## Information About Private Preshared Key

With the advent of Internet of Things (IoT), the number of devices that connect to the internet has increased manifold. Not all of these devices support the 802.1x supplicant and need an alternate mechanism to connect to the internet. One of the security mechanisms, WPA-PSK, could be considered as an alternative. With the current configuration, the PSK is the same for all the clients that connect to the same WLAN. In certain deployments, such as educational institutions, this results in the key being shared to unauthorized users leading to security breach. This necessitates the need to provision unique PSKs for different clients on a large scale.

Identity PSKs are unique PSKs created for individuals or groups of users on the same SSID. No complex configuration is required for the clients. It provides the same simplicity of PSK, making it ideal for IoT, Bring your own device (BYOD), and guest deployments.

Identity PSKs are supported on most devices, in which 802.1X is not, enabling stronger security for IoT. It is possible to easily revoke access, for a single device or individual without affecting everyone else. Thousands of keys can easily be managed and distributed through the AAA server.

---

**Note** Special characters, such as '<' and '>' are not supported in SSID Preshared key.

---

---

**Note** PSK supports whitespace in passwords (before or after or in-between) within double quotes only; single quotes for whitespaces are not supported.

---

**IPSK Solution**

During client authentication, the AAA server authorizes the client MAC address and sends the passphrase (if configured) as part of the Cisco-AV pair list. The Cisco Wireless Controller (WLC) receives this as part of the RADIUS response and processes this further for the computation of PSKs.

When a client sends an association request to the SSID broadcast by the corresponding access point, the controller forms the RADIUS request packet with the particular mac address of the client and relays to the RADIUS server.

The RADIUS server performs the authentication and checks whether the client is allowed or not and sends either ACCESS-ACCEPT or ACCESS-REJECT as response to the WLC.

To support Identity PSKs, in addition to sending the authentication response, the authentication server also provides the AV pair passphrase for this specific client. This is used for the computation of the PMK.

The RADIUS server might also provide additional parameters, such as username, VLAN, Quality of Service (QoS), and so on, in the response, that is specific to this client. For multiple devices owned by a single user, the passphrase can remain the same.

---

**Note** When the PSK length is less than 15 characters in Federal Information Processing Standard (FIPS), the controller allows the WLAN configuration but displays the following error message on the console:  
**"AP is allowed to join but corresponding WLAN will not be pushed to the access point"**

---

## Configuring a PSK in a WLAN (CLI)

Follow the procedure given below to configure a PSK in a WLAN:

**Before you begin**

- Security should be configured for a pre-shared key (PSK) in a WLAN.
- If there is no override from the AAA server, the value on the corresponding WLAN is considered for authentication.
- In Federal Information Processing Standard (FIPS) and common criteria mode, ensure that the PSK WLAN has a minimum of 15 ASCII characters, else APs won't join the controller.

**Procedure**

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wlan wlan-name wlan-id ssid</b>  <b>Example:</b> Device(config)# wlan test-profile 4 abc	Configures the WLAN and SSID.

	Command or Action	Purpose
<b>Step 3</b>	<b>no security wpa akm dot1x</b> <b>Example:</b> Device(config-wlan)# no security wpa akm dot1x	Disables security AKM for dot1x.
<b>Step 4</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Configures the security type PSK.
<b>Step 5</b>	<b>security wpa akm psk set-key ascii/hex key</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk set-key ascii 0	Configures the PSK authenticated key management (AKM) shared key. <b>Note</b> You must set the <b>psk set-key</b> before configuring AKM PSK.
<b>Step 6</b>	<b>security wpa akm psk</b> <b>Example:</b> Device(config-wlan)# security wpa akm psk	Configures PSK support.
<b>Step 7</b>	<b>security wpa wpa2 mpsk</b> <b>Example:</b> Device(config-wlan)# security wpa wpa2 mpsk	Configures multi-preshared key (MPSK) support. <b>Note</b> AKM PSK should be enabled for MPSK to work.
<b>Step 8</b>	<b>mac-filtering auth-list-name</b> <b>Example:</b> Device(config-wlan)# mac-filtering test1	Specifies MAC filtering in a WLAN.

## Configuring a PSK in a WLAN (GUI)

### Procedure

- 
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** On the **Wireless Networks** page, click **Security** tab.
- Step 3** In the **Layer 2** window that is displayed, go to the **WPA Parameters** section.
- Step 4** From the **Auth Key Mgmt** drop-down, select the PSK format and type.
- Step 5** Enter the Pre-Shared Key in hexadecimal characters.
- If you selected the PSK format as HEX, the key length must be exactly 64 characters.
  - If you selected the PSK format as ASCII, the key length must be in the range of 8-63 characters.

Note that once you have configured the key, these details are not visible even if you click on the eye icon next to the preshared key box, due to security reasons.

**Step 6** Click **Save & Apply to Device**.

## Applying a Policy Profile to a WLAN (GUI)

### Procedure

- Step 1** Choose **Configuration > Tags & Profiles > Tags**.
- Step 2** On the **Manage Tags** page, click **Policy** tab.
- Step 3** Click **Add** to view the **Add Policy Tag** window.
- Step 4** Enter a name and description for the policy tag.
- Step 5** Click **Add** to map WLAN and policy.
- Step 6** Choose the WLAN profile to map with the appropriate policy profile, and click the tick icon.
- Step 7** Click **Save & Apply to Device**.

## Applying a Policy Profile to a WLAN (CLI)

Follow the procedure given below to a apply policy profile to a WLAN:

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> Device# configure terminal	Enters global configuration mode.
<b>Step 2</b>	<b>wireless profile policy <i>policy-profile-name</i></b>  <b>Example:</b> Device(config)# wireless profile policy policy-iot	Configures the default policy profile.
<b>Step 3</b>	<b>aaa-override</b>  <b>Example:</b> Device(config-wireless-policy)# aaa-override	Configures AAA override to apply policies coming from the AAA server or ISE the Cisco Identify Services Engine (ISE) server.

# Verifying a Private PSK

Use the following **show** commands to verify the configuration of a WLAN and a client:

```
Device# show wlan id 2
```

```

WLAN Profile Name      : test_ppsk
=====
Identifier              : 2
Network Name (SSID)    : test_ppsk
