 2 ACL names do not conflict with the FlexConnect ACL names because an access point does not support the same Layer 2 and Layer 3 ACL names.

The following example shows how to apply a Layer 2 ACL on a WLAN:

```
(Cisco Controller) > config wlan layer2 acl 1 acl_l2_1
```
config wlan ldap

To add or delete a link to a configured Lightweight Directory Access Protocol (LDAP) server, use the `config wlan ldap` command.

```bash
cfg wlan ldap { add wlan_id server_id | delete wlan_id { all | server_id } }
```

**Syntax Description**
- **add**: Adds a link to a configured LDAP server.
- **wlan_id**: Wireless LAN identifier between 1 and 512.
- **server_id**: LDAP server index.
- **delete**: Removes the link to a configured LDAP server.
- **all**: Specifies all LDAP servers.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to specify the LDAP server priority for the WLAN.

To specify the LDAP server priority, one of the following must be configured and enabled:

- 802.1X authentication and Local EAP
- Web authentication and LDAP

**Note**
Local EAP was introduced in controller software release 4.1; LDAP support on Web authentication was introduced in controller software release 4.2.

The following example shows how to add a link to a configured LDAP server with the WLAN ID 100 and server ID 4:

```
(Cisco Controller) >config wlan ldap add 100 4
```
To configure client IP address learning on a centrally switched WLAN, use the `config wlan learn-ipaddr-cswlan` command.

```
config wlan learn-ipaddr-cswlan wlan_id { enable | disable }
```

**Syntax Description**
- `wlan_id`: Wireless LAN identifier from 1 to 512.
- `enable`: Enables client IPv4 address learning on the centrally switched WLAN.
- `disable`: Disables client IPv4 address learning on the centrally switched WLAN.

**Command Default**
None

**Command History**
- **Release**
  - 7.6: This command was introduced in a release earlier than Release 7.6.
  - 8.0: This command supports only IPv4 address format.

**Usage Guidelines**
If the client is configured with Layer 2 encryption, the Cisco WLC cannot learn the client IP address and will periodically drop the client. Disable this option so that the Cisco WLC maintains the client connection without waiting to learn the client IP address.

The following example shows how to enable client IP address learning on a centrally switched WLAN:

```
(Cisco Controller) > config wlan learn-ipaddr-cswlan 2 enable
```

**Related Commands**
- `show wlan`
config wlan load-balance

To override the global load balance configuration and enable or disable load balancing on a particular WLAN, use the `config wlan load-balance` command.

```
config wlan load-balance allow {enable | disable} wlan_id
```

<table>
<thead>

The following example shows how to enable band selection on a wireless LAN with WLAN ID 3:

```
(Cisco Controller) > config wlan load-balance allow enable 3
```
**config wlan lobby-admin-access**

To provide admin access to the lobby user on a particular WLAN, use the `config wlan lobby-admin-access` command.

```
config wlan lobby-admin-access { enable | disable } wlan_id
```

### Syntax Description

- **enable**: Enables band selection on a wireless LAN.
- **disable**: Disables band selection on a wireless LAN.
- **wlan_id**: Wireless LAN identifier between 1 and 512.

### Command Default

Lobby admin user is disabled by default.

### Command History

<table>
<thead>
<tr>
<th>Release</th>

The following example shows how to specify the maximum number of client connections on WLAN ID 2:

```
(Cisco Controller) >config wlan max-associated-clients 25 2
```
config wlan max-radio-clients

To configure the maximum number of WLAN client per access point, use the `config wlan max-radio-clients` command.

```
config wlan max-radio-clients max_radio_clients wlan_id
```

**Syntax Description**

- `max_radio_clients`  
  Maximum number of client connections to be accepted per access point radio. The valid range is from 1 to 200.

- `wlan_id`  
  Wireless LAN identifier between 1 and 512.

**Command Default**

None

**Command History**

</tr>
<tr>
<td>none</td>
<td>Removes all existing mDNS profiles from the WLAN. You cannot configure mDNS profiles on the WLAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
<tr>
<td>all</td>
<td>Configures the mDNS profile for all WLANs.</td>
</tr>
</tbody>
</table>

**Command Default**

By default, mDNS snooping is enabled on WLANs.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must disable the WLAN before you use this command. Clients receive service advertisements only for the services associated with the profile. The controller gives the highest priority to the profiles associated to interface groups, followed by the interface profiles, and then the WLAN profiles. Each client is mapped to a profile based on the order of priority.

The following example shows how to configure an mDNS profile for a WLAN.

```
(Cisco Controller) >config wlan mdns profile profile1 1
```
config wlan media-stream

To configure multicast-direct for a wireless LAN media stream, use the `config wlan media-stream` command.

```
cfg wlan media-stream multicast-direct {wlan_id | all} {enable | disable}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>multicast-direct</code></td>
<td>Configures multicast-direct for a wireless LAN media stream.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Configures the wireless LAN on all media streams.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables global multicast to unicast conversion.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables global multicast to unicast conversion.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Media stream multicast-direct requires load based Call Admission Control (CAC) to run. WLAN quality of service (QoS) needs to be set to either gold or platinum.

The following example shows how to enable the global multicast-direct media stream with WLAN ID 2:

(Cisco Controller) > `config wlan media-stream multicast-direct 2 enable`
config wlan mfp

To configure management frame protection (MFP) options for the wireless LAN, use the `config wlan mfp` command.

```
config wlan mfp { client [ enable | disable ] wlan_id | infrastructure protection [ enable | disable ] wlan_id }
```

**Syntax Description**

- **client** (Optional) Enables client MFP for the wireless LAN.
- **enable** (Optional) Enables the feature.
- **disable** (Optional) Disables the feature.
- **wlan_id** Wireless LAN identifier (1 to 512).
- **infrastructure protection** (Optional) Enables infrastructure MFP for the wireless LAN.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<td><code>priority priority-number</code> parameter introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure and set priority to the mobility wireless LAN anchor list with WLAN ID 4 and IPv4 address 192.168.0.14

```
(Cisco Controller) > config wlan mobility anchor add 4 192.168.0.14 priority 1
```

**Related Commands**

- `show wlan`
To configure interfaces or interface groups for foreign Cisco WLCs, use the `config wlan mobility foreign-map` command.

```
config wlan mobility foreign-map { add | delete } wlan_id foreign_mac_address {interface_name | interface_group_name}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>add</strong></td>
<td>Adds an interface or interface group to the map of foreign controllers.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>Deletes an interface or interface group from the map of foreign controllers.</td>

**config wlan nac**

To enable or disable Network Admission Control (NAC) out-of-band support for a WLAN, use the `config wlan nac` command.

```
config wlan nac { snmp | radius } { enable | disable } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>snmp</strong></td>
<td>Configures SNMP NAC support.</td>
</tr>
<tr>
<td><strong>radius</strong></td>
<td>Configures RADIUS NAC support.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>Enables NAC for the WLAN.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>Disables NAC for the WLAN.</td>
</tr>
<tr>
<td><strong>wlan_id</strong></td>
<td>WLAN identifier from 1 to 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You should enable AAA override before you enable the RADIUS NAC state. You also should disable FlexConnect local switching before you enable the RADIUS NAC state.

The following example shows how to configure SNMP NAC support for WLAN 13:

```
(Cisco Controller) > config wlan nac snmp enable 13
```

The following example shows how to configure RADIUS NAC support for WLAN 34:

```
(Cisco Controller) > config wlan nac radius enable 20
```
**config wlan override-rate-limit**

To override the bandwidth limits for upstream and downstream traffic per user and per service set identifier (SSID) defined in the QoS profile, use the `config wlan override-rate-limit` command.

```
cfg-wlan override-rate-limit wlan_id { average-data-rate | average-realtime-rate | burst-data-rate | burst-realtime-rate } { per-ssid | per-client } { downstream | upstream } rate
```

**Syntax Description**
- **wlan_id**: Wireless LAN identifier between 1 and 512.
- **average-data-rate**: Specifies the average data rate for TCP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.
- **average-realtime-rate**: Specifies the average real-time data rate for UDP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.
- **burst-data-rate**: Specifies the peak data rate for TCP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.
- **burst-realtime-rate**: Specifies the peak real-time data rate for UDP traffic per user or per SSID. The range is from 0 to 51,2000 Kbps.
- **per-ssid**: Configures the rate limit for an SSID per radio. The combined traffic of all clients will not exceed this limit.
- **per-client**: Configures the rate limit for each client associated with the SSID.
- **downstream**: Configures the rate limit for downstream traffic.
- **upstream**: Configures the rate limit for upstream traffic.
- **rate**: Data rate for TCP or UDP traffic per user or per SSID. The range is form 0 to 51,2000 Kbps. A value of 0 imposes no bandwidth restriction on the QoS profile.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The rate limits are enforced by the controller and the AP. For central switching, the controller handles the downstream enforcement of per-client rate limit and the AP handles the enforcement of the upstream traffic and per-SSID rate limit for downstream traffic. When the AP enters standalone mode it handles the downstream enforcement of per-client rate limits too.

In FlexConnect local switching and standalone modes, per-client and per-SSID rate limiting is done by the AP for downstream and upstream traffic. However, in FlexConnect standalone mode, the configuration is not saved on the AP, so when the AP reloads, the configuration is lost and rate limiting does not happen after reboot.
For roaming clients, if the client roams between the APs on the same controller, same rate limit parameters are applied on the client. However, if the client roams from an anchor to a foreign controller, the per-client downstream rate limiting uses the parameters configured on the anchor controller while upstream rate limiting uses the parameters of the foreign controller.

The following example shows how to configure the burst real-time actual rate 2000 Kbps for the upstream traffic per SSID:

```
(Cisco Controller) >config wlan override-rate-limit 2 burst-realtime-rate per-ssid upstream 2000
```
**config wlan opendns-mode**

To configure WLAN OpenDNS mode to force or copy or ignore the DNS to OpenDNS server access, use the `config wlan opendns-mode` command.

```
config wlan opendns-mode wlan-id { ignore | force | copy }
```

**Syntax Description**

- `wlan-id` Wireless LAN (WLAN) identifier.
- `ignore` Ignores the OpenDNS mode.
- `force` Forces the OpenDNS mode.
- `copy` Copies the OpenDNS mode.

**Command Modes**

(Controller Configuration) >

**Command History**

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td></td>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

None

**Example**

The following example shows how to configure a WLAN on OpenDNS profile to force the DNS to OpenDNS server:

```
(Cisco Controller) > config wlan opendns-profile wlan1 user1 enable
```
config wlan passive-client

To configure passive-client feature on a wireless LAN, use the `config wlan passive-client` command.

```
config wlan passive-client { enable | disable } wlan_id
```

**Syntax Description**
- `enable`: Enables the passive-client feature on a WLAN.
- `disable`: Disables the passive-client feature on a WLAN.
- `wlan_id`: WLAN identifier between 1 and 512.

**Command Default**
None

**Command History**
- Release 7.6: This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**
You need to enable the global multicast mode and multicast-multicast mode by using the `config network multicast global` and `config network multicast mode` commands before entering this command.

**Note**
You should configure the multicast in multicast-multicast mode only not in unicast mode. The passive client feature does not work with multicast-unicast mode in this release.

The following example shows how to configure the passive client on wireless LAN ID 2:

```
(Cisco Controller) > config wlan passive-client enable 2
```
**config wlan peer-blocking**

To configure peer-to-peer blocking on a WLAN, use the `config wlan peer-blocking` command.

```plaintext
config wlan peer-blocking { disable | drop | forward-upstream } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must disable the WLAN when you configure the mobility type.

The following example shows how to configure the mobility type as PMIPv6 on a WLAN:

```
(Cisco Controller) > config wlan pmipv6 mobility-type pmipv6 16
```
To configure a profile name for the PMIPv6 WLAN, use the `config wlan pmipv6 profile_name` command.

```
config wlan pmipv6 profile_name profile_name wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Profile name for the PMIPv6 WLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>profile_name</code></td>
</tr>
<tr>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command binds a profile name to the PMIPv6 WLAN or SSID. Each time that a mobile node associates with the controller, it uses the profile name and NAI in the trigger to the PMIPv6 module. The PMIPv6 module extracts all the profile specific parameters such as LMA IP, APN, and NAI and sends the PBU to the ASR5K.

The following example shows how to create a profile named ABC01 on a PMIPv6 WLAN:

```
(Cisco Controller) > config wlan pmipv6 profile_name ABC01 16
```
config wlan policy

To configure a policy on a WLAN, use the `config wlan policy` command.

```
config wlan policy  { add | delete }  priority-index  wlan-id
```

**Syntax Description**

- `add` Adds a policy on a WLAN.
- `delete` Deletes an existing policy from a WLAN.
- `priority-index` Priority index of the policy to be configured on the WLAN. The policies are applied to the clients according to the priority index. The range is from 1 to 16.
- `policy_name` Name of the profiling policy.
- `wlan-id` WLAN identifier from 1 to 512.

**Command Default**

There is no WLAN policy.

**Command History**

**Release** | **Modification**
--- | ---
7.5 | This command was introduced.

**Usage Guidelines**

You can apply up to 16 policies on a WLAN.

The following example shows how to configure a policy on a WLAN:

```
(Cisco Controller) > config wlan policy add 1 teacher_policy 1
```
**config wlan profile**

To edit a profile associated to a WLAN, use the `config wlan profile` command.

```
config wlan profile  wlan_id profile-name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>WLAN identifier from 1 to 512.</td>
</tr>
<tr>
<td>profile-name</td>
<td>Name of the WLAN profile.</td>

</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to edit a profile associated to a WLAN:

```
(Cisco Controller) > config wlan disable 1
(Cisco Controller) > config wlan profile 1 new_sample
(Cisco Controller) > show wlan summary

Number of WLANs............................... 1

WLAN ID  WLAN Profile Name / SSID  Status  Interface Name  PMIPv6 Mobility
---------  -------------------------  ------  --------------  --------------
1         new_sample / new_samp    Disabled management none
```
To configure client profiling on a WLAN, use the `config wlan profiling` command.

```
config wlan profiling { local | radius } { all | dhcp | http } { enable | disable } wlan_id
```

### Syntax Description
- **local**
  - Configures client profiling in Local mode for a WLAN.

- **radius**
  - Configures client profiling in RADIUS mode on a WLAN.

- **all**
  - Configures DHCP and HTTP client profiling in a WLAN.

- **dhcp**
  - Configures DHCP client profiling alone in a WLAN.

- **http**
  - Configures HTTP client profiling in a WLAN.

- **enable**
  - Enables the specific type of client profiling in a WLAN.
  - When you enable HTTP profiling, the Cisco WLC collects the HTTP attributes of clients for profiling.
  - When you enable DHCP profiling, the Cisco WLC collects the DHCP attributes of clients for profiling.

- **disable**
  - Disables the specific type of client profiling in a WLAN.

- **wlan_id**
  - Wireless LAN identifier from 1 to 512.

### Usage Guidelines
Ensure that you have disabled the WLAN before configuring client profiling on the WLAN.

### Command Default
Client profiling is disabled.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
- Only clients connected to port 80 for HTTP can be profiled. IPv6 only clients are not profiled.
- If a session timeout is configured for a WLAN, clients must send the HTTP traffic before the configured timeout to get profiled.
- This feature is not supported on the following:
  - FlexConnect Standalone mode
  - FlexConnect Local Authentication

The following example shows how to enable both DHCP and HTTP profiling on a WLAN:
(Cisco Controller) >config wlan profiling radius all enable 6
HTTP Profiling successfully enabled.
DHCP Profiling successfully enabled.
config wlan qos

To change the quality of service (QoS) for a wireless LAN, use the `config wlan qos` command.

```
cfg wlan qos wlan_id {bronze | silver | gold | platinum}
cfg wlan qos foreignAp {bronze | silver | gold | platinum}
```

**Syntax Description**

- `wlan_id` Wireless LAN identifier between 1 and 512.
- `bronze` Specifies the bronze QoS policy.
- `silver` Specifies the silver QoS policy.
- `gold` Specifies the gold QoS policy.
- `platinum` Specifies the platinum QoS policy.
- `foreignAp` Specifies third-party access points.

**Command Default**

The default QoS policy is silver.

**Command History**

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the wireless LAN on all radio bands:

(Cisco Controller) > config wlan radio 1 all
To configure RADIUS accounting servers of a WLAN, use the `config wlan radius_server acct` command.

```plaintext
config wlan radius_server acct {enable | disable} wlan_id | add wlan_id server_id | delete wlan_id
{all | server_id} | framed-ipv6 {address | both | prefix} wlan_id
```

**Syntax Description**
- **enable**: Enables RADIUS accounting for the WLAN.
- **disable**: Disables RADIUS accounting for the WLAN.
- **wlan_id**: Wireless LAN identifier from 1 to 512.
- **add**: Adds a link to a configured RADIUS accounting server.
- **server_id**: RADIUS server index.
- **delete**: Deletes a link to a configured RADIUS accounting server.
- **address**: Configures an accounting framed IPv6 attribute to an IPv6 address.
- **both**: Configures the accounting framed IPv6 attribute to an IPv6 address and prefix.
- **prefix**: Configures the accounting framed IPv6 attribute to an IPv6 prefix.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable RADIUS accounting for the WLAN 2:

```
(Cisco Controller) > config wlan radius_server acct enable 2
```

The following example shows how to add a link to a configured RADIUS accounting server:

```
(Cisco Controller) > config wlan radius_server acct add 2 5
```
config wlan radius_server acct interim-update

To configure the interim update of a RADIUS accounting server of a WLAN, use the `config wlan radius_server acct interim-update` command.

```
config wlan radius_server acct interim-update {enable | disable | interval} wlan_id
```

**Syntax Description**

- **interim-update**
  - Configures the interim update of the RADIUS accounting server.

- **enable**
  - Enables interim update of the RADIUS accounting server for the WLAN.

- **disable**
  - Disables interim update of the RADIUS accounting server for the WLAN.

- **interval**
  - Interim update interval that you specify. The valid range is 60 to 3600 seconds.

- **wlan_id**
  - Wireless LAN identifier between 1 and 512.

**Command Default**

Interim update of a RADIUS accounting sever is set at 600 seconds.

**Command History**

<table>
<thead>
<tr>

</table>

The following example shows how to add a link to a configured RADIUS authentication server with WLAN ID 1 and Server ID 1:

```
(Cisco Controller) >config wlan radius_server auth add 1 1
```
config wlan radius_server overwrite-interface

To configure a wireless LAN’s RADIUS dynamic interface, use the config wlan radius_server overwrite-interface command.

```
config wlan radius_server overwrite-interface { apgroup | enable | disable | wlan } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apgroup</td>
<td>Enables AP group’s interface for all RADIUS traffic on the WLAN.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables RADIUS dynamic interface for this WLAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables RADIUS dynamic interface for this WLAN.</td>
</tr>
<tr>
<td>wlan</td>
<td>Enables WLAN’s interface for all RADIUS traffic on the WLAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The controller uses the management interface as identity. If the RADIUS server is on a directly connected dynamic interface, the traffic is sourced from the dynamic interface. Otherwise, the management IP address is used.

If the feature is enabled, controller uses the interface specified on the WLAN configuration as identity and source for all RADIUS related traffic on the WLAN.

The following example shows how to enable RADIUS dynamic interface for a WLAN with an ID 1:

(Cisco Controller) >config wlan radius_server overwrite-interface enable 1
**config wlan radius_server realm**

To configure realm on a WLAN, use the `config wlan radius_server realm` command.

```
config wlan radius_server realm { enable | disable } wlan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>radius_server</code></td>
<td>Radius server index. The range is from 1 to 17.</td>

To change the encryption level of 802.1X security on the wireless LAN Cisco radios, use the following key sizes:

- 0—no 802.1X encryption.
- 40—40/64-bit encryption.
- 104—104/128-bit encryption. (This is the default encryption setting.)

The following example shows how to configure 802.1X security on WLAN ID 16.

(Cisco Controller) > config wlan security 802.1X enable 16
**config wlan security ckip**

To configure Cisco Key Integrity Protocol (CKIP) security options for the wireless LAN, use the `config wlan security ckip` command.

```
config wlan security ckip { enable | disable } wlan_id [ akm psk set-key { hex | ascii } { 40 | 104 } key key_index wlan_id | mmh-mic { enable | disable } wlan_id | kp { enable | disable } wlan_id ]
```

<table>

**Usage Guidelines**

Ensure that you have disabled the WLAN before you proceed.

The following example shows how to enable 802.11r Fast Transition Roaming support on WLAN 2:

```
(Cisco Controller) >config wlan security ft enable 2
```

The following example shows how to set a reassociation timeout value of 20 seconds for 802.11r Fast Transition Roaming support on WLAN 2:

```
(Cisco Controller) >config wlan security ft reassociation-timeout 20 2
```
To configure 802.11r fast transition parameters over a distributed system, use the `config wlan security ft over-the-ds` command.

```
config wlan security ft over-the-ds { enable | disable } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>

**Usage Guidelines**

Ensure that you have disabled the WLAN before you proceed.

Ensure that 802.11r fast transition is enabled on the WLAN.

The following example shows how to enable 802.11r fast transition roaming support over a distributed system on WLAN ID 2:

```
(Cisco Controller) > config wlan security ft over-the-ds enable 2
```
config wlan security IPsec disable

To disable IPsec security, use the `config wlan security IPsec disable` command.

```
config wlan security IPsec disable  {wlan_id | foreignAp}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

IKE is used as a method of distributing the session keys (encryption and authentication), as well as providing a way for the VPN endpoints to agree on how the data should be protected. IKE keeps track of connections by assigning a bundle of Security Associations (SAs), to each connection.

The following example shows how to configure the quote-of-the-day server IP 44.55.66.77 for cfg-mode for WLAN 1:

```
(Cisco Controller) > config wlan security IPsec config qotd 44.55.66.77 1
```
**config wlan security IPsec ike authentication**

To modify the IPsec Internet Key Exchange (IKE) authentication protocol used on the wireless LAN, use the `config wlan security IPsec ike authentication` command.

```
config wlan security IPsec ike authentication { certificates { wlan_id | foreignAp } | pre-share-key { wlan_id | foreignAp } key | xauth-psk { wlan_id | foreignAp } key }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>

</table>

The following example shows how to configure the Diffie Hellman group parameter for group-1:

```
(Cisco Controller) >config wlan security IPsec ike dh-group 1 group-1
```
config wlan security IPsec ike lifetime

To modify the IPsec Internet Key Exchange (IKE) lifetime used on the wireless LAN, use the `config wlan security IPsec ike lifetime` command.

```
config wlan security IPsec ike lifetime {wlan_id | foreignAp} seconds
```

**Syntax Description**

- **wlan_id**
  - Wireless LAN identifier between 1 and 512.
- **foreignAp**
  - Specifies third-party access points.
- **seconds**
  - IKE lifetime in seconds, between 1800 and 345600.

**Command Default**

None

8.3         This command was introduced.
```

**Usage Guidelines**

Ensure that you have disabled the WLAN before you proceed.

The following example shows how to enable 802.11r Fast Transition Roaming support on WLAN 2:

```
(Cisco Controller) >config wlan security ft enable 2
```

The following example shows how to set a reassociation timeout value of 20 seconds for 802.11r Fast Transition Roaming support on WLAN 2:

```
(Cisco Controller) >config wlan security ft reassociation-timeout 20 2
```
config wlan security passthru

To modify the IPsec pass-through used on the wireless LAN, use the `config wlan security passthru` command.

```
config wlan security passthru { enable | disable } { wlan_id | foreignAp } [ ip_address ]
```

**Syntax Description**

- `enable` Enables IPsec pass-through.
- `disable` Disables IPsec pass-through.
- `wlan_id` Wireless LAN identifier between 1 and 512.
- `foreignAp` Specifies third-party access points.
- `ip_address` (Optional) IP address of the IPsec gateway (router) that is terminating the VPN tunnel.

**Command Default**

None

```
### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables 802.11w MFP protection on a WLAN.</td>
</tr>
<tr>
<td>optional</td>
<td>Enables 802.11w MFP protection on a WLAN.</td>
</tr>
<tr>
<td>required</td>
<td>Requires clients to negotiate 802.11w MFP protection on a WLAN.</td>
</tr>
<tr>
<td>association-comeback</td>
<td>Configures the 802.11w association comeback time.</td>
</tr>
<tr>
<td>association-comeback_timeout</td>
<td>Association comeback interval in seconds. Time interval that an associated client must wait before the association is tried again after it is denied with a status code 30. The status code 30 message is &quot;Association request rejected temporarily; Try again later&quot;. The range is from 1 to 20 seconds.</td>
</tr>
<tr>
<td>saquery-retrytimeout</td>
<td>Configures the 802.11w Security Association (SA) query retry timeout.</td>
</tr>
<tr>
<td>saquery-retry_timeout</td>
<td>Time interval identified in the association response to an already associated client before the association can be tried again. This time interval checks if the client is a real client and not a rogue client during the association comeback time. If the client does not respond within this time, the client association is deleted from the controller. The range is from 100 to 500 ms.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
</tbody>
</table>

### Command Default

Default SA query retry timeout is 200 milliseconds.

Default association comeback timeout is 1 second.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

802.11w introduces an Integrity Group Temporal Key (IGTK) that is used to protect broadcast or multicast robust management frames. IGTK is a random value, assigned by the authenticator station (controller) used to protect MAC management protocol data units (MMPDUs) from the source STA. The 802.11w IGTK key is derived using the four way handshake and is used only on WLANs that are configured with WPA or WPA2 security at Layer 2.

The following example shows how to enable 802.11w MFP protection on a WLAN:

(Cisco Controller) > config wlan security pmf optional 1
The following example shows how to configure the SA query retry timeout on a WLAN:

(Cisco Controller) > config wlan security pmf saquery-retrytimeout 300 1
**config wlan security sgt**

To configure a Secure Group Tag (SGT) for a WLAN, use the `config wlan security sgt` command.

```
config wlan security sgt { value | wlan-id } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

One unique WEP key index can be applied to each wireless LAN. Because there are only four WEP key indexes, only four wireless LANs can be configured for static WEP Layer 2 encryption.

Make sure to disable 802.1X before using this command.

The following example shows how to configure the static WEP keys for WLAN ID 1 that uses hexadecimal character 0201702001 and key index 2:

```
(Cisco Controller) >config wlan security static-wep-key encryption 1 40 hex 0201702001 2
```
config wlan security tkip

To configure the Temporal Key Integrity Protocol (TKIP) Message Integrity Check (MIC) countermeasure hold-down timer, use the config wlan security tkip command.

config wlan security tkip hold-down time wlan_id

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hold-down</td>
<td>Configures the TKIP MIC countermeasure hold-down timer.</td>
</tr>
<tr>
<td>time</td>
<td>TKIP MIC countermeasure hold-down time in seconds. The range is from 0 to 60 seconds.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
</tbody>
</table>

Command Default

The default TKIP countermeasure is set to 60 seconds.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

TKIP countermeasure mode can occur if the access point receives 2 MIC errors within a 60 second period. When this situation occurs, the access point deauthenticates all TKIP clients that are associated to that 802.11 radio and holds off any clients for the countermeasure holdoff time.

The following example shows how to configure the TKIP MIC countermeasure hold-down timer:

(Cisco Controller) > config wlan security tkip
To configure the timeout for idle client sessions for a WLAN, use the `config wlan usertimeout` command.

```
config wlan usertimeout timeout wlan_id
```

**Syntax Description**

- `timeout` Timeout for idle client sessions for a WLAN. If the client sends traffic less than the threshold, the client is removed on timeout. The range is from 15 to 100000 seconds.
- `wlan_id` Wireless LAN identifier between 1 and 512.

**Command Default**
The default client session idle timeout is 300 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The timeout value that you configure here overrides the global timeout that you define using the command `config network usertimeout`.

The following example shows how to configure the idle client sessions for a WLAN:

```
(Cisco Controller) > config wlan usertimeout 100 1
```
To change the status of web authentication used on a wireless LAN, use the `config wlan security web-auth` command.

```plaintext
config wlan security web-auth { { acl | enable | disable } { wlan_id | foreignAp } { acl_name | none } } | { on-macfilter-failure wlan_id } | { server-precedence wlan_id | local | ldap | radius } | { flexacl wlan_id { ipv4_acl_name | none } } | { ipv6 wlan_id { ipv6_acl_name | none } } | { mac-auth-server { ip_address wlan_id } } | { timeout { value_in_seconds wlan_id } } | { web-portal-server { ip_address wlan_id } }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>acl</code></td>
<td>Enables web authentication.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables web authentication.</td>

<tr>
<td><code>disable</code></td>
<td>Disables web authentication.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier from 1 to 512.</td>
</tr>
<tr>
<td><code>foreignAp</code></td>
<td>Specifies third-party access points.</td>
</tr>
<tr>
<td><code>acl_name</code></td>
<td>(Optional) ACL name (up to 32 alphanumeric characters).</td>
</tr>
<tr>
<td><code>none</code></td>
<td>(Optional) Specifies no ACL name.</td>
</tr>
<tr>
<td><code>on-macfilter-failure</code></td>
<td>Enables web authentication on MAC filter failure.</td>
</tr>
<tr>
<td><code>server-precedence</code></td>
<td>Configures the authentication server precedence order for Web-Auth users.</td>
</tr>
<tr>
<td><code>local</code></td>
<td>Specifies the server type.</td>
</tr>
<tr>
<td><code>ldap</code></td>
<td>Specifies the server type.</td>
</tr>
<tr>
<td><code>radius</code></td>
<td>Specifies the server type.</td>
</tr>
<tr>
<td><code>flexacl</code></td>
<td>Configures Flexconnect Access Control List.</td>
</tr>
<tr>
<td><code>ipv4_acl_name</code></td>
<td>(Optional) IPv4 ACL name. You can enter up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><code>ipv6_acl_name</code></td>
<td>(Optional) IPv6 ACL name. You can enter up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td><code>ipv6</code></td>
<td>Configures IPv6 related parameters.</td>
</tr>
<tr>
<td><code>mac-auth-server</code></td>
<td>Configures MAC authentication server for the WLAN.</td>
</tr>
<tr>
<td><code>timeout</code></td>
<td>Configures Web authentication Timeout.</td>
</tr>
<tr>
<td><code>value_in_seconds</code></td>
<td>Timeout value in seconds; valid range is between 300 and 14400 seconds.</td>
</tr>
</tbody>
</table>
# config wlan security web-auth

## web-portal-server

Configures CMCC web portal server for the WLAN.

<table>
<thead>

The following example shows how to enable Captive Network Bypass:

```
(Cisco Controller) > config wlan security web-auth captive-bypass enable 1
```
config wlan security web-auth qrscan-des-key

To configure the QR-scan DES key in a WLAN, use the `config wlan security web-auth qrscan-des-key` command.

```
config wlan security web-auth qrscan-des-key {DES key string wlan_id }
```

**Syntax Description**

- **DES key string**: Enter the DES key of 8 characters.
- **wlan-id**: Enter WLAN Identifier between 1 and 16.

**Command History**

- **Release** | **Modification**
  - 8.4 | This command was introduced.

The following example shows how to configure the QR-scan DES key:

```
(Cisco Controller) > config wlan security web-auth qrscan-des-key 1
```
**config wlan security web-passthrough acl**

To add an access control list (ACL) to the wireless LAN definition, use the `config wlan security web-passthrough acl` command.

```
config wlan security web-passthrough acl wlan_id foreignAp acl_name none
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan_id</code></td>

The following example shows how to configure authentication key-management using 802.11r fast transition:

```bash
(Cisco Controller) > config wlan security wpa akm ft reassociation-timeout 25 1
```
config wlan security wpa akm pmf

To configure Authenticated Key Management (AKM) of management frames, use the `config wlan security wpa akm pmf` command.

```
config wlan security wpa akm pmf (802.1x | psk) {enable | disable} wlan_id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.1x</td>
<td>Configures 802.1X authentication for protection of management frames (PMF).</td>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

802.11w has two new AKM suites: 00-0F-AC:5 or 00-0F-AC:6. You must enable WPA and then disable the WLAN to configure PMF on the WLAN.

The following example shows how to enable 802.1X authentication for PMF in a WLAN:

```
(Cisco Controller) >config wlan security wpa akm pmf 802.1x enable 1
```
config wlan security wpa akm psk

To configure the Wi-Fi protected access (WPA) preshared key mode, use the `config wlan security wpa akm psk` command.

```
config wlan security wpa akm psk { enable | disable | set-key key-format key } wlan_id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables WPA-PSK.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables WPA-PSK.</td>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you are not specifying the WPA versions, it implies the following:

- If the cipher enabled is AES, you are configuring WPA2/AES.
- If the ciphers enabled is AES+TKIP, you are configuring WPA/TKIP, WPA2/AES, or WPA/TKIP.
- If the cipher enabled is TKIP, you are configuring WPA/TKIP or WPA2/TKIP.

From Release 8.0, you cannot configure TKIP as a standalone encryption method. TKIP can be used only with the AES encryption method.

The following example shows how to encrypt the WPA:

```
(Cisco Controller) > config wlan security wpa wpa1 ciphers aes enable 1
```
config wlan security wpa gtk-random

To enable the randomization of group temporal keys (GTK) between access points and clients on a WLAN, use the `config wlan security wpa gtk-random` command.

```
config wlan security wpa gtk-random { enable | disable } wlan_id
```

**Syntax Description**

- **enable**  Enables the randomization of GTK keys between the access point and clients.
- **disable**  Disables the randomization of GTK keys between the access point and clients.
- **wlan_id**  WLAN identifier between 1 and 512.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you enable this command, the clients in the Basic Service Set (BSS) get a unique GTK key. The clients do not receive multicast or broadcast traffic.

The following example shows how to enable the GTK randomization for each client associated on a WLAN:

```
(Cisco Controller) > config wlan security wpa gtk-random enable 3
```
**config wlan security wpa osen disable**

To disable OSU Server-Only Authenticated L2 Encryption Network (OSEN) on a WLAN, use the `config wlan security wpa osen enable` command in WLAN configuration mode.

```
config wlan security wpa osen disable  wlan-id
```

**Syntax Description**

- `wlan-id` WLAN identification number. Enter a value between 1 and 512.

**Command Default**

OSEN is enabled.

**Command Modes**

WLAN configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to disable OSEN on a WLAN:

```
Cisco Controller > config wlan security wpa osen disable 12
```
**config wlan security wpa osen enable**

To enable OSU Server-Only Authenticated L2 Encryption Network (OSEN) on a WLAN, use the `config wlan security wpa osen enable` command in WLAN configuration mode.

```
config wlan security wpa osen enable  wlan-id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>wlan-id</th>
<th>WLAN identification number. Enter a value between 1 and 512.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td></td>
<td>OSEN is not enabled.</td>

The following example shows how to enable WPA2:

```
(Cisco Controller) > config wlan security wpa wpa2 enable 1
```
config wlan security wpa wpa2 cache

To configure caching methods on a WLAN, use the **config wlan security wpa wpa2 cache** command.

```
config wlan security wpa wpa2 cache sticky {enable | disable} wlan_id
```

### Syntax Description

- **sticky**: Configures Sticky Key Caching (SKC) roaming support on the WLAN.
- **enable**: Enables SKC roaming support on the WLAN.
- **disable**: Disables SKC roaming support on the WLAN.
- **wlan_id**: Wireless LAN identifier between 1 and 512.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

In SKC (Sticky Key caching) also known as PKC (Pro Active Key caching), the client stores each Pairwise Master Key (PMK) ID (PMKID) against a Pairwise Master Key Security Association (PMKSA). When a client finds an AP for which it has a PMKSA, it sends the PMKID in the association request to the AP. If the PMKSA is alive in the AP, the AP provides support for fast roaming. In SKC, full authentication is done on each new AP to which the client associates and the client must keep the PMKSA associated with all APs.

The following example shows how to enable SKC roaming support on a WLAN:

```
(Cisco Controller) > config wlan security wpa wpa2 cache sticky enable 1
```
**config wlan security wpa wpa2 cache sticky**

To configure Sticky PMKID Caching (SKC) on a WLAN, use the `config wlan security wpa wpa2 cache sticky` command.

```plaintext
config wlan security wpa wpa2 cache sticky { enable | disable } wlan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables SKC on a WLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables SKC on a WLAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512 (inclusive).</td>
</tr>
</tbody>
</table>

**Command Default**

Sticky PMKID Caching is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Beginning in Release 7.2 and later releases, the controller supports Sticky PMKID Caching (SKC). With sticky PMKID caching, the client receives and stores a different PMKID for every AP it associates with. The APs also maintain a database of the PMKID issued to the client. In SKC also known as PKC (Pro Active Key caching), the client stores each Pairwise Master Key (PMK) ID (PMKID) against a Pairwise Master Key Security Association (PMKSA). When a client finds an AP for which it has the PMKSA, it sends the PMKID in the association request to the AP. If the PMKSA is alive in the AP, the AP provides support for fast roaming. In SKC, full authentication is done on each new AP to which the client associates and the client must keep the PMKSA associated with all APs. For SKC, PMKSA is a per AP cache that the client stores and PMKSA is precalculated based on the BSSID of the new AP.

- You cannot use SKC for large scale deployments as the controller supports SKC only up to eight APs.
- SKC does not work across controllers in a mobility group.
- SKC works only on WPA2-enabled WLANs.
- SKC works only on local mode APs.

The following example shows how to enable Sticky PMKID Caching on WLAN 5:

```plaintext
(Cisco Controller) > config wlan security wpa wpa2 cache sticky enable 5
```
**config wlan security wpa wpa2 ciphers**

To configure WPA2 ciphers and enable or disable Advanced Encryption Standard (AES) or Temporal Key Integrity Protocol (TKIP) data encryption for WPA2, use the `config wlan security wpa wpa2 ciphers` command.

```
config wlan security wpa wpa2 ciphers { aes | tkip } { enable | disable } wlan_id
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aes</code></td>
<td>Configures AES data encryption for WPA2.</td>
</tr>
<tr>
<td><code>tkip</code></td>
<td>Configures TKIP data encryption for WPA2.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables AES or TKIP data encryption for WPA2.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables AES or TKIP data encryption for WPA2.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

### Command Default

AES is enabled by default.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable AES data encryption for WPA2:

```
(Cisco Controller) > config wlan security wpa wpa2 ciphers aes enable 1
```
config wlan session-timeout

To change the timeout of wireless LAN clients, use the **config wlan session-timeout** command.

**config wlan session-timeout  \( \) \( \) \( wlan_id \mid foreignAp \) \( \) seconds**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
<tr>
<td>foreignAp</td>
<td>Specifies third-party access points.</td>
</tr>
<tr>
<td>seconds</td>
<td>Timeout or session duration in seconds. A value of zero is equivalent to no timeout.</td>
</tr>
</tbody>
</table>

**Note** The range of session timeout depends on the security type:

- Open system: 0-65535 (sec)
- 802.1x: 300-86400 (sec)
- static wep: 0-65535 (sec)
- cranite: 0-65535 (sec)
- fortress: 0-65535 (sec)
- CKIP: 0-65535 (sec)
- open+web auth: 0-65535 (sec)
- web pass-thru: 0-65535 (sec)
- wpa-psk: 0-65535 (sec)
- disable: To disable reauth/session-timeout timers.

**Command Default** None

**Usage Guidelines** For 802.1X client security type, which creates the PMK cache, the maximum session timeout that can be set is 86400 seconds when the session timeout is disabled. For other client security such as open, WebAuth, and PSK for which the PMK cache is not created, the session timeout value is shown as infinite when session timeout is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the client timeout to 6000 seconds for WLAN ID 1:
(Cisco Controller) >config wlan session-timeout 1 6000
To enable client disassociation in case of session initiation protocol (SIP) call admission control (CAC) failure, use the `config wlan sip-cac disassoc-client` command.

```
config wlan sip-cac disassoc-client { enable | disable } wlan_id
```

**Syntax Description**
- `enable` Enables a client disassociation on a SIP CAC failure.
- `disable` Disables a client disassociation on a SIP CAC failure.
- `wlan_id` Wireless LAN identifier between 1 and 512.

**Command Default**
Client disassociation for SIP CAC is disabled.

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable a client disassociation on a SIP CAC failure where the WLAN ID is 1:

```
(Cisco Controller) >config wlan sip-cac disassoc-client enable 1
```
**config wlan sip-cac send-486busy**

To configure sending session initiation protocol (SIP) 486 busy message if a SIP call admission control (CAC) failure occurs, use the `config wlan sip-cac send-486busy` command:

```
config wlan sip-cac send-486busy { enable | disable } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables sending a SIP 486 busy message upon a SIP CAC failure.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables sending a SIP 486 busy message upon a SIP CAC failure.</td>
</tr>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

Session initiation protocol is enabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

The following example shows how to enable sending a SIP 486 busy message upon a SIP CAC failure where the WLAN ID is 1:

```
(Cisco Controller) > config wlan sip-cac send-busy486 enable 1
```
config wlan ssid

To edit an SSID associated to a WLAN, use the config wlan ssid command.

```
config wlan ssid wlan_id ssid
```

**Syntax Description**

- `wlan_id`: WLAN identifier from 1 to 512.
- `ssid`: Service Set Identifier (SSID) associated to a WLAN.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

</tbody>
</table>

The following example shows how to enable static IP client tunneling support for WLAN ID 3:

```
(Cisco Controller) > config wlan static-ip tunneling enable 34
```
config wlan uapsd compliant client enable

To enable WPA1, use the config wlan uapsd compliant-client enable command.

Note
This was introduced for Ascom non-wmm capable phones and is not applicable for Cisco 792x/9971 IP phones.

Syntax Description

```
config wlan uapsd compliant-client enable wlan-id
```

| Syntax Description | wlan_id | Wireless LAN identifier between 1 and 512. |

Command Default
None

Command History

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to enable WPA1:

```
(Cisco Controller) > config wlan uapsd compliant-client enable 1
```
config wlan uapsd compliant-client disable

To disable WPA1, use the `config wlan uapsd compliant-client disable` command.

---

**Note**

This was introduced for Ascom non-wmm capable phones and is not applicable for Cisco 792x/9971 IP phones.

---

`config wlan uapsd compliant-client disable wlan-id`

**Syntax Description**

<table>
<thead>
<tr>
<th>wlan_id</th>
<th>Wireless LAN identifier between 1 and 512.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable WPA1:

```
(Cisco Controller) > config wlan uapsd compliant-client disable 1
```
**config wlan url-acl**

To configure the WLAN's URL ACL, use the `config wlan url-acl` command.

```
config wlan url-acl WLAN-id acl-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>WLAN-id</code></td>
</tr>
<tr>
<td><code>acl-name</code></td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to configure a WLAN URL ACL:

```
(Cisco Controller) >config wlan url-acl 3 testacl
```
config wlan user-idle-threshold

To configure the threshold data sent by the client during the idle timeout for client sessions for a WLAN, use the `config wlan user-idle-threshold` command.

`config wlan user-idle-threshold bytes wlan_id`

**Syntax Description**

<table>
<thead>
<tr>
<th><strong>bytes</strong></th>
<th>Threshold data sent by the client during the idle timeout for the client session for a WLAN. If the client send traffic less than the defined threshold, the client is removed on timeout. The range is from 0 to 10000000 bytes.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>wlan_id</strong></td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

The default timeout for threshold data sent by client during the idle timeout is 0 bytes.

**Command History**

<table>
<thead>
<tr>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the threshold data sent by the client during the idle timeout for client sessions for a WLAN:

```
(Cisco Controller) > config wlan user-idle-threshold 100 1
```
**config wlan usertimeout**

To configure the timeout for idle client sessions for a WLAN, use the `config wlan usertimeout` command.

```plaintext
config wlan usertimeout timeout wlan_id
```

**Syntax Description**

- **timeout**: Timeout for idle client sessions for a WLAN. If the client sends traffic less than the threshold, the client is removed on timeout. The range is from 15 to 100000 seconds.
- **wlan_id**: Wireless LAN identifier between 1 and 512.

**Command Default**

The default client session idle timeout is 300 seconds.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The timeout value that you configure here overrides the global timeout that you define using the command `config network usertimeout`.

The following example shows how to configure the idle client sessions for a WLAN:

```plaintext
(Cisco Controller) > config wlan usertimeout 100 1
```
**config wlan webauth-exclude**

To release the guest user IP address when the web authentication policy time expires and exclude the guest user from acquiring an IP address for three minutes, use the `config wlan webauth-exclude` command.

```
config wlan webauth-exclude wlan_id { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>wlan_id</code></td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables web authentication exclusion.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables web authentication exclusion.</td>
</tr>
</tbody>
</table>

**Command Default**

Disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command for guest WLANs that are configured with web authentication. This command is applicable when you configure the internal DHCP scope on the controller.

By default, when the web authentication timer expires for a guest user, the guest user can immediately reassociate with the same IP address before another guest user can acquire the IP address. If there are many guest users or limited IP address in the DHCP pool, some guest users might not be able to acquire an IP address.

When you enable this feature on the guest WLAN, the guest user’s IP address is released when the web authentication policy time expires and the guest user is excluded from acquiring an IP address for three minutes. The IP address is available for another guest user to use. After three minutes, the excluded guest user can reassociate and acquire an IP address, if available.

The following example shows how to enable the web authentication exclusion for WLAN ID 5:

```
(Cisco Controller) >config wlan webauth-exclude 5 enable
```
To configure WGB broadcast tagging on a WLAN, use the `config wlan wgb broadcast-tagging` command.

```
config wlan wgb broadcast-tagging {enable | disable} wlan-id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>enable</th>
<th>Enables downlink broadcast packet VLAN tagging on a WLAN.</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Disables downlink broadcast packet VLAN tagging on a WLAN.</td>
</tr>
<tr>
<td>wlan-id</td>
<td>WLAN ID on which the configuration is to be applied.</td>
</tr>
</tbody>
</table>

**Command Default**

WGB broadcast tagging is disabled by default.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable WGB broadcast tagging on WLAN ID 1:

```
(Cisco Controller) >config wlan wgb broadcast-tagging wlan 1
```
config wlan wifidirect

To configure Wi-Fi Direct Client Policy on a WLAN, use the `config wlan wifidirect` command.

```
config wlan wifidirect { allow | disable | not-allow | xconnect-not-allow } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow</td>
<td>Allows Wi-Fi Direct clients to associate with the WLAN</td>
</tr>
<tr>
<td>disable</td>
<td>Ignores the Wi-Fi Direct status of clients thereby allowing Wi-Fi Direct clients to associate</td>
</tr>
<tr>
<td>not-allow</td>
<td>Disallows the Wi-Fi Direct clients from associating with the WLAN</td>
</tr>
<tr>
<td>xconnect-not-allow</td>
<td>Enables AP to allow a client with the Wi-Fi Direct option enabled to associate, but the client (if it works according to the Wi-Fi standards) will refrain from setting up a peer-to-peer connection</td>
</tr>
</tbody>
</table>

| wlan_id            | Wireless LAN identifier (1 to 16). |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to allow Wi-Fi Direct Client Policy on WLAN ID 1:

```
(Cisco Controller) > config wlan wifidirect allow 1
```
To configure Wi-Fi Multimedia (WMM) mode on a wireless LAN, use the `config wlan wmm` command.

```
config wlan wmm { allow | disable | require } wlan_id
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow</td>
<td>Allows WMM on the wireless LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables WMM on the wireless LAN.</td>
</tr>
<tr>
<td>require</td>
<td>Specifies that clients use WMM on the specified wireless LAN.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier (1 to 512).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the controller is in Layer 2 mode and WMM is enabled, you must put the access points on a trunk port in order to allow them to join the controller.

The following example shows how to configure wireless LAN ID 1 to allow WMM:

```
(Cisco Controller) > config wlan wmm allow 1
```

The following example shows how to configure wireless LAN ID 1 to specify that clients use WMM:

```
(Cisco Controller) > config wlan wmm require 1
```
To configure access point neighbor authentication, use the `config wps ap-authentication` command.

```
config wps ap-authentication [ enable | disable threshold threshold_value ]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>(Optional) Enables WMM on the wireless LAN.</td>
</tr>
<tr>
<td>disable</td>
<td>(Optional) Disables WMM on the wireless LAN.</td>
</tr>
<tr>
<td>threshold</td>
<td>(Optional) Specifies that WMM-enabled clients are on the wireless LAN.</td>
</tr>
<tr>
<td>threshold_value</td>
<td>Threshold value (1 to 255).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the access point neighbor authentication:

```
(Cisco Controller) > config wps ap-authentication threshold 25
```

**Related Commands**

- `show wps ap-authentication summary`
config wps auto-immune

To enable or disable protection from Denial of Service (DoS) attacks, use the `config wps auto-immune` command.

```
config wps auto-immune {enable | disable | stop}
```

**Syntax Description**
- `enable` Enables the auto-immune feature.
- `disable` Disables the auto-immune feature.
- `stop` Stops dynamic auto-immune feature.

**Command Default**
Disabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
A potential attacker can use specially crafted packets to mislead the Intrusion Detection System (IDS) into treating a legitimate client as an attacker. It causes the controller to disconnect this legitimate client and launch a DoS attack. The auto-immune feature, when enabled, is designed to protect against such attacks. However, conversations using Cisco 792x phones might be interrupted intermittently when the auto-immune feature is enabled. If you experience frequent disruptions when using 792x phones, you might want to disable this feature.

The following example shows how to configure the auto-immune mode:

```
(Cisco Controller) > config wps auto-immune enable
```

The following example shows how to stop the auto-immune mode:

```
(Cisco Controller) > config wps auto-immune stop
Dynamic Auto Immune by WIPS is stopped
```

**Related Commands**
- `show wps summary`
# config wps cids-sensor

To configure Intrusion Detection System (IDS) sensors for the Wireless Protection System (WPS), use the `config wps cids-sensor` command.

```plaintext
config wps cids-sensor { [add index ip_address username password] | [delete index] | [enable index] | [disable index] | [port index port] | [interval index query_interval] | [fingerprint sha1 fingerprint] }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>add</strong></td>
<td>(Optional) Configures a new IDS sensor.</td>
</tr>
<tr>
<td><strong>index</strong></td>
<td>IDS sensor internal index.</td>
</tr>
<tr>
<td><strong>ip_address</strong></td>
<td>IDS sensor IP address.</td>
</tr>
<tr>
<td><strong>username</strong></td>
<td>IDS sensor username.</td>
</tr>
<tr>
<td><strong>password</strong></td>
<td>IDS sensor password.</td>
</tr>
<tr>
<td><strong>delete</strong></td>
<td>(Optional) Deletes an IDS sensor.</td>
</tr>
<tr>
<td><strong>enable</strong></td>
<td>(Optional) Enables an IDS sensor.</td>
</tr>
<tr>
<td><strong>disable</strong></td>
<td>(Optional) Disables an IDS sensor.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>(Optional) Configures the IDS sensor’s port number.</td>
</tr>
<tr>
<td><strong>port</strong></td>
<td>Port number.</td>
</tr>
<tr>
<td><strong>interval</strong></td>
<td>(Optional) Specifies the IDS sensor’s query interval.</td>
</tr>
<tr>
<td><strong>query_interval</strong></td>
<td>Query interval setting.</td>
</tr>
<tr>
<td><strong>fingerprint</strong></td>
<td>(Optional) Specifies the IDS sensor’s TLS fingerprint.</td>
</tr>
<tr>
<td><strong>sha1 fingerprint</strong></td>
<td>(Optional) Specifies the TLS fingerprint.</td>
</tr>
<tr>
<td><strong>fingerprint</strong></td>
<td>TLS fingerprint.</td>
</tr>
</tbody>
</table>

## Command Default

Command defaults are listed below as follows:

<table>
<thead>
<tr>
<th>Default</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port</td>
<td>443</td>
</tr>
<tr>
<td>Query interval</td>
<td>60</td>
</tr>
<tr>
<td>Certification fingerprint</td>
<td>00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00</td>
</tr>
<tr>
<td>Query state</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
This command was introduced in a release earlier than Release 7.6.

The following example shows how to configure the intrusion detection system with the IDS index 1, IDS sensor IP address 10.0.0.51, IDS username Sensor_user0doc1, and IDS password passowrd01:

(Cisco Controller) > config wps cids-sensor add 1 10.0.0.51 Sensor_user0doc1 password01

Related Commands: show wps cids-sensor detail
# config wps client-exclusion

To configure client exclusion policies, use the `config wps client-exclusion` command.

```
config wps client-exclusion {802.11-assoc | 802.11-auth | 802.11x-auth | ip-theft | web-auth | all} {enable | disable}
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>802.11-assoc</code></td>
<td>Specifies that the controller excludes clients on the sixth 802.11 association attempt, after five consecutive failures.</td>
</tr>
<tr>
<td><code>802.11-auth</code></td>
<td>Specifies that the controller excludes clients on the sixth 802.11 authentication attempt, after five consecutive failures.</td>
</tr>
<tr>
<td><code>802.11x-auth</code></td>
<td>Specifies that the controller excludes clients on the sixth 802.11X authentication attempt, after five consecutive failures.</td>
</tr>
<tr>
<td><code>ip-theft</code></td>
<td>Specifies that the control excludes clients if the IP address is already assigned to another device.</td>
</tr>
<tr>
<td><code>web-auth</code></td>
<td>Specifies that the controller excludes clients on the fourth web authentication attempt, after three consecutive failures.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies that the controller excludes clients for all of the above reasons.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables client exclusion policies.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables client exclusion policies.</td>
</tr>
</tbody>
</table>

## Command Default

All policies are enabled.

## Command History

<table>
<thead>
<tr>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the infrastructure MFP:

```
(Cisco Controller) > config wps mfp infrastructure enable
```

**Related Commands**

`show wps mfp`
config wps shun-list re-sync

To force the controller to synchronization with other controllers in the mobility group for the shun list, use the config wps shun-list re-sync command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tbody>
</table>

The following example shows how to configure the controller to synchronize with other controllers for the shun list:

(Cisco Controller) > config wps shun-list re-sync

Related Commands

show wps shun-list
**config wps signature**

To enable or disable Intrusion Detection System (IDS) signature processing, or to enable or disable a specific IDS signature, use the `config wps signature` command.

```
config wps signature { standard | custom } state signature_id { enable | disable }
```

**Syntax Description**
- `standard` Configures a standard IDS signature.
- `custom` Configures a standard IDS signature.
- `state` Specifies the state of the IDS signature.
- `signature_id` Identifier for the signature to be enabled or disabled.
- `enable` Enables the IDS signature processing or a specific IDS signature.
- `disable` Disables IDS signature processing or a specific IDS signature.

**Command Default**
IDS signature processing is enabled by default.

**Command History**
- **Release** 7.6
- **Modification** This command was introduced in a release earlier than Release 7.6.

**Usage Guidelines**
If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

The following example shows how to enable IDS signature processing, which enables the processing of all IDS signatures:

```
(Cisco Controller) > config wps signature enable
```

The following example shows how to disable a standard individual IDS signature:

```
(Cisco Controller) > config wps signature standard state 15 disable
```

**Related Commands**
- `config wps signature frequency`
- `config wps signature interval`
- `config wps signature mac-frequency`
- `config wps signature quiet-time`
- `config wps signature reset`
- `show wps signature events`
show wps signature summary
show wps summary
config wps signature frequency

To specify the number of matching packets per interval that must be identified at the individual access point level before an attack is detected, use the `config wps signature frequency` command.

`config wps signature frequency signature_id frequency`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>signature_id</td>
<td>Identifier for the signature to be configured.</td>
</tr>
<tr>
<td>frequency</td>
<td>Number of matching packets per interval that must be at the individual access point level before an attack is detected. The range is 1 to 32,000 packets per interval.</td>
</tr>
</tbody>
</table>

**Command Default**
The `frequency` default value varies per signature.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

The following example shows how to set the number of matching packets per interval per access point before an attack is detected to 1800 for signature ID 4:

```
(Cisco Controller) > config wps signature frequency 4 1800
```

**Related Commands**

- `config wps signature frequency`
- `config wps signature interval`
- `config wps signature quiet-time`
- `config wps signature reset`
- `show wps signature events`
- `show wps signature summary`
- `show wps summary`
config wps signature interval

To specify the number of seconds that must elapse before the signature frequency threshold is reached within the configured interval, use the `config wps signature interval` command.

```
config wps signature interval signature_id interval
```

**Syntax Description**

- **signature_id**: Identifier for the signature to be configured.
- **interval**: Number of seconds that must elapse before the signature frequency threshold is reached. The range is 1 to 3,600 seconds.

**Command Default**
The default value of `interval` varies per signature.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

The following example shows how to set the number of seconds to elapse before reaching the signature frequency threshold to 200 for signature ID 1:

```
(Cisco Controller) > config wps signature interval 1 200
```

**Related Commands**

- `config wps signature frequency`
- `config wps signature`
- `config wps signature mac-frequency`
- `config wps signature quiet-time`
- `config wps signature reset`
- `show wps signature events`
- `show wps signature summary`
- `show wps summary`
**config wps signature mac-frequency**

To specify the number of matching packets per interval that must be identified per client per access point before an attack is detected, use the **config wps signature mac-frequency** command.

**config wps signature mac-frequency** *signature_id* *mac_frequency*

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>signature_id</em></td>
<td>Identifier for the signature to be configured.</td>
</tr>
<tr>
<td><em>mac_frequency</em></td>
<td>Number of matching packets per interval that must be identified per client per access point before an attack is detected. The range is 1 to 32,000 packets per interval.</td>
</tr>
</tbody>
</table>

**Command Default**

The *mac_frequency* default value varies per signature.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

The following example shows how to set the number of matching packets per interval per client before an attack is detected to 50 for signature ID 3:

(Cisco Controller) > config wps signature mac-frequency 3 50

**Related Commands**

- config wps signature frequency
- config wps signature interval
- config wps signature
- config wps signature quiet-time
- config wps signature reset
- show wps signature events
- show wps signature summary
- show wps summary
config wps signature quiet-time

To specify the length of time after which no attacks have been detected at the individual access point level and the alarm can stop, use the `config wps signature quiet-time` command.

```
config wps signature quiet-time signature_id quiet_time
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>signature_id</code></td>
<td>Identifier for the signature to be configured.</td>
</tr>
<tr>
<td><code>quiet_time</code></td>
<td>Length of time after which no attacks have been detected at the individual access point level and the alarm can stop. The range is 60 to 32,000 seconds.</td>
</tr>
</tbody>
</table>

| Command Default | The default value of `quiet_time` varies per signature. |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

| Usage Guidelines | If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures. |

The following example shows how to set the number of seconds after which no attacks have been detected per access point to 60 for signature ID 1:

```
(Cisco Controller) > config wps signature quiet-time 1 60
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th><code>config wps signature</code></th>
</tr>
</thead>
<tbody>

<td></td>
<td><code>config wps signature mac-frequency</code></td>
</tr>
<tr>
<td></td>
<td><code>config wps signature reset</code></td>
</tr>
<tr>
<td></td>
<td><code>show wps signature events</code></td>
</tr>
<tr>
<td></td>
<td><code>show wps signature summary</code></td>
</tr>
<tr>
<td></td>
<td><code>show wps summary</code></td>
</tr>
</tbody>
</table>
config wps signature reset

To reset a specific Intrusion Detection System (IDS) signature or all IDS signatures to default values, use the `config wps signature reset` command.

```
config wps signature reset  {signature_id | all}
```

**Syntax Description**
- `signature_id`: Identifier for the specific IDS signature to be reset.
- `all`: Resets all IDS signatures.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
If IDS signature processing is disabled, all signatures are disabled, regardless of the state configured for individual signatures.

The following example shows how to reset the IDS signature 1 to default values:

```
(Cisco Controller) > config wps signature reset 1
```

**Related Commands**

- Debug Commands: a to i, on page 1287
- Debug Commands: j to q, on page 1359
- Debug Commands: r to z, on page 1385
Debug Commands: 802.11

- debug 11k, on page 1280
- debug 11w-pmf, on page 1281
- debug 11v all, on page 1282
- debug 11v detail, on page 1283
- debug 11v error, on page 1284
- debug 11w-pmf, on page 1285
debug 11k

To configure the debugging of 802.11k settings, use the debug 11k command.

**Syntax**
```bash
dev 11k { all | detail | errors | events | history | optimization | simulation } { enable | disable }
```

**Syntax Description**
- **all**: Configures the debugging of all 802.11k messages.
- **detail**: Configures the debugging of 802.11k details.
- **errors**: Configures the debugging of 802.11k errors.
- **events**: Configures the debugging of all 802.11k events.
- **history**: Configures the debugging of all 802.11k history. The Cisco WLC collects roam history of the client.
- **optimization**: Configures the debugging of 802.11k optimizations. You can view optimization steps of neighbor lists.
- **simulation**: Configures the debugging of 802.11k simulation data. You can view details of client roaming parameters and import them for offline simulation.
- **enable**: Enables the 802.1k debugging.
- **disable**: Disables the 802.1k debugging.

**Command Default**
None.

**Command History**

<table>

• debug hotspot, on page 1357
• debug ipv6, on page 1358
To configure the debugging of AAA settings, use the `debug aaa` command.

```
debug aaa { [all | avp-xml | detail | events | packet | ldap | local-auth | tacacs] [ enable | disable] }
```

**Syntax Description**
- **all** (Optional) Configures the debugging of all AAA messages.
- **avp-xml** (Optional) Configures debug of AAA Avp xml events.
- **detail** (Optional) Configures the debugging of AAA errors.
- **events** (Optional) Configures the debugging of AAA events.
- **packet** (Optional) Configures the debugging of AAA packets.
- **ldap** (Optional) Configures the debugging of the AAA Lightweight Directory Access Protocol (LDAP) events.
- **local-auth** (Optional) Configures the debugging of the AAA local Extensible Authentication Protocol (EAP) events.
- **tacacs** (Optional) Configures the debugging of the AAA TACACS+ events.
- **enable** (Optional) Enables the debugging.
- **disable** (Optional) Disables the debugging.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>

8.3  This command was introduced.
8.6  The command is enhanced with new keyword. The new keyword is `avp-xml`.

The following example shows how to enable the debugging of AAA LDAP events:

```
(Cisco Controller) > debug aaa ldap enable
```

**Related Commands**
debug aaa local-auth eap
show running-config
debug aaa events

To configure the debugging related to DNS-based ACLs, use the `debug aaa events enable` command.

```
default aaa events enable
```

**Syntax Description**

- **events** Configures the debugging of DNS-based ACLs.

**Command History**

<table>

</tbody>
</table>

The following example shows how to enable the remote debugging on access point AP01:

```
debug ap enable cisco_ap AP01
```
(Cisco Controller) >debug ap enable AP01

The following example shows how to execute the `config ap location` command on access point AP02:

(Cisco Controller) >debug ap command "config ap location "Building 1" AP02"

The following example shows how to execute the flash LED command on access point AP03:

(Cisco Controller) >debug ap command "led flash 30" AP03
debug ap enable

To configure the remote debugging of Cisco lightweight access points or to remotely execute a command on a lightweight access point, use the debug ap enable command.

depug ap {enable | disable | command cmd} cisco_ap

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the remote debugging.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the remote debugging.</td>
</tr>
<tr>
<td>command</td>
<td>Specifies that a CLI command is to be executed on the access point.</td>
</tr>
<tr>
<td>cmd</td>
<td>Command to be executed.</td>
</tr>
</tbody>
</table>

**Note**

- The debugging information is displayed only to the controller console and does not send output to a controller Telnet/SSH CLI session.

- The command to be executed must be enclosed in double quotes, such as **debug ap command “led flash 30” AP03**.

- The output of the command displays only to the controller console and does not send output to a controller Telnet/SSH CLI session.

**Command Default**

- None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the remote debugging on access point AP01:

(Cisco Controller) >debug ap enable AP01

The following example shows how to disable the remote debugging on access point AP02:
(Cisco Controller) > debug ap disable AP02

The following example shows how to execute the flash LED command on access point AP03:

(Cisco Controller) > debug ap command "led flash 30" AP03
debug ap packet-dump

To configure the debugging of Packet Capture, use the `debug ap packet-dump` command.

```
debug ap packet-dump { enable | disable }
```

**Syntax Description**
- `enable` Enables the debugging of Packet Capture of an access point.
- `disable` Disables the debugging of Packet Capture of an access point.

**Command Default**
Debugging of Packet Capture is disabled.

**Command History**
- Release 7.6: This command was introduced in a release earlier than Release 7.6.
- Release 8.3: This command was introduced.

**Usage Guidelines**
Packet Capture does not work during inter-Cisco WLC roaming.

The Cisco WLC does not capture packets created in the radio firmware and sent out of the access point, such as beacon or probe response. Only packets that flow through the radio driver in the Tx path will be captured.

The following example shows how to enable the debugging of Packet Capture from an access point:

```
(Cisco Controller) > debug ap packet-dump enable
```
debug ap show stats

To debug video messages and statistics of Cisco lightweight access points, use the `debug ap show stats` command.

debug ap show stats {802.11a | 802.11b} cisco_ap {tx-queue | packet | load | multicast | client {client_MAC | video | all} | video metrics}

debug ap show stats video cisco_ap {multicast mgid mgid_database_number | admission | bandwidth}

Syntax Description

<table>
<thead>

```

The following example shows how to disable ARP debug settings:

```
(Cisco Controller) > debug arp error disable
```
debug avc

To configure the debugging of Application Visibility and Control (AVC) options, use the debug avc error command.

```
debug avc {events | error} {enable | disable}
```

**Syntax Description**
- `events` Configures the debugging of AVC events.
- `error` Configures the debugging of AVC errors.
- `enable` Enables the debugging of AVC events or errors.
- `disable` Disables the debugging of AVC events or errors.

**Command Default**
By default, the debugging of AVC options is disabled.

**Command History**

<table>

The following example shows how to enable CCX RM debugging:

```
(Cisco Controller) > debug ccxrm all enable
```
debug ccxs69

To configure debugging of CCX S69 tasks, use the `debug ccxs69` command.

```
debug ccxs69 { all | error | event } { enable | disable }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>Configures debugging of all the CCX S69 messages.</td>

The following example shows how to enable CCX S69 debugging:

```
(Cisco Controller) >debug ccxs69 all enable
```
debug cckm

To configure the debugging of the Cisco Centralized Key Management options, use the `debug cckm` command:

```
ddebug cckm { client | detailed } { enable | disable }
```

**Syntax Description**

- `client`: Configures debugging of the Cisco Centralized Key Management of clients.
- `detailed`: Configures detailed debugging of Cisco Centralized Key Management.
- `enable`: Enables debugging of Cisco Centralized Key Management.
- `disable`: Disables debugging of Cisco Centralized Key Management.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

The following example shows how to enable detailed debugging of Cisco Centralized Key Management:

```
(Cisco Controller) > debug cckm detailed enable
```
debug client

To configure the debugging for a specific client, use the **debug client** command.

```
debug client  mac_address
```

**Syntax Description**
- `mac_address`: MAC address of the client.

**Command Default**
None

**Usage Guidelines**
After entering the `debug client mac_address` command, if you enter the `debug aaa events enable` command, then the AAA events logs are displayed for that particular client MAC address.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

The following example shows how to debug a specific client:

```
(Cisco Controller) > debug client 01:35:6x:yy:21:00
```
**debug cts aaa**

To configure the Cisco TrustSec AAA debug options, use the `debug cts aaa` command.

```
debug cts aaa  {all  |  errors  |  events}  {enable  |  disable}
```

**Syntax Description**

- `all` - Configures debugging of all the CTS AAA debug options
- `errors` - Configures debugging of all the CTS AAA errors
- `events` - Configures debugging of all the CTS AAA events
- `enable` - Enables debugging
- `disable` - Disables debugging

**Command Default**

None

</tbody>
</table>
debug cts sxp

To configure debugging of Cisco TrustSec SXP options, use the debug cts sxp command.

dump cts sxp { all | errors | events | framework | message } { enable | disable }

Syntax Description

- all: Configures debugging of all the CTS SXP options
- errors: Configures debugging of the CTS SXP errors
- events: Configures debugging of the CTS SXP events
- framework: Configures debugging of the CTS SXP framework
- message: Configures debugging of the CTS SXP messages
- enable: Enables debugging
- disable: Disables debugging

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>
**debug cac**

To configure the debugging of Call Admission Control (CAC) options, use the `debug cac` command.

```
debug cac { all | event | packet } { enable | disable }
```

### Syntax Description

- **all**: Configures the debugging options for all CAC messages.
- **event**: Configures the debugging options for CAC events.
- **packet**: Configures the debugging options for selected CAC packets.
- **kts**: Configures the debugging options for KTS-based CAC messages.
- **enable**: Enables the debugging of CAC settings.
- **disable**: Disables the debugging of CAC settings.

### Command Default

By default, the debugging of CAC options is disabled.

### Command History

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The debug actions described here are used in conjunction with CAPWAP troubleshooting.

The following example shows how to enable DTLS packet debugging:

```
(Cisco Controller) > debug dtls packet enable
```
## debug fastpath

To debug the issues in the 10-Gigabit Ethernet interface of the controller and to view details of all the management and control features of the controller, use the **debug fastpath** command.

```plaintext
debug fastpath [ {disable | enable | errors | events | warning | log | status | dump | audit | clear} ]
debug fastpath log [ {error events show} ]
debug fastpath dump [ {stats DP_number} | {fpapoolDP_number} | {ownerdb} | {portdb} | {preauthuri client-mac 0 | 1 | All} | {tun4dbindexDP_number} | {scdbindexDP_number} | {cfgtool -- dump.sfp} | {urlacldbstart-acl-id start-rule-index} | {vlandb} | {dpcp-stats} | {clear stats} | {systemdb} | {debug | {wlanappstatswlan_id}} | {appqosdb} ]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>disable</td>
<td>Enables debug of fastpath messages.</td>
</tr>
<tr>
<td>enable</td>
<td>Disables debug of fastpath messages.</td>
</tr>
<tr>
<td>errors</td>
<td>Displays the debug messages related to the fastpath errors.</td>
</tr>
<tr>
<td>events</td>
<td>Displays the debug messages related to the fastpath events.</td>
</tr>
<tr>
<td>warnings</td>
<td>Displays the debug messages related to the fastpath warnings.</td>
</tr>
<tr>
<td>log</td>
<td>Configures debug of log messages.</td>
</tr>
<tr>
<td>errors</td>
<td>Configures debug of fastpath errors.</td>
</tr>
<tr>
<td>events</td>
<td>Configures debug of fastpath events.</td>
</tr>
<tr>
<td>show</td>
<td>Displays log of most recent events related to fastpath.</td>
</tr>
<tr>
<td>status</td>
<td>Displays status of fastpath configuration.</td>
</tr>
<tr>
<td>dump</td>
<td>Displays the CLI dump commands.</td>
</tr>
<tr>
<td>stats</td>
<td>Displays the debug statistics from the data plane.</td>
</tr>
</tbody>
</table>

**DP_number**

Displays the statistic counters at data plane based on selected data plane number. Values include 0, 1, and All. The default option is All. You must select:

- The index 0 for the Cisco Wireless LAN Controller 2504 Series, Cisco Wireless LAN Controller 5508 Series, Cisco Wireless LAN Controller 7500 Series, Cisco Wireless LAN Controller 8500 Series.
- The index 0 and/or 1 respectively for the two data planes in WiSM2 to view statistics of individual data plane or from both.
### fpaPool
Displays statistics of packet buffer in data plane.

### DP_number
Displays statistics of packet buffer based on data plane number. Values include 0, 1, and All. The default option is All. You must select:
- The index 0 for the Cisco Wireless LAN Controller 2504 Series, Cisco Wireless LAN Controller 5508 Series, Cisco Wireless LAN Controller 7500 Series, Cisco Wireless LAN Controller 8500 Series.
- The index 0 and/or 1 respectively for the two data planes in WiSM2 to view statistics of individual data plane or from both.

### ownerdb
Displays the data plane owner information.

### portdb
Displays the port database at data plane.

### preauthurl
Preauth URL learned IPs.

### client-mac
MAC address of the client.

**0 | 1 | All**
Dataplane options.

### tun4db
Dumps the first 20 tunnels from the data plane.

### index
Dumps 20 tunnel entries from index provided. You must use data plane number 0/1 to denote WISM2 data plane processor.

### DP_number
Dumps the first twenty client entries from the data plane. Values include 0, 1, and All. The default option is All. You must select:
- The index 0 for the Cisco Wireless LAN Controller 2504 Series, Cisco Wireless LAN Controller 5508 Series, Cisco Wireless LAN Controller 7500 Series, Cisco Wireless LAN Controller 8500 Series.
- The index 0 and/or 1 respectively for the two data planes in WiSM2 to view statistics of individual data plane or from both.

### scbDB
Dumps 20 client entries starting from index provided. You must use data plane number 0/1 to denote WISM2 data plane processor.

### index
Dumps client information for the selected MAC address.
### Dump the first twenty client entries from the data plane.
Values include 0, 1, and All. The default option is All. You must select:

- The index 0 for the Cisco Wireless LAN Controller 2504 Series, Cisco Wireless LAN Controller 5508 Series, Cisco Wireless LAN Controller 7500 Series, Cisco Wireless LAN Controller 8500 Series.
- The index 0 and/or 1 respectively for the two data planes in WiSM2 to view statistics of individual data plane or from both.

### Display the model/type of SX/LC/T small form-factor plug-in (SFP) modules with the OUI Partnumber.

<table>
<thead>

</tbody>
</table>

The following example shows how to enable the debugging of access point groups:

```
(Cisco Controller) >debug group enable
```
# debug fmchs

To configure debugging of Fixed Mobile Convergence Handover Service (FMCHS) of the controller, use the `debug fmchs` command.

```
debug fmchs { all | error | event | nmsp | packet } { enable | disable }
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>Configures debugging of all FMCHS messages.</td>
</tr>
<tr>
<td><code>error</code></td>
<td>Configures debugging of the FMCHS errors.</td>
</tr>
<tr>
<td><code>event</code></td>
<td>Configures debugging of the FMCHS events.</td>
</tr>
<tr>
<td><code>nmsp</code></td>
<td>Configures debugging of the FMCHS NMSP events.</td>
</tr>
<tr>
<td><code>packet</code></td>
<td>Configures debugging of the FMCHS packets.</td>
</tr>
<tr>
<td><code>enable</code></td>
<td>Enables debugging of the FMCHS options.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables debugging of the FMCHS options.</td>
</tr>
</tbody>
</table>

8.3 This command was introduced.

The following example shows how to debug FlexConnect client ap 'room' MAC addresses:

(Cisco Controller) > debug flexconnect client ap room add 00.0c.41.07.33.a6 0A.0c.52.17.97.b6
To configure debug logging of the syslog server for a FlexConnect client AP, use the `debug flexconnect client ap` command.

```
debug flexconnect client ap ap-name syslog {ip-address | disable}
```

**Syntax Description**

- `ip-address`: Configures the syslog server ip-address for debug logging.
- `disable`: Disables the debug logging to the syslog server.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was added.</td>
</tr>
</tbody>
</table>

8.3 | This command was introduced.

The following example shows how to configure syslog server for debug log for the FlexConnect client AP 'room':

```
(Cisco Controller) > debug flexconnect client ap room syslog 192.168.1.1
```
debug flexconnect client group

To debug FlexConnect client group MAC addresses, use the **debug flexconnect client group** command.

```
default flexconnect client group group-name { add | delete } MAC-address1 MAC-address2 MAC-address3 MAC-address4
```

**Syntax Description**

- **add** Adds the MAC address to the group.
- **delete** Deletes the MAC address from the group.
- **MAC-address** MAC address of the client.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

The following example shows how to debug FlexConnect client group MAC addresses:

(Cisco Controller) >debug flexconnect client group school add 00.0c.41.07.33.a6 0A.0c.52.17.97.b6
debug flexconnect client group syslog

To debug FlexConnect group access point syslog, use the **debug flexconnect client group** command.

```
debug flexconnect client group group-name syslog ip-address | disable
```

**Syntax Description**

- **ip-address**  Configures the syslog server ip-address for debug logging.
- **disable**  Disables the debug logging to the syslog server.

**Command Default**
None

**Command History**

<table>

The following example shows how to enable the debugging of FlexConnect access point groups:

```
(Cisco Controller) > debug flexconnect group enable
```
debug ft

To configure debugging of 802.11r, use the `debug ft` command.

```
dump ft {events | keys} {enable | disable}
```

### Syntax Description

- **events**: Configures debugging of the 802.11r events.
- **keys**: Configures debugging of the 802.11r keys.
- **enable**: Enables debugging of the 802.11r options.
- **disable**: Disables debugging of the 802.11r options.

### Command Default

None

</tbody>
</table>

The following example shows how to enable debugging of hotspot events:

```
(Cisco Controller) >debug hotspot events enable
```
To configure debugging of IPv6 options, use the `debug ipv6` command.

```
dump ipv6 {all | bt | classifier | errors | events | filter | fsm | gleaner | hwapi | memory | ndsuppress | parser | policy | ra_throttler | switcher} {enable | disable}
```

**Syntax Description**

- `all`: Configures debugging of all the IPv6 information.
- `bt`: Configures debugging of the IPv6 neighbor binding table.
- `classifier`: Configures debugging of the IPv6 packet classifiers.
- `errors`: Configures debugging of the IPv6 errors.
- `events`: Configures debugging of the IPv6 events.
- `filter`: Configures filters for the IPv6 debugs.
- `fsm`: Configures debugging of the IPv6 finite state machine (FSM).
- `gleaner`: Configures debugging of the IPv6 gleaner. Learning of entries is called gleaning.
- `hwapi`: Configures debugging of the IPv6 hardware APIs.
- `memory`: Configures debugging of the IPv6 binding table memory usage.
- `ndsuppress`: Configures debugging of the suppressed IPv6 neighbor discoveries.
- `parser`: Configures debugging of the IPv6 parser.
- `policy`: Configures debugging of the IPv6 policies.
- `ra_throttler`: Configures debugging of the IPv6 router advertising throttler.
- `switcher`: Configures debugging of the IPv6 switcher.
- `enable`: Enables debugging of the IPv6 options.
- `disable`: Disables debugging of the IPv6 options.

- show mdns profile
- show mdns service
- clear mdns service-database
- debug mdns all
- debug mdns error
debug mdns error

To debug multicast DNS (mDNS) errors, use the `debug mdns error` command.

```
d-debug mdns error  { enable | disable }
```

**Syntax Description**
- `enable` Enables the debugging of mDNS errors.
- `disable` Disables the debugging of mDNS errors.

**Command Default**
This command is disabled by default.

**Command History**
```
<table>
<thead>
<tr>

- show mdns profile
- show mdns service
- clear mdns service-database
- debug mdns all
- debug mdns error
- debug mdns detail
To debug all the multicast Domain Name System (mDNS) High Availability (HA) messages, use the `debug mdns ha` command.

```
ddebug mdns ha  {enable | disable}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables debugging of all the mDNS HA messages.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables debugging of all the mDNS HA messages.</td>
</tr>
</tbody>
</table>

**Command Default**

This command is disabled by default.

**Command History**

- **Release 7.5**
  - This command was introduced.

**Usage Guidelines**

This command is automatically enabled when the `debug mdns all` command is enabled.

The following example shows how to enable debugging of all the mDNS HA messages:

```
(Cisco Controller) > debug mdns ha enable
```
debug memory

To enable or disable the debugging of errors or events during the memory allocation of the Cisco WLC, use the `debug memory` command.

```
debug memory {errors | events} {enable | disable}
```

**Syntax Description**
- `errors`: Configures the debugging of memory leak errors.
- `events`: Configures debugging of memory leak events.
- `enable`: Enables the debugging of memory leak events.
- `disable`: Disables the debugging of memory leak events.

**Command Default**
By default, the debugging of errors or events during the memory allocation of the Cisco WLC is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>

The following example shows how to enable the debugging of the packets sent to the Cisco WLC CPU:

```
(Cisco Controller) > debug packet error enable
```
# debug packet logging

To configure logging of the packets sent to the Cisco Wireless LAN Controller CPU, use the `debug packet logging` command.

```
devices packet logging acl disable enable rx tx all packet_count display_size format hex2pcap text2pcap 
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acl</td>
<td>Filters the displayed packets according to a rule.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables logging of all the packets.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables logging of all the packets.</td>
</tr>
<tr>
<td>rx</td>
<td>Displays all the received packets.</td>
</tr>
<tr>
<td>tx</td>
<td>Displays all the transmitted packets.</td>
</tr>
<tr>
<td>all</td>
<td>Displays both the transmitted and the received packets.</td>
</tr>
<tr>
<td>packet_count</td>
<td>Maximum number of packets to be logged. The range is from 1 to 65535. The default value is 25.</td>
</tr>
<tr>
<td>display_size</td>
<td>Number of bytes to be displayed when printing a packet. By default, the entire packet is displayed.</td>
</tr>
<tr>
<td>format</td>
<td>Configures the format of the debug output.</td>
</tr>
<tr>
<td>hex2pcap</td>
<td>Configures the output format to be compatible with the hex2pcap format. The standard format used by Cisco IOS supports the use of hex2pcap and can be decoded using an HTML front end.</td>
</tr>
<tr>
<td>text2pcap</td>
<td>Configures the output format to be compatible with the text2pcap format. In this format, the sequence of packets can be decoded from the same console log file.</td>
</tr>
<tr>
<td>clear-all</td>
<td>Clears all the existing rules pertaining to the packets.</td>
</tr>
<tr>
<td>driver</td>
<td>Filters the packets based on an incoming port or a Network Processing Unit (NPU) encapsulation type.</td>
</tr>
<tr>
<td>rule_index</td>
<td>Index of the rule that is a value between 1 and 6 (inclusive).</td>
</tr>
<tr>
<td>action</td>
<td>Action for the rule, which can be <code>permit</code>, <code>deny</code>, or <code>disable</code>.</td>
</tr>
</tbody>
</table>
**npu_encap**
NPU encapsulation type that determines how the packets are filtered. The possible values are dhcp, dot11-mgmt, dot11-probe, dot1x, eoip-ping, iapp, ip, lwapp, multicast, orphan-from-sta, orphan-to-sta, rbcp, wired-guest, or any.

**port**
Physical port for packet transmission or reception.

**eoip-eth**
Filters packets based on the Ethernet II header in the Ethernet over IP (EoIP) payload.

**dst**
Destination MAC address.

**src**
Source MAC address.

**type**
Two-byte type code, such as 0x800 for IP, 0x806 for Address Resolution Protocol (ARP). You can also enter a few common string values such as ip (0x800) or arp (0x806).

**vlan**
Two-byte VLAN identifier.

**eoip-ip**
Filters packets based on the IP header in the EoIP payload.

**proto**
Protocol. Valid values are: ip, icmp, igmp, ggp, ipencap, st, tcp, egp, pup, udp, hmp, xns-idp, rlp, iso-ip4, xtp, ddp, idpr-cmtp, rsvp, vnet, ospf, ipip, and encap.

**src_port**
User Datagram Protocol or Transmission Control Protocol (UDP or TCP) two-byte source port, such as telnet, 23, or any. The Cisco WLC supports the following strings: tcpmux, echo, discard, systat, daytime, netstat, qotd, msp, chargen, ftp-data, ftp, fsp, ssh, telnet, smtp, time, rlp, nameserver, whois, re-mail-ck, domain, mtp, bootps, bootpc, tftp, gopher, rje, finger, www, link, kerberos, supdup, hostnames, iso-tsap, csnet-ns, 3com-tsmux, rtelnet, pop-2, pop-3, sunrpc, auth, sftp, uucp-path, nntp, rlogin, netbios-ns, netbios-dgm, netbios-ssn, imap2, smtp, smtp-trap, cmip-man, cmip-agent, xdmcp, nextstep, bgp, prospero, irc, smux, at-rtp, at-btb, at-echo, at-zis, qntp, z3950, ipx, imap3, ulistserv, https, snmp, saft, npmp-local, npmp-gui, and hnmmp-ind.

**dst_port**
UDP or TCP two-byte destination port, such as telnet, 23, or any. The Cisco WLC supports the same strings as those for the src_port.

**eth**
Filters packets based on the values in the Ethernet II header.

**ip**
Filters packets based on the values in the IP header.

**lwapp-dot11**
Filters packets based on the 802.11 header in the Lightweight Access Point Protocol (LWAPP) payload.

**bssid**
Basic Service Set Identifier of the VLAN.

**lwapp-ip**
Filters packets based on the IP header in the LWAPP payload.
The following example shows how to enable logging of a packet:

(Cisco Controller) > debug packet logging enable
debug pem

To configure debugging of the access policy manager, use the debug pem command.

```
debug pem {events | state} {enable | disable}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>events</td>
<td>Configures the debugging of the policy manager events.</td>
</tr>
<tr>
<td>state</td>
<td>Configures the debugging of the policy manager state machine.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables the debugging of the access policy manager.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the debugging of the access policy manager.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the debugging of the access policy manager:

```
(Cisco Controller) >debug pem state enable
```
To configure the debugging of the security policy manager module, use the `debug pm` command.

```
depug pm { all disable | ( config | hwcrypto | ikemsg | init | list | message | pki | rng |
               | rules | sa-export | sa-import | ssh-l2tp | ssh-appgw | ssh-engine | ssh-int | ssh-pmgr |
               | ssh-ppp | ssh-tcp ) { enable | disable } }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all disable</code></td>
<td>Disables all debugging in the policy manager module.</td>
</tr>
<tr>
<td><code>config</code></td>
<td>Configures the debugging of the policy manager configuration.</td>

```
(Cisco Controller) > debug transfer trace enable
```

**Related Commands**

`debug disable-all`
debug voice-diag

To trace call or packet flow, use the debug voice-diag command.

```
debug voice-diag { enable client_mac1 [client_mac2] [verbose] | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the debugging of voice diagnostics for voice clients involved in a call.</td>
</tr>
<tr>
<td>client_mac1</td>
<td>MAC address of a voice client.</td>
</tr>
<tr>
<td>client_mac2</td>
<td>(Optional) MAC address of an additional voice client.</td>
</tr>
<tr>
<td>verbose</td>
<td>(Optional) Enables debug information to be displayed on the console.</td>
</tr>
</tbody>
</table>

**Note**

Voice diagnostics can be enabled or disabled for a maximum of two voice clients at a time.

**Command Default**

None

**Usage Guidelines**

Follow these guidelines when you use the debug voice-diag command:

- When the command is entered, the validity of the clients is not checked.
- A few output messages of the command are sent to the NCS or Prime Infrastructure.
- The command expires automatically after 60 minutes.
- The command provides the details of the call flow between a pair of client MACs involved in an active call.

**Note**

Voice diagnostics can be enabled for a maximum of two voice clients at a time.

**Command History**

<table>

The following example shows how to enable the debugging of WPS signature settings:

```
(Cisco Controller) > debug wps sig enable
```

**Related Commands**

debug wps mfp
debug disable-all
**debug wps mfp**

To configure the debugging of WPS Management Frame Protection (MFP) settings, use the `debug wps mfp` command.

```
debug wps mfp { client | capwap | detail | report | mm } { enable | disable }
```

**Syntax Description**

- **client**
  - Configures the debugging for client MFP messages.

- **capwap**
  - Configures the debugging for MFP messages between the controller and access points.

- **detail**
  - Configures the detailed debugging for MFP messages.

- **report**
  - Configures the debugging for MFP reporting.

- **mm**
  - Configures the debugging for MFP mobility (inter-Cisco WLC) messages.

- **enable**
  - Enables the debugging for WPS MFP settings.

- **disable**
  - Disables the debugging for WPS MFP settings.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

- license modify priority, on page 1421
- license revoke, on page 1423
- license save, on page 1424
- license smart, on page 1425
License Commands

license activate ap-count eval

To activate an evaluation access point license on the Cisco Flex 7500 Series and Cisco 8500 Series Wireless LAN Controllers, use the `license activate ap-count eval` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

By default, in release 7.3 Cisco Flex 7500 Series Controllers and Cisco 8500 Series Wireless LAN Controllers support 6000 APs.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you activate this license, the controller prompts you to accept or reject the End User License Agreement (EULA) for the given license. If you activate a license that supports a smaller number of APs than the current number of APs connected to the controller, the activation command fails.

The following example shows how to activate an evaluation AP-count license on a Cisco Flex 7500 Series controller:

```
(Cisco Controller) > license activate ap-count eval
```
license activate feature

To activate a feature license on Cisco Flex 7500 Series and Cisco 8500 Series Wireless LAN Controllers, use the `license activate feature` command.

```
license activate feature license_name
```

**Syntax Description**

- `license_name` Name of the feature license. The license name can be up to 50 case-sensitive characters.

**Command Default**

None

**Command History**

- **Release** 7.6
  - This command was introduced in a release earlier than Release 7.6.

The following example shows how to activate a data DTLS feature license on a Cisco Flex 7500 Series controller:

```
(Cisco Controller) > license activate feature data-DTLS
```
license add ap-count

To configure the number of access points (APs) that an AP license can support on Cisco Flex 7500 and 8500 Series Wireless LAN controllers, use the **license add ap-count** command.

**license add ap-count count**

**Syntax Description**

*count*  Number of APs that the AP license supports. The range is from 1 to the maximum number of APs that the controller can support. The count must be a multiple of 5.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Right to Use (RTU) licensing allows you to enable a desired AP license count on the controller after accepting the End User License Agreement (EULA). You can now easily add AP counts on a controller without using external tools. RTU licensing is available only on Cisco Flex 7500 and 8500 series Wireless LAN controllers.

You can use this command to increase the count of an existing AP license. When you activate a license that supports a smaller number of APs than the current number of APs connected to the controller, the activation command fails.

The following example shows how to configure the count of an AP license on a Cisco Flex 7500 Series controller:

```
(Cisco Controller) > license add ap-count 5000
```
license add feature

To add a license for a feature on the Cisco 5520 WLC, Cisco Flex 7510 WLC, Cisco 8510 WLC, Cisco 8540 WLC, and Cisco Virtual Controller, use the `license add feature` command.

```
license add feature license_name
```

**Syntax Description**

| license_name | Name of the feature license. The license name can be up to 50 case-sensitive characters. For example, `data_encryption`. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6. This command is applicable to Cisco Flex 7510 WLC and Cisco 8510 WLC.</td>
</tr>
<tr>
<td>8.1</td>
<td>This command is applicable to Cisco 5520 WLC, Cisco Flex 7510 WLC, Cisco 8510 WLC, Cisco 8540 WLC, and Cisco vWLC.</td>
</tr>
</tbody>
</table>

The following example shows how to add a data_encryption feature license:

```
(Cisco Controller) > license add feature data_encryption
```
license clear

To remove a license from the Cisco 5500 Series Controller, use the `license clear` command.

```
license clear license_name
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Name of the license.</th>
</tr>
</thead>
<tbody>
<tr>
<td>license_name</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can delete an expired evaluation license or any unused license. You cannot delete unexpired evaluation licenses, the permanent base image license, or licenses that are in use by the controller.

The following example shows how to remove the license settings of the license named wplus-ap-count:

```
(Cisco Controller) > license clear wplus-ap-count
```
License Commands

license comment

To add comments to a license or delete comments from a license on the Cisco 5500 Series Controller, use the license comment command.

```
license comment { add | delete } license_name comment_string
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>Adds a comment.</td>

The following example shows how to add a comment “wplus ap count license” to the license name wplus-ap-count:

```
(Cisco Controller) > license comment add wplus-ap-count Comment for wplus ap count license
```
license deactivate ap-count eval

To deactivate an evaluation access point license on the Cisco Flex 7500 Series and Cisco 8500 Series Wireless LAN Controllers, use the `license deactivate ap-count eval` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>

The following example shows how to deactivate an evaluation AP license on a Cisco Flex 7500 Series controller:

```
(Cisco Controller) > license deactivate ap-count eval
```
license deactivate feature

To deactivate a feature license on Cisco Flex 7500 Series and Cisco 8500 Series Wireless LAN controllers, use the **license deactivate feature** command.

Syntax Description

```
license deactivate feature license_name

license_name    Name of the feature license. The license name can be up to 50 case-sensitive characters.
```

Command Default

None

Command History

```
Release  Modification

7.6     This command was introduced in a release earlier than Release 7.6.
```

The following example shows how to deactivate a data DTLS feature license on a Cisco Flex 7500 Series controller:

```
(Cisco Controller) > license deactivate feature data_DTLS
```
license delete ap-count

To delete an access point (AP) count license on the Cisco Flex 7500 Series and Cisco 8500 Series Wireless LAN Controllers, use the license delete ap-count command.

```
license delete ap-count count
```

**Syntax Description**

```
count  Number of APs that the AP license supports. The range is from 1 to the maximum number of APs that the controller can support. The count must be a multiple of 5.
```

**Command Default**

None

**Command History**

<table>

<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

We recommend that the access point count be the same for the base-ap-count and wplus-ap-count licenses installed on your controller. If your controller has a base-ap-count license of 100 and you install a wplus-ap-count license of 12, the controller supports up to 100 access points when the base license is in use but only a maximum of 12 access points when the wplus license is in use.

You cannot install a wplus license that has an access point count greater than the controller's base license. For example, you cannot apply a wplus-ap-count 100 license to a controller with an existing base-ap-count 12 license. If you attempt to register for such a license, an error message appears indicating that the license registration has failed. Before upgrading to a wplus-ap-count 100 license, you would first have to upgrade the controller to a base-ap-count 100 or 250 license.

The following example shows how to install a license on the controller from the URL tftp://10.10.10.10/path/license.lic:

(Cisco Controller) > license install tftp://10.10.10.10/path/license.lic
To raise or lower the priority of the base-ap-count or wplus-ap-count evaluation license on a Cisco 5500 Series Controller, use the `license modify priority` command.

```plaintext
license modify priority license_name (high | low)
```

**Syntax Description**
- `license_name` : Ap-count evaluation license.
- `high` : Modifies the priority of an ap-count evaluation license.
- `low` : Modifies the priority of an ap-count evaluation license.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you are considering upgrading to a license with a higher access point count, you can try an evaluation license before upgrading to a permanent version of the license. For example, if you are using a permanent license with a 50 access point count and want to try an evaluation license with a 100 access point count, you can try out the evaluation license for 60 days.

AP-count evaluation licenses are set to low priority by default so that the controller uses the ap-count permanent license. If you want to try an evaluation license with an increased access point count, you must change its priority to high. If you no longer want to have this higher capacity, you can lower the priority of the ap-count evaluation license, which forces the controller to use the permanent license.

**Note**
You can set the priority only for ap-count evaluation licenses. AP-count permanent licenses always have a medium priority, which cannot be configured.

**Note**
If the ap-count evaluation license is a wplus license and the ap-count permanent license is a base license, you must also change the feature set to wplus.

**Note**
To prevent disruptions in operation, the controller does not switch licenses when an evaluation license expires. You must reboot the controller in order to return to a permanent license. Following a reboot, the controller defaults to the same feature set level as the expired evaluation license. If no permanent license at the same feature set level is installed, the controller uses a permanent license at another level or an unexpired evaluation license.

The following example shows how to set the priority of the wplus-ap-count to high:
license modify priority

(Cisco Controller) > license modify priority wplus-ap-count high
license revoke

To rehost a license on a Cisco 5500 Series WLC, use the license revoke command.

```
license revoke  { permission_ticket_url | rehost rehost_ticket_url }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>permission_ticket_url</td>
<td>URL of the TFTP server (tftp://server_ip/path/filename) where you saved the permission ticket.</td>
</tr>
<tr>
<td>rehost</td>
<td>Specifies the rehost license settings.</td>
</tr>
<tr>
<td>rehost_ticket_url</td>
<td>URL of the TFTP server (tftp://server_ip/path/filename) where you saved the rehost ticket.</td>
</tr>
</tbody>
</table>

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you revoke a license, save the device credentials by using the license save credential url command.

You can rehost all permanent licenses except the permanent base image license. Evaluation licenses and the permanent base image license cannot be rehosted.

In order to rehost a license, you must generate credential information from the controller and use it to obtain a permission ticket to revoke the license from the Cisco licensing site, https://tools.cisco.com/SWIFT/LicensingUI/Quickstart. Next, you must obtain a rehost ticket and use it to obtain a license installation file for the controller on which you want to install the license.

For detailed information on rehosting licenses, see the “Installing and Configuring Licenses” section in the Cisco Wireless LAN Controller Configuration Guide.

The following example shows how to revoke the license settings from the saved permission ticket URL tftp://10.10.10.10/path/permit_ticket.lic:

```
(Cisco Controller) > license revoke tftp://10.10.10.10/path/permit_ticket.lic
```

The following example shows how to revoke the license settings from the saved rehost ticket URL tftp://10.10.10.10/path/rehost_ticket.lic:

```
(Cisco Controller) > license revoke rehost tftp://10.10.10.10/path/rehost_ticket.lic
```
### license save

To save a backup copy of all installed licenses or license credentials on the Cisco 5500 Series Controller, use the `license save` command.

```
license save credential url
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>credential</td>
<td>Device credential information.</td>
</tr>
<tr>
<td>url</td>
<td>URL of the TFTP server (tftp://server_ip/path/filename).</td>
</tr>
</tbody>
</table>

| Command Default    | None                               |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

| Usage Guidelines   | Save the device credentials before you revoke the license by using the `license revoke` command. |

The following example shows how to save a backup copy of all installed licenses or license credentials on tftp://10.10.10.10/path/cred.lic:

```
(Cisco Controller) > license save credential tftp://10.10.10.10/path/cred.lic
```
license smart

To register or deregister a device using Cisco Smart Software Licensing platform, use the \texttt{license smart} command.

\begin{verbatim}
license smart \{ register | deregister \} idtoken
\end{verbatim}

\textbf{Syntax Description}

<table>
<thead>
<tr>
<th>register</th>
<th>To add and activate a device on Cisco Smart Software License platform</th>
</tr>
</thead>
<tbody>
<tr>
<td>deregister</td>
<td>To delete a device on Cisco Smart Software License platform</td>

show 802.11 cleanair device type

To display the information of all the interferers device type detected by a specific access point on the 802.11 radio band, use the `show 802.11 cleanair device type` command.

```
show 802.11 { a  |  b  |  h } cleanair device type device_type
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>

<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td>h</td>
<td>Specifies the 802.11h network.</td>
</tr>
</tbody>
</table>

`device_type` Interferer device type for a specified radio band. The device type is one of the following:

- tdd-tx—Tdd-transmitter device information.
- jammer—Jammer device information.
- cont-tx—Continuous-transmitter devices information.
- dect-like—Dect-like phone devices information.
- video—Video devices information.
- 802.11-inv—WiFi inverted devices information.
- 802.11-nonstd—Nonstandard WiFi devices information.
- superag—Superag devices information.
- canopy—Canopy devices information.
- wimax-mobile—WiMax mobile devices information.
- wimax-fixed—WiMax fixed devices information.

show 802.11 extended

To display access point radio extended configurations, use the `show 802.11 extended` command.

```
show 802.11 {a | b} extended
```

**Syntax Description**

- **a**
  -Specifies the 802.11a network.

- **b**
  -Specifies the 802.11b/g network.

- **extended**
  -Displays the 802.11a/b radio extended configurations.

**Command Default**

None

</tr>
</tbody>
</table>

The following example shows how to display radio extended configurations:

```
(Cisco Controller) > show 802.11a extended
Default 802.11a band radio extended configurations:
  beacon period 300, range 60;
  multicast buffer 45, rate 200;
  RX SOP -80; CCA threshold -90;
AP0022.9090..b618 00:24:97:88:99:60
  beacon period 300, range 60; multicast buffer 45, rate 200;
  RX SOP -80; CCA threshold -77
AP0022.9090.bb3e 00:24:97:88:c5:d0
  beacon period 300, range 0; multicast buffer 0, rate 0;
  RX SOP -80; CCA threshold -0
ironRap.ddb9 00:17:df:36:dd:b0
  beacon period 300, range 0; multicast buffer 0, rate 0;
  RX SOP -80; CCA threshold -0

The following example shows how to display radio extended configurations and the Rx SOP threshold:

```
(Cisco Controller) > show 802.11a extended
Default 802.11a band Radio Extended Configurations:
  Beacon period: 100, range: 0 (AUTO);
  RX SOP threshold: -76; CCA threshold: 0 (AUTO);
AP3600-XALE3  34:a8:4e:6a:7b:00
  Beacon period: 100, range: 0 (AUTO);
  Multicast buffer: 0 (AUTO), rate: 0 (AUTO);
```
RX SOP threshold: -76; CCA threshold: 0 (AUTO);
show 802.11 media-stream

To display the multicast-direct configuration state, use the show 802.11 media-stream command.

```
show 802.11 {a | b | h} media-stream media_stream_name
```

<table>
<thead>
<tr>

**show aaa auth**

To display the configuration settings for the AAA authentication server database, use the `show aaa auth` command.

```
show aaa auth
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the configuration settings for the AAA authentication server database:

```
(Cisco Controller) > show aaa auth
Management authentication server order:
  1............................................ local
  2............................................ tacacs
```

**Related Commands**

- `config aaa auth`
- `config aaa auth mgmt`
show acl

To display the access control lists (ACLs) that are configured on the controller, use the `show acl` command.

```
show acl { cpu | detailed acl_name | summary | layer2 { summary | detailed acl_name } }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cpu</td>
<td>Displays the ACLs configured on the Cisco WLC's central processing unit (CPU).</td>
</tr>
<tr>
<td>detailed</td>
<td>Displays detailed information about a specific ACL.</td>
</tr>
<tr>
<td>acl_name</td>
<td>ACL name. The name can be up to 32 alphanumeric characters.</td>
</tr>
<tr>
<td>summary</td>
<td>Displays a summary of all ACLs configured on the controller.</td>
</tr>
<tr>
<td>layer2</td>
<td>Displays the Layer 2 ACLs.</td>
</tr>
</tbody>
</table>

The following example shows how to display the access control lists on the CPU.

```
(Cisco Controller) > show acl cpu

CPU Acl Name.................................
Wireless Traffic............................ Disabled
Wired Traffic............................... Disabled
Applied to NPU.............................. No
```

The following example shows how to display a summary of the access control lists.

```
(Cisco Controller) > show acl summary

ACL Counter Status Disabled
IPv4 ACL Name Applied
------------------------
ac11 Yes
ac12 Yes
ac13 Yes
------------------------
IPv6 ACL Name Applied
```
 acl6 No

The following examples show how to display the detailed information of the access control lists.

(Cisco Controller) > **show acl detailed acl_name**

<table>
<thead>
<tr>
<th>Source</th>
<th>Destination</th>
<th>Source Port</th>
<th>Dest Port</th>
<th>Action</th>
<th>Counter</th>
</tr>
</thead>
<tbody>
<tr>
<td>Any 0.0.0.0/0.0.0.0</td>
<td>0.0.0.0/0.0.0.0</td>
<td>Any 0-65535</td>
<td>0-65535</td>
<td>Deny</td>
<td>0</td>
</tr>
<tr>
<td>In 0.0.0.0/0.0.0.0</td>
<td>200.200.200.0/255.255.255.0</td>
<td>6 80-80</td>
<td>0-65535</td>
<td>Permit</td>
<td>0</td>
</tr>
</tbody>
</table>

DenyCounter : 0

---

**Note**
The Counter field increments each time a packet matches an ACL rule, and the DenyCounter field increments each time a packet does not match any of the rules.

---

**Related Commands**
- clear acl counters
- config acl apply
- config acl counter
- config acl cpu
- config acl create
- config acl delete
- config interface acl
- config acl rule
show acl detailed

To display detailed DNS-based ACL information, use the `show acl detailed` command.

```
show acl detailed acl_name
```

**Syntax Description**

- `acl_name` Name of the access control list.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show acl detailed acl_name` command.

```
(Cisco Controller) > show acl detailed android

No rules are configured for this ACL.
DenyCounter : 0
URLs configured in this ACL
-----------------------------
*.play.google.com
*.store.google.com
```
**show acl url-acl detailed**

To display detailed URL ACL profile information, use the `show acl url-acl detailed` command.

`show acl url-acl detailed acl_name`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>acl_name</th>
<th>Name of the access control list.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the statistics for coverage hole detection:

(Cisco Controller) > show advanced 802.11a coverage

Coverage Hole Detection

802.11a Coverage Hole Detection Mode.......... Enabled
802.11a Coverage Voice Packet Count............... 100 packets
802.11a Coverage Voice Packet Percentage....... 50%
802.11a Coverage Voice RSSI Threshold.......... -80 dBm
802.11a Coverage Data Packet Count............. 50 packets
802.11a Coverage Data Packet Percentage........ 50%
802.11a Coverage Data RSSI Threshold........... -80 dBm
802.11a Global coverage exception level........ 25 %
802.11a Global client minimum exception lev.... 3 clients
show advanced 802.11 group

To display 802.11a or 802.11b Cisco radio RF grouping, use the show advanced 802.11 group command.

show advanced 802.11 {a | b} group

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>

<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display Cisco radio RF group settings:

(Cisco Controller) > show advanced 802.11a group
Radio RF Grouping
  802.11a Group Mode................................. AUTO
  802.11a Group Update Interval..................... 600 seconds
  802.11a Group Leader.............................. xx:xx:xx:xx:xx
  802.11a Group Member.............................. xx:xx:xx:xx:xx
  802.11a Last Run................................. 133 seconds ago
show advanced hyperlocation summary

To view a summary of Cisco Hyperlocation configuration information, use the `show advanced hyperlocation summary` command.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced in Release 8.1.</td>
</tr>
</tbody>
</table>

The following is a sample output:

```
(Cisco Controller) >show advanced hyperlocation summary

Hyperlocation.................................... DOWN
Hyperlocation NTP Server......................... 0.0.0.0
Hyperlocation pak-rssi Threshold................. -100
Hyperlocation pak-rssi Trigger-Threshold........ 10
Hyperlocation pak-rssi Reset-Threshold.......... 8
Hyperlocation pak-rssi Timeout................... 3

AP Name Ethernet MAC Slots Hyperlocation Explicit AP
----------------- ----------------- ----- --------------- ------------------
APA023.9FD8.EA4C 40:ce:24:bf:8f:40 2 DOWN 0
APA023.9FD8.EA50 40:ce:24:bf:8f:80 2 DOWN 0
APA023.9FD8.EA9C 40:ce:24:bf:94:40 2 DOWN 0
AP0C75.BD13.B496 a0:23:9f:8a:5c:00 2 DOWN 0
```
show advanced hyperlocation ble-beacon

To view information about BLE beacons in APs, use the `show advanced hyperlocation ble-beacon` command.

```
show advanced hyperlocation ble-beacon {all | firmware-download summary | beacon-id id | {ap-name ap-name | ap-group group-name}}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Shows details of all BLE beacons.</td>
</tr>
<tr>
<td>firmware-download summary</td>
<td>Lists all APs in BLE firmware download process.</td>

BLE Advertised Transmit Power: c5 (-59 dBm)
show advanced 802.11 l2roam

To display 802.11a or 802.11b/g Layer 2 client roaming information, use the **show advanced 802.11 l2roam** command.

```plaintext
show advanced 802.11 {a | b} l2roam {rf-param | statistics} mac_address
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.
- **b**
  - Specifies the 802.11b/g network.
- **rf-param**
  - Specifies the Layer 2 frequency parameters.
- **statistics**
  - Specifies the Layer 2 client roaming statistics.
- **mac_address**
  - MAC address of the client.

**Command Default**

None

**Command History**

- **Release**  
  - 7.6 This command was introduced in a release earlier than Release 7.6.

**Command History**

- **Release**  
  - 8.3 This command was introduced.

The following is a sample output of the **show advanced 802.11b l2roam rf-param** command:

```
(Cisco Controller) > show advanced 802.11b l2roam rf-param
L2Roam 802.11bg RF Parameters..................
  Config Mode................................ Default
  Minimum RSSI.................................. -85
  Roam Hysteresis.............................. 2
  Scan Threshold.............................. -72
  Transition time............................. 5
```
show advanced 802.11 logging

To display 802.11a or 802.11b RF event and performance logging, use the `show advanced 802.11 logging` command.

```
show advanced 802.11 { a | b } logging
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>b</code></td>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display 802.11b RF event and performance logging:

```
(Cisco Controller) > show advanced 802.11b logging
RF Event and Performance Logging
  Channel Update Logging........................ Off
  Coverage Profile Logging....................... Off
  Foreign Profile Logging........................ Off
  Load Profile Logging........................... Off
  Noise Profile Logging.......................... Off
  Performance Profile Logging................. Off
  TxPower Update Logging....................... Off
```
show advanced 802.11 monitor

To display the 802.11a or 802.11b default Cisco radio monitoring, use the `show advanced 802.11 monitor` command.

```
show advanced 802.11 {a | b} monitor
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the radio monitoring for the 802.11b network:

```
(Cisco Controller) > show advanced 802.11b monitor
Default 802.11b AP monitoring
  802.11b Monitor Mode......................... enable
  802.11b Monitor Channels.................... Country channels
  802.11b RRM Neighbor Discovery Type........ Transparent
  802.11b AP Coverage Interval............... 180 seconds
  802.11b AP Load Interval.................... 60 seconds
  802.11b AP Noise Interval.................. 180 seconds
  802.11b AP Signal Strength Interval........ 60 seconds
```
show advanced 802.11 optimized roaming

To display the optimized roaming configurations for 802.11a/b networks, use the `show advanced 802.11 optimized roaming` command.

```
show advanced 802.11 {a | b} optimized roaming [stats]
```

**Syntax Description**
- `stats` (Optional) Displays optimized roaming statistics for a 802.11a/b network.

**Command Default**
- None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the optimized roaming configurations for an 802.11a network:

```
(Cisco Controller) > show advanced 802.11a optimized roaming
OptimizedRoaming
802.11a OptimizedRoaming Mode.................. Enabled
802.11a OptimizedRoaming Reporting Interval.... 20 seconds
802.11a OptimizedRoaming Rate Threshold........ disabled
```

The following example shows how to display the optimized roaming statistics for an 802.11a network:

```
(Cisco Controller) > show advanced 802.11a optimized roaming stats
OptimizedRoaming Stats
802.11a OptimizedRoaming Disassociations....... 2
802.11a OptimizedRoaming Rejections............ 1
```
**show advanced 802.11 profile**

To display the 802.11a or 802.11b lightweight access point performance profiles, use the `show advanced 802.11 profile` command.

```
show advanced 802.11 {a | b} profile {global | cisco_ap}
```

**Syntax Description**

- **a**
  - Specifies the 802.11a network.
- **b**
  - Specifies the 802.11b/g network.
- **global**
  - Specifies all Cisco lightweight access points.
- **cisco_ap**
  - Name of a specific Cisco lightweight access point.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the global configuration and statistics of an 802.11a profile:

```
(Cisco Controller) > show advanced 802.11 profile global
Default 802.11a AP performance profiles
  802.11a Global Interference threshold.............. 10%
  802.11a Global noise threshold..................... -70 dBm
  802.11a Global RF utilization threshold........... 80% 
  802.11a Global throughput threshold............. 1000000 bps
  802.11a Global clients threshold............... 12 clients
  802.11a Global coverage threshold............... 12 dB
  802.11a Global coverage exception level........ 80%
  802.11a Global client minimum exception lev....... 3 clients
```

The following example shows how to display the configuration and statistics of a specific access point profile:

```
(Cisco Controller) > show advanced 802.11 profile AP1
Cisco AP performance profile not customized
```

This response indicates that the performance profile for this lightweight access point is using the global defaults and has not been individually configured.
show advanced 802.11 receiver

To display the configuration and statistics of the 802.11a or 802.11b receiver, use the `show advanced 802.11 receiver` command.

```
show advanced 802.11 {a | b} receiver
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>

</tbody>
</table>

The following example shows how to display the configuration and statistics of the 802.11a network settings:

```
(Cisco Controller) > show advanced 802.11 receiver
802.11a Receiver Settings
   RxStart : Signal Threshold........................... 15
   RxStart : Signal Lamp Threshold..................... 5
   RxStart : Preamble Power Threshold................... 2
   RxReStart : Signal Jump Status....................... Enabled
   RxReStart : Signal Jump Threshold.................... 10
   TxStomp : Low RSSI Status............................ Enabled
   TxStomp : Low RSSI Threshold.......................... 30
   TxStomp : Wrong BSSID Status........................ Enabled
   TxStomp : Wrong BSSID Data Only Status................ Enabled
   RxAbort : Raw Power Drop Status.................... Disabled
   RxAbort : Raw Power Drop Threshold.................. 10
   RxAbort : Low RSSI Status............................ Disabled
   RxAbort : Low RSSI Threshold........................ 0
   RxAbort : Wrong BSSID Status....................... Disabled
   RxAbort : Wrong BSSID Data Only Status............... Disabled
```
show advanced 802.11 summary

To display the 802.11a or 802.11b Cisco lightweight access point name, channel, and transmit level summary, use the show advanced 802.11 summary command.

```
show advanced 802.11 {a | b} summary
```

**Syntax Description**

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td>b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
</tbody>

</tr>
</tbody>
</table>

The following example shows how to display the configuration and statistics of the 802.11b transmit power cost:

(Cisco Controller) > show advanced 802.11b txpower
Automatic Transmit Power Assignment
  Transmit Power Assignment Mode................. AUTO
  Transmit Power Update Interval............... 600 seconds
  Transmit Power Threshold...................... -65 dBm
  Transmit Power Neighbor Count................. 3 APs
  Transmit Power Update Contribution.......... SN.
  Transmit Power Assignment Leader............ xx:xx:xx:xx:xx:xx
  Last Run.................................... 384 seconds ago
show advanced backup-controller

To display a list of primary and secondary backup WLCs, use the `show advanced backup-controller` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the backup controller information:

```
(Cisco Controller) >
show advanced backup-controller
AP primary Backup Controller .................... controller 10.10.10.10
AP secondary Backup Controller ................. 0.0.0.0
```
show advanced ble summary

To view all APs Bluetooth Low Energy (BLE) summary, use the show advanced ble summary command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.8.120.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the BLE summary:

(Cisco Controller) > show advanced ble summary
show advanced dot11-padding

To display the state of over-the-air frame padding on a wireless LAN controller, use the show advanced dot11-padding command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to view the state of over-the-air frame padding:

(Cisco Controller) > show advanced dot11-padding
dot11-padding................................. Disabled
show advanced hotspot

To display the advanced HotSpot parameters, use the `show advanced hotspot` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the advanced HotSpot parameters:

```
(Cisco Controller) > show advanced hotspot
ANQP 4-way state............................ Disabled
GARP Broadcast state: ....................... Enabled
GAS request rate limit ..................... Disabled
ANQP comeback delay in TUs(TU=1024usec) .... 50
```
show advanced max-1x-sessions

To display the maximum number of simultaneous 802.1X sessions allowed per access point, use the show advanced max-1x-sessions command.

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the maximum 802.1X sessions per access point:

(Cisco Controller) > show advanced max-1x-sessions
Max 802.1x session per AP at a given time........ 0
show advanced probe

To display the number of probes sent to the Cisco WLC per access point per client and the probe interval in milliseconds, use the `show advanced probe` command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the probe settings for the WLAN controller:

```
(Cisco Controller) >show advanced probe
Probe request filtering......................... Enabled
Probes fwd to controller per client per radio.... 12
Probe request rate-limiting interval............. 100 msec
```
show advanced rate

To display whether control path rate limiting is enabled or disabled, use the `show advanced rate` command.

show advanced rate

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the switch control path rate limiting mode:

```
(Cisco Controller) >show advanced rate
Control Path Rate Limiting....................... Disabled
```
show advanced timers

To display the mobility anchor, authentication response, and rogue access point entry timers, use the `show advanced timers` command.

Syntax Description

This command has no arguments or keywords.

The defaults are shown in the “Examples” section.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the system timers setting:

(Cisco Controller) > `show advanced timers`
Authentication Response Timeout (seconds).......... 10
Rogue Entry Timeout (seconds)...................... 1200
AP Heart Beat Timeout (seconds)...................... 30
AP Discovery Timeout (seconds)...................... 10
AP Local mode Fast Heartbeat (seconds)............. disable
AP flexconnect mode Fast Heartbeat (seconds)........ disable
AP Primary Discovery Timeout (seconds)............. 120
show advanced client-handoff

To display the number of automatic client handoffs after retries, use the `show advanced client-handoff` command.

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the client auto handoff mode after excessive retries:

(Cisco Controller) > `show advanced client-handoff`
Client auto handoff after retries........................ 130
show advanced eap

To display Extensible Authentication Protocol (EAP) settings, use the show advanced eap command.

show advanced eap

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the EAP settings:

(Cisco Controller) > show advanced eap
EAP-Identity-Request Timeout (seconds)........... 1
EAP-Identity-Request Max Retries.................. 20
EAP Key-Index for Dynamic WEP..................... 0
EAP Max-Login Ignore Identity Response............ enable
EAP-Request Timeout (seconds)..................... 1
EAP-Request Max Retries.......................... 20
EAPOL-Key Timeout (milliseconds)............... 1000
EAPOL-Key Max Retries............................ 2

**Related Commands**

- config advanced eap
- config advanced timers eap-identity-request-delay
- config advanced timers eap-timeout
show advanced fra

To display Flexible Radio Assignment (FRA) settings, use the `show advanced fra` command.

**show advanced fra**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows the FRA settings when you set service-priority as coverage using the `config advanced fra service-priority coverage` command:

```
(Cisco Controller) > show advanced fra
FRA State................................. Enabled
FRA Sensitivity............................ medium (95%)
FRA Interval.............................. 1 Hour(s)
   Last Run................................ 2890 seconds ago
   Last Run Time.......................... 0 seconds
Service Priority......................... Coverage

AP Name   MAC Address Slot Current Band
COF %   Sensor % Suggested Mode
----------------- ---- --------------

<td>0</td>
<td>None (Static)</td>
<td></td>
</tr>
</tbody>
</table>

**COF**: Coverage Overlap Factor

[]: COF when radio was in 2.4GHz Band
show advanced send-disassoc-on-handoff

To display whether the WLAN controller disassociates clients after a handoff, use the show advanced send-disassoc-on-handoff command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the show advanced send-disassoc-on-handoff command:

(Cisco Controller) > show advanced send-disassoc-on-handoff
Send Disassociate on Handoff....................... Disabled
show advanced sip-preferred-call-no

To display the list of preferred call numbers, use the show advanced sip-preferred-call-no command.

**show advanced sip-preferred-call-no**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>This command has no arguments or keywords.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td>7.6</td>
</tr>
</tbody>
</table>

The following is a sample output of the show advanced sip-preferred-call-no command:

```
(Cisco Controller) > show advanced sip-preferred-call-no
Preferred Call Numbers List
Call Index | Preferred Call No
-----------|-----------------
   1        | 911
   2        | 100
   3        | 101
   4        | 102
   5        | 103
   6        | 104
```
show advanced sip-snooping-ports

To display the port range for call snooping, use the show advanced sip-snooping-ports command.

show advanced sip-snooping-ports

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the show advanced sip-snooping-ports command:

(Cisco Controller) > show advanced sip-snooping-ports
SIP Call Snoop Ports: 1000 - 2000
show arp kernel

To display the kernel Address Resolution Protocol (ARP) cache information, use the **show arp kernel** command.

**show arp kernel**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
</table>
| 7.6     | This command was introduced in a release earlier than Release 7.6.

The following is a sample output of the **show arp kernel** command:

```
(Cisco Controller) > show arp kernel
IP address     HW type Flags   HW address         Mask   Device
192.0.2.1      0x1       0x2   00:1A:6C:2A:09:C2   *      dtl0
192.0.2.8      0x1       0x6   00:1E:E5:E6:DB:56   *      dtl0
```
show arp switch

To display the Cisco wireless LAN controller MAC addresses, IP addresses, and port types, use the **show arp switch** command.

**show arp switch**

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

Frame Request ........................ Disabled
Interval .............................. 60
Iteration ............................. 10
**show ap cdp**

To display the Cisco Discovery Protocol (CDP) information for an access point, use the `show ap cdp` command.

```
show ap cdp { all | ap-name cisco_ap | neighbors { all | ap-name cisco_ap | detail cisco_ap } }
```

**Syntax Description**

- **all**: Displays the CDP status on all access points.
- **ap-name**: Displays the CDP status for a specified access point.
- **cisco_ap**: Specified access point name.
- **neighbors**: Displays neighbors using CDP.
- **detail** : Displays details about a specific access point neighbor using CDP.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

 Allowed Channel List ..............104,108,112,116,132,136,140,
 Allowed Channel List ..............149,153,157,161
```
show ap config

To display the detailed configuration for a lightweight access point, use the `show ap config` command.

```
show ap config 802.11a AP02
```

### Syntax Description

- **802.11a**
  - Specifies the 802.11a or 802.11b/g network.

- **802.11b**
  - Specifies the 802.11b/g network.

- **summary**
  - (Optional) Displays radio summary of all APs

- **cisco_ap**
  - Lightweight access point name.

### Command Default

None

### Command History

show ap dtls-cipher-suite

To display the DTLS show cipher suite information, use the `show ap dtls-cipher-suite` command.

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display DTLS cipher suite information:

```
(Cisco Controller) > show ap dtls-cipher-suite
DTLS Cipher Suite................................. RSA-AES256-SHA
```
show ap ethernet tag

To display the VLAN tagging information of an Ethernet interface, use the `show ap ethernet tag` command.

```
show ap ethernet tag \{ summary | cisco_ap \}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Summary</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays the VLAN tagging information for all access points associated to the controller.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the Cisco lightweight access point. Displays the VLAN tagging information for a specific access point associated to the controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If the access point is unable to route traffic or reach the controller using the specified trunk VLAN, it falls back to the untagged configuration. If the access point joins the controller using this fallback configuration, the controller sends a trap to a trap server such as the WCS, which indicates the failure of the trunk VLAN. In this scenario, the "Failover to untagged" message appears in show command output.

The following example shows how to display the VLAN tagging information for all access points associated to the controller:

```
(Cisco Controller) >show ap ethernet tag summary

AP Name  Vlan Tag Configuration
--------- ----------------------
AP2      7 (Failover to untagged)
charan.AP1140.II  disabled
```
**show ap eventlog**

To display the contents of the event log file for an access point that is joined to the controller, use the `show ap eventlog` command.

`show ap eventlog ap_name`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Event log for the specified access point.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ap_name</strong></td>
<td></td>
</tr>
</tbody>
</table>

| Command Default    | None                                     |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the event log of an access point:

```
(Cisco Controller) > show ap eventlog ciscoAP
AP event log download has been initiated
Waiting for download to complete
AP event log download completed.

```

```
*Feb 13 11:54:17.146: %CAPWAP-3-CLIENTEVENTLOG: AP event log has been cleared from the controller 'admin'
*Mar 1 00:00:39.134: %CDP_PD-4-POWER_OK: Full power - NEGOTIATED inline power source
*Mar 1 00:00:39.211: %LINK-3-UPDOWN: Interface Dot11Radio1, changed state to up
*Mar 1 00:00:39.211: %LINK-3-UPDOWN: Interface Dot11Radio0, changed state to up
*Mar 1 00:00:49.947: %CAPWAP-3-CLIENTEVENTLOG: Did not get vendor specific options from DHCP.
...
```

---

**Cisco Wireless Controller Command Reference, Release 8.8**

1514
show ap flexconnect

To view the details of APs in FlexConnect mode, use the `show ap flexconnect` command.

```
show ap flexconnect module-vlan  ap-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>module-vlan</code></td>
<td>Displays the status of FlexConnect local switching and VLAN ID value</td>
</tr>
<tr>
<td><code>ap-name</code></td>
<td>Cisco AP name</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Release</strong> 8.1 <strong>Modification</strong></td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Release</strong> 8.3 <strong>Modification</strong></td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show ap image

To display the detailed information about the predownloaded image for specified access points, use the `show ap image` command.

```
show ap image {cisco_ap | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of the lightweight access point.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

**Note**

If you have an AP that has the name `all`, it conflicts with the keyword `all` that specifies all access points. In this scenario, the keyword `all` takes precedence over the AP that is named `all`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show ap image status

To view download status on all APs, use the `show ap image status` command.

```
show ap image status
```

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show ap inventory

To display inventory information for an access point, use the `show ap inventory` command.

```
show ap inventory  {ap-name | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-name</td>
<td>Inventory for the specified AP.</td>
<td></td>
</tr>
<tr>
<td>all</td>
<td>Inventory for all the APs.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release</td>
<td>Modification</td>
<td></td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to display the inventory of an access point:

```
(Cisco Controller) >show ap inventory test101
NAME: "test101" , DESCR: "Cisco Wireless Access Point"
PID: AIR-LAP1131AG-A-K9 , VID: V01, SN: FTX1123T2XX
```
show ap join stats detailed

To display all join-related statistics collected for a specific access point, use the **show ap join stats detailed** command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ap_mac</strong></td>
<td>Access point Ethernet MAC address or the MAC address of the 802.11 radio interface.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display join information for a specific access point trying to join the controller:

```
(Cisco Controller) >show ap join stats detailed 00:0b:85:02:0d:20
```

**Discovery phase statistics**
- Discovery requests received....................... 2
- Successful discovery responses sent............... 2

Show Commands

the AP

- Time at which the last join error occurred........... Aug 21 12:50:34:374
show ap join stats summary

To display the last join error detail for a specific access point, use the `show ap join stats summary` command.

```
show ap join stats summary ap_mac
```

**Syntax Description**

| ap_mac | Access point Ethernet MAC address or the MAC address of the 802.11 radio interface. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To obtain the MAC address of the 802.11 radio interface, enter the `show interface` command on the access point.

The following example shows how to display specific join information for an access point:

```
(Cisco Controller) > show ap join stats summary 00:0b:85:02:0d:20
Is the AP currently connected to controller.......................... No
Time at which the AP joined this controller last time............... Aug 21 12:50:36:061
Type of error that occurred last..................................... Lwapp join request rejected
Reason for error that occurred last.................................. RADIUS authorization is pending for the AP
Time at which the last join error occurred........................... Aug 21 12:50:34:374
```
show ap join stats summary all

To display the MAC addresses of all the access points that are joined to the controller or that have tried to join, use the `show ap join stats summary all` command.

```
(Cisco Controller) > show ap join stats summary all
Number of APs: 4

<table>
<thead>
<tr>
<th>Base Mac</th>
<th>AP EthernetMac</th>
<th>AP Name</th>
<th>IP Address</th>
<th>Status</th>
</tr>

</tr>
<tr>
<td>00:21:1b:ea:36:60</td>
<td>00:0c:d4:8a:6b:c1</td>
<td>AP2</td>
<td>10.10.163.214</td>
<td>Not joined</td>
</tr>
</tbody>
</table>
```
**show ap led-state**

To view the LED state of all access points or a specific access point, use the `show ap led-state` command.

```
show ap led-state { all | cisco_ap }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Shows the LED state for all access points.</td>
<td></td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the access point whose LED state is to be shown.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

The AP LED state is enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to get the LED state of all access points:

```
(Cisco Controller) > show ap led-state all
Global LED State: Enabled (default)
```
show ap led-flash

To display the LED flash status of an access point, use the **show ap led-flash** command.

```plaintext
show ap led-flash cisco_ap
```

**Syntax Description**

- `cisco_ap` Enter the name of the Cisco AP.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the LED flash status of an access point:

```plaintext
(Cisco Controller) >show ap led-flash
```
show ap link-encryption

To display the MAC addresses of all the access points that are joined to the controller or that have tried to join, use the `show ap link-encryption` command.

```
show ap link-encryption {all | cisco_ap}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Specifies all access points.</td>
</tr>
<tr>
<td>cisco_ap</td>
<td>Name of the lightweight access point.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the link encryption status of all access points:

```
(Cisco Controller) > show ap link-encryption all
Encryption Dnstream Upstream Last
AP Name State Count Count Update
----------------- ------ -------- -------- -------
1240 Dis 4406 237553 Never
1130 En 2484 276308 19:31
```
show ap max-count summary

To display the maximum number of access points supported by the Cisco WLC, use the `show ap max-count summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show ap max-count summary` command:

```
(Cisco Controller) > show ap max-count
The max number of AP's supported................. 500
```
show ap monitor-mode summary

To display the current channel-optimized monitor mode settings, use the `show ap monitor-mode summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display current channel-optimized monitor mode settings:

```
(Cisco Controller) > show ap monitor-mode summary
AP Name     Ethernet MAC  Status  Scanning Channel List
            ----------------- ------------- ----------------------
AP_004      xx:xx:xx:xx:xx Tracking  1, 6, 11, 4
```
show ap module summary

To view detailed information about the external module, for a specific Cisco AP or for all Cisco APs, use the `show ap module summary` command.

`show ap module summary {ap-name | all}`

**Syntax Description**

- `ap-name` Cisco AP name that has the external module
- `all` All Cisco APs that have the external module

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show ap packet-dump status

To display access point Packet Capture configurations, use the `show ap packet-dump status` command.

**show ap packet-dump status**

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Packet Capture does not work during intercontroller roaming.

The controller does not capture packets created in the radio firmware and sent out of the access point, such as the beacon or probe response. Only packets that flow through the Radio driver in the Tx path are captured.

The following example shows how to display the access point Packet Capture configurations:

```
(Cisco Controller) > show ap packet-dump status
Packet Capture Status............................ Stopped
FTP Server IP Address............................ 0.0.0.0
FTP Server Path..................................
FTP Server Username..............................
FTP Server Password.............................. ********
Buffer Size for Capture.......................... 2048 KB
Packet Capture Time.............................. 45 Minutes
Packet Truncate Length........................... Unspecified
Packet Capture Classifier....................... None
```
show ap prefer-mode stats

To view prefer-mode global and per AP group statistics, use the `show ap prefer-mode stats` command.

**show ap prefer-mode stats**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>stats</td>
<td>Displays prefer-mode global and per AP group statistics</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Release 8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show ap retransmit

To display access point control packet retransmission parameters, use the \texttt{show ap retransmit} command.

\texttt{show ap retransmit \{all \mid cisco\_ap\}}

\begin{itemize}
\item \texttt{all} \quad Specifies all access points.
\item \texttt{cisco\_ap} \quad Name of the access point.
\end{itemize}

\begin{tabular}{|c|c|}
\hline
\textbf{Syntax Description} & \textbf{Command Default} \\
\hline
all & None \\
\hline
cisco\_ap & \textbf{Command History} \\
\hline
\end{tabular}

\begin{tabular}{|c|c|}
\hline
\textbf{Release} & \textbf{Modification} \\
\hline
7.6 & This command was introduced in a release earlier than Release 7.6. \\
\hline
\end{tabular}

\begin{tabular}{|c|c|c|}
\hline
\textbf{Command History} & \textbf{Release} & \textbf{Modification} \\
\hline
& 8.3 & This command was introduced. \\
\hline
\end{tabular}

The following example shows how to display the control packet retransmission parameters of all access points on a network:

(Cisco Controller) >\texttt{show ap retransmit all}

Global control packet retransmit interval: 3 (default)
Global control packet retransmit count: 5 (default)

<table>
<thead>
<tr>
<th>AP Name</th>
<th>Retransmit Interval</th>
<th>Retransmit Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP_004</td>
<td>3 (default)</td>
<td>5 (WLC default), 5 (AP default)</td>
</tr>
</tbody>
</table>
To display the statistics for a Cisco lightweight access point, use the `show ap stats` command.

```
show ap stats { 802.11 { a | b } | wlan | ethernet summary } cisco_ap [ tsm { client_mac | all } ]
```

**Syntax Description**

- **802.11**
  - `a`: Specifies the 802.11a network.
  - `b`: Specifies the 802.11b/g network.

- **wlan**: Specifies WLAN statistics.

- **ethernet**: Specifies AP ethernet interface statistics.

- **summary**: Displays ethernet interface summary of all the connected Cisco access points.

- **cisco_ap**: Name of the lightweight access point.

- **tsm**
  - (Optional) Specifies the traffic stream metrics.

- **client_mac**
  - (Optional) MAC address of the client.

- **all**
  - (Optional) Specifies all access points.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command was modified. The OEAP WMM Counters were added to the output.</td>
</tr>
</tbody>
</table>

The following example shows how to display statistics of an access point for the 802.11b network:

```
(Cisco Controller) > show ap stats 802.11b Ibiza
```

```
Number Of Slots.................................. 2
AP Name.......................................... Ibiza
MAC Address...................................... 44:2b:03:9a:8a:73
Radio Type....................................... RADIO_TYPE_80211a
Stats Information
  Number of Users................................ 0
  TxFragmentCount................................ 84628
  MulticastTxFrameCnt............................ 84628
  FailedCount.................................... 0
```
### Show Commands

show ap summary

To display a summary of all lightweight access points attached to the controller, use the `show ap summary` command.

```
show ap summary [cisco_ap]
```

**Syntax Description**

- `cisco_ap`  
  (Optional) Type sequence of characters that make up the name of a specific AP or a group of APs, or enter a wild character search pattern.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

A list that contains each lightweight access point name, number of slots, manufacturer, MAC address, location, and the controller port number appears. When you specify

The following example shows how to display a summary of all connected access points:

```
(Cisco Controller) > show ap summary
Number of APs................................. 2
Global AP username............................ user
Global AP Dot1x username..................... Not Configured
Number of APs................................. 2
Global AP username............................ user
Global AP Dot1x username..................... Not Configured

<table>
<thead>
<tr>
<th>AP Name</th>
<th>Slots</th>
<th>AP Model</th>
<th>Ethernet MAC</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>US</td>
</tr>
<tr>
<td>Location</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>US</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Access Points using IPv6 transport:</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>AP Name</td>
<td>Slots</td>
<td>AP Model</td>
<td>Ethernet MAC</td>
<td>Location</td>
</tr>
<tr>
<td>---------</td>
<td>-------</td>
<td>----------------</td>
<td>--------------</td>
<td>----------</td>
</tr>
<tr>
<td>AP1040</td>
<td>2</td>
<td>AIR-LAP1042N-A-K9</td>
<td>00:40:96:b9:4b:89</td>
<td>default</td>
</tr>
</tbody>
</table>
```
show ap tcp-mss-adjust

To display the Basic Service Set Identifier (BSSID) value for each WLAN defined on an access point, use the `show ap tcp-mss-adjust` command.

```
show ap tcp-mss-adjust {cisco_ap | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco_ap</code></td>
<td>Specified lightweight access point name.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Specifies all access points.</td>
</tr>
</tbody>
</table>

**Note**

If an AP itself is configured with the keyword `all`, the all access points case takes precedence over the AP that is with the keyword `all`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display Transmission Control Protocol (TCP) maximum segment size (MSS) information of all access points:

```
(Cisco Controller) > show ap tcp-mss-adjust all
AP Name    TCP State MSS Size
----------------- --------- -------
AP-1140     enabled  536
AP-1240     disabled -
AP-1130     disabled -
```
show ap wlan

To display the Basic Service Set Identifier (BSSID) value for each WLAN defined on an access point, use the `show ap wlan` command.

```
show ap wlan 802.11 {a | b} cisco_ap
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>802.11a</th>
<th>Specifies the 802.11a network.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>802.11b</td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td></td>
<td>ap_name</td>
<td>Lightweight access point name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display BSSIDs of an access point for the 802.11b network:

```
(Cisco Controller) >show ap wlan 802.11b AP01
Site Name........................................ MY_AP_GROUP1
Site Description................................. MY_AP_GROUP1
WLAN ID Interface BSSID
------- ----------- --------------------------
1 management 00:1c:0f:81:fc:20
2 dynamic    00:1c:0f:81:fc:21
```
show assisted-roaming

To display assisted roaming and 802.11k configurations, use the `show assisted-roaming` command.

**show assisted-roaming**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display assisted roaming and 802.11k configurations:

(Cisco Controller) > `show assisted-roaming`
Assisted Roaming and 80211k Information:
Floor RSSI Bias.................................. 15 dBm
Maximum Denial................................... 2 counts
Minimum Optimized Neighbor Assigned............. 2 neighbors

Assisted Roaming Performance Chart:
Matching Assigned Neighbor....................... [0] = 0
Matching Assigned Neighbor....................... [1] = 0
Matching Assigned Neighbor....................... [2] = 0
Matching Assigned Neighbor....................... [3] = 0
Matching Assigned Neighbor....................... [5] = 0
Matching Assigned Neighbor....................... [6] = 0
Matching Assigned Neighbor....................... [7] = 0
No Matching Neighbor............................. [8] = 0
No Neighbor Assigned............................. [9] = 0

**Related Commands**

- config assisted-roaming
- config wlan assisted-roaming
- debug 11k
show atf config

To monitor Cisco Airtime Fairness configuration, use the `show atf config` command.

```
show atf config { all | {ap-name ap-name} | {802.11a | b} | policy | wlan }
```

**Syntax Description**

- `all`: Shows Cisco ATF configuration of all radios
- `ap-name`: Shows Cisco ATF configuration of an AP
- `ap-name`: AP name that you must specify
- `802.11a`: Shows Cisco ATF configuration of all 5-GHz radios
- `802.11b`: Shows Cisco ATF configuration of all 2.4-GHz radios
- `policy`: Shows configuration of all airtime policies
- `wlan`: Shows Cisco ATF configuration of all WLANs

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced</td>
</tr>
</tbody>
</table>

This example shows how to monitor Cisco Airtime Fairness configuration:

```
(Cisco Controller) > show atf config all
```
show atf statistics ap

To monitor Cisco Airtime Fairness statistics, use the `show atf statistics` command.

```
show atf statistics ap ap-name 802.11 { a | b } { summary | wlan-id | policy-id }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Shows detailed statistics on all 5-GHz radios.</td>
</tr>
<tr>
<td>802.11b</td>
<td>Shows detailed statistics on all 2.4-GHz radios.</td>
</tr>
<tr>
<td>summary</td>
<td>Shows summary statistics for the AP.</td>
</tr>
<tr>
<td>wlan wlan-id</td>
<td>Shows detailed ATF statistics for the specified WLAN.</td>
</tr>
<tr>
<td>policy policy-name</td>
<td>Shows detailed ATF statistics for the specified policy name.</td>
</tr>
</tbody>
</table>

| Command Default | None |
| Command History | Release   | Modification                              |
|                 | 8.1       | This command was introduced.               |

This example shows how to monitor Cisco Airtime Fairness statistics:

```
(Cisco Controller) > show atf statistics ap Ap01323 802.11a summary
```
show auth-list

To display the access point authorization list, use the `show auth-list` command.

**show auth-list**

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</tr>
</tbody>
</table>

The following example shows how to display the access point authorization list:

```
(Cisco Controller) >show auth-list
Authorize APs against AAA...................... disabled
Allow APs with Self-signed Certificate (SSC)... disabled
Mac Addr Cert Type Key Hash
----------------------- ---------- ------------------------------------------
```

Cisco Wireless Controller Command Reference, Release 8.8
show avc applications

To display all the supported Application Visibility and Control (AVC) applications, use the show avc applications command.

show avc applications

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

AVC uses the Network-Based Application Recognition (NBAR) deep packet inspection technology to classify applications based on the protocol they use. Using AVC, the controller can detect more than 1500 Layer 4 to Layer 7 protocols.

The following is a sample output of the show avc applications command:

(Cisco Controller) > show avc applications

<table>

show avc engine

To display information about the Network-Based Application Recognition 2 (NBAR2) engine, use the `show avc engine` command.

**show avc engine version**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>version</th>
<th>Displays the version of the NBAR2 engine.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>

</tr>
</tbody>
</table>

**Usage Guidelines**

The Application Visibility and Control (AVC) protocol pack is not supported in the Cisco 2500 Series Wireless Controllers.

The following is a sample output of the `show avc engine` command:

(Cisco Controller) > show avc engine version

AVC Engine Version: 13
show avc profile

To display Application Visibility and Control (AVC) profiles, use the `show avc profile` command.

```
show avc profile { summary | detailed profile_name }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays a summary of AVC profiles.</td>
</tr>
<tr>
<td>detailed</td>
<td>Displays the details of an AVC profile.</td>

AVC Protocol Pack Version: 1.0
show avc statistics application

To display the statistics of an application, use the **show avc statistics application** command.

**show avc statistics application application_name top-users [downstream wlan | upstream wlan | wlan] [wlan_id]**

**Syntax Description**

- **application_name**: Name of the application. The application name can be up to 32 case-sensitive, alphanumeric characters.
- **top-users**: Displays AVC statistics for top application users.
- **downstream**: (Optional) Displays statistics of top downstream applications.
- **wlan**: (Optional) Displays AVC statistics of a WLAN.
- **wlan_id**: WLAN identifier from 1 to 512.
- **upstream**: (Optional) Displays statistics of top upstream applications.

**Command Default**

None

**Command History**

- **Release** 7.4
- **Modification** This command was introduced.

The following is a sample output of the **show avc statistics application** command:

(Cisco Controller) > show avc statistics application ftp top-users downstream wlan 1

show avc statistics guest-lan

To display the Application Visibility and Control (AVC) statistics of a guest LAN, use the `show avc statistics guest-lan` command.

```
show avc statistics guest-lan guest-lan_id [ application application_name | top-app-groups [ upstream | downstream ] ] | top-apps [ upstream | downstream ]
```

**Syntax Description**

- **guest-lan_id**: Guest LAN identifier from 1 to 5.
- **application**: Displays AVC statistics for an application.
- **application_name**: Name of the application. The application name can be up to 32 case-sensitive, alphanumeric characters.
- **top-app-groups**: Displays AVC statistics for top application groups.
- **upstream** (Optional): Displays statistics of top upstream applications.
- **downstream** (Optional): Displays statistics of top downstream applications.
- **top-apps**: Displays AVC statistics for top applications.

show avc statistics remote-lan

To display the Application Visibility and Control (AVC) statistics of a remote LAN, use the **show avc statistics remote-lan** command.

**show avc statistics remote-lan** *remote-lan_id* [application *application_name* | top-app-groups [upstream | downstream] | top-apps [upstream | downstream]]

**Syntax Description**

- **remote-lan_id**
  - Displays LAN identifier from 1 to 512.

- **application**
  - Displays AVC statistics for an application.

- **application_name**
  - Name of the application. The application name can be up to 32 case-sensitive, alphanumeric characters.

- **top-app-groups**
  - Displays AVC statistics for top application groups.

- **upstream**
  - (Optional) Displays statistics of top upstream applications.

- **downstream**
  - (Optional) Displays statistics of top downstream applications.

- **top-apps**
  - Displays AVC statistics for top applications.

**Command Default**

None

show boot

To display the primary and backup software build numbers with an indication of which is active, use the `show boot` command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each Cisco wireless LAN controller retains one primary and one backup operating system software load in nonvolatile RAM to allow controllers to boot off the primary load (default) or revert to the backup load when desired.

The following is a sample output of the `show boot` command:

```
(Cisco Controller) > show boot
Primary Boot Image........................... 3.2.13.0 (active)
Backup Boot Image............................ 3.2.15.0
```

**Related Commands**
`config boot`
show band-select

To display band selection information, use the **show band-select** command.

**show band-select**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the **show band-select** command:

(Cisco Controller) > **show band-select**

Band Select Probe Response....................... per WLAN enabling
  Cycle Count................................... 3 cycles
  Cycle Threshold............................... 200 milliseconds
  Age Out Suppression........................... 20 seconds
  Age Out Dual Band............................. 60 seconds
  Client RSSI................................... -80 dBm

**Related Commands**

- config band-select
- config wlan band-select
show buffers

To display buffer information of the controller, use the **show buffers** command.

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

show cac voice summary

To view the list of all APs with brief voice statistics (includes bandwidth used, maximum bandwidth available, and the number of calls information), use the `show cac voice summary` command.

**show cac voice summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>

8.3       | This command was introduced. |

The following is a sample output of the `show cac voice summary` command:

```
(Cisco Controller) > show cac voice summary
                     AP Name   Slot#  Radio  BW Used/Max   Calls
                     -------------- ----- ------ -------------- -----
APc47d.4f3a.3547   0  11b/g  0/23437     0
1  11a   1072/23437  1
```
show cac video stats

To view the detailed video CAC statistics of the 802.11a or 802.11b radio, use the show cac video stats command.

```
show cac video stats {802.11a | 802.11b}
```

### Syntax Description
- `802.11a` Displays detailed video CAC statistics for 802.11a.
- `802.11b` Displays detailed video CAC statistics for 802.11b/g.

### Command History

show call-control ap

The show call-control ap command is applicable only for SIP based calls.

To see the metrics for successful calls or the traps generated for failed calls, use the show call-control ap command.

```
show call-control ap {802.11a | 802.11b} cisco_ap {metrics | traps}
```

### Syntax Description

- **802.11a**: Specifies the 802.11a network.
- **802.11b**: Specifies the 802.11b/g network.
- **cisco_ap**: Cisco access point name.
- **metrics**: Specifies the call metrics information.
- **traps**: Specifies the trap information for call control.

### Command Default

None

### Command History

- **Release 7.6**: This command was introduced in a release earlier than Release 7.6.

### Usage Guidelines

To aid in troubleshooting, the output of this command shows an error code for any failed calls. This table explains the possible error codes for failed calls.

#### Table 12: Error Codes for Failed VoIP Calls

<table>
<thead>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display clients associated to an access point and their SSIDs:

```
(Cisco Controller) > show capwap reap association
```
### show capwap reap status

To display the status of the FlexConnect access point (connected or standalone), use the `show capwap reap status` command.

#### Syntax Description

This command has no arguments or keywords.

#### Command Default

None

#### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

#### Usage Guidelines

The command shows only the VLAN when configured as AP-specific.

The following example shows how to display the status of the FlexConnect access point:

(Cisco Controller) >`show capwap reap status`
To display the status and details of the Cisco Discovery Protocol (CDP), use the `show cdp` command.

```bash
show cdp {neighbors [detail] | entry all | traffic}
```

**Syntax Description**

- **neighbors** (Optional) Displays a list of all CDP neighbors on all interfaces.
- **detail** (Optional) Displays detailed information of the controller’s CDP neighbors. This command shows only the CDP neighbors of the controller; it does not show the CDP neighbors of the controller’s associated access points.
- **entry all** Displays all CDP entries in the database.
- **traffic** Displays CDP traffic information.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show cdp` command:

```bash
(Cisco Controller) > show cdp
CDP counters:
Total packets output: 0, input: 0
Chksum error: 0
No memory: 0, Invalid packet: 0,
```

**Related Commands**

- `config cdp`
- `config ap cdp`
- `show ap cdp`
show certificate compatibility

To display whether or not certificates are verified as compatible in the Cisco wireless LAN controller, use the `show certificate compatibility` command.

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show certificate compatibility` command:

```
(Cisco Controller) > show certificate compatibility
Certificate compatibility mode:................. off
```
show certificate lsc

To verify that the controller has generated a Locally Significant Certificate (LSC), use the **show certificate lsc summary** command.

**show certificate lsc  {summary | ap-provision}**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays a summary of LSC certificate settings and certificates.</td>
<td></td>
</tr>
<tr>
<td>ap-provision</td>
<td>Displays details about the access points that are provisioned using the LSC.</td>
<td></td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the **show certificate lsc summary** command:

```
(Cisco Controller) > show certificate lsc summary
LSC Enabled.................................... Yes
LSC CA-Server.................................... http://10.0.0.1:8080/caserver
LSC AP-Provisioning............................. Yes
Provision-List................................. Not Configured
LSC Revert Count in AP reboots.................. 3
LSC Params:
  Country...................................... 4
  State......................................... ca
  City.......................................... ss
  Orgn.......................................... org
  Dept.......................................... dep
  Email......................................... dep@co.com
  KeySize...................................... 390
LSC Certs:
  CA Cert...................................... Not Configured
  RA Cert...................................... Not Configured
```

This example shows how to display the details about the access points that are provisioned using the LSC:

```
(Cisco Controller) > show certificate lsc ap-provision
LSC AP-Provisioning............................. Yes
Provision-List................................. Present
  Idx Mac Address
  --- -----------
  1 00:18:74:c0:90
```
show certificate ssc

To view the Self Signed Device Certificate (SSC) and hash key of the virtual controller, use the show certificate ssc command.

Syntax Description

This command has no arguments or keywords.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the show certificate ssc command:

(Cisco Controller) > show certificate ssc
SSC Hash validation.............................. Enabled.

SSC Device Certificate details:

Subject Name :
   C=US, ST=California, L=San Jose, O=Cisco Virtual Wireless LAN Controller, 
   CN=DEVICE-vWLC-AIR-CTVM-K9-000C297F2CF7, MAILTO=support@vwlc.com

Validity :
   End : 2022 Jun 1st, 15:47:53 GMT

Hash key : 5870ffabb15de2a617132bafcd73
show certificate summary

To verify that the controller has generated a certificate, use the show certificate summary command.

show certificate summary

Syntax Description
This command has no arguments or keywords.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the show certificate summary command:

(Cisco Controller) > show certificate summary
Web Administration Certificate.................. Locally Generated
Web Authentication Certificate.................. Locally Generated
Certificate compatibility mode:................. off
show client ap

To display the clients on a Cisco lightweight access point, use the `show client ap` command.

```plaintext
show client ap 802.11 {a | b} cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>802.11a</code></td>
<td>Specifies the 802.11a network.</td>
</tr>
<tr>
<td><code>802.11b</code></td>
<td>Specifies the 802.11b/g network.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Cisco lightweight access point name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Usage Guidelines**

The `show client ap` command may list the status of automatically disabled clients. Use the `show exclusionlist` command to view clients on the exclusion list (blacklisted).

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display client information on an access point:

```bash
(Cisco Controller) > show client ap 802.11b AP1
MAC Address  AP Id  Status     WLAN Id  Authenticated
------------- ------ ----------- -------- ---------------
xx:xx:xx:xx:xx:xx 1  Associated 1  No
```
show client calls

To display the total number of active or rejected calls on the controller, use the `show client calls` command.

```
show client calls {active | rejected} {802.11a | 802.11bg | all}
```

**Syntax Description**

- `active` Specifies active calls.
- `rejected` Specifies rejected calls.
- `802.11a` Specifies the 802.11a network.
- `802.11bg` Specifies the 802.11b/g network.
- `all` Specifies both the 802.11a and 802.11b/g network.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show client calls active 802.11a` command:

```
(Cisco Controller) > show client calls active 802.11a
Client MAC  Username  Total Call Duration (sec)  AP Name  Radio Type
----------  -------  ------------  ------------  --------  802.11a
00:09: ef: 02:65:70 abc  45  VJ-1240C-ed45cc  802.11a
00:13: ce: cc: 51:39 xyz  45  AP1130-a416  802.11a
00:40:96: af: 15:15 def  45  AP1130-a416  802.11a
00:40:96:b2:69: df  def  45  AP1130-a416  802.11a
Number of Active Calls ------------------------------------ 4
```
show client ccx client-capability

To display the client’s capability information, use the `show client ccx client-capability` command.

```
show client ccx client-capability client_mac_address
```

**Syntax Description**

- `client_mac_address` MAC address of the client.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the client’s available capabilities, not the current settings for the capabilities.

The following is a sample output of the `show client ccx client-capability` command:

```
(Cisco Controller) > show client ccx client-capability 00:40:96:a8:f7:98
Service Capability.................................. Voice, Streaming(uni-directional)

Are you sure you want to start? (y/N)y Are you sure you want to start? (y/N)
```
show client ccx frame-data

To display the data frames sent from the client for the last test, use the `show client ccx frame-data` command.

`show client ccx frame-data client_mac_address`

**Syntax Description**

<table>
<thead>
<tr>
<th>client_mac_address</th>
<th>MAC address of the client.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

The following is a sample output of the `show client ccx results` command:

```
(Cisco Controller) > show client ccx results xx.xx.xx.xx
dot1x Complete........................................ Success
EAP Method.................................................. *1,Host OS Login Credentials
dot1x Status................................................ 255
```
show client ccx rm

To display Cisco Client eXtension (CCX) client radio management report information, use the show client ccx rm command.

```
show client ccx rm client_MAC {status | {report {chan-load | noise-hist | frame | beacon | pathloss}}}
```

**Syntax Description**

- **client_MAC**: Client MAC address.
- **status**: Displays the client CCX radio management status information.
- **report**: Displays the client CCX radio management report.
- **chan-load**: Displays radio management channel load reports.
- **noise-hist**: Displays radio management noise histogram reports.
- **beacon**: Displays radio management beacon load reports.
- **frame**: Displays radio management frame reports.
- **pathloss**: Displays radio management path loss reports.

**Command Default**

None

The following example shows how to display the location calibration summary information:

```
(Cisco Controller) > show client location-calibration summary
MAC Address Interval
-----------------------
10:10:10:10:10:10       60
```
show client roam-history

To display the roaming history of a specified client, use the `show client roam-history` command.

```
show client roam-history mac_address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>mac_address</code></td>
<td>Client MAC address.</td>
</tr>
</tbody>
</table>

**Command Default**

```
None
```

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show client roam-history` command:

```
(Cisco Controller) > show client roam-history 00:14:6c:0a:57:77
```
show client summary

To display a summary of clients associated with a Cisco lightweight access point, use the `show client summary` command.

`show client summary [ssid / ip / username / devicetype]`

**Syntax Description**
This command has no arguments or keywords up to Release 7.4.

```
ssid / ip / username / devicetype
```

(Optional) Displays active clients selective details on any of the following parameters or all the parameters in any order:

- SSID
- IP address
- Username
- Device type (such as Samsung-Device or WindowsXP-Workstation)

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use `show client ap` command to list the status of automatically disabled clients. Use the `show exclusionlist` command to display clients on the exclusion list (blacklisted).

The following example shows how to display a summary of the active clients:

```
(Cisco Controller) > show client summary
Number of Clients................................ 24
Number of PMIPv6 Clients.......................... 200
MAC Address       AP Name       Status       WLAN/GLAN/RLAN Auth Protocol Port
Wired  PMIPv6
----------------- ----------------- -------------- ---- ---------------- ----
----- ------
00:00:15:01:00:01 NMSP-TalwarSIM1-2 Associated 1 Yes 802.11a 13
No    Yes
00:00:15:01:00:02 NMSP-TalwarSIM1-2 Associated 1 Yes 802.11a 13
No No
00:00:15:01:00:03 NMSP-TalwarSIM1-2 Associated 1 Yes 802.11a 13
No Yes
00:00:15:01:00:04 NMSP-TalwarSIM1-2 Associated 1 Yes 802.11a 13
No No
```
The following example shows how to display all clients that are WindowsXP-Workstation device type:

(Cisco Controller) >show client summary WindowsXP-Workstation
Number of Clients in WLAN......................... 0

MAC Address  AP Name  Status  Auth Protocol  Port Wired Mobility Role
----------------- -------- ------------- ---------------- ---------- --------------

Number of Clients with requested device type..... 0
show client summary guest-lan

To display the active wired guest LAN clients, use the `show client summary guest-lan` command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show client summary guest-lan` command:

```
(Cisco Controller) > show client summary guest-lan
Number of Clients......................... 1
MAC Address  AP Name  Status     WLAN  Auth  Protocol  Port Wired
-----------  --------  --------   ----  ----  --------   ---- -----
00:16:36:40:ac:58  N/A      Associated     1   No    802.3        1   Yes
```

**Related Commands**
`show client summary`
show client tsm

To display the client traffic stream metrics (TSM) statistics, use the show client tsm command.

```
show client tsm 802.11 {a | b} client_mac {ap_mac | all}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>802.11a</td>
<td>Specifies the 802.11a network.</td>

```
show client voice-diag

To display voice diagnostics statistics, use the show client voice-diag command.

show client voice-diag { quos-map | roam-history | rssi | status | tspec }

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>quos-map</td>
<td>Displays information about the QoS/DSCP mapping and packet statistics in each of the four queues: VO, VI, BE, BK. The different DSCP values are also displayed.</td>
</tr>
<tr>
<td>roam-history</td>
<td>Displays information about history of the last three roamings. The output contains the timestamp, access point associated with the roaming, the roaming reason, and if there is a roaming failure, the reason for the roaming failure.</td>
</tr>
<tr>
<td>rssi</td>
<td>Displays the client’s RSSI values in the last 5 seconds when voice diagnostics are enabled.</td>
</tr>
<tr>
<td>status</td>
<td>Displays the status of voice diagnostics for clients.</td>
</tr>
<tr>
<td>tspec</td>
<td>Displays TSPEC for the voice diagnostic for clients.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>
show cts summary

To view CTS summary, use the `show cts summary` command.

**show cts summary**

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command History</td>
<td></td>
</tr>
<tr>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

(Cisco Controller) > `show cts summary`

<table>
<thead>
<tr>
<th>CTS Status</th>
<th>Enabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>CTS Device Identity</td>
<td>Not Configured</td>
</tr>
<tr>
<td>Inline Tag Status</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
show cts sxp

To view CTS SXP information, use the show cts sxp command.

```
show cts sxp { ap { connections | summary } cisco-ap } | connections | summary
```

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
show coredump summary

To display a summary of the controller’s core dump file, use the **show coredump summary** command.

**show coredump summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the **show coredump summary** command:

```
(Cisco Controller) > show coredump summary
Core Dump is enabled
FTP Server IP.................................... 10.10.10.17
FTP Filename..................................... file1
FTP Username..................................... ftpuser
FTP Password.................................. *********
```

**Related Commands**

- `config coredump`
- `config coredump ftp`
- `config coredump username`
**show country**

To display the configured country and the radio types that are supported, use the `show country` command.

```
show country
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the configured countries and supported radio types:

```
(Cisco Controller) >show country
Configured Country.......................... United States
Configured Country Codes
US - United States........................... 802.11a / 802.11b / 802.11g
```
show country channels

To display the radio channels supported in the configured country, use the show country channels command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the auto-RF channels for the configured countries:

```
(Cisco Controller) >show country channels
Configured Country............................. United States
  KEY: * = Channel is legal in this country and may be configured manually.
Configured Country............................. United States
  KEY: * = Channel is legal in this country and may be configured manually.
  A = Channel is the Auto-RF default in this country.
  . = Channel is not legal in this country.
  C = Channel has been configured for use by Auto-RF.
  x = Channel is available to be configured for use by Auto-RF.

  802.11BG :
  Channels : 1 1 1 1 1
            : 1 2 3 4 5 6 7 8 9 0 1 2 3 4

show cpu

To display current WLAN controller CPU usage information, use the `show cpu` command.

```
show cpu
```

**Syntax Description**

This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show cpu` command:

```
(Cisco Controller) > show cpu
Current CPU load: 2.50%
```

show custom-web

To display all the web authentication customization information, use the `show custom-web` command.

```
show custom-web all remote-lan guest-lan sleep-client webauth-bundle wlan
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Display all Web-Auth customization information.</td>
</tr>
<tr>
<td>remote-lan</td>
<td>Display per WLAN Web-Auth customization information.</td>
</tr>
<tr>
<td>guest-lan</td>
<td>Display per Guest LAN Web-Auth customization information.</td>
</tr>
<tr>
<td>sleep-client</td>
<td>Display all Web-Auth Sleeping Client entries summary.</td>
</tr>
<tr>
<td>webauth-bundle</td>
<td>Display the content of Web-Auth Bundle.</td>
</tr>
<tr>
<td>wlan</td>
<td>Display per WLAN Web-Auth customization information.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in the release earlier than 7.6.</td>
</tr>
<tr>
<td>8.2</td>
<td>This command was modified and the all, remote-lan, guest-lan, sleep-client, webauth-bundle, and wlan keywords are added.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show custom-web all` command:

```
(Cisco Controller) > show custom-web all
Radius Authentication Method..................... PAP
Cisco Logo....................................... Enabled
CustomLogo....................................... None
Custom Title..................................... None
Custom Message................................... None
Custom Redirect URL.............................. None
Web Authentication Type.......................... Internal Default
Logout-popup..................................... Enabled
External Web Authentication URL................. None
```
show database summary

To display the maximum number of entries in the database, use the `show database summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show database summary` command:

(Cisco Controller) > `show database summary`
Maximum Database Entries......................... 2048
Maximum Database Entries On Next Reboot.......... 2048
Database Contents
  MAC Filter Entries......................... 2
  Exclusion List Entries............... 0
  AP Authorization List Entries.......... 1
  Management Users......................... 1
  Local Network Users..................... 1
  Local Users................................ 1
  Guest Users............................ 0
  Total.................................... 5

**Related Commands**

`config database size`
show dhcp

To display the internal Dynamic Host Configuration Protocol (DHCP) server configuration, use the `show dhcp` command.

```
show dhcp { leases | summary | scope }
```

**Syntax Description**
- **leases**  
  Displays allocated DHCP leases.
  
- **summary**  
  Displays DHCP summary information.
  
- **scope**  
  Name of a scope to display the DHCP information for that scope.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the allocated DHCP leases:

```
(Cisco Controller) > show dhcp leases
No leases allocated.
```

The following example shows how to display the DHCP summary information:

```
(Cisco Controller) > show dhcp summary
Scope Name     Enabled Address Range
003            No  0.0.0.0 -> 0.0.0.0
```

The following example shows how to display the DHCP information for the scope 003:

```
(Cisco Controller) > show dhcp 003
Enabled................................. No
Lease Time.............................. 0
Pool Start................................ 0.0.0.0
Pool End................................. 0.0.0.0
Network.................................. 0.0.0.0
Netmask______________________________ 0.0.0.0
Default Routers_______________________ 0.0.0.0 0.0.0.0 0.0.0.0
DNS Domain___________________________
DNS______________________________ 0.0.0.0 0.0.0.0 0.0.0.0
Netbios Name Servers________________ 0.0.0.0 0.0.0.0 0.0.0.0
```
show dhcp proxy

To display the status of DHCP proxy handling, use the `show dhcp proxy` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the status of DHCP proxy information:

```
(Cisco Controller) > show dhcp proxy

DHCP Proxy Behavior: enabled
```
show dhcp timeout

To display the DHCP timeout value, use the show dhcp timeout command.

show dhcp timeout

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the DHCP timeout value:

(Cisco Controller) >show dhcp timeout

DHCP Timeout (seconds)................. 10
show dtls connections

To display the Datagram Transport Layer Security (DTLS) server status, use the **show dtls connections** command.

**show dtls connections**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3       This command was introduced.

The following is a sample output of the **show dtls connections** command.

```
Device > show dtls connections

<table>
<thead>
<tr>
<th>AP Name</th>
<th>Local Port</th>
<th>Peer IP</th>
<th>Peer Port</th>
<th>Ciphersuite</th>
</tr>
</thead>
<tbody>
<tr>
<td>1130 Capwap_Ctrl</td>
<td>1.100.163.210</td>
<td>23678</td>
<td>TLS_RSA_WITH_AES_128_CBC_SHA</td>
<td></td>
</tr>
<tr>
<td>1130 Capwap_Data</td>
<td>1.100.163.210</td>
<td>23678</td>
<td>TLS_RSA_WITH_AES_128_CBC_SHA</td>
<td></td>
</tr>
<tr>
<td>1240 Capwap_Ctrl</td>
<td>1.100.163.209</td>
<td>59674</td>
<td>TLS_RSA_WITH_AES_128_CBC_SHA</td>
<td></td>
</tr>
</tbody>
</table>
```
show exclusionlist

To display a summary of all clients on the manual exclusion list (blacklisted) from associating with this Cisco wireless LAN controller, use the `show exclusionlist` command.

**show exclusionlist**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays all manually excluded MAC addresses.

The following example shows how to display the exclusion list:

```
(Cisco Controller) > show exclusionlist
No manually disabled clients.
Dynamically Disabled Clients

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Exclusion Reason</th>
<th>Time Remaining (in secs)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:40:96:b4:82:55</td>
<td>802.1X Failure</td>
<td>51</td>
</tr>
</tbody>
</table>
```

**Related Commands**

`config exclusionlist`
show fabric summary

To check the status of fabric, MAP server ip details, VNID mappings and timers, use the show fabric summary command.

show fabric summary

Syntax Description
This command has no keywords or arguments.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Example
The following example shows how to view the fabric status, MAP server ip details, VNID mappings, and timers:

(Controller) >show fabric summary

Fabric Support.......................... enabled

Enterprise Control Plane MS config
--------------------------------------

show fabric summary
show flexconnect acl detailed

To display a detailed summary of FlexConnect access control lists, use the `show flexconnect acl detailed` command.

```
show flexconnect acl detailed acl-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>acl-name</th>
<th>Name of the access control list.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the FlexConnect detailed ACLs:

```
(Cisco Controller) > show flexconnect acl detailed acl-2
```
show flexconnect acl summary

To display a summary of all access control lists on FlexConnect access points, use the show flexconnect acl summary command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

```
# show flexconnect group detail

To display details of a FlexConnect group, use the `show flexconnect group detail` command.

```
show flexconnect group detail {group_name | default-flex-group} [module-vlan | aps]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group_name</code></td>
<td>Name of the FlexConnect group.</td>
</tr>
<tr>
<td><code>module-vlan</code></td>
<td>Displays status of the FlexConnect local switching and VLAN ID in the group</td>
</tr>
<tr>
<td><code>aps</code></td>
<td>Displays list of APs that are part of the FlexConnect group</td>
</tr>
<tr>
<td><code>default-flex-group</code></td>
<td>Displays configuration of the default-flexgroup and the APs that are part of it.</td>
</tr>
</tbody>
</table>

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.1</td>
<td>The <code>module-vlan</code> and <code>aps</code> parameters were added.</td>
</tr>
<tr>
<td>8.3</td>
<td>The <code>default-flex-group</code> option was added.</td>
</tr>
</tbody>
</table>

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the detailed information for a specific FlexConnect group:

```
(Cisco Controller) > show flexconnect group detail myflexgroup
Number of Ap’s in Group: 1
00:0a:b8:3b:0b:c2 AP1200 Joined
Group Radius Auth Servers:
  Primary Server Index ..................... Disabled
  Secondary Server Index ................... Disabled
```
show flexconnect group summary

To display the current list of FlexConnect groups, use the `show flexconnect group summary` command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the current list of FlexConnect groups:

```
(Cisco Controller) > show flexconnect group summary
flexconnect Group Summary:  Count 1
Group Name  # APs
Group 1     1
```
**show flexconnect office-extend**

To view information about OfficeExtend access points that in FlexConnect mode, use the `show flexconnect office-extend` command.

```
show flexconnect office-extend {summary | latency}
```

**Syntax Description**

- **summary**: Displays a list of all OfficeExtend access points.
- **latency**: Displays the link delay for OfficeExtend access points.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display information about the list of FlexConnect OfficeExtend access points:

```
(Cisco Controller) > show flexconnect office-extend summary
Summary of OfficeExtend AP
AP Name Ethernet MAC Encryption Join-Mode Join-Time
----------------- ----------------- ---------- ----------- ----------
```

The following example shows how to display the FlexConnect OfficeExtend access point’s link delay:

```
(Cisco Controller) > show flexconnect office-extend latency
Summary of OfficeExtend AP link latency
AP Name Status Current Maximum Minimum
----------------------------------------------
AP1130 Enabled 15 ms 45 ms 12 ms
AP1140 Enabled 14 ms 179 ms 12 ms
```
show flow exporter

To display the details or the statistics of the flow exporter, use the `show flow exporter` command.

```
show flow exporter { summary | statistics }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays a summary of the flow exporter.</td>
</tr>
<tr>
<td>statistics</td>
<td>Displays the statistics of flow exporters such as the number of records sent, or the time when the last record was sent.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show flow exporter summary` command:

```
(Cisco Controller) > show flow exporter summary
Exporter-Name  Exporter-IP   Port
--------------  ----------   ----
explo1          9.9.120.115  800
```
show flow monitor summary

To display the details of the NetFlow monitor, use the `show flow monitor summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Netflow record monitoring and export are used for integration with an NMS or any Netflow analysis tool.

The following is a sample output of the `show flow monitor summary`:

```
(Cisco Controller) > show flow monitor summary
Monitor-Name        Exporter-Name   Exporter-IP   Port   Record Name
-------------------- ------------------ -------------- ----- ---------------
mon1                expo1            9.9.120.115    800    ipv4_client_app_flow_record
```
show guest-lan

To display the configuration of a specific wired guest LAN, use the `show guest-lan` command.

```
show guest-lan guest_lan_id
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>guest_lan_id</td>
<td>ID of the selected wired guest LAN.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To display all wired guest LANs configured on the controller, use the `show guest-lan summary` command.

The following is a sample output of the `show guest-lan guest_lan_id` command:

```
(Cisco Controller) > show guest-lan 2
Guest LAN Identifier........................... 1
Profile Name.................................... guestlan
Network Name (SSID)............................ guestlan
Status......................................... Enabled
AAA Policy Override............................ Disabled
Number of Active Clients....................... 1
Exclusionlist Timeout......................... 60 seconds
Session Timeout................................ Infinity
Interface...................................... wired
Ingress Interface.............................. wired-guest
WLAN ACL...................................... unconfigured
DHCP Server.................................... 10.20.236.90
DHCP Address Assignment Required.............. Disabled
Quality of Service............................. Silver (best effort)
Security
  Web Based Authentication.................... Enabled
  ACL.......................................... Unconfigured
  Web-Passthrough............................ Disabled
  Conditional Web Redirect.................... Disabled
  Auto Anchor................................. Disabled
Mobility Anchor List
GLAN ID IP Address Status
```
show icons summary

To display a summary of the icons present in the flash memory of the system, use the show icons summary command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

**Release**  **Modification**

8.2  This command was introduced.

8.3  This command was introduced.

The following is sample output from the show icons summary command::

Cisco Controller > show icons summary

Icon files (downloaded) in Flash memory

<table>
<thead>
<tr>
<th>No.</th>
<th>Filename</th>
<th>Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>dhk_icon.png</td>
<td>120694</td>
</tr>
<tr>
<td>2.</td>
<td>myIconCopy1.png</td>
<td>120694</td>
</tr>
<tr>
<td>3.</td>
<td>myIconCopy2.png</td>
<td>120694</td>
</tr>
</tbody>
</table>
**show ike**

To display active Internet Key Exchange (IKE) security associations (SAs), use the `show ike` command.

```
show ike  {brief | detailed}  IP_or_MAC_address
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>Displays a brief summary of all active IKE SAs.</td>
</tr>
<tr>
<td>detailed</td>
<td>Displays a detailed summary of all active IKE SAs.</td>
</tr>
<tr>
<td>IP_or_MAC_address</td>
<td>IP or MAC address of active IKE SA.</td>
</tr>
</tbody>
</table>

| Command Default | None |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the active Internet Key Exchange security associations:

```
(Cisco Controller) > show ike brief 209.165.200.254
```
show interface summary

To display summary details of the system interfaces, use the `show interface summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command was updated and displays IPv6 related details</td>
</tr>
</tbody>
</table>

The following example displays the summary of the local IPv4 interfaces:

(Cisco Controller) > `show interface summary`

```
Number of Interfaces..................... 6

<table>
<thead>
<tr>
<th>Interface Name</th>
<th>Port</th>
<th>Vlan Id</th>
<th>IP Address</th>
<th>Type</th>
<th>Ap Mgr</th>

</tr>
</tbody>
</table>
```

Cisco Wireless Controller Command Reference, Release 8.8
show interface detailed

To display details of the system interfaces, use the **show interface** command.

```plaintext
show interface detailed {interface_name | management | redundancy-management | redundancy-port | service-port | virtual}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detailed</td>
<td>Displays detailed interface information.</td>
</tr>
<tr>
<td>interface_name</td>
<td>Interface name for detailed display.</td>

Some WLAN controllers may have only one physical port listed because they have only one physical port.

The following example shows how to display the detailed redundancy management interface information:

```
(Cisco Controller) > show interface detailed redundancy-management
Interface Name................................... redundancy-management
MAC Address...................................... 88:43:e1:7e:0b:20
IP Address....................................... 209.165.201.2
```

The following example shows how to display the detailed redundancy port information:

```
(Cisco Controller) > show interface detailed redundancy-port
Interface Name................................... redundancy-port
MAC Address...................................... 88:43:e1:7e:0b:22
IP Address....................................... 169.254.120.5
```

The following example shows how to display the detailed service port information:

```
(Cisco Controller) > show interface detailed service-port
Interface Name................................... redundancy-port
MAC Address...................................... 88:43:e1:7e:0b:22
IP Address....................................... 169.254.120.5
```

The following example shows how to display the detailed virtual gateway interface information:

```
(Cisco Controller) > show interface detailed virtual
Interface Name................................... virtual
MAC Address...................................... 88:43:e1:7e:0b:20
IP Address....................................... 192.0.2.1
```
Virtual DNS Host Name.............................. Disabled
AP Manager.............................................. No
Guest Interface........................................ No
show interface group

To display details of system interface groups, use the `show interface group` command.

```
show interface group { summary | detailed interface_group_name }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>summary</code></td>
<td>Displays a summary of the local interface groups.</td>
</tr>
<tr>
<td><code>detailed</code></td>
<td>Displays detailed interface group information.</td>
</tr>
<tr>
<td><code>interface_group_name</code></td>
<td>Interface group name for a detailed display.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of local interface groups:

```
(Cisco Controller) > show interface group summary
Interface Group Name Total Interfaces Total WLANs Total AP Groups Quarantine
--------------------------------------------- ------------- ---------- ---------- ------
mygroup1                                             1             0          0        1     No
mygroup2                                             1             0          0        1     No
mygroup3                                             5             1          0        1     No
```

The following example shows how to display the detailed interface group information:

```
(Cisco Controller) > show interface group detailed mygroup1
Interface Group Name........................................... mygroup1
Quarantine ...................................................... No
Number of Wlans using the Interface Group............. 0
Number of AP Groups using the Interface Group...... 0

mDNS Profile Name............................................. NCS12Prof
Interface Group Description.............................. My Interface Group
Next interface for allocation to client.............. testabc
Interfaces Contained in this group..................... testabc
Interface marked with * indicates DHCP dirty interface
Interface list sorted based on vlan:

Index Vlan Interface Name
----- ---- ------------------
```
show interface group

0  42  testabc
show invalid-config

To see any ignored commands or invalid configuration values in an edited configuration file, use the `show invalid-config` command.

`show invalid-config`

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can enter this command only before the `clear config` or `save config` command.

The following is a sample output of the `show invalid-config` command:

```
(Cisco Controller) > show invalid-config
config wlan peer-blocking drop 3
config wlan dhcp_server 3 192.168.0.44 required
```
show inventory

To display a physical inventory of the Cisco wireless LAN controller, use the `show inventory` command.

**show inventory**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Some wireless LAN controllers may have no crypto accelerator (VPN termination module) or power supplies listed because they have no provisions for VPN termination modules or power supplies.

The following is a sample output of the `show inventory` command:

```
(Cisco Controller) > show inventory
Burned-in MAC Address............................ 50:3D:E5:1A:31:A0
Power Supply 1................................... Present, OK
Power Supply 2................................... Absent
Maximum number of APs supported.................. 500
NAME: "Chassis" , DESCR: "Cisco 5500 Series Wireless LAN Controller"
PID: AIR-CT5508-K9, VID: V01, SN: XXXXXXXXXXX
```
show IPsec

To display active Internet Protocol Security (IPsec) security associations (SAs), use the `show IPsec` command.

```
show IPsec {brief | detailed} IP_or_MAC_address
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brief</td>
<td>Displays a brief summary of active IPsec SAs.</td>
</tr>
<tr>
<td>detailed</td>
<td>Displays a detailed summary of active IPsec SAs.</td>
</tr>
<tr>
<td>IP_or_MAC_address</td>
<td>IP address or MAC address of a device.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display brief information about the active Internet Protocol Security (IPsec) security associations (SAs):

```
(Cisco Controller) > show IPsec brief 209.165.200.254
```

show ipv6 acl

To display the IPv6 access control lists (ACLs) that are configured on the controller, use the `show ipv6 acl` command.

`show ipv6 acl detailed {acl_name | summary}`

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>acl_name</code></td>
<td>IPv6 ACL name. The name can be up to 32 alphanumeric characters.</td>
</tr>
<tr>

```
show guest-lan

To display the configuration of a specific wired guest LAN, use the show guest-lan command.

show guest-lan guest_lan_id

Syntax Description

| guest_lan_id | ID of the selected wired guest LAN. |

Command Default

None

Command History

Release       Modification
7.6           This command was introduced in a release earlier than Release 7.6.

8.3           This command was introduced.

Usage Guidelines

To display all wired guest LANs configured on the controller, use the show guest-lan summary command.

The following is a sample output of the show guest-lan guest_lan_id command:

(Cisco Controller) >show guest-lan 2
Guest LAN Identifier.......................... 1
Profile Name................................... guestlan
Network Name (SSID)............................ guestlan

</tr>
</tbody>
</table>

The following is sample output from the `show icons file-info` command:

```
ICON File Info:
No.     Filename         Type  Lang  Width  Height
------  ------------------ ------ ----- ------ ------
1       dhk_icon.png    png    eng    200    300
2       myIconCopy2.png png    eng    222    333
3       myIconCopy1.png png    eng    555    444
```
show ipv6 acl

To display the IPv6 access control lists (ACLs) that are configured on the controller, use the show ipv6 acl command.

show ipv6 acl detailed {acl_name | summary}

Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>acl_name</th>
<th>detailed</th>
</tr>
</thead>
<tbody>
<tr>
<td>IPv6ACLname. The name can be up to 32 alphanumeric characters.</td>
<td>Displays detailed information about a specific ACL.</td>
<td></td>
</tr>
</tbody>
</table>

Command Default None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the detailed information of the access control lists:

(Cisco Controller) > show ipv6 acl detailed acl6
Rule Index............................... 1
Direction................................ Any
IPv6 source prefix....................... ::/0
IPv6 destination prefix............... ::/0
Protocol................................ Any
Source Port Range......................... 0-65535
Destination Port Range............... 0-65535
DSCP..................................... Any
Flow label................................ 0
Action.................................. Permit
Counter.................................. 0
Deny Counter............................. 0
show ipv6 acl cpu

To display the IPv6 ACL CPU details, use the **show ipv6 acl cpu** command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports IPv6 address format.</td>
</tr>
</tbody>
</table>

The following is a sample output of the **show ipv6 acl cpu** command:

```
(Cisco Controller) > show ipv6 acl cpu
CPU Acl Name................................ NOT CONFIGURED
Wireless Traffic............................ Disabled
Wired Traffic............................... Disabled
```

---

**Cisco Wireless Controller Command Reference, Release 8.8**
show ipv6 acl detailed

To display the IPv6 ACL details, use the `show ipv6 acl detailed` command.

**show ipv6 acl detailed**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports IPv6 address format.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show ipv6 acl detailed TestACL` command:

(Cisco Controller) > show ipv6 acl detailed ddd

```
Rule Index....................................... 1
Direction........................................ Any
IPv6 source prefix............................... 2001:9:5:90::115/128
IPv6 destination prefix.......................... ::/0
Protocol......................................... 6

IPv6 destination prefix.......................... 2001:9:5:90::115/128
Protocol......................................... 6
Source Port Range................................ 0-65535
Destination Port Range........................... 0-65535
DSCP............................................. Any
Action.......................................... Permit
Counter.......................................... 0
```
show ipv6 neighbor-binding

To display the IPv6 neighbor binding data that are configured on the controller, use the `show ipv6 neighbor-binding` command.

```
show ipv6 neighbor-binding { capture-policy | counters | detailed { mac mac_address | port port_number | vlan vlan_id } | features | policies | ra-throttle { statistics vlan_id | routers vlan_id } | summary }
```

**Syntax Description**

- `capture-policy`: Displays IPv6 next-hop message capture policies.
- `counters`: Displays IPv6 next-hop counters (Bridging mode only).
- `detailed`: Displays the IPv6 neighbor binding table.
- `mac`: Displays the IPv6 binding table entries for a specific MAC address.
- `mac_address`: Displays the IPv6 binding table entries for a specific MAC address.
- `port`: Displays the IPv6 binding table entries for a specific port.
- `port_number`: Port Number. You can enter ap for an access point or LAG for a LAG port.
- `vlan`: Displays the IPv6 neighbor binding table entries for a specific VLAN.
- `vlan_id`: VLAN identifier.
- `features`: Displays IPv6 next-hop registered features.
- `policies`: Displays IPv6 next-hop policies.
- `ra-throttle`: Displays RA throttle information.
- `statistics`: Displays RA throttle statistics.
- `routers`: Displays RA throttle routers.
- `summary`: Displays the IPv6 neighbor binding table.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
Usage Guidelines

DHCPv6 counters are applicable only for IPv6 bridging mode.

The following is the output of the `show ipv6 neighbor-binding summary` command:

```
(Cisco Controller) >show ipv6 neighbor-binding summary
Binding Table has 6 entries, 5 dynamic
Codes: L - Local, S - Static, ND - Neighbor Discovery, DH - DDCP
Preflevel flags (prlvl):
  0001:MAC and LLA match 0002:Orig trunk 0004:Orig access
  0008:Orig trusted access 0010:Orig trusted trunk 0020:DHCP assigned
  0040:Cga authenticated 0080:Cert authenticated 0100:Statically assigned
IPv6 address     MAC Address   Port VLAN Type   prlvl age     state    Time left
------------------------------------------------------------------------------
ND fe80::216:46ff:fe43:eb01 00:16:46:eb:01 1 980 wired 0005
  2 REACHABLE 157
ND fe80::9cf9:b009:b1b4:1ed9 70:f1:a1:dd:cb:d4 AP 980 wireless 0005
  2 REACHABLE 157
ND fe80::6233:4bff:fe05:25ef 60:33:4b:05:25:ef AP 980 wireless 0005
  2 REACHABLE 203
ND fe80::250:56ff:fe8b:4a8f 00:50:56:8b:4a:8f AP 980 wireless 0005
  2 REACHABLE 157
  5 REACHABLE 157
S 2001:410:0:1::9 00:00:00:00:00:08 AP 980 wireless 0100
  1 REACHABLE 205
```

The following is the output of the `show ipv6 neighbor-binding detailed` command:

```
(Cisco Controller) >show ipv6 neighbor-binding detailed mac 60:33:4b:05:25:ef
macDB has 3 entries for mac 60:33:4b:05:25:ef, 3 dynamic
Codes: L - Local, S - Static, ND - Neighbor Discovery, DH - DDCP
Preflevel flags (prlvl):
  0001:MAC and LLA match 0002:Orig trunk 0004:Orig access
  0008:Orig trusted access 0010:Orig trusted trunk 0020:DHCP assigned
  0040:Cga authenticated 0080:Cert authenticated 0100:Statically assigned
IPv6 address     MAC Address   Port VLAN Type   prlvl age     state    Time left
------------------------------------------------------------------------------
ND fe80::6233:4bff:fe05:25ef 60:33:4b:05:25:ef AP 980 wireless 0009
  0 REACHABLE 303
  0 REACHABLE 300
  0 REACHABLE 301
```

The following is the output of the `show ipv6 neighbor-binding counters` command:

```
(Cisco Controller) >show ipv6 neighbor-binding counters

(Cisco Controller) > >
show ipv6 ra-guard

To display the RA guard statistics, use the `show ipv6 ra-guard` command.

`show ipv6 ra-guard {ap | wlc} summary`

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap</td>
<td>Displays Cisco access point details.</td>
</tr>
<tr>
<td>wlc</td>
<td>Displays Cisco controller details.</td>
</tr>
<tr>
<td>summary</td>
<td>Displays RA guard statistics.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows the output of the `show ipv6 ra-guard ap summary` command:

```
(Cisco Controller) > show ipv6 ra-guard ap summary
IPv6 RA Guard on AP..................... Enabled
RA Dropped per client:
MAC Address  AP Name  WLAN/GLAN  Number of RA Dropped
----------------- ----------------- -------------------- ---------------------
00:40:96:b9:4b:89 Bhavik_1130_1_p13 2 19

Total RA Dropped on AP................. 19
```

The following example shows how to display the RA guard statistics for a controller:

```
(Cisco Controller) > show ipv6 ra-guard wlc summary
IPv6 RA Guard on WLC.................... Enabled
```
show ipv6 route summary

To display configuration information for IPv6 route, use the show ipv6 route summary command.

show ipv6 route summary
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in a Release 8.0.</td>
</tr>
</tbody>
</table>

The following is a sample output of the show ipv6 route summary command:

(Cisco Controller) > show ipv6 route summary
Number of Routes................................. 1

<table>
<thead>
<tr>
<th>Destination Network Prefix</th>
<th>Length</th>
<th>Gateway</th>
</tr>
</thead>
</table>
show ipv6 summary

To display the IPv6 configuration settings, use the **show ipv6 summary** command.

**show ipv6 summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example displays the output of the **show ipv6 summary** command:

```
(Cisco Controller) >show ipv6 summary
Global Config............................... Enabled
Reachable-lifetime value.................... 30
Stale-lifetime value......................... 300
Down-lifetime value......................... 300
RA Throttling............................... Disabled
RA Throttling allow at-least................. 1
RA Throttling allow at-most................. no-limit
RA Throttling max-through................... 5
RA Throttling throttle-period.............. 600
RA Throttling interval-option.............. ignore
NS Mulitcast CacheMiss Forwarding........... Enabled
NA Mulitcast Forwarding..................... Enabled
IPv6 Capwap UDP Lite........................ Enabled
Operating System IPv6 state ............... Enabled
```
**show known ap**

To display known Cisco lightweight access point information, use the `show known ap` command.

```
show known ap {summary | detailed MAC}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>summary</code></td>
<td>Displays a list of all known access points.</td>
</tr>
<tr>
<td><code>detailed</code></td>

**show l2tp**

To display Layer 2 Tunneling Protocol (L2TP) sessions, use the **show l2tp** command.

```
show l2tp  {summary  |  ip_address}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays all L2TP sessions.</td>
</tr>
<tr>
<td>ip_address</td>
<td>IP address.</td>
</tr>
</tbody>
</table>

</tbody>
</table>

The following example shows how to display a summary of all L2TP sessions:

(Cisco Controller) > **show l2tp summary**

```
LAC_IPaddr  LTid  LSid  RTid  RSid  ATid  ASid  State
-----------  ----  ----  ----  ----  ----  ----  ----
```
show lag eth-port-hash

To display the physical port used for specific MAC addresses, use the `show lag eth-port-hash` command.

```
show lag eth-port-hash dest_MAC [source_MAC]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>dest_MAC</code></td>
<td>MAC address to determine output port for non-IP packets.</td>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the physical port used for a specific MAC address:

```
(Cisco Controller) > show lag eth-port-hash 11:11:11:11:11:11
Destination MAC 11:11:11:11:11:11 currently maps to port 1
```
show lag ip-port-hash

To display the physical port used for specific IP addresses, use the `show lag ip-port-hash` command.

```
show lag ip-port-hash dest_IP [source_IP]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>dest_IP</th>
<th>IP address to determine the output port for IP packets.</th>
</tr>
</thead>
<tbody>
<tr>
<td>source_IP</td>
<td>(Optional) IP address to determine the output port for IP packets.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both — IPv4 and IPv6 addresses.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

For CAPWAP packets, enter the IP address of the access points. For EOIP packets, enter the IP address of the controller. For WIRED_GUEST packets, enter its IP address. For non tunneled IP packets from WLC, enter the destination IP address. For other non tunneled IP packets, enter both destination and source IP addresses.

This command is applicable for both IPv4 and IPv6 addresses.

The following example shows how to display the physical port used for a specific IP address:

```
(Cisco Controller) > show lag ip-port-hash 192.168.102.138
Destination IP 192.168.102.138 currently maps to port 1
```
show lag summary

To display the current link aggregation (LAG) status, use the `show lag summary` command.

**show lag summary**

This command has no arguments or keywords.

None

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the current status of the LAG configuration:

```
(Cisco Controller) > show lag summary
LAG Enabled
```
**show ldap**

To display the Lightweight Directory Access Protocol (LDAP) server information for a particular LDAP server, use the `show ldap` command.

```
show ldap index
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>index</strong></td>
<td>LDAP server index. Valid values are from 1 to 17.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the detailed LDAP server information:

```
(Cisco Controller) > show ldap 1
Server Index..................................... 1
Address.......................................... 2.3.1.4
Port............................................. 389
Enabled.......................................... Yes
User DN.......................................... name1
User Attribute................................... attr1
User Type........................................ username1
Retransmit Timeout............................... 3 seconds
Bind Method ..................................... Anonymous
```

**Related Commands**

- `config ldap`
- `config ldap add`
- `config ldap simple-bind`
- `show ldap statistics`
- `show ldap summary`
show ldap statistics

To display all Lightweight Directory Access Protocol (LDAP) server information, use the `show ldap statistics` command.

```
show ldap statistics
```

**Syntax Description**
This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the LDAP server statistics:

```
(Cisco Controller) > show ldap statistics
Server Index............................. 1
Server statistics:
  Initialized OK......................... 0
  Initialization failed................ 0
  Initialization retries.............. 0
  Closed OK............................. 0
Request statistics:
  Received................................ 0
  Sent.................................... 0
  OK...................................... 0
  Success................................ 0
  Authentication failed................ 0
  Server not found.................... 0
  No received attributes............. 0
  No passed username.................. 0
  Not connected to server........... 0
  Internal error....................... 0
  Retries................................ 0
Server Index............................. 2
...```

**Related Commands**
- config ldap
- config ldap add
- config ldap simple-bind
- show ldap
- show ldap summary
show ldap summary

To display the current Lightweight Directory Access Protocol (LDAP) server status, use the `show ldap summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3     | This command was introduced. |

The following example shows how to display a summary of configured LDAP servers:

```
(Cisco Controller) > show ldap summary
Idx  Server Address  Port  Enabled
---  -------------  ----  -----
 1    2.3.1.4        389   Yes
 2    10.10.20.22    389   Yes
```

**Related Commands**

- `config ldap`
- `config ldap add`
- `config ldap simple-bind`
- `show ldap statistics`
- `show ldap`
show license all

To display information for all licenses on the Cisco WLCs, use the `show license all` command.

**show license all**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display all the licenses:

```
> show license all

show license capacity

To display the maximum number of access points allowed for this license on the Cisco 5500 Series Controller, the number of access points currently joined to the controller, and the number of access points that can still join the controller, use the \texttt{show license capacity} command.

\texttt{show license capacity}

\textbf{Syntax Description}

This command has no arguments or keywords.

\textbf{Command Default}

None.

This example shows how to display the license capacity:

\begin{verbatim}
> show license capacity
Licensed Feature        Max Count  Current Count  Remaining Count
AF Count               250         47           203
\end{verbatim}

\textbf{Related Commands}

\texttt{license install}

\texttt{show license all}

\texttt{show license detail}

\texttt{show license feature}

\texttt{show license image-level}

\texttt{show license summary}

\texttt{license modify priority}

\texttt{show license evaluation}
show license detail

To display details of a specific license on the Cisco 5500 Series Controller, use the `show license detail` command.

`show license detail license-name`

**Syntax Description**

| license-name | Name of a specific license. |

**Command Default**

None.

This example shows how to display the license details:

```
> show license detail wplus
Feature: wplus   Period left: Life time
Index: 1       Feature: wplus   Version: 1.0
  License Type: Permanent
  License State: Active, In Use
  License Count: Non-Counted
  License Priority: Medium
  Store Index: 2
  Store Name: Primary License Storage
Index: 2       Feature: wplus   Version: 1.0
  License Type: Evaluation
  License State: Inactive
  Evaluation total period:  8 weeks  4 days
  Evaluation period left:  6 weeks  6 days
  License Count: Non-Counted
  License Priority: Low
  Store Index: 0
```

**Related Commands**

- `license install`
- `show license agent`
- `show license all`
- `show license feature`
- `show license image-level`
- `show license summary`
- `license modify priority`
show license expiring

To display details of expiring licenses on the Cisco 5500 Series Controller, use the `show license expiring` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the details of the expiring licenses:

```
> show license expiring
StoreIndex:  0  Feature: wplus  Version: 1.0
  License Type: Evaluation
  License State: Inactive
    Evaluation total period:  8 weeks  4 days
    Evaluation period left:  6 weeks  6 days
  License Count: Non-Counted
  License Priority: Low
StoreIndex:  1  Feature: wplus-ap-count  Version: 1.0
  License Type: Evaluation
  License State: Active, In Use
    Evaluation total period:  8 weeks  4 days
    Evaluation period left:  2 weeks  3 days
    Expiry date: Thu Jun 25 18:09:43 2009

  License Priority: High
StoreIndex:  2  Feature: base  Version: 1.0
  License Type: Evaluation
  License State: Inactive
    Evaluation total period:  8 weeks  4 days
    Evaluation period left:  8 weeks  4 days
  License Count: Non-Counted
  License Priority: Low
StoreIndex:  3  Feature: base-ap-count  Version: 1.0
  License Type: Evaluation
  License State: Active, Not in Use, EULA accepted
    Evaluation total period:  8 weeks  4 days
    Evaluation period left:  8 weeks  3 days
  License Count: 250/0/0
  License Priority: Low
```

**Related Commands**

- `license install`
- `show license all`
- `show license detail`
- `show license in-use`
- `show license summary`
- `license modify priority`
- `show license evaluation`
show license evaluation

To display details of evaluation licenses on the Cisco 5500 Series Controller, use the `show license evaluation` command.

**show license evaluation**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the details of the evaluation licenses:

```
> show license evaluation
StoreIndex: 0 Feature: wplus Version: 1.0
 License Type: Evaluation
 License State: Inactive
 Evaluation total period: 8 weeks 4 days
 Evaluation period left: 6 weeks 6 days
 License Count: Non-Counted
 License Priority: Low
StoreIndex: 1 Feature: wplus-ap-count Version: 1.0
 License Type: Evaluation
 License State: Active, In Use
 Evaluation total period: 8 weeks 4 days
 Evaluation period left: 2 weeks 3 days
 Expiry date: Thu Jun 25 18:09:43 2009
 License Count: 250/250/0
 License Priority: High
StoreIndex: 2 Feature: base Version: 1.0
 License Type: Evaluation
 License State: Inactive
 Evaluation total period: 8 weeks 4 days
 Evaluation period left: 8 weeks 4 days
 License Count: Non-Counted
 License Priority: Low
StoreIndex: 3 Feature: base-ap-count Version: 1.0
 License Type: Evaluation
 License State: Active, Not in Use, EULA accepted
 Evaluation total period: 8 weeks 4 days
 Evaluation period left: 8 weeks 3 days
 License Count: 250/0/0
 License Priority: Low
```

**Related Commands**

- `license install`
- `show license all`
- `show license detail`
- `show license expiring`
- `show license in-use`
- `show license summary`
- `license modify priority`
show license feature

To display a summary of license-enabled features on the Cisco 5500 Series Controller, use the `show license feature` command.

**show license feature**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the license-enabled features:

```
> show license feature

Feature name  Enforcement  Evaluation  Clear  Allowed  Enabled
wpplus         yes          yes        yes    yes       yes
wpplus-ap-count yes          yes        yes    yes       yes
base           no           yes        yes    yes       no
base-ap-count  yes          yes        yes    yes       no
```

**Related Commands**

- `license install`
- `show license all`
- `show license detail`
- `show license expiring`
- `show license image-level`
- `show license in-use`
- `show license summary`
- `show license modify priority`
- `show license evaluation`
show license file

To display a summary of license-enabled features on the Cisco 5500 Series Controller, use the show license file command.

**show license file**

---

**Syntax Description**

This command has no arguments or keywords.

This example shows how to display the license files:

> show license file

License Store: Primary License Storage

show license expiring
show license feature
show license image-level
show license in-use
show license summary
show license evaluation
show license handle

To display the license handles on the Cisco 5500 Series Controller, use the `show license handle` command.

```
show license handle
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None.

This example shows how to display the license handles:

```
> show license handle
Feature: wplus , Handle Count: 1
  Units: 01( 0), ID: 0x5e000001, NotifyPC: 0x1001e8f4 LS-Handle (0x00000001),

```

**Related Commands**
- `license install`
- `show license all`
- `show license detail`
- `show license expiring`
- `show license feature`
- `show license image-level`
- `show license in-use`
- `show license summary`
show license image-level

To display the license image level that is in use on the Cisco 5500 Series Controller, use the `show license image-level` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the image level license settings:

```
> show license image-level
Module name Image level Priority Configured Valid license
wnbu wplus 1 YES wplus
base 2 NO
NOTE: wplus includes two additional features: Office Extend AP, Mesh AP.
```

**Related Commands**

- license install
- show license all
- show license detail
- show license expiring
- show license feature
- license modify priority
- show license in-use
- show license summary
To display the licenses that are in use on the Cisco 5500 Series Controller, use the `show license in-use` command.

This command has no arguments or keywords.

This example shows how to display the licenses that are in use:

```
> show license in-use
StoreIndex: 2  Feature: wplus  Version: 1.0
  License Type: Permanent
  License State: Active, In Use
  License Count: Non-Counted
  License Priority: Medium
StoreIndex: 1  Feature: wplus-ap-count  Version: 1.0
  License Type: Evaluation
  License State: Active, In Use
  Evaluation total period: 8 weeks 4 days
  Evaluation period left: 2 weeks 3 days
  Expiry date: Thu Jun 25 18:09:43 2009
  License Count: 250/250/0
  License Priority: High
```
show license permanent

To display the permanent licenses on the Cisco 5500 Series Controller, use the show license permanent command.

show license permanent

Syntax Description

This command has no arguments or keywords.

Command Default

None.

This example shows how to display the permanent license’s information:

```plaintext
> show license permanent
  StoreIndex: 0 Feature: wplus-ap-count  Version: 1.0
      License Type: Permanent
      License State: Inactive
      License Count: 12/0/0
      License Priority: Medium
  StoreIndex: 1 Feature: base  Version: 1.0
      License Type: Permanent
      License State: Active, Not in Use
      License Count: Non-Counted
      License Priority: Medium
  StoreIndex: 2 Feature: wplus  Version: 1.0
      License Type: Permanent
      License State: Active, In Use
      License Count: Non-Counted
      License Priority: Medium
```

Related Commands

license install
show license all
show license detail
show license expiring
show license feature
show license image-level
show license in-use
show license summary
license modify priority
show license evaluation
show license status

To display the license status on the Cisco Wireless Controller, use the show license status command.

**show license status**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to view the license status on the RTU license mechanism:

```
> show license status
License Type Supported
    permanent Non-expiring node locked license
    extension Expiring node locked license
    evaluation Expiring non node locked license
License Operation Supported
    install Install license
    clear Clear license
    annotate Comment license
    save Save license
    revoke Revoke license
Device status
    Device Credential type: DEVICE
    Device Credential Verification: PASS
    Rehost Type: DC_OR_IC
```

This example shows how to view the/license status on the Smart License mechanism:

```
(Cisco Controller) > show license status
Smart Licensing is ENABLED
Registration:
    Status: REGISTERED
    Smart Account: vWLC-Prod
    Virtual Account: Default
    Export-Controlled Functionality: Allowed
    Initial Registration: SUCCEEDED on Dec 11 12:19:38 2015 UTC
    Last Renewal Attempt: None
    Next Renewal Attempt: Jun 08 12:19:37 2016 UTC
    Registration Expires: Dec 10 12:16:56 2016 UTC
License Authorization:
    Status: AUTHORIZED on Dec 11 12:20:12 2015 UTC
    Last Communication Attempt: SUCCEEDED on Dec 11 12:20:12 2015 UTC
    Next Communication Attempt: Jan 10 12:20:11 2016 UTC
    Communication Deadline: Mar 10 12:17:43 2016 UTC
```
show license statistics

To display license statistics on the Cisco 5500 Series Controller, use the show license statistics command.

```
show license statistics
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the license statistics:

```
> show license statistics
  Administrative statistics
  Install success count: 0
  Install failure count: 0
  Install duplicate count: 0
  Comment add count: 0
  Comment delete count: 0
  Clear count: 0
  c
  Save count: 0
  Save cred count: 0
  Client status
  Request success count 2
  Request failure count 0
  Release count 0
  Global Notify count 0
```

**Related Commands**

- license install
- show license all
- show license detail
- show license expiring
- show license feature
- show license image-level
- show license in-use
- show license summary
- license modify priority
- show license evaluation
show license summary

To display a brief summary of all licenses on the Cisco WLCs, use the `show license summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display a brief summary of all licenses:

```
> show license summary
Index 1 Feature: wplus
   Period left: Life time
   License Type: Permanent
   License State: Active, In Use
   License Count: Non-Counted
   License Priority: Medium
Index 2 Feature: wplus-ap-count
   Period left: 2 weeks 3 days
   License Type: Evaluation
   License State: Active, In Use
   License Count: 250/250/0
   License Priority: High
Index 3 Feature: base
   Period left: Life time
   License Type: Permanent
   License State: Active, Not in Use
   License Count: Non-Counted
   License Priority: Medium
Index 4 Feature: base-ap-count
   Period left: 8 weeks 3 days
   License Type: Evaluation
   License State: Active, Not in Use, EULA accepted
   License Count: 250/0/0
   License Priority: Low
```

This example shows how to view the `license summary` on the Smart License mechanism:

```
(Cisco Controller) >show license summary
Smart Licensing is ENABLED
Registration:
   Status: REGISTERED
   Smart Account: vWLC-Prod
   Virtual Account: Default
   Export-Controlled Functionality: Allowed
   Last Renewal Attempt: None
   Next Renewal Attempt: Jun 08 12:19:38 2016 UTC
License Authorization:
   Status: AUTHORIZED
   Last Communication Attempt: SUCCEEDED
   Next Communication Attempt: Jan 10 12:20:11 2016 UTC
```
show license udi

To display unique device identifier (UDI) values for licenses on the Cisco WLCs, use the **show license udi** command.

**show license udi**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to view the UDI values for licenses on the RTU license mechanism:

```
(Cisco Controller) > show license udi
Device# PID   SN      UDI
*0  AIR-CT5508-K9 RFD000P2D27  AIR-CT5508-K9:RFD000P2D27
```

This example shows how to view the UDI values for licenses on the Smart License mechanism:

```
(Cisco Controller) > show license udi
UDI: PID:AIR-CTVM-K9, SN:91U8NQ5XDBE
```
show license usage

To display the entitlement details and usage per handle and its entitlement tag, use the `show license usage` command.

(Cisco Controller) > show license usage
```

Cisco Wireless Controller Command Reference, Release 8.8
show load-balancing

To display the status of the load-balancing feature, use the show load-balancing command.

show load-balancing

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the load-balancing status:

> show load-balancing
Aggressive Load Balancing......................... Enabled
Aggressive Load Balancing Window................. 0 clients
Aggressive Load Balancing Denial Count......... 3
Statistics
Total Denied Count............................... 10 clients
Total Denial Sent................................ 20 messages
Exceeded Denial Max Limit Count................. 0 times
None 5G Candidate Count.......................... 0 times
None 2.4G Candidate Count....................... 0 times

Related Commands

config load-balancing
**show local-auth config**

To display local authentication configuration information, use the `show local-auth config` command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the local authentication configuration information:

```
(Cisco Controller) > show local-auth config
User credentials database search order:
Primary .......................... Local DB
Configured EAP profiles:
Name ................................ default
Certificate issuer .................... default
Enabled methods ..................... fast
Configured on WLANs ................. 2
EAP Method configuration:
EAP-TLS:
Certificate issuer .................... default
Peer verification options:
  Check against CA certificates ..... Enabled
  Verify certificate CN identity .... Disabled
  Check certificate date validity ... Enabled
EAP-FAST:
  TTL for the PAC ...................... 3 600
  Initial client message .......... <none>
Local certificate required ......... No
Client certificate required ......... No
Vendor certificate required ......... No
Anonymous provision allowed ........ Yes
Authenticator ID .................... 7b7fffffff000000000000000000000000
Authority Information ............. Test
EAP Profile.......................... tls-prof
Enabled methods for this profile .... tls
Active on WLANs ...................... 1 3EAP Method configuration:
EAP-TLS:
```
Certificate issuer used ............... cisco
Peer verification options:
  Check against CA certificates ..... disabled
  Verify certificate CN identity .... disabled
  Check certificate date validity ... disabled

Related Commands

</tbody>
</table>
show logging last-reset

To display the logging buffer saved on last reset or power cycle of the controller, use the show logging last-reset command.

**show logging last-reset**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced in 8.0.140.0.</td>
</tr>
</tbody>
</table>
show logging flags

To display the existing flags, use the **show logging flags** command.

**show logging flags** AP | Client

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the current flags details:

```
> show logging flags
ID  username  Connection  From  Idle Time  Login Time
00  admin     EIA-232   00:00:00  00:19:04
```

**Related Commands**

- config logging flags close
show loginsession

To display the existing sessions, use the `show loginsession` command.

```
show loginsession
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the current session details:

```
> show loginsession
ID username Connection From Idle Time Session Time
-- --------------- --------------- ------------ ------------
00 admin EIA-232 00:00:00 00:19:04
```

**Related Commands**

`config login session close`
show macfilter

To display the MAC filter parameters, use the **show macfilter** command.

```
show macfilter { summary | detail MAC | mesh | { wlan wlan-id } }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<th>Usage Guidelines</th>
<th></th>
</tr>
</thead>
</table>

The MAC delimiter (none, colon, or hyphen) for MAC addresses sent to RADIUS servers is displayed. The MAC filter table lists the clients that are always allowed to associate with a wireless LAN.

The following example shows how to display the detailed display of a MAC filter entry:

```
WLAN Identifier.......................... Any
Interface Name........................... management
Description............................. RAP
```

The following example shows how to display a summary of the MAC filter parameters:

```
(Cisco Controller) > show macfilter summary
MAC Filter RADIUS Compatibility mode........... Cisco ACS
MAC Filter Delimiter........................... None
Local Mac Filter Table
MAC Address          WLAN Id        Description
--------------------- ------------- -----------------
```
show mdns ap summary

To display all the access points for which multicast Domain Name System (mDNS) forwarding is enabled, use the `show mdns ap summary` command.

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show mdns ap summary` command:

```
(Cisco Controller) > show mdns ap summary
Number of mDNS APs............................. 2

<table>
<thead>
<tr>
<th>AP Name</th>
<th>Ethernet MAC</th>
<th>Number of Vlans</th>
<th>VlanIdentifiers</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-3500</td>
<td>cc:ef:48:72:0d:d9</td>
<td>0</td>
<td>Not applicable</td>
</tr>
<tr>
<td>ap-3600</td>
<td>00:22:bd:df:04:68</td>
<td>2</td>
<td>124,122</td>
</tr>
</tbody>
</table>
```

The following table describes the significant fields shown in the display.

### Table 13: show mdns ap summary Field Descriptions

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AP Name</td>
<td>Name of the mDNS access point (access point for which mDNS forwarding is enabled).</td>
</tr>
<tr>
<td>Ethernet MAC</td>
<td>MAC address of the mDNS access point.</td>
</tr>
<tr>
<td>Number of VLANs</td>
<td>Number of VLANs from which the access point snoops the mDNS advertisements from the wired side. An access point can snoop on a maximum of 10 VLANs.</td>
</tr>
<tr>
<td>VLAN Identifiers</td>
<td>Identifiers of the VLANs the access point snoops on.</td>
</tr>
</tbody>
</table>
show mdns domain-name-ip summary

To display the summary of the multicast Domain Name System (mDNS) domain names, use the `show mdns domain-name-ip summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each service advertisement contains a record that maps the domain name of the service provider to the IP address. The mapping also contains details such as the client MAC address, VLAN ID, Time to Live (TTL), and IPv4 address.

The following is a sample output of the `show mdns domain-name-ip summary` command:

```
(Cisco Controller) > show mdns domain-name-ip summary
Number of Domain Name-IP Entries................. 1

DomainName       MAC Address       IP Address      Vlan Id Type   TTL   Time left (in seconds) (in seconds)
----------------- -------------- -------------- -------------- ------- ----------------------
tixp77.local.    00:50:b6:4f:69:70 209.165.202.128 999 mDNSAP 4725 906
```

The following table describes the significant fields shown in the display.

**Table 14: show mdns domain-name-ip summary Field Descriptions**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Name</td>
<td>Domain name of the service provider.</td>
</tr>
<tr>
<td>MAC Address</td>
<td>MAC address of the service provider.</td>
</tr>
<tr>
<td>IP Address</td>
<td>IP address of the service provider.</td>
</tr>
<tr>
<td>VLAN ID</td>
<td>VLAN ID of the service provider.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>Origin of service that can be one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Wired</td>
</tr>
<tr>
<td></td>
<td>• Wireless</td>
</tr>
<tr>
<td></td>
<td>• Wired guest</td>
</tr>
<tr>
<td></td>
<td>• mDNS AP</td>
</tr>
<tr>
<td>TTL</td>
<td>TTL value, in seconds, that determines the validity of the service offered by the service provider. The service provider is removed from the Cisco Wireless LAN Controller when the TTL expires.</td>
</tr>
<tr>
<td>Time Left</td>
<td>Time remaining, in seconds, before the service provider is removed from the Cisco WLC.</td>
</tr>
</tbody>
</table>
show mdns profile

To display mDNS profile information, use the **show mdns profile** command.

**Syntax:**
```
show mdns profile  { summary | detailed profile-name }
```

**Syntax Description**
- `summary` Displays the summary of the mDNS profiles.
- `detailed` Displays details of an mDNS profile.
- `profile-name` Name of the mDNS profile.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display a summary of all the mDNS profiles:

```
> show mdns profile summary
Number of Profiles............................... 2
PROFILENAME No. OF SERVICES
-------------------------------- ---------------
default-mdns-profile 5
profile1 2
```

This example shows how to display the detailed information of an mDNS profile:

```
> show mdns profile detailed default-mdns-profile
PROFILE NAME.......................... default-mdns-profile
PROFILE ID............................. 1
NO. SERVICES............................ 5
SERVICES................................. AirPrint
                                      AppleTV
                                      HP_Photosmart_Printer_1
                                      HP_Photosmart_Printer_2
                                      Printer
NO. INTERFACES ATTACHED.................... 0
NO. INTERFACE GROUPS ATTACHED.............. 0
NO. WLANS ATTACHED........................ 1
WLANS IDS.................................. 1
```

**Related Commands**
- `config mdns query interval`

</tbody>
</table>

This example shows how to display a summary media-stream clients:

```
> show media-stream client summary
Number of Clients............................ 1
Client Mac           Stream Name  Stream Type  Radio  WLAN  QoS  Status
------------------- ----------- ----------- ---- ---- ---- -----
00:1a:73:dd:b1:12   mountainview MC-direct 2.4  2 Video Admitted
```

**Related Commands**

`show media-stream group summary`
show media-stream group detail

To display the details for a specific media-stream group, use the `show media-stream group detail` command.

```plaintext
show media-stream group detail media-stream_name
```

**Syntax Description**

- `media-stream_name` Name of the media-stream group.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display media-stream group configuration details:

```plaintext
> show media-stream group detail abc
Media Stream Name............................ abc
Start IP Address............................ 227.8.8.8
End IP Address.............................. 227.9.9.9
RRC Parameters
  Avg Packet Size(Bytes)........................ 1200
  Expected Bandwidth(Kbps)....................... 300
  Policy........................................ Admit
  RRC re-evaluation............................ periodic
  QoS........................................... Video
  Status....................................... Multicast-direct
  Usage Priority.................................. 5
  Violation...................................... drop
```

**Related Commands**

- `show media-stream group summary`
show media-stream group summary

To display the summary of the media stream and client information, use the `show media-stream group summary` command.

show media-stream group summary

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>

- `show 802.11 media-stream client`
- `show media-stream client`
- `show media-stream group detail`
show mesh ap

To display settings for mesh access points, use the `show mesh ap` command.

```
show mesh ap {summary | tree}
```

**Syntax Description**

**summary**
- Displays a summary of mesh access point information including the name, model, bridge virtual interface (BVI) MAC address, United States Computer Emergency Response Team (US-CERT) MAC address, hop, and bridge group name.

**tree**
- Displays a summary of mesh access point information in a tree configuration, including the name, hop counter, link signal-to-noise ratio (SNR), and bridge group name.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary format:

```
(Cisco Controller) > show mesh ap summary
AP Name      AP Model      BVI MAC      CERT MAC      Hop  Bridge Group Name
------------------- ------------------- ------------------- -------------- ------ ----
SB_RAP1      AIR-LAP1522AG-A-K9 00:1d:71:0e:d0:00 00:1d:71:0e:d0:00 0  sbox
SB_MAP1      AIR-LAP1522AG-A-K9 00:1d:71:0e:85:00 00:1d:71:0e:85:00 1  sbox
SB_MAP2      AIR-LAP1522AG-A-K9 00:1b:d4:a7:8b:00 00:1b:d4:a7:8b:00 2  sbox
SB_MAP3      AIR-LAP1522AG-A-K9 00:1d:71:0d:ee:00 00:1d:71:0d:ee:00 3  sbox
Number of Mesh APs............................... 4
Number of RAPs................................... 1
Number of MAPs................................... 3
```

The following example shows how to display settings in a hierarchical (tree) format:

```
(Cisco Controller) > show mesh ap tree

|-- SB_RAP1[0,0,sbox]
   |-- SB_MAP1[1,32,sbox]
   |    |-- SB_MAP2[2,27,sbox]
   |    |-- SB_MAP3[3,30,sbox]

Number of Mesh APs............................... 4
Number of RAPs................................... 1
Number of MAPs................................... 3
```
show mesh astools stats

To display antistranding statistics for outdoor mesh access points, use the `show mesh astools stats` command.

```
show mesh astools stats [cisco_ap]
```

**Syntax Description**
- `cisco_ap` (Optional) Antistranding feature statistics for a designated mesh access point.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display anti-stranding statistics on all outdoor mesh access points:

```
(Cisco Controller) >show mesh astools stats
Total No of Aps stranded : 0
```

The following example shows how to display anti-stranding statistics for access point `sb_map1`:

```
(Cisco Controller) >show mesh astools stats sb_map1
Total No of Aps stranded : 0
```
**show mesh backhaul**

To check the current backhaul information, use the `show mesh backhaul` command.

```
show mesh backhaul cisco_ap
```

<table>
<thead>
<tr>

<tr>
<td>Name of the access point.</td>
<td>None</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the current backhaul:

```
(Cisco Controller) > show mesh backhaul
```

If the current backhaul is 5 GHz, the output is as follows:

```
Basic Basic Attributes for Slot 0
   Radio Type................................. RADIO_TYPE_80211g
   Radio Role................................. DOWNLINK ACCESS
   Administrative State .................... ADMIN_ENABLED
   Operation State .......................... UP
   Current Tx Power Level .................. 1
```

If the current backhaul is 2.4 GHz, the output is as follows:

```
Basic Basic Attributes for Slot 1
   Radio Type................................. RADIO_TYPE_80211a
   Radio Subband............................. RADIO_SUBBAND_ALL
   Radio Role................................. DOWNLINK ACCESS
   Administrative State .................... ADMIN_ENABLED
   Operation State .......................... UP

```
show mesh convergence

To display mesh convergence settings, use the show mesh convergence command.

`show mesh convergence`

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port.

The following example shows how to display mesh convergence settings:

```
ap_console > show mesh convergence
Convergence method: fast
Subset channels: 157 165
Num. of Subset channels: 2

Mesh Convergence Global Data
old_conv_method: standard
updated_subset: 1 subset_chan_seek: 1
```
show mesh env

To display global or specific environment summary information for mesh networks, use the `show mesh env` command.

```
show mesh env { summary | cisco_ap }
```

**Syntax Description**

- **summary**
  - Displays global environment summary information.
- **cisco_ap**
  - Name of access point for which environment summary information is requested.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

  Tx Unicast Packets........................... 9630
  Tx Non-Unicast Packets....................... 3331
GigabitEthernet1 Status.......................... DOWN
  POE Out.................................... OFF
  Battery...................................... N/A
```
show mesh neigh

To display summary or detailed information about the mesh neighbors of a mesh access point, use the `show mesh neigh` command.

```
show mesh neigh {detail | summary} {cisco_ap | all}
```

**Syntax Description**

- **detail**
  - Displays the channel and signal-to-noise ratio (SNR) details between the designated mesh access point and its neighbor.

- **summary**
  - Displays the mesh neighbors for a designated mesh access point.

- **cisco_ap**
  - Cisco lightweight access point name.

- **all**
  - Displays all access points.

**Note**

If an AP itself is configured with the `all` keyword, the `all` keyword access points take precedence over the AP that is named `all`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

<tr>
<td>AP Name</td>
<td>Name of the mesh access point.</td>
</tr>
</tbody>
</table>
| FLAGS       | Describes adjacency. The possible values are as follows:  
  - UPDATED—Recently updated neighbor.  
  - NEIGH—One of the top neighbors.  
  - EXCLUDED—Neighbor is currently excluded.  
  - WAS EXCLUDED—Neighbor was recently removed from the exclusion list.  
  - PERMSNR—Permanent SNR neighbor.  
  - CHILD—A child neighbor.  
  - PARENT—A parent neighbor.  
  - NEEDUPDATE—Not a current neighbor and needs an update.  
  - BEACON—Heard a beacon from this neighbor.  
  - ETHER—Ethernet neighbor. |
<p>| worstDv     | Worst distance vector through the neighbor. |
| Ant         | Antenna on which the route was received. |
| channel     | Channel of the neighbor. |
| biters      | Number of black list timeouts left. |
| ppiters     | Number of potential parent timeouts left. |
| Numroutes   | Number of distance routes. |
| snr         | Signal to Noise Ratio. |
| snrUp       | SNR of the link to the AP. |
| snrDown     | SNR of the link from the AP. |
| linkSnr     | Calculated SNR of the link. |
| adjustedEase| Ease to the root AP through this AP. It is based on the current SNR and threshold SNR values. |</p>
<table>

</tbody>
</table>
show mesh path

To display the channel and signal-to-noise ratio (SNR) details for a link between a mesh access point and its neighbor, use the `show mesh path` command.

```
show mesh path cisco_ap
```

**Syntax Description**

| cisco_ap                        | Mesh access point name. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display channel and SNR details for a designated link path:

```
(Cisco Controller) >show mesh path mesh-45-rap1
AP Name/Radio Mac Channel Rate Link-Snr Flags State
----------------- ------- ----- -------- -------- --------
MAP1-BB00 157 54 32 0x0 UPDATED NEIGH PARENT BEACON
RAP1 157 54 37 0x0 BEACON
```
show mesh per-stats

To display the percentage of packet errors for packets transmitted by the neighbors of a specified mesh access point, use the `show mesh per-stats` command.

```
show mesh per-stats summary  {cisco_ap | all}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>summary</code></td>
<td>Displays the packet error rate stats summary.</td>
</tr>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of mesh access point.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Displays all mesh access points.</td>
</tr>
</tbody>
</table>

**Note**

If an AP itself is configured with the `all` keyword, the `all` keyword access points take precedence over the AP that is named `all`.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The packet error rate percentage equals 1, which is the number of successfully transmitted packets divided by the number of total packets transmitted.

The following example shows how to display the percentage of packet errors for packets transmitted by the neighbors to a mesh access point:

```
(Cisco Controller) >show mesh per-stats summary ap_12
Neighbor MAC Address 00:0B:85:5F:FA:F0
Total Packets transmitted: 104833
Total Packets transmitted successfully: 104833
Total Packets transmitted: 104833
Total Packets retried for transmission: 33028
RTS Attempts: 0
RTS Success: 0
Neighbor MAC Address: 00:0B:85:80:ED:D0
Total Packets transmitted: 0
Total Packets transmitted successfully: 0
Total Packets transmitted: 0
Total Packets retried for transmission: 0
Neighbor MAC Address: 00:17:94:FE:C3:5F
Total Packets transmitted: 0
Total Packets transmitted successfully: 0
Total Packets transmitted: 0
Total Packets retried for transmission: 0
RTS Attempts: 0
RTS Success: 0
```
show mesh public-safety

To display 4.8-GHz public safety settings, use the show mesh public-safety command.

```
show mesh public-safety
```

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to view 4.8-GHz public safety settings:

```
(Cisco Controller) > (Cisco Controller) > show mesh public-safety
Global Public Safety status: disabled
```
**show mesh queue-stats**

To display the number of packets in a client access queue by type for a mesh access point, use the `show mesh queue-stats` command.

```
show mesh queue-stats {cisco_ap | all}
```

**Note**

If an AP itself is configured with the `all` keyword, the `all` keyword access points take precedence over the AP that is named `all`.

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of access point for which you want packet queue statistics.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Displays all access points.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display packet queue statistics for access point ap417:

```
(Cisco Controller) >show mesh queue-stats ap417
Queue Type  Overflows  Peak length  Average length
----------  -----------  -------------  ------------
Silver      0          1             0.000
Gold        0          4             0.004
Platinum    0          4             0.001
Bronze      0          0             0.000
Management  0          0             0.000
```
show mesh security-stats

To display packet error statistics for a specific access point, use the `show mesh security-stats` command.

```
show mesh security-stats {cisco_ap | all}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cisco_ap</code></td>
<td>Name of access point for which you want packet error statistics.</td>
</tr>
<tr>
<td><code>all</code></td>
<td>Displays all access points.</td>
</tr>
</tbody>
</table>

**Note**

If an AP itself is configured with the `all` keyword, the `all` keyword access points take precedence over the AP that is named `all`.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command shows packet error statistics and a count of failures, timeouts, and successes with respect to associations and authentications as well as reassociations and reauthentications for the specified access point and its child.

The following example shows how to view packet error statistics for access point `ap417`:

```
(Cisco Controller) >show mesh security-stats ap417
AP MAC : 00:0B:85:5F:FA:F0
Packet/Error Statistics:
-----------------------------
X Packets 14, Rx Packets 19, Rx Error Packets 0
Parent-Side Statistics:
--------------------------
Unknown Association Requests 0
Invalid Association Requests 0
Unknown Re-Authentication Requests 0
Invalid Re-Authentication Requests 0
Unknown Re-Association Requests 0
Invalid Re-Association Requests 0
Child-Side Statistics:
--------------------------
Association Failures 0
Association Timeouts 0
Association Successes 0
Authentication Failures 0
Authentication Timeouts 0
Authentication Successes 0
Re-Association Failures 0
Re-Association Timeouts 0
Re-Association Successes 0
Re-Authentication Failures 0
```
show mesh security-stats

Re-Authentication Timeouts 0
Re-Authentication Successes 0
show mesh stats

To display the mesh statistics for an access point, use the **show mesh stats** command.

```
show mesh stats cisco_ap
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cisco_ap</td>
<td>Access point name.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display statistics of an access point:

```
(Cisco Controller) >show mesh stats RAP_AP1
RAP in state Maint
rxNeighReq 759978, rxNeighRsp 568673
txNeighReq 115433, txNeighRsp 759978
rxNeighUpd 8266447 txNeighUpd 693062
tnextchan 0, nextant 0, downAnt 0, downChan 0, curAnts 0
tnextNeigh 0, malformedNeighPackets 244, poorNeighSnr 27901
blacklistPackets 0, insufficientMemory 0
authenticationFailures 0
Parent Changes 1, Neighbor Timeouts 16625
```
show mgmtuser

To display the local management user accounts on the Cisco wireless LAN controller, use the show mgmtuser command.

```
show mgmtuser
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display a list of management users:

```
> show mgmtuser
User Name | Permissions | Description | Password Strength
admin     | read-write  |             | Weak
```

**Related Commands**

- config mgmtuser add
- config mgmtuser delete
- config mgmtuser description
- config mgmtuser password
show mobility anchor

To display the wireless LAN anchor export list for the Cisco wireless LAN controller mobility groups or to display a list and status of controllers configured as mobility anchors for a specific WLAN or wired guest LAN, use the `show mobility anchor` command.

```
show mobility anchor [wlan wlan_id | guest-lan guest_lan_id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan</td>
<td>(Optional) Displays wireless LAN mobility group settings.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier from 1 to 512 (inclusive).</td>
</tr>
<tr>
<td>guest-lan</td>
<td>(Optional) Displays guest LAN mobility group settings.</td>
</tr>
<tr>
<td>guest_lan_id</td>
<td>Guest LAN identifier from 1 to 5 (inclusive).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**

The status field display (see example) shows one of the following values:

- **UP**—The controller is reachable and able to pass data.
- **CNTRL_PATH_DOWN**—The mpings failed. The controller cannot be reached through the control path and is considered failed.
- **DATA_PATH_DOWN**—The epings failed. The controller cannot be reached and is considered failed.
- **CNTRL_DATA_PATH_DOWN**—Both the mpings and epings failed. The controller cannot be reached and is considered failed.

The following example shows how to display a mobility wireless LAN anchor list:

```
(Cisco Controller) > show mobility anchor
Mobility Anchor Export List
WLAN ID   IP Address   Status
-------   --------------- -----
12     192.168.0.15     UP
GLAN ID   IP Address   Status
-------   --------------- -----
1     192.168.0.9      CNTRL_DATA_PATH_DOWN
```
show mobility ap-list

To display the mobility AP list, use the `show mobility ap-list` command.

```
show mobility ap-list
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the mobility AP list:

```
(Cisco Controller) > show mobility ap-list
AP Name                  AP Radio MAC address  Controller       Learnt From
------------------------ ----------------------- --------------- ------------
AP30e4.dbc5.38ab         b8:62:1f:e5:33:10     9.7.104.10       Self
```

The AP name is displayed only with New Mobility. With Old Mobility, the AP name is displayed as *Unknown*. 
show mobility dtls

To view the status of the DTLS connections, use the **show mobility dtls** command.

**show mobility dtls connections**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>connections</th>
<th>Displays DTLS connection summary.</th>
</tr>
</thead>
</table>

| Command Default          | None        |

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.8.111.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to view the status of the DTLS connections:

(Cisco Controller) > **show mobility dtls connections**
show mobility foreign-map

To display a mobility wireless LAN foreign map list, use the **show mobility foreign-map** command.

**show mobility foreign-map wlan wlan_id**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>wlan</td>
<td>Displays the mobility WLAN foreign-map list.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Wireless LAN identifier between 1 and 512.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to get a mobility wireless LAN foreign map list:

```
(Cisco Controller) >show mobility foreign-map wlan 2
```

**Mobility Foreign Map List**

<table>
<thead>
<tr>
<th>WLAN ID</th>
<th>Foreign MAC Address</th>
<th>Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>00:1b:d4:6b:87:20</td>
<td>dynamic-105</td>
</tr>
</tbody>
</table>
show mobility group member

To display the details of the mobility group members in the same domain, use the `show mobility group member` command.

**show mobility group member hash**

<table>
<thead>
<tr>
<th><strong>Syntax Description</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>hash</td>
<td>Displays the hash keys of the mobility group members in the same domain.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Command History</strong></th>
<th><strong>Release</strong></th>
<th><strong>Modification</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the hash keys of the mobility group members:

```
(Cisco Controller) > show mobility group member hash
Default Mobility Domain.......................... new-mob

<table>
<thead>
<tr>
<th>IP Address</th>
<th>Hash Key</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.2.115.68</td>
<td>a819d479dcfeb3e0974421b6e8335582263d9169</td>
</tr>
<tr>
<td>9.6.99.10</td>
<td>0974421b6e8335582263d9169a819d479dcfeb3e</td>
</tr>
<tr>
<td>9.7.7.7</td>
<td>feb3e0974421b6e8335582263d9169a819d479dc</td>
</tr>
</tbody>
</table>
```
show mobility oracle

To display the status of the mobility controllers known to the Mobility Oracle (MO) or display the details of the MO client database, use the `show mobility oracle` command.

```
show mobility oracle  {client {detail | summary} | summary}
```

**Syntax Description**

- **client**: Displays the MO client database.
- **detail**: Displays details pertaining to a client in MO client database.
- **summary**: Displays the summary of the MO database.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3.112.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show mobility oracle summary` command:

```
(Cisco Controller) >show mobility oracle summary

Number of MCs.................................... 2

<table>
<thead>
<tr>
<th>IP Address</th>
<th>MAC Address</th>
<th>Link Status</th>
<th>Client Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>9.71.104.10</td>
<td>88:43:e1:7d:fe:00</td>
<td>Control Path Down</td>
<td>0</td>
</tr>
<tr>
<td>9.71.104.250</td>
<td>e8:b7:48:a2:16:e0</td>
<td>Up</td>
<td>2</td>
</tr>
</tbody>
</table>
```

The following is a sample output of the `show mobility oracle client summary` command:

```
(Cisco Controller) >show mobility oracle client summary

Number of Clients................................ 2

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>Anchor MC</th>
<th>Foreign MC</th>
<th>AssocTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:18:de:b0:5c:91</td>
<td>9.72.104.250</td>
<td>-</td>
<td>0</td>
</tr>
<tr>
<td>00:1e:e5:f9:c9:e2</td>
<td>9.72.104.250</td>
<td>-</td>
<td>0</td>
</tr>
</tbody>
</table>
```

The following is a sample output of the `show mobility oracle client detail` command:

```
(Cisco Controller) >show mobility oracle client detail 00:1e:e5:f9:c9:e2

Client MAC Address : 00:1e:e5:f9:c9:e2
Client IP address : 0.0.0.0
Anchor MC IP address : 9.71.104.250
Anchor MC NAT IP address : 9.71.104.250
Foreign MC IP address : -
Foreign MC NAT IP address : -
Client Association Time : 0
Client Entry update timestamp : 1278543135.0
```
show mobility oracle
show mobility statistics

To display the statistics information for the Cisco wireless LAN controller mobility groups, use the show mobility statistics command.

**show mobility statistics**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display statistics of the mobility manager:

(Cisco Controller) >show mobility statistics

**Global Mobility Statistics**

- Rx Errors.......................... 0
- Tx Errors.......................... 0
- Responses Retransmitted............ 0
- Handoff Requests Received.......... 0
- Handoff End Requests Received...... 0
- State Transitions Disallowed...... 0
- Resource Unavailable............... 0

**Mobility Initiator Statistics**

- Handoff Requests Sent.............. 0
- Handoff Replies Received........... 0
- Handoff as Local Received......... 2
- Handoff as Foreign Received........ 0
- Handoff Denys Received............... 0
- Anchor Request Sent................ 0
- Anchor Deny Received............... 0
- Anchor Grant Received............... 0
- Anchor Transfer Received........... 0

**Mobility Responder Statistics**

- Handoff Requests Ignored........... 0
- Ping Pong Handoff Requests Dropped.. 0
- Handoff Requests Dropped............ 0
- Handoff Requests Denied............... 0
- Client Handoff as Local............... 0
- Client Handoff as Foreign............ 0
- Client Handoff Inter Group.......... 0
- Anchor Requests Received............ 0
- Anchor Requests Denied............... 0
- Anchor Requests Granted............... 0
- Anchor Transferred.................. 0
show mobility summary

To display the summary information for the Cisco WLC mobility groups, use the show mobility summary command.

show mobility summary

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Some WLAN controllers may list no mobility security mode.

The following is a sample output of the show mobility summary command.

(Cisco Controller) >show mobility summary

Symmetric Mobility Tunneling (current) .......... Disabled
Symmetric Mobility Tunneling (after reboot) ...... Disabled
Mobility Protocol Port........................... 16666
Mobility Security Mode........................... Disabled
Default Mobility Domain.......................... snmp_gui
Multicast Mode .................................. Disabled
Mobility Domain ID for 802.11r................... 0x66bd
Mobility Keepalive Interval...................... 10
Mobility Keepalive Count......................... 3
Mobility Group Members Configured.............. 1
Mobility Control Message DSCP Value.............. 0
Controllers configured in the Mobility Group
MAC Address    IP Address    Group Name          Multicast IP Status
00:1b:d4:6b:87:20 1.100.163.70  snmp_gui 0.0.0.0 Up

The following is a sample output of the show mobility summary command with new mobility architecture.

(Cisco Controller) >show mobility summary

Mobility Protocol Port........................... 16666
Default Mobility Domain.......................... Mobility
Multicast Mode .................................. Disabled
Mobility Domain ID for 802.11r................... 0xb348

</tr>
</tbody>
</table>
show mobility summary encryption

To display the link encryption status for the Mobility Peers, use the **show mobility summary encryption** command.

**show mobility summary encryption**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.8.111.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the **show mobility summary encryption** command.

```
(Cisco Controller) >show mobility summary encryption

Mobility Number of Mobility members configure.... 2

<table>
<thead>
<tr>
<th>MAC Address</th>
<th>IP Address</th>
<th>Group Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>62:35:68:78:90:61</td>
<td>1.3.23.4</td>
<td>group_1</td>
</tr>
<tr>
<td></td>
<td>Enabled</td>
<td>Control and Data Path Down</td>
</tr>
<tr>
<td>34:6e:11:2a:3e:00</td>
<td>10.226.167.33</td>
<td>test</td>
</tr>
<tr>
<td></td>
<td>N/A</td>
<td>Up</td>
</tr>
</tbody>
</table>
```
show msglog

To display the message logs written to the Cisco WLC database, use the show msglog command.

show msglog

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
If there are more than 15 entries, you are prompted to display the messages shown in the example.

The following example shows how to display message logs:

(Cisco Controller) > show msglog
Message Log Severity Level................. ERROR

show nac statistics

To display detailed Network Access Control (NAC) information about a Cisco wireless LAN controller, use the `show nac statistics` command.

### show nac statistics

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display detailed statistics of network access control settings:

```
(Cisco Controller) > show nac statistics
Server Index....................................................... 1
Server Address.................................................... xxx.xxx.xxx.xxx
Number of requests sent............................................ 0
Number of retransmissions.......................................... 0
Number of requests received........................................ 0
Number of malformed requests received.............................. 0
Number of bad auth requests received............................... 0
Number of pending requests......................................... 0
Number of timed out requests...................................... 0
Number of misc dropped request received.......................... 0
Number of requests sent............................................ 0
```

**Related Commands**

- `show nac summary`
- `config guest-lan nac`
- `config wlan nac`
- `debug nac`
show nac summary

To display NAC summary information for a Cisco wireless LAN controller, use the `show nac summary` command.

**show nac summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary information of network access control settings:

(Cisco Controller) > `show nac summary`

<table>
<thead>
<tr>
<th>NAC ACL Name</th>
<th>Index</th>
<th>Server Address</th>
<th>Port</th>
<th>State</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>xxx.xxx.xxx.xxx</td>
<td>13336</td>
<td>Enabled</td>
<td></td>
</tr>
</tbody>
</table>

**Related Commands**

- `show nac statistics`
- `config guest-lan nac`
- `config wlan nac`
- `debug nac`
show network

To display the current status of 802.3 bridging for all WLANs, use the `show network` command.

```
show network
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the network details:

```
(Cisco Controller) > show network
```

**Related Commands**

- `config network`
- `show network summary`
- `show network multicast mgid detail`
- `show network multicast mgid summary`
To display the network configuration of the Cisco wireless LAN controller, use the `show network summary` command.

**Show network summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

show netuser

To display the configuration of a particular user in the local user database, use the **show netuser** command.

```
show netuser { detail user_name | guest-roles | summary }
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>detail</code></td>
<td>Displays detailed information about the specified network user.</td>
</tr>
<tr>
<td><code>user_name</code></td>
<td>Network user.</td>
</tr>
<tr>
<td><code>guest_roles</code></td>
<td>Displays configured roles for guest users.</td>
</tr>
<tr>
<td><code>summary</code></td>
<td>Displays a summary of all users in the local user database.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

**Release** | **Modification**
---|---
7.6 | This command was introduced in a release earlier than Release 7.6.

**Release** | **Modification**
---|---
8.3 | This command was introduced.

The following is a sample output of the **show netuser summary** command:

```
(Cisco Controller) > show netuser summary
Maximum logins allowed for a given username ........Unlimited
```

The following is a sample output of the **show netuser detail** command:

```
(Cisco Controller) > show netuser detail john10
username........................................... abc
WLAN Id............................................. Any
Lifetime............................................ Permanent
Description........................................ test user
```

### Related Commands

- `config netuser add`
- `config netuser delete`
- `config netuser description`
- `config netuser guest-role apply`
- `config netuser wlan-id`
- `config netuser guest-roles`
show netuser guest-roles

To display a list of the current quality of service (QoS) roles and their bandwidth parameters, use the `show netuser guest-roles` command.

Syntax Description

- `show netuser guest-roles`

  This command has no arguments or keywords.

Command Default

- None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to display a QoS role for the guest network user:

```
(Cisco Controller) > show netuser guest-roles
Role Name.............................. Contractor
  Average Data Rate.................. 10
  Burst Data Rate.................... 10
  Average Realtime Rate.............. 100
  Burst Realtime Rate............... 100
Role Name.............................. Vendor
  Average Data Rate.................. unconfigured
  Burst Data Rate.................... unconfigured
  Average Realtime Rate.............. unconfigured
  Burst Realtime Rate............... unconfigured
```

Related Commands

- `config netuser add`
- `config netuser delete`
- `config netuser description`
- `config netuser guest-role apply`
- `config netuser wlan-id`
- `show netuser guest-roles`
- `show netuser`
show network multicast mgid detail

To display all the clients joined to the multicast group in a specific multicast group identification (MGID), use the `show network multicast mgid detail` command.

```
show network multicast mgid detail mgid_value
```

**Syntax Description**

<table>
<thead>
<tr>
<th>mgid_value</th>
<th>Number between 550 and 4095.</th>
</tr>
</thead>
</table>

**Command Default**

None.

This example shows how to display details of the multicast database:

```
> show network multicast mgid detail
Mgid ............................... 550
Multicast Group Address ............ 239.255.255.250
Vlan ............................... 0
Rx Packet Count .................... 807399588
No of clients ...................... 1
Client List ........................
   Client MAC  Expire Time (mm:ss)
   00:13:02:23:82:ad  0:20
```

**Related Commands**

- `show network summary`
- `show network multicast mgid detail`
- `show network`
show network multicast mgid summary

To display all the multicast groups and their corresponding multicast group identifications (MGIDs), use the `show network multicast mgid summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display a summary of multicast groups and their MGIDs:

```
> show network multicast mgid summary
Layer2 MGID Mapping:
=-----------------
InterfaceName  vlanId  MGID
--------------------- ----- -------
management      0       0
test            0       9
wired           20      8
Layer3 MGID Mapping:
=----------------------------
Number of Layer3 MGIDs ........... 1
Group address  Vlan   MGID
--------------------- ----- -------
239.255.255.250  0      550
```

**Related Commands**

- `show network summary`
- `show network multicast mgid detail`
- `show network`
show network summary

To display the network configuration settings, use the `show network summary` command.

**show network summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

**show nmsp notify-interval summary**

To display the Network Mobility Services Protocol (NMSP) configuration settings, use the **show nmsp notify-interval summary** command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display NMSP configuration settings:

```
> show nmsp notify-interval summary
NMSP Notification Interval Summary
Client
  Measurement interval:  2 sec
RFID
  Measurement interval:  8 sec
Rogue AP
  Measurement interval:  2 sec
Rogue Client
  Measurement interval:  2 sec
```

**Related Commands**

- clear locp statistics
- clear nmsp statistics
- config nmsp notify-interval measurement
- show nmsp statistics
- show nmsp status
**show nmsp status**

To view the active NMSP connections status, use the `show nmsp status` command.

**show nmsp status**

This command has no arguments or keywords.

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>

**Related Commands**

- `show nmssp notify-interval summary`
- `clear nmssp statistics`
- `config nmssp notify-interval measurement`
- `show nmssp status`
show nmsp subscription

To display the Network Mobility Services Protocol (NMSP) services that are active on the controller, use the `show nmsp subscription` command.

```
show nmsp subscription  { summary  |  detail ip-addr }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays all of the NMSP services to which the controller is subscribed.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays details for all of the NMSP services to which the controller is subscribed.</td>
</tr>
<tr>
<td>ip-addr</td>
<td>Details only for the NMSP services subscribed to by a specific IPv4 or IPv6 address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

This example shows how to display a summary of all the NMSP services to which the controller is subscribed:

```
> show nmsp subscription summary
Mobility Services Subscribed:
Server IP  Services
----------  ---------
10.10.10.31 RSSI, Info, Statistics
```

This example shows how to display details of all the NMSP services:

```
> show nmsp subscription detail 10.10.10.31
Mobility Services Subscribed by 10.10.10.31
Services  Sub-services
----------  ---------
RSSI        Mobile Station, Tags,
Info        Mobile Station,
Statistics  Mobile Station, Tags,

> show nmsp subscription detail 2001:9:6:40::623
Mobility Services Subscribed by 2001:9:6:40::623
Services  Sub-services
----------  ---------
"
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show nmsp subscription</td>
<td>Mobile Station, Tags, Info Mobile Station, Statistics Mobile Station, Tags,</td>
</tr>
</tbody>
</table>
show nmsp subscription summary

To view the mobility services subscribed on controller by Mobility Services Engine, use the `show nmsp subscription summary` command.

**show nmsp subscription summary**

This command has no arguments or keywords.

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows the subscribed mobility services on controller:

```
(Cisco Controller) > show nmsp subscription summary
```
show nmsp subscription group

To display the Network Mobility Services Protocol (NMSP) group subscription details, use the `show nmsp subscription group` command.

```
show nmsp subscription group {summary | detail {services | ap-list} {cmx-ipaddr cmx-subscribed-grp-name}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays the group subscription summary of all the CMX connections.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays details of a subscribed group by a CMX connection.</td>
</tr>
<tr>
<td>services</td>
<td>Displays the services subscribed for a group by the CMX connection.</td>
</tr>
<tr>
<td>ap-list</td>
<td>Displays the AP MAC list subscribed for a group by the CMX connection.</td>
</tr>
<tr>
<td>cmx-ipaddr</td>
<td>CMX connection IP address</td>
</tr>
<tr>
<td>cmx-subscribed-grp-name</td>
<td>CMX subscribed group name</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.7</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the group subscription summary of all the CMX connections:

```
> show nmsp subscription group summary
NMSP connection ip......................... 209.165.200.235

Groups subscribed by this CMX server:
--------------------------------------
No groups subscribed by this CMX server

NMSP connection ip......................... 209.165.200.235

Groups subscribed by this CMX server:
--------------------------------------
CMX_209.165.200.235

NMSP connection ip......................... 209.165.200.235

Groups subscribed by this CMX server:
--------------------------------------
CMX_209.165.200.235
```
show ntp-keys

To display network time protocol authentication key details, use the **show ntp-keys** command.

**show ntp-keys**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to display NTP authentication key details:

```
(Cisco Controller) > show ntp-keys
Ntp Authentication Key Details.................
   Key Index
           ---------
           1
           3
```

**Related Commands**

`config time ntp`
show ntp-keys

To display network time protocol authentication key details, use the `show ntp-keys` command.

```
show ntp-keys
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

</table>

This example shows how to display NTP authentication key details:

```
(Cisco Controller) > show ntp-keys
Ntp Authentication Key Details...............  
Key Index                                  
       ---------  
       1           
       3           
```

**Related Commands**
`config time ntp`
show opendns summary

To display OpenDNS configuration details, use the `show opendns summary` command.

Syntax Description

This command has no keywords or arguments.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.4</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Example

The following example shows how to view an OpenDNS configuration:

```
(Cisco Controller) > show opendns summary
OpenDnsGlobalStatus.......................... Enabled
OpenDns-ApiToken................................ 12
Profile-Name   Device ID   State
--------------- ------------- ------------
guest1 010a8501693bf162 Profile Registered

Profiles Mapped to WLANIDs
-------------------------------
Profile Name   WLAN IDs (Mapped)
--------------- ---------------
guest1         7

Profiles Mapped to APGroup WLAN-IDs
-------------------------------------
Profile Name   Site Name / WLAN IDs (Mapped)
--------------- -----------------------
guest1         NONE

Profiles Mapped to Local Policies
--More-- or {q}uit
-------------------------------
Profile Name   Local Policies (Mapped)
--------------- ---------------
guest1         NONE
```
show pmk-cache

To display information about the pairwise master key (PMK) cache, use the **show pmk-cache** command.

```
show pmk-cache  { all  |  MAC }
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>all</th>
<th>Displays information about all entries in the PMK cache.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>MAC</td>
<td>Information about a single entry in the PMK cache.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display information about a single entry in the PMK cache:

```
(Cisco Controller) >show pmk-cache xx:xx:xx:xx:xx
```

The following example shows how to display information about all entries in the PMK cache:

```
(Cisco Controller) >show pmk-cache all
PMK Cache
Station Lifetime VLAN Override IP Override
----------------- -------- --------------- ---------------
```
show pmipv6 domain

To display the summary information of a PMIPv6 domain, use the **show pmipv6 domain** command.

**show pmipv6 domain domain_name profile profile_name**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>domain_name</strong></td>
<td>Name of the PMIPv6 domain. The domain name can be up to 127 case-sensitive alphanumeric characters.</td>
</tr>
<tr>
<td><strong>profile</strong></td>
<td>Specifies the PMIPv6 profile.</td>
</tr>
<tr>
<td><strong>profile_name</strong></td>
<td>Name of the profile associated with the PMIPv6 domain. The profile name can be up to 127 case-sensitive alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the summary information of a PMIPv6 domain:

(Cisco Controller) >show pmipv6 domain floor1 profile profile1
NAI: @example.com
APN: Example
LMA: Examplelma

NAI: *
APN: ciscoapn
LMA: ciscolma
show pmipv6 mag bindings

To display the binding information of a Mobile Access Gateway (MAG), use the `show pmipv6 mag binding` command.

```
show pmipv6 mag bindings [lma lma_name | nai nai_string]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>lma</th>
<th>(Optional) Displays the binding details of the MAG to an Local Mobility Anchor (LMA).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>lma_name</code></td>
<td>Name of the LMA. The LMA name is case-sensitive and can be up to 127 alphanumeric characters.</td>
</tr>
<tr>
<td>nai</td>
<td>(Optional) Displays the binding details of the MAG to a client.</td>
</tr>
<tr>
<td><code>nai_string</code></td>
<td>Network Access Identifier (NAI) of the client. The NAI is case-sensitive and can be up to 127 alphanumeric characters. You can use all special characters except a colon.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the MAG bindings:

```
(Cisco Controller) >show pmipv6 mag binding
[Binding][MN]: Domain: D1, Nai: MN1@cisco.com
    [Binding][MN]: State: ACTIVE
    [Binding][MN]: Interface: Management
    [Binding][MN]: Hoa: 0xE0E0E02, att: 3, llid: aabb.cc00.c800
    [Binding][MN][LMA]: Id: LMA1
    [Binding][MN][LMA]: lifetime: 3600
    [Binding][MN][GREKEY]: Upstream: 102, Downstream: 1
```
show pmipv6 mag globals

To display the global PMIPv6 parameters of the Mobile Access Gateway (MAG), use the `show pmipv6 mag globals` command.

**show pmipv6 mag globals**

**Syntax Description**
This command has no arguments or keywords.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the global PMIPv6 parameters of a MAG:

```
(Cisco Controller) > show pmipv6 mag globals
Domain : D1
MAG Identifier : M1
  MAG Interface : Management
  Max Bindings : 10000
  Registration Lifetime : 3600 (sec)
  BRI Init-delay time : 1000 (msec)
  BRI Max-delay time : 2000 (msec)
  BRI Max retries : 1
  Refresh time : 300 (sec)
  Refresh RetxInit time : 1000 (msec)
  Refresh RetxMax time : 32000 (msec)
  Timestamp option : Enabled
  Validity Window : 7
Peer#1:
  LMA Name: AN-LMA-5K  LMA IP: 209.165.201.10
Peer#2:
  LMA Name: AN-LMA  LMA IP: 209.165.201.4
Peer#3:
  LMA Name: AN-LMA  LMA IP: 209.165.201.4
```
show pmipv6 mag stats

To display the statistics of the Mobile Access Gateway (MAG), use the `show pmipv6 mag stats` command.

```
show pmipv6 mag stats [domain domain_name peer lma_name]
```

**Syntax Description**

- `domain` (Optional) Displays the MAG statistics for a Local Mobility Anchor (LMA) in the domain.

- `domain_name` Name of the PMIPv6 domain. The domain name is case-sensitive and can be up to 127 alphanumeric characters.

- `peer` (Optional) Displays the MAG statistics for an LMA.

- `lma_name` Name of the LMA. The LMA name is case sensitive and can be up to 127 alphanumeric characters.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This table lists the descriptions of the LMA statistics.

**Table 16: Descriptions of the LMA Statistics:**

<table>
<thead>
<tr>
<th>LMA Statistics</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PBU Sent</td>
<td>Total number of Proxy Binding Updates (PBUs) sent to the LMA by the MAG. PBU is a request message sent by the MAG to a mobile node’s LMA for establishing a binding between the mobile node’s interface and its current care-of address (Proxy-CoA).</td>
</tr>
<tr>
<td>PBA Received</td>
<td>Total number of Proxy Binding Acknowledgements (PBAs) received by the MAG from the LMA. PBA is a reply message sent by an LMA in response to a PBU message that it receives from a MAG.</td>
</tr>
<tr>
<td>PBRI Sent</td>
<td>Total number of Proxy Binding Revocation Indications (PBRI) sent by the MAG to the LMA.</td>
</tr>
<tr>
<td>PBRI Received</td>
<td>Total number of PBRI received from the LMA by the MAG.</td>
</tr>
<tr>
<td>PBRA Sent</td>
<td>Total number of Proxy Binding Revocation Acknowledgements (PBRA) sent by the MAG to the LMA.</td>
</tr>
<tr>
<td>PBRA Received</td>
<td>Total number of PBRA that the MAG receives from the LMA.</td>
</tr>
<tr>
<td>Number of Handoff</td>
<td>Number of handoffs between the MAG and the LMA.</td>
</tr>
</tbody>
</table>
The following example shows how to display the LMA statistics:

(Cisco Controller) > show pmipv6 mag stats
[M1]: Total Bindings : 1
[M1]: PBU Sent : 7
[M1]: PBA Rcvd : 4
[M1]: PBRI Sent : 0
[M1]: PBRI Rcvd : 0
[M1]: PBRA Sent : 0
[M1]: PBRA Rcvd : 0
[M1]: No Of handoff : 0
show pmipv6 profile summary

To display the summary of the PMIPv6 profiles, use the **show pmipv6 profile summary** command.

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the summary of the PMIPv6 profiles:

```
(Cisco Controller) > show pmipv6 profile summary
Profile Name    WLAN IDS (Mapped)
--------------- ------------------
Group1          6
```
show policy

To display the summary of the configured policies, and the details and statistics of a policy, use the show policy command.

show policy  { summary | policy-name [ statistics ] }

Syntax Description

**summary**  Displays the summary of configured policies.

**policy-name**  Name of the policy.

**statistics**  (Optional) Displays the statistics of a policy.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

### Match Device Types
-------

Android

The following example shows how to display the statistics of a policy:

```plaintext
(Cisco Controller) > show policy student-FullAccess statistics

<table>
<thead>
<tr>
<th>Policy Index</th>
<th>student-FullAccess</th>
</tr>
</thead>
<tbody>
<tr>
<td>Matching Attributes None</td>
<td>619</td>
</tr>
<tr>
<td>No Policy Match</td>
<td>224</td>
</tr>
<tr>
<td>Device Type Match</td>
<td>0</td>
</tr>
<tr>
<td>EAP Type Match</td>
<td>0</td>
</tr>
<tr>
<td>Role Type Match</td>
<td>0</td>
</tr>
<tr>
<td>Client Disconnected</td>
<td>4</td>
</tr>
<tr>
<td>Acl Applied</td>
<td>0</td>
</tr>
<tr>
<td>Vlan changed</td>
<td>614</td>
</tr>
<tr>
<td>Session Timeout Applied</td>
<td>4</td>
</tr>
<tr>
<td>QoS Applied</td>
<td>0</td>
</tr>
<tr>
<td>Avg Data Rate Applied</td>
<td>0</td>
</tr>
<tr>
<td>Avg Real Time Rate Applied</td>
<td>0</td>
</tr>
<tr>

<td>0</td>
</tr>
</tbody>
</table>
```
show port

To display the Cisco wireless LAN controller port settings on an individual or global basis, use the **show port** command.

```
show port {port-number | summary | detailed-info | sfp-info | vlan}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>port-number</th>
<th>Port number of the physical interface.</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays a summary of all ports.</td>
</tr>
<tr>
<td>detailed-info</td>
<td>Displays detailed port information.</td>
</tr>
<tr>
<td>sfp-info</td>
<td>Displays SFP information.</td>
</tr>
<tr>
<td>Note</td>
<td>This feature is applicable only to Cisco 5520 and 8540 WLCs.</td>
</tr>
<tr>
<td>vlan</td>
<td>Displays VLAN port table summary.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.8</td>
<td>sfp-info parameter was added.</td>
</tr>
</tbody>
</table>

The following example shows how to display information about an individual wireless LAN controller port:

```
(Cisco Controller) > show port 1
STP Admin Physical Physical Link Link Mcast
Pr Type Stat Mode Mode Status Status Trap Appliance POE
-------- ------ ------- ------- ------ ------- ------- ------- -------
-------- ------ ------- ------- ------ ------- ------- ------- -------
1 Normal Disa Enable Auto 1000 Full Down Enable Enable N/A
```

**Note**

Some WLAN controllers may not have multicast or Power over Ethernet (PoE) listed because they do not support those features.

The following example shows how to display a summary of all ports:
(Cisco Controller) > `show port summary`

<table>
<thead>
<tr>
<th>Pr</th>
<th>Type</th>
<th>Stat</th>
<th>Mode</th>
<th>SFPType</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Normal</td>
<td>Forw</td>
<td>Enable</td>
<td>Auto</td>
</tr>
<tr>
<td>2</td>
<td>Normal</td>
<td>Disa</td>
<td>Enable</td>
<td>Auto</td>
</tr>
<tr>
<td>3</td>
<td>Normal</td>
<td>Disa</td>
<td>Enable</td>
<td>Auto</td>
</tr>
<tr>
<td>4</td>
<td>Normal</td>
<td>Disa</td>
<td>Enable</td>
<td>Auto</td>
</tr>
</tbody>
</table>

Some WLAN controllers may have only one port listed because they have only one physical port.

The following example shows how to display SFP information:

(Cisco Controller) > `show port sfp-info`
(Cisco Controller) > `FP0`

<table>
<thead>
<tr>
<th>Port SFP Vendor</th>
<th>Transceiver Type</th>
<th>OUI</th>
<th>PartNumber</th>
<th>Rev</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 CISCO-AVAGO</td>
<td>(0x08) 1000BaseTX</td>
<td>XXXX-XXXXX</td>
<td>XXXX-XXXXX</td>
<td>ok</td>
</tr>
<tr>
<td>2 Not Present</td>
<td>(0x00) NOT_SUPPORTED</td>
<td>fail</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

FP0.
show profiling policy summary

To display local device classification of the Cisco Wireless LAN Controller (WLC), use the `show profiling policy summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced.</td>
</tr>
</tbody>

show qos

To display quality of service (QoS) information, use the `show qos` command.

```
show qos {bronze | gold | platinum | silver}
```

**Syntax Description**

- **bronze**: Displays QoS information for the bronze profile of the WLAN.
- **gold**: Displays QoS information for the gold profile of the WLAN.
- **platinum**: Displays QoS information for the platinum profile of the WLAN.
- **silver**: Displays QoS information for the silver profile of the WLAN.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display QoS information for the gold profile:

```
> show qos gold
Description................................. For Video Applications
Maximum Priority............................ video
Unicast Default Priority..................... video
Multicast Default Priority................... video
Per-SSID Rate Limits......................... UpstreamDownstream
Average Data Rate............................ 0 0

The following example shows how to display a RADIUS authentication server summary:

```
(Cisco Controller) > show radius summary
Vendor Id Backward Compatibility............... Disabled
Credentials Caching............................... Disabled
Call Station Id Type.............................. IP Address
Administrative Authentication via RADIUS........ Enabled
Authentication Servers
Index Type Server Address Port State Tout RFC-3576 IPsec - AuthMod e/Phase1/Group/Lifetime/Auth/Encr
----- ---- ---------------------- -------- ---- -------- ---------------
Accounting Servers
Index Type Server Address Port State Tout RFC-3576 IPsec - AuthMod e/Phase1/Group/Lifetime/Auth/Encr
----- ---- ---------------------- -------- ---- -------- ---------------
```

**Related Commands**

- show radius auth statistics
- show radius acct statistics
show redundancy interfaces

To display details of redundancy and service port IP addresses, use the `show redundancy interfaces` command.

**show redundancy interfaces**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the redundancy and service port IP addresses information:

```
(Cisco Controller) > show redundancy interfaces

Redundancy Management IP Address.................. 9.4.120.5
Peer Redundancy Management IP Address............. 9.4.120.3
Redundancy Port IP Address....................... 169.254.120.5
Peer Redundancy Port IP Address.................. 169.254.120.3
Peer Service Port IP Address..................... 10.104.175.189
```
show redundancy latency

To display the average latency to reach the management gateway and the peer redundancy management IP address, use the `show redundancy latency` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the average latency to reach the management gateway and the peer redundancy management IP address:

```
(Cisco Controller) >show redundancy latency

Network Latencies (RTT) for the Peer Reachability on the Redundancy Port in micro seconds for the past 10 intervals
Peer Reachability Latency[ 1 ] : 524 usecs
Peer Reachability Latency[ 2 ] : 524 usecs
Peer Reachability Latency[ 3 ] : 522 usecs
Peer Reachability Latency[ 5 ] : 524 usecs
Peer Reachability Latency[ 6 ] : 524 usecs
Peer Reachability Latency[ 7 ] : 522 usecs
Peer Reachability Latency[ 8 ] : 522 usecs
Peer Reachability Latency[ 9 ] : 526 usecs
Peer Reachability Latency[ 10 ] : 523 usecs

Network Latencies (RTT) for the Management Gateway Reachability in micro seconds for the past 10 intervals
Gateway Reachability Latency[ 1 ] : 1347 usecs
Gateway Reachability Latency[ 8 ] : 2853 usecs
Gateway Reachability Latency[ 9 ] : 832 usecs
Gateway Reachability Latency[ 10 ] : 3708 usecs
```
# show redundancy mobilitymac

To display the High Availability (HA) mobility MAC address that is used to communicate with the peer, use the `show redundancy mobilitymac` command.

**show redundancy mobilitymac**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>This command has no arguments or keywords.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>
</tr>
<tr>
<td>Command History</td>
<td></td>
</tr>
<tr>
<td><strong>Release</strong></td>
<td><strong>Modification</strong></td>

<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the HA mobility MAC address used to communicate with the peer:

```
(Cisco Controller) > show redundancy mobilitymac
ff:ff:ff:ff:ff:ff
```
show redundancy peer-route summary

To display the routes assigned to the standby WLC, use the `show redundancy peer-route summary` command.

**show redundancy peer-route summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display all the configured routes of the standby WLC:

(Cisco Controller) > show redundancy peer-route summary
Number of Routes......................... 1

<table>
<thead>
<tr>
<th>Destination Network</th>
<th>Netmask</th>
<th>Gateway</th>
</tr>
</thead>
<tbody>
<tr>
<td>xxx.xxx.xxx.xxx</td>
<td>255.255.255.0</td>
<td>xxx.xxx.xxx.xxx</td>
</tr>
</tbody>
</table>
show redundancy peer-system statistics

To display statistical information about the standby WLC, use the `show redundancy peer-system statistics` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.7</td>
<td>The serial number and fan status of the standby WLC are added to the output of the command.</td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

{Cisco Controller} > `show redundancy peer-system statistics`

```
Peer System CPU statistics: Current CPU(s) load: 0%
Individual CPU load: 0%/1%, 0%/0%, 0%/1%, 0%/0%, 0%/0%, 0%/0%, 0%/0%, 0%/0%, 0%/1%

Peer System Memory Statistics:
Total System Memory............: 1027727360 bytes (980.18 MB)
Used System Memory.............: 535404544 bytes (510.63 MB)
Free System Memory............: 492322816 bytes (469.54 MB)
Bytes allocated from RTOS....: 5550080 bytes (5.29 MB)
Chunks Free....................: 7 bytes
Number of mmapped regions....: 86
Total space in mmapped regions.: 369500160 bytes (352.40 MB)
Total allocated space.........: 4200328 bytes (4.00 MB)
Total non-inuse space..........: 1349752 bytes (1.28 MB)

Peer system Power supply statistics:
Power Supply 1..........................: Present, OK
Power Supply 2........................: Absent
Serial Number.......................: XXXXXXXXX
Fan Status............................: OK
```
show redundancy statistics

To display the statistics information of the Redundancy Manager, use the `show redundancy statistics` command.

**show redundancy statistics**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays the statistics of different redundancy counters.

Local Physical Ports - Connectivity status of each physical port of the controller. 1 indicates that the port is up and 0 indicates that the port is down.

Peer Physical Ports - Connectivity status of each physical port of the peer controller. 1 indicates that the port is up and 0 indicates that the port is down.

The following example shows how to display the statistics information of the Redundancy Manager:

(Cisco Controller) > `show redundancy statistics`

```
Redundancy Manager Statistics

Keep Alive Request Send Counter : 16
Keep Alive Response Receive Counter : 16
Keep Alive Request Receive Counter : 500322
Keep Alive Response Send Counter : 500322
Ping Request to Default GW Counter : 63360
Ping Response from Default GW Counter : 63360
Ping Request to Peer Counter : 12
Ping Response from Peer Counter : 3
Keep Alive Loss Counter : 0
Default GW Loss Counter : 0
Local Physical Ports 1...8 : 10000000
Peer Physical Ports 1...8 : 10000000
```
show redundancy summary

To display the redundancy summary information, use the `show redundancy summary` command.

**show redundancy summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the redundancy summary information of the controller:

```plaintext
(Cisco Controller) > show redundancy summary
Redundancy Mode = SSO DISABLED
  Local State = ACTIVE
  Peer State = N/A
  Unit = Primary
  Unit ID = 88:43:E1:7E:03:80
Redundancy State = N/A
  Mobility MAC = 88:43:E1:7E:03:80
Network Monitor = ENABLED
Link Encryption = DISABLED

  BulkSync Status = <Status>
Average Redundancy Peer Reachability Latency = 1390 usecs
Average Management Gateway Reachability Latency = 1165 usecs

Redundancy Management IP Address................. 9.4.92.12
Peer Redundancy Management IP Address............. 9.4.92.14
Redundancy Port IP Address....................... 169.254.92.12
Peer Redundancy Port IP Address.................. 169.254.92.14
```
show redundancy timers

To display details of the Redundancy Manager timers, use the **show redundancy timers** command.

**show redundancy timers**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the details of the Redundancy Manager timers:

(Cisco Controller) >**show redundancy timers**

```
  Keep Alive Timer : 100 msecs
  Peer Search Timer : 120 secs
```
show remote-lan

To display information about remote LAN configuration, use the **show remote-lan** command.

**show remote-lan** { summary | remote-lan-id }

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>summary</strong></td>
<td>Displays a summary of all remote LANs.</td>
</tr>
<tr>
<td><strong>remote-lan-id</strong></td>
<td>Remote LAN identifier.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>

show reset

To display the scheduled system reset parameters, use the `show reset` command.

```
show reset
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the scheduled system reset parameters:

```
> show reset
System reset is scheduled for Mar 27 01:01:01 2010
Current local time and date is Mar 24 02:57:44 2010
A trap will be generated 10 minutes before each scheduled system reset.
Use ‘reset system cancel’ to cancel the reset.
Configuration will be saved before the system reset.
```

**Related Commands**

- `reset system at`
- `reset system in`
- `reset system cancel`
- `reset system notify-time`
show rfid client

To display the radio frequency identification (RFID) tags that are associated to the controller as clients, use the `show rfid client` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Usage Guidelines**

When the RFID tag is not in client mode, the above fields are blank.

This example shows how to display the RFID tag that is associated to the controller as clients:

```
> show rfid client
------------------ -------- --------- ----------------- ------ ----------------
<table>
<thead>
<tr>
<th>Heard</th>
<th>RFID Mac</th>
<th>VENDOR</th>
<th>Sec Ago</th>
<th>Associated AP</th>
<th>Chnl</th>
<th>Client State</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:14:7e:00:0b:b1</td>
<td>Pango</td>
<td>35</td>
<td>AP0019.e75c.fef4</td>
<td>1</td>
<td>Probing</td>
<td></td>
</tr>
</tbody>
</table>
```

**Related Commands**

- config rfid status
- config rfid timeout
- show rfid config
- show rfid detail
- show rfid summary
show rfid config

To display the current radio frequency identification (RFID) configuration settings, use the `show rfid config` command.

```
show rfid config
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

This example shows how to display the current RFID configuration settings:

```
> show rfid config
RFID Tag Data Collection .................. Enabled
RFID Tag Auto-Timeout ...................... Enabled
RFID Client Data Collection ................. Disabled
RFID Data Timeout ............................ 200 seconds
```

**Related Commands**

- config rfid status
- config rfid timeout
- show rfid client
- show rfid detail
- show rfid summary
**show rfid detail**

To display detailed radio frequency identification (RFID) information for a specified tag, use the `show rfid detail` command.

`show rfid detail mac_address`

**Syntax Description**

| `mac_address` | MAC address of an RFID tag. |

**Command Default**

None.

This example shows how to display detailed RFID information:

```
> show rfid detail 00:12:b8:00:20:52
RFID address..................................... 00:12:b8:00:20:52

```

**Related Commands**

- `config rfid status`
- `config rfid timeout`
- `show rfid config`
- `show rfid client`
- `show rfid summary`
show rfid summary

To display a summary of the radio frequency identification (RFID) information for a specified tag, use the show rfid summary command.

Syntax Description

This command has no arguments or keywords.

Command Default

None.

This example shows how to display a summary of RFID information:

> show rfid summary
Total Number of RFID : 5

<table>
<thead>
<tr>
<th>RFID ID</th>
<th>VENDOR</th>
<th>Closest AP</th>
<th>RSSI</th>
<th>Time Since Last Heard</th>

The following example shows how to display detailed ad-hoc rogue MAC address information:

```plaintext
(Cisco Controller) > show rogue adhoc client detailed 02:61:ce:8e:a8:8c
Adhoc Rogue MAC address: 02:61:ce:8e:a8:8c
Adhoc Rogue BSSID: 02:61:ce:8e:a8:8c
State: Alert
First Time Adhoc Rogue was Reported: Tue Dec 11 20:45:45 2007
Last Time Adhoc Rogue was Reported: Tue Dec 11 20:45:45 2007
Reported By
AP 1
MAC Address: 00:14:1b:58:4a:e0
Name: AP0014.1ced.2a60
Radio Type: 802.11b
SSID: rf4k3ap
Channel: 3
RSSI: -56 dBm
SNR: 15 dB
Encryption: Disabled
ShortPreamble: Disabled
WPA Support: Disabled
Last reported by this AP: Tue Dec 11 20:45:45 2007
```

Related Commands
- `config rogue adhoc`
- `show rogue ignore-list`
- `show rogue rule summary`
show rogue rule detailed
config rogue rule
show rogue adhoc summary
show rogue adhoc friendly summary

To display information about friendly rogue ad-hoc rogue access points, use the `show rogue adhoc friendly summary` command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

```

**Related Commands**

- clear ap
- debug arp
- show arp kernel
- config route add
- config route delete
show route summary

To display the routes assigned to the Cisco wireless LAN controller service port, use the `show route summary` command.

**show route summary**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display all the configured routes:

```plaintext
> show route summary
Number of Routes............................... 1
Destination Network Genmask Gateway
------------------- ------------------- -------------------
xxx.xxx.xxx.xxx 255.255.255.0 xxx.xxx.xxx.xxx
```

**Related Commands**

`config route`
show rules

To display the active internal firewall rules, use the `show rules` command.

```
show rules
```

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3 This command was introduced.

The following example shows how to display active internal firewall rules:

```
(Cisco Controller) > show rules
-------------------------------------------------------------------------
Rule ID.............: 3
Ref count...........: 0
Precedence..........: 99999999
Flags...............: 00000001 ( PASS )
Source IP range:
  (Local stack)
Destination IP range:
  (Local stack)
-------------------------------------------------------------------------
Rule ID.............: 25
Ref count...........: 0
Precedence..........: 99999999
Flags...............: 00000001 ( PASS )
Service Info
  Service name.......: GDB
  Protocol...........: 6
  Source port low....: 0
  Source port high...: 0
  Dest port low......: 1000
  Dest port high.....: 1000
Source IP range:
  IP High............: 0.0.0.0
  Interface..........: ANY
Destination IP range:
  (Local stack)
-------------------------------------------------------------------------
```
show run-config

To display a comprehensive view of the current Cisco wireless LAN controller configuration, use the **show run-config all** command.

`show run-config { all | commands } [ no-ap | commands ]`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>Shows all the commands under the show run-config.</td>
</tr>
<tr>
<td>no-ap</td>
<td>(Optional) Excludes access point configuration settings.</td>
</tr>
<tr>
<td>commands</td>
<td>(Optional) Displays a list of user-configured commands on the controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

These commands have replaced the **show running-config** command.

Some WLAN controllers may have no Crypto Accelerator (VPN termination module) or power supplies listed because they have no provisions for VPN termination modules or power supplies.

The **show run-config all** command shows only values configured by the user. It does not show system-configured default values.

The following is a sample output of the **show run-config all** command:

```
(Cisco Controller) > show run-config all
Press Enter to continue...
System Inventory
Switch Description............................... Cisco Controller
Machine Model....................................
Serial Number.................................... FLS0923003B
Crypto Accelerator 1............................. Absent
Crypto Accelerator 2............................. Absent
Power Supply 1................................... Absent
Power Supply 2................................... Present, OK
Press Enter to continue Or <Ctl Z> to abort...
```
show run-config startup-commands

To display a comprehensive view of the current Cisco wireless LAN controller configuration, use the `show run-config startup-commands` command.

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>run-config</code></td>
<td>Displays the running configuration commands.</td>
</tr>
<tr>
<td><code>startup-commands</code></td>
<td>Display list of configured startup commands on Wireless LAN Controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The configuration commands on the Wireless LAN controller are uploaded to the TFTP or NCS servers using the transfer upload process. The `show run-config startup-commands` command enables the Wireless LAN controller to generate running-configuration in CLI format. The configuration commands generated can be used as backup configuration to restore the network.

**Example**

The following is a sample output of the `show run-config startup-commands` command:

```
show run-config startup-commands
(Cisco Controller) > show run-config startup-commands
This may take some time. Are you sure you want to proceed? (y/N) y

config location expiry tags 5
config mdns profile service add default-mdns-profile AirPrint
config mdns profile service add default-mdns-profile AirTunes
config mdns profile service add default-mdns-profile AppleTV
config mdns profile service add default-mdns-profile HP_Photosmart_Printer_1
config mdns profile service add default-mdns-profile HP_Photosmart_Printer_2
config mdns profile service add default-mdns-profile Printer
config mdns profile create default-
```
show serial

To display the serial (console) port configuration, use the `show serial` command.

```
show serial
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The default values for Baud rate, Character, Flow Control, Stop Bits, Parity type of the port configuration are 9600, 8, off, 1, none.

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

The following example shows how to display EIA-232 parameters and the serial port inactivity timeout:

```
(Cisco Controller) > show serial
Serial Port Login Timeout (minutes)........ 45
Baud Rate.................................. 9600
Character Size............................. 8
Flow Control:............................. Disable
Stop Bits.................................. 1
Parity Type:............................... none
```
show sessions

To display the console port login timeout and maximum number of simultaneous command-line interface (CLI) sessions, use the show sessions command.

show sessions

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

5 minutes, 5 sessions.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the CLI session configuration setting:

```
> show sessions
CLI Login Timeout (minutes)............ 0
Maximum Number of CLI Sessions........ 5
```

The response indicates that the CLI sessions never time out and that the Cisco wireless LAN controller can host up to five simultaneous CLI sessions.

**Related Commands**

- config sessions maxsessions
- config sessions timeout
show snmpcommunity

To display Simple Network Management Protocol (SNMP) community entries, use the **show snmpcommunity** command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display SNMP community entries:

```bash
> show snmpcommunity
SNMP Community Name | Client IP Address | Client IP Mask | Access Mode | Status
-------------------|------------------|---------------|-------------|-------
public             | 0.0.0.0           | 0.0.0.0       | Read Only   | Enable
************       | 0.0.0.0           | 0.0.0.0       | Read/Write  | Enable
```

**Related Commands**

- config snmp community accessmode
- config snmp community create
- config snmp community delete
- config snmp community ipaddr
- config snmp community mode
- config snmp syscontact
show snmpengineID

To display the SNMP engine ID, use the show snmpengineID command.

show snmpengineID

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the SNMP engine ID:

```
> show snmpengineID
SNMP EngineId... fxxxxxxxxxxxxx
```

Related Commands

config snmp engineID
show snmptrap

To display Cisco wireless LAN controller Simple Network Management Protocol (SNMP) trap receivers and their status, use the `show snmptrap` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display SNMP trap receivers and their status:

```
> show snmptrap
SNMP Trap Receiver Name | IP Address   | Status     
-------------------------|--------------|------------
.xxx.xxx.xxx.xxx          | xxx.xxx.xxx.xxx | Enable     
```
show snmpv3user

To display Simple Network Management Protocol (SNMP) version 3 configuration, use the `show snmpv3user` command.

**show snmpv3user**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display SNMP version 3 configuration information:

```
> show snmpv3user
SNMP v3 username   AccessMode   Authentication Encryption
------------------- ----------- -------------- ----------
default            Read/Write  HMAC-SHA      CFB-AES
```

**Related Commands**

- `config snmp v3user create`
- `config snmp v3user delete`
show snmpversion

To display which versions of Simple Network Management Protocol (SNMP) are enabled or disabled on your controller, use the **show snmpversion** command.

**show snmpversion**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Enable.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the SNMP v1/v2/v3 status:

```plaintext
> show snmpversion
SNMP v1 Mode.............................. Disable
SNMP v2c Mode.............................. Enable
SNMP v3 Mode.............................. Enable
```

**Related Commands**

`config snmp version`
show spanningtree port

To display the Cisco wireless LAN controller spanning tree port configuration, use the show spanningtree port command.

**Syntax Description**

```
show spanningtree port [port]
```

- **port**: Physical port number:
  - 1 through 4 on Cisco 2100 Series Wireless LAN Controller.
  - 1 or 2 on Cisco 4402 Series Wireless LAN Controller.
  - 1 through 4 on Cisco 4404 Series Wireless LAN Controller.

**Command Default**

The default SPT configuration output values are 800C, Disabled, 802.1D, 128, 100, Auto.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When the a Cisco 4400 Series wireless LAN controller is configured for port redundancy, the Spanning Tree Protocol (STP) must be disabled for all ports on the Cisco 4400 Series Wireless LAN Controller. STP can remain enabled on the switch connected to the Cisco 4400 Series Wireless LAN Controller.

**Note**

Some WLAN controllers do not support the spanning tree function.

The following example shows how to display spanning tree values on a per port basis:

```
(Cisco Controller) > show spanningtree port 3
STP Port ID................................. 800C
STP Port State.............................. Disabled
STP Port Administrative Mode............. 802.1D
STP Port Priority........................... 128
STP Port Path Cost......................... 100
STP Port Path Cost Mode................... Auto
```
**show spanningtree switch**

To display the Cisco wireless LAN controller network (DS port) spanning tree configuration, use the `show spanningtree switch` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Some WLAN controllers do not support the spanning tree function.

The following example shows how to display spanning tree values on a per switch basis:

```
(Cisco Controller) > show spanningtree switch
STP Specification...................... IEEE 802.1D
STP Base MAC Address................... 00:0B:85:02:0D:20
Spanning Tree Algorithm............... Disable
STP Bridge Priority.................... 32768
STP Bridge Max. Age (seconds)......... 20
STP Bridge Hello Time (seconds)....... 2
STP Bridge Forward Delay (seconds).... 15
```
show stats port

To display physical port receive and transmit statistics, use the `show stats port` command.

```
show stats port { detailed port | summary port }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>detailed</code></td>
<td>Displays detailed port statistics.</td>
</tr>
<tr>
<td><code>summary</code></td>
<td>Displays port summary statistics.</td>
</tr>
<tr>
<td><code>port</code></td>
<td>Physical port number:</td>
</tr>
<tr>
<td></td>
<td>• 1 through 4 on Cisco 2100 Series Wireless LAN Controllers.</td>
</tr>
<tr>
<td></td>
<td>• 1 or 2 on Cisco 4402 Series Wireless LAN Controllers.</td>
</tr>
<tr>
<td></td>
<td>• 1 through 4 on Cisco 4404 Series Wireless LAN Controllers.</td>
</tr>
<tr>
<td></td>
<td>• 1 on Cisco WLCM Series Wireless LAN Controllers.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the port summary information:

```
(Cisco Controller) > show stats port summary
Packets Received Without Error..................... 399958
Packets Received With Error...................... 0
Broadcast Packets Received......................... 8350
Packets Transmitted Without Error................. 106060
Transmit Packets Errors.......................... 0
Collisions Frames................................. 0
Time Since Counters Last Cleared................. 2 day 11 hr 16 min 23 sec
```

The following example shows how to display the detailed port information:

```
(Cisco Controller) > show stats port detailed 1
PACKETS RECEIVED (OCTETS)

show switchconfig

To display parameters that apply to the Cisco wireless LAN controller, use the `show switchconfig` command.

**show switchconfig**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Enabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to display parameters that apply to the Cisco wireless LAN controller:

```
(Cisco Controller) >> show switchconfig
802.3x Flow Control Mode......................... Disabled
FIPS prerequisite features....................... Enabled
Boot Break....................................... Enabled
secret obfuscation............................... Enabled
Strong Password Check Features:
  case-check ...........Disabled
  consecutive-check ....Disabled
  default-check ......Disabled
  username-check ......Disabled
```

**Related Commands**

- `config switchconfig mode`
- `config switchconfig secret-obfuscation`
- `config switchconfig strong-pwd`
- `config switchconfig flowcontrol`
- `config switchconfig fips-prerequisite`
- `show stats switch`
show sysinfo

To display high-level Cisco WLC information, use the `show sysinfo` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

show system iostat

To display CPU statistics, input or output statistics for devices, and partitions with extended statistics of the system, use the `show system iostat` command.

`show system iostat { detail  |  summary }`

**Syntax Description**

**detail**
Provides CPU statistics, input or output statistics for devices, and partitions with extended statistics of the system.

**summary**
Provides CPU statistics, input or output statistics for devices, and partitions of the system.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following is a sample output of the `show system iostat summary` command:

```
(Cisco Controller) > show system iostat summary
Linux 2.6.21_mvlcge500-octeon-mips64_octeon_v2_be (localhost) 10/11/13
avg-cpu: %user %nice %system %iowait %steal %idle
  1.13  0.00  0.27  0.08  0.00  98.52
Device: tps MB_read/s MB_wrtn/s MB_read MB_wrtn
  cfa 1.21  0.02  0.00  15  0
```

The following is a sample output of the `show system iostat detail` command:

```
(Cisco Controller) > show system iostat detail
Linux 2.6.21_mvlcge500-octeon-mips64_octeon_v2_be (localhost) 10/11/13

**show tacacs acct statistics**

To display detailed radio frequency identification (RFID) information for a specified tag, use the `show tacacs acct statistics` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display detailed RFID information:

(Cisco Controller) > `show tacacs acct statistics`

Accounting Servers:
Server Index................................. 1
Server Address................................. 10.0.0.0
Msg Round Trip Time.......................... 0 (1/100 second)
First Requests............................... 1
Retry Requests............................... 0
Accounting Response......................... 0
Accounting Request Success.................. 0
Accounting Request Failure.................. 0
Malformed Msgs.............................. 0
Bad Authenticator Msgs....................... 0
Pending Requests............................ -1
Timeout Requests............................ 1
Unknowntype Msgs............................ 0
Other Drops................................. 0
**show tacacs auth statistics**

To display TACACS+ server authentication statistics, use the `show tacacs auth statistics` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display TACACS server authentication statistics:

```
(Cisco Controller) > show tacacs auth statistics
Authentication Servers:
Server Index..................................... 2
Server Address................................. 10.0.0.2
Msg Round Trip Time............................ 0 (msec)
First Requests.................................. 0
Retry Requests.................................. 0
Accept Responses.............................. 0
Reject Responses.............................. 0
Error Responses............................... 0
Restart Responses............................. 0
Follow Responses.............................. 0
GetData Responses............................. 0
Encrypt no secret Responses.................. 0
Challenge Responses.......................... 0
Malformed Msgs................................ 0
Bad Authenticator Msgs......................... 0
Pending Requests.............................. 0
Timeout Requests............................. 0
Unknowntype Msgs.............................. 0
Other Drops................................... 0
```
show tacacs summary

To display TACACS+ server summary information, use the `show tacacs summary` command.

```
show tacacs summary
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display TACACS server summary information:

```
(Cisco Controller) > show tacacs summary
Authentication Servers
Idx  Server Address  Port  State  Tout
---  ----------------- ------ -------- ----
  2   10.0.0.1         49     Enabled 30

Accounting Servers
Idx  Server Address  Port  State  Tout
---  ----------------- ------ -------- ----
  1   10.0.0.0         49     Enabled 5

Authorization Servers
Idx  Server Address  Port  State  Tout
---  ----------------- ------ -------- ----
  3   10.0.0.3         49     Enabled 5
  4   2001:9:6:40::623 49     Enabled 5
...
```

**Related Commands**

- `config tacacs acct`
- `config tacacs athr`
- `config tacacs auth`
- `show tacacs summary`
- `show tacacs athr statistics`
- `show tacacs auth statistics`
show tech-support

To display Cisco wireless LAN controller variables frequently requested by Cisco Technical Assistance Center (TAC), use the show tech-support command.

show tech-support

Syntax Description

This command has no arguments or keywords.

Command Default

None.

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display system resource information:

```plaintext
> show tech-support
Current CPU Load........................................ 0%
System Buffers
   Max Free Buffers.............................. 4608
   Free Buffers.................................. 4604
   Buffers In Use................................. 4
Web Server Resources
   Descriptors Allocated......................... 152
   Descriptors Used.............................. 3
   Segments Allocated............................. 152
   Segments Used................................. 3
System Resources
   Uptime........................................ 747040 Secs
   Total Ram..................................... 127552 Kbytes
   Free Ram....................................... 19540 Kbytes
   Shared Ram..................................... 0 Kbytes
   Buffer Ram.................................... 460 Kbytes
```
show time

To display the Cisco wireless LAN controller time and date, use the `show time` command.

**show time**

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

This example shows how to display the controller time and date when authentication is not enabled:

```
> show time
Time............................................. Wed Apr 13 09:29:15 2011
Timezone delta................................... 0:0
Timezone location............................ (GMT +5:30) Colombo, New Delhi, Chennai, Kolkata
NTP Servers
  NTP Polling Interval......................... 3600
     Index  NTP Key Index  NTP Server  NTP Msg Auth Status
     -------  -------------  ---------  -------------------------------
     1       0            9.2.60.60  AUTH DISABLED
```

This example shows successful authentication of NTP Message results in the AUTH Success:

```
> show time
Time............................................. Thu Apr  7 13:56:37 2011
Timezone delta................................... 0:0
Timezone location............................ (GMT +5:30) Colombo, New Delhi, Chennai, Kolkata
NTP Servers
  NTP Polling Interval......................... 3600
     Index  NTP Key Index  NTP Server  NTP Msg Auth Status
     -------  -------------  ---------  -------------------------------
     1       1            9.2.60.60  AUTH SUCCESS
```

This example shows that if the packet received has errors, then the NTP Msg Auth status will show AUTH Failure:

```
> show time
Time............................................. Thu Apr  7 13:56:37 2011
Timezone delta................................... 0:0
Timezone location............................ (GMT +5:30) Colombo, New Delhi, Chennai, Kolkata
NTP Servers
  NTP Polling Interval......................... 3600
     Index  NTP Key Index  NTP Server  NTP Msg Auth Status
     -------  -------------  ---------  -------------------------------
     1       10           9.2.60.60  AUTH FAILURE
```

This example shows that if there is no response from NTP server for the packets, the NTP Msg Auth status will be blank:
show time

Time............................................. Thu Apr 7 13:56:37 2011
Timezone delta................................. 0:0
Timezone location............................... (GMT +5:30) Colombo, New Delhi, Chennai, Kolkata

NTP Servers

<table>

Would you like to display more entries? (y/n)
show tunnel profile summary

To show the summary of all the profiles, use the show tunnel profile command.

```
show tunnel profile { summary | detail { profile-name } }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Summary of all profiles.</td>
</tr>
<tr>
<td>detail</td>
<td>Shows details of a specific profile.</td>
</tr>
<tr>
<td>profile-name</td>
<td>Name of the profile.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the summary of all the profiles:

```
show tunnel profile summary
```
show tunnel profile-detail

To show details of a specific profile, use the `show tunnel profile` command.

```
show tunnel profile detail profile-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>detail</td>
<td>Displays details of a specific profile.</td>
</tr>
<tr>
<td>profile-name</td>
<td>Name of the profile.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command History</td>
<td></td>
</tr>
<tr>
<td>Release</td>
<td>Modification</td>
</tr>
<tr>
<td>Release 8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display specific profile details:

```
show tunnel profile detail test
```
show tunnel eogre-summary

To show the global configuration summary, use the `show tunnel eogre` command.

```
show tunnel eogre summary
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>summary</code></td>
<td>Displays the global configuration summary.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the global configuration details:

```
(Cisco Controller) > show tunnel eogre summary
```
show tunnel eogre-statistics

To display the EoGRE Tunnel statistics, use the `show tunnel eogre` command.

```
show tunnel eogrestatistics
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>statistics</td>
<td>Displays the EoGRE Tunnel statistics.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the EoGRE Tunnel statistics details:

```
show tunnel eogre statistics
```
show tunnel eogre-domain-summary

To display the EoGRE domain summary, use the `show tunnel eogre` command.

```
show tunnel eogre-domain-summary
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>summary</th>
<th>Displays the EoGRE domain summary.</th>
</tr>
</thead>
</table>

| Command Default     | None    |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the EoGRE domain summary:

```
show tunnel eogre domain summary
```
show tunnel eogre gateway

To view the EoGRE tunnel gateway summary and statistics, use the show tunnel eogre command.

```
show tunnel eogre gateway \( \text{summary} \mid \text{statistics} \)
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays the EoGRE tunnel gateway summary.</td>
</tr>
<tr>
<td>statistics</td>
<td>Displays the EoGRE tunnel gateway statistics.</td>
</tr>
</tbody>
</table>

| Command Default    | None |

| Usage Guidelines   | The show tunnel eogre gateway summary command lists details of only the FlexConnect central switching clients and Local Mode AP clients. To view the details of FlexConnect local switching clients, use the show ap eogre gateway ap-name command. |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.1</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td></td>
<td>8.5</td>
<td>The statistics parameter was added.</td>
</tr>
</tbody>
</table>
**show watchlist**

To display the client watchlist, use the `show watchlist` command.

```
show watchlist
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display the client watchlist information:

```
(Cisco Controller) >show watchlist
client watchlist state is disabled
```
**show wlan**

To display configuration information for a specified wireless LAN or a foreign access point, or to display wireless LAN summary information, use the `show wlan` command.

`show wlan { apgroups | summary | wlan_id | foreignAp | lobby-admin-access}`

**Syntax Description**

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>apgroups</td>
<td>Displays access point group information.</td>
</tr>
<tr>
<td>summary</td>
<td>Displays a summary of all wireless LANs.</td>
</tr>
<tr>
<td>wlan_id</td>
<td>Displays the configuration of a WLAN. The Wireless LAN identifier range is from 1 to 512.</td>
</tr>
<tr>
<td>foreignAp</td>
<td>Displays the configuration for support of foreign access points.</td>
</tr>
<tr>
<td>lobby-admin-access</td>
<td>Display all wlangs that have lobby-admin-access enabled.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Usage Guidelines**

For 802.1X client security type, which creates the PMK cache, the maximum session timeout that can be set is 86400 seconds when the session timeout is disabled. For other client security such as open, WebAuth, and PSK for which the PMK cache is not created, the session timeout value is shown as infinite when session timeout is disabled.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.4</td>
<td>Shows WLANs which have lobby-admin-access enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of wireless LANs for wlan_id 1:

```
(Cisco Controller) > show wlan 1

show wps ap-authentication summary

To display the access point neighbor authentication configuration on the controller, use the `show wps ap-authentication summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of the Wireless Protection System (WPS) access point neighbor authentication:

```
(Cisco Controller) > show wps ap-authentication summary
AP neighbor authentication is <disabled>.
Authentication alarm threshold is 1.
RF-Network Name: <B1>
```

**Related Commands**

`config wps ap-authentication`
show wps cids-sensor

To display Intrusion Detection System (IDS) sensor summary information or detailed information on a specified Wireless Protection System (WPS) IDS sensor, use the show wps cids-sensor command.

```
show wps cids-sensor { summary | detail index }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays a summary of sensor settings.</td>
</tr>
<tr>
<td>detail</td>
<td>Displays all settings for the selected sensor.</td>
</tr>
<tr>
<td>index</td>
<td>IDS sensor identifier.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display all settings for the selected sensor:

```
(Cisco Controller) > show wps cids-sensor detail1
IP Address....................................... 10.0.0.51
Port............................................. 443
Query Interval................................... 60
Username......................................... Sensor_user1
Cert Fingerprint................................. SHA1: 00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00:00
Query State...................................... Disabled
Last Query Result............................... Unknown
Number of Queries Sent......................... 0
```

**Related Commands**

- config wps ap-authentication
**show wps mfp**

To display Management Frame Protection (MFP) information, use the `show wps mfp` command.

```plaintext
show wps mfp {summary | statistics}
```

**Syntax Description**

- `summary` Displays the MFP configuration and status.
- `statistics` Displays MFP statistics.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of the MFP configuration and status:

```
(Cisco Controller) > show wps mfp summary
Global Infrastructure MFP state.................. DISABLED (*all infrastructure settings are overridden)
Controller Time Source Valid..................... False

WLAN ID  WLAN Name   WLAN Status  Protection Protection
--------- --------------- ---------- --------- ---------- ----------
1 homeap  (WPA2 not configured) Disabled *Enabled Optional but inactive
2 7921   (WPA2 not configured) Enabled   *Enabled Optional but inactive
3 open1  (WPA2 not configured) Enabled   *Enabled Optional but inactive
4 7920   (WPA2 not configured) Enabled   *Enabled Optional but inactive

Infra. Operational --Infra. Capability--
AP Name Validation Radio State Protection Validation
-------------------- ---------- ----- -------------- ---------- ----------
AP1252AG-EW *Enabled b/g Down Full Full
```

The following example shows how to display the MFP statistics:

```
(Cisco Controller) > show wps mfp statistics
BSSID Radio Validator AP Last Source Addr Found Error Type
Count Frame Types
------------------------------- -------------------------------
--- --- ------
no errors
```

**Related Commands**

- `config wps mfp`
show wps shun-list

To display the Intrusion Detection System (IDS) sensor shun list, use the `show wps shun-list` command.

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the IDS system sensor shun list:

```
(Cisco Controller) > show wps shun-list
```

**Related Commands**
`config wps shun-list re-sync`
## show wps signature detail

To display installed signatures, use the `show wps signature detail` command.

**show wps signature detail sig-id**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sig-id</code></td>
<td></td>
<td>Signature ID of an installed signature.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>

<tr>
<td>-----------------</td>
<td>-----------------</td>
<td>---------------</td>
</tr>
<tr>
<td>7.6</td>
<td>None</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

This example shows how to display information on the attacks detected by standard signature 1:

(Cisco Controller) > `show wps signature detail 1`
Signature-ID..................................... 1
Precedence...................................... 1
Signature Name................................... Bcast deauth
Type............................................. standard
FrameType........................................ management
State............................................ enabled
Action........................................... report
Tracking......................................... per Signature and Mac
Signature Frequency............................ 500 pkts/interval
Signature Mac Frequency....................... 300 pkts/interval
Interval......................................... 10 sec
Quiet Time....................................... 300 sec
Description...................................... Broadcast Deauthentication Frame
Patterns:
  0 (Header):0x0:0x0
  4 (Header):0x0:0x0

**Related Commands**

- `config wps signature`
- `config wps signature frequency`
- `config wps signature mac-frequency`
- `config wps signature interval`
- `config wps signature quiet-time`
- `config wps signature reset`
- `show wps signature events`
- `show wps signature summary`
- `show wps summary`
show wps signature events

To display more information about the attacks detected by a particular standard or custom signature, use the show wps signature events command.

```
show wps signature events {summary | {standard | custom} precedenceID {summary | detailed}}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>summary</td>
<td>Displays all tracking signature summary information.</td>
</tr>
<tr>
<td>standard</td>
<td>Displays Standard Intrusion Detection System (IDS) signature settings.</td>
</tr>
<tr>
<td>custom</td>
<td>Displays custom IDS signature settings.</td>
</tr>
<tr>
<td>precedenceID</td>
<td>Signature precedence identification value.</td>
</tr>
<tr>
<td>detailed</td>
<td>Displays tracking source MAC address details.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display the number of attacks detected by all enabled signatures:

```
(Cisco Controller) > show wps signature events summary
Precedence Signature Name Type # Events
---------- ------------------ -------- --------
1 Bcast deauth Standard 2
2 NULL probe resp 1 Standard 1
```

This example shows how to display a summary of information on the attacks detected by standard signature 1:

```
(Cisco Controller) > show wps signature events standard 1 summary
Precedence .................................. 1
Signature Name................................ Bcast deauth
Type............................................. Standard
Number of active events....................... 2
Source MAC Addr | Track Method | Frequency | # APs | Last Heard
----------------- -------------- --------- ----- ------------------------
00:a0:f8:58:60:dd Per Signature 50 1 Wed Oct 25 15:03:05 2006
00:a0:f8:58:60:dd Per Mac 30 1 Wed Oct 25 15:02:53 2006
```

Cisco Wireless Controller Command Reference, Release 8.8
show wps signature events

**Related Commands**

- `config wps signature frequency`
- `config wps signature mac-frequency`
- `config wps signature interval`
- `config wps signature quiet-time`
- `config wps signature reset`
- `config wps signature`
- `show wps signature summary`
- `show wps summary`
show wps signature summary

To see individual summaries of all of the standard and custom signatures installed on the controller, use the `show wps signature summary` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

- show wps signature events
- show wps signature mac-frequency
- show wps summary
- config wps signature
- config wps signature interval
show wps wips statistics

To display the current state of the Cisco Wireless Intrusion Prevention System (wIPS) operation on the controller, use the `show wps wips statistics` command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>

```

**Related Commands**

- `config 802.11 enable`
- `config ap mode`
- `config ap monitor-mode`
- `show ap config`
- `show ap monitor-mode summary`
- `show wps wips summary`
show wps wips summary

To display the adaptive Cisco Wireless Intrusion Prevention System (wIPS) configuration that the Wireless Control System (WCS) forwards to the controller, use the show wps wips summary command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</table>

The following example shows how to display a summary of the wIPS configuration:

(Cisco Controller) > show wps wips summary
Policy Name.................................................. Default
Policy Version............................................... 3

Related Commands

- config 802.11 enable
- config ap mode
- config ap monitor-mode
- show ap config
- show ap monitor-mode summary
- show wps wips statistics
show wps ap-authentication summary

To display the access point neighbor authentication configuration on the controller, use the **show wps ap-authentication summary** command.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to display a summary of the Wireless Protection System (WPS) access point neighbor authentication:

```
(Cisco Controller) > show wps ap-authentication summary
AP neighbor authentication is <disabled>.
Authentication alarm threshold is 1.
RF-Network Name: <B1>
```

**Related Commands**

- `config wps ap-authentication`
show wps ap-authentication summary
PART VIII

Miscellaneous Commands

• Miscellaneous Commands: 1, on page 1921
• Miscellaneous Commands: 2, on page 1927
Miscellaneous Commands: 1

- cping, on page 1922
- eping, on page 1923
- mping, on page 1924
- ping, on page 1925
To test mobility data traffic using CAPWAP, use the `cping` command.

**Syntax Description**

```
cping mobility_peer_IP_address
```

- `mobility_peer_IP_address` IP address of a peer mobility controller.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.5</td>
<td>This command was introduced in the controller 7.5 Release.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command tests the mobility data traffic using the new mobility architecture.

The following example shows how to test the data traffic of a controller with peer mobility IP address as 172.12.35.31:

```plaintext
(Cisco Controller) >cping 172.12.35.31
```
To test the mobility Ethernet over IP (EoIP) data packet communication between two Cisco WLCs, use the `eping` command.

**eping mobility_peer_IP_address**

**Syntax Description**

| IP address of a controller that belongs to a mobility group. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command tests the mobility data traffic over the management interface.

This ping test is not Internet Control Message Protocol (ICMP) based. The term “ping” is used to indicate an echo request and an echo reply message.

The IPv6 address format for this command is not supported.

The following example shows how to test EoIP data packets and to set the IP address of a controller that belongs to a mobility group to 172.12.35.31:

```
(Cisco Controller) >eping 172.12.35.31
```
To test mobility UDP control packet communication between two Cisco WLCs, use the `mping` command.

`mping mobility_peer_IP_address`

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mobility_peer_IP_address</td>
<td>IP address of a controller that belongs to a mobility group.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This test runs over mobility UDP port 16666. It tests whether the mobility control packet can be reached over the management interface.

**Note**

This ping test is not Internet Control Message Protocol (ICMP) based. The term “ping” is used to indicate an echo request and an echo reply message.

The following example shows how to test mobility UDP control packet communications and to set the IP address of a Cisco WLC that belongs to a mobility group to 172.12.35.31:

```shell
(Cisco Controller) > mping 172.12.35.31
```
ping

To send ICMP echo packets to a specified IP address, use the ping command:

```
ping ip-addr interface-name
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ip-addr</td>
<td>IP address of the interface that you are trying to send ICMP echo packets to</td>
</tr>
<tr>
<td>interface-name</td>
<td>Name of the interface to which you are trying to send ICMP echo packets</td>
</tr>
</tbody>
</table>

| Command Default    | None                                                                       |

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

Usage Guidelines

When you run the `ping` command, the CPU spikes up to 98 percent in the “osapi_ping_rx process”. While the `ping` command is running, the terminal and web activity on the Cisco WLC is blocked.

Example

The following example shows how to send ICMP echo packets to an interface:

```
(Cisco Controller) >ping 209.165.200.225 dyn-interface-1
```
ping

capwap ap controller ip address

To configure the controller IP address into the CAPWAP access point from the access point’s console port, use the `capwap ap controller ip address` command.

`capwap ap controller ip address A.B.C.D`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
</table>
| `A.B.C.D`                 | IP address of the controller.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port. This command is applicable for IPv4 addresses only.

**Note**

The access point must be running Cisco IOS Release 12.3(11)JX1 or later releases.

The following example shows how to configure the controller IP address 10.23.90.81 into the CAPWAP access point:

```
ap_console >capwap ap controller ip address 10.23.90.81
```
To configure DHCP release override on Cisco APs, use the `config ap dhcp release-override` command.

```
config ap dhcp release-override { enable | disable } { cisco-ap-name | all }
```

**Syntax Description**
- **enable** - Enables DHCP release override and sets the number of DHCP releases sent by AP to 1. To be used as a workaround for a few DHCP servers that mark the AP's IP address as bad. We recommend that you use this configuration only in highly reliable networks.
- **disable** - Disables DHCP release override and sets the number of DHCP releases sent by AP to 3, which is the default value. This ensures that the DHCP server receives the release message even if one of the packets is lost.
- **cisco-ap-name** - Configuration is applied to the Cisco AP that you enter.
- **all** - Configuration is applied to all Cisco APs.

**Command Default**
Disabled

**Command History**
- **Release**
  - **8.2** - This command was introduced.

**Usage Guidelines**
Use this command when you are using Cisco lightweight APs with Windows Server 2008 R2 or 2012 as the DHCP server.
**capwap ap dot1x**

To configure the dot1x username and password into the CAPWAP access point from the access point’s console port, use the **capwap ap dot1x** command.

```
capwap ap dot1x username user_name password password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>user_name</td>
<td>Dot1x username.</td>
</tr>
<tr>
<td>password</td>
<td>Dot1x password.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port.

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the dot1x username ABC and password pass01:

```
ap_console >capwap ap dot1x username ABC password pass01
```
capwap ap hostname

To configure the access point host name from the access point’s console port, use the `capwap ap hostname` command.

```
capwap ap hostname host_name
```

**Syntax Description**

- `host_name` Hostname of the access point.

**Command Default**

None

**Command History**

- **Release** 7.6
  - **Modification** This command was introduced in a release earlier than Release 7.6.

**Command History**

- **Release** 8.3
  - **Modification** This command was introduced.

**Usage Guidelines**

This command must be entered from an access point’s console port.

**Note**

The access point must be running Cisco IOS Release 12.3(11)JX1 or later releases. This command is available only for the Cisco Lightweight AP IOS Software recovery image (rcvk9w8) without any private-config. You can remove the private-config by using the `clear capwap private-config` command.

This example shows how to configure the hostname WLC into the capwap access point:

```
ap_console >capwap ap hostname WLC
```
capwap ap ip address

To configure the IP address into the CAPWAP access point from the access point’s console port, use the capwap ap ip address command.

```
capwap ap ip address A.B.C.D
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.B.C.D</td>
<td>IP address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>

</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port. This command supports only IPv4 address format.

**Note**

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the IP address 10.0.0.1 into CAPWAP access point:

```
ap_console >capwap ap ip address 10.0.0.1
```
capwap ap ip default-gateway

To configure the default gateway from the access point’s console port, use the `capwap ap ip default-gateway` command.

```
capwap ap ip default-gateway A.B.C.D
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A.B.C.D</td>
<td>Default gateway address of the capwap access point.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command must be entered from an access point’s console port. This command supports only IPv4 address format.

#### Note

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the CAPWAP access point with the default gateway address 10.0.0.1:

```
ap_console >capwap ap ip default-gateway 10.0.0.1
```
capwap ap ipv6 primary-base

To configure the primary controller name and IPv6 address into the CAPWAP access point from the Cisco Wave 1 access point’s console port, use the `capwap ap ipv6 primary-base` command.

```
capwap ap ipv6 primary-base WORD ipv6_addr
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>WORD</code></td>
<td>Name of the primary controller.</td>
</tr>
<tr>
<td><code>ipv6_addr</code></td>
<td>IPv6 address of the primary controller.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports IPv6 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from the Cisco Wave 1 access point’s console port in config mode.

This example shows how to configure the primary controller name WLC1 and primary controller IPv6 address 2001:DB8::1 into the CAPWAP access point:

```
ap_console > capwap ap ipv6 primary-base WLC1 2001:DB8::1
```
# capwap ap log-server

To configure the system log server to log all the CAPWAP errors, use the `capwap ap log-server` command.

```plaintext
capwap ap log-server  A.B.C.D
```

## Syntax Description

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>A.B.C.D</code></td>
<td>IP address of the syslog server.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

This command must be entered from an access point’s console port. This command supports only IPv4 address format.

## Note

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the syslog server with the IP address 10.0.0.1:

```plaintext
ap_console >capwap ap log-server 10.0.0.1
```
**capwap ap mode**

To configure the local or bridge mode on the access point, use the `capwap ap mode` command.

```
capwap ap mode local | bridge
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>local</code></td>
<td>Configures the access point in local mode.</td>
</tr>
<tr>
<td><code>bridge</code></td>
<td>Configures the access point in bridge mode.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
<td>The command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port.

**Note**

When you execute this command, the access point reboots.

The following example shows how to configure an access point in bridge mode:

```
ap_console #capwap ap mode bridge
```
**capwap ap primary-base**

To configure the primary controller name and IP address into the CAPWAP access point from the access point’s console port, use the `capwap ap primary-base` command.

---

**Note**

This command configures the IPv4 and IPv6 address for Cisco Wave 2 APs.

However, this command configures only the IPv4 address for a Cisco Wave 1 AP. To configure Cisco Wave 1 APs with IPv6 address refer the command `capwap ap ipv6 primary-base`

---

**Syntax Description**

```
capwap ap primary-base  WORD  A.B.C.D
```

- **WORD**
  - Name of the primary controller.
- **A.B.C.D**
  - IP address of the primary controller.

---

**Command Default**

None

---

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports IPv4 and IPv6 address format.</td>
</tr>
</tbody>
</table>

---

**Usage Guidelines**

This command must be entered from an access point’s console port in enable mode (elevated access).

This example shows how to configure the primary controller name WLC1 and primary controller IP address 209.165.200.225 into the CAPWAP access point:

```
ap_console > capwap ap primary-base WLC1 209.165.200.225
```
capwap ap primed-timer

To configure the primed timer into the CAPWAP access point, use the `capwap ap primed-timer` command.

```
capwap ap primed-timer  { enable | disable }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables the primed timer settings</td>
</tr>
<tr>
<td>disable</td>
<td>Disables the primed timer settings.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port.

**Note**

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to enable the primed-timer settings:

```
ap_console > capwap ap primed-timer enable
```
capwap ap secondary-base

To configure the name and IP address of the secondary Cisco WLC into the CAPWAP access point from the access point’s console port, use the **capwap ap secondary-base** command.

```
capwap ap secondary-base controller_name controller_ip_address
```

### Syntax Description

<table>
<thead>
<tr>
<th>controller_name</th>
<th>Name of the secondary Cisco WLC.</th>
</tr>
</thead>
<tbody>
<tr>
<td>controller_ip_address</td>
<td>IP address of the secondary Cisco WLC.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command must be entered from an access point’s console port. This command supports only IPv4 address format.

### Note

The access point must be running Cisco Access Point IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the secondary Cisco WLC name as WLC2 and secondary Cisco WLC IP address 209.165.200.226 into the CAPWAP access point:

```
ap_console > capwap ap secondary-base WLC2 209.165.200.226
```
capwap ap tertiary-base

To configure the name and IP address of the tertiary Cisco WLC into the CAPWAP access point from the access point’s console port, use the **capwap ap tertiary-base** command.

```
capwap ap tertiary-base WORDA.B.C.D
```

**Syntax Description**

```
WORD

A.B.C.D
```

- **WORD**
  - Name of the tertiary Cisco WLC.
- **A.B.C.D**
  - IP address of the tertiary Cisco WLC.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port. This command supports only IPv4 address format.

**Note**

The access point must be running Cisco IOS Release 12.3(11)JX1 or later releases.

This example shows how to configure the tertiary Cisco WLC with the name WLC3 and secondary Cisco WLC IP address 209.165.200.227 into the CAPWAP access point:

```
ap_console > capwap ap tertiary-base WLC3 209.165.200.227
```
**lwapp ap controller ip address**

To configure the Cisco WLC IP address into the FlexConnect access point from the access point’s console port, use the **lwapp ap controller ip address** command.

**lwapp ap controller ip address A.B.C.D**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>A.B.C.D</th>
<th>IP address of the controller.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports only IPv4 address format.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command must be entered from an access point’s console port. This command is applicable for IPv4 addresses only.

Prior to changing the FlexConnect configuration on an access point using the access point’s console port, the access point must be in standalone mode (not connected to a controller) and you must remove the current LWAPP private configuration by using the **clear lwapp private-config** command.

**Note**

The access point must be running Cisco IOS Release 12.3(11)JX1 or higher releases.

The following example shows how to configure the controller IP address 10.92.109.1 into the FlexConnect access point:

```
ap_console > lwapp ap controller ip address 10.92.109.1
```
reset system at

To reset the system at a specified time, use the `reset system at` command.

```
reset system at YYYY-MM-DD HH: MM: SS image {no-swap | swap} reset-aps [save-config]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>YYYY-MM-DD</td>
<td>Specifies the date.</td>
</tr>
<tr>
<td>HH: MM: SS</td>
<td>Specifies the time in a 24-hour format.</td>
</tr>
<tr>
<td>image</td>
<td>Configures the image to be rebooted.</td>
</tr>
<tr>
<td>swap</td>
<td>Changes the active boot image; boots the non-active image and sets the default flag on it on the next reboot.</td>
</tr>
<tr>
<td>no-swap</td>
<td>Boots from the active image.</td>
</tr>
<tr>
<td>reset-aps</td>
<td>Resets all access points during the system reset.</td>
</tr>
<tr>
<td>save-config</td>
<td>(Optional) Saves the configuration before the system reset.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to reset the system at 2010-03-29 and 12:01:01 time:

```
(Cisco Controller) > reset system at 2010-03-29 12:01:01 image swap reset-aps save-config
```
reset system in

To specify the amount of time delay before the devices reboot, use the `reset system in` command.

```
reset system in HH :MM :SS image {swap | no-swap} reset-aps save-config
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HH :MM :SS</td>
<td>Specifies a delay in duration.</td>
</tr>
<tr>
<td>image</td>
<td>Configures the image to be rebooted.</td>
</tr>
<tr>
<td>swap</td>
<td>Changes the active boot image; boots the non-active image and sets the default flag on it on the next reboot.</td>
</tr>
<tr>
<td>no-swap</td>
<td>Boots from the active image.</td>
</tr>
<tr>
<td>reset-aps</td>
<td>Resets all access points during the system reset.</td>
</tr>
<tr>
<td>save-config</td>
<td>Saves the configuration before the system reset.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>
```

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to reset the system after a delay of 00:01:01:

```
(Cisco Controller) > reset system in 00:01:01 image swap reset-aps save-config
```
reset system cancel

To cancel a scheduled reset, use the **reset system cancel** command.

```
reset system cancel
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to cancel a scheduled reset:

```
(Cisco Controller) > reset system cancel
```
reset system notify-time

To configure the trap generation prior to scheduled resets, use the `reset system notify-time` command.

```
reset system notify-time minutes
```

**Syntax Description**

| minutes | Number of minutes before each scheduled reset at which to generate a trap. |

**Command Default**

The default time period to configure the trap generation prior to scheduled resets is 10 minutes.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the trap generation to 10 minutes before the scheduled resets:

```
(Cisco Controller) > reset system notify-time 55
```
reset peer-system

To reset the peer controller, use the reset peer-system command.

reset peer-system

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to reset the peer controller:

```
> reset peer-system
```
save config

To save the controller configurations, use the `save config` command.

**save config**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>This command has no arguments or keywords.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command Default</td>
<td>None</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to save the controller settings:

```
(Cisco Controller) > save config
Are you sure you want to save? (y/n) y
Configuration Saved!
```
**transfer download certpassword**

To set the password for the .PEM file so that the operating system can decrypt the web administration SSL key and certificate, use the `transfer download certpassword` command.

```bash
transfer download certpassword private_key_password
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>private_key_password</code></td>
<td>Certificate’s private key password.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to transfer a file to the switch with the certificate’s private key password `certpassword`:

```
(Cisco Controller) > transfer download certpassword
Clearing password
```
**transfer download datatype**

To set the download file type, use the `transfer download datatype` command.

```
transfer download datatype { avc-protocol-pack | code | config | eapdevcert | eapcacert | icon | image | ipseccacert | ipsecdevcert | login-banner | radius-avplist | signature | webadmincert | webauthbundle | webauthcert }
```

### Syntax Description

- **avc-protocol-pack**: Downloads an AVC protocol pack to the system.
- **code**: Downloads an executable image to the system.
- **config**: Downloads the configuration file.
- **eapcacert**: Downloads an EAP ca certificate to the system.
- **eapdevcert**: Downloads an EAP dev certificate to the system.
- **icon**: Downloads an executable image to the system.
- **image**: Downloads a web page login to the system.
- **ipseccacert**: Downloads an IPSec Certificate Authority (CA) certificate to the system.
- **ipsecdevcert**: Downloads an IPSec dev certificate to the system.
- **login-banner**: Downloads the controller login banner. Only text file is supported with a maximum of 1500 bytes.
- **radius-avplist**: Downloads the RADIUS AVPs in the XML file format from the FTP server.
- **signature**: Downloads a signature file to the system.
- **webadmincert**: Downloads a certificate for web administration to the system.
- **webauthbundle**: Downloads a custom webauth bundle to the system.
- **webauthcert**: Downloads a web certificate for the web portal to the system.

### Command Default

None

### Command History

**Release** | **Modification**
--- | ---
7.6 | This command was introduced in a release earlier than Release 7.6.
8.0 | The `ipseccacert`, `ipsecdevcert`, and `radius-avplist` options were introduced.
The following example shows how to download an executable image to the system:

(Cisco Controller) > transfer download datatype code
transfer download datatype icon

To download icon from TFTP or FTP server onto the controller, use the transfer download datatype icon command.

### Syntax Description

| None |

### Command Default

None

### Command Modes

WLAN configuration

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Example**

This example shows how to download icon from TFTP or FTP server onto the controller:

```
Cisco Controller > transfer download datatype icon
```
**transfer download filename**

To download a specific file, use the `transfer download filename` command.

```
transfer download filename filename
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>filename</td>
<td>Filename that contains up to 512 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot use special characters such as `\ : * ? " < >` for the filename.

The following example shows how to transfer a file named build603:

```
(Cisco Controller) > transfer download filename build603
```
**transfer download mode**

To set the transfer mode, use the `transfer download mode` command.

```
transfer upload mode {ftp | tftp | sftp}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>ftp</th>
<th>Sets the transfer mode to FTP.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>tftp</td>
<td>Sets the transfer mode to TFTP.</td>
</tr>
<tr>
<td></td>
<td>sftp</td>
<td>Sets the transfer mode to SFTP.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to transfer a file using the TFTP mode:

```
(Cisco Controller) > transfer download mode tftp
```
transfer download password

To set the password for an FTP transfer, use the transfer download password command.

```
transfer download password password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>password</th>
<th>Password.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the password for FTP transfer to pass01:

```
(Cisco Controller) > transfer download password pass01
```
**transfer download path**

To set a specific FTP or TFTP path, use the `transfer download path` command.

```
transfer download path path
```

**Syntax Description**

- **path**
  - Directory path.

**Note**
Path names on a TFTP or FTP server are relative to the server’s default or root directory. For example, in the case of the Solarwinds TFTP server, the path is “/”.

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot use special characters such as `\: * ? " < > |` for the file path.

The following example shows how to transfer a file to the path `c:\install\version2`:

```
(Cisco Controller) > transfer download path c:\install\version2
```
transfer download port

To specify the FTP port, use the `transfer download port` command.

```
transfer download port port
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td></td>
<td>FTP port.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>The default FTP port is 21.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Release Modification</td>
<td></td>
<td></td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
<td></td>
</tr>
</tbody>
</table>

The following example shows how to specify FTP port number 23:

```
(Cisco Controller) > transfer download port 23
```
transfer download serverip

To configure the IPv4 or IPv6 address of the TFTP server from which to download information, use the `transfer download serverip` command.

`transfer download serverip IP addr`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>IP addr</code></td>
<td>TFTP server IPv4 or IPv6 address.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>

<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Release</strong></td>
<td><strong>Modification</strong></td>
</tr>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the IPv4 address of the TFTP server:

(Cisco Controller) > `transfer download serverip 175.34.56.78`

The following example shows how to configure the IPv6 address of the TFTP server:

(Cisco Controller) > `transfer download serverip 2001:10:1:1::1`
transfer download start

To initiate a download, use the transfer download start command.

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to initiate a download:

(Cisco Controller) > transfer download start
Mode................................. TFTP
Data Type.............................. Site Cert
TFTP Server IP........................ 172.16.16.78
TFTP Path.............................. directory path
TFTP Filename.......................... webadmincert_name
This may take some time.
Are you sure you want to start? (y/n) Y
TFTP Webadmin cert transfer starting.
Certificate installed.
Please restart the switch (reset system) to use the new certificate.
transfer download tftpPktTimeout

To specify the TFTP packet timeout, use the transfer download tftpPktTimeout command.

transfer download tftpPktTimeout timeout

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timeout</td>
<td>Timeout in seconds between 1 and 254.</td>
</tr>
</tbody>
</table>

Command Default

None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to transfer a file with the TFTP packet timeout of 55 seconds:

(Cisco Controller) > transfer download tftpPktTimeout 55
**transfer download tftpMaxRetries**

To specify the number of allowed TFTP packet retries, use the `transfer download tftpMaxRetries` command.

```
transfer download tftpMaxRetries retries
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>retries</th>
<th>Number of allowed TFTP packet retries between 1 and 254 seconds.</th>
</tr>
</thead>
</table>

| Command Default     | None    |
| Command History     |         |

<table>
<thead>
<tr>

</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the number of allowed TFTP packet retries to 55:

```
(Cisco Controller) > transfer download tftpMaxRetries 55
```
transfer download username

To specify the FTP username, use the `transfer download username` command.

```
transfer download username username
```

**Syntax Description**

<table>
<thead>
<tr>
<th>username</th>
<th>Username.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>

<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the FTP username to `ftp_username`:

```
(Cisco Controller) > transfer download username ftp_username
```
transfer encrypt

To configure encryption for configuration file transfers, use the `transfer encrypt` command.

```
transfer encrypt { enable | disable | set-key key }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>enable</code></td>
<td>Enables the encryption settings.</td>
</tr>
<tr>
<td><code>disable</code></td>
<td>Disables the encryption settings.</td>
</tr>
<tr>
<td><code>set-key</code></td>
<td>Specifies the encryption key for configuration file transfers.</td>
</tr>
<tr>
<td><code>key</code></td>
<td>Encryption key for config file transfers.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to enable the encryption settings:

```
(Cisco Controller) > transfer encrypt enable
```
**transfer upload datatype**

To set the controller to upload specified log and crash files, use the `transfer upload datatype` command.

```
transfer upload datatype { ap-crash-data | config | coredump | crashfile | debug-file |
eapcacert | eapdevcert | errorlog | invalid-config | ipseccacert | ipsecdevcert | pac |
packet-capture | panic-crash-file | radio-core-dump | radius-avplist | rrm-log | run-config |
signature | systemtrace | traplog | watchdog-crash-file | webadmincert | webauthbundle | webauthcert | webauth-ca-cert | yang-bundle }
```

### Syntax Description

<table>
<thead>
<tr>
<th>datatype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ap-crash-data</td>
<td>Uploads the AP crash files.</td>
</tr>
<tr>
<td>config</td>
<td>Uploads the system configuration file.</td>
</tr>
<tr>
<td>coredump</td>
<td>Uploads the core-dump file.</td>
</tr>
<tr>
<td>crashfile</td>
<td>Uploads the system crash file.</td>
</tr>
<tr>
<td>debug-file</td>
<td>Uploads the system's debug log file.</td>
</tr>
<tr>
<td>eapcacert</td>
<td>Uploads an EAP CA certificate.</td>
</tr>
<tr>
<td>eapdevcert</td>
<td>Uploads an EAP Dev certificate.</td>
</tr>
<tr>
<td>errorlog</td>
<td>Uploads the system error log file.</td>
</tr>
<tr>
<td>invalid-config</td>
<td>Uploads the system invalid-config file.</td>
</tr>
<tr>
<td>ipseccacert</td>
<td>Uploads CA certificate file.</td>
</tr>
<tr>
<td>ipsecdevcert</td>
<td>Uploads device certificate file.</td>
</tr>
<tr>
<td>pac</td>
<td>Uploads a Protected Access Credential (PAC).</td>
</tr>
<tr>
<td>packet-capture</td>
<td>Uploads a packet capture file.</td>
</tr>
<tr>
<td>panic-crash-file</td>
<td>Uploads the kernel panic information file.</td>
</tr>
<tr>
<td>radio-core-dump</td>
<td>Uploads the system error log.</td>
</tr>
<tr>
<td>radius-avplist</td>
<td>Uploads the XML file from the controller to the RADIUS server.</td>
</tr>
<tr>
<td>rrm-log</td>
<td>Uploads the system's trap log.</td>
</tr>
<tr>
<td>run-config</td>
<td>Uploads the WLC's running configuration</td>
</tr>
<tr>
<td>signature</td>
<td>Uploads the system signature file.</td>
</tr>
<tr>
<td>systemtrace</td>
<td>Uploads the system trace file.</td>
</tr>
<tr>
<td>traplog</td>
<td>Uploads the system trap log.</td>
</tr>
</tbody>
</table>
watchdog-crash-file
Uploads a console dump file resulting from a software-watchdog-initiated controller reboot following a crash.

webadmincert
Uploads Web Admin certificate.

webauthbundle
Uploads a Web Auth bundle.

webauthcert
Upload a web certificate.

webauth-ca-cert
Upload a Webhook CA certificate.

yang-bundle
Upload the YANG files.

Command Default
None

Command History
Release Modification
7.6 This command was introduced in a release earlier than Release 7.6.
8.0 The ipseccacert, ipsecevcer, and radius-avplist options were introduced.
8.8 The webauth-ca-cert and yang-bundle options were introduced.

The following example shows how to upload the system error log file:

(Cisco Controller) > transfer upload datatype errorlog
transfer upload filename

To upload a specific file, use the `transfer upload filename` command.

```
transfer upload filename filename
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>filename</th>
<th>Filename that contains up to 16 alphanumeric characters.</th>
</tr>
</thead>
</table>

<table>

<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot use special characters such as `\: *?"<>|` for the filename.

The following example shows how to upload a file build603:

```
(Cisco Controller) > transfer upload filename build603
```
**transfer upload mode**

To configure the transfer mode, use the `transfer upload mode` command.

```
transfer upload mode {ftp | tftp | sftp}
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ftp</td>
<td>Sets the transfer mode to FTP.</td>
</tr>
<tr>
<td>tftp</td>
<td>Sets the transfer mode to TFTP.</td>
</tr>
<tr>
<td>sftp</td>
<td>Sets the transfer mode to SFTP.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

The following example shows how to set the transfer mode to TFTP:

```
(Cisco Controller) > transfer upload mode tftp
```
transfer upload pac

To load a Protected Access Credential (PAC) to support the local authentication feature and allow a client to import the PAC, use the `transfer upload pac` command.

`transfer upload pac username validity password`

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>username</code></td>
<td>User identity of the PAC.</td>
</tr>
<tr>
<td><code>validity</code></td>
<td>Validity period (days) of the PAC.</td>
</tr>
<tr>
<td><code>password</code></td>
<td>Password to protect the PAC.</td>
</tr>
</tbody>
</table>

**Command Default**: None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The client upload process uses a TFTP or FTP server.

The following example shows how to upload a PAC with the username `user1`, validity period 53, and password `pass01`:

{(Cisco Controller) > `transfer upload pac user1 53 pass01`
transfer upload password

To configure the password for FTP transfer, use the `transfer upload password` command.

**Syntax Description**

| `password` | Password needed to access the FTP server. |

```
transfer upload password password
```

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to configure the password for the FTP transfer to pass01:

```
(Cisco Controller) > transfer upload password pass01
```
transfer upload path

To set a specific upload path, use the **transfer upload path** command.

```
transfer upload path path
```

**Syntax Description**

<table>
<thead>
<tr>
<th>path</th>
<th>Server path to file.</th>
</tr>
</thead>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

8.3 This command was introduced.

**Usage Guidelines**

You cannot use special characters such as `\: * ? " < > |` for the file path.

The following example shows how to set the upload path to `c:\install\version2`:

```
(Cisco Controller) > transfer upload path c:\install\version2
```
transfer upload peer-start

To upload a file to the peer WLC, use the transfer upload peer-start command.

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to start uploading a file to the peer controller:

(Cisco Controller) > transfer upload peer-start
Mode...................... FTP
FTP Server IP......................... 209.165.201.1
FTP Server Port...................... 21
FTP Path.......................... /builds/nimm/
FTP Filename...................... AS_5500_7_4_1_20.aes
FTP Username...................... wnbu
FTP Password...................... *********
Data Type....................... Error Log

Are you sure you want to start upload from standby? (y/N) n

Transfer Canceled
transfer upload port

To specify the FTP port, use the `transfer upload port` command.

```
transfer upload port port
```

**Syntax Description**

- `port` Port number.

**Command Default**

The default FTP port is 21.

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to specify FTP port 23:

```
(Cisco Controller) > transfer upload port 23
```
transfer upload serverip

To configure the IPv4 or IPv6 address of the TFTP server to upload files to, use the **transfer upload serverip** command.

```
transfer upload serverip IP addr
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>IP addr</strong></td>
<td>TFTP Server IPv4 or IPv6 address.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
<tr>
<td>8.0</td>
<td>This command supports both IPv4 and IPv6 address formats.</td>
</tr>
</tbody>
</table>

The following example shows how to set the IPv4 address of the TFTP server to 175.31.56.78:

```
(Cisco Controller) > transfer upload serverip 175.31.56.78
```

The following example shows how to set the IPv6 address of the TFTP server to 175.31.56.78:

```
(Cisco Controller) > transfer upload serverip 2001:10:1:1::1
```
transfer upload start

To initiate an upload, use the transfer upload start command.

**transfer upload start**

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

The following example shows how to initiate an upload of a file:

```shell
(Cisco Controller) > transfer upload start
Mode: TFTP
TFTP Server IP: 172.16.16.78
TFTP Path: c:\find\off/
TFTP Filename: wpa_2_0_75_0.aes
Data Type: Code
Are you sure you want to start? (y/n) n
Transfer Cancelled
```
transfer upload username

To specify the FTP username, use the transfer upload username command.

**Syntax Description**

| username | Username required to access the FTP server. The username can contain up to 31 characters. |

**Command Default**

None

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.6</td>
<td>This command was introduced in a release earlier than Release 7.6.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.3</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

The following example shows how to set the FTP username to ftp_username:

(Cisco Controller) > transfer upload username ftp_username
transfer upload username
