gas-ap-rate-limit

To set the number of Generic Advertisement Service (GAS) or Access Network Query Protocol (ANQP) request action frames sent to the controller by an access point (AP) for a given duration, use the **gas-ap-rate-limit** command.

gas-ap-rate-limit number-of-requests request-limit-interval

number-of-requests	Number of GAS or ANQP requests allo	owed in a given interval. Valid range is from
	1-100.	
request-limit-interval	Interval in which the maximum numbe from 100-1000 milliseconds.	ers of requests is applicable. Valid range is
Limit is not enabled.		
AP Profile Configuration	on (config-ap-profile)	
Release	Modification	-
Cisco IOS XE Gibralta	r 16.12.1 This command was introduced.	-
	Limit is not enabled. AP Profile Configuration Release	request-limit-interval Interval in which the maximum number from 100-1000 milliseconds. Limit is not enabled. AP Profile Configuration (config-ap-profile) Release Modification Cisco IOS XE Gibraltar 16.12.1 This command was

Example

The following example shows how to configure the number of GAS or ANQP request action frames sent to the controller by an AP for a given duration:

Device(config)# ap profile hotspot
Device(config-ap-profile)# gas-ap-rate-limit 12 120

group

To configure a group for a venue and a venue type, use the **group** command. To remove the group, use the **no** form of the command.

group venue-group venue-type

Syntax Description	venue-group			ness, educational, industrial, institutional, , unspecified, utility, and vehicular.
	venue-type	Venue type. The	e options vary based on the	venue-group.
Command Default	None			
Command Modes	Wireless ANQ	P Server Configu	ration (config-wireless-anq	p-server)
Command Modes Command History	Wireless ANQ	P Server Configu	ration (config-wireless-anq Modification	p-server)

Example

The following example shows how to configure a group for a venue and a venue type:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# group business bank

gtk-randomize

To configure random-GTK for hole-196 mitigation, use the **gtk-randomize** command. Use the **no** form of the command to remove the icon.

gtk-randomize

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	WLAN Configuration (config-w	vlan)	
Command History	Release Modification		
	Cisco IOS XE Gibraltar 16.12.1	This command was	

Usage Guidelines The GTK used for each mobile device should be different from every GTK used for the other mobile devices associated to the BSS.

Example

The following example shows how to configure random-GTK for hole-196 mitigation.

Device(config-wlan)# security wpa wpa2 gtk-randomize

gnxi (Insecure Mode)

gNXI is a collection of tools for Network Management that use the gNMI and gNOI protocols. They are:

- gNMI gRPC Network Management Interface
- gNOI gRPC Network Operations Interface

gNMI is gRPC Network Management Interface developed by Google. gNMI provides the mechanism to install, manipulate, and delete the configuration of network devices, and also to view operational data. gRPC Network Operations Interface (gNOI) defines a set of gRPC-based micro-services for executing operational commands on network devices.

To configure and start gNXI process in an insecure mode, use the **gnxi** command. To disable this feature, use the **no** form of the command.

gnxi {port port-number | secure-client-auth | secure-init | secure-password-auth |
secure-peer-verify-trustpoint | secure-port | secure-server | secure-trustpoint | server}

no gnxi {port *port-number* | **secure-client-auth** | **secure-init** | **secure-password-auth** | secure-peer-verify-trustpoint | secure-port | secure-server | secure-trustpoint | server}

Syntax Description	gnxi	Starts the gNXI process		
	port	Configures the gNXI server p	ort	
	port-number	Specifies the port number. Th	e default port number is 50052.	
	secure-client-auth	Configures the gNXI with clie	ent authentication	
	secure-init	Enables the gNMI secure serve	er by using the primary self-signed certificate	
	secure-password-auth	Configures the gNXI with pas	ssword authentication	
	secure-peer-verify-trustpoint	t Configures the gNXI server peer validation trustpoint		
	secure-port	Configures the gNXI secure s	erver port	
	secure-server	Enables the gNXI secure serv	er	
	secure-trustpoint	Configures the gNXI server certificate trustpoint		
	server	Enables the gNXI server		
Command Default	None			
Command Modes	Global Configuration			
Command History	Release	Modification		
	Cisco IOS XE Bengaluru 17.6.1	This command was introduced.		
			-	

Examples

The following example shows how to configure the gNIX server (Insecure Mode):

Device# configure terminal Device(config)# gnxi server Device(config)# end

L

gnxi (Secure Mode)

gNXI is a collection of tools for Network Management that use the gNMI and gNOI protocols. They are:

- gNMI gRPC Network Management Interface
- gNOI gRPC Network Operations Interface

gNMI is gRPC Network Management Interface developed by Google. gNMI provides the mechanism to install, manipulate, and delete the configuration of network devices, and also to view operational data. gRPC Network Operations Interface (gNOI) defines a set of gRPC-based micro-services for executing operational commands on network devices.

To configure and start gNXI process in a secure mode, use the **gnxi** command. To disable this feature, use the **no** form of the command.

gnxi {secure-server | secure-trustpoint trustpoint-name | secure-client-auth | secure-port}

no gnxi {secure-server | secure-trustpoint trustpoint-name | secure-client-auth | secure-port}

Syntax Description	gnxi	Starts the gNXI process	
	secure-server	Enables the gNXI secure server	
	secure-trustpoint	Configures the gNXI server certificate tru	stpoint
	trustpoint-name	Specifies the trustpoint name	
	secure-client-auth	Configures the gNXI with client authent	ication
	secure-port	Configures the gNXI secure server port	
Command Default	None		
Command Modes	Global Configuration	n	
Command History	Release	Modification	-
	Cisco IOS XE Benga	aluru 17.6.1 This command was introduced.	-
Examples	The following examp mode:	ole shows how to configure the gNIX serve	r and the secure trustpoint in a secure
	Device# configure Device(config)# g Device(config)# e	nxi secure-trustpoint <trustpoint-n< th=""><th>ame></th></trustpoint-n<>	ame>

hessid

To configure a homogenous extended service set, use the **hessid** command. To remove the service set, use the **no** form of the command.

hessid HESSID-value

Syntax Description	HESSID-value	HESSID value.	-	
Command Default	None			
Command Modes	Wireless ANQP	Server Configu	ration (config-wireless-anqp-s	erver)
Command History	Release		Modification	_
	Cisco IOS XE G	ibraltar 16.12.1	This command was introduced.	_

Example

The following example shows how to configure a homogenous extended service set:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# hessid 00:40:96:b4:82:55

high-density clients count

To configure the maximum number of client connections per AP radio, use the **high-density clients count** command in the RF profile mode. Use the **no** form of this command to disable the feature.

high-density clients count max-client-conn-per-radio

[no] high-density clients count max-client-conn-per-radio

Syntax Descriptionmax-client-conn-per-radioConfigures the maximum number of client connections per AP radio. The valid
range is between 0 and 400. The default value is 200 client connections.

 Command Default
 None

 Command Modes
 RF configuration mode

 Command History
 Release
 Modification

 Cisco IOS XE Cupertino 17.8.1
 This command was

introduced.

Example

The following example explains how to configure the maximum number of client connections per AP radio.

Device(config)# ap dotl1 5ghz rf-profile rfprofile Device(config-rf-profile)# high-density clients count 30

hotspot anqp-server

To associate a hotspot server with a policy profile, use the **hotspot anqp-server** command. To remove the server, use the **no** form of the command.

hotspot anqp-server server-name

Syntax Description	server-name N	Jame of the Hots	pot 2.0 ANQP server.
Command Default	None		
Command Modes	Wireless Policy	Configuration (c	config-wireless-policy)
Command History	Release		Modification
	Cisco IOS XE G	ibraltar 16.12.1	This command was introduced.

Example

The following example shows how to configure a Hotspot 2.0 ANQP server:

Device(config)# wireless profile policy hs-policy Device(config-wireless-policy)# hotspot anqp-server test

hyperlocation

To configure Hyperlocation and related parameters for an AP group, use the **hyperlocation** command in the WLAN AP Group configuration (Device (config-apgroup) #) mode. To disable Hyperlocation and related parameter configuration for the AP group, use the **no** form of the command.

[no] hyperlocation [threshold {detection *value-in-dBm* | reset *value-btwn-0-99* | trigger *value-btwn-1-100*}]

	Enables or disables Hyperlocation for an AP group.		
eshold detection value-in-dBm		old to filter out packets with low RSSI. The [no] form of the esets the threshold to its default value.	
eshold reset value-btwn-0-99	Resets value in scan cycles after trigger. The [no] form of the commar resets the threshold to its default value.		
eshold trigger ue-btwn-1-100		mber of scan cycles before sending a BAR to clients. The of the command resets the threshold to its default value.	
	Note	Ensure that the Hyperlocation threshold reset value is less than the threshold trigger value.	
	eshold reset <i>value-btwn-0-99</i> eshold trigger	command r eshold reset value-btwn-0-99 Resets valu resets the th eshold trigger Sets the num ue-btwn-1-100 [no] form o	

Command Modes

WLAN AP Group configuration

Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		
	• This example shows how to set threshold to filter out packets with low RSSI:			
	Device(config-apgroup)# [no] hyperlocation threshold detection -100			
	• This example shows how t	to reset value in scan cycles after trigger:		
	Device(config-apgroup)	<pre># [no] hyperlocation threshold reset 8</pre>		
	• This example shows how t	to set the number of scan cycles before sending a BAR to clients:		

Device(config-apgroup)# [no] hyperlocation threshold trigger 10

icon

To configure an icon for an Online Sign-Up (OSU) provider, use the **icon** command. To remove the icon, use the **no** form of the command.

icon file-name

Syntax Description	<i>file-name</i> File name of the icon.	_
Command Default	None	
Command Modes	ANQP OSU Provider Configura	tion (config-anqp-osu-provider)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.
Usage Guidelines	The icon must be configured und	der the hotspot ANQP server.
	Example	

The following example shows how to configure an icon for the OSU provider:

Device(config-wireless-anqp-server)# osu-provider my-osu Device(config-anqp-osu-provider)# icon test

icap subscription client exclude telemetry-data wlan

To enable iCAP filtering in an AP, use the icap subscription client exclude telemetry-data wlan command.

icap subscription client exclude telemetry-data wlan wlan-profile-name

Syntax Description	wlan-profile-name Specifies the name of the WLAN profile.		
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Dublin 17.10.1	This command was introduced.	

This example shows how to enable iCAP filtering in an AP:

```
Device# configure terminal
Device(config)# ap profile xyz-ap-profile
Device(config-ap-profile)# description "xyz ap profile"
Device(config-ap-profile)# icap subscription client exclude telemetry-data wlan wlan-name
```

idle-timeout

To configure the idle-timeout value in seconds for a wireless profile policy, use the idle-timeout command.

 idle-timeout value

 Syntax Description
 value

 Value
 Sets the idle-timeout value. Valid range is 15 to 100000 seconds.

 Command Default
 None

 Command Modes
 config-wireless-policy

 Command History
 Release

 Modification

 Cisco IOS XE Gibraltar 16.10.1

 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to set the idle-timeout in a wireless profile policy:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy policy-profile-name
Device(config-wireless-policy)# idle-timeout 100
```

ids (mesh)

To configure IDS (Rogue/Signature Detection) reporting for outdoor mesh APs, use the ids command.

	ids	
Syntax Description	This command has no keyword	s or arguments.
Command Default	IDS is disabled.	
Command Modes	config-wireless-mesh-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

The following example shows how to configure IDS (Rogue/Signature Detection) reporting for outdoor mesh APs:

```
Device # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device (config)# wireless profile mesh mesh-profile
Device (config-wireless-mesh-profile)# ids
```

inactive-timeout

To enable in-active timer, use the inactive-timeout command.

inactive-timeout timeout-in-seconds

 Syntax Description
 timeout-in-seconds
 Specifies the inactive flow timeout value. The range is from 1 to 604800.

 Command Default
 None

 Command Modes
 ET-Analytics configuration

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced.

This example shows how to enable in-active timer in the ET-Analytics configuration mode:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# et-analytics
Device(config-et-analytics)# inactive-timeout 15
Device(config-et-analytics)# end
```

inner-auth-eap

To configure inner authentication Extensible Authentication Protocol (EAP) method, use the **inner-auth-eap** command. To remove the inner authentication EAP method, use the **no** form of the command.

inner-auth-eap {eap-aka | eap-fast | eap-leap | eap-peap | eap-sim | eap-tls | eap-ttls }

Syntax Description	eap-aka	Enables EAP authentication and key agreement method.
		EAP-AKA is an EAP mechanism for authentication and session key distribution using the UMTS Subscriber Identity Module.
	eap-fast	Enables EAP flexible authentication through the secure tunneling method.
		EAP-FAST is a flexible EAP protocol that allows mutual authentication of a supplicant and a server. It is similar to EAP-PEAP, but typically does not require the use of client or server certificates.
	eap-leap	Enables EAP lightweight extensible authentication protocol method.
		EAP-LEAP is an EAP authentication protocol used primarily in Cisco Aironet WLANs. It encrypts data transmissions using dynamically generated wired equivalent privacy (WEP) keys, and supports mutual authentication.
	eap-peap	Enables EAP-protected extensible authentication protocol method.
		EAP-PEAP is an EAP authentication protocol used in wireless networks and point-to-point connections. PEAP is designed to provide more secure authentication for 802.11 WLANs that support 802.1X port access control.
	eap-sim	Enables EAP subscriber identity module method.
		EAP-SIM is an EAP authentication protocol used for authentication and session key distribution using the subscriber identity module (SIM) from the Global System for Mobile Communications (GSM).
	eap-tls	Enables EAP transport layer security method.
		EAP-TLS is an EAP authentication protocol, and an IETF open standard that uses the Transport Layer Security (TLS) protocol. EAP-TLS is the original, standard wireless LAN EAP authentication protocol.
	eap-ttls	Enables EAP-tunneled transport layer security method.
		EAP-TTLS is a simple WPA2-Enterprise Wi-Fi authentication method that has been a standard system for many years. When a user wants to connect to the network, the device initiates communication with the network and confirms that it is the correct network by identifying the server certificate.
Command Default	None	
Command Modes	ANOP NA	I EAP Authentication Configuration (config-anqp-nai-eap-auth)

Command History Usage Guidelines	Release	Modification				
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced in a release earlier than Cisco IOS XE Amsterdam 17.3.1.				
	Prior to Cisco IOS XE Amsterdam 17.3.1, only one inner EAP authentication method was allowed. For example, inner-auth-eap eap-aka . If you use multiple inner EAP authentication methods such as inner-auth-eap eap-aka and inner-auth-eap eap-fast , then only the last method is used, and previous one was discarded. From Cisco IOS XE Amsterdam 17.3.1 onwards, you can configure multiple inner EAP authentication methods. For an example, see the code snippet given below:					
	wireless hotspot andp-server nai-realm myvenue.cisco.com eap-method eap-aka credential certificate credential usim inner-auth-eap eap-aka inner-auth-eap eap-fast inner-auth-non-eap chap inner-auth-non-eap pap tunneled-eap-credential anor tunneled-eap-credential soft	lymous				

Example

The following example shows how to configure the inner authentication EAP method:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless hotspot anqp-server my_anqp
Device(config-wireless-anqp-server)# nai-realm myvenue.cisco.com
Device(config-anqp-nai-eap)# eap-method eap-aka
Device(config-anqp-nai-eap-auth)#inner-auth-eap eap-aka
```

L

inner-auth-non-eap

To configure the inner authentication non-Extensible Authentication Protocol (EAP) method, use the **inner-auth-non-eap** command. To remove the inner authentication non-EAP method, use the **no** form of this command.

inner-auth-non-eap { chap | mschap - v2 | pap }

Syntax Description	chap	Challenge handshake authentication protocol method.		
		CHAP is an authentication scheme used by Point-to-Point Protocol (PPP) servers to validate the identity of remote clients. CHAP periodically verifies the identity of a client by using a three-way handshake.		
	mschap	Microsoft challenge handshake authentication protocol method.		
	mschap-v2	Microsoft challenge handshake authentication protocol Version 2 method.		
	pap Password authentication protocol method.			
		PAP is a password-based authentication protocol used by PPP to validate users.		
Command Default	None			
Command Modes	ANQP NAI I	EAP Authentication Configuration (config-anqp-nai-eap-auth)		
Command History	Release	Modification		
	Cisco IOS X	E Amsterdam 17.3.1 This command was		

introduced.

Example

The following example shows how to configure the inner authentication non-EAP method:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless hotspot angp-server my_angp
Device(config-wireless-angp-server)# nai-realm myvenue.cisco.com
Device(config-angp-nai-eap)# eap-method eap-aka
Device(config-angp-nai-eap-auth)#inner-auth-eap pap
```

install abort

To cancel an ongoing predownload or rolling access point (AP) upgrade operation, use the **install abort** command.

	install abort issu issu Forces the operation to use the In-Service Software Upgrade (ISSU) technique.		
Syntax Description			
Command Default	None		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.	
Usage Guidelines	The install abort command ens continue to have the image in th		ut the predownload image do not reboot and
Examples	The following example shows h	now to cancel a current predown	load or install operation:

install add file activate commit

To activate an installed SMU package and to commit the changes to the loadpath, use the **install add file activate commit** command.

	install add file	t	
Syntax Description	prompt-level	Sets the promp	t level.
	none	Prompting is n done.	ot
Command Default	None		
Command Modes	Privileged EXE	EC (#)	
Command History	Release		Modification
	Cisco IOS XE	Gibraltar 16.11.1	This command was introduced.

Example

The following example shows how to activate an installed package and commit the changes:

Device# install add file vwlc_apsp_16.11.1.0_74.bin activate commit

install add file flash activate issu commit

To activate the installed package using issu technique and to commit the changes to the loadpath, use the **install add file flash activate issu commit** command.

install add file flash activate issu commit

Syntax Description	on This command has no keywords or arguments.		
Command Default	None		
Command Modes Privileged EXEC (#)			
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.	

Example

This example shows how to activate the installed package using issu technique and to commit the changes to the loadpath:

Device# install add file flash activate issu commit

install add profile

To select the profile to rollback the AP images with AP image predownload support, use the **install add profile** command.

install add profile profile-name [activate]

Syntax Description	profile-name	Profile name. The pr	ofile name can have	a maximum of only 15 characters.	
	activate Activates the installed package.				
Command Default	None				
Command Modes	Privileged EXI	C (#)			
Command History	Release	Mod	ification		
	Cisco IOS XE	Gibraltar 16.12.1 This intro	command was duced.		

Example

The following example shows how to select the profile to rollback the AP images: Device# install add profile profile1

install activate

To activate an installed package, use the install activate command.

install activate {auto-abort-timer | file | profile | prompt-level }

Syntax Description

x Description	auto-abort-timer	Sets the cancel timer. The time range is between 30 and 1200 minutes.	
	file	Specifies the package to be activated.	
	profile	Specifies the profile to be activated.	
	prompt-level	Sets the prompt level.	

Command Default	None
-----------------	------

Privileged EXEC (#) **Command Modes**

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.2s	This command was introduced.

Example

The following example shows how to activate the installed package:

```
Device# install activate profile default
install activate: START Thu Nov 24 20:14:53 UTC 2019
System configuration has been modified.
Press Yes(y) to save the configuration and proceed.
Press No(n) for proceeding without saving the configuration.
Press Quit(q) to exit, you may save configuration and re-enter the command. [y/n/q] y
Building configuration...
[OK]Modified configuration has been saved
Jan 24 20:15:02.745: %INSTALL-5-INSTALL START INFO: R0/0: install engine: Started install
activate
Jan 24 20:15:02.745 %INSTALL-5-INSTALL_START_INFO: R0/0: install_engine: Started install
activate
install activate: Activating PACKAGE
```

install activate profile

To activate an installed package, use the install activate profile command.

	install activate profile	
Syntax Description	profile To activate the profile.	
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.2s	This command was introduced.

Example

The following example shows how to activate the installed package:

Device#install activate profile default install activate: START Thu Nov 24 20:14:53 UTC 2019

```
System configuration has been modified.
Press Yes(y) to save the configuration and proceed.
Press No(n) for proceeding without saving the configuration.
Press Quit(q) to exit, you may save configuration and re-enter the command. [y/n/q] y
Building configuration...
[OK]Modified configuration has been saved
Jan 24 20:15:02.745: %INSTALL-5-INSTALL_START_INFO: R0/0: install_engine: Started install
activate
Jan 24 20:15:02.745 %INSTALL-5-INSTALL_START_INFO: R0/0: install_engine: Started install
activate
install_activate: Activating PACKAGE
```

install activate file

To activate an installed package, use the install activate file command.

install activate file file-name

Syntax Description	<i>file-name</i> Specifies the packa	ge name. Options are: bootflash:, flash:, and webui:
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Example

The following example shows how to use an auto cancel timer while activating an install package on a standby location:

Device# install activate file vwlc_apsp_16.11.1.0_74.bin

install commit

To commit the changes to the loadpath, use the install commit command.

install commit

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.	

Example

The following example shows how to commit the changes to the loadpath:

Device# install commit

install remove profile default

To specify an install package that is to be removed, use the install remove profile default command.

	install remove profile default		
Syntax Description	remove	Removes the install	package.
	profile	Specifies the profile t	o be removed.
Command Default	None		
Command Modes	Privileged	EXEC (#)	
Command History	Release		Modification
	Cisco IO	S XE Gibraltar 16.11.1	This command was introduced.

Example

The following example shows how to remove a default profile: Device# install remove profile default

install deactivate

To specify an install package that is to be deactivated, use the install deactivate file command.

install deactivate file file-name

Syntax Description	<i>file-name</i> Specifies the packa	ge name. Options are: bootflash:,	flash:, and webui:.
Command Default	None		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.	

Example

The following example shows how to deactivate an install package:

Device# install deactivate file vwlc_apsp_16.11.1.0_74.bin

install deactivate

To specify an install package that is to be deactivated, use the install deactivate file command.

install deactivate file file-name

Syntax Description	<i>file-name</i> Specifies the packa	ge name. Options are: bootflash:, flash:, and webui:.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Example

The following example shows how to deactivate an install package:

Device# install deactivate file vwlc_apsp_16.11.1.0_74.bin

install prepare

To prepare a SMU package to cancel, activate, or deactivate an operation, use the install prepare command.

install prepare { abort | activate file file-name | deactivate file file-name }

abort	Prepares a SMU package for cancel operation.
activate file	Prepares a SMU package for activation.
file-name	Package name.
deactivate file	Prepares a SMU package for deactivation.
None	
Privileged EXEC	C (#)
Release	Modification
Cisco IOS XE G	ibraltar 16.11.1 This command was
	activate file file-name deactivate file None Privileged EXEC Release

Example

The following example shows how to prepare a package for cancel, activate, or deactivate operation:

Device# install prepare abort Device# install prepare activate file vwlc_apsp_16.11.1.0_74.bin Device# install prepare deactivate file vwlc apsp 16.11.1.0 74.bin

install prepare rollback

To prepare a SMU package for rollback operation, use the install prepare rollback command.

install prepare rollback to { base | committed | id id | label label }

	_	
Syntax Description	base	Prepares to roll back to the base image.
	committed	Prepares to roll back to the last committed installation point.
	id	Prepares rollback to the last committed installation point.
	id	The identifier of the install point to roll back to.
	label	Prepares to roll back to a specific install point label.
	label	Label name, with a maximum of 15 characters.
Command Default	None	
Command Modes	Privileged E	XEC (#)
Command History	Release	Modification
	Cisco IOS X	E Gibraltar 16.11.1 This command was introduced.

Example

This example shows how to prepare a package for roll back to a particular id:

Device# install prepare rollback to id 2

install rollback

To roll back to a particular installation point, use the install rollback command.

install rollback to {base | committed | id id | label label} [prompt-level none]

Syntax Description	base	Rolls back to the base image.	
	prompt-level none	Sets the prompt level as none.	
	committed	Rolls back to the last committed installation point.	
	id	Rolls back to a specific install point ID.	
	labelRolls back to a specific install point label.		
Command Default	None		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibral	tar 16.11.1 This command was introduced.	

Example

The following example shows how to specify the ID of the install point to roll back to: Device# install rollback to id 1

interface vlan

To create or access a dynamic switch virtual interface (SVI) and to enter interface configuration mode, use the **interface vlan** command in global configuration mode. To delete an SVI, use the **no** form of this command.

interface vlan vlan-id no interface vlan vlan-id

Syntax Description	<i>vlan-id</i> VLAN number. The range is 1 to 4094.		
Command Default	The default VLAN interface is VLAN 1.		
Command Modes	Global configuration		
Command History	Release Modification		
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.		
Jsage Guidelines	SVIs are created the first time you enter the interface vlan <i>vlan-id</i> command for a particular VLAN. The <i>vlan-id</i> corresponds to the VLAN-tag associated with data frames on an IEEE 802.1Q encapsulated trunk o the VLAN ID configured for an access port.		
-	Note When you create an SVI, it does not become active until it is associated with a physical port.		
	If you delete an SVI using the no interface vlan <i>vlan-id</i> command, it is no longer visible in the output from the show interfaces privileged EXEC command.		
	Note You cannot delete the VLAN 1 interface.		
	You can reinstate a deleted SVI by entering the interface vlan <i>vlan-id</i> command for the deleted interface. The interface comes back up, but the previous configuration is gone.		
	The interrelationship between the number of SVIs configured on a chassis or a chassis stack and the number of other features being configured might have an impact on CPU utilization due to hardware limitations. You can use the sdm prefer global configuration command to reallocate system hardware resources based on templates and feature tables.		
	You can verify your setting by entering the show interfaces and show interfaces vlan <i>vlan-id</i> privileged EXEC commands.		
	This example shows how to create a new SVI with VLAN ID 23 and enter interface configuration mode:		

```
Device(config) # interface vlan 23
Device(config-if) #
```

ip access-group

To configure WLAN access control group (ACL), use the **ip access-group** command. To remove a WLAN ACL group, use the **no** form of the command.

ip access-group [web] acl-name
no ip access-group [web]

Syntax Description	web (Optional) Configures the IPv4 web ACL.			
	<i>acl-name</i> Specify the preauth ACL used for the WLAN with the security type value as webauth.			
Command Default	None			
Command Modes	WLAN configuration			
Usage Guidelines	You must disable the WLAN before using this command. See Related Commands section for more info on how to disable a WLAN.			
Command History	Release Modification			
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.			
	This example shows how to configure a WLAN ACL:			
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wlan wlan1 Device(config-wlan)# ip access-group test-acl			
	This example shows how to configure an IPv4 WLAN web ACL:			
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z.			

Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wlan wlan1 Device(config-wlan)# ip access-group web test Device(config-wlan)#

ip access-list extended

To configure extended access list, use the ip access-list extended command.			
ip access-list extended { <100-199> <2000-2699> <i>access-list-name</i> }			
<100-199> Extended IP access-list number.			
<2000-2699> Extended IP acce	ss-list number (expanded range).		
None			
Global configuration (config)			
Release	Modification		
Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		
	<pre>ip access-list extended {<100- </pre> <pre></pre> <pre><</pre>		

Examples

The following example shows how to configure extended access list:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# ip access-list extended access-list-name

ip address

To set a primary or secondary IP address for an interface, use the **ip address** command in interface configuration mode. To remove an IP address or disable IP processing, use the noform of this command.

ip address ip-address mask [secondary [vrf vrf-name]]
no ip address ip-address mask [secondary [vrf vrf-name]]

Syntax Description	<i>ip-address</i> IP address.				
	mask	Mask for the associated IP subnet.			
	secondary		es that the configured address is gured address is the primary IP	s a secondary IP address. If this keyword is address.	
			secondary address is used for a ord, the vrf keyword must be sp	VRF table configuration with the vrf pecified also.	
	vrf	(Optional) Name of the VRF table. The <i>vrf-name</i> argument specifies the VRF name of the ingress interface.			
Command Default	No IP addres	s is defined for the	interface.		
Command Modes	Interface con	figuration (config-i	f)		
Command History	Release		Modification		
	Cisco IOS X	E Gibraltar 16.10.1	This command was introduced.		
Usage Guidelines	Cisco IOS so		ne primary IP address. Therefore	ndary IP addresses. Packets generated by the e, all devices and access servers on a segment	
	Hosts can determine subnet masks using the Internet Control Message Protocol (ICMP) mask request Devices respond to this request with an ICMP mask reply message. You can disable IP processing on a particular interface by removing its IP address with the no ip a command. If the software detects another host using one of its IP addresses, it will print an error m the console.				
				-	
	The optional secondary keyword allows you to specify an unlimited number of secondary addresses. Secondary addresses are treated like primary addresses, except the system never generates datagrams other than routing updates with secondary source addresses. IP broadcasts and Address Resolution Protocol (ARP) requests are handled properly, as are interface routes in the IP routing table.				
	Secondary IP addresses can be used in a variety of situations. The following are the most common applications				
	• There may not be enough host addresses for a particular network segment. For e allows up to 254 hosts per logical subnet, but on one physical subnet you need 30				

secondary IP addresses on the devices or access servers allows you to have two logical subnets using one physical subnet.

- Many older networks were built using Level 2 bridges. The judicious use of secondary addresses can aid in the transition to a subnetted, device-based network. Devices on an older, bridged segment can be easily made aware that many subnets are on that segment.
- Two subnets of a single network might otherwise be separated by another network. This situation is not permitted when subnets are in use. In these instances, the first network is *extended*, or layered on top of the second network using secondary addresses.

Note

- If any device on a network segment uses a secondary address, all other devices on that same segment must also use a secondary address from the same network or subnet. Inconsistent use of secondary addresses on a network segment can very quickly cause routing loops.
- When you are routing using the Open Shortest Path First (OSPF) algorithm, ensure that all secondary addresses of an interface fall into the same OSPF area as the primary addresses.
- If you configure a secondary IP address, you must disable sending ICMP redirect messages by entering the no ip redirects command, to avoid high CPU utilization.

Examples

In the following example, 192.108.1.27 is the primary address and 192.31.7.17 is the secondary address for GigabitEthernet interface 1/0/1:

```
Device# enable
Device# configure terminal
Device(config)# interface GigabitEthernet 1/0/1
Device(config-if)# ip address 192.108.1.27 255.255.255.0
Device(config-if)# ip address 192.31.7.17 255.255.255.0 secondary
```

Related Commands	Command	Description
	match ip route-source	Specifies a source IP address to match to required route maps that have been set up based on VRF connected routes.
	route-map	Defines the conditions for redistributing routes from one routing protocol into another, or to enable policy routing.
	set vrf	Enables VPN VRF selection within a route map for policy-based routing VRF selection.
	show ip arp	Displays the ARP cache, in which SLIP addresses appear as permanent ARP table entries.
	show ip interface	Displays the usability status of interfaces configured for IP.
	show route-map	Displays static and dynamic route maps.

ip arp-limit rate

• •	To configure rat	e limiting for Address Resolution Protocol (ARP)	packets, use the ip arp-limit rate command.		
	ip arp-limit ra	te { burst-interval burst-interval none pps p	ps }		
Syntax Description	pps	The maximum number of ARP packets allowed per client exceeds the configured limit, they are 1500, with a default value of 100 seconds.			
	burst-interval	The burst interval in seconds for excluding client pps crosses the configured value. Valid values ra 5 seconds.			
	none	Disables the ARP rate-limiting.			
Command Default	Default values	are configured. Profile Configuration (config-wireless-policy)			
Command History	 Release	Modification	-		
Command History		Amsterdam 17.3.5 This command was introduced.	-		
Usage Guidelines	This command is only available in the following releases: Cisco IOS XE Amsterdam 17.3.5 and later, IOS XE Bengaluru 17.6.3 and later, and Cisco IOS XE Cupertino 17.8.1 and above.				
	For RLAN, the	default values are used. You cannot change the va	alues using this command.		
Examples	The following example shows how to configure rate limiting for ARP packets:		ARP packets:		
	Device# configure terminal				

Device# configure terminal Device(config)# wireless profile policy test1 Device(config-wireless-policy)# ip arp-limit rate pps 90

ip admission

To enable web authentication, use the **ip admission** command in interface configuration mode. You can also use this command in fallback-profile configuration mode. To disable web authentication, use the **no** form of this command.

ip admission *rule* no ip admission *rule*

Syntax Description *rule* IP admission rule name.

Command Default Web authentication is disabled.

Command Modes Interface configuration

Fallback-profile configuration

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

Usage Guidelines The **ip admission** command applies a web authentication rule to a switch port.

This example shows how to apply a web authentication rule to a switchport:

```
Device# configure terminal
Device(config)# interface gigabitethernet1/0/1
Device(config-if)# ip admission rule1
```

This example shows how to apply a web authentication rule to a fallback profile for use on an IEEE 802.1x enabled switch port.

Device# configure terminal Device(config)# fallback profile profile1 Device(config-fallback-profile)# ip admission rule1

ip dhcp pool

To configure a Dynamic Host Configuration Protocol (DHCP) address pool on a DHCP server and enter DHCP pool configuration mode, use the **ip dhcp pool** command in global configuration mode. To remove the address pool, use the no form of this command.

- ip dhcp pool name
- no ip dhcp pool name

Note

When configuring the **ip dhcp pool** command, note that it can be affected by the **ip dhcp database** command if an incorrect URL is provided. The console may hang due to multiple attempts by the DHCP service to reach the URL before it returns a failure. This is expected behavior. To prevent this issue, ensure that the correct URL, including the file name, is provided when using the **ip dhcp database** command, especially when it includes ftp/tftp.

Syntax Description	name	Name of the pool. Can either be a symbolic string (such as engineering) or an integer (such as 0).
--------------------	------	----------------------------------------------------------------------------------------------------

Command Default	DHCP address pools are not configured.
-----------------	----------------------------------------

Command Modes Global configuration

Command History	Release	Modification
	12.0(1)T	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Usage Guidelines During execution of this command, the configuration mode changes to DHCP pool configuration mode, which is identified by the (config-dhcp)# prompt. In this mode, the administrator can configure pool parameters, like the IP subnet number and default router list.

Examples The following example configures pool1 as the DHCP address pool:

ip dhcp pool pool1

Related Commands	Command	Description
	host	Specifies the IP address and network mask for a manual binding to a DHCP client.
	ip dhcp excluded-address	Specifies IP addresses that a Cisco IOS DHCP server should not assign to DHCP clients.

I

Command	Description	
network (DHCP)	Configures the subnet number and mask for a DHCP address pool on a Cisco IOS DHCP server.	

ip dhcp-relay information option server-override

To enable the system to globally insert the server ID override and link selection suboptions into the DHCP relay agent information option in forwarded BOOTREQUEST messages to a Dynamic Host Configuration Protocol (DHCP) server, use the **ip dhcp-relay information option server-override** command in global configuration mode. To disable inserting the server ID override and link selection suboptions into the DHCP relay agent information option, use the **no** form of this command.

ip dhcp-relay information option server-override no ip dhcp-relay information option server-override

Syntax Description This command has no arguments or keywords.

Command Default The server ID override and link selection suboptions are not inserted into the DHCP relay agent information option.

Command Modes Global configuration (config)

Command History	Release	Modification				
	Cisco IOS XE Release 2.1	This command was introduced on Cisco ASR 1000 Series Aggregation Services Routers.				
	12.2(33)SRE	This command was integrated into Cisco IOS Release 12.2(33)SRE.				
	15.1(1)SY	This command was integrated into Cisco IOS Release 15.1(1)SY.				
Command History	Release	Modification				
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.					
Usage Guidelines	The ip dhcp-relay information option server-override command adds the following suboptions into the relay agent information option when DHCP broadcasts are forwarded by the relay agent from clients to a DHCP server:					
	Server ID override suboption					
	Link selection suboption					
	When this command is configured, the gateway address (giaddr) will be set to the IP address of the c interface, which is the interface that is reachable by the DHCP server.					
	If the ip dhcp relay information option server-id-override command is configured on an interface, it overrides the global configuration on that interface only.					
Examples	In the following example, the DHCP relay will insert the server ID override and link selection suboptions into the relay information option of the DHCP packet. The loopback interface IP address is configured to be the source IP address for the relayed messages.					

Device(config)# ip dhcp-relay information option server-override Device(config)# ip dhcp-relay source-interface loopback 0 Device(config)# interface Loopback 0 Device(config-if)# ip address 10.2.2.1 255.255.255.0

Related Commands	Command	Description
	ip dhcp relay information option server-id-override	Enables the system to insert the server ID override and link selection suboptions on a specific interface into the DHCP relay agent information option in forwarded BOOTREQUEST messages to a DHCP server.

ip dhcp-relay source-interface

To globally configure the source interface for the relay agent to use as the source IP address for relayed messages, use the **ip dhcp-relay source-interface** command in global configuration mode. To remove the source interface configuration, use the **no** form of this command.

ip dhcp-relay source-interface type number **no ip dhcp-relay source-interface** type number

Syntax Description	<i>type</i> Interface type. For more information, use the question mark (?) online help function			e information, use the question mark (?) online help function.		
	number	Interface or subinterface number. For more information about the numbering system for your networking device, use the question mark (?) online help function.				
Command Default	The source interface is not configured.					
Command Modes	Global co	onfiguration (confi	g)			
Command History	Release		Modi	fication		
	Cisco IO	S XE Release 2.1	This c Route	command was introduced on Cisco ASR 1000 Series Aggregation Services ers.		
	12.2(33)	SRE	This o	This command was integrated into Cisco IOS Release 12.2(33)SRE.		
	15.1(1)S	Y	This o	command was integrated into Cisco IOS Release 15.1(1)SY.		
Usage Guidelines	The ip dhcp-relay source-interface command allows the network administrator to specify a stable, hardware-independent IP address (such as a loopback interface) for the relay agent to use as a source IP address for relayed messages.					
	If the ip dhcp-relay source-interface global configuration command is configured and the ip dhcp relay source-interface command is also configured, the ip dhcp relay source-interface command takes preceder over the global configuration command. However, the global configuration is applied to interfaces withou the interface configuration.					
Examples	In the following example, the loopback interface IP address is configured to be the source IP address for the relayed messages:			back interface IP address is configured to be the source IP address		
	Device(config)# ip dhcp-relay source-interface loopback 0 Device(config)# interface loopback 0 Device(config-if)# ip address 10.2.2.1 255.255.255.0					
Related Commands	Comman	d		Description		
	ip dhcp relay source-inte		rface	Configures the source interface for the relay agent to use as the source IP address for relayed messages.		

ip dhcp compatibility suboption

	To configure the server override and link-selection suboption to an RFC or Cisco specific value, use the ip dhcp compatibility suboption [server-override link-selection] command.				
	ip dhcp compatibility subopti ip dhcp compatibility subopti		-		
Syntax Description	server-override Configures th	e server override suboption to a	n RFC or Cisco specific value.		
	link-selection Configures th	e link-selection suboption to an	RFC or Cisco specific value.		
Command Default	None				
Command Modes	Global Configuration				
Command History	Release	Modification	-		
	Cisco IOS XE Bengaluru 17.4.1	This command was introduced.	-		
Usage Guidelines	This example shows how to con Device# configure terminal Device(config)# ip dhcp con Device(config)# ip dhcp con Device(config)# end	mpatibility suboption serve	er-override cisco		

ip domain lookup

To enable IP Domain Name System (DNS)-based hostname-to-address translation, use the **ip domain lookup** command in global configuration mode. To disable DNS-based hostname-to-address translation, use the **no** form of this command.

ip domain lookup [**nsap** | **recursive** | **source-interface** *interface-type-number* | **vrf** *vrf-name* { **source-interface** *interface-type-number* }]

Syntax Description	nsap	(Optional) Enables IP DNS queries for Connectionless Network Service (CLNS) and Network Service Access Point (NSAP) addresses.			
	recursive	(Optional) Enables IP DNS recursive lookup.			
	source-interface interface-type-number	(Optional) Specifies the source interface for the DNS resolver. Enter an interface type and number.			
	vrf vrf-name	(Optional) Defines a Virtual Routing and Forwarding (VRF) table. For vrf-name, enter a name for the VRF table.			
Command Default	IP DNS-based hostname-t	o-address translation is enabled.			
Command Modes	Global configuration (con	ñg)			
Command History	Release	Modification			
	Cisco IOS XE Fuji 16.9.2	This command was introduced.			
	Cisco IOS XE Dublin 17.12.1	An issue relating to the configuration of the ip domain lookup source-interface <i>interface-type-number</i> command on Layer 3 physical interfaces was resolved.			
		Starting from this release, even if configured on a Layer 3 physical interface, the command is retained across reloads and in case the port mode is changed.			
Usage Guidelines	If this command is enabled on a device and you execute the show tcp brief command, the output may be displayed very slowly.				
	When both IP and ISO CLNS are enabled on a device, the ip domain lookup nsap command allows you to discover a CLNS address without having to specify a full CLNS address, given a hostname.				
	This command is useful for the ping (ISO CLNS) command, and for CLNS Telnet connections.				
	If you configure the ip domain lookup source-interface <i>interface-type-number</i> command on a Layer 3 physical interface, note the following: If the port mode is changed or in case of a device reload, the command is automatically removed from running configuration (Refer to the output of the show running-configuration privileged EXEC command when this happens). Removal of the command causes DNS queries that use the specified source interface, to be dropped. The only available workaround is to reconfigure the command. Starting with Cisco IOS XE Dublin 17.12.1, this issue is resolved.				
Examples	The following example sh	ows how to configure IP DNS-based hostname-to-address translation:			

Device# configure terminal Device(config)# ip domain lookup Device(config)# end

The following example shows how to configure a source interface for the DNS domain lookup:

Device# configure terminal Device(config)# ip domain lookup source-interface gigabitethernet1/0/2 Device(config)# end

ip domain-name

To configure the host domain on the device, use the ip domain-name command.

ip domain-name *domain-name* [**vrf** *vrf-name*]

Syntax Description	domain-name Default domain name.			
	vrf-name	Specifies the virtu	ual routing and forwarding (VRF) to use to resolve the domain name.	
Command Default	None			
Command Modes	Global config	guration (config)		
Command History	Release		Modification	
	Cisco IOS X	E Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure a host domain in a device:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# ip domain-name domain-name

ip flow-export destination

To configure ETA flow export destination, use the **ip flow-export destination** command.

 ip flow-export destination ip_address port_number

 Syntax Description

 port_number

 Port_number

 Port number. The range is from 1 to 65535.

 Command Default

 None

 ET-Analytics configuration

 Command History

 Release
 Modification

Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

This example shows how to configure ETA flow export destination in the ET-Analytics configuration mode:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# et-analytics
Device(config-et-analytics)# ip flow-export
destination 120.0.0.1 2055
Device(config-et-analytics)# end
```

L

ip helper-address

To enable forwarding of User Datagram Protocol (UDP) broadcasts, including Bootstrap Protocol (BOOTP), received on an interface, use the **ip helper-address** command in interface configuration mode. To disable forwarding of broadcast packets to specific addresses, use the**no** form of this command.

ip helper-address[{vrf name | global}] address {[redundancy vrg-name]}
no ip helper-address [{vrf name | global}] address {[redundancy vrg-name]}

Syntax Description vrf name			(Optional) Enables the VPN routing and forwarding (VRF) instance and the VRF name.		
	global		(Optional) Configures a global routing table.		
	address		Destination broadcast or host address to be used when forwarding UDP broadcasts. There can be more than one helper address per interface.		
	redundancy	vrg-name	(Optional) Defines the Virtual Router Group (VRG) name.		
Command Default	UDP broadcas	ts are not fo	rwarded.		
Command Modes	Interface confi	guration (co	onfig-if)		
Command History	Release	Modification			
	10.0	This command was introduced.			
	12.2(4)B	This command was modified. The vrf <i>name</i> keyword and argument pair and the global keyword were added.			
	12.2(15)T	This command was modified. The redundancy <i>vrg-name</i> keyword and argument pair was added.			
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.			
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.			
	12.28X	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.			
Usage Guidelines	-	-	ommand along with the ip helper-address command allows you to control broadcast are forwarded.		

One common application that requires helper addresses is DHCP, which is defined in RFC 1531. To enable BOOTP or DHCP broadcast forwarding for a set of clients, configure a helper address on the router interface connected to the client. The helper address must specify the address of the BOOTP or DHCP server. If you have multiple servers, configure one helper address for each server.

The following conditions must be met for a UDP or IP packet to be able to use the **ip helper-address** command:

The MAC address of the received frame must be all-ones broadcast address (ffff.ffff.ffff).

- The IP destination address must be one of the following: all-ones broadcast (255.255.255.255), subnet broadcast for the receiving interface, or major-net broadcast for the receiving interface if the **no ip classless** command is also configured.
- The IP time-to-live (TTL) value must be at least 2.
- The IP protocol must be UDP (17).
- The UDP destination port must be for TFTP, Domain Name System (DNS), Time, NetBIOS, ND, BOOTP or DHCP packet, or a UDP port specified by the **ip forward-protocol udp** command in global configuration mode.

If the DHCP server resides in a VPN or global space that is different from the interface VPN, then the **vrf** *name* or the **global** option allows you to specify the name of the VRF or global space in which the DHCP server resides.

The **ip helper-addressvrf***name address* option uses the address associated with the VRF name regardless of the VRF of the incoming interface. If the **ip helper-addressvrf***name address* command is configured and later the VRF is deleted from the configuration, then all IP helper addresses associated with that VRF name will be removed from the interface configuration.

If the **ip helper-address** address command is already configured on an interface with no VRF name configured, and later the interface is configured with the **ip helper-address vrf** name address command, then the previously configured **ip helper-address** command is considered to be global.

Note

The **ip helper-address** command does not work on an X.25 interface on a destination router because the router cannot determine if the packet was intended as a physical broadcast.

The **service dhcp** command must be configured on the router to enable IP helper statements to work with DHCP. If the command is not configured, the DHCP packets will not be relayed through the IP helper statements. The **service dhcp** command is configured by default.

Examples

The following example shows how to define an address that acts as a helper address:

```
Router(config)# interface ethernet 1
Router(config-if)# ip helper-address 10.24.43.2
```

The following example shows how to define an address that acts as a helper address and is associated with a VRF named host1:

```
Router(config)# interface ethernet 1/0
Router(config-if)# ip helper-address vrf host1 10.25.44.2
```

The following example shows how to define an address that acts as a helper address and is associated with a VRG named group1:

```
Router(config)# interface ethernet 1/0
Router(config-if)# ip helper-address 10.25.45.2 redundancy group1
```

Related	Commands
---------	----------

ıds	Command	Description
	ip forward-protocol	Specifies which protocols and ports the router forwards when forwarding broadcast packets.
	service dhcp	Enables the DHCP server and relay agent features on the router.

ip http authentication

To specify a particular authentication method for HTTP server users, use the **ip http authentication** command in global configuration mode. To disable a configured authentication method, use the no form of this command ip http authentication { aaa { command-authorization level list-name | exec-authorization list-name **login-authentication** *list-name* } | **enable** | **local** } no ip http authentication { aaa { command-authorization level list-name | exec-authorization list-name **login-authentication** *list-name* } | **enable** | **local** } Syntax Description ลลล Indicates that the authentication method used for the authentication, authorization, and accounting (AAA) login service should be used for authentication. The AAA login authentication method is specified by the aaa authentication login default command, unless otherwise specified by the login-authentication listname keyword and argument. **command-authorization** Sets the authorization method list for commands at the specified privilege level. level Indicates a privilege value from 0 through 15. By default, there are the following three command privilege levels on the router: 1. 0--Includes the disable , enable , exit , help , and logout commands. **2.** 1--Includes all user-level commands at the device prompt (>). **3.** 15--Includes all enable-level commands at the device prompt (>). Sets the name of the method list. list-name exec-authorization Sets the method list for EXEC authorization, which applies authorization for starting an EXEC session. login-authentication Sets the method list for login authentication, which enables AAA authentication for logins. enable Indicates that the "enable" password should be used for authentication. (This is the default method.) local ndicates that the login user name, password and privilege level access combination specified in the local system configuration (by the **username** global configuration command) should be used for authentication and authorization. None **Command Default** Global Configuration (config) **Command Modes Command History** Release Modification Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

The **ip http authentication** command specifies the authentication method to be used for login when a client **Usage Guidelines** connects to the HTTP server. Use of the aaa option is recommended. The enable, local, and tacacs methods should be specified using the aaa authentication login command. The "enable" password method is the default HTTP server authentication method. If the enable password is used as the HTTP server login authentication method, the client connects to the HTTP server with a default privilege level of 15. **Examples** The following example shows how to specify that AAA should be used for authentication for HTTP server users. The AAA login method is configured as the "local" username/password authentication method. This example also shows how to specify using the local username database for login authentication and EXEC authorization of HTTP sessions: Device (config) # ip http authentication aaa authentication login LOCALDB local Device(config) # aaa authorization exec LOCALDB local Device (config) # ip http authentication aaa login-authentication LOCALDB Device(config)# ip http authentication aaa exec-authorization LOCALDB

ip http auth-retry

To configure the maximum number of authentication retry attempts within a specific time-window, use the **ip http auth-retry** command.

ip http auth-retry retry_number time-window time-in-minutes

Syntax Description	retry_number	<i>retry_number</i> Specifies the maximum number of authentication retry attempts.				
	time-window	time-window Retry time window in minutes.				
	time-in-minutes	<i>inutes</i> The time window period in minutes during which the maximum number of authentication retries specified can be attempted.				
Command Default	None					
Command Modes	Global configurat	tion (config)				
Command History	Release	Modification				
	Cisco IOS XE Gi	ibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.				
Examples	as 5 in a time-wir	ample shows how to configure the maximum number of authentication retry attempts ndow of 2 minutes: p auth-retry 5 time-window 2				

ip http active-session-modules

To selectively enable HTTP applications that will service incoming HTTP requests from remote clients, use the ip http active-session-modules command. Use the no form of this command to return to the default, for which all HTTP services will be enabled. **ip http active-session-modules** { *list-name* | **all** | **none** } **no ip http active-session-modules** { *list-name* | **all** | **none** } **Syntax Description** Enables only those HTTP services configured in the list identified by the **ip http** list-name session-module-list command to serve HTTP requests. All other HTTP or HTTPS applications on the controller will be disabled. all Enables all HTTP applications to service incoming HTTP requests from remote clients. none Disables all HTTP services. If no arguments or keywords are specified, all HTTP services are enabled. **Command Default** Global configuration (config) **Command Modes Command History** Release Modification Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1. Use the **ip http active-session-modules** command to selectively enable HTTP applications, for servicing **Usage Guidelines** incoming HTTP requests from remote clients. With this command, a selected list of applications can be enabled. All the applications can be enabled or none of the applications can be enabled, in other words, all disabled. Use the **ip http session-module-list** command to define a list of HTTP or secure HTTP (HTTPS) application names to be enabled. If an HTTP request is made for a service that is disabled, a 404 error message is displayed in the remote client browser. **Examples** The following example shows how to configure a different set of services to be available for HTTP and HTTPS requests. In this example, all HTTP applications are enabled for providing services to remote clients, but for HTTPS services, only the HTTPS applications defined in list1 (Simple Certificate Enrollment Protocol [SCEP] and HOME PAGE) are enabled: Device# ip http session-module-list list1 SCEP, HOME PAGE ip http active-session-modules all ip http server ip http secure-server ip http secure-active-session-modules list1

ip http client secure-ciphersuite

To specify the CipherSuite that should be used for encryption over the secure HTTP connection from the client to a remote server, use the **ip http client secure-ciphersuite** command in global configuration mode. To remove a previously configured CipherSuite specification for the client, use the **no** form of this command.

ip http client secure-ciphersuite [3des-ede-cbc-sha] [rc4-128-sha] [rc4-128-md5] [des-cbc-sha] no ip http client secure-ciphersuite

Syntax Description	3des-ede-cbc-sha	SSL_RSA_WITH_3DES_EDE_CBC_SHARivest, Shamir, and Adleman (RSA) key exchange with 3DES and DES-EDE3-CBC for message encryption and Secure Hash Algorithm (SHA) for message digest.		
	rc4-128-sha	sha SSL_RSA_WITH_RC4_128_SHARSA key exchange (RSA Public Key Cryptography with RC4 128-bit encryption for message encryption and SHA for message digest.		
	rc4-128-md5	SSL_RSA_WITH_RC4_128_MD5RSA key exchange (RSA Public Key Cryptography) with RC4 128-bit encryption for message encryption and Message Digest 5 (MD5) for message digest.		
	des-cbc-sha	SSL_RSA_WITH_DES_CBC_SHARSA key exchange with DES-CBC for message encryption and SHA for message digest.		
Command Default	The client and server negotiate the best CipherSuite that they both support from the list of available CipherSuites.			
Command Modes	Global configuration			
Command History	Release		Modification	
	Cisco IOS XE Gibra	altar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE	
Usage Guidelines	This command allows you to restrict the list of CipherSuites (encryption algorithms) that the client offers when connecting to a secure HTTP server. For example, you may want to allow only the most secure CipherSuites to be used.			
	Unless you have a reason to specify the CipherSuites that should be used, or you are unfamiliar with the details of these CipherSuites, you should leave this command unconfigured and let the server and client negotiate the CipherSuite that they both support (this is the default). The no form of this command returns the list of available CipherSuites to the default (that is, all CipherSuites supported on your device are available for negotiation).			
Examples	The following example shows how to configure the HTTPS client to use only the SSL_RSA_WITH_3DES_EDE_CBC_SHA CipherSuite:			
	Router(config)# ip http client secure-ciphersuite 3des-ede-cbc-sha			

ip http secure-ciphersuite

To specify the CipherSuites that should be used by the secure HTTP server when negotiating a connection with a remote client, use the **ip http secure-ciphersuite** command in global configuration mode. To return the configuration to the default set of CipherSuites, use the **no** form of this command.

ip http secure-ciphersuite [3des-ede-cbc-sha] [rc4-128-sha] [rc4-128-md5] [des-cbc-sha] no ip http secure-ciphersuite

Syntax Description	3des-ede-cbc-sha		_WITH_3DES_EDE_CBC_SHARivest, Shamir, and Adleman (RSA) key		
		exchange with 3DES and DES-EDE3-CBC for message encryption and Secure Hash Algorithm (SHA) for message digest.			
	rc4-128-sha	SSL_RSA_WITH_RC4_128_SHARSA key exchange (RSA Public Key Cryptography) with RC4 128-bit encryption for message encryption and SHA for message digest.			
	rc4-128-md5	SSL_RSA_WITH_RC4_128_MD5RSA key exchange (RSA Public Key Cryptography) with RC4 128-bit encryption for message encryption and Message Digest 5 (MD5) for message digest.			
	des-cbc-sha	SSL_RSA_WITH_DES_CBC_SHARSA key exchange with DES-CBC for message encryption and SHA for message digest.			
Command Default	The HTTPS server negotiates the best CipherSuite using the list received from the connecting client.				
Command Modes	- Global configuratio	n			
Command History	Release		Modification		
	Cisco IOS XE Gibraltar		This command was introduced in a release earlier than Cisco IOS XE		
Usage Guidelines	This command is used to restrict the list of CipherSuites (encryption algorithms) that should be used for encryption over the HTTPS connection. For example, you may want to allow only the most secure CipherSuites to be used.				
	Unless you have a reason to specify the CipherSuites that should be used, or you are unfamiliar with the details of these CipherSuites, you should leave this command unconfigured and let the server and client negotiate the CipherSuite that they both support (this is the default).				
	 The supported CipherSuites vary by Cisco IOS software image. For example, "IP Sec56" ("k8") images support only the SSL_RSA_WITH_DES_CBC_SHA CipherSuite in Cisco IOS Release 12.2(15)T. In terms of router processing load (speed), the following list ranks the CipherSuites from fastest to slowes (slightly more processing time is required for the more secure and more complex CipherSuites): 1. SSL_RSA_WITH_DES_CBC_SHA 				
	2. SSL_RSA_WITH_RC4_128_MD5				
	3. SSL_RSA_WITH_RC4_128_SHA				

4. SSL_RSA_WITH_3DES_EDE_CBC_SHA

Additional information about these CipherSuites can be found online from sources that document the Secure Sockets Layer (SSL) 3.0 protocol.

Examples The following exampleshows how to restricts the CipherSuites offered to a connecting secure web client:

Router(config) # ip http secure-ciphersuite rc4-128-sha rc4-128-md5

ip http secure-server

To enable a secure HTTP (HTTPS) server, enter the **ip http secure-server** command in global configuration mode. To disable the HTTPS server, use the **no** form of this command..

ip http secure-server no ip http secure-server

Syntax Description This command has no arguments or keywords.

Command Default The HTTPS server is disabled.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

The HTTPS server uses the Secure Sockets Layer (SSL) version 3.0 protocol.

Caution

∕!∖

• When enabling an HTTPS server, you should always disable the standard HTTP server to prevent unsecured connections to the same services. Disable the standard HTTP server using the **no ip http server** command in global configuration mode (this step is precautionary; typically, the HTTP server is disabled by default).

If a certificate authority (CA) is used for certification, you should declare the CA trustpoint on the routing device before enabling the HTTPS server.

To close HTTP/TCP port 8090, you must disable both the HTTP and HTTPS servers. Enter the **no http server** and the **no http secure-server** commands, respectively.

Examples

In the following example the HTTPS server is enabled, and the (previously configured) CA trustpoint CA-trust-local is specified:

```
Device#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)#ip http secure-server
Device(config)#ip http secure-trustpoint CA-trust-local
Device(config)#end
Device#show ip http server secure status
HTTP secure server status: Enabled
HTTP secure server port: 443
HTTP secure server ciphersuite: 3des-ede-cbc-sha des-cbc-sha rc4-128-md5 rc4-12a
```

HTTP secure server client authentication: Disabled

HTTP secure server trustpoint: CA-trust-local

Related Commands

Command	Description
ip http secure-trustpoint	Specifies the CA trustpoint that should be used for obtaining signed certificates for the HTTPS server.
ip http server	Enables the HTTP server on an IP or IPv6 system, including the Cisco web browser user interface.
show ip http server secure status	Displays the configuration status of the HTTPS server.

ip http server

To enable the HTTP server on your IP or IPv6 system, including the Cisco web browser user interface, enter the **ip http server** command in global configuration mode. To disable the HTTP server, use the **no** form of this command..

ip http server no ip http server

Syntax Description This command has no arguments or keywords.

Command Default The HTTP server uses the standard port 80 by default.

HTTP/TCP port 8090 is open by default.

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines The command enables both IPv4 and IPv6 access to the HTTP server. However, an access list configured with the **ip http access-class** command is applied only to IPv4 traffic. IPv6 traffic filtering is not supported.

 \triangle

Caution The standard HTTP server and the secure HTTP (HTTPS) server can run on a system at the same time. If you enable the HTTPS server using the **ip http secure-server** command, disable the standard HTTP server using the **no ip http server** command to ensure that secure data cannot be accessed through the standard HTTP connection.

To close HTTP/TCP port 8090, you must disable both the HTTP and HTTPS servers. Enter the **no http server** and the **no http secure-server** commands, respectively.

Examples

The following example shows how to enable the HTTP server on both IPv4 and IPv6 systems.

After enabling the HTTP server, you can set the base path by specifying the location of the HTML files to be served. HTML files used by the HTTP web server typically reside in system flash memory. Remote URLs can be specified using this command, but use of remote path names (for example, where HTML files are located on a remote TFTP server) is not recommended.

Device(config) **#ip** http server Device(config) **#ip** http path flash:

Related Commands	Command	Description
	ip http access-class	Specifies the access list that should be used to restrict access to the HTTP server.
	ip http path	Specifies the base path used to locate files for use by the HTTP server.

Command	Description
ip http secure-server	Enables the HTTPS server.

ip http session-module-list

To define a list of HTTP or secure HTTP application names, use the **ip http session-module-list** command in global configuration mode. To remove the defined list, use the **no** form of this command.

ip http session-module-list *listname prefix1* [*prefix2,...prefixn*]

no ip http session-module-list *listname prefix1* [*prefix2,...prefixn*]

listname	Name of the list.			
prefix 1	<i>brefix 1</i> Associated HTTP or HTTPS application names. Prefix strings represent the names of applications, for example, SCEP, WEB_EXEC or HOME_PAGE.			
prefix2,prefixn	(Optional) Additional associated HTTP or HTTPS application names. Each application is separated by a comma.			
No list of HTTP or	r HTTPS application names is defined.			
Global configurati	on (config)			
Release	Modification			
Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.				
Use this command to define a list of HTTP or HTTPS application names. The defined list can then be used by the ip http active-session-modules or ip http secure-active-session-modules commands to selectively enable HTTP or HTTPS applications, respectively, for servicing incoming HTTP and HTTPS requests from remote clients.				
When defining a list of HTTP or HTTPS application names, use the following guidelines:				
• A maximum of four lists can be defined on a controller. Attempts to define more than four lists w and an error message will be displayed stating the limit restrictions.				
• An existing li	st can be removed using the no ip http session-module-list command.			
• You cannot reconfigure an existing list. Instead of reconfiguring an existing list, remove the existing list and create a new list with the same name.				
• There is no limit to how many application names can be in the list. However, the maximum number of sessions that can be registered with the Cisco IOS HTTP or HTTPS server is 32.				
The following example shows how to configure a different set of services to be available for HT and HTTPS requests. In this example, all HTTP applications are enabled for providing services remote clients, but for HTTPS services, only the HTTPS applications defined in list1 (Simple Certificate Enrollment Protocol [SCEP] and HOME_PAGE) are enabled: Device# ip http session-module-list list1 SCEP, HOME_PAGE Device# ip http active-session-modules all				
	prefix 1 prefix2,prefixn No list of HTTP of Global configurati Release Cisco IOS XE Gib Use this command by the ip http acti enable HTTP or H remote clients. ip igmp snooping

To globally enable Internet Group Management Protocol (IGMP) snooping on the device or to enable it on a per-VLAN basis, use the **ip igmp snooping** global configuration command on the device stack or on a standalone device. To return to the default setting, use the **no** form of this command.

ip igmp snooping [**vlan** *vlan-id*] **no ip igmp snooping** [**vlan** *vlan-id*]

Syntax Description	vlan vlan-id (Optional) Enables IGMP sr 1006—4094.	nooping on the specified VLAN. Ranges are 1-1001 and
Command Default	IGMP snooping is globally enabled on the c IGMP snooping is enabled on VLAN interfa	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines When IGMP snooping is enabled globally, it is enabled in all of the existing VLAN interfaces. When IGMP snooping is globally disabled, it is disabled on all of the existing VLAN interfaces.

VLAN IDs 1002 to 1005 are reserved for Token Ring and FDDI VLANs, and cannot be used in IGMP snooping.

Example

The following example shows how to globally enable IGMP snooping:

Device(config) # ip igmp snooping

The following example shows how to enable IGMP snooping on VLAN 1:

Device(config) # ip igmp snooping vlan 1

You can verify your settings by entering the **show ip igmp snooping** command in privileged EXEC mode.

ip mac-binding

To configure the ip-mac binding on the device, use the **ip mac-binding** command. To disable ip-mac binding on the device, use the **no** form of the command

[no] ip mac-binding

To configure Secure Shell (SSH) control parameters on your router, use the **ip ssh** command in global configuration mode. To restore the default value, use the **no** form of this command.

ip ssh [{timeout seconds | authentication-retries integer}]
no ip ssh [{timeout seconds | authentication-retries integer}]

Syntax Description	timeout		(Optional) The time interval that the router waits for the SSH client to respond.	
			This setting applies to the SSH negotiation phase. Once the EXEC session starts, the standard timeouts configured for the vty apply. By default, there are 5 vtys defined (0-4), therefore 5 terminal sessions are possible. After the SSH executes a shell, the vty timeout starts. The vty timeout defaults to 10 minutes.	
	seconds authentication- retries		 (Optional) The number of seconds until timeout disconnects, with a maximum of 120 seconds. The default is 120 seconds. (Optional) The number of attempts after which the interface is reset. 	
	integer		(Optional) The number of retries, with a maximum of 5 authentication retries. The default is 3.	
Command Default	SSH control parameters are	e set to default router value	25.	
Command Modes	- Global configuration (conf	ig)		
Command History	Release	Modification		
	12.0(5)S	This command was introd	duced.	
	12.1(1)T	This command was integ	rated into Cisco IOS Release 12.1(1) T.

	Cisco IOS XE Release 2.4	This command was imple	emented on the Cisco ASR 1000 series routers.	
Usage Guidelines	Before you configure SSH rsa command.	I on your router, you must enable the SSH server using the crypto key generate		
Examples	The following examples co	onfigure SSH control parar	neters on your router:	

ip ssh timeout 120 ip ssh authentication-retries 3

ip ssh

ip ssh version

To specify the version of Secure Shell (SSH) to be run on a router, use the **ip ssh version**command in global configuration mode. To disable the version of SSH that was configured and to return to compatibility mode, use the **no** form of this command.

```
 \begin{array}{l} \mbox{ip ssh version } \left[ \left\{ 1 \mid 2 \right\} \right] \\ \mbox{no ip ssh version } \left[ \left\{ 1 \mid 2 \right\} \right] \end{array}
```

Syntax Description	1 (Optional) Router runs only SSH Version 1.			
	2 (Optional) Router runs only SSH Version 2.			
Command Default	If this command is not configured, SSH operates in compatibility mode, that is, Version 1 and Version 2 are both supported.			
Command Modes	- Global configuration			
Command History	Release Modification			
	12.3(4)T This command was introduced.			
	12.3(2)XE This command was integrated into Cisco IOS Release 12.3(2)XE.			
	12.2(25)S This command was integrated into Cisco IOS Release 12.2(25)S.			
	12.3(7)JA This command was integrated into Cisco IOS Release 12.3(7)JA.			
	12.0(32)SY This command was integrated into Cisco IOS Release 12.0(32)SY.			
	12.4(20)T This command was integrated into Cisco IOS Release 12.4(20)T.			
	15.2(2)SA2 This command was implemented on the Cisco ME 2600X Series Ethernet Access Switches.			
Usage Guidelines	You can use this command with the 2 keyword to ensure that your router will not inadvertently establish a weaker SSH Version 1 connection.			
Examples	The following example shows that only SSH Version 1 support is configured:			
	Router (config)# ip ssh version 1			
	The following example shows that only SSH Version 2 is configured:			
	Router (config)# ip ssh version 2			
	The following example shows that SSH Versions 1 and 2 are configured:			
	Router (config)# no ip ssh version			

Related Commands

Command	Description
debug ip ssh	Displays debug messages for SSH.
disconnect ssh	Terminates a SSH connection on your router.

ipv4 arp-proxy

To enable proxy-ARP, use the **ipv4 arp-proxy** command. To disable proxy-ARP, use the **no** form of this command.

ipv4 arp-proxy

no	ipv4	arp-proxy
----	------	-----------

Syntax Description	This command has no arguments or keywords.
--------------------	--------------------------------------------

Command Default ARP proxy is not enabled.

Command Modes wireless policy configuration (config-wireless-policy)

Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.

Usage Guidelines Proxy-ARP is applicable to only in central switching mode.

Example

The following example shows how to enable proxy-ARP:

Device(config-wireless-policy) **#ipv4 arp-proxy**

ipv4 dhcp

To configure the DHCP parameters for a WLAN, use the **ipv4 dhcp** command.

ipv4 dhcp {opt82 | {ascii | rid | format | {ap_ethmac | ap_location | apmac | apname | policy_tag | ssid | vlan_id }} | required | server *dhcp-ip-addr*}

Syntax Description	opt82	Sets DHCP option 82 for wireless clients on this WLAN
	required	Specifies whether DHCP address assignment is required
	server	Configures the WLAN's IPv4 DHCP Server
	ascii	Supports ASCII for DHCP option 82
	rid	Supports adding Cisco 2 byte RID for DHCP option 82
	format	Sets RemoteID format
	ap_ethmac	Enables DHCP AP Ethernet MAC address
	ap_location	Enables AP location
	apmac	Enables AP MAC address
	apname	Enables AP name
	site_tag (Policy tag)	Enables Site tag
	ssid	Enables SSID
	vlan_id	Enables VLAN ID
	dhcp-ip-addr	Enter the override DHCP server's IP Address.
Command Default	None	
Command Modes	config-wireless-polic	у
Command History	Release	Modification
	Cisco IOS XE Gibral	tar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE

Examples

The following example shows how to configure DHCP address assignment as a requirement:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy demo-profile-name
Device(config-wireless-policy)# ipv4 dhcp required
```

ipv4 flow monitor

To configure the IPv4 traffic ingress flow monitor for a WLAN profile policy, use the **ipv4 flow monitor input** command.

ipv4 flow monitor monitor-name input

Syntax Description	monitor-na	me Flow monitor name.	_
	input	Enables flow monitor on ingress traffic	-
Command Default	None		
Command Modes	config-wir	eless-policy	
Command History	Release	Modification	
	Cisco IOS	XE Gibraltar 16.10.1 This command was Gibraltar 16.10.1.	introduced in a release earlier than Cisco IOS XE

Examples

The following example shows how to configure the IPv4 traffic ingress flow monitor for a WLAN profile policy:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy policy-profile-name
Device(config-wireless-policy)# ipv4 flow monitor flow-monitor-name input
```

ipv6 access-list

To define an IPv6 access list and to place the device in IPv6 access list configuration mode, use the **ipv6 access-list** command in global configuration mode. To remove the access list, use the **no** form of this command.

ipv6 access-list *access-list-name* | **match-local-traffic** | **log-update threshold** *threshold-in-msgs* | **role-based** *list-name* **noipv6 access-list** *access-list-name* | **client** *permit-control-packets* | **log-update** *threshold* | **role-based** *list-name*

Syntax Description	ipv6 access-list-name	Creates a named IPv6 ACL (up to 64 characters in length) and enters IPv6 ACL configuration mode. <i>access-list-name</i> - Name of the IPv6 access list. Names cannot contain a space or quotation mark, or begin with a numeric.
	match-local-traffic	Enables matching for locally-generated traffic.
	log-update threshold threshold-in-msgs	Determines how syslog messages are generated after the initial packet match. <i>threshold-in-msgs</i> - Number of packets generated.
	role-based list-name	Creates a role-based IPv6 ACL.

Command Default No IPv6 access list is defined.

Command Modes

Global configuration

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines

IPv6 ACLs are defined by using the **ipv6 access-list**command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit**commands in IPv6 access list configuration mode. Configuring the **ipv6 access-list**command places the device in IPv6 access list configuration mode--the device prompt changes to Device(config-ipv6-acl)#. From IPv6 access list configuration mode, permit and deny conditions can be set for the defined IPv6 ACL.

Note IPv6 ACLs are defined by a unique name (IPv6 does not support numbered ACLs). An IPv4 ACL and an IPv6 ACL cannot share the same name.

IPv6 is automatically configured as the protocol type in **permit any any** and **deny any any** statements that are translated from global configuration mode to IPv6 access list configuration mode.

Every IPv6 ACL has implicit **permit icmp any any nd-na**, **permit icmp any any nd-ns**, and **deny ipv6 any any** statements as its last match conditions. (The former two match conditions allow for ICMPv6 neighbor

discovery.) An IPv6 ACL must contain at least one entry for the implicit deny ipv6 any any statement to take effect. The IPv6 neighbor discovery process makes use of the IPv6 network layer service; therefore, by default, IPv6 ACLs implicitly allow IPv6 neighbor discovery packets to be sent and received on an interface. In IPv4, the Address Resolution Protocol (ARP), which is equivalent to the IPv6 neighbor discovery process, makes use of a separate data link layer protocol; therefore, by default, IPv4 ACLs implicitly allow ARP packets to be sent and received on an interface. Use the **ipv6 traffic-filter** interface configuration command with the *access-list-name* argument to apply an IPv6 ACL to an IPv6 interface. Use the ipv6 access-class line configuration command with the access-list-name argument to apply an IPv6 ACL to incoming and outgoing IPv6 virtual terminal connections to and from the device. An IPv6 ACL applied to an interface with the **ipv6 traffic-filter** command filters traffic that is forwarded, not originated, by the device. Examples The example configures the IPv6 ACL list named list1 and places the device in IPv6 access list configuration mode. Device (config) # ipv6 access-list list1 Device (config-ipv6-acl) # The following example configures the IPv6 ACL named list2 and applies the ACL to outbound traffic on Ethernet interface 0. Specifically, the first ACL entry keeps all packets from the network FEC0:0:0:2::/64 (packets that have the site-local prefix FEC0:0:0:2 as the first 64 bits of their source IPv6 address) from exiting out of Ethernet interface 0. The second entry in the ACL permits all other traffic to exit out of Ethernet interface 0. The second entry is necessary because an implicit deny all condition is at the end of each IPv6 ACL. Device (config) # ipv6 access-list list2 deny FEC0:0:0:2::/64 any Device (config) # ipv6 access-list list2 permit any any Device(config) # interface ethernet 0

Device(config-if) # ipv6 traffic-filter list2 out

ipv6-address-type

To configure the 802.11u IPv6 address type, use the **ipv6-address-type** command. To remove the address type, use the **no** form of the command.

ipv6-address-type { available | not-available | not-known }

Syntax Description	available	Sets IPv6 address type as available.
	not-available	Sets IPv6 address type as not available.
	not-known	Sets IPv6 address type availability as not known.
Command Default	None	
Command Default Command Modes	_	P Server Configuration (config-wireless-anqp-server)
	_	P Server Configuration (config-wireless-anqp-server) Modification

Example

The following example shows how to configure a 802.11u IPv6 address type:

Device(config)# wireless hotspot angp-server my-server Device(config-wireless-angp-server)# ipv4-address-type available

ipv6 address

To configure an IPv6 address based on an IPv6 general prefix and enable IPv6 processing on an interface, use the **ipv6 address** command in interface configuration mode. To remove the address from the interface, use the **no** form of this command.

ipv6 address {*ipv6-prefix/prefix-length* | *prefix-name sub-bits/prefix-length*} **no ipv6 address** {*ipv6-address/prefix-length* | *prefix-name sub-bits/prefix-length*}

Syntax Description	ipv6-address	The IPv6 address to be used.
	/ prefix-length	The length of the IPv6 prefix. A decimal value that indicates how many of the high-order contiguous bits of the address comprise the prefix (the network portion of the address). A slash mark must precede the decimal value.
	prefix-name	A general prefix, which specifies the leading bits of the network to be configured on the interface.
	sub-bits	The subprefix bits and host bits of the address to be concatenated with the prefixes provided by the general prefix specified with the <i>prefix-name</i> argument.
		The <i>sub-bits</i> argument must be in the form documented in RFC 2373 where the address is specified in hexadecimal using 16-bit values between colons.

Command Default No IPv6 addresses are defined for any interface.

Command Modes

Interface configuration

Command History	Release	Modification
	12.2(2)T	This command was introduced.
	12.2(28)SB	This command was integrated into Cisco IOS Release 12.2(28)SB.
	12.2(25)SG	This command was integrated into Cisco IOS Release 12.2(25)SG.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2(33)SXH	This command was integrated into Cisco IOS Release 12.2(33)SXH.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco ASR 1000 Series devices.
	15.2(4)S	This command was integrated into Cisco IOS Release 15.2(4)S.
	15.2(2)SNG	This command was implemented on the Cisco ASR 901 Series Aggregation Services devices.
	Cisco IOS XE Release 3.2SE	This command was integrated into Cisco IOS XE Release 3.2SE.

Usage Guidelines	The ipv6 address command allows multiple IPv6 addresses to be configured on an interface in various different ways, with varying options. The most common way is to specify the IPv6 address with the prefix length.
	Addresses may also be defined using the general prefix mechanism, which separates the aggregated IPv6 prefix bits from the subprefix and host bits. In this case, the leading bits of the address are defined in a general prefix, which is globally configured or learned (for example, through use of Dynamic Host Configuration Protocol-Prefix Delegation (DHCP-PD)), and then applied using the <i>prefix-name</i> argument. The subprefix bits and host bits are defined using the <i>sub-bits</i> argument.
	Using the no ipv6 address autoconfig command without arguments removes all IPv6 addresses from an interface.
	IPv6 link-local addresses must be configured and IPv6 processing must be enabled on an interface by using the ipv6 address link-local command.
Examples	The following example shows how to enable IPv6 processing on the interface and configure an
	address based on the general prefix called my-prefix and the directly specified bits:
	Device(config-if) ipv6 address my-prefix 0:0:0:7272::72/64
	Assuming the general prefix named my-prefix has the value of 2001:DB8:2222::/48, then the interface would be configured with the global address 2001:DB8:2222:7272::72/64.

Related Commands	Command	Description
	ipv6 address anycast	Configures an IPv6 anycast address and enables IPv6 processing on an interface.
	ipv6 address eui-64	Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address.
	ipv6 address link-local	Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.
	ipv6 unnumbered	Enables IPv6 processing on an interface without assigning an explicit IPv6 address to the interface.
	no ipv6 address autoconfig	Removes all IPv6 addresses from an interface.
	show ipv6 interface	Displays the usability status of interfaces configured for IPv6.

ipv6 dhcp pool

To configure a Dynamic Host Configuration Protocol (DHCP) for IPv6 server configuration information pool and enter DHCP for IPv6 pool configuration mode, use the **ipv6 dhcp pool** command in global configuration mode. To delete a DHCP for IPv6 pool, use the **no** form of this command.

ipv6 dhcp pool poolname no ipv6 dhcp pool poolname

Syntax Description	poolname	User-defined name for the local prefix pool. The pool name can be a symbolic string (such as "Engineering") or an integer (such as 0).

Command Default DHCP for IPv6 pools are not configured.

Command Modes

Global configuration

Command History	Release	Modification
	12.3(4)T	This command was introduced.
	12.2(18)SXE	This command was integrated into Cisco IOS Release 12.2(18)SXE.
	12.4(24)T	This command was integrated into Cisco IOS Release 12.4(24)T.
	Cisco IOS XE Release 2.1	This command was integrated into Cisco IOS XE Release 2.1.
	12.2(33)SRE	This command was modified. It was integrated into Cisco IOS Release 12.2(33)SRE.
	12.2(33)XNE	This command was modified. It was integrated into Cisco IOS Release 12.2(33)XNE.

Usage Guidelines

Use the **ipv6 dhcp pool**command to create a DHCP for IPv6 server configuration information pool. When the **ipv6 dhcp pool** command is enabled, the configuration mode changes to DHCP for IPv6 pool configuration mode. In this mode, the administrator can configure pool parameters, such as prefixes to be delegated and Domain Name System (DNS) servers, using the following commands:

- address prefix *IPv6-prefix* [lifetime {*valid-lifetime preferred-lifetime* | infinite}]sets an address prefix for address assignment. This address must be in hexadecimal, using 16-bit values between colons.
- **link-address** *IPv6-prefix* sets a link-address IPv6 prefix. When an address on the incoming interface or a link-address in the packet matches the specified IPv6-prefix, the server uses the configuration information pool. This address must be in hexadecimal, using 16-bit values between colons.
- **vendor-specific** *vendor-id* enables DHCPv6 vendor-specific configuration mode. Specify a vendor identification number. This number is the vendor IANA Private Enterprise Number. The range is 1 to 4294967295. The following configuration command is available:
 - **suboption** *number* sets vendor-specific suboption number. The range is 1 to 65535. You can enter an IPv6 address, ASCII text, or a hex string as defined by the suboption parameters.

	Note	The hex value used under the suboption keyword allows users to enter only hex digits (0-f). Entering an invalid hex value does not delete the previous configuration.
	to a use	ce the DHCP for IPv6 configuration information pool has been created, use the ipv6 dhcp server command associate the pool with a server on an interface. If you do not configure an information pool, you need to the ipv6 dhcp server interface configuration command to enable the DHCPv6 server function on an erface.
	inte	ten you associate a DHCPv6 pool with an interface, only that pool services requests on the associated erface. The pool also services other interfaces. If you do not associate a DHCPv6 pool with an interface, an service requests on any interface.
	No	t using any IPv6 address prefix means that the pool returns only configured options.
		e link-address command allows matching a link-address without necessarily allocating an address. You match the pool from multiple relays by using multiple link-address configuration commands inside a pool.
		ce a longest match is performed on either the address pool information or the link information, you can figure one pool to allocate addresses and another pool on a subprefix that returns only configured options.
Examples		e following example specifies a DHCP for IPv6 configuration information pool named cisco1 and ces the router in DHCP for IPv6 pool configuration mode:
		<pre>iter(config)# ipv6 dhcp pool ciscol iter(config-dhcpv6)#</pre>
		e following example shows how to configure an IPv6 address prefix for the IPv6 configuration of cisco1:
		<pre>uter(config-dhcpv6)# address prefix 2001:1000::0/64 uter(config-dhcpv6)# end</pre>
		e following example shows how to configure a pool named engineering with three link-address fixes and an IPv6 address prefix:
	Rou Rou Rou Rou Rou	<pre>htter# configure terminal htter(config)# ipv6 dhcp pool engineering htter(config-dhcpv6)# link-address 2001:1001::0/64 htter(config-dhcpv6)# link-address 2001:1002::0/64 htter(config-dhcpv6)# link-address 2001:2000::0/48 htter(config-dhcpv6)# address prefix 2001:1003::0/64 htter(config-dhcpv6)# end</pre>
	The	e following example shows how to configure a pool named 350 with vendor-specific options:
	Rou Rou Rou Rou	<pre>htter# configure terminal htter(config)# ipv6 dhcp pool 350 htter(config-dhcpv6)# vendor-specific 9 htter(config-dhcpv6-vs)# suboption 1 address 1000:235D::1 htter(config-dhcpv6-vs)# suboption 2 ascii "IP-Phone" htter(config-dhcpv6-vs)# end</pre>

Related Commands

ıds	Command	Description
	ipv6 dhcp server	Enables DHCP for IPv6 service on an interface.
	show ipv6 dhcp pool	Displays DHCP for IPv6 configuration pool information.

ipv6 enable

To enable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **ipv6 enable**command in interface configuration mode. To disable IPv6 processing on an interface that has not been configured with an explicit IPv6 address, use the **no** form of this command.

ipv6 enable no ipv6 enable

- **Syntax Description** This command has no arguments or keywords.
- **Command Default** IPv6 is disabled.

	also enabling the interface for	utomatically configures an IPv6 link-local unicast address on the interface while r IPv6 processing. The no ipv6 enable command does not disable IPv6 processing ured with an explicit IPv6 address.		

Examples

The following example enables IPv6 processing on Ethernet interface 0/0:

I

Device(config)# interface ethernet 0/0
Device(config-if)# ipv6 enable

Related Commands

Command	Description	
ipv6 address link-local	Configures an IPv6 link-local address for an interface and enables IPv6 processing on the interface.	
ipv6 address eui-64	Configures an IPv6 address and enables IPv6 processing on an interface using an EUI-64 interface ID in the low-order 64 bits of the address.	
ipv6 unnumbered	Enables IPv6 processing on an interface without assigning an explicit IPv6 address to the interface.	
show ipv6 interface	Displays the usability status of interfaces configured for IPv6.	

ipv6 flow-export destination

loopback0 ipfix

Device(config-et-analytics) # end

To configure IPv6 ETA flow export destination, use the ipv6 flow-export destination command.

ipv6 flow-export destination ipv6_address port_number [source-interface interface-name] [ipfix]

Syntax Description	ip_address	<i>ip_address</i> Flow destination address.				
	<i>port_number</i> Flow destination port number. The range is from 1 to 65535.					
	source-interface	(Optional) The	source interface nam	ne of the exported ETA record.		
	<i>interface-number</i> (Optional) The source address of the exported ETA record. The IP address of the interface is used as source IP address of the exported ETA record packet.					
	ipfix	(Optional) The	format of the export	ed ETA records.		
Command Default	None					
Command Modes	ET-Analytics con	figuration				
Command History	Release		Modification			
	Cisco IOS XE Ar	nsterdam 17.1.1s	This command was introduced.	3		
	This example shows how to configure ETA flow export destination:					
	Device(config)#	tion commands, et-analytics	one per line. B			
	Device(config-e	t-analytics)# i	.pv6 flow-export d	estination 2001:181:181::1 22 source	-interface	

ipv6 nd proxy

		-	ery (ND) or Duplicate A D proxy, use the no form	address Detection (DAD), use the ipv6 nd proxy n of this command.
	ipv6 nd proxy {dad-proxy full-proxy}			
	no ipv6 nd j	proxy {dad-proxy	full-proxy}	
Syntax Description	dad-proxy	Enables the DAD p	proxy.	
	full-proxy	Enables the full pro-	xy. This enables DAD p	proxy and non-DAD Neighbor Solicitation proxy.
Command Default	Neighbor Discovery Proxy is not enabled.			
Command Modes	wireless policy configuration (config-wireless-policy)			
Command History	Release		Modification	
	Cisco IOS X	E Amsterdam 17.3.1	This command was introduced.	
Usage Guidelines	DAD proxy is applicable only in central switching mode.			
	Example			
	The followin	g example shows how	w to enable DAD proxy	<i>r</i> .

Device(config-wireless-policy) **#ipv6 nd proxy dad-proxy**

ipv6 mld snooping

To enable Multicast Listener Discovery version 2 (MLDv2) protocol snooping globally, use the **ipv6 mld snooping** command in global configuration mode. To disable the MLDv2 snooping globally, use the **no** form of this command.

ipv6 mld snooping no ipv6 mld snooping

Syntax Description This command has no arguments or keywords.

Command Default This command is enabled.

Command Modes

Global configuration

show ipv6 mld snooping

Command History	Release	Release Modification				
	12.2(18)SXE	12.2(18)SXE This command was introduced on the Supervisor Engine 720.				
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.				
	15.4(2)S	This command was implemented on the Cisco ASR 901 Series Aggregation Services Router.				
Usage Guidelines	MLDv2 snooping is supported on the Supervisor Engine 720 with all versions of the Policy Feature Card 3 (PFC3).					
		2 snooping, configure a Layer 3 interface in the subnet for IPv6 multicast routing or enable the ing querier in the subnet.				
Examples	This example shows how to enable MLDv2 snooping globally:					
	Router(config)# ipv6 mld snooping					
Related Commands	Command	Description				

Displays MLDv2 snooping information.

ipv6 nd managed-config-flag

To set the managed address configuration flag in IPv6 router advertisements, use the **ipv6 nd managed-config-flag** command in an appropriate configuration mode. To clear the flag from IPv6 router advertisements, use the **no** form of this command.

ipv6 nd managed-config-flag no ipv6 nd managed-config-flag

Syntax Description	This command has no keywords or arguments. The managed address configuration flag is not set in IPv6 router advertisements. Interface configuration		
Command Default			
Command Modes			
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	
Usage Guidelines	Setting the managed address configuration flag in IPv6 router advertisements indicates to attached hosts whether they should use stateful autoconfiguration to obtain addresses. If the flag is set, the attached hosts should use stateful autoconfiguration to obtain addresses. If the flag is not set, the attached hosts should not use stateful autoconfiguration to obtain addresses.		
	Hosts may use stateful and stateless address autoconfiguration simultaneously.		
Examples	This example shows how to configure the managed address configuration flag in IPv6 router advertisements:		
	Device(config)# interface Device(config-if)# ipv6 nd	managed-config-flag	

ipv6 nd other-config-flag

To set the other stateful configuration flag in IPv6 router advertisements, use the **ipv6 nd other-config-flag** command in an appropriate configuration mode. To clear the flag from IPv6 router advertisements, use the **no** form of this command.

ipv6 nd other-config-flag

Syntax Description	This command has no keywords or arguments.			
Command Default	The other stateful configuration flag is not set in IPv6 router advertisements.			
Command Modes	Interface configuration			
	Dynamic template configuration			
Command History	Release Modification			
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.			
Usage Guidelines	The setting of the other stateful configuration flag in IPv6 router advertisements indicates to attached hosts how they can obtain autoconfiguration information other than addresses. If the flag is set, the attached hosts should use stateful autoconfiguration to obtain the other (nonaddress) information.			
	Note If the managed address configuration flag is set using the ipv6 nd managed-config-flag command, then an attached host can use stateful autoconfiguration to obtain the other (nonaddress) information regardless of the setting of the other stateful configuration flag.			
Examples	This example (not applicable for BNG) configures the "other stateful configuration" flag in IPv6 router advertisements:			
	Device(config)# interface Device(config-if)# ipv6 nd other-config-flag			

ipv6 nd ra throttler attach-policy

To configure a IPv6 policy for feature RA throttler, use the ipv6 nd ra-throttler attach-policy command.

ipv6 nd ra-throttler attach-policy policy-name

Syntax Description	ipv6	IPv6 root chain.	
	ra-throttler	ra-throttler Configure RA throttler on the VLAN.	
	attach-policy Apply a policy for feature RA throttler.		or feature RA throttler.
	policy-name	Policy name for f	feature RA throttler
Command Default	None		
Command Modes	config-vlan		
Command History	Release		Modification
	Cisco IOS XE	Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure configure a IPv6 policy for feature RA throttler:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# vlan configuration vlan-id
Device(config-vlan-config)# ipv6 nd ra-throttler attach-policy
```

ipv6 nd raguard policy

To define the router advertisement (RA) guard policy name and enter RA guard policy configuration mode, use the **ipv6 nd raguard policy** command in global configuration mode.

ipv6 nd raguardpolicy policy-name

Syntax Description	policy-name	IPv6 RA guard policy name.
--------------------	-------------	----------------------------

Command Default An RA guard policy is not configured.

Command Modes

Global configuration (config)#

Command History	Release	Modification
	12.2(50)SY	This command was introduced.
	15.2(4)S	This command was integrated into Cisco IOS Release 15.2(4)S.
	15.0(2)SE	This command was integrated into Cisco IOS Release 15.0(2)SE.
	Cisco IOS XE Release 3.2SE	This command was integrated into Cisco IOS XE Release 3.2SE.

Usage Guidelines

Use the **ipv6 nd raguard policy** command to configure RA guard globally on a router. Once the device is in ND inspection policy configuration mode, you can use any of the following commands:

- device-role
- drop-unsecure
- limit address-count
- sec-level minimum
- trusted-port
- validate source-mac

After IPv6 RA guard is configured globally, you can use the **ipv6 nd raguard attach-policy** command to enable IPv6 RA guard on a specific interface.

Examples The following example shows how to define the RA guard policy name as policy1 and place the device in policy configuration mode:

Device(config)# ipv6 nd raguard policy policy1
Device(config-ra-guard)#

Related Commands

Table 1:

Command	Description
device-role	Specifies the role of the device attached to the port.
drop-unsecure	Drops messages with no or invalid options or an invalid signature.
ipv6 nd raguard attach-policy	Applies the IPv6 RA guard feature on a specified interface.
limit address-count	Limits the number of IPv6 addresses allowed to be used on the port.
sec-level minimum	Specifies the minimum security level parameter value when CGA options are used.
trusted-port	Configures a port to become a trusted port.
validate source-mac	Checks the source MAC address against the link layer address.

ipv6 traffic-filter

This command enables IPv6 traffic filter.

To enable the filtering of IPv6 traffic on an interface, use the **ipv6 traffic-filter** command. To disable the filtering of IPv6 traffic on an interface, use the **no** form of the command.

Use the **ipv6 traffic-filter** interface configuration command on the switch stack or on a standalone switch to filter IPv6 traffic on an interface. The type and direction of traffic that you can filter depends on the feature set running on the switch stack. Use the **no** form of this command to disable the filtering of IPv6 traffic on an interface.

ipv6 traffic-filter [web] acl-name
no ipv6 traffic-filter [web]

Syntax Description	web (Optional) Specifies an IPv6 access name for the WLAN Web ACL.	
	acl-name Specifies an IPv6 access name.	
Command Default	Filtering of IPv6 traffic on an interface is not configured.	
Command Modes	wlan	
Command History	Release Modification	
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.	
Usage Guidelines	To configure the dual IPv4 and IPv6 template, enter the sdm prefer dual-ipv4-and-ipv6 {default vlan} global configuration command and reload the switch.	
	You can use the ipv6 traffic-filter command on physical interfaces (Layer 2 or Layer 3 ports), Layer 3 port channels, or switch virtual interfaces (SVIs).	
	You can apply an ACL to outbound or inbound traffic on Layer 3 interfaces (port ACLs), or to inbound tra on Layer 2 interfaces (router ACLs).	
	If any port ACL (IPv4, IPv6, or MAC) is applied to an interface, that port ACL is used to filter packets, any router ACLs attached to the SVI of the port VLAN are ignored.	
	This example shows how to filter IPv6 traffic on an interface: Device (config-wlan) # ipv6 traffic-filter TestDocTrafficFilter	

key

To identify an authentication key on a key chain, use the **key** command in key-chain configuration mode. To remove the key from the key chain, use the **no** form of this command.

key key-id no key key-id

Related Commands	Comma	and	Description
	Device (config-keychain) #key 1		
Examples			how to specify a key to identify authentication on a key-chain:
	To remove all keys, remove the key chain by using the no key chain command.		e key chain by using the no key chain command.
	If the last key expires, authentication will continue and an error message will be generated. To disable authentication, you must manually delete the last valid key.		
	Each key has its own key identifier, which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use. Only one authentication packet is sent, regardless of the number of valid keys. The software starts looking at the lowest key identifier number and uses the first valid key.		
Usage Guidelines	It is useful to have multiple keys on a key chain so that the software can sequence through the keys as the become invalid after time, based on the accept-lifetime and send-lifetime key chain key command setting		
Command Modes	Command Modes Key-chain configuration (config-keychain)		
Command Default	No key	exists on the key chain	.
	Key-iu		y identification numbers need not be consecutive.
Syntax Description	key-id	Identification number	r of an authentication key on a key chain. The range of keys is from 0 to

mmands	Command	Description
	accept-lifetime	Sets the time period during which the authentication key on a key chain is received as valid.
	key chain	Defines an authentication key chain needed to enable authentication for routing protocols.
	key-string (authentication)	Specifies the authentication string for a key.
	show key chain	Displays authentication key information.

key config-key password-encrypt

To set a private configuration key for password encryption, use the **key config-key password-encrypt** command. To disable this feature, use the **no** form of this command.

key config-key password-encrypt <config-key>

Syntax Description	config-key Enter a value with minimum 8 characters.		
		The value must not begin with the following special characters:	
		!, #, and ;	
Command Default	None		
Command Modes	Global configuration mode		
Command History	Release	Modification	
Command History			

Examples

The following example shows how to set a username and password for AP management:

```
Device# enable
Device# configure terminal
Device(config)# key config-key password-encryption 12345678
Device(config-ap-profile)# password encryption aes
Device(config-ap-profile)# end
```

Idap attribute-map

To configure a dynamic attribute map on an SLDAP server, use the **ldap attribute-map** command.

Idap attribute-map map-name

 Command Default
 None

 Command Modes
 Global configuration (config)

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced.

This example shows how to configure a dynamic attribute map on an SLDAP server:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# ldap attribute-map map1 Device(config-attr-map)# map type department supplicant-group Device(config-attr-map)# exit

Idap server

To configure secure LDAP, use the ldap server command.

Syntax Description	name Server name.	
ommand Default	None	
ommand Modes	Global configuration (config)	
ommand History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

This example shows how to configure secure LDAP:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ldap server server1
Device(config-ldap-server)# ipv4 9.4.109.20
Device(config-ldap-server)# timeout retransmit 20
Device(config-ldap-server)# bind authenticate root-dn
CN=ldapipv6user,CN=Users,DC=ca,DC=ssh2,DC=com password Cisco12345
Device(config-ldap-server)# base-dn CN=Users,DC=ca,DC=ssh2,DC=com
Device(config-ldap-server)# mode secure no- negotiation
Device(config-ldap-server)# end
```

license air level

To configure AIR licenses on a wireless controller, enter the **license air level** command in global configuration mode. To revert to the default setting, use the **no** form of this command.

no license air level

Syntax Description	air-network-advantage	Configures the AIR Network Advantage license level.				
	addon air-dna-advantage (Optional) Configures the add-on AIR DNA Advantage license level.					
		This add-on option is available with the AIR Network Advantage license.				
	air-network-essentials Configures the AIR Network Essentials license level.					
	addon air-dna-essentials (Optional) Configures the add-on AIR DNA Essentials license level.					
		This add-on option is available with the AIR Network Essential license.				
Command Default	For all Cisco Catalyst 9800 Wireless controllers the default license is AIR DNA Advantage.					
	For EWC-APs:					
	• Prior to Cisco IOS XE	Bengaluru 17.4.1, the default license is AIR DNA Essentials.				
	Starting with Cisco IOS	S XE Bengaluru 17.4.1, the default license is AIR Network Essentials				
Command Modes	Global configuration (config	;)				
Command History	Release	Modification				
	Cisco IOS XE Gibraltar 16.	10.1 This command was introduced.				
	Cisco IOS XE Amsterdam 17	7.3.2a This command continues to be available and applicable with the introduction of Smart Licensing Using Policy.				
	Cisco IOS XE Bengaluru 17	7.4.1 Only for EWC-APs, the default license was changed from AIR DNA Essentials to AIR Network Essentials.				
Usage Guidelines	In the Smart Licensing Using Policy environment, you can use the license air level complicense level being used on the product instance, or to additionally configure an add-on licenstance. The change is effective after a reload.					
	The licenses that can be configured are:					
	AIR Network Essential					
	AIR Network Advantage	ge				
	• AIR DNA Essential					

AIR DNA Advantage

You can configure AIR DNA Essential or AIR DNA Advantage license level and on term expiry, you can move to the Network Advantage or Network Essentials license level, if you do not want to renew the DNA license.

Every connecting AP requires a Cisco DNA Center License to leverage the unique value properties of the controller.

Examples

The following example show how to configure the AIR DNA Essential license level:

```
Device# configure terminal
Device(config)# license air level network-essentials addon air-dna-essentials
```

The following example shows how the AIR DNA Advantage license level is configured to begin with and then changed to AIR DNA Essentials:

Current configuration as AIR DNA Advantage:

```
Device# show version
Cisco IOS XE Software, Version 17.03.02
Cisco IOS Software [Amsterdam], C9800-CL Software (C9800-CL-K9_IOSXE), Version 17.3.2,
RELEASE SOFTWARE
<output truncated>
AIR License Level: AIR DNA Advantage
Next reload AIR license Level: AIR DNA Advantage
```

Smart Licensing Status: Registration Not Applicable/Not Applicable <output truncated>

Configuration of AIR DNA Essentials :

```
Device# configure terminal
Device(config)# license air level air-network-essentials addon air-dna-essentials
```

Device# exit
Device# show version
Cisco IOS XE Software, Version 17.03.02
Cisco IOS Software [Amsterdam], C9800-CL Software (C9800-CL-K9_IOSXE), Version 17.3.2,
RELEASE SOFTWARE
<output truncated>
AIR License Level: AIR DNA Advantage
Next reload AIR license Level: AIR DNA Essentials
Smart Licensing Status: Registration Not Applicable/Not Applicable
<output truncated>

Device# write memory Device# reload

After reload:

Device# show version Cisco IOS XE Software, Version 17.03.02 Cisco IOS Software [Amsterdam], C9800-CL Software (C9800-CL-K9_IOSXE), Version 17.3.2, RELEASE SOFTWARE <output truncated> AIR License Level: AIR DNA Essentials Next reload AIR license Level: AIR DNA Essentials

Smart Licensing Status: Registration Not Applicable/Not Applicable <output truncated>

license smart (global config)

To configure licensing-related settings such as the mode of transport and the URL that the product instance uses to communicate with Cisco Smart Software Manager (CSSM), or Cisco Smart Licensing Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), to configure the usage reporting interval, to configure the information that must be exluded or included in a license usage report (RUM report), enter the **license smart** command in global configuration mode. Use the **no** form of the command to revert to default values.

license smart { custom_id ID | enable | privacy { all | hostname | version } | proxy { address address_hostname | port port } | reservation | server-identity-check | transport { automatic | callhome | cslu | off | smart } | url { url | cslu cslu_or_on-prem_url | default | smart smart_url | utility secondary_url } | usage { customer-tags { tag1 | tag2 | tag3 | tag4 } tag_value | interval_in_days } | utility [customer_info { city city | country country | postalcode postalcode | state state | street street }] }

no license smart { custom_id | enable | privacy { all | hostname | version } | proxy { address address_hostname | port port } | reservation | server-identity-check | transport | url { url | cslu cslu_or_on-prem_url | default | smart smart_url | utility secondary_url } | usage { customer-tags { tag1 | tag2 | tag3 | tag4 } tag_value | interval interval_in_days } | utility [customer_info { city city | country country | postalcode | state state | street street }] }

Syntax Description	custom_id ID	Although available on the CLI, this option is not supported.
	enable	Although visible on the CLI, configuring this keyword has no effect. Smart licensing is always enabled.

<pre>privacy { all hostname version }</pre>	Sets a privacy flag to prevent the sending of the specified data privacy related information.
	When the flag is disabled, the corresponding information is sent in a message or offline file created by the product instance.
	Depending on the topology this is sent to one or more components, including CSSM, CSLU, and SSM On-Prem.
	All data privacy settings are disabled by default. You must configure the option you want to exclude from all communication:
	• all: All data privacy related information is excluded from any communication.
	The no form of the command causes all data privacy related information to be sent in a message or offline file.
	Note The Product ID (PID) and serial number are <i>included in the RUM report</i> regardless of whether data privacy is enabled or not.
	• hostname : Excludes hostname information from any communication. When hostname privacy is enabled, the <i>UDI</i> of the product instance is displayed on the applicable user interfaces (CSSM, CSLU, and SSM On-Prem).
	The no form of the command causes hostname information to be sent in a message or offline file. The hostname is displayed on the applicable user interfaces (CSSM, CSLU, and SSM On-Prem).
	• version: Excludes the Cisco IOS-XE software version running on the product instance and the Smart Agent version from any communication.
	The no form of the command causes version information to be sent in a message or offline file.

I

<pre>proxy { address address_hostname port port }</pre>	Configures a proxy for license usage synchronization with CSLU or CSSM. This means that you can use this option to configure a proxy only if the transport mode is license smart transport smart (CSSM), or license smart transport cslu (CSLU).		
	synchroniza	ou cannot configure a proxy for license usage ation in an SSM On-Prem deployment, which cense smart transport cslu as the transport	
	Configure t	he following options:	
	• addres addres	ss <i>address_hostname</i> : Configures the proxy s.	
	For <i>address_hostname</i> , enter the enter the IP address or hostname of the proxy.		
	• portpa	ort: Configures the proxy port.	
	For po	rt, enter the proxy port number.	
reservation	Enables or o	disables a license reservation feature.	
	Note	Although available on the CLI, this option is not applicable because license <i>reservation</i> is not applicable in the Smart Licensing Using Policy environment.	
server-identity-check	Enables or o	disables the HTTP secure server identity check.	
<pre>transport { automatic callhome cslu off smart }</pre>		the mode of transport the product instance uses icate with CSSM. Choose from the following	
	• autom	atic: Sets the transport mode cslu.	
	Note	The automatic keyword is not supported on Cisco Catalyst Wireless Controllers.	
	• callho	me: Enables Call Home as the transport mode.	
		nables CSLU as the transport mode. This is the transport mode.	
	On-Pre	me keyword applies to both CSLU <i>and</i> SSM em, but the URLs are different. See <i>lu_or_on-prem_url</i> in the following row.	
	• off: Di instanc	sables all communication from the product be.	
	• smart	Enables Smart transport.	

url { url | cslu cslu_url | default | smart
smart_url | utility secondary_url }

Sets URL that is used for the configured transport mode. Choose from the following options:

• *url*: If you have configured the transport mode as **callhome**, configure this option. Enter the CSSM URL exactly as follows:

https://tools.cisco.com/its/service/oddce/services/DDCEService

The **no license smart url** *url* command reverts to the default URL.

- cslu *cslu_or_on-prem_url*: If you have configured the transport mode as cslu, configure this option, with the URL for CSLU or SSM On-Prem, as applicable:
 - If you are using CSLU, enter the URL as follows:

http://<cslu_ip_or_host>:8182/cslu/v1/pi

For <cslu_ip_or_host>, enter the hostname or the IP address of the windows host where you have installed CSLU. 8182 is the port number and it is the only port number that CSLU uses.

The no license smart url cslu

cslu_or_on-prem_url command reverts to http://cslu-local:8182/cslu/v1/pi

• If you are using SSM On-Prem, enter the URL as follows:

http://<ip>/cslu/v1/pi/<tenant ID>

For <ip>, enter the hostname or the IP address of the server where you have installed SSM On-Prem. The <tenantID> must be the default local virtual account ID.

Tip You can retrieve the entire URL from SSM On-Prem. In the software configuration guide (17.3.x and later), see Smart Licensing Using Policy > Task Library for Smart Licensing Using Policy > Retrieving the Transport URL (SSM On-Prem UI).

The **no license smart url cslu** *cslu_or_on-prem_url* command reverts to http://cslu-local:8182/cslu/v1/pi

• **default**: Depends on the configured transport mode. Only the **smart** and **cslu** transport modes are supported with this option.

If the transport mode is set to **cslu**, and you configure **license smart url default**, the CSLU URL is

L

configured automatically
(https://cslu-local:8182/cslu/v1/pi).

If the transport mode is set to **smart**, and you configure **license smart url default**, the Smart URL is configured automatically

(https://smartreceiver.cisco.com/licservice/license).

• **smart** *smart_url*: If you have configured the transport type as **smart**, configure this option. Enter the URL exactly as follows:

https://smartreceiver.cisco.com/licservice/license

When you configure this option, the system automatically creates a duplicate of the URL in **license smart url** *url*. You can ignore the duplicate entry, no further action is required.

The **no license smart url smart***smart_url* command reverts to the default URL.

utility smart_url: Although available on the CLI, this option is not supported.

		gs { tag1 tag2 tag3 Configures usage reporting settings. You can set the terval <i>interval_in_days</i> } following options:	
		• customer-tags { tag1 tag2 tag3 tag4 } tag_value: Defines strings for inclusion in data models, for telemetry. Up to 4 strings (or tags) may be defined.	
		For <i>tag_value</i> , enter the string value for each tag that you define.	
		• interval <i>interval_in_days</i> : Sets the reporting interval in days. By default the RUM report is sent every 30 days. The valid value range is 1 to 3650.	
		If you set the value to zero, RUM reports are not sent, regardless of what the applied policy specifies - this applies to topologies where CSLU or CSSM may be on the receiving end.	
		If you set a value that is greater than zero and the transport type is set to off , then, between the <i>interval_in_days</i> and the policy value for Ongoing reporting frequency(days):, the lower of the two values is applied. For example, if <i>interval_in_days</i> is set to 100, and the value in the in the policy says Ongoing reporting frequency (days):90, RUM reports are sent every 90 days.	
		If you do not set an interval, and the default is effective, the reporting interval is determined entirely by the policy value. For example, if the default value is effective and only unenforced licenses are in use, if the policy states that reporting is not required, then RUM reports are not sent.	
	<pre>utility [customer_info { city city country Although visible on the CLI, this option is not supported. country postalcode postalcode state state street street }]</pre>		
Command Default	Cisco IOS XE Amste	dam 17.3.1 or earlier: Smart Licensing is enabled by default.	
	Cisco IOS XE Amste	dam 17.3.2a and later: Smart Licensing Using Policy is enabled by default.	
Command Modes	Global config (config		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

Release	Modification		
Cisco IOS XE Amsterdam 17.3.2a	The following keywords and variables were introduced with Smart Licensing Using Policy:		
	• Under the url keyword, these options were introduced:		
	{ cslu_url smart_url }		
	• Under the transport keyword, these options were introduced:		
	{ cslu off }		
	Further, the default transport type was changed from callhome, to cslu.		
	<pre>• usage { customer-tags { tag1 tag2 tag3 tag4 } tag_value interval interval_in_days }</pre>		
	The following keywords and variables under the license smart command are deprecated and no longer available on the CLI: enable and conversion automatic .		
Cisco IOS XE Amsterdam 17.3.3	SSM On-Prem support was introduced. For product instance-initiated communication in an SSM On-Prem deployment, the existing [no]license smart url cslu <i>cslu_or_on-prem_url</i> command supports the configuration of a URL for SSM On-Prem as well. But the required URL format for SSM On-Prem is: http:// <ip>/cslu/v1/pi/<tenant id="">.</tenant></ip>		
	The corresponding transport mode that must be configured is also an existing command (license smart transport cslu).		
Cisco IOS XE Cupertino 17.7.1	If version privacy is disabled (no license smart privacy version global configuration command), the Cisco IOS-XE software version running on the product instance and the Smart Agent version is <i>included</i> in the RUM report.		
	To exclude version information from the RUM report, version privacy must be enabled (license smart privacy version).		
Cisco IOS XE Cupertino 17.9.1	• A new mechanism to send all data privacy related information was introduced. This information is no longer included in a RUM report.		
	If data privacy is disabled (no license smart privacy { all hostname version } global configuration command), data privacy related information is sent in a separate sync message or offline file.		
	• Support for sending hostname information was introduced.		
	If the privacy setting for the hostname is disabled (no license smart privacy hostname global configuration command), hostname information is sent from the product instance, in a separate sync message, or offline file. Depending on the topology you have implemented, the hostname information is received by CSSM, CSLU, or SSM On-Prem. It is also displayed on the corresponding user interface.		

Usage Guidelines Data Privacy Settings

Configuration Commands: g to z

When you disable a privacy setting, the topology you have implemented determines the recipient and how the information reaches its destination:

• The recipient of the information may be one or more of the following: CSSM, CSLU, and SSM On-Prem. The privacy setting has no effect on a controller (Cisco DNA Center).

In case of the **hostname** keyword, after the hostname information is received by CSSM, CSLU, or SSM On-Prem, it is also displayed on the corresponding UIs – as applicable. If you then *enable* privacy the corresponding UIs revert to displaying the UDI of the product instance.

- How the information is sent.
 - In case of a topology where the product instance initiates communication, the product instance initiates the sending of this information in a message, to CSSM, or CSLU, or SSM On-Prem.

The product instance sends the hostname sent every time one of the following events occur: the product instance boots up, the hostname changes, there is a switchover in a High Availability set-up.

 In case of a topology where CSLU or SSM On-Prem initiate communication, the corresponding component initiates the retrieval of privacy information from the product instance.

The hostname is retrieved at the frequency you configure in CSLU or SSM On-Prem, to retrieve information.

• In case of a topology where the product instance is in an air-gapped network, privacy information is included in the offline file that is generated when you enter the **license smart save usage** privileged EXEC command.

Note For all topologies, data privacy related information is *not* included in the RUM report.

Data privacy related information it is not stored by the product instance *prior* to sending or saving. This ensures that if and when information is sent, it is consistent with the data privacy setting at the time of sending or saving.

Communication failures and reporting

The reporting interval that you configure (**license smart usage interval** *interval_in_days* command), determines the date and time at which the product instance sends out the RUM report. If the scheduled interval coincides with a communication failure, the product instance attempts to send out the RUM report for up to four hours after the scheduled time has expired. If it is still unable to send out the report (because the communication failure persists), the system resets the interval to 15 minutes. Once the communication failure is resolved, the system reverts the reporting interval to the value that you last configured.

The system message you may see in case of a communicatin failure is %SMART_LIC-3-COMM_FAILED. For information about resolving this error and restoring the reporting interval value, in the software configuration guide of the required release (17.3.x onwards), see *System Configuration* > *Smart Licensing Using Policy* > *Troubleshooting Smart Licensing Using Policy*.

Proxy server acceptance

When configuring the **license smart proxy** {**address** *address_hostname* | **port***port*} command, note the change in the criteria for the acceptance of proxy servers, starting with Cisco IOS XE Bengaluru 17.6.1: only the status code of the proxy server response is verified by the system and not the reason phrase. The RFC

format is status-line = HTTP-version SP status-code SP reason-phrase CRLF, where the status code is a three-digit numeric code. For more information about the status line, see section 3.1.2 of RFC 7230.

Examples

- Examples for Data Privacy, on page 127
- Examples for Transport Type and URL, on page 128
- Examples for Usage Reporting Options, on page 129

Examples for Data Privacy

The following examples show how to configure data privacy related information using **license smart privacy** command in global configuration mode. The accompanying **show license status** output displays configured information.

Note

The output of the **show** command only tells you if a particular option is enabled or disabled.

Here, no data privacy related information information is sent:

```
Device# configure terminal
Device(config)# license smart privacy all
Device(config)# exit
Device# show license status
<output truncated>
Data Privacy:
Sending Hostname: no
Callhome hostname privacy: ENABLED
Smart Licensing hostname privacy: ENABLED
Version privacy: ENABLED
Transport:
```

Type: Callhome <output truncated>

Here, the software version running on the product instance is Cisco IOS XE Cupertino 17.9.1. Version privacy is disabled, and the Cisco IOS-XE software version running on the product instance and the Smart Agent version is included in the RUM report:

```
Device# configure terminal
Device(config)# license smart privacy hostname
Device(config)# no license smart privacy version
Device(config)# exit
Device# show license all
<output truncated>
Data Privacy:
Sending Hostname: no
Callhome hostname privacy: DISABLED
Smart Licensing hostname privacy: ENABLED
Version privacy: DISABLED
Transport:
Type: Smart
```

Proxy: Not Configured VRF: Not Configured

<output truncated>

Here, the software version running on the product instance is Cisco IOS XE Cupertino 17.9.1. The hostname is included and version information is excluded in the message initiated from the product instance. The product instance is directly connected to CSSM (transport type is **smart**, with the corresponding URL).

```
Device# configure terminal
Device(config)# license smart privacy version
Device (config) # no license smart privacy hostname
Device(config) # exit
Device# show license all
<output truncated>
Data Privacy:
  Sending Hostname: no
   Callhome hostname privacy: DISABLED
   Smart Licensing hostname privacy: ENABLED
  Version privacy: DISABLED
Transport:
  Type: Smart
  URL: https://smartreceiver.cisco.com/licservice/license
  Proxv:
   Not Configured
  VRF:
   Not Configured
<output truncated>
```

Examples for Transport Type and URL

The following examples show how to configure some of the transport types using the **license smart transport** and the **license smart url** commands in global configuration mode. The accompanying **show license all** output displays configured information.

Transport cslu:

```
Device# configure terminal
Device(config)# license smart transport cslu
Device(config)# license smart url default
Device(config)# exit
Device# show license all
<output truncated>
Transport:
Type: cslu
Cslu address: http://192.168.0.1:8182/cslu/v1/pi
Proxy:
Not Configured
<output truncated>
```

Transport smart:

```
Device# configure terminal
Device(config)# license smart transport smart
Device(config)# license smart url smart https://smartreceiver.cisco.com/licservice/license
```

```
Device(config)# exit
Device# show license all
<output truncated>
Transport:
   Type: Smart
   URL: https://smartreceiver-stage.cisco.com/licservice/license
   Proxy:
        Not Configured
<output truncated>
```

Examples for Usage Reporting Options

The following examples show how to configure some of the usage reporting settings using the **license smart usage** command in global configuration mode. The accompanying **show running-config** output displays configured information.

Configuring the **customer-tag** option:

```
Device# configure terminal
Device(config)# license smart usage customer-tags tag1 SA/VA:01
Device(config)# exit
Device# show running-config | include tag1
license smart usage customer-tags tag1 SA/VA:01
```

Configuring a narrower reporting interval than the currently applied policy:

```
Device# show license status
<output truncated>
Usage Reporting:
Last ACK received: Sep 22 13:49:38 2020 PST
Next ACK deadline: Dec 21 12:02:21 2020 PST
Reporting push interval: 30 days
Next ACK push check: Sep 22 12:20:34 2020 PST
Next report push: Oct 22 12:05:43 2020 PST
Last report push: Sep 22 12:05:43 2020 PST
Last report file write: <none>
<output truncated>
```

```
Device# configure terminal
Device(config)# license smart usage interval 20
Device(config)# exit
Device# show license status
<output truncated>
```

Usage Reporting: Last ACK received: Sep 22 13:49:38 2020 PST Next ACK deadline: Nov 22 12:02:21 2020 PST Reporting push interval: 20 days Next ACK push check: Sep 22 12:20:34 2020 PST Next report push: Oct 12 12:05:43 2020 PST Last report push: Sep 22 12:05:43 2020 PST Last report file write: <none> <output truncated>

license smart (privileged EXEC)

To configure licensing functions such as requesting or returning authorization codes, saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, establishing trust with Cisco Smart Software Manager (CSSM), synchronizing the product instance with CSSM, or Cisco Smart License Utility (CSLU), or Smart Software Manager On-Prem (SSM On-Prem), and removing licensing information from the product instance, enter the **license smart** command in privileged EXEC mode with the corresponding keyword or argument.

license smart { authorization { request { add | replace | save filepath_filename } feature_name { all | local } | return { all | local } { offline [filepath_filename] | online } } | clear eventlog | export return { all | local } feature_name | factory reset | import filepath_filename | save { trust-request filepath_filename | usage { all | days days | rum-id rum-ID | unreported } { file filepath_filename } } | sync { all | local } | trust idtoken id_token_value { local | all } [{ force }] }

Syntax Description	smart	Provides options for Smart Licensing.
	authorization	Provides the option to request for, or return, authorization codes.
		Authorization codes are required <i>only</i> if you use licenses with enforcement type: export-controlled or enfored.
	request	Requests an authorization code from CSSM, CSLU (CSLU in-turn fetches it from CSSM), or SSM On-Prem and installs it on the product instance.
	add	Adds the requested license to the existing authorization code. The new authorization code will contain all the licenses of the existing authorization code and the requested license.
	replace	Replaces the existing authorization code. The new authorization code will contain only the requested license. All licenses in the current authorization code are returned.
		When you enter this option, the product instance verifies if licenses that correspond to the authorization codes that will be removed, are in-use. If licenses are being used, an error message tells you to first disable the corresponding features.
	savefilepath_filename	Saves the authorization code request to a file.
		For <i>filepath_filename</i> , specify the absolute path to the file, including the filename.
	feature_name	Name of the license for which you are requesting an authorization code.
	all	Performs the action for all product instances in a High Availability configuration.
	local	Performs the action for the <i>active</i> product instance. This is the default option.
	return	Returns an authorization code back to the license pool in CSSM.

offline filepath_filename	Means the product instance is not connected to CSSM. The authorization code is returned offline. This option requires you to print the return code to a file.	
	Optionally, you can also specify a path to save the file. The file format can be any readable format, such as .txt	
	If you choose the offline option, you must complete the additional step of copying the return code from the CLI or the saved file and entering it in CSSM.	
online	Means that the product instance is in a connected mode. The authorization c is returned to CSLU or CSSM directly.	
clear eventlog	Clears all event log files from the product instance.	
export return	Returns the authorization key for an export-controlled license.	
factory reset	Clears all saved licensing information from the product instance.	
import filepath_filename	Imports a file on to the product instance. The file may be that of an authorization code, a trust code, or, or a policy.	
	For <i>filepath_filename</i> , specify the location, including the filename.	
save	Provides options to save RUM reports or trust code requests.	
trust-request	Saves the trust code request for the active product instance in the specified location.	
filepath_filename	For <i>filepath_filename</i> , specify the absolute path to the file, including the filename.	
usage { all days days rum-id rum-ID	Saves RUM reports (license usage information) in the specified location. You must specify one of these options:	
<pre>unreported } { file file_path }</pre>	• all: Saves all RUM reports.	
у - , у	• days <i>days</i> : Saves RUM report for the last <i>n</i> number of days (excluding the current day). Enter a number. The valid range is 0 to 4294967295.	
	For example, if you enter 3, RUM reports of the last three days are saved.	
	• rum-Id <i>rum-ID</i> : Saves a specified RUM ID. The valid value range is 0 to 18446744073709551615.	
	• unreported: Saves all unreported RUM reports.	
	file <i>filepath_filename</i> : Saves the specified usage information to a file. Specify the absolute path to the file, including the filename.	

I

	<pre>sync { all local }</pre>	Synchronizes with CSSM or CSLU, or SSM On-Prem, to send and receive any pending data. This includes uploading pending RUM reports, downloading the ACK response, any pending authorization codes, trust codes, and policies for the product instance.
		Specify the product instance by entering one of these options:
		• all: Performs synchronization for all the product instances in a High Availability set-up. If you choose this option, the product instance also sends the list of all the UDIs in the synchronization request.
		• local : Performs synchronization only for the active product instance sending the request, that is, its own UDI. This is the default option.
	trust idtoken	Establishes a trusted connection with CSSM.
	id_token_value	To use this option, you must first generate a token in the CSSM portal. Provide the generated token value for <i>id_token_value</i> .
	force	Submits a trust code request even if a trust code already exists on the product instance.
		A trust code is node-locked to the UDI of a product instance. If the UDI is already registered, CSSM does not allow a new registration for the same UDI. Entering the force keyword overrides this behavior.
Command Default	Cisco IOS XE Amster	rdam 17.3.1 or earlier: Smart Licensing is enabled by default.
	Cisco IOS XE Amster	rdam 17.3.2a and later: Smart Licensing Using Policy is enabled by default.
Command Modes	Privileged EXEC	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Release	Modification		
Cisco IOS XE Amsterdam 17.3.2a	The following keywords and variables were introduced with Smart Licensing Using Policy:		
	 authorization { request { add replace } feature_name { all local } return { all local } { offline [path] online } } 		
	• import file_path		
	• save { trust-request filepath_filename usage { all days days rum-id rum-ID unreported } { file file_path } }		
	• sync { all local }		
	<pre>• trust idtoken id_token_value { local all } [force]</pre>		
	The following keywords and variables under the license smart command are deprecated and no longer available on the CLI:		
	• register idtoken token_id [force]		
	• renew id { ID auth }		
	• debug { error debug trace all }		
	 reservation { cancel [all local] install [file] key request { all local universal } return [all authorization { auth_code file filename } Local] key } 		
	• mfg reservation { request install install file cancel }		
	• conversion { start stop }		
Cisco IOS XE Amsterdam 17.3.3	Support for SSM On-Prem was introduced. You can perform licensing-related tasks such as saving Resource Utilization Measurement reports (RUM reports), importing a file on to a product instance, synchronizing the product instance, returning authorization codes, and removing licensing information from the product instance in an SSM On-Prem deployment.		
Cisco IOS XE	The following enhancements were introduced in this release:		
Cupertino 17.7.1	• The save <i>filepath_filename</i> keyword and variable was added to the license smart authorization request string.		
	Although visible on the CLI, the new keywords are not applicable, because there are no export-controlled or enforced licenses on any of the Cisco Catalys Wireless Controllers.		
	• The existing license smart save usage command was enhanced to include a trust code request in applicable topologies.		

Usage Guidelines

Overwriting a Trust Code

Use case for the **force** option when configuring the **license smart trust idtoken** command: You use same token for all the product instances that are part of one Virtual Account. If the product instance has moved

from one account to another (for instance, because it was added to a High Availability set-up, which is part of another Virtual Account), then there may be an existing trust code you have to overwrite.

Removing Licensing Information

Entering the **licence smart factory reset** command removes all licensing information (except the licenses in-use) from the product instance, including any authorization codes, RUM reports etc. Therefore, we recommend the use of this command only if the product instance is being returned (Return Material Authrization, or RMA), or being decommissioned permanently. We also recommend that you send a RUM report to CSSM, before you remove licensing information from the product instance - this is to ensure that CSSM has up-to-date usage information.

Authorization Codes and License Reservations:

Options relating to authorization codes and license reservations:

- Since there are no export-controlled or enforced licenses on any of the Cisco Catalyst Wireless Controllers, and the notion of reserved licenses is not applicable in the Smart Licensing Using Policy environment, the following commands are not applicable:
 - { { license smart authorization request { add | replace | save *path* } *feature_name* { all | local } *request_count* } }
 - license smart export return
- The following option is applicable and required for any SLR authorization codes you may want to return:

license smart authorization return { all | local } { offline [path] | online }

Examples

- Example for Saving Licensing Usage Information, on page 134
- Example for Installing a Trust Code, on page 135
- Example for Returning an SLR Authorization Code, on page 135

Example for Saving Licensing Usage Information

The following example shows how you can save license usage information on the product instance. You can use this option to fulfil reporting requirements in an air-gapped network. In the example, the file is first save to flash memory and then copied to a TFTP location:

```
Device> enable
Device# license smart save usage unreported file flash:RUM-unrep.txt
Device# dir
Directory of bootflash:/
33 -rw- 5994 Nov 2 2020 03:58:04 +05:00 RUM-unrep.txt
Device# copy flash:RUM-unrep.txt tftp://192.168.0.1//auto/tftp-user/user01/
Address or name of remote host [192.168.0.1]?
Destination filename [//auto/tftp-user/user01/RUM-unrep.txt]?
!!
15128 bytes copied in 0.161 secs (93963 bytes/sec)
```

After you save RUM reports to a file, you must upload it to CSSM (from a workstation that has connectivity to the internet, and Cisco).

Example for Installing a Trust Code

The following example shows how to install a trust code even if one is already installed on the product instance. This requires connectivity to CSSM. The accompanying **show license status** output shows sample output after successful installation:

Before you can install a trust code, you must generate a token and download the corresponding file from CSSM.

Use the show license status command (Trust Code Installed:) to verify results.

```
Device> enable
Device# license smart trust idtoken
NGMwMjk5mYtNZaxMS00NzMZmtgWm local force
Device# show license status
<output truncated>
Trust Code Installed:
   Active: PID:C9800-CL-K9,SN:93BBAH93MGS
   INSTALLED on Nov 02 05:19:05 2020 IST
   Standby: PID:C9800-CL-K9,SN:9XECPSUU4XN
   INSTALLED on Nov 02 05:19:05 2020 IST
<output truncated>
```

Example for Returning an SLR Authorization Code

Overall status:

The following example shows how to remove and return an SLR authorization code. Here the code is returned offline (no connectivity to CSSM). The accompanying **show license all** output shows sample output after successful return:

```
Device> enable
Device# show license all
<output truncated>
License Authorizations
_____
Overall status:
 Active: PID:C9800-CL-K9, SN:93BBAH93MGS
      Status: SPECIFIC INSTALLED on Nov 02 03:16:01 2020 IST
     Last Confirmation code: 102fc949
  Standby: PID:C9800-CL-K9, SN:9XECPSUU4XN
     Status: SPECIFIC INSTALLED on Nov 02 03:15:45 2020 IST
     Last Confirmation code: ad4382fe
<output truncated>
Device# license smart authorization return local offlline
Enter this return code in Cisco Smart Software Manager portal:
UDI: PID:C9800-CL-K9, SN:93BBAH93MGS
   Return code: CqaUPW-WSPYiq-ZNU2ci-SnWydS-hBCXHP-MuyPqy-PJ1GiG-tPTGQj-S2h
UDI: PID:C9800-CL-K9, SN:9XECPSUU4XN
    Return code: CNLwxR-eWiAEJ-XaTEQg-j4rrYW-dSRz9j-37VpcP-imjuLD-mNeA4k-TXA
Device# show license all
<output truncated>
License Authorizations
 _____
```

Active: PID:C9800-CL-K9,SN:93BBAH93MGS
Status: NOT INSTALLED
Last return code: CqaUPW-WSPYiq-ZNU2ci-SnWydS-hBCXHP-MuyPqy-PJ1GiG-tPTGQj-S2h
Standby: PID:C9800-CL-K9,SN:9XECPSUU4XN
Status: NOT INSTALLED
Last return code: CNLwxR-eWiAEJ-XaTEQg-j4rrYW-dSRz9j-37VpcP-imjuLD-mNeA4k-TXA
<output truncated>

If you choose the **offline** option, you must complete the additional step of copying the return code from the CLI or the saved file and entering it in CSSM.

license wireless high-performance

To upgrade the scale and capacity of a Cisco Catalyst C9800-L-K9 Wireless Controller, use the **license wireless high-performance** command. To unconfigure the high-performance license, use the **no** form of this command.

license wireless high-performance

no license wireless high-performance

Syntax Description	This command has no keywords or arguments
--------------------	-------------------------------------------

Command Default High-performance license is not configured

Command Modes Global(config)

Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.1.1s This command was introduced.	
		This command continues to be available and applicable with the introduction of Smart Licensing Using Policy in this release.

Usage Guidelines This command is synchronized with the standby controller. However, the standby controller should also have a performance license to get the upgraded capacity.

The license can be released back to the license pool by unconfiguring the high-performance license. This releases the license to the license pool so that another controller can make use of it, if needed.

In the case of RMA, the customer should call Cisco Technical Assistance Center (TAC) to remove the product instances from the customer's virtual account so that all the licenses used by the controller are returned to the license pool and can be used on the new hardware.

Reboot the device before configuring the license wireless high-performancecommand.

Example

To upgrade the scale and capacity of a controller, use the following command:

Device# configure terminal
Device(config#) license wireless high-performance

line vty

To identify a specific line for configuration and begin the command in line configuration mode in a virtual terminal for remote console access, use the **line vty** command.

line vty line_number

Syntax Description	<i>line_number</i> First line number. Valid values range from 0 to 530.		
Command Default	None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	
Examples	The following example shows h	now to identify a specific line for configuration in a virtual terminal:	

Configuration Commands: g to z

link-local-bridging

To enable the link local bridging for each policy profile, use the **link-local-bridging** command. Use the **no** form of this command to disable the feature.

link-local-bridging

no link-local-bridging

Syntax Description	link-local-bridging Enables	link-local bridging for each policy profi
Command Default	None	
Command Modes	Wireless policy configuration n	node
Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.6.	This command was introduced.

Usage Guidelines

Example

The following example shows you how to enable link-local bridging for each policy profile:

```
Device# configure terminal
Device(config)# wireless profile policy default-policy-profile
Device(config-wireless-policy) # link-local-bridging
```

load

	To configure site tag-based	l load balancing, use the load co	ommand.
	load load		
Syntax Description	load Specifies the estimat	e of the relative load reserved for	or the site.
	Values range betwee	n 0 to 1000. The default value 0	means no load recommendation for the site.
Command Default	None		
Command Modes	Global configuration (configuration)	ĩg)	
Command History	Release	Modification	
	Cisco IOS XE Dublin 17.10.1	This command was introduced.	

This example shows how to configure site tag-based load balancing:

```
Device# configure terminal
Device(config)# wireless tag site areal
Device(config-site-tag)# load 200
Device(config-site-tag)# end
```

local-admin-mac deny

To deny association of clients using Locally Administered Addresses, use the **local-admin-mac deny** command. Use the **no** form of this command to disable the feature.

local-admin-mac deny

no local-admin-mac deny

Syntax Description	local-admin-mac	Specifies the locally administered MAC addresses.
	deny	Denies the association of clients using Locally Administered Addresses
Command Default	None	
Command Modes	WLAN configuration	mode (config-wlan)
Command History	Release	Modification
	Cisco IOS XE Benga	luru 17.5.1 This command was introduced.

Example

The following example shows how to deny association of clients using Locally Administered Addresses:

Device# configure terminal Device(config)# wlan wlan-test 3 ssid-test Device(config-wlan)# shutdownDevice(config-wlan)# [no] local-admin-mac deny Device(config-wlan)# no shutdown

local-auth ap eap-fast

To configure Flex policy local authentication using EAP Fast method, use the local-auth ap eap-fast command.

local-auth ap eap-fast profile-name

Syntax Description	profile-name Enter eap-fast pro name.	file
Command Default	None	
Command Modes	config-wireless-flex-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure EAP Fast method authentication on a Flex policy:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile flex profile-name
Device(config-wireless-flex-profile)# local-auth ap eap-fast eap-fast-profile-name
```

local-site

To configure the site as local site, use the local-site command.

local-site	
local-site Configure this site as local site.	
None	
config-site-tag	
Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
	local-site Configure this site as site. None config-site-tag Release Image: Configure this site as site.

Examples

The following example shows how to set the current site as local site:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless tag site tag-name
Device(config-site-tag)# local-site
```

location expiry

To configure the location expiry duration, use the location expiry command in global configuration mode.

	location expiry {	calibrating-client client tags } timeout-duration	
Syntax Description	calibrating-client	Timeout value for calibrating clients.	
	client	Timeout value for clients.	
	tags	Timeout value for RFID tags.	
	timeout-duration	Timeout duration, in seconds.	
Command Default	Timeout value is not configured.		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gib	raltar 16.10.1 This command was introduced.	

Example

This example shows how to configure the location expiry duration:

Device(config) # location expiry tags 50

location notify-threshold

To configure the NMSP notification threshold for RSSI measurements, use the **location notify-threshold** command in global configuration mode. To remove the NMSP notification threshold for RSSI measurements, use the **no** form of this command.

location notify-threshold {client | rogue-aps | tags } db no location notify-threshold {client | rogue-aps | tags }

Syntax Description	client	Specifies the NMSP notification threshold (in dB) for clients and rogue clients.		
		The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.		
	rogue-aps	Specifies the NMSP notification threshold (in dB) for rogue access points.		
		The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.		
	tags	Specifies the NMSP notification threshold (in dB) for RFID tags.		
		The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.		
	db	The valid range for the threshold parameter is 0 to 10 dB, and the default value is 0 dB.		
Command Default	No default b	behavior or values.		
Command Modes	Global conf	iguration		
Command History	Release	Modification		
	Cisco IOS 2	XE Gibraltar 16.10.1 This command was introduced.		

This example shows how to configure the NMSP notification threshold to 10 dB for clients. A notification NMSP message is sent to MSE as soon as the client RSSI changes by 10 dB:

```
Device# configure terminal
Device(config)# location notify-threshold client 10
Device(config)# end
```

login authentication

To configure login authentication parameters, use the login authentication command.

	login authentication word default	
Syntax Description	word Authentication list with	n a name.
	default Uses the default authent	ication list.
Command Default	None	
Command Modes	Line configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
Examples	The following example shows l	how to configure login authentication :
	Device# configure terminal Enter configuration comman Device(config)# line conso Device(config-line)# login	ds, one per line. End with CNTL/Z. le 0

login block-for

To configure the login security on the Cisco controller and to set the duration for which the controller has to block further login attempts after a specified number of consecutive failed login attempts within a certain time frame, use the **login block-for** command.

login block-for duration attempts attempts within time-frame

duration	Specifies the duration in seconds for which the device will block login attempts			
attempts	empts Number of consecutive failed login attempts			
attempts	Specifies the maximum number of failed attempts			
within	Time frame within which the specified number of consecutive failed login attempts must occur to trigger the blocking			
time-frame	<i>time-frame</i> Specifies the time period in seconds			
None				
Global Configuration				
Release	Modification			
Cisco IOS X	XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.			
of 60 second	ng example shows how to configure the login security on the controller to set the duration Is for which the controller has to block further login attempts after 3 unsuccessful login hin a period of 10 seconds.:			
	attempts attempts attempts within time-frame None Global Conf Release Cisco IOS X The following of 60 second			

lsc-only-auth (mesh)

To configure mesh security to Locally Significant Certificate (LSC) only MAP authentication, use the **lsc-only-auth** command.

lsc-only-auth

Syntax Description	yntax Description This command has no keywords or arguments.	
Command Default LSC only authentication is enabled.		led.
Command Modes	config-wireless-mesh-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

The following example shows how to configure mesh security to LSC only MAP authentication:

```
Device # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device (config)# wireless profile mesh mesh-profile
Device (config-wireless-mesh-profile)# lsc-only-auth
```

mac-filtering

To enable MAC filtering on a WLAN, use the mac-filtering command.

mac-filtering [mac-authorization-list]

Syntax Description	<i>mac-authorization-list</i> Name of list.	of the Authorization
Command Default	None	
Command Modes	config-wlan	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enable MAC filtering on a WLAN:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wlan wlan-name wlan-index SSID-name
Device(config-wlan)# mac-filtering
```

mab request format attribute

To configure the delimiter while configuring MAC filtering on a WLAN, use the **mab request format attribute** command in global configuration mode. To disable the delimiter while configuring MAC filtering on a WLAN, use the **no** form of this command.

mab request format attribute { 1 groupsize *size* separator *separator* [lowercase | uppercase] | 2 { 0 | 7 | LINE } LINE *password* | 32 vlan access-vlan }

no mab request format attribute { 1 groupsize size separator separator [lowercase | uppercase] | 2 { 0 | 7 | LINE } LINE password | 32 vlan access-vlan }

Syntax Description	1	Specifies the username format used for MAB requests.	
	groupsize size	Specifies the number of hex digits per group.	
		The valid values range from 1 to 12.	
	separator separator	Specifies how to separate groups.	
		The separators are hyphen (-), colon (:), and full stop (.)	
		For more information about the groupsize and separator, refer to the Overview of the Configurable MAB Username and Password.	
	lowercase	Specifies the username in lowercase format.	
	uppercase	Specifies the username in uppercase format.	
	2	Specifies the global password used for all the MAB requests.	
	0	Specifies the unencrypted password.	
	7	Specifies the hidden password.	
	LINE	Specifies the encrypted or unencrypted password.	
	password	LINE password.	
	32	Specifies the NAS-Identifier attribute.	
	vlan	Specifies a VLAN.	
	access-vlan	Specifies the configured access VLAN.	
Command Default	None		
Command Modes	Global configuration (config)		

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE
		Gibraltar 16.10.1.

Example:

The following example shows how to configure the delimiter while configuring MAC filtering:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# mab request format attribute 1 groupsize 4 separator -

mbo

To configure WiFi Alliance Agile Multiband (MBO) on WLAN, use the mbo command.

	mbo		
Syntax Description	This command has no arguments or keywords.		
Command Default	MBO is not enabled.		
Command Modes	WLAN configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.	

Usage Guidelines

This example shows how to configure WiFi Alliance Agile Multiband (MBO) on WLAN:

```
Device# configure terminal
Device(config)# wlan wlan-demo 1 ssid-demo
Device(config-wlan)# mbo
Device(config-wlan)# end
```

```
Note
```

If you use WPA2 WLAN while configuring MBO for WLAN, you need to enable PMF in your configuration.

management gateway-failover enable

To enable gateway monitoring, use the **management gateway-failover enable** command. To disable gateway monitoring, use the **no** form of this command.

management gateway-failover enable no management gateway-failover enable

This command has no arguments or keywords.		
None		
Global configuration		
Release	Modification	
Cisco IOS XE Amsterdam 17.1.1s	This command was introduced.	
	None Global configuration Release	

This example shows how to enable gateway monitoring:

```
Device# configure terminal
Device(config)# management gateway-failover enable
Device(config)# end
```

management gateway-failover interval

To configure the gateway monitoring interval, use the management gateway-failover interval command.

management gateway-failover interval interval-value

Syntax Description	<i>interval-value</i> Refers to the gat 8.	eway monitoring interval. The	valid range is from 6 to 12. Default value is
Command Default	None		
Command Modes	Global Configuration		
Command History	Release	Modification	-
	Cisco IOS XE Bengaluru 17.4.1	This command was introduced.	-
Usage Guidelines	- This example shows how to con	figure the gateway monitoring	interval:
	Device# configure terminal Device(config)# management Device(config)# end	gateway-failover interval	6

map-fast-ancestor-find

To configure the MAP fast ancestor find mode in wireless mesh profile, use the **map-fast-ancestor-find** command.

map-fast-ancestor-find

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Wireless mesh profile configu	ration (config-wireless-mesh-p	rofile)
Command History	Release	Modification	_
	Cisco IOS XE Dublin 17.11.1	This command was introduced.	_

Example

The following example shows how to configure MAP fast ancestor find mode for a mesh AP profile:

```
Device # configure terminal
Device (config) # wireless profile mesh mesh-profile
Device (config-wireless-mesh-profile) # map-fast-ancestor-find
```

match activated-service-template

To create a condition that evaluates true based on the service template activated on a session, use the **match activated-service-template** command in control class-map filter configuration mode. To create a condition that evaluates true if the service template activated on a session does not match the specified template, use the **no-match activated-service-template** command in control class-map filter configuration mode. To remove the condition, use the **no** form of this command.

match activated-service-template template-name
no-match activated-service-template template-name
no {match | no-match} activated-service-template template-name

Syntax Description	<i>template-name</i> Name of a configured service template as defined by the service-template command.		
Command Default	The control class does not contain a condition based on the service template.		
Command Modes	Control class-map filter config	guration (config-filter-control-classmap)	
Command History	Release	Modification	
	Cisco IOS XE Release 3.2SE	This command was introduced.	
Usage Guidelines	ge Guidelines The match activated-service-template command configures a match condition in a control class the service template applied to a session. A control class can contain multiple conditions, each of version evaluate as either true or false. The control class defines whether all, any, or none of the condition evaluate true for the actions of the control policy to be executed.		
	The no-match form of this command specifies a value that results in an unsuccessful match. All other values of the specified match criterion result in a successful match. For example, if you configure the no-match activated-service-template SVC_1 command, all template values except SVC_1 are accepted as a successful match.		
	The class command associates a control class with a control policy.		
Examples	The following example shows how to configure a control class that evaluates true if the service template named VLAN_1 is activated on the session:		
	class-map type control subscriber match-all CLASS_1 match activated-service-template VLAN_1		
Related Commands	Command	Description	
	activate (policy-map action)	Activates a control policy or service template on a subscriber session.	
	class	Associates a control class with one or more actions in a control policy.	
	match service-template	Creates a condition that evaluates true based on an event's service template.	

Command	Description
service-template	Defines a template that contains a set of service policy attributes to apply to subscriber sessions.

match any

To perform a match on any protocol that passes through the device, use the **match any** command.

	match any	
Command Default	None	
Command Modes	config-cmap	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to match any packet passing through the device:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map cmap-name
Device(config-cmap)# match any
```

match application name

To configure the use of the application name as a key field for a flow record, use the **match application name** command in flow record configuration mode. To disable the use of the application name as a key field for a flow record, use the **no** form of this command.

match application name no match application name

Syntax Description This command has no arguments or keywords.

Command Default The application name is not configured as a key field.

Command Modes

Flow record configuration (config-flow-record)

Command History	Release	Modification
	15.0(1)M	This command was introduced.
	15.2(2)T	This command was integrated into Cisco IOS Release 15.2(2)T for Cisco Performance Monitor.
	Cisco IOS XE Release 3.5S	This command was integrated into Cisco IOS XE Release 3.5S for Cisco Performance Monitor.

Usage Guidelines This command can be used with both Flexible NetFlow and Performance Monitor. These products use different commands to enter the configuration mode in which you issue this command, however the mode prompt is the same for both products. For Performance Monitor, you must first enter the flow record type performance-monitor command before you can use this command.

Because the mode prompt is the same for both products, here we refer to the command mode for both products as flow record configuration mode. However, for Flexible NetFlow, the mode is also known as Flexible NetFlow flow record configuration mode; and for Performance Monitor, the mode is also known as Performance Monitor flow record configuration mode.

A flow record requires at least one key field before it can be used in a flow monitor. The key fields differentiate flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

Examples The following example configures the application name as a key field:

Router(config)# flow record FLOW-RECORD-1 Router(config-flow-record)# match application name

Cisco Performance Monitor in Cisco IOS Release 15.2(2)T and XE 3.5S

The following example configures the application name as a key field:

Router(config)# flow record type performance-monitor RECORD-1
Router(config-flow-record)# match application name

Related Commands

Command	Description
collect application name	Configures the use of application name as a nonkey field for a Flexible NetFlow flow record.
flow record	Creates a flow record, and enters Flexible NetFlow flow record configuration mode.
flow record type performance-monitor	Creates a flow record, and enters Performance Monitor flow record configuration mode.

match day

To perform a match using day, days, or a generic grouping of days (weekends or weekdays), use the **match day** command.

match day day-stringCommand DefaultNoneCommand ModesFilter Control Classmap Configuration (config-filter-control-classmap)Command HistoryReleaseModificationCisco IOS XE Gibraltar 16.11.1This command was
introduced.Usage GuidelinesYou should also disable AAA override for this command to work.Examples
The following example shows to perform a match using day:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map type control subscriber match-all class-map-name
Device(config-filter-control-classmap)# match day day-string
```

Command Default

match device-type

To perform a match using device type, use the match device-type command.

match device-type device-type

Command Modes Filter Control Classmap Configuration (config-filter-control-classmap)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Usage Guidelines You should enable device classifier for the device list to be populated.

Examples

None

The following example shows how to perform a match using device type:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map type control subscriber match-allclass-map-name
Device(config-filter-control-classmap)# match device-type device-type
```

match eap-type

To perform a match using Extensible Authentication Protocol (EAP), use the match eap-type command.

match eap-type {fast | gtc | leap | md5 | mschapv2 | peap | tls}

Syntax Description	fast Flexible authentication through secure tunneling.						
	gtc	Generic token card.					
	leap	Lightweight extensibl	e authentication protocol.				
	md5	MD5-tunneled authentication protocol. MSCHAPV2 authentication mechanism. Protected extensible authentication protocol.					
	mschapv2						
	peap						
	tls	Transport layer security.					
Command Default	None						
Command Modes	Filter Contro	l Classmap Configurati	on (config-filter-control-classm				
Command History	Release	Мо	dification				
	Cisco IOS X	E Gibraltar 16.11.1 Thi intr	s command was oduced.				
Usage Guidelines	You should a		duced. de for this command to work.				

Examples

The following example shows how to perform a match using the eap-type PEAP:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map type control subscriber match-all class-map-name
Device(config-filter-control-classmap)# match eap-type peap
```

match interface

To configure the input and output interfaces as key fields for a flow record, use the **match interface** command in flow record configuration mode. To disable the use of the input and output interfaces as key fields for a flow record, use the **no** form of this command.

match interface {input | output}
no match interface {input | output}

Syntax Description	input Configures the input interface as a key field.					
	output Configures the output interface as a key field.					
Command Default	The input and output interfaces are not configured as key fields.					
Command Modes	Flow record configuration					
Command History	Release Modification					
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.					
Usage Guidelines	A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command.					
	The following example configures the input interface as a key field:					
	Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match interface input					
	The following example configures the output interface as a key field:					
	Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match interface output					

match ipv4

To configure one or more of the IPv4 fields as a key field for a flow record, use the **match ipv4** command in flow record configuration mode. To disable the use of one or more of the IPv4 fields as a key field for a flow record, use the **no** form of this command.

 $\label{eq:matchipv4} \begin{array}{l} \mbox{(destination address | protocol | source address | tos | version)} \\ \mbox{no match ipv4} & \mbox{(destination address | protocol | source address | tos | version)} \end{array}$

Syntax Description	destination address	Configures the IPv4 destination address as a key field. For more information see match ipv4 destination address, on page 167.					
	protocol	Configures the IPv4 protocol as a key field.					
	source address	Configures the IPv4 destination address as a key field. For more information see match ipv4 source address, on page 169.					
	tos	Configures the IPv4 ToS as a key field.					
	version	Configures the IP version from IPv4 header as a key field.					
Command Default		e of the IPv4 fields as a key field for a user-defined flow record is not enabled.					
Command Modes	Flow record configurat	ion

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

To return this command to its default settings, use the **no match ipv6 destination address** or **default match ipv6 destination address** flow record configuration command.

The following example configures the IPv6 destination address as a key field:

Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 destination address

match ipv6 hop-limit

To configure the IPv6 hop limit as a key field for a flow record, use the **match ipv6 hop-limit** command in flow record configuration mode. To disable the use of a section of an IPv6 packet as a key field for a flow record, use the **no** form of this command.

match ipv6 hop-limit no match ipv6 hop-limit

 Syntax Description
 This command has no arguments or keywords.

 Command Default
 The use of the IPv6 hop limit as a key field for a user-defined flow record is not enabled by default.

 Command Modes
 Flow record configuration

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced.

 Usage Guidelines
 A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command.

 The following example configures the hop limit of the packets in the flow as a key field:

```
Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match ipv6 hop-limit
```

match ipv6 hop-limit

To configure the IPv6 hop limit as a key field for a flow record, use the **match ipv6 hop-limit** command in flow record configuration mode. To disable the use of a section of an IPv6 packet as a key field for a flow record, use the **no** form of this command.

match ipv6 hop-limit no match ipv6 hop-limit

This command has no arguments or keywords. **Syntax Description** The use of the IPv6 hop limit as a key field for a user-defined flow record is not enabled by default. **Command Default** Flow record configuration **Command Modes Command History** Modification Release Cisco IOS XE Gibraltar 16.10.1 This command was introduced. A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish **Usage Guidelines** flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command. The following example configures the hop limit of the packets in the flow as a key field: Device(config) # flow record FLOW-RECORD-1 Device(config-flow-record) # match ipv6 hop-limit

match ipv6 source address

To configure the IPv6 source address as a key field for a flow record, use the **match ipv6 source address** command in flow record configuration mode. To disable the use of the IPv6 source address as a key field for a flow record, use the **no** form of this command.

match ipv6 source address no match ipv6 source address

Syntax Description	This command has no arguments or keywords.		
Command Default	The IPv6 source address is not configured as a key field.		
Command Modes	Flow record configuration		
Command History	Release Modification		
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.		
Usage Guidelines	A flow record requires at least one key field before it can be used in a flow monitor. The key fields distinguish flows, with each flow having a unique set of values for the key fields. The key fields are defined using the match command.		
	To return this command to its default settings, use the no match ipv6 source address or default match ipv6 source address flow record configuration command.		
	The following example configures a IPv6 source address as a key field:		
	Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match ipv6 source address		

match ipv6 source address

To configure the IPv6 source address as a key field for a flow record, use the **match ipv6 source address** command in flow record configuration mode. To disable the use of the IPv6 source address as a key field for a flow record, use the **no** form of this command.

match ipv6 source address no match ipv6 source address

Syntax Description	This command has no arguments or keywords.		
Command Default	The IPv6 source address is not configured as a key field.		
Command Modes	Flow record configu	iration	
Command History	Release	Modification	-
	Cisco IOS XE Gibra	altar 16.10.1 This command was introduced.	-
Usage Guidelines	1	res at least one key field before it can be used w having a unique set of values for the key f	in a flow monitor. The key fields distinguish ields. The key fields are defined using the
	To return this command to its default settings, use the no match ipv6 source address or default match ipv6 source address flow record configuration command.		
	The following example configures a IPv6 source address as a key field:		
		<pre>ilow record FLOW-RECORD-1 ww-record) # match ipv6 source address</pre>	

match join-time-of-day

To perform a match using time of the day, use the **match join-time-of-day** command.

match join-time-of-day start-time end-time

Command Default	None	
Command Modes	Filter Control Classmap Config	uration (config-filter-control-classmap)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Usage Guidelines Join time is considered for matching. For example, if the match filter is set from 11:00 a.m. to 2:00 p.m., a device joining at 10:59 a.m. is not considered, even if it acquires credentials after 11:00 a.m.

You should also disable AAA override for the command to work.

Examples

The following example shows how to perform a match using the joining time:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# class-map type control subscriber match-all class-map-name
Device(config-filter-control-classmap)# match join-time-of-day start-time end-time
```

match message-type

To set a message type to match a service list, use the **match message-type** command.

Syntax Description	announcement Allows only service advertisements or announcements for the Device.		
	any	Allows any match type.	
	query	Allows only a query from the client for a certa	in Device in the network.
Command Default	None		
Command Modes	Service list config	guration.	
Command History	Release	Modification	
	Cisco IOS XE Gi	ibraltar 16.10.1 This command was introduced.	
Usage Guidelines	Multiple service maps of the same name with different sequence numbers can be created, and the evaluation of the filters will be ordered on the sequence number. Service lists are an ordered sequence of individual statements, with each one having a permit or deny result. The evaluation of a service list consists of a list scan in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is stopped once the first statement match is found and a permit/deny action associated with the statement match is performed. The default action after scanning through the entire list is to deny.		

Example

The following example shows how to set the announcement message type to be matched:

query command. The match command can be used only for the permit or deny option.

Device(config-mdns-sd-sl)# match message-type announcement

match non-client-nrt

To match non-client NRT (non-real-time), use the match non-client-nrt command in class-map configuration mode. Use the no form of this command to return to the default setting.

match non-client-nrt no match non-client-nrt

Command History	Release	Modification
Command Modes	Class-map	
Command Default	None	
Syntax Description	This command has no a	arguments or keywords.

Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

None **Usage Guidelines**

This example show how you can configure non-client NRT:

Device(config) # class-map test_1000 Device(config-cmap)# match non-client-nrt

match protocol

To configure the match criterion for a class map on the basis of a specified protocol, use the **match protocol** command in class-map configuration or policy inline configuration mode. To remove the protocol-based match criterion from the class map, use the **no** form of this command. For more information about the **match protocol** command, refer to the *Cisco IOS Quality of Service Solutions Command Reference*.

match protocol {*protocol-name* | **attribute category** *category-name* | **attribute sub-category** *sub-category-name* | **attribute application-group** *application-group-name* }

Syntax Description	protocol-name	Name of the protocol (for example,	bgp) used as a matching criterion.	
	category-name	Name of the application category used as a matching criterion.		
	sub-category-name	Name of the application subcategor	y used as a matching criterion.	
	application-group-name	·· • ·	matching criterion. When the application configured as the match criterion instead of	
Command Default	No match criterion is conf	igured.		
Command Modes	Class-map configuration			
Command History	Release	Modification	_	
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.			
	category, and sub category Device# configure term Device(config)# class- Device(config-cmap)# m Device(config-cmap)#en	ninal map cat-browsing Natch protocol attribute categor	y browsing	
	Device# configure term Device(config)# class -	ninal map cat-fileshare Match protocol attribute categor	ry file-sharing	
		map match-any subcat-terminal match protocol attribute sub-cat	egory terminal	
	=	ninal map match-any webex-meeting match protocol webex-meeting		

This example shows how to create policy maps and define existing class maps for upstream QoS:

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 150000
Device(config-pmap-c)# set dscp 12
Device(config-pmap-c)#end
```

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class cat-fileshare
Device(config-pmap-c)# police 1000000
Device(config-pmap-c)# set dscp 20
Device(config-pmap-c)#end
```

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class subcat-terminal
Device(config-pmap-c)# police 120000
Device(config-pmap-c)# set dscp 15
Device(config-pmap-c)#end
```

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class webex-meeting
Device(config-pmap-c)# police 50000000
Device(config-pmap-c)# set dscp 21
Device(config-pmap-c)#end
```

This example shows how to create policy maps and define existing class maps for downstream QoS:

```
Device# configure terminal
Device(config)# policy-map test-avc-down
Device(config-pmap)# class cat-browsing
Device(config-pmap-c)# police 200000
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)#end
```

Device# configure terminal

```
Device(config) # policy-map test-avc-up
Device(config-pmap) # class cat-fileshare
Device(config-pmap-c) # police 300000
Device(config-pmap-c) # set wlan user-priority 2
Device(config-pmap-c) # set dscp 20
Device(config-pmap-c) # end
```

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class subcat-terminal
Device(config-pmap-c)# police 100000
Device(config-pmap-c)# set dscp 25
Device(config-pmap-c)#end
```

```
Device# configure terminal
Device(config)# policy-map test-avc-up
Device(config-pmap)# class webex-meeting
Device(config-pmap-c)# police 60000000
```

Device(config-pmap-c)# set dscp 41
Device(config-pmap-c)#end

This example shows how to apply defined QoS policy on a WLAN:

```
Device# configure terminal
Device(config)#wlan alpha
Device(config-wlan)#shut
Device(config-wlan)#end
Device(config-wlan)#service-policy client input test-avc-up
Device(config-wlan)#service-policy client output test-avc-down
Device(config-wlan)#no shut
Device(config-wlan)#end
```

match service-instance

To set a service instance to match a service list, use the match service-instance command.

	match service-instance line		
Syntax Description	<i>line</i> Regular expression to match the service instance in packets.		
Command Default	None

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16	5.10.1 This command was intro	oduced.
Usage Guidelines	1	2	be used in a flow monitor. The key fields distinguish he key fields. The key fields are defined using the
	The following example co	nfigures the IPv6 ICMP code	field as a key field:
	Device(config)# flow r Device(config-flow-rec	ecord FLOW-RECORD-1 ord)# match transport icm	p ipv6 code
	The following example co	nfigures the IPv6 ICMP type f	field as a key field:
	Device(config)# flow r Device(config-flow-rec	ecord FLOW-RECORD-1 ord)# match transport icm	p ipv6 type

match user-role

To configure the class-map attribute filter criteria, use the match user-role command.

match user-role user-role

Command Default None

Command Modes config-filter-control-classmap

Command History

Release Modification

Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure a class-map attribute filter criteria:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# class-map type control subscriber match-any map-name Device(config-filter-control-classmap)# match user-role user-role

match username

To create a condition that evaluates true based on an event's username, use the **match username** command in control class-map filter configuration mode. To create a condition that evaluates true if an event's username does not match the specified username, use the **no-match username** command in control class-map filter configuration mode. To remove the condition, use the **no** form of this command.

match username username
no-match username username
no {match | no-match} username username

Syntax Description	<i>username</i> Username.		
Command Default	The control class does not con-	tain a condition based on the	event's username.
Command Modes	Control class-map filter configuration (config-filter-control-classmap)		
Command History	Release	Modification	
	Cisco IOS XE Release 3.2SE	This command was introduc	ed.
Usage Guidelines	 The match username command configures a match condition in a control class based on the username. A control class can contain multiple conditions, each of which will evaluate as either true or false. The control class defines whether all, any, or none of the conditions must evaluate true to execute the actions of the control policy. The no-match form of this command specifies a value that results in an unsuccessful match. All other values of the specified match criterion result in a successful match. For example, if you configure the no-match username josmithe command, the control class accepts any username value except josmithe as a successful match. The class command associates a control class with a control policy. 		
Examples	The following example shows how to configure a control class that evaluates true if the username is josmithe:		
	class-map type control subscriber match-all CLASS_1 match username josmithe		
Related Commands	Command	Description	

Related Commands	Command	Description
	class	Associates a control class with one or more actions in a control policy.
	policy-map type control subscriber	Defines a control policy for subscriber sessions

Command History

match wireless ssid (wireless)

To configure the SSID of the wireless network as a key field for a flow record, use the **match wireless ssid** command in flow record configuration mode. To disable the use of the SSID of the wireless network as a key field for a flow record, use the **no** form of this command

match wireless ssid no match wireless ssid

Syntax Description This command has no arguments or keywords.

Command Default The SSID of the wireless network is not configured as a key field.

Command Modes Flow record configuration

Release

Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

Usage Guidelines A flow record requires at least one key field before it can be used in a flow monitor. The key fields differentiate flows, with each flow having a unique set of values for the key fields. The key fields are defined using the **match** command.

The following example configures the SSID of the wireless network as a key field:

Device(config)# flow record FLOW-RECORD-1
Device(config-flow-record)# match wireless ssid

Modification

match wireless ssid (wireless)

To configure the SSID of the wireless network as a key field for a flow record, use the **match wireless ssid** command in flow record configuration mode. To disable the use of the SSID of the wireless network as a key field for a flow record, use the **no** form of this command

match wireless ssid no match wireless ssid

Syntax Description	This command has no arguments or keywords.			
Command Default	The SSID of the wireless network is not configured as a key field.			
Command Modes	Flow record configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		
Usage Guidelines	1 9	e it can be used in a flow monitor. The key fields differentiate les for the key fields. The key fields are defined using the		
	The following example configures the SSID of the wireless network as a key field:			
	Device(config)# flow record FLOW-RECORD-1 Device(config-flow-record)# match wireles			

match (access-map configuration)

To set the VLAN map to match packets against one or more access lists, use the **match** command in access-map configuration mode. Use the **no** form of this command to remove the match parameters.

{match ip address {namenumber} [{namenumber}] [{namenumber}]...|mac address name [name]
[name]...}
{no match ip address {namenumber} [{namenumber}] [{namenumber}]...|mac address name
[name] [name]...}

Syntax Description	ip address	s Set the access map to match packets against an IP address access list.			
	mac address	Set the access map to match packets against a MAC address access list.			
	name	Name of the access list to match packets against.			
	number	Number of the access list to match packets against. This option is not valid for MAC access lists.			
Command Default	The default a	he default action is to have no match parameters applied to a VLAN map.			
Command Modes	Access-map	configuration			
Command History	Release Modification				
	Cisco IOS X 16.10.1	XE Gibraltar This command was introduced.			
Usage Guidelines	You enter ac	ccess-map configuration mode by using the vlan access-map global configuration command.			
	 You must enter one access list name or number; others are optional. You can match packets against one more access lists. Matching any of the lists counts as a match of the entry. In access-map configuration mode, use the match command to define the match conditions for a VLAN applied to a VLAN. Use the action command to set the action that occurs when the packet matches the conditions. Packets are matched only against access lists of the same protocol type; IP packets are matched against access lists, and all other packets are matched against MAC access lists. 				
	Both IP and	MAC addresses can be specified for the same map entry.			
Examples	-	e shows how to define and apply a VLAN access map <i>vmap4</i> to VLANs 5 and 6 that he interface to drop an IP packet if the packet matches the conditions defined in access			
	Device(conf Device(conf	fig)# vlan access-map vmap4 fig-access-map)# match ip address al2 fig-access-map)# action drop fig-access-map)# exit			

Device(config) # vlan filter vmap4 vlan-list 5-6

You can verify your settings by entering the show vlan access-map privileged EXEC command.

match (class-map configuration)

To define the match criteria to classify traffic, use the **match** command in class-map configuration mode. Use the **no** form of this command to remove the match criteria.

Cisco IOS XE Everest 16.5.x and Earlier Releases

match {access-group {nameacl-name acl-index} | class-map class-map-name | cos cos-value | dscp *dscp-value* | [ip] *dscp dscp-list* | [ip] **precedence** *ip-precedence-list* | **precedence** precedence-value1...value4 | qos-group qos-group-value | vlan vlan-id} **no match** {access-group{nameacl-name acl-index} | class-map class-map-name | cos cos-value | dscp dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | precedence precedence-value1...value4 | qos-group qos-group-value | vlan vlan-id}

Cisco IOS XE Everest 16.6.x and Later Releases

match {access-group{name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp dscp-list [ip] precedence *ip-precedence-list* | mpls *experimental-value* | non-client-nrt | precedence precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan wlan-id}

no match {access-group{name acl-name acl-index} | cos cos-value | dscp dscp-value | [ip] dscp dscp-list | [ip] precedence ip-precedence-list | mpls experimental-value | non-client-nrt | precedence precedence-value1...value4 | protocol protocol-name | qos-group qos-group-value | vlan vlan-id | wlan wlan-id}

Syntax Description	access-group	Specifies an access group.	
	name acl-name	Specifies the name of an IP standard or extended access control list (ACL) or MAC ACL.	
	acl-index	Specifies the number of an IP standard or extended access control list (ACL) or MAC ACL. For an IP standard ACL, the ACL index range is 1 to 99 and 1300 to 1999. For an IP extended ACL, the ACL index range is 100 to 199 and 2000 to 2699.	
	class-map class-map-name	Uses a traffic class as a classification policy and specifies a traffic class name to use as the match criterion.	
	cos cos-value	Matches a packet on the basis of a Layer 2 class of service (CoS)/Inter-Switch Link (ISL) marking. The cos-value is from 0 to 7. You can specify up to four CoS values in one match cos statement, separated by a space.	
	dscp dscp-value	Specifies the parameters for each DSCP value. You can specify a value in the range 0 to 63 specifying the differentiated services code point value.	

Sy

I

	ip dscp dscp-list	Specifies a list of up to eight IP Differentiated Services Code Point (DSCP) values to match against incoming packets. Separate each value with a space. The range is 0 to 63. You also can enter a mnemonic name for a commonly used value.		
	ip precedence <i>ip-precedence-list</i>	Specifies a list of up to eight IP-precedence values to match against incoming packets. Separate each value with a space. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.		
	precedence precedence-value1value4	Assigns an IP precedence value to the classified traffic. The range is 0 to 7. You also can enter a mnemonic name for a commonly used value.		
	qos-group qos-group-value	Identifies a specific QoS group value as a match criterion. The range is 0 to 31.		
	vlan vlan-id	Identifies a specific VLAN as a match criterion. The range is 1 to 4094.		
	mpls experimental-value	Specifies Multi Protocol Label Switching specific values.		
	non-client-nrt Matches a non-client NRT (non-real-time).			
	protocol protocol-name	Specifies the type of protocol.		
	wlan wlan-id	Identifies 802.11 specific values.		
Command Default	No match criteria are defined.			
Command Modes	Class-map configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was intro		
Usage Guidelines	The match command is used to specify which fields in the incoming packets are examined to classify the packets. Only the IP access group or the MAC access group matching to the Ether Type/Len are supported.			
	If you enter the class-map match-any class-match following match commands:	nap-name global configuration command, you can enter the		
	• match access-group name acl-name			
	Note The ACL must be an extended named	d ACL.		

• match ip precedence *ip-precedence-list*

The **match access-group** *acl-index* command is not supported. To define packet classification on a physical-port basis, only one **match** command per class map is supported. In this situation, the **match-any** keyword is equivalent. For the **match ip dscp**-list or the **match ip precedence** *ip*-precedence-list command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **match ip dscp af11** command, which is the same as entering the **match ip dscp 10** command. You can enter the **match ip precedence critical** command, which is the same as entering the match ip precedence 5 command. For a list of supported mnemonics, enter the **match ip dscp**? or the **match ip precedence**? command to see the command-line help strings. Use the **input-interface** *interface-id-list* keyword when you are configuring an interface-level class map in a hierarchical policy map. For the *interface-id-list*, you can specify up to six entries. **Examples** This example shows how to create a class map called class2, which matches all the incoming traffic with DSCP values of 10, 11, and 12: Device(config) # class-map class2 Device(config-cmap) # match ip dscp 10 11 12 Device(config-cmap)# exit This example shows how to create a class map called class3, which matches all the incoming traffic with IP-precedence values of 5, 6, and 7: Device(config) # class-map class3 Device(config-cmap) # match ip precedence 5 6 7 Device(config-cmap)# exit This example shows how to delete the IP-precedence match criteria and to classify traffic using acl1: Device(config) # class-map class2 Device(config-cmap) # match ip precedence 5 6 7 Device(config-cmap) # no match ip precedence Device(config-cmap) # match access-group acl1 Device(config-cmap)# exit This example shows how to specify a list of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4
Device(config-cmap)# match cos 4
Device(config-cmap)# exit
```

This example shows how to specify a range of physical ports to which an interface-level class map in a hierarchical policy map applies:

```
Device(config)# class-map match-any class4
Device(config-cmap)# match cos 4
Device(config-cmap)# exit
```

You can verify your settings by entering the show class-map privileged EXEC command.

I

match wlan user-priority

	To match 802.11 specific values, use the match wlan user-priority command in class-map config mode. Use the no form of this command to return to the default setting.		
		priority wlan-value [wlan-value] [wla ser-priority wlan-value [wlan-value]	
Syntax Description		2.11-specific values. Enter the user priority 8 p to three user priority values separated by w	
Command Default	None		
Command Modes	Class-map configura	ation (config-cmap)	
Command History	Release	Modification	
	Cisco IOS XE Gibra	altar 16.10.1 This command was introduced.	
Usage Guidelines	None		
	This example show	how you can configure user-priority values:	
		lass-map test_1000 p)# match wlan user-priority 7	

max-bandwidth

To configure the wireless media-stream's maximum expected stream bandwidth in Kbps, use the **max-bandwidth** command.

max-bandwidth bandwidth

Syntax Description	bandwidth Maximum Expected Stream Bandwidth in Kbps. Valid range is 1 to 35000 Kbps.		
Command Default	None		
Command Modes	media-stream		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure wireless media-stream bandwidth in Kbps:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group doc-grp 224.0.0.0 224.0.0.223
Device(config-media-stream)# max-bandwidth 3500
```

max-through

To limit multicast router advertisements (RAs) per VLAN per throttle period, use the **max-through** command in IPv6 RA throttle policy configuration mode. To reset the command to its defaults, use the **no** form of this command.

max-through {*mt-value* | **inherit** | **no-limit**}

Syntax Description	mt-value	<i>alue</i> Number of multicast RAs allowed on the VLAN before throttling occurs. The range is from 0 through 256.			
	inherit	Merges the set	ting between target policies.		
	no-limit	Multicast RAs	are not limited on the VLAN.		
Command Default	- 10 RAs pe	er VLAN per 10	minutes		
Command Modes	IPv6 RA throttle policy configuration (config-nd-ra-throttle)				
Command History	Release		Modification		
	Cisco IOS 3.2XE	S XE Release	This command was introduced.		
Usage Guidelines		-	nd limits the amount of multication and can be configured only on	est RAs that are passed through to the VLAN per a VLAN.	
	Example				

```
Device(config)# ipv6 nd ra-throttle policy policy1
Device(config-nd-ra-throttle)# max-through 25
```

mdns-sd

To configure the mDNS service discovery gateway, use the **mdns-sd** command. To disable the configuration, use the **no** form of this command.

mdns-sd { **gateway** | **service-definition** *service-definition-name* | **service-list** *service-list-name* { **IN** | **OUT** } | **service-policy** *service-policy-name* }

no mdns-sd { **gateway** | **service-definition** *service-definition-name* | **service-list** *service-list-name* { **IN** | **OUT** } | **service-policy** *service-policy-name* }

Syntax Description	mdns-sd	Configures the mDNS service discovery gateway.		
	gateway	Configures mDNS gateway.		
	service-definition	Configures mDNS service definition.		
	service-definition-name	Specifies the mDNS service definition name.		
	service-list	Configures mDNS service list.		
	service-list-name	Specifies the mDNS service definition name.Specifies the inbound filtering.Specifies the outbound filtering.Configures mDNS service policy.		
	IN			
	OUT			
	service-policy			
	<i>service-policy-name</i> Specifies the mDNS service policy name.			
Command Default	None			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS XE Amsterda	introduced.		
Usage Guidelines	None			
	Example			

The following example shows how to configure the mDNS service discovery gateway:

Device(config) # mdns-sd gateway

mdns-sd flex-profile

To configure the mDNS service discovery flex profile, use the **mdns-sd flex-profile** command. To disable the command, use the **no** form of this command.

mdns-sd flex-profile flex-profile-name

no mdns-sd flex-profile *flex-profile-name*

mdns-sd flex-profile	Configures the mDNS service discovery flex profile	
flex-profile-name	Specifies the mDNS flex profile name.	
None		
Global configuration		
Release	Modification	
Cisco IOS XE Amsterdam 17.3.1 This command was introduced.		
	<i>flex-profile-name</i> None Global configuration Release	

Usage Guidelines None

Example

The following example shows how to configure the mDNS service discovery flex profile:

Device(config)# mdns-sd flex-profile mdns-flex-profile

mdns-sd profile

To apply the mDNS flex profile to the wireless flex profile, use the **mdns-sd profile** command in the wireless flex profile mode. To disable the command, use the **no** form of this command.

mdns-sd profile flex-profile-name

no mdns-sd profile flex-profile-name

Syntax Description	mdns-sd profile Configures the mDNS flex profile in the wireless flex profile		
	flex-profile-name	Specifies the mDNS flex profile name.	
Command Default	None		
Command Modes	Wireless flex profi	le configuration	
Command History	Release	Modification	

 	mounouton
Cisco IOS XE Amsterdam 17.3.1	This command was introduced.

Usage Guidelines None

Example

The following example shows how to apply the mDNS flex profile to the wireless flex profile:

Device(config-wireless-flex-profile) # mdns-sd profile mdns-flex-profile

mdns-sd wired-filter

To configure an mDNS wired filter, use the mdns-sd wired-filter command.

mdns-sd wired-filter wired-filter-name

Syntax Description	wired-filter-name Is the wired name.	filter
Command Default	None	
Command Modes	Global Configuration	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.8.1	This command was introduced.
Usage Guidelines	- This example shows how to co	nfigure an mDNS wired filter:

Device# enable Device# configure terminal Device(config)# mdns-sd wired-filter WIRED_FILTER_APPLE_TV Device(config-mdns-wired-filter)# match mac a886.ddb2.05e9 Device(config-mdns-wired-filter)# match vlan 100 Device(config-mdns-wired-filter)# exit

method

To configure the primary and secondary supported Online Sign-Up (OSU) method of an OSU operator, use the **method** command. To to remove the OSU method, use the **no** form of the command.

method {oma-dm | soap-xml-sp }

Syntax Description	oma-dm	Sets OMA-DM as the primary or secondary OSU	method for an OSU operator.
	soap-xml-sp	Sets SOAP or XML-SPP as the primary or seconda	ary OSU method for an OSU operator.
Command Default	None		
Command Modes	ANQP OSU I	rovider Configuration (config-anqp-osu-provider)	
Command History	Release	Modification	
	Cisco IOS XI	Gibraltar 16.12.1 This command was introduced.	

Example

The following example shows how to configure the primary and secondary supported OSU method of the OSU operator:

Device(config-wireless-anqp-server)# osu-provider my-osu
Device(config-anqp-osu-provider)# method soap-xml-spp oma-dm

method (mesh)

To configure authentication and authorization method for a mesh AP profile, use the **method** command.

Syntax Description	authentication	AAA method for mesh AP authentication.
	authorization	AAA method for mesh AP authorization.
	method	Named method list.
Command Default	Authentication an	ad authorization method is not configured.
Command Default Command Modes	Authentication an	C C
	_	C C

Example

The following example shows how to configure authentication for a mesh AP profile:

```
Device # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device (config)# wireless profile mesh mesh-profile
Device (config-wireless-mesh-profile)# method authentication auth1
```

method fast

To configure EAP profile to support EAP-FAST method, use the method fast command.

method fast [**profile** *profile-name*]

Syntax Description	profile-name Specify the metho profile.	nd
Command Default	None	
Command Modes	config-eap-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enable EAP Fast method on a EAP profile:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# eap profile profile-name
Device(config-eap-profile)# method fast
```

mesh backhaul

To enable mesh backhaul in the radio profile configuration mode, use the **mesh backhaul** command. Use the **no** form of this command to disable the feature.

mesh backhaul

no mesh backhaul

Syntax Description	This command has no keywords	or arguments.
Command Default	None	
Command Modes	Wireless Radio Profile Configur	ration
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.

Usage Guidelines Mesh backhaul can be disabled on specific slot. Mesh backhaul is disabled to stop the specific slot from being the backhaul candidate.

Example

The following example shows you how to enable mesh backhaul in the radio profile configuration mode:

```
Device# configure terminal
Device(config)# wireless radio profile radio-profile-name
Device(config-wireless-radio-profile)# mesh backhaul
```

mesh designated downlink

To enable the radio slot as a designated mesh downlink in the radio profile configuration mode, use the **mesh** designated downlink command. Use the **no** form of this command to disable the feature.

mesh designated downlink

no mesh designated downlink

Syntax Description This command has no keywords or arguments.

Command Default By default this command is disabled. By default all the radio slots are mesh-enabled and not designated as downlink.

Command Modes Wireless Radio Profile Configuration

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.

Usage Guidelines This command is enabled only for slot 2 of the mesh APs. If a slot other than slot 2 is designated downlink configured as the designated downlink, the following warning message is displayed: Designated downlink is supported only on slot 2 of mesh APs. Associate in the RF tag accordingly.

Example

This example shows how to enable the radio slot as a designated mesh downlink:

Device# configure terminal Device(config)# wireless radio profile radio-profile-name Device(config-wireless-radio-profile)# mesh designated downlink

mgmtuser username

To set a username and password for AP management, use the **mgmtuser username** command. To disable this feature, use the **no** form of this command.

mgmtuser username	username	password	{0	8	ł	password
ingintuser username	username	passworu	[U]	0	ì	passwora

Syntax Description	username	Enter a username f	For AP management.
	0	Specifies an UNEN	NCRYPTED password.
	8	Specifies an AES of	encrypted password.
	password	Configures the enco	ryption password (key).
Command Default	None		
Command Modes	AP Profil	e Configuration (co	nfig-ap-profile)
Command History	Release		Modification

Examples

The following example shows how to set a username and password for AP management:

```
Device# enable
Device# configure terminal
Device(config)# ap profile default-ap-profile
Device(config-ap-profile)# mgmtuser username myusername password 0
Device(config-ap-profile)# end
```

mobility anchor

To configure mobility sticky anchoring, use the **mobility anchor** command. To disable the mobility anchoring, use the **no** form of the command.

To configure guest anchoring, use the **mobility anchor** *ip-address* command. To delete the guest anchor, use the **no** form of the command.

To configure the device as an auto-anchor, use the **mobility anchor** command.

mobility anchor *ip-address* **no mobility anchor** *ip-address*

Syntax Description	<i>ip-address</i> Configures the IP address for the guest anchor.		
Command Default	None		
Command Modes	Wireless policy configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	
	This example shows how to configure	guest anchoring:	
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy default-policy-profile Device(config-wireless-policy)# mobility anchor 209.165.200.224		
	This example shows how to configure	the device as an auto-anchor:	

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy default-policy-profile Device(config-wireless-policy)# mobility anchor

monitor capture (access list/class map)

To configure a monitor capture specifying an access list or a class map as the core filter for the packet capture, use the **monitor capture** command in privileged EXEC mode. To disable the monitor capture with the specified access list or class map as the core filter, use the **no** form of this command.

monitor capture capture-name { access-list access-list-name | class-map class-map-name
}
no monitor capture capture-name { access-list access-list-name | class-map
class-map-name }

Syntax Description	capture-name	The name of the capture.		
	access-list access-list-name	Configures an access list with	the specified name.	
	class-map class-map-name	Configures a class map with t	the specified name.	
Command Default	A monitor capture with the s configured.	pecified access list or a class ma	ap as the core filter fo	or the packet capture is not
Command Modes	Privileged EXEC (#)			
Command History	Release	Modification]	
	Cisco IOS XE Release 3.7S	This command was introduced.		
Usage Guidelines	before using the monitor ca inline filter as the core filter.	ng the ip access-list command of pture command. You can speci If you have already specified th and replaces the existing filter.	fy a class map, or an	access list, or an explicit
Examples	The following example show	s how to define a core system fil	ter using an existing a	access control list:
	Device> enable Device# configure termin Device(config)# ip access Device(config-std-nacl)# Device(config-std-nacl)# Device(config)# exit Device# monitor capture Device# end	s-list standard acl1 permit any exit		
	The following example show	vs how to define a core system fi	ilter using an existing	g class map:
	Device> enable Device# configure termin Device(config)# ip access Device(config-std-nacl)# Device(config-std-nacl)# Device(config)# class-ma Device(config-cmap)# mat Device(config-cmap)# exi	s-list standard acl1 permit any exit p match-all cmap cch access-group name acl		

Device(config)# exit Device# monitor capture mycap class-map classmap1 Device# end

monitor capture export

To store captured packets in a file, use the monitor capture export command in privileged EXEC mode.

monitor capture capture-name export filelocation / file-name

Syntax Description	<i>capture-name</i> Name of the capture.				
	export	Stores	all the packets in capture buffer t	to a file of type .PCAP.	•
	file-location/file-name	Destin	ation file location and name.		
Command Default	The captured packets ar	e not sto	pred.		
Command Modes	Privileged EXEC (#)				
Command History	Release		Modification		
	Cisco IOS XE Gibraltar	16.12.1	This command was introduced.		
Usage Guidelines	Use the monitor capture export command only when the storage destination is a capture buffer. The file may be stored either remotely or locally. Use this command either during capture or after the packet capture has stopped. The packet capture could have stopped because one or more end conditions has been met or you entered the monitor capture stop command.				
Examples	The following example shows how to export capture buffer contents:				
	Device> enable Device# monitor capt	ure my	cap export tftp://10.1.88.9/	mycap.pcap	

Device# end

monitor capture (interface/control plane)

To configure monitor capture specifying an attachment point and the packet flow direction, use the **monitor** capture command in privileged EXEC mode. To disable the monitor capture with the specified attachment point and the packet flow direction, use the **no** form of this command.

monitor capture capture-name { interface type number | control-plane } { in | out | both }
no monitor capture capture-name { interface type number | control-plane } { in | out | both }
}

Syntax Description	capture-name	Name of the capture.	
	interface type number	Configures an interface with the specified type and number as an attachment point.	
	~ ~		
	control-plane	Configures a control plane as an attachment point.	
	in	Specifies the inbound traffic direction.	
	out	Specifies the outbound traffic direction.	
	both	Specifies both inbound and outbound traffic directions.	
Command Default	The monitor packet capture filter specifying is not configured.		
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar	T16.12.1 This command was introduced.	
Usage Guidelines	Repeat the monitor ca	apture command as many times as required to add multiple attachment points.	
Examples	The following example shows how to add an attachment point to an interface:		
	Device> enable Device# monitor capture mycap interface GigabitEthernet 0/0/1 in Device# end The following example shows how to add an attachment point to a control plane: Device> enable Device# monitor capture mycap control-plane out Device# end		

monitor capture limit

To configure capture limits, use the **monitor capture limit** command in privileged EXEC mode. To remove the capture limits, use the **no** form of this command.

```
monitor capture capture-name limit [duration seconds] [every number] [
packet-length size] [packets number] [pps number]
no monitor capture name limit [duration] [every] [packet-length] [packets]
[pps]
```

Syntax Description	<i>capture-name</i> Name of the packet capture.				
	duration seconds		ional) Specifies the duration of the duration	ne capture, in seconds. The range is from 1	
	every number	(Optional) Specifies that, in a series of packets, the packet whose numerical order is denoted by the <i>number</i> argument should be captured. The range is from 2 to 100000.			
	packet-length bytes	the s	(Optional) Specifies the packet length, in bytes. If the actual packet is longer than the specified length, only the first set of bytes whose number is denoted by the <i>bytes</i> argument is stored.		
	packets packets-number	(Opt	cional) Specifies the number of pa	ackets to be processed for capture.	
	pps pps-number	1 · •	ional) Specifies the number of pa om 1 to 1000000.	ckets to be captured per second. The range	
Command Default	No capture limits are conf	igured	d.		
Command Modes	Privileged EXEC (#)				
Command History	Release		Modification		
	Cisco IOS XE Gibraltar 16	5.12.1	This command was introduced.		
Usage Guidelines	processed if the packet-le captured, if the every num the packets packets-numb	e ngth ber k ber k	<i>bytes</i> keyword-argument pair is keyword-argument pair is not spe- eyword-argument pair is not spec	nually interrupted. The entire packet is not specified. All matched packets are cified. All matched packets are captured if ified. The incoming packets are captured at ord-argument pair is not specified.	
Examples	The following example sh	ows h	now to specify capture limits:		
	Device> enable Device# monitor captur Device# monitor captur Device# monitor captur Device# monitor captur	e myo e myo	cap limit packet-length 128 cap limit packets 100		

Device# monitor capture mycap limit duration 10 packet-length 128 packets 100 Device# end

monitor capture match

To define an explicit inline core filter, use the **monitor capture match** command in privileged EXEC mode. To remove this filter, use the **no** form of this command.

monitor capture capture-name match

{ any | { ipv4 | ipv6 } { source-prefix/length | any | host } source-ip-address { { destination-prefix/length | any | host } destination-ip-address } | protocol { tcp | udp } { { source-prefix/length | any | host } { destination-prefix/length | any | host } | [[{ eq | gt | lt | neg }] port-number] | range start-port-number end-port-number | [{ eq | gt | lt | neg }] port-number | range start-port-number end-port-number } | mac { source-mac-address | { any | host } source-mac-address } source-mac-address -mask { destination-mac-address | { any | host } destination-mac-address } destination-mac-address -mask } no monitor capture capture-name match

 epc-capture-name	Name of the capture.		
any	Specifies all packets.		
ipv4	Specifies IPv4 packets.		
ipv6	Specifies IPv6 packets.		
source-prefix/length	The network prefix and length of the IPv4 or IPv6 source address.		
any	Specifies network prefix of any source IPv4 or IPv6 address.		
host	Specifies the source host.		
source-ip-address	Source IPv4 or IPv6 address.Destination IPv4 or IPv6 address.		
destination-prefix/length			
any	Specifies the network prefix and length of any IPv4 or IPv6 destination address.		
host	Specifies the destination host.		
destination-ip-address	Destination IPv4 or IPv6 address.		
protocol	Specifies the protocol.		
tcp	Specifies the TCP protocol.		
udp	Specifies the UDP protocol.		
eq	(Optional) Specifies that only packets with a port number that is equal to the port number associated with the IP address are matched.		

Syntax Description

gt	(Optional) Specifies that only packets with a port number that is greater than the port number associated with the IP address are matched.	
lt	(Optional) Specifies that only packets with a port number that is lower than the port number associated with the IP address are matched.	
neq	(Optional) Specifies that only packets with a port number that is not equal to the port number associated with the IP address are matched.	
port-number	(Optional) The port number associated with the IP address. The range is from 0 to 65535.	
range	(Optional) Specifies the range of port numbers.	
start-port-number	(Optional) The start of the range of port numbers. The range is from 0 to 65535.	
end-port-number	(Optional) The end of the range of port numbers. The range is from 0 to 65535.	
mac	Specifies a Layer 2 packet.	
source-mac-address	The source MAC address.	
any	Specifies the network prefix of any source MAC address.	
host	Specifies the MAC source host.	
source-mac-address-mask	The source MAC address mask.	
destination-mac-address	The destination MAC address.	
any	Specifies the network prefix of any destination MAC address.	
host	Specifies the MAC source host.	
destination-mac-address-mask	The destination MAC address mask.	

Command Modes Privileged EXEC (#)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 17.12.1	This command was introduced.

Usage Guidelines

Use the **monitor capture** command to specify the core filter as a class map, access list, or explicit inline filter. Any filter has already specified before you enter the **monitor capture match** command is replaced.

Examples

The following example shows how to set various explicit filters:

```
Device> enable
Device# monitor capture mycap match any
Device# monitor capture mycap match mac any any
Device# monitor capture mycap match ipv4 any any
Device# monitor capture mycap match ipv4 protocol udp 198.51.100.0/24 eq 20001 any
Device# end
```

The following example shows how to set a filter for MAC addresses:

```
Device> enable
Device# monitor capture match mycap mac 0030.9629.9f84 0000.0000 0030.7524.9f84
0000.0000
Device# end
```

The following example shows how to set a filter for IPv4 traffic:

```
Device> enable
Device# monitor capture match mycap ipv4 198.51.100.0/24 198.51.100.1 203.0.113.0/24
203.0.113.254
Device# end
```

monitor capture start

To start the capture of packet data at a traffic trace point into a buffer, use the **monitor** capture start command in privileged EXEC mode.

	monitor capture epc-captu	ure-name start	
Syntax Description	<i>epc-capture-name</i> Name of t	he capture.	
Command Default	Data packets are not captured in	to a buffer.	
Command Modes	Privileged EXEC (#)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.	
Usage Guidelines	Use the monitor capture start command to enable the packet data capture after the capture point is define To stop the capture of packet data, use the monitor capture stop command.		
	Ensure that system resources su	ch as CPU and memory are avail	able before starting a capture.
Examples	The following example shows h	now to start capture buffer conten	ts:
		cap export tftp://10.1.88.9/ cap limit packets 100 durati	

monitor capture stop

To stop the capture of packet data at a traffic trace point, use the **monitor** capture stop command in privileged EXEC mode.

	monitor capture epc-captu	re-name stop	
Syntax Description	<i>epc-capture-name</i> Name of	the capture.	
Command Default	The packet data capture is ongoin	ing.	
Command Modes	Privileged EXEC (#)		
Command History	Release Modification		
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.	
Usage Guidelines	Use the monitor capture start command to start the capture of packet data that you started by using the monitor capture start command. You can configure two types of capture buffers: linear and circular. When the linear buffer is full, data capture stops automatically. When the circular buffer is full, data capture starts from the beginning and the data is overwritten.		
Examples	The following example shows h	ow to stop capture buffer conten	ts:
	Device> enable Device# monitor capture myc Device# end	cap stop	

mop enabled

To enable an interface to support the Maintenance Operation Protocol (MOP), use the **mopenabled** command in interface configuration mode. To disable MOP on an interface, use the **no** form of this command.

mop enabled no mop enabled

Syntax Description This command has no arguments or keywords.

Command Default Enabled on Ethernet interfaces and disabled on all other interfaces.

Command Modes Interface configuration

Release Modification 10.0 This command was introduced. 12.2(33)SRA This command was integrated into Cisco IOS Release 12.2(33)SRA. 12.2SX This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

Examples

The following example enables MOP for serial interface 0:

Router(config)# interface serial 0
Router(config-if)# mop enabled

Related Commands	Command	Description
	mop retransmit-timer	Configures the length of time that the Cisco IOS software waits before sending boot requests again to a MOP server.
	mop retries	Configures the number of times the Cisco IOS software will send boot requests again to a MOP server.
	mop sysid	Enables an interface to send out periodic MOP system identification messages.

mop sysid

To enable an interface to send out periodic Maintenance Operation Protocol (MOP) system identification messages, use the mopsysid command in interface configuration mode. To disable MOP message support on an interface, use the no form of this command.

mop sysid no mop sysid

Syntax Description This command has no arguments or keywords.

Enabled **Command Default**

Interface configuration **Command Modes**

Command History	Release	Modification
	10.0	This command was introduced.
	12.2(33)SRA	This command was integrated into Cisco IOS Release 12.2(33)SRA.
	12.2SX	This command is supported in the Cisco IOS Release 12.2SX train. Support in a specific 12.2SX release of this train depends on your feature set, platform, and platform hardware.

You can still run MOP without having the background system ID messages sent. This command lets you use **Usage Guidelines** the MOP remote console, but does not generate messages used by the configurator.

Examples The following example enables serial interface 0 to send MOP system identification messages:

```
Router(config)# interface serial 0
Router(config-if) # mop sysid
```

Relate

ted Commands	Command	Description
	mop device-code	Identifies the type of device sending MOP sysid messages and request program messages.
	mop enabled	Enables an interface to support the MOP.

multicast

To configure mesh multicast mode, use the **multicast** command.

multicast { in-only in-out	<pre>regular }</pre>
in-only Configures mesh multi	cast In Mode.
in-out Configures mesh multi	cast In-Out Mode.
regular Configures mesh multic	cast Regular Mode.
in-out	
config-wireless-mesh-profile	
Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
	in-only Configures mesh multi in-out Configures mesh multi regular Configures mesh multi in-out config-wireless-mesh-profile Release

Examples

The following example shows how to configure the multicast In Mode for a mesh AP profile:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile mesh mesh-profile
Device(config-wireless-mesh-profile)# multicast in-only
```

multicast vlan

To configure multicast on a single VLAN, use the multicast vlan command. To remove the multicast, use the **no** form of the command.

multicast vlan vlan-id multicast vlan vlan-id no **Syntax Description** vlan-id Specifies the VLAN ID.

Command Default

Wireless policy configuration **Command Modes**

Disabled.

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

This example shows how to configure multicast:

```
Device# configure terminal
Enter configuration commands, one per line. End with \ensuremath{\texttt{CNTL}/\texttt{Z}} .
Device(config)# wireless profile policy policy-test
Device(config-wireless-policy) # multicast vlan 12
```

multicast filter

To configure multicast filters, use the **multicast filter** command. To disable the feature, use the **no** form of the command.

multicast filter

Syntax Description	multicast filter	Configures mu filters.	lticast
Command Default	None		
Command Modes	Wireless policy co	onfiguration	
Command History	Release		Modification
	Cisco IOS XE Ar	nsterdam 17.2.1	This command was introduced.

Example

This example shows how to configure multicast filters:

Device(config-wireless-policy)# multicast filter

name

To configure the name of the Online Sign-Up (OSU) operator in a given language, use the **name** command. To remove the name of the OSU operator, use the **no** form of the command.

name operator-name language-code [service-description]

Syntax Description	operator-name	OSU operator name.		
	language-codeA three character language code for the operator. Use only the first three letter language, in lower case, for the language code. For example, use <i>eng</i> for Engl			
		To see the full list of language codes, go to: http://www.loc.gov/standards/iso639-2/php/cod	e_list.php.	
	service-description Service description for the OSU operator.			
Command Default	None			
Command Modes	ANQP OSU Prov	ider Configuration (config-anqp-osu-provider)		
Command History	Release	Modification		
	Cisco IOS XE Gil	braltar 16.12.1 This command was introduced.		

Example

The following example shows how to configure the name of an OSU operator in a given language:

Device(config-wireless-anqp-server)# osu-provider my-osu Device(config-anqp-osu-provider)# name xxy eng

nac

To enable RADIUS Network Admission Control (NAC) support, use the nac command. To disable NAC support, use the **no** form of this command. [ise | xwf] nac no nac **Syntax Description** ise Configures Radius NAC support (Identity Service Engine) xwf Configures Express Wi-Fi NAC support. NAC is disabled. **Command Default** Wireless policy configuration **Command Modes Command History Modification** Release Cisco IOS XE Gibraltar 16.10.1 This command was introduced. This example shows how to configure RADIUS NAC:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy default-policy-profile
Device(config-wireless-policy)# nac
```

nai-realm

To configure the 802.11u Network Access Identifier (NAI) realm, use the **nai-realm** command. To remove the realm, use the **no** form of the command.

nai-realm nai-realm

Syntax Description	nai-realm NAI realm name.		
		The realm name sho	ould not exceed 220 characters.
Command Default	None		
Command Modes	Wireless Al	NQP Server Configu	ration (config-wireless-anqp-server)
Command History			
Command History	Release		Modification

Example

The following example shows how to configure the 802.11u NAI realm:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# nai-realm cisco.com

nai-realm

To configure the Network Access Identifier (NAI) realm for advice of charge, use the **nai-realm** command. To remove the NAI realm for advice of charge, use the **no** form of this command.

	nai-realm realm-name			
Syntax Description	<i>realm-name</i> NAI realm name for	or advice of charge.		
Command Default	NAI realm is not configured.			
Command Modes	Wireless ANQP Advice Charge C	Configuration (config-anqp-advice-charge)		
Command History	Release	Modification		
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.		

Example

The following example shows how to configure the NAI realm for advice of charge:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# advice-charge unlimited Device(config-anqp-advice-charge)# nai-realm cisco

nai-realm (OSU Provider)

To configure the Network Access Identifier (NAI) realm of the OSU operator, use the **nai-realm** command. To remove the realm of the OSU operator, use the **no** form of the command.

nai-realm nai-realm

Syntax Description	nai-realm	NAI realm name.	ould not exceed 220 characters
Command Default	None		
Command Modes	ANQP OSU	J Provider Configura	tion (config-anqp-osu-provider)
Command History	Release		Modification
	Cisco IOS	XE Gibraltar 16.12.1	This command was introduced.

Example

The following example shows how to configure the NAI realm of the OSU operator:

Device(config-anqp-osu-provider)# nai-realm cisco.com

nas-id

To configure option parameters for a NAS ID, use the **nas-id** command.

nas-id { option1 | option2 | option3 } { ap-eth-mac | ap-ip | ap-location | ap-mac | ap-name | ap-policy-tag | ap-site-tag | custom-string custom-string | ssid | sys-ip | sys-mac | sys-name }

Syntax Description	ap-eth-mac	Ethernet MAC address of the AP.			
	ap-ip	IP address of the AP.			
	ap-location	Location of the AP.			
	ap-mac	MAC address of the AP.			
	ap-name	Name of the AP.			
	ap-policy-tag	Policy tag of the AP. Site tag of the AP. Custom string, with various combinations of option1, option2 and option3.			
	ap-site-tag				
	custom-stringcustom-string				
	ssid	SSID.			
	sys-ip	ys-ip IP address of the system.			
	sys-mac MAC address of the system.				
	sys-name	Name of the system.			
Command Default	None				
Command Modes	config-aaa-policy				
Command History	Release	Modification			
	Cisco IOS XE Gibraltar 16.1	0.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.			
	Cisco IOS XE Cupertino 17.	7.1 This command was modified by adding the following keyword and variable:			
		• custom-string			
		• custom-string			

Examples

The following example shows how to configure the system IP address for the NAS-ID:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
```

```
Device(config)# wireless aaa policy profile-name
Device(config-aaa-policy)# nas-id option2 sys-ip
```

The following example shows how to configure a custom string for the NAS-ID:

Device# configure terminal

Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless aaa policy profile-name Device(config-aaa-policy)# nas-id option2 custom-string test

nas-id option2

To configure option 2 parameters for a NAS-ID, use the nas-id option2 command.

nas-id option2 {sys-ip | sys-name | sys-mac }

Syntax Description	sys-ip System IP Address	
	sys-name System Name.	
	sys-mac System MAC address.	
Command Default	None	
Command Modes	config-aaa-policy	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10	1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the system IP address for the NAS-ID:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless aaa policy profile-name
Device(config-aaa-policy)# nas-id option2 sys-ip
```

ndp-mode

To configure the NDP mode for an AP under the RF profile, use the **ndp-mode** command in the RF profile configuration.

	ndp-mode	{ auto off-cha	nnel }
Syntax Description	ndp-mode	Configures operation	ng mode for 802.11a neighbor discovery.
	auto	Enables the auto m	node.
	off-channel	Enables NDP pack	ets on RF ASIC radio.
Command Modes	RF profile co	onfiguration (config-	rf-profile)
Command History	Release		Modification
	Cisco IOS X	E Bengaluru 17.5.1	This command was introduced.

Example

The following example shows how to configure the operating mode for 802.11a neighbor discovery:

```
Device# configure terminal
Device(config)# ap dot11 24ghz rf-profile rf-profile-name
Device(config-rf-profile)# ndp-mode auto
```

network

	To configure the network number in decimal notation, use the network command. network <i>network-number</i> [{ <i>network-mask</i> secondary }]			
Syntax Description	<i>ipv4-address</i> Network number in dotted-decimal notation.			
	network-mask Network mask or prefix length.			
	secondary Configure as se	econdary subnet.		
Command Default	None			
Command Modes	dhcp-config			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to configure network number and the mask address:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip dhcp pool name
Device(dhcp-config)# network 209.165.200.224 255.255.255.0
```

network-type

To configure the 802.11u network type, use the **network-type** command. To remove the network type, use the **no** form of the command.

network-type { chargeable-public

| emergency | free-public | guest-private | personal-device | private | test | wildcard } internet-access { allowed | forbidden }

Syntax Description	chargeable-public	Sets as chargeable public network.		
	emergency	Sets as emergency network.		
	free-public Sets as free public network.			
	guest-private	Sets as guest private network.		
	personal-device	Sets as personal device network.		
	private	Sets as private network.		
	test	Sets as test network.		
	wildcard	Sets as wildcard network.		
	internet-access Configures network ability to access the			
	allowed	Enables internet access.		
	disabled	Disables internet access.		
Command Default	- None			
Command Modes	Wireless ANQP Server Configuration (config-wireless-anqp-server)			
Command History	Release	Modification		
	Cisco IOS XE Gibral	tar 16.12.1 This command was introduced.		

Example

The following example shows how to configure 802.11u network type:

Device(config) # wireless hotspot angp-server my-server Device(config-wireless-angp-server) # network-type wildcard internet-access allowed

nmsp cloud-services enable

To configure NMSP cloud services, use the **nmsp cloud-services enable** command.

nmsp cloud-services enable

Command DefaultNoneCommand ModesGlobal of

Global configuration (config)

Command History

Release Modification

Cisco IOS XE Gibraltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enable NMSP cloud services:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# nmsp cloud-services enable

nmsp cloud-services http-proxy

To configure the proxy for NMSP cloud server, use the **nmsp cloud-services http-proxy** command.

nmsp cloud-services http-proxy *proxy-server port*

Syntax Description	n <i>proxy-server</i> Enter the hostname or the IP address of the proxy server for NMSP cloud services.			
	<i>port</i> Enter the proxy s	erver port number for NMSP cloud services.		
Command Default	None			
Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to configure the proxy for NMSP cloud server:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# nmsp cloud-services http-proxy host-name port-number

nmsp cloud-services server token

To configure the NMSP cloud services server parameters, use the **nmsp cloud-services server token** command.

nmsp cloud-services server token token

Syntax Description	token Authentication token for the NMSP cloud services.		
Command Default	None		
Command Modes	config		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure the for the NMSP cloud services server parameters:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# nmsp cloud-services server token authentication-token

nmsp cloud-services server url

To configure NMSP cloud services server URL, use the **nmsp cloud-services server url** command.

 nmsp cloud-services server url url

 Syntax Description
 ul URL of the NMSP cloud services server.

 Command Default
 None

 Command Modes
 Global configuration (config)

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure a URL for NMSP cloud services server:

Device(config) # nmps cloud-services server url http://www.example.com

nmsp notification interval

To modify the Network Mobility Services Protocol (NMSP) notification interval value on the controller to address latency in the network, use the **nmsp notification interval** command in global configuration mode.

nmsp notification interval { attachment | location | rssi { clients | rfid | rogues { ap | client }
} }

Syntax Description	attachment	Specifies the time used to aggregate attachment information.		
	location	Specifies the time used to aggregate location information.		
	rssi	Specifies the time used to aggregate RSSI information.		
	clients	Specifies the time interval for clients.		
	rfid	Specifies the time interval for rfid tags.		
	rogues	Specifies the time interval for rogue APs and rogue clients		
	ар	Specifies the time used to aggregate rogue APs .		
	client	Specifies the time used to aggregate rogue clients.		
Command Default	No default behavior or values.			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		
	This example shows how to set the NMSP notification interval for the active RFID tags to 25 seconds:			
	Device# configure terminal Device(config)# nmsp notification-interval rfid 25 Device(config)# end			
	This example shows how to modify NMSP notification intervals for device attachment (connecting to the network or disconnecting from the network) every 10 seconds:			
	Device# configure terminal Device(config)# nmsp notification-interval attachment 10 Device(config)# end			
		ation-interval attachment 10		

Device# configure terminal Device(config)# nmsp notification-interval location 20 Device(config)# end

L

nmsp strong-cipher

To enable the new ciphers, use the **nmsp strong-cipher** command in global configuration mode. To disable, use the **no** form of this command.

nmsp strong-cipher no nmsp strong-cipher

Syntax Description This co	mmand has no arguments or ke	eywords.
----------------------------	------------------------------	----------

Command Default The new ciphers are not enabled.

Command Modes

Global configuration (config)

Command History	Release	Modification
	15.2(2)E	This command was introduced.

Usage Guidelines The nmsp strong-cipher command enables strong ciphers for new Network Mobility Service Protocol (NMSP) connections.

Note The existing NMSP connections will use the default cipher.

Examples The following example shows how to enable a strong-cipher for NMSP:

Device> enable Device> configure terminal Device(config)# nmsp strong-cipher

Related Commands	Command	Description
	show nmsp status	Displays the status of active NMSP connections.

no redun-management fast-switchover

To disable explicit fast switchover notification, use the no redun-management fast-switchover command.

	Note	ote Configure this in the primary controller. This configuration is not required in the secondary controller.		
	no re	edun-management fast-sw	vitchover	
Syntax Description	This	This command has no arguments or keywords.		
Command Default	None	None		
Command Modes	Glob	al configuration (config)		
Command History	Rele	ease	Modification	
	Cisc	to IOS XE Cupertino 17.9.1	This command was introduced.	3

Examples

The following example shows how to disable explicit fast switchover notification:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config) # no redun-management fast-switchover

no redun-management garp-retransmit initial

To disable the initial GARP, use the no redun-management garp-retransmit initial command.

	no redun-management garp-r	etransmit initial	
Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Cupertino 17.9.1	This command was introduced.	

Examples

The following example shows how to disable the initial GARP:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# no redun-management garp-retransmit initial

no accounting-interim

To disable Interim accounting, use the **no accounting-interim** command.

no accounting-interim

Syntax Description	This command has no arguments or keywords.	
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.1	This command was introduced.

Examples

The following example shows how to disable Interim accounting:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy <default-policy-profile> Device(config-wireless-policy)# no accounting-interim

ntp auth-key

To configure the Network Time Protocol (NTP) server authentication key information on an AP profile, use the **ntp auth-key** command. To remove the NTP server authentication key information from an AP profile, use the **no ntp auth-key** command.

ntp auth-key index key-index type { md5 | sha1 } format { ascii | hex } key { 0 | 8 } server-key

Syntax Description	key-index	Key index. Valid range is from 1 to 65535.			
	md5	Specifies that a Message Digest 5 (MD5) authentication key will follow.			
	sha1	Specifies that a Secure Hash Algorithm 1 (SHA1) authentication key will follow.			
	format	Defines the key format—ASCII or HEX			
	ascii	Specifies that an ASCII key will follow.			
	hex	Specifies that a hex key will follow.			
	key	Defines the NTP server key—unencrypted or encrypted.			
	0	Specifies that an UNENCRYPTED password will follow.			
	8	Specifies that an AES encrypted password will follow.			
	server-key	NTP server key. For ASCII key, ensure that the length is less than 21 bytes. For HEX key, length should be less than 41, using only numbers between 0-9 and characters from a-f.			
Command Default	NTP server	authentication is not set.			
Command Modes	AP profile configuration (config-ap-profile)				
Command History	Release Modification				
	Cisco IOS 2	XE Bengaluru 17.6.1 This command was introduced.			
Examples	The followin AP profile:	ng example shows how to configure NTP server authentication key information on an			
		nfigure terminal fig)# ap profile test fig-ap-profile)# ntp ip 198.51.100.5			

office-extend

To enable the OfficeExtend AP mode for a FlexConnect AP, use the office-extend command.

	office-extend	
Command Default	None	
Command Modes	config-wireless-flex-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enable the OfficeExtend AP mode for a FlexConnect AP:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile flex flex-profile-name
Device(config-wireless-flex-profile)# office-extend
```

okc

I

	To enable Opportunistic Key Cac the feature, use the no form of the	•	enabled, use the okc command. To disable
	okc		
	[no] okc		
Syntax Description	okc Enables or disables Opport	unistic Key Caching (OKC). OF	C is enabled by default.
Command Default	None		
Command Modes	WLAN configuration		
Command History	Release	Modification	-
	Cisco IOS XE Amsterdam 17.2.1	This command was introduced.	-
		This command was	-

Example

The following example helps to show how OKC is enabled: Device(config-wlan) # okc

open-roaming-oi

To set open roaming element alias, use the **open-roaming-oi** command. To remove the open roaming element alias, use the **no** form of the command.

open-roaming-oi alias

Syntax Description	alias Roaming organizational ic	lentifier alias.
Command Default	Roaming organizational identifier	alias is not configured.
Command Modes	Wireless ANQP Server Configura	tion (config-wireless-anqp-server)#
Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.2.1	This command was introduced.

Example

The following example shows how to set open roaming element alias:

```
Device# configure terminal
Device(config)# wireless hotspot angp-server my_server
Device(config-wireless-angp-server)# open-roaming-oi allow-all
```

operator

To configure a Hotspot 2.0 operator-friendly name in a given language, use the **operator** command. To remove the operator name, use the **no** form of the command.

operator operator-name language-code

 A three character language code for the operator. Use only the first three letters of the language, in lower case, for the language code. For example, use <i>eng</i> for English. To see the full list of language codes, go to: http://www.loc.gov/standards/iso639-2/php/code_list.php.
P Server Configuration (config-wireless-anqp-server)
Modification
Gibraltar 16.12.1 This command was introduced.
-

Example

The following example shows how to configure an operator-friendly name:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# operator XYZ-operator eng

operating-class

To configure a Hotspot 2.0 operating class identifier, use the **operating-class** command. To remove the operating class, use the **no** form of the command.

operating-class class-id

Syntax Description	<i>class-id</i> Operating class ID number.	
Command Default	None	
Command Modes	Wireless ANQP Server Configu	ration (config-wireless-anqp-server)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.

Example

The following example shows how to configure an operating class identifier:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# operating-class 25 To configure optional data parameters for a flow exporter for , use the **option** command in flow exporter configuration mode. To remove optional data parameters for a flow exporter, use the **no** form of this command.

option {exporter-stats | interface-table | sampler-table} [{timeout seconds}] no option {exporter-stats | interface-table | sampler-table}

Contra Da 14		
Syntax Description	exporter-stats	Configures the exporter statistics option for flow exporters.
	interface-table	Configures the interface table option for flow exporters.
	sampler-table	Configures the export sampler table option for flow exporters.
	timeout seconds	(Optional) Configures the option resend time in seconds for flow exporters. The range is 1 to 86400. The default is 600.
Command Default	The timeout is 600 seconds. All other optional data parameters are not configured.	
Command Modes	Flow exporter configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.1	0.1 This command was introduced.
Usage Guidelines		ommand causes the periodic sending of the exporter statistics, including the d packets sent. This command allows the collector to estimate packet loss for the

The following example shows how to enable the periodic sending of an options table, which allows the collector to map the interface SNMP indexes provided in the flow records to interface names:

Device(config)# flow exporter FLOW-EXPORTER-1
Device(config-flow-exporter)# option interface-table

osu-provider

To configure a Hotspot 2.0 online sign up (OSU) provider, use the **osu-provider** command. Use the **no** form of the command to remove the OSU provider.

osu-provider provider-name

Syntax Description	<i>provider-name</i> Name of the provider.	OSU
Command Default	None	
Command Modes	Wireless ANQP Server Config	uration (config-wireless-anqp-server)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.	This command was introduced.

Example

The following example shows how to configure an OSU provider:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# osu-provider yyy

osu-ssid

To configure the service set Identifier (SSID) for the wireless client to use for online sign-up (OSU), use the **osu-ssid** command. To remove the SSID, use the **no** form of the command.

osu-ssid ssid

Syntax Description	5500 11	ame of the SSID for th he SSID length can be u		
Command Default	None			
Command Modes	Wireless	ANQP Server Configu	ration (config-wireless-and	qp-server)
Command History	Release		Modification	
	Cisco IO	S XE Gibraltar 16.12.1	This command was introduced.	

Example

The following example shows how to configure the SSID for the wireless client to use during OSU:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# osu-ssid cisco

packet-capture

To enable packet capture on the AP profile, use the **packet-capture** command.

packet-capture profile-name

Command Default None

Command Modes config-ap-profile

Command History

ReleaseModificationCisco IOS XE Gibraltar 16.10.1This command was introduced in a release earlier than Cisco IOS XE
Gibraltar 16.10.1.

Examples

The following example shows how to configure packet capture on the AP profile:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ap profile demo-profile-name
Device(config-ap-profile)# packet capture demo-profile
```

parameter-map type subscriber attribute-to-service

To configure parameter map type and name, use the **parameter-map type subscriber attribute-to-service** command.

parameter-map type subscriber attribute-to-service parameter-map-name

Syntax Description	attribute-to-service Name the attribute to service.		
	parameter-map-name Name of	the parameter map. The map name is limited to 33 characters.	
Command Default	- None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure parameter map type and name:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# parameter-map type subscriber attribute-to-service parameter-map-name
```

pae

I

	To enable product telemetry collection, use the pae command. To disable product telemetry collection, use the no form of this command.		
	рае		
	no pae		
Command Default	Product telemetry is enable	ed.	
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Dublin 17.10.1	This command was introduced.	
Examples	The following example sho	ows how to disable product teler	metry collection:
	Device# configure term Device(config)# no pae		

parameter-map type webauth

To configure the webauth parameter type for a specific parameter map or all the parameter maps, use the **parameter-map type webauth** command.

	<pre>parameter-map type webauth { parameter-map-name global }</pre>		
Syntax Description	parameter-map-name Name o	f the parameter map. The map name is limited to 99 characters.	
	global Applies	the configuration to all the parameter maps.	
Command Default	None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.	1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	
Examples	The following example shows named <i>parameter-map1</i> :	how to configure the webauth parameter type for a parameter map	
	Device# configure termina Device(config)# parameter	l -map type webauth <i>parameter-map1</i>	

password encryption aes

To enable strong (AES) password encryption, use the **password encryption aes** command. To disable this feature, use the **no** form of this command.

password encryption aes

no password encryption aes

Syntax Description	password	Configures the en	cryption password (key).	
	encryption Encrypts system passwords.		passwords.	
	aes	Enables stronger (AES) password encryption.		
Command Default	None			
Command Modes	Global config	guration mode.		
Command History	Release		Modification	
	Cisco IOS X	E Gibraltar 16.12.2s	This command was introduced.	
			introduced.	

Example

The following example shows how to enable AES password encryption :

Device(config) #password encryption aes

peer-blocking

To configure peer-to-peer blocking on a WLAN, use the **peer-blocking** command. To disable peer-to-peer blocking, use the **no** form of this command.

peer-blocking {allow-private-group | drop | forward-upstream}
no peer-blocking

Syntax Description	allow-private-group	Specifies	the device to allow a private g	group.
		Note	The allow-private-group p works only with the Identit	peer-to-peer blocking WLAN configuration y PSK (iPSK) WLAN.
	drop	Specifies	the device to discard the pack	ets.
	forward-upstream	Specifies the packets to be forwarded on the upstream VLAN. The device next in the hierarchy to the device decides what action to take regarding the packets.		
		Note The forward-upstream option is not supported for Flex local switching. Traffic is dropped even if this option is configured. Also, peer to peer blocking for local switching SSIDs are available only for the clients on the same AP.		
Command Default	Peer blocking is disable	led.		
Command Modes	WLAN configuration			
Command History	Release		Modification	-
	Cisco IOS XE Gibralta		This command was introduced.	-
Usage Guidelines	You must disable the WLAN before using this command. See Related Commands section for more information on how to disable a WLAN.			
This example shows how to enabl blocking:		ble the drop, forward, and priva	ate group options for peer-to-peer	
	Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wlan wlan1 Device(config-wlan)# peer-blocking allow-private-group Device(config-wlan)# peer-blocking drop Device(config-wlan)# peer-blocking forward-upstream			
	This example shows h blocking:	ow to disal	ble the drop, forward, and priv	rate group options for peer-to-peer
	Device# configure t Enter configuratior Device(config)# wla	commands	s, one per line. End with	n CNTL/Z.

Device(config-wlan)# no peer-blocking allow-private-group Device(config-wlan)# no peer-blocking drop Device(config-wlan)# no peer-blocking forward-upstream

plan

To configure the plan information for advice of charge, use the **plan** command. To remove the plan information for advice of charge, use the **no** form of this command.

plan {language-code | currency-code | info { bootflash | flash } file-name }

Syntax Description	<u></u>	Dian dataile such as file name in the form of	haatflachtflangeng on flachtflangeng
Syntax Description	filename	Plan details, such as file name, in the form of	bootilash.mename or hash.mename.
	<i>language-code</i> First three letters of the language code (ISO 639) for this Advice of Charge, in lower case, for example, <i>eng</i> for English.		
	<i>currency-code</i> First three letters of the currency code (ISO 4217) for this Advice of Charge, for example, <i>EUR</i> for Euros.		
Command Default	Plan information	is not configured.	
Command Modes	Wireless ANQP	Advice Charge Configuration (config-anqp-adv	ice-charge)
Command History	Release	Modification	-
	Cisco IOS XE A	msterdam 17.3.1 This command was introduced.	-
			_

Example

The following example shows how to configure the plan information for advice of charge:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# advice-charge unlimited Device(config-anqp-advice-charge)# plan eng EUR info bootflash:plan-a

pmk propagate

To propogate the (PMK) information to other APs in the site, use the **pmk propagate** command.

	pmk propagate		
Syntax Description	This command has no arguments or keywords.		
Command Default	None		
Command Modes	config-wireless-flex-profile		
Command History	Release Modification		
	Cisco IOS XE Cupertino 17.8.1	This command was introduced.	
Examples	The following example shows how to propagate the PMK information to the other APs in the sit		mation to the other APs in the site
	Device# configure terminal		_

Device(config)# wireless profile flex test-flex-profile Device(config-wireless-flex-profile)# pmk propogate

no platform sudi cmca3

To disable the SUDI99 migration and revert to certificate mapping as per older release, use the **no platform sudi cmca3** command.

no platform sudi cmca3

Syntax Description	This command has no keywords or arguments.		
Command Default	SUDI99 is set as trustpoint.		
Command Modes	Global configuration (config)		
Command History	Release Modification		-
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.	-
Usage Guidelines	For high-availability (HA) topology, form the HA pair before running the command. Afterwards, save the configuration and reload the controller to disable the SUDI certificate.		
Examples	The following example shows how to disable the SUDI99 migration and revert to certificate mapping as per the earlier release:		
	Device# configure terminal Device(config)# no platfor	m sudi cmca3	

policy

 To configure media stream admission policy, use the policy command.

 policy {admit | deny}

 Syntax Description

 admit Allows traffic for a media stream group.

 deny Denies traffic for a media stream group.

 deny Denies traffic for a media stream group.

 deny Denies traffic for a media stream group.

 Command Default

 None

 media-stream

 Command History

 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1

 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to allow traffic for a media stream group:

```
Device # configure terminal
```

```
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group ms-group 224.0.0.0 224.0.0.223
Device(media-stream)# policy admit
```

police

To define a policer for classified traffic, use the **police** command in policy-map class configuration mode. Use the **no** form of this command to remove an existing policer.

police rate-bps burst-byte [conform-action transmit]
no police rate-bps burst-byte [conform-action transmit]

Syntax Description	rate-bps	Specify the average traffic rate in bits per second (b/s). The range is 1000000 to 1000000000.		
	burst-byte	Specify the normal burst size in bytes. The range is 8000 to 1000000.		
	conform-action transmit	(Optional) When less than the specified rate, specify that the switch transmits the packet.		
Command Default	No policers are defined.			
Command Modes	Policy-map class configur	ration		
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		
Usage Guidelines	A policer defines a maximum permissible rate of transmission, a maximum burst size for transmissions, and an action to take if either maximum is exceeded.			
	When configuring hierarchical policy maps, you can only use the police policy-map command in a secondary interface-level policy map.			
	The port ASIC device, which controls more than one physical port, supports 256 policers on the switch (255 user-configurable policers plus 1 policer reserved for internal use). The maximum number of configurable policers supported per port is 63. Policers are allocated on demand by the software and are constrained by the hardware and ASIC boundaries. You cannot reserve policers per port. There is no guarantee that a port will be assigned to any policer.			
	To return to policy-map co the end command.	onfiguration mode, use the exit command. To return to privileged EXEC mode, use		
Examples		to configure a policer that transmits packets if traffic is less than 1 Mb/s size of 20 KB. There is no packet modification.		
	Device(config)# class Device(config-cmap)# (Device(config)# policy Device(config-pmap)# (Device(config-pmap-c); Device(config-pmap-c);	exit y-map policy1 class class1 # police 1000000 20000 conform-action transmit		

This example shows how to configure a policer that transmits packets if traffic is less than 1 Mb/s average rate with a burst size of 20 KB. There is no packet modification. This example uses an abbreviated syntax:

```
Device(config) # class-map class1
Device(config-cmap) # exit
Device(config) # policy-map policy1
Device(config-pmap) # class class1
Device(config-pmap-c) # police 1m 20000 conform-action transmit
Device(config-pmap-c) # exit
```

This example shows how to configure a policer, which marks down the DSCP values with the values defined in policed-DSCP map and sends the packet:

```
Device(config) # policy-map policy2
Device(config-pmap)# class class2
Device(config-pmap-c)# police 1000000 20000 exceed-action policed-dscp-transmit
Device(config-pmap-c)# exit
```

You can verify your settings by entering the show policy-map privileged EXEC command.

police cir

To set the policing of committed information rate, use the **police cir** command.

	police cir < <i>target bit rate</i> >		
Syntax Description	police cir	Polices committed information rate.	
	8000-10000000000	8000-10000000000 Sets the target bit rate at bits per second. The range is between 8000 and 1000000	
Command Default	None		
Command Modes	Policy map class cont	figuration	
Command History	Release	Modification	
	Cisco IOS XE Amste	erdam 17.2.1 This command was introduced.	

Example

This example shows how to set the committed information rate: Device(config-pmap-c)#police cir 8000

policy-tag

To map a policy tag to the AP, use the **policy-tag**command.

policy-tag policy-tag-name

Syntax Description		Name of the policy ag.	
Command Default	None		
Command Modes	config-ap-tag		
Command History	Release	Modificat	ion
	Cisco IOS XE Gibra	altar 16.10.1 This comr introduced	
Usage Guidelines	The AP will disconr	nect and rejoin after run	ning this command.
	Example		
	The following exam	ple shows how to confi	gure a policy tag:

Device(config-ap-tag) # policy-tag policytag1

Configuration Commands: g to z

policy-map

To create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode, use the **policy-map** command in global configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name
no policy-map policy-map-name

Syntax Description	<i>policy-map-name</i> Name of the policy map.		
Command Default	No policy maps are defined.		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	
Usage Guidelines	After entering the policy-map command, you enter policy commands are available:	y-map configuration mode, and these configuration	
	• class—Defines the classification match criteria for the	he specified class map.	
	• description—Describes the policy map (up to 200 c	haracters).	
	• exit—Exits policy-map configuration mode and returns you to global configuration mode.		
	• no —Removes a previously defined policy map.		
	• sequence-interval—Enables sequence number capability.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the class-map global configuration and match class-map configuration commands. You define packet classification on a physical-port basis. Only one policy map per ingress port is supported. You can apply the same policy map to multiple physical ports.		
	You can apply a nonhierarchical policy maps to physical the port-based policy maps in the device.	ports. A nonhierarchical policy map is the same as	
	A hierarchical policy map has two levels in the format of modified but the child policy (port-child policy) can be m		

In VLAN-based QoS, a service policy is applied to an SVI interface.

Note Not all MQC QoS combinations are supported for wired ports. For information about these restrictions, see chapters "Restrictions for QoS on Wired Targets" in the QoS configuration guide.

Examples

This example shows how to create a policy map called policy1. When attached to the ingress port, it matches all the incoming traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic less than the profile is sent.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police 1000000 20000 conform-action transmit
Device(config-pmap-c)# exit
```

This example show you how to configure hierarchical polices:

```
Device# configure terminal
Device(config)# class-map cl
Device(config-cmap)# exit
```

Device(config)# class-map c2
Device(config-cmap)# exit

```
Device(config) # policy-map child
Device(config-pmap)# class c1
Device(config-pmap-c) # priority level 1
Device(config-pmap-c) # police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c-police) # exit
Device(config-pmap-c) # exit
```

```
Device(config-pmap)# class c2
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
```

```
Device(config-pmap)# class class-default
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

```
Device(config)# policy-map parent
Device(config-pmap)# class class-default
Device(config-pmap-c)# shape average 1000000
Device(config-pmap-c)# service-policy child
Deviceconfig-pmap-c)# end
```

This example shows how to delete a policy map:

```
Device(config) # no policy-map policymap2
```

You can verify your settings by entering the show policy-map privileged EXEC command.

policy-map

To create or modify a policy map that can be attached to multiple physical ports or switch virtual interfaces (SVIs) and to enter policy-map configuration mode, use the **policy-map** command in global configuration mode. Use the **no** form of this command to delete an existing policy map and to return to global configuration mode.

policy-map policy-map-name
no policy-map policy-map-name

Syntax Description	<i>policy-map-name</i> Name of the policy map.		
Command Default	No policy maps are defined.		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	
Usage Guidelines	After entering the policy-map command, you enter policy commands are available:	y-map configuration mode, and these configuration	
	• class—Defines the classification match criteria for the	he specified class map.	
	• description—Describes the policy map (up to 200 c	haracters).	
	• exit—Exits policy-map configuration mode and returns you to global configuration mode.		
	• no —Removes a previously defined policy map.		
	• sequence-interval—Enables sequence number capability.		
	To return to global configuration mode, use the exit command. To return to privileged EXEC mode, use the end command.		
	Before configuring policies for classes whose match criteria are defined in a class map, use the policy-map command to specify the name of the policy map to be created, added to, or modified. Entering the policy-map command also enables the policy-map configuration mode in which you can configure or modify the class policies for that policy map.		
	You can configure class policies in a policy map only if the classes have match criteria defined for them. To configure the match criteria for a class, use the class-map global configuration and match class-map configuration commands. You define packet classification on a physical-port basis. Only one policy map per ingress port is supported. You can apply the same policy map to multiple physical ports.		
	You can apply a nonhierarchical policy maps to physical the port-based policy maps in the device.	ports. A nonhierarchical policy map is the same as	
	A hierarchical policy map has two levels in the format of modified but the child policy (port-child policy) can be m		

In VLAN-based QoS, a service policy is applied to an SVI interface.

Note Not all MQC QoS combinations are supported for wired ports. For information about these restrictions, see chapters "Restrictions for QoS on Wired Targets" in the QoS configuration guide.

Examples

This example shows how to create a policy map called policy1. When attached to the ingress port, it matches all the incoming traffic defined in class1, sets the IP DSCP to 10, and polices the traffic at an average rate of 1 Mb/s and bursts at 20 KB. Traffic less than the profile is sent.

```
Device(config)# policy-map policy1
Device(config-pmap)# class class1
Device(config-pmap-c)# set dscp 10
Device(config-pmap-c)# police 1000000 20000 conform-action transmit
Device(config-pmap-c)# exit
```

This example show you how to configure hierarchical polices:

```
Device# configure terminal
Device(config)# class-map cl
Device(config-cmap)# exit
```

Device(config)# class-map c2
Device(config-cmap)# exit

```
Device(config) # policy-map child
Device(config-pmap)# class c1
Device(config-pmap-c) # priority level 1
Device(config-pmap-c) # police rate percent 20 conform-action transmit exceed action drop
Device(config-pmap-c-police) # exit
Device(config-pmap-c) # exit
```

```
Device(config-pmap)# class c2
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
```

```
Device(config-pmap)# class class-default
Device(config-pmap-c)# bandwidth 20000
Device(config-pmap-c)# exit
Device(config-pmap)# exit
```

```
Device(config)# policy-map parent
Device(config-pmap)# class class-default
Device(config-pmap-c)# shape average 1000000
Device(config-pmap-c)# service-policy child
Deviceconfig-pmap-c)# end
```

This example shows how to delete a policy map:

```
Device(config) # no policy-map policymap2
```

You can verify your settings by entering the show policy-map privileged EXEC command.

I

port

To configure the port number to use when configuring the custom application, use the **port** command.

	port port-no	
Syntax Description	port-no Port number.	
Command Default	None	
Command Modes	config-custom	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the port number to use when configuring the custom application:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ip nbar custom custom-protocol http host host-string
Device(config-custom)# http host hostname
Device(config-custom)# port port-no
```

priority priority-value

To configure media stream priority, use the **priority** *priority*-value command.

priority priority-value

Syntax Description	<i>priority-value</i> Media stream priority value. Valid range is 1 to 8, with 1 being lowest priority and 8 being highest priority.			
Command Default	None			
Command Modes	config-media-stream			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to set the media stream priority value to the highest, that is 8:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group my-media-group 224.0.0.0 224.0.0.223
Device(config-media-stream)# priority 8
```

priority-queue

Command Default

To enable the egress expedite queue on a port, use the **priority-queue** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

 priority-queue out

 no
 priority-queue out

 Syntax Description
 at

The egress expedite queue is disabled.

Command Modes Interface configuration

Command History Release **Modification** Cisco IOS XE Gibraltar This command was introduced. 16.10.1 When you configure the **priority-queue out** command, the shaped round robin (SRR) weight ratios are **Usage Guidelines** affected because there is one fewer queue participating in SRR. This means that weight1 in the srr-queue bandwidth shape or the srr-queue bandwidth shape interface configuration command is ignored (not used in the ratio calculation). The expedite queue is a priority queue, and it is serviced until empty before the other queues are serviced. Follow these guidelines when the expedite queue is enabled or the egress queues are serviced based on their SRR weights: • If the egress expedite queue is enabled, it overrides the SRR shaped and shared weights for queue 1. • If the egress expedite queue is disabled and the SRR shaped and shared weights are configured, the shaped mode overrides the shared mode for queue 1, and SRR services this queue in shaped mode. • If the egress expedite queue is disabled and the SRR shaped weights are not configured, SRR services the queue in shared mode. **Examples** This example shows how to enable the egress expedite queue when the SRR weights are configured. The egress expedite queue overrides the configured SRR weights. Device (config) # interface gigabitethernet1/0/2 Device(config-if)# srr-queue bandwidth shape 25 0 0 0 Device (config-if) # srr-queue bandwidth share 30 20 25 25 Device (config-if) # priority-queue out This example shows how to disable the egress expedite queue after the SRR shaped and shared weights are configured. The shaped mode overrides the shared mode. Device(config) # interface gigabitethernet1/0/2

```
Device(config-if)# srr-queue bandwidth shape 25 0 0 0
Device(config-if)# srr-queue bandwidth share 30 20 25 25
```

Device(config-if) # no priority-queue out

You can verify your settings by entering the **show mls qos interface** *interface-id* **queueing** or the **show running-config** privileged EXEC command.

Related	Commands
	•••••••

Command	Description	
show mls qos interface queueing	Displays the queueing strategy (SRR, priority queueing), the weights corresponding to the queues, and the CoS-to-egress-queue map.	
srr-queue bandwidth shape	Assigns the shaped weights and enables bandwidth shaping on the four egress queues mapped to a port.	
srr-queue bandwidth share	Assigns the shared weights and enables bandwidth sharing on the four egress queues mapped to a port.	

priority

To assign priority to a class of traffic belonging to a policy map, use the **priority** command in policy-map class configuration mode. To remove a previously specified priority for a class, use the **no** form of this command.

priority[Kbps[burst -in-bytes]|level level-value[Kbps[burst -in-bytes]||percentpercentage[Kb/s[burst -in-bytes]||level value[Kb/s[burst -in-bytes]||percentpercentage[Kb/s[burst -in-bytes]||level value[Kb/s[burst -in-bytes]||percent

	percentage [K0/3 [ourst -ut-oytes]]]				
Syntax Description	_				
Command Default	No priority is set.				
Command Modes	Policy-map class configuration (config-pmap-c)				
Command History	Release	Modification	—		
	Cisco IOS XE Gibra	altar 16.10.1 This command was introduced			
Usage Guidelines	The priority command allows you to set up classes based on a variety of criteria (not just User Datagram Ports [UDP] ports) and assign priority to them, and is available for use on serial interfaces and permanent virtual circuits (PVCs). A similar command, the ip rtp priority command, allows you to stipulate priority flows based only on UDP port numbers and is not available for PVCs.				
		priority commands cannot be used in the sam to be used together in the same policy map.	ne class, within the same policy map. However,		
	Within a policy map, you can give one or more classes priority status. When multiple classes within policy map are configured as priority classes, all traffic from these classes is queued to the same, sin priority queue.				
	When the policy map containing class policy configurations is attached to the interface to stipulate the service policy for that interface, available bandwidth is assessed. If a policy map cannot be attached to a particular interface because of insufficient interface bandwidth, the policy is removed from all interfaces to which it was successfully attached.				
	Example				
	The following example shows how to configure the priority of the class in policy map policy				
	Device(config)# c Device(config-cma Device(config-cma	ap)#match precedence 2			
	Device(config)# cl Device(config-cma Device(config-cma	ap)#match dscp 30			

Device(config)# policy-map policy1
Device(config-pmap)# class cm1
Device(config-pmap-c)# priority level 1
Device(config-pmap-c)# police lm

Device(config-pmap-c-police)#exit
Device(config-pmap-c)#exit
Device(config-pmap)#exit

Device(config)#policy-map policy1 Device(config-pmap)#class cm2 Device(config-pmap-c)#priority level 2 Device(config-pmap-c)#police 1m

profile (prime filter)

To apply an access point (AP) filter priming profile, use the **profile** command. To disable profile, use the **no** form of this command.

profile profile-name

no profile profile-name

Syntax Description	profile-name	AP priming proname.	file
Syntax Description	This command	l has no argument	ts or keywords.
Command Default	None		
Command Modes	AP prime filter	r configuration (c	onfig-ap-pr-filter)
Command History	Release		Modification
	Cisco IOS XE	Cupertino 17.9.2	This command was introduced.
Examples	The following	example shows h	now to apply a priming profile:
	Device(confi	2. 1	name test-filter type priming)# profile Prime-FX

protocol (IPv6 snooping)

To specify that addresses should be gleaned with Dynamic Host Configuration Protocol (DHCP) or Neighbor Discovery Protocol (NDP), or to associate the protocol with an IPv6 prefix list, use the **protocol** command. To disable address gleaning with DHCP or NDP, use the **no** form of the command.

Syntax Description	dhcp Specifies that addresses should be gleaned in Dynamic Host Configuration Protocol (DHCP) packets.				
	ndp Specifies that addresses should be gleaned	d in Neighbor Discovery Protocol (NDP) packets.			
Command Default	Snooping and recovery are attempted using both D	DHCP and NDP.			
Command Modes	IPv6 snooping configuration mode				
Command History	Release	Modification			
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.			
Usage Guidelines	If an address does not match the prefix list associated with DHCP or NDP, then control packets will be dropped and recovery of the binding table entry will not be attempted with that protocol.				
	• Using the no protocol { dhcp ndp } command indicates that a protocol will not be used for snooping or gleaning.				
	• If the no protocol dhcp command is used, DHCP can still be used for binding table recovery.				
	• Data glean can recover with DHCP and NDP, though destination guard will only recovery through DHCP.				
	This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure the port to use DHCP to glean addresses:				

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# protocol dhcp

primary (ap prime)

To configure the primary controller for access point (AP) fallback, use the **primary** command. To remove the primary controller from being used for AP priming, use the **no** form of this command.

primary controller-name ip-address

no primary controller-name ip-address

Syntax Description	controller-name N	Name of the	e primary controller.	
	<i>ip-address</i> I	Pv4 or IPv6	6 address of the controller.	
Command Default	None			
Command Modes	AP prime configurati	ion (config-	-priming)	
Command History	Release		Modification	
	Cisco IOS XE Cupert	tino 17.9.2	This command was introduced.	
Examples	The following examp	ole shows h	ow to configure the prima	ry controller for AP fallback:
	Device# configure Device(config)# wi		cofile ap priming Prim	e-FX

Device (config-priming) # primary aaaa 209.165.201.2

priming-override

To override the existing access point (AP) priming configurations, use the **priming-override** command. To disable priming override, use the **no** form of this command.

priming-override

no priming-override

Syntax Description This command has no arguments or keywords.

Command Default Priming override is disabled.

Command Modes AP prime configuration (config-priming)

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.2	This command was introduced.

Usage Guidelines • When priming override is disabled, information stored in the AP priming profile is not sent to the APs.

• N+1 upgrade may not work properly when priming override is enabled. Before using N+1 upgrade, ensure that priming override is disabled using the **no priming-override** command.

Examples The following example shows how to override the existing AP priming configurations:

Device# configure terminal Device(config)# wireless profile ap priming Prime-FX Device(config-priming)# priming-override

public-ip

To configure the NAT public IP address of the controller, use the public-ip command.

public-ip{*ipv4-address*| *ipv6-address*}

Syntax Description *ipv4-address* Sets IPv4 address.

None

ipv6-address Sets IPv6 address.

Command Modes Management Interface Configuration(config-mgmt-interface)

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Usage Guidelines

Command Default

Example

The following example shows how to configure the NAT public IP address of the controller:

Device# configure terminal Device(config)# wireless management interface Vlan1 Device(config-mgmt-interface)# public-ip 192.168.172.100

qbss-load

To enable QoS enhanced basic service set (QBSS) IE, use the **qbss-load** command. To disable the feature, use the **no** form of the command.

	qbss-load		
	[no] qbss-lo	ad	
Syntax Description	qbss-load	Enables QoS enhanc IE.	eed basis service set (QBSS)
Command Default	None		
Command Modes	Wireless pol	licy configuration	
Command History	Release		Modification
	Cisco IOS 2	XE Amsterdam 17.2.1	This command was introduced.

Example

The following example shows how QBSS-load is configured:

Device(config-wireless-policy)#qbss-load

qos-map

To configure a quality of service (QoS) map, use the **qos-map** command in ap profile configuration mode. Use the **no** form of the command to disable the configuration.

qos-map { **action-frame** | **dscp-to-up-exception** *dscp-value user-priority* | **dscp-to-up-range** *user-priority dscp-value lower-dscp-range upper-dscp-range* | **trust-dscp-upstream** }

Syntax Description	action-frame	Sends the 802.11 QoS map action frame when the QoS map configuration is changed.		
	dscp-to-up-exception	Provides DSCP-to-user priority mapping exception.		
	dscp-to-up-range	p-range Provides DSCP-to-user priority mapping.		
		To delete all the custom mapping, use the no dscp-to-up-range command.		
	dscp-value	User priority-to-DSCP upstream. Valid range is from 0-63.		
	user-priority	User priority. Valid range is from 1-7.		
	lower-dscp-range	lower-dscp-rangeLower-end of the DSCP range. Valid range is from 0-63.upper-dscp-rangeUpper-end of the DSCP range. Valid range is from 0-63.		
	upper-dscp-range			
	trust-dscp-upstream	Instructs an access point (AP) to trust upstream DSCP instead of user priority.		
Command Default	None			
Command Modes	AP Profile Configuratio	on (config-ap-profile)		
Command History	Release	Modification		
	Cisco IOS XE Gibraltar	16.12.1 This command was introduced.		
Usage Guidelines	For internetworking wit	h IP networks, a mapping is devised between the 802.11e user priorities and IP DSCP.		
	The mapping is specified as DSCP ranges to individual UP values, and as a set of exceptions with one-to-or mapping between DSCP values and UP values. If the QoS Map is enabled and user configurable mapping are not added, then the default values are used.			
	0 1	You can configure up to eight configuration entries for <i>user-priority</i> ; one for each <i>user-priority</i> value. If you do not configure a custom value, a non-configured value (0xFF) is sent to the corresponding AP and the wireless clients.		
	For dscp-to-up-exception , you can configure a maximum of 21 entries.			
	-	ws a QoS map where the corresponding AP provides a wireless client with the required to 802.11e user priorities.		

Table 2: Default DSCP-range to UP Mapping

IP DSCP Range	802.11e User Priority	
0-7	0	
8-15	1	
16-23	2	
24-31	3	
32-39	4	
40-47	5	
48-55	6	
56-63	7	

The following table shows the set of exceptions with one-to-one mapping between DSCP values and user priority values.

Table 3: Default DSCP-range to UP Mapping Exceptions

IP DSCP	802.11e User Priority
0	0
2	1
4	1
6	1
10	2
12	2
14	2
18	3
20	3
22	3
26	4
34	5
46	6
48	7
56	7

Example

The following example shows how to configure a QoS map:

Device(config)# ap profile hotspot
Device(config-ap-profile)# qos-map dscp-to-up-range 6 52 23 62

qos queue-softmax-multiplier

To increase the value of softmax buffer, use the **qos queue-softmax-multiplier** command in the global configuration mode.

qos queue-softmax-multiplier *range-of-multiplier* **no qos queue-softmax-multiplier** *range-of-multiplier*

Syntax Description	range-of-multiplier	You can specify a value in the range of 100 to 1200. The default value is 100.
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release Modification	
	This command was introduced.	
Usage Guidelines		
		y on the ports where a policy-map is attached. If configured as 1200, the non-primary priority queue (!=level 1) are multiplied by 12 with their applicable for priority queue level 1.

qos video

To configure over-the-air QoS class to video only, use the **qos video** command.

	qos video	
Command Default	None	
Command Modes	config-media-stream	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure over-the-air QoS class to video only:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group my-media-group 224.0.0.0 224.0.0.223
Device(config-media-stream)# qos video
```

L

qos wireless-default untrust

To configure the default trust behavior to untrust wireless packets, use the **qos wireless-default untrust** command. To configure the default trust behavior of wireless traffic to trust, use the no form of the command. qos wireless-default-untrust no qos wireless-default-untrust This command has no arguments or keywords. **Syntax Description** To check the trust behavior on the device, use the show running-config | sec qos or the show run | include **Command Default** untrust command. Configuration **Command Modes Command History** Release Modification Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

The following command changes the default behavior for trusting wireless traffic to untrust.

Device(config) # qos wireless-default-untrust

queue-buffers ratio

To configure the queue buffer for the class, use the **queue-buffers ratio** command in policy-map class configuration mode. Use the **no** form of this command to remove the ratio limit.

queue-buffers ratio ratio limit no queue-buffers ratio ratio limit

Syntax Description (Optional) Configures the queue buffer for the class. Enter the queue buffers ratio limit (0-100). ratio limit No queue buffer for the class is defined. **Command Default** Policy-map class configuration (config-pmap-c) **Command Modes Command History** Release Modification Cisco IOS XE Gibraltar 16.10.1 This command was introduced. Either the **bandwidth**, **shape**, or **priority** command must be used before using this command. For more **Usage Guidelines** information about these commands, see Cisco IOS Quality of Service Solutions Command Reference available on Cisco.com The allows you to allocate buffers to queues. If buffers are not allocated, then they are divided equally amongst all queues. You can use the queue-buffer ratio to divide it in a particular ratio. The buffers are soft buffers because Dynamic Threshold and Scaling (DTS) is active on all queues by default. **Example** The following example sets the queue buffers ratio to 10 percent: Device(config) # policy-map policy_queuebuf01 Device(config-pmap)# class_map class_queuebuf01 Device (config-cmap) # exit Device (config) # policy policy queuebuf01 Device (config-pmap) # class class_queuebuf01 Device (config-pmap-c) # bandwidth percent 80 Device(config-pmap-c) # queue-buffers ratio 10 Device(config-pmap) # end

You can verify your settings by entering the **show policy-map** privileged EXEC command.

queue-limit

To specify or modify the maximum number of packets the queue can hold for a class policy configured in a policy map, use the **queue-limit** policy-map class configuration command. To remove the queue packet limit from a class, use the **no** form of this command.

queue-limit *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets* **no queue-limit** *queue-limit-size* [{**packets**}] {**cos** *cos-value* | **dscp** *dscp-value*} **percent** *percentage-of-packets*

Syntax Description	queue-limit-size	The maximum size of the queue. The maximum varies according to the optional unit of measure keyword specified (bytes, ms, us, or packets).		
	cos cos-value	Specifies parameters for each cos value. CoS values are from 0 to 7.		
	dscp dscp-value	Specifies parameters for each DSCP value.		
		You can specify a value in the range 0 to 63 specifying the differentiated services code point value for the type of queue limit.		
	percent percentage-of-packet.	A percentage in the range 1 to 100 specifying the maximum percentage of packets that the queue for this class can accumulate.		
Command Default	None			
Command Modes	Policy-map class configuration	(policy-map-c)		
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.			
Usage Guidelines	Although visible in the comman percent unit of measure.	nd line help-strings, the packets unit of measure is not supported; use the		
-	Note This command is supporte	d only on wired ports in the egress direction.		

Weighted fair queuing (WFQ) creates a queue for every class for which a class map is defined. Packets satisfying the match criteria for a class accumulate in the queue reserved for the class until they are sent, which occurs when the queue is serviced by the fair queuing process. When the maximum packet threshold you defined for the class is reached, queuing of any further packets to the class queue causes tail drop.

You use queue limits to configure Weighted Tail Drop (WTD). WTD ensures the configuration of more than one threshold per queue. Each class of service is dropped at a different threshold value to provide for QoS differentiation.

You can configure the maximum queue thresholds for the different subclasses of traffic, that is, DSCP and CoS and configure the maximum queue thresholds for each subclass.

Example

The following example configures a policy map called port-queue to contain policy for a class called dscp-1. The policy for this class is set so that the queue reserved for it has a maximum packet limit of 20 percent:

```
Device(config)# policy-map policy11
Device(config-pmap)# class dscp-1
Device(config-pmap-c)# bandwidth percent 20
Device(config-pmap-c)# queue-limit dscp 1 percent 20
```

queue-set

To map a port to a queue set, use the **queue-set** command in interface configuration mode. Use the **no** form of this command to return to the default setting.

queue-set *qset-id* **no queue-set** *qset-id*

Syntax Description *qset-id* Queue-set ID. Each port belongs to a queue set, which defines all the characteristics of the four egress queues per port. The range is 1 to 2.

Command Default The queue set ID is 1.

Command Modes Interface configuration

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

Examples This example shows how to map a port to queue-set 2:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# queue-set 2
```

You can verify your settings by entering the **show mls qos interface** [*interface-id*] **buffers** privileged EXEC command.

Related Commands	Command	Description
	mls qos queue-set output buffers	Allocates buffers to a queue set.
	mls qos queue-set output threshold	Configures the weighted tail-drop (WTD) thresholds, guarantees the availability of buffers, and configures the maximum memory allocation to a queue set.

a 5GHz

radio policy dot11 5ghz slot

To configure a WLAN radio policy on a specific 5-GHz slot, use the radio policy dot11 5ghz slot command.

radio policy dot11 5ghz slot slot_id

Syntax Description	0 Configures the WLAN on 5-GHz radio with radio slot 0. 1 Configures the WLAN on 5-GHz radio with radio slot 1.		
	2 Configures the	WLAN on 5-GHz radio with radio slot	2 (if present).
		u will be able to configure WLAN on t iof slot only.	he specified 5 GHz
Command Default	Radio policy is enab	oled on all the bands.	
Command Modes	WLAN configuratio	n	
Command History	Release	Modification	
	Cisco IOS XE Beng	aluru 17.6.1 This command was introduced.	
Usage Guidelines	You can choose a specific radio and a slot to broadcast the WLAN. This option is only available on radio.		
Examples	This example shows	s how to configure a radio policy on a s	pecific WLAN slot:
	-	an test4 n)# radio policy dot11 5ghz n-radio-5ghz)# slot 1	

radio spatial-stream

To configure the spatial streams for the 2.4-GHz, 5-GHz, 6-GHz, and secondary 5-GHz radios, use the **radio spatial-stream** command.

```
sequence-number radio { 24ghz | 5ghz | 6ghz | secondary-5ghz } spatial-stream { 1 | 2 | 3 | 4 | 8 }
```

Syntax Description	sequence-number	The power profile settings are ordered by sequence numbers. AP derating takes place as per the sequence number entered. The same combination of interface identifiers and parameter values does not appear in another sequence number. The same interface with the same parameter can appear multiple times with different parameter values.
	24ghz	Configures 2.4-GHz radio.
	5ghz	Configures 5-GHz radio.
	6ghz	Configures 6-GHz radio.
	secondary-5ghz	Configures secondary 5-GHz radio.
	$\{ 1 \mid 2 \mid 3 \mid 4 \mid 8 \}$	• 1: Specifies a 1X1 radio spatial stream.
		• 2: Specifies a 2X2 radio spatial stream.
		• 3: Specifies a 3X3 radio spatial stream.
		• 4: Specifies a 4X4 radio spatial stream.
		• 8: Specifies a 8X8 radio spatial stream.
Command Default	None	
Command Modes	Wireless power pro	ofile configuration
Command History	Release	Modification

Release	Modification
Cisco IOS XE Cupertino 17.10.1	This command was introduced.

Example

The following example shows how to configure radio spatial streams in the wireless power profile configuration mode:

Device(config)# wireless profile power power-profile-name Device(config-wireless-power-profile)# 20 radio radio 5ghz spatial-stream 4

radius server

To configure the RADIUS server, use the radius server command in global configuration mode.

	radius server	server-name	
Syntax Description	server-name	RADIUS server na	ame.
Command Default	None		
Command Modes	Global config	uration	
Command History	Release		Modification
	Cisco IOS XI	E Gibraltar 16.10.1	This command was introduced.
Usage Guidelines	None		
	T1 C 11 '	1 1 1	u to configure o redius comuce
	The following	g example shows ho	w to configure a radius server:

radius-server deadtime

To improve RADIUS response times when some servers might be unavailable, use the **radius-server deadtime** command to cause the unavailable servers to be skipped immediately. To set dead-time to the default value of 0, use the **no** form of this command.

radius-server deadtime time-in-minutes

no radius-server deadtime

Syntax Description	<i>time-in-minutes</i> Length of time, in minutes, for which a RADIUS server is skipped over by transaction requests, up to a maximum of 1440 minutes (24 hours).		
Command Default	Dead time is set to 0.		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	
Usage Guidelines	Use this command to mark as "dead" any RADIUS servers that fail to respond to authentication requests, th avoiding the wait for the request to time out before trying the next configured server. A RADIUS server marked as "dead" is skipped by additional requests for the duration of minutes or unless there are no serve not marked "dead."		

Example

The following example shows how to set deadtime for RADIUS servers that fail to respond to authentication requests:

Device(config) # radius-server deadtime 5

radius-server attribute wireless accounting call-station-id

To configure call station identifier sent in the RADIUS accounting messages, use the **radius-server attribute** wireless accounting call-station-id command. To remove the call station identifier from the radius accounting messages, use the **no** form of the command.

radius-server attribute wireless authentication call-station-id { ap-ethmac-only | ap-ethmac-ssid | ap-ethmac-ssid-flexprofilename | ap-ethmac-ssid-policytagname | ap-ethmac-ssid-sitetagname | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-macaddress | ap-macaddress-ssid | ap-macaddress-ssid-flexprofilename | ap-macaddress-ssid-policytagname | ap-macaddress-ssid-sitetagname | ap-name | ap-name-ssid | flex-profile-name | ipaddress | macaddress | ap-location | ap-macaddress | ap

ap-ethmac-only	Sets the call station identifier type to be AP's radio MAC address.
ap-ethmac-ssid	Sets the call station identifier type AP's radio MAC address with SSID.
ap-ethmac-ssid-flexprofilename	Sets the call station identifier type AP's radio MAC address with SSID and flex profile name.
ap-ethmac-ssid-policytagname	Sets the call station identifier type AP's radio MAC address with SSID and policy tag name.
ap-ethmac-ssid-sitetagname	Sets the call station identifier type AP's radio MAC address with SSID and site tag name.
ap-group-name	Sets the call station identifier type to use the AP group name.
ap-label-address	Sets the call station identifier type to the AP's radio MAC address that is printed on the AP label.
ap-label-address-ssid	Sets the call station identifier type to the AP's radio MAC address and SSID that is printed on the AP label.
ap-location	Sets the call station identifier type to the AP location.
ap-macaddress	Sets the call station identifier type to the AP's radio MAC address
ap-macaddress-ssid	Sets the call station identifier type to the AP's radio MAC address with SSID.
ap-macaddress-ssid-flexprofilename	Sets the call station identifier type to the AP's radio MAC address with SSID and flex profile name.
ap-macaddress-ssid-policytagname	Sets the call station identifier type to the AP's radio MAC address with SSID and policy tag name.
ap-macaddress-ssid-sitetagname	Sets the call station identifier type to the AP's radio MAC address with SSID and site tag name.
ap-name	Sets the call station identifier type to the AP name.

Syntax Description

	ap-name-ssid	Sets the call station identifier type to the AP name with SSID.	
	flex-profile-name	Sets the call station identifier type to the flex profile name.	
	ipaddress	Sets the call station identifier type to the IP address of the system.	
	macaddress	Sets the call station identifier type to the MAC address of the system	
	policy-tag-name	Sets the call station identifier type to the policy tag name.	
	site-tag-name	Sets the call station identifier type to the site tag name.	
	vlan-id	Sets the call station identifier type to the system's VLAN ID.	
Command Default	Call station identifier is not con	figured.	
Command Modes	Global Configuration(config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.	

Usage Guidelines

Example

The following example shows how to configure a call station identifier sent in the RADIUS accounting messages:

Device (config) # radius-server attribute wireless accounting call-station-id site-tag-name

radius-server attribute wireless authentication call-station-id

To configure call station identifier sent in the RADIUS authentication messages, use the **radius-server attribute wireless authentication call-station-id** command. To remove the call station identifier from the radius accounting messages, use the **no** form of the command.

radius-server attribute wireless authentication call-station-id { ap-ethmac-only | ap-ethmac-ssid | ap-ethmac-ssid-flexprofilename | ap-ethmac-ssid-policytagname | ap-ethmac-ssid-sitetagname | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-macaddress | ap-macaddress-ssid | ap-macaddress-ssid-flexprofilename | ap-macaddress-ssid-policytagname | ap-macaddress-ssid-sitetagname | ap-name | ap-name-ssid | flex-profile-name | ipaddress | macaddress | ap-location | ap-macaddress | ap

Syntax Description	ap-ethmac-only	Sets the call station identifier type to be AP's radio MAC address.	
	ap-ethmac-ssid	Sets the call station identifier type AP's radio MAC address with SSID.	
	ap-ethmac-ssid-flexprofilename	Sets the call station identifier type AP's radio MAC address with SSID and flex profile name.	
	ap-ethmac-ssid-policytagname	Sets the call station identifier type AP's radio MAC address with SSID and policy tag name. Sets the call station identifier type AP's radio MAC address with SSID and site tag name.	
	ap-ethmac-ssid-sitetagname		
	ap-group-name	Sets the call station identifier type to use the AP group name.	
	ap-label-address	Sets the call station identifier type to the AP's radio MAC address that is printed on the AP label.	
	ap-label-address-ssid	Sets the call station identifier type to the AP's radio MAC address and SSID that is printed on the AP label.	
	ap-location	Sets the call station identifier type to the AP location.	
	ap-macaddress	Sets the call station identifier type to the AP's radio MAC address.	
	ap-macaddress-ssid	Sets the call station identifier type to the AP's radio MAC address with SSID.	
	ap-macaddress-ssid-flexprofilename	Sets the call station identifier type to the AP's radio MAC address with SSID and flex profile name.	
	ap-macaddress-ssid-policytagname	Sets the call station identifier type to the AP's radio MAC address with SSID and policy tag name.	
	ap-macaddress-ssid-sitetagname	Sets the call station identifier type to the AP's radio MAC address with SSID and site tag name.	
	ap-name	Sets the call station identifier type to the AP name.	

	ap-name-ssid	Sets the call station identifier type to the AP name with SSID.		
	flex-profile-name	Sets the call station identifier type to the flex profile name.		
	ipaddress	Sets the call station identifier type to the IP address of the system.		
	macaddress	Sets the call station identifier type to the MAC address of the system		
	policy-tag-name	Sets the call station identifier type to the policy tag name.		
	site-tag-name	Sets the call station identifier type to the site tag name.		
	vlan-id	Sets the call station identifier type to the system's VLAN ID.		
Command Default	Call station identifier is not configured.			
Command Modes	Global Configuration(config)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.		
	Cisco IOS XE Bengaluru 17.4.1	This command was modified. The policy-tag-name , flex-profile-name , ap-macaddress-ssid-flexprofilename , ap-macaddress-ssid-policytagname ap-macaddress-ssid-sitetagname , ap-ethmac-ssid-flexprofilename , ap-ethmac-ssid-policytagname , and ap-ethmac-ssid-sitetagname keywords were introduced.		

Usage Guidelines

Example

The following example shows how to configure a call station identifier sent in the RADIUS authentication messages:

Device (config) # radius-server attribute wireless authentication call-station-id site-tag-name

radius-server attribute wireless location delivery out-of-band include-location-capable

To enable the Location-Capable attribute which provides the location information configured on the device, use the **radius-server attribute wireless location delivery out-of-band include-location-capable** command. To disable the Location-Capable attribute, use the **no** form of this command.

radius-server attribute wireless location delivery out-of-band include-location-capable

no radius-server attribute wireless location delivery out-of-band include-location-capable

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Dublin 17.11.1	This command was introduced.	
Usage Guidelines	6		it-of-band include-location-capable command ion-Information and Location-Data) attributes.
	•		ery out-of-band include-location-capable tion (Location-Information and Location-Data)
	To enable the Location attribu wireless location delivery ou	-	e attribute, use the radius-server attribute
Examples	• •	how to enable the Location-Cap es configuration on the device:	pable attribute and provide the details
	Device# configure termina Device(config)# radius-se include-location-capable		cation delivery out-of-band

range

To configure range from MAP to RAP bridge, use the range command.

range range-in-feet

Syntax Description	range-in-feet Configure the range	ge value in terms of feet. Valid range is from 150 feet to 132000 feet.
Command Default	1200	
Command Modes	config-wireless-mesh-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure range from MAP to RAP bridge for a mesh AP profile:

```
Device # configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device (config) # wireless profile mesh mesh-profile
Device (config-wireless-mesh-profile) # range 300
```

reanchor class

To configure classmap with protocols for the selective reanchoring feature, use the reanchor class command.

	reanchor class class-name	
Syntax Description	class-name AVC reanchor class name.	
Command Default	None	
Command Modes	config-wireless-policy	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure an AVC reanchor classname:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy default-policy-profile Device(config-wireless-policy)# reanchor class AVC-Reanchor-Class

record wireless avc basic

To apply the *wireless avc basic* AVC flow record to a flow monitor, use the **record wireless avc basic** command.

record wireless avc basic

Command Default	None	
Command Modes	config-flow-monitor	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
Usage Guidelines	÷	sic wireless AVC template. When you are configuring AVC, you will need to record wireless avc basic command.
	Examples	
	The following example shows he named <i>test-flow</i> :	ow to apply the wireless avc basic AVC flow record to a flow monitor

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# flow monitor test-flow
Device(config-flow-monitor)# record wireless avc basic
```

redundancy revertive

To set redundancy model as revertive, use the redundancy revertive command.

	redundancy revertive	
Syntax Description	This command has no keywords	s or arguments.
Command Default	None	
Command Modes	EoGRE domain configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Example

This example shows how to set redundancy model as revertive:

Device(config-eogre-domain) # redundancy revertive

redun-management interface Vlan

	To configure Redu	indancy Ma	anagement Interface (RMI), use the re	edun-management interface Vlan command.
	redun-managem chassis-number a		•	chassis-number address ip-address chassis
Syntax Description	vlan-interface-no	Is the VL	AN interface number. The valid ran	ge is from 1 to 4094.
		Note	Here, the <i>vlan-interface-no</i> is the That is, both must be on the same	e same VLAN as the Management VLAN. e subnet.
	chassis-number	Is the cha	assis number. The valid range is from	n 1 to 2.
	ip-address	Are the R	RMI IPs.	
Command Default	None			
Command Modes	Global configurat	tion		
Command History	Release		Modification	_
	Cisco IOS XE An	nsterdam 1	7.1.1s This command was introduced.	_
	This example sho	ws how to	configure Redundancy Managemen	nt Interface (RMI):
	Device# chassis	redunda	ncy ha-interface GigabitEthern	et 3

```
Device# configure terminal
Device(config)# redun-management interface Vlan 200 chassis 1 address 9.10.90.147 chassis
2 address
9.10.90.149
Device(config)# end
```

redun-management garp-retransmit

To determine the rate at which the GARP resend is performed, use the **redun-management garp-retransmit** command.

redun-management garp-retransmit burst packet-burst-size interval time-interval

Syntax Description	packet-burst-size The val	lid range is from 0 to 1000. The v	value 0 refers to the disabled retransmit.
		to the time interval in seconds. The disabled retransmit.	he valid range is from 0 to 5 seconds. The value 0
Command Default	None		
Command Modes	Global configuration (con	nfig)	
Command History	Release	Modification	
	Cisco IOS XE Cupertino	17.9.1 This command was introduced.	

Examples

The following example shows how to determine the rate at which the GARP resend is performed:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# redun-management garp-retransmit burst packet-burst-size interval
time-interval
```

redirect

To configure a redirect to an external portal, use the redirect command.

redirect {for-login | on-failure | on-success } redirect-url-name

Syntax Description	for-login	To login, redirect to this URL.
	on-failure	If login fails, redirect to this URL.
	on-success	If login is successful, redirect to this URL.
	redirect-url-name	Redirect URL name.
Command Default	None	

Command Modes	config-params-parameter-map	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure an redirect to an external IPv4 URL to login:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# parameter-map type webauth parameter-name
Device(config-params-parameter-map)# redirect for-login cisco.com
```

redirect portal

To configure external IPv4 or IPv6 portal, use the redirect portal command.

redirect portal {ipv4 | ipv6 }*ip-addr*

Syntax Description	ipv4 IPv4 portal address	
	ipv6 IPv6 portal address	
Command Default	None	
Command Modes	config-params-parameter-map	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure an external IPv4 portal address:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# parameter-map type webauth parameter-name
Device(config-params-parameter-map)# redirect portal ipv4 192.168.1.100
```

remote-span

To configure a VLAN as a Remote Switched Port Analyzer (RSPAN) VLAN, use the **remote-span** command in VLAN configuration mode on the switch stack or on a standalone switch. To remove the RSPAN designation from the VLAN, use the **no** form of this command.

remote-span no remote-span

Syntax Description	This command	has no arguments	or keywords.
--------------------	--------------	------------------	--------------

Command Default No RSPAN VLANs are defined.

Command Modes VLAN configuration (config-VLAN)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines If VLAN Trunking Protocol (VTP) is enabled, the RSPAN feature is propagated by VTP for VLAN IDs that are lower than 1005. If the RSPAN VLAN ID is in the extended range, you must manually configure intermediate switches (those in the RSPAN VLAN between the source switch and the destination switch).

Before you configure the RSPAN **remote-span** command, use the **vlan** (global configuration) command to create the VLAN.

The RSPAN VLAN has these characteristics:

- No MAC address learning occurs on it.
- RSPAN VLAN traffic flows only on trunk ports.
- Spanning Tree Protocol (STP) can run in the RSPAN VLAN, but it does not run on RSPAN destination ports.

When an existing VLAN is configured as an RSPAN VLAN, the VLAN is first deleted and then recreated as an RSPAN VLAN. Any access ports are made inactive until the RSPAN feature is disabled.

This example shows how to configure a VLAN as an RSPAN VLAN:

```
Device(config)# vlan 901
Device(config-vlan)# remote-span
```

This example shows how to remove the RSPAN feature from a VLAN:

Device(config) # vlan 901
Device(config-vlan) # no remote-span

You can verify your settings by entering the show vlan remote-span user EXEC command.

remote-lan

To map an RLAN policy profile to an RLAN profile, use the remote-lan command.

remote-lan remote-lan-profile-name policy rlan-policy-profile-name port-id port-id

Syntax Description	remote-lan-profile-name	Remote LAN profile name.
	rlan-policy-profile-name	Remote LAN policy profile name.
	port-id	Port ID.
Command Default	None	
Command Modes	Global configuration (conf	ig)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16	0.10.1 This command was introduced.

Example

This example shows how to map an RLAN policy profile to an RLAN profile:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless tag policy remote-lan-policy-tag
Device(config-policy-tag)# remote-lan rlan_profile_name policy rlan_policy_profile port-id
2
Device(config-policy-tag)# end
```

remote-lan rlan-profile policy rlan-policy ext-module

To configure the remote LAN profile and policy mapping to external module, use the **remote-lan** *rlan-profile* **policy** *rlan-policy***ext-module** command. To disable the remote LAN profile and policy mapping to external module, use the **no** form of the command.

	remote-lan	rlan-profile polic	y rlan-policyext-module
Syntax Description	rlan-profile	Configures the F	RLAN profile for the external module
	rlan-policy	Configures the I	RLAN policy for the external module
Command Default	None		
Command Modes	Global Conf	iguration	
Command History	Release		Modification
	Cisco IOS X	XE Gibraltar 17.3.1	This command was introduced.

Example

The following example shows how to configure the remote LAN profile and policy mapping to external module under a policy tag:

Device(config)# wireless tag policy default-policy-tag Device(config-policy-tag)# remote-lan <rlan-profile> policy <rlan-policy> ext-module

resilient

To enable the Flex Resilient feature in Flex+Bridge mode APs, use the resilient command.

	resilient	
Syntax Description	This command has no keyword	s or arguments.
Command Default	None	
Command Modes	Global Configuration	
Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.3.1	This command was introduced.

Usage Guidelines

This example shows how to enable the Flex Resilient feature in Flex+Bridge mode APs:

```
Device# configure terminal
Device(config)# wireless profile flex new-flex-profile
Device(config-wireless-flex-profile)# arp-caching
Device(config-wireless-flex-profile)# description "new flex profile"
Device(config-wireless-flex-profile)# native-vlan-id 2660
Device(config-wireless-flex-profile)# resilient
Device(config-wireless-flex-profile)# vlan-name VLAN2659
Device(config-wireless-flex-profile)# vlan-id 2659
Device(config-wireless-flex-profile)# end
```

rf tag

	To configure an RF tag to the AP, use the rf tag command.	
	rf tag rf-tag-name	
Syntax Description	<i>rf-tag-name</i> RF tag name.	
Command Default	None	
Command Modes	config-ap-tag	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.	1 This command was introduced.
Usage Guidelines	The AP will disconnect and rejoin after running this comma	
	Example	
	The following example shows	how to configure an RF tag:

Device(config-ap-tag)# rf-tag rftag1

roaming-oi

To configure a 802.11u roaming organization identifier, use the **roaming-oi** command. To remove the roaming organization identifier, use the **no** form of the command.

roaming-oi OI-value [beacon]

Syntax Description	<i>OI-value</i> Roaming organization identifier value.			
	beacon Advertises the roar	ning organization identifier as pa	rt of the BSSID beacon.	
Command Default	None			
Command Modes	Wireless ANQP Server Configuration (config-wireless-anqp-server)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.		
Usage Guidelines	You can configure up to 255 dif	fferent OI values.		
	You can use a maximum of three beacons for roaming OIs.			
	If beacon is specified, the roam only be returned while doing th	e	VLAN beacon or probe response, else it will	

Example

The following example shows how to configure an operating class identifier:

Device(config)#wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# roaming-oi 24 beacon

rrc-evaluation

To configure Resource Reservation Control (RRC) reevaluation admission, use the rrc-evaluation command.

	rrc-evaluation {initial periodic}		
Syntax Description	initial Configures initial adm	nission evaluation.	
	periodic Configures periodic admission evaluation.		
Command Default	None		
Command Modes	config-media-stream		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XI Gibraltar 16.10.1.	

Examples

The following example shows how to configure the RRC reevaluation admission to initial admission evaluation.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group my-media-group 224.0.0.0 224.0.0.223
Device(config-media-stream)# rrc-evaluation initial
```

sampling

To configure the data sampling interval in the AP sensor environment, use the **sampling** command. Use the **no** form of this command to set the data sampling interval to the default time of 5 seconds.

	sampling data-sampling-interval		
	no sampling data-san	npling-interval	
Syntax Description	data-sampling-interval	Configures the data sampling interv	al.
		The valid range is between 5 second seconds.	ds and 3600 seconds. The default value is 5
Command Default	None		
Command Modes	AP sensor configuration	mode	
Command History	Release	Modification	_
	Cisco IOS XE Cupertino	17.8.1 This command was introduced.	_
			_

Example

The following example shows you how to configure the data sampling interval in the AP sensor environment:

```
Device(config)# ap profile ap-profile-name
Device(config-ap-profile)# sensor environment air-quality
Device(config-ap-sensor)# sampling 300
```

scheduler asr

To enable advanced scheduling request feature on a WLAN, use the **scheduler asr** command. To disable the advanced scheduling request feature on a WLAN, use the **no** form of the command.

scheduler asr

no scheduler asr

Command History	Release	Modification
Command Modes	WLAN configuration (config-wlan)	
Command Default	Advanced scheduling	request feature is enabled.
Syntax Description	This command has no	keywords or arguments.

Example

The following example shows how to configure the Advanced Scheduling Request feature on a WLAN:

introduced

Device# configure terminal Device(config)# wlan test4 Device(config-wlan)# scheduler asr

Cisco IOS XE Bengaluru 17.4.1 This command was

secondary (ap prime)

To configure a secondary controller for access point (AP) fallback, use the **secondary** command. To remove the secondary controller from being used for AP priming, use the **no** form of this command.

secondary controller-name ip-address

no secondary controller-name ip-address

Syntax Description	controller-name	Name of the secondary controller.	
.,	ip-address	IPv4 or IPv6 address of the controller.	
Command Default	None		
Command Modes	AP prime configu	ration (config-priming)	
Command History Examples	Release	Modification	
	Cisco IOS XE Cuj	pertino 17.9.2 This command was introduced.	_
	The following exa	mple shows how to configure a secondary	controller for AP fallback:
		re terminal wireless profile ap priming Prime-F riming)# secondary bbbb 209.165.201.	

secure-webauth-disable

To disable the HTTP secure server for web authentication, use the **secure-webauth-disable** command in the global parameter-map mode. Use the **no** form of the command to negate the command.

secure-webauth-disable

no secure-webauth-disable

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Global parameter-map mode		
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Example

This example shows how to disable the HTTP secure server for web authentication:

Device(config-params-parameter-map) # secure-weauth-disable

security

To configure mesh security, use the security command.

	security { eap psk }	
Syntax Description	ep Configure mesh security EA	AP for Mesh AP.
	pk Configure mesh security PS	SK for Mesh AP
Command Default	EAP	
Command Modes	config-wireless-mesh-profile	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure mesh security with EAP protcol on an Mesh AP:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile mesh profile-name
Device(config-wireless-mesh-profile)# security eap
```

security dot1x authentication-list

To configure security authentication list for IEEE 802.1x, use the **security dot1x authentication-list** *auth-list-name* command.

security dot1x authentication-list auth-list-name

Syntax Description	Parameter	Description
	auth-list-name	Authentication list name.
Command Default	None	
Command Modes	config-wlan	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure security authentication list for IEEE 802.1x:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wlan wlan-name
Device(config-wlan)# security dot1x authentication-list auth-list-realm
```

security dot1x request

To configure EAP request related parameters, use the **security dot1x request** command. To reset the EAP request related parameters, use the **no** form of this command.

	<pre>security dot1x request { retries retry-num timeout timeout-value }</pre>		
	no security dot1x requ	est { retries retry-num timeout timeout-value }	
Syntax Description	retries retries	For EAP messages, specifies the maximum number of times that the controller retransmits the message to a wireless client.	
		Valid values range from 0 to 20.	
	timeout timeout-value	For EAP messages, specifies the amount of time that the controller waits before retransmitting the message to a wireless client.	
		Valid values range from 1 to 120.	
Command Default	None		
Command Modes	Remote LAN Configura	tion (config-remote-lan)	
Command History	Release Modification		
	This command introduced.	was	

This example lists all the commands under wireless security dot1x .

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ap remote-lan profile-name rlan_profile_name 3
Device(config-remote-lan)# security dot1x request retries 10
Device(config-remote-lan)# security dot1x request timeout 100
```

security dot1x identity-request

To configure EAP ID request related parameters, use the **security dot1x identity-request** command. To reset the EAP ID request related parameters, use the **no** form of this command.

security dot1x identity-request { retries retry-num | timeout timeout-value }
no security dot1x identity-request { retries retry-num | timeout timeout-value }

Syntax Description	retries retries	For EAP ID requests, specifies the maximum number of times that the controller retransmits the requests.			
		Valid values range from 1 to 20.			
	timeout <i>timeout-value</i> For EAP ID requests, specifies the amount of time that the controller retransmitting the message.				
		Valid values range from 1 to 120.			
Command Default	None				
Command Modes	Remote LAN Configura	tion (config-remote-lan)			
Command History	Release Modification				
	This command introduced.	was			
Examples	The following example	shows how to configure EAP ID request related parameters:			
	Device(config)# ap r Device(config-remote	rminal commands, one per line. End with CNTL/Z. emote-lan profile-name rlan_profile_name 3 -lan)# security dot1x identity-request retries 10 -lan)# security dot1x identity-request timeout 100			

security ft

To configure 802.11r fast transition parameters, use the **security ft** command. To configure fast transition **over the air**, use the **no security ft over-the-ds** command.

security ft [{over-the-ds | reassociation-timeout timeout-jn-seconds}]
no security ft [{over-the-ds | reassociation-timeout}]

Syntax Description	over-the-ds	ast transition occurs over a distributed system. is parameter configures security ft over the			
	reassociation-timeout	(Optiona	l) Configures the reassociati	on timeout interval.	
	timeout-in-seconds		 Specifies the reassociation to 100. The default value 	timeout interval in seconds. The valid range e is 20.	
Command Default	The feature is disabled.				
Command Modes	WLAN configuration				
Command History	Release	N	Iodification	-	
	Cisco IOS XE Gibraltar		his command was ttroduced.	_	
Usage Guidelines	None				
Ū	WLAN Security must be enabled.				
	Example				
	The following example configures security FT configuration for an open WLAN:				
	Device#wlan test Device(config-wlan)# Device(config-wlan)# Device(config-wlan)# Device(config-wlan)# Device(config-wlan)# Device(config-wlan)# Device(config-wlan)#	no mobil no secur no secur no secur security	ity anchor sticky ity wpa ity wpa akm dot1x ity wpa wpa2 ity wpa wpa2 ciphers aes ft	5	
	The following example s	shows a sai	mple security FT on a WPA-	enabled WLAN:	
	Device# wlan test Device(config-wlan)# Device(config-wlan)# Device(config-wlan)# Device(config-wlan)#	no secur security	ity wpa akm dot1x	cii 0 test-test	

Device(config-wlan)# security ft
Device(config-wlan)# no shutdown

security level (IPv6 snooping)

To specify the level of security enforced, use the **security-level** command in IPv6 snooping policy configuration mode.

security level {glean | guard | inspect}

Syntax Description	glean	Extracts addresses from the messages and installs them into the binding table without performing any verification.		
	guardPerforms both glean and inspect. Additionally, RA and DH messages are rejected unless they are received on a trusted p policy authorizes them.			
	inspect	Validates messages for consistency and conformance; in particular, address ownership is enforced. Invalid messages are dropped.		
Command Default	The default security level is gu	iard.		
Command Modes	IPv6 snooping configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10	D.1This command was introduced.		
		fine on ID-(magning relieven and relievel, place the device in		

This example shows how to define an IPv6 snooping policy name as policy1, place the device in IPv6 snooping configuration mode, and configure the security level as inspect:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# security-level inspect

security pmf

To configure 802.11w Management Frame Protection (PMF) on a WLAN, use the **security pmf** command. To disable management frame protection, use the **no** form of the command.

security pmf {association-comeback association-comeback-time-seconds | mandatory | optional |
saquery-retry-time saquery-retry-time-milliseconds}

no security pmf [{**association-comeback** *association-comeback-time-seconds* | **mandatory** | **optional** | **saquery-retry-time** *saquery-retry-time-milliseconds*}]

Syntax Description	association-comeback	Configures the 802	Configures the 802.11w association comeback time.		
	association-comeback-time-sec	associated client n after it is denied w	Association comeback interval in seconds. Time interval that an associated client must wait before the association is tried again after it is denied with a status code 30. The status code 30 message is "Association request rejected temporarily; Try again later."		
		The range is from	1 through 20 seconds.		
	mandatory		Specifies that clients are required to negotiate 802.1w PMF protection on the WLAN.Specifies that the WLAN does not mandate 802.11w support on clients. Clients with no 802.11w capability can also join.Time interval identified before which the SA query response is expected. If the device does not get a response, another SA query 		
	optional	1			
	saquery-retry-time	expected. If the dev			
	saquery-retry-time-millisecond.		time in milliseconds. The range is from 100 lue must be specified in multiples of 100		
Command Default	PMF is disabled.				
Command Modes	WLAN configuration				
Command History	Release	Modification	_		
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.		_		
Usage Guidelines			thentication Key Management) configured to nation on configuring the security parameters.		
	robust management frames. IGT	K is a random value, assigned	that is used to protect broadcast or multicast by the authenticator station (device) used to m the source STA. The 802.11w IGTK key is		

derived using the four-way handshake and is used only on WLANs that are configured with WPA2 security at Layer 2.

This example shows how to enable the association comeback value at 15 seconds.

Device(config-wlan) # security pmf association-comeback 15

This example shows how to configure mandatory 802.11w MPF protection for clients on a WLAN:

Device(config-wlan) # security pmf mandatory

This example shows how to configure optional 802.11w MPF protection for clients on a WLAN:

Device(config-wlan) # security pmf optional

This example shows how to configure the saquery parameter:

Device(config-wlan)# security pmf saquery-retry-time 100

This example shows how to disable the PMF feature:

Device(config-wlan) # no security pmf

security static-wep-key

To configure static WEP keys on a WLAN, use the security static-wep-key command.

security static-wep-key {authentication {open | sharedkey } | encryption {104 | 40 } {ascii | hex | {0 | 8}wep-key | wep-index }}

Syntax Description	open	Open system authen	tication.	
	sharedkey	Shared key authenti	cation.	
	0	Specifies an UNENCRYPTED password is used.		
	8 Specifies an AES encrypted password is used.		crypted password is used.	
	wep-key	Enter the name of the	e WEP key.	
Command Default	None			
Command Modes	config-wla	n		
Command History	Release		Modification	
	Cisco IOS	XE Gibraltar 16.10.1	This command was introduc Gibraltar 16.10.1.	ed in a release earlier than Cisco IOS XE

Examples

The following example shows how to authenticate 802.11 using shared key:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wlan profile-name wlan-id
Device(config-wlan)# security static-wep-key authentication sharedkey
```

security web-auth

To change the status of web authentication used on a WLAN, use the **security web-auth** command. To disable web authentication on a WLAN, use the **no** form of the command.

security web-auth [{authentication-list authentication-list-name | **on-macfilter-failure** | **parameter-map** parameter-map-name}]

no security web-auth [{authentication-list [authentication-list-name]|on-macfilter-failure| parameter-map [parameter-name]}]

Syntax Description	authentication-list authenticat	<i>ion-list-name</i> Sets the au	Sets the authentication list for IEEE 802.1x.	
	on-macfilter-failure	Enables w	eb authentication on MAC failure.	
	parameter-map parameter-ma	<i>p-name</i> Configure	s the parameter map.	
Command Default	Web authentication is disabled.			
Command Modes	WLAN configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		

Examples

The following example shows how to configure the authentication-list web authentication on a WLAN:

Device(config-wlan) # security web-auth authentication-list test

security wpa akm

To configure authentication key management using Cisco Centralized Key Management (CCKM), use the **security wpa akm** command. To disable the authentication key management for Cisco Centralized Key Management, use the **no** form of the command.

Syntax Description	akm	Configures the Authentic	cation Key Management (AKM) parameters.	
	aes	Configures AES (Advar support.	nced Encryption Standard) encryption	
	cckm	Configures Cisco Centr	alized Key Management support.	
	ciphers	Configures WPA cipher	rs.	
	dot1x	Configures 802.1x supp	port.	
	ft	Configures fast transition using 802.11r. Configures 802.11w management frame protection. Configures 802.11r fast transition pre-shared key (PSK) support. Configures Temporal Key Integrity Protocol (TKIP) encryption support.		
	pmf			
	psk			
	tkip			
	wpa2	Configures Wi-Fi Prote	cted Access 2 (WPA2) support.	
Command Default			PSK, CCKM, FT dot1x, FT PSK, PMF timeout is set to 20 seconds, PMF SA Query	
Command Modes	WLAN Configuration (config-w	vlan)		
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was		

Example

The following example shows how to configure CCKM on the WLAN.

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z.

I

Device(config)# wlan wlan1 Device(config-wlan)#**security wpa akm cckm**

security wpa akm ft sae

To enable 802.11r Fast Transition on an SAE security–enabled WLAN, use the **security wpa akm ft sae** command.

security wpa akm ft sae

Syntax Description	security	Configures the secu	rity policy for a WLAN.
	wpa	Configures WPA/W	PA2 Support for a WLAN.
	akm	Configures Auth Ke	ey Management.
	ft	Configures 802.11r	Fast Transition.
	sae Configures SAE support.		
Command Default	None		
Command Modes	WLAN co	nfiguration mode (co	nfig-wlan)
Command History	Release		Modification
	Cisco IOS	XE Cupertino 17.9.1	This command was introduced.

Examples

The following example shows how to enable 802.11r Fast Transition on an SAE security–enabled WLAN:

```
Device# configure terminal
Device(config)# wlan wlan-test 3 ssid-test
Device(config-wlan)# security ft
Device(config-wlan)# no security wpa wpa2
Device(config-wlan)# security wpa psk set-key ascii 0 123456789
Device(config-wlan)# no security wpa akm dot1x
Device(config-wlan)# security wpa akm ft sae
Device(config-wlan)# security wpa wpa3
Device(config-wlan)# security pmf mandatory
Device(config-wlan)# no shutdown
```

security wpa akm owe

To enable Auth Key Management (AKM) Opportunistic Wireless Encryption (OWE), use the **security wpa akm owe** command. Use the **no** form of this command to disable the feature.

security wpa akm owe

no security wpa akm owe

Syntax Description	security	Configures the secu	rity policy for a WLAN.	
	wpa	Configures WPA/W	PA2 Support for a WLAN.	
	akm	Configures Auth Ke	y Management.	
	owe	Configures OWE support.		
Command Default	None			
Command Modes	WLAN co	onfiguration mode (co	nfig-wlan)	
Command History	Release		Modification	
	Cisco IOS	XE Bengaluru 17.5.1	This command was introduced.	

The following example shows how to enable Auth Key Management (AKM) Opportunistic Wireless Encryption (OWE):

Device# configure terminal Device(config)# wlan *wlan-test* 3 *ssid-test* Device(config-wlan)# security wpa akm owe

security wpa akm psk

To enable Auth Key Management (AKM) pre-shared key (PSK), use the **security wpa akm psk** command. Use the **no** form of this command to disable the feature.

security wpa akm psk

no security wpa akm psk

Syntax Description	security	Configures the secur	rity policy for a WLAN.
	wpa	Configures WPA/W	PA2 Support for a WLAN.
	akm	Configures Auth Ke	y Management.
	psk	Configures PSK sup	pport.
Command Default	None		
Command Modes	WLAN co	onfiguration mode (co	nfig-wlan)
Command History	Release		Modification
	Cisco IOS	XE Bengaluru 17.5.1	This command was introduced.

The following example shows how to enable Auth Key Management (AKM) pre-shared key (PSK):

Device# configure terminal Device(config)# wlan *wlan-test* 3 *ssid-test* Device(config-wlan)# security wpa akm psk

security wpa akm sae

To enable Auth Key Management (AKM) Secure Agile Exchange (SAE), use the **security wpa akm sae pwe** command. Use the **no** form of this command to disable the feature.

security wpa akm sae pwe { h2e | hnp | both-h2e-hnp}

no security wpa akm sae pwe { h2e | hnp | both-h2e-hnp}

Syntax Description	security	Configures the se	ecurity policy for a WLAN			
	wpa	Configures WPA/WPA2 Support for a WLAN.				
	akm	Configures Auth	Key Management.			
	sae	Configures SAE	support.			
	pwe	Configures SAE	Password Element.			
	h2e	Configures Hash	To Element only (Disable	s Hunting and Pecking).		
	hnp	np Configures Hunting And Pecking only (Disables Hash To Element).				
	both-h2e-hnp	Configures both	Hash to Element and Hunti	ng and Pecking support (Is the default option).		
Command Default	None					
Command Modes	WLAN config	guration mode (con	nfig-wlan)			
Command History	Release		Modification			
	Cisco IOS XE	Bengaluru 17.5.1	This command was introduced.			
	The following (SAE):	example shows ho	ow to enable Auth Key Mar	nagement (AKM) Secure Agile Exchange		
	Device(confi	igure terminal g)# wlan <i>wlan-t</i> g-wlan)# securi	test 3 ssid-test ty wpa akm sae			

security wpa akm sae pwe

To enable Auth Key Management (AKM) Secure Agile Exchange (SAE) PWE support, use the **security wpa akm sae pwe** command.

	security wpa a	1km sae pwe { h2e hnp both-h2e-hnp}
Syntax Description	h2e	Hash-to-Element only; disables HnP.
	hnp	Hunting and Pecking only; disables H2E.
	Both-h2e-hnp	Both Hash-to-Element and Hunting and Pecking support (Is the default option).
Command Default	None	
Command Modes	Global Configu	iration
Command History	Release	Modification
	Cisco IOS XE	Cupertino 17.7.1 This command was modified.
Usage Guidelines	- This example s	hows how to enable AKM SAE PWE support:
	Device(config Device(config	gure terminal g)# wlan WPA3 1 WPA3 g-wlan)# no security wpa akm dot1x
	Device (config Device (config Device (config Device (config Device (config	g-wlan)# no security ft over-the-ds g-wlan)# no security ft g-wlan)# no security wpa wpa2 g-wlan)# security wpa wpa2 ciphers aes g-wlan)# security wpa psk set-key ascii 0 Cisco123 g-wlan)# security wpa wpa3 g-wlan)# security wpa akm sae
	Device (config	g-wlan)# security wpa akm sae pwe g-wlan)# no shutdown

segment

To configure a segment name that identifies a group of devices that share the same application services, use the **segment** command. To remove a segment, use the **no** form of this command.

segment segment-name

no segment

Syntax Description	<i>segment-name</i> Segment name, which can be a maximum of 63 alphanumeric characters.		
Command Default	Segment name is not configured	1.	
Command Modes	SD Service Configuration (conf	ig-sd-service)	
Command History	Release	Modification	-
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.	-
Examples	The following example shows h that share the same application s	6 6	e that identifies a group of device.
	Device# configure terminal		

Enter configuration commands, one per line. End with CNTL/Z.

Device(config-sd-service) # segment test-segment

Device(config) # avc sd-service

sensor environment

To configure the AP sensor environment, use the **sensor environment** command. Use the **no** form of this command to disable this feature.

	sensor environ	ment { air-qua	ality temperature }
	no sensor envi	ronment { air-	quality temperature }
Syntax Description	air-quality	Specifies the air	r quality sensor.
	temperature	Specifies the ter	nperature and humidity sensor.
Command Default	None		
Command Modes	AP profile cont	figuration mode	
Command History	Release		Modification
	Cisco IOS XE	Cupertino 17.8.1	This command was introduced.

Example

The following example shows you how to configure the AP sensor environment:

Device(config)# ap profile ap-profile-name
Device(config-ap-profile)# sensor environment air-quality

sequence-number ethernet

To configure the power policy for Ethernet in the wireless power profile configuration mode, use the *sequence-number* **ethernet** command. Use the **no** form of this command to disable the feature.

	<u>^</u>	ethernet { GigabitEthernet0 GigabitEthernet1 speed { 1000mbps mbps 5000mbps } LAN1 LAN2 LAN3 state disable }		
	-	er ethernet { GigabitEthernet0 GigabitEthernet1 speed { 1000mbps mbps 5000mbps } LAN1 LAN2 LAN3 state disable }		
Syntax Description	sequence-number	The power profile settings are ordered by sequence numbers. AP derating takes place as per the sequence number entered. The same combination of interface identifiers and parameter values does not appear in another sequence number. The same interface with the same parameter can appear multiple times with different parameter values.		
	GigabitEthernet0	Configures GigabitEthernet0.		
	GigabitEthernet1	Configures GigabitEthernet1.		
	speed	Configures the Ethernet speed limit.		
		Note Ethernet speed configuration is not operational in Cisco IOS XE Cupertino 17.8.1.		
	1000mbps	Configures the Ethernet speed limit to 1000 Mbps.		
	100mbps	igures the Ethernet speed limit to 100 Mbps.		
	2500mbps	Configures the Ethernet speed limit to 2500 Mbps.		
	5000mbps	Configures the Ethernet speed limit to 5000 Mbps.		
	LAN1	Configures the LAN1 port.		
	LAN2	Configures the LAN2 port.		
	LAN3	Configures the LAN3 port.		
Command Default	None			
Command Modes	Wireless power prof	file configuration mode		
Command History	Release	Modification		
	Cisco IOS XE Cupe	ertino 17.8.1 This command was		

introduced.

Example

The following example shows how to configure the power policy for Ethernet in the wireless power profile configuration mode:

```
Device(config) # wireless profile power power-profile-name
Device(config-wireless-power-profile) # 10 ethernet gigabitethernet1 speed 1000mbps
```

Note

The Ethernet speed configuration is not operational in Cisco IOS XE Cupertino 17.8.1.

sequence-number radio

		wer policy for radio in the wireless power profile configuration mode, use the adio command. Use the no form of this command to disable the feature.
	sequence-number	radio { 24ghz 5ghz 6ghz secondary-5ghz } state shutdown
	no sequence-numb	er radio { 24ghz 5ghz 6ghz secondary-5ghz } state shutdown
Syntax Description	sequence-number	The power profile settings are ordered by sequence numbers. AP derating takes place as per the sequence number entered. The same combination of interface identifiers and parameter values does not appear in another sequence number. The same interface with the same parameter can appear multiple times with different parameter values.
	24ghz	Configures 2.4-GHz radio.
	5ghz	Configures 5-GHz radio.
	6ghz	Configures 6-GHz radio.
	secondary-5ghz	Configures secondary 5-GHz radio.
	state shutdown	Specifies the radio state as down.
Command Default	None	
Command Modes	Wireless power pro	file configuration
Command History	Release	Modification
	Cisco IOS XE Cup	ertino 17.8.1 This command was introduced.

Example

The following example shows how to configure the power policy for radio in the wireless power profile configuration mode:

Device(config)# wireless profile power power-profile-name
Device(config-wireless-power-profile)# 20 radio 6ghz state shutdown

sequence-number usb 0 state disable

To configure the power policy for USB, in the wireless power profile configuration mode, use the *sequence-number* **usb 0 state disable** command. Use the **no** form of this command to disable the feature.

sequence-number usb 0 state disable

no sequence-number usb 0 state disable

Syntax Description *sequence-number* The power profile settings are ordered by sequence numbers. AP derating takes place as per the sequence number entered. The same combination of interface identifiers and parameter values does not appear in another sequence number. The same interface with the same parameter can appear multiple times with different parameter values.

Command Modes Wireless power profile configuration mode

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.8.1	This command was introduced.

Example

None

Command Default

The following example shows how to configure the power policy for USB, in the wireless power profile configuration mode:

Device(config)# wireless profile power power-profile-name
Device(config-wireless-power-profile)# 30 usb 0 state disable

server-uri

To configure the server Uniform Resource Identifier (URI) of an Online Sign-Up (OSU) operator, use the **server-uri** command. To remove the server URI, use the **no** form of the command.

server-uri server-uri

Syntax Description	server-uri Server URI of an O	SU operator.
Command Default	None	
Command Modes	ANQP OSU Provider Configura	tion (config-anqp-osu-provider)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.

Example

The following example shows how to configure the server URI of an OSU operator:

Device(config-wireless-anqp-server)# osu-provider my-osu Device(config-anqp-osu-provider)# server-uri yyyy

service-policy

To configure the quality of service (QoS) service policy, use the **service-policy** command. To disable a QoS policy, use the **no** form of this command.

	service-policy no {	v { client input input output	output } policy-na. } policy-name	me	
Syntax Description	client Assigns a policy map to all clients in the WLAN.				
	input	input Assigns an input policy map.			
	output	Assigns an output poli	cy map.		
	policy-name	The policy map name.			
Command Default	None				
Command Modes	Wireless polic	ey configuration			
Command History	Release		Modification		
	Cisco IOS X	E Gibraltar 16.10.1	This command was i	ntroduced.	
Examples	-	_	the input service policy:		
	Enter config	-	e per line. End with policy default-policy		

Device(config-wireless-policy) # service-policy input test1

service-policy qos

To configure a QoS service policy, use the service-policy qos command.

service-policy qos {input | output}policy-name

input	Input QoS policy.	-
output	Output QoS policy.	-
policy-name	Policy name.	-
None		
config-servi	ce-template	
History Release		Modification
Cisco IOS X	KE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
	output policy-name None config-servi Release	output Output QoS policy. policy-name Policy name. None config-service-template

Examples

The following example shows how to configure an output QoS policy:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# service-template fabric-profile-name
Device(config-service-template)# service-policy qos output policy-name
```

service-template

	service-template service	<pre>ce-template-name {access-group acl_list vlan vlan_id absolute-timer seconds {input output}}</pre>	
Syntax Description	service-template-name	e Name of the service template.	
	acl_list	Access list name to be applied.	
	vlan_id	VLAN ID. The VLAN ID value ranges from 1 to 4094.	
	seconds	Session timeout value for service template. The session timeout value ranges from 1 to 65535 seconds.	
	service-policy qos { ir	nput output QoS policies for client.	
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.		
Usage Guidelines	None		
	The following example	e shows how to configure service template:	
	Device(config-servi Device(config-servi	<pre>ice-template cisco-phone-template ce-template)#access-group foo-acl ce-template)#vlan 100 ce-template)#service-policy gos input foo-gos</pre>	

To configure service template, use the service-template command.

service timestamps

To configure the system to time-stamp debugging or logging messages, use the**service timestamps** command in global configuration commands. Use the **no** form of this command to disable this service.

service timestamps debug log {datetime | **uptime***localtimemsecshow-timezoneyear*} **no service timestamps debuglog**

debug	Debug as the timestamp message type.		
log	Log as the timestamp message type.		
datetime	datetime		
uptime	(Optional) Time stamp with time since the system was rebooted.		
localtime	(Optional) Time stamp relative to the local time zone.		
msec	(Optional) Include milliseconds in the date and time stamp.		
show-timezone	(Optional) Include the time zone name in the time stamp.		
year	(Optional) Include year in timestamp.		
No time-stamping.			
If service timestamps is specified with no arguments or keywords, default is service timestamps debug uptime .			
The default for service timestamps debugdatetime is to format the time in UTC, with no milliseconds and no time zone name.			
The command no service timestamps by itself disables time stamps for both debug and log messages.			
Global configurat	ion		
Release	Modification		
Cisco IOS XE An	nsterdam 17.1.1s This command was introduced in a release earlier than Cisco IOS XE Amsterdam 17.1.1s.		
command adds tir The datetime form date and time acco	be added to either debugging or logging messages independently. The uptime form of the ne stamps in the format HHHH:MM:SS, indicating the time since the system was rebooted. n of the command adds time stamps in the format MMM DD HH:MM:SS, indicating the ording to the system clock. If the system clock has not been set, the date and time are preceded to indicate that the date and time are probably not correct.		
Example			
	log datetime uptime localtime msec show-timezone year No time-stamping If service timesta uptime. The default for see no time zone name The command no Global configurate Release Cisco IOS XE Are Time stamps can command adds tin The datetime form date and time accco by an asterisk (*)		

Device(config) # service timestamps debug uptime

The following example enables time stamps on logging messages, showing the current time and date relative to the local time zone, with the time zone name included:

Device(config) # service timestamps log datetime localtime show-timezone

session-timeout

To configure session timeout for clients associated to a WLAN, use the **session-timeout** command. To restore the default value, use the **no** form of this command.

session-timeout seconds no session-timeout

Syntax Description seconds Timeout or session duration in seconds. The range is from 300 to 86400. The default value is 1800.

Configuring 86400 is equivalent to max timeout. And value 0 is not recommended.

Command Default None

Command Modes WLAN configuration

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

This example shows how to configure a session timeout to 3600 seconds:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)#wireless profile policy policy1
Device(config-wireless-policy)#session-timeout 3600
```

set

L

To classify IP traffic by setting a Differentiated Services Code Point (DSCP) or an IP-precedence value in the packet, use the **set** command in policy-map class configuration mode. Use the **no** form of this command to remove traffic classification.

set

cos | dscp | precedence | ip | qos-group | wlan
set cos
{cos-value } | {cos | dscp | precedence | qos-group | wlan} [{table table-map-name}]
set dscp
{dscp-value } | {cos | dscp | precedence | qos-group | wlan} [{table table-map-name}]
set ip {dscp | precedence}
set precedence {precedence > l (cos | dscp | precedence | qos-group > l (table table-map-name}]
set qos-group

{*qos-group-value* | **dscp** [{**table** *table-map-name*}] | **precedence** [{**table** *table-map-name*}]} set wlan user-priority

user-priority-value | **costable** *table-map-name* | **dscptable** *table-map-name* | **qos-grouptable** *table-map-name* | **wlantable** *table-map-name*

Syntax Description

cos

- *cos-value*—CoS value from 0 to 7. You also can enter a mnemonic name for a commonly used value.
- Specify a packet-marking category to set the CoS value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
 - **cos**—Sets a value from the CoS value or user priority.
 - **dscp**—Sets a value from packet differentiated services code point (DSCP).
 - **precedence**—Sets a value from packet precedence.
 - qos-group—Sets a value from the QoS group.
 - wlan—Sets the WLAN user priority values.
- (Optional)**table** *table-map-name*—Indicates that the values set in a specified table map are used to set the CoS value. Enter the name of the table map used to specify the CoS value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the CoS value. For example, if you enter the **set cos precedence** command, the precedence (packet-marking category) value is copied and used as the CoS value.

dscp	Sets the differentiated services code point (DSCP) value to mark IP(v4) and IPv6 packets. You can specify these values:
	• <i>cos-value</i> —Number that sets the DSCP value. The range is from 0 to 63. You also can enter a mnemonic name for a commonly used value.
	• Specify a packet-marking category to set the DSCP value of the packet. If you also configure a table map for mapping and converting packet-marking values, this establishes the "map from" packet-marking category. Packet-marking category keywords:
	• cos —Sets a value from the CoS value or user priority.
	• dscp —Sets a value from packet differentiated services code point (DSCP).
	• precedence —Sets a value from packet precedence.
	• qos-group —Sets a value from the QoS group.
	• wlan—Sets a value from WLAN.
	• (Optional) table <i>table-map-name</i> —Indicates that the values set in a specified table map will be used to se the DSCP value. Enter the name of the table map used to specify the DSCP value. The table map name can be a maximum of 64 alphanumeric characters.
	If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the DSCP value. For example, if you enter the set dscp cos command, the CoS value (packet-marking category) is copied and used as the DSCP value.
ip	Sets IP values to the classified traffic. You can specify these values:
	• dscp —Specify an IP DSCP value from 0 to 63 or a packet marking category.
	• precedence —Specify a precedence-bit value in the IP header; valid values are from 0 to 7 or specify a packet marking category.

precedence

Sets the precedence value in the packet header. You can specify these values:

- *precedence-value* Sets the precedence bit in the packet header; valid values are from 0 to 7. You also can enter a mnemonic name for a commonly used value.
- Specify a packet marking category to set the precedence value of the packet.
 - cos—Sets a value from the CoS or user priority.
 - **dscp**—Sets a value from packet differentiated services code point (DSCP).
 - **precedence**—Sets a value from packet precedence.
 - qos-group—Sets a value from the QoS group.
- (Optional)**table** *table-map-name*—Indicates that the values set in a specified table map will be used to set the precedence value. Enter the name of the table map used to specify the precedence value. The table map name can be a maximum of 64 alphanumeric characters.

If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the precedence value. For example, if you enter the **set precedence cos** command, the CoS value (packet-marking category) is copied and used as the precedence value.

qos-group	Assigns a QoS group identifier that can be used later to classify packets.
	• <i>qos-group-value</i> —Sets a QoS value to the classified traffic. The range is 0 to 31. You also can enter a mnemonic name for a commonly used value.
	 dscp—Sets the original DSCP field value of the packe as the QoS group value.
	 precedence—Sets the original precedence field value of the packet as the QoS group value. (Optional)table table-map-name—Indicates that the values set in a specified table map will be used to se the DSCP or precedence value. Enter the name of the table map used to specify the value. The table map name can be a maximum of 64 alphanumeric characters.
	If you specify a packet-marking category (dscp or precedence) but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the QoS group value. For example, if you enter the set qos-group precedence command, the precedence value (packet-marking category) is copied and used as the QoS group value

	wlan user-priority wlan-user-priority	Assigns a WLAN user-priority to the classified traffic. You can specify these values:
		 <i>wlan-user-priority</i>—Sets a WLAN user priority to the classified traffic. The range is 0 to 7.
		• cos —Sets the Layer 2 CoS field value as the WLAN user priority.
		 dscp—Sets the DSCP field value as the WLAN user priority.
		• precedence —Sets the precedence field value as the WLAN user priority.
		• wlan—Sets the WLAN user priority field value as the WLAN user priority.
		• (Optional) table <i>table-map-name</i> —Indicates that the values set in a specified table map will be used to set the WLAN user priority value. Enter the name of the table map used to specify the value. The table map name can be a maximum of 64 alphanumeric characters.
		If you specify a packet-marking category but do not specify the table map, the default action is to copy the value associated with the packet-marking category as the WLAN user priority. For example, if you enter the set wlan user-priority cos command, the cos value (packet-marking category) is copied and used as the WLAN user priority.
Command Default	No traffic classification is defined.	
Command Modes	Policy-map class configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command w

The cos, dscp, qos-grou

Usage Guidelines

For the **set dscp** *dscp-value* command, the **set cos** *cos-value* command, and the **set ip precedence** *precedence-value* command, you can enter a mnemonic name for a commonly used value. For example, you can enter the **set dscp af11** command, which is the same as entering the **set dscp 10** command. You can enter the **set ip precedence critical** command, which is the same as entering the **set ip precedence 5** command. For a list of supported mnemonics, enter the **set dscp ?** or the **set ip precedence ?** command to see the command-line help strings.

When you configure the **set dscp cos**command, note the following: The CoS value is a 3-bit field, and the DSCP value is a 6-bit field. Only the three bits of the CoS field are used.

- The valid range for the DSCP value is a number from 0 to 63. The valid value range for the QoS group is a number from 0 to 99.
- If a QoS group value falls within both value ranges (for example, 44), the packet-marking value is copied and the packets is marked.
- If QoS group value exceeds the DSCP range (for example, 77), the packet-marking value is not be copied and the packet is not marked. No action is taken.

The **set qos-group** command cannot be applied until you create a service policy in policy-map configuration mode and then attach the service policy to an interface or ATM virtual circuit (VC).

To return to policy-map configuration mode, use the **exit** command. To return to privileged EXEC mode, use the **end** command.

Examples

This example shows how to assign DSCP 10 to all FTP traffic without any policers:

```
Device(config) # policy-map policy_ftp
Device(config-pmap) # class-map ftp_class
Device(config-cmap) # exit
Device(config) # policy policy_ftp
Device(config-pmap) # class ftp_class
Device(config-pmap-c) # set dscp 10
Device(config-pmap) # exit
```

You can verify your settings by entering the **show policy-map** privileged EXEC command.

set trace capwap ap ha

To trace the control and provisioning of wireless access point high availability, use the **set trace capwap ap ha** command.

set trace capwap ap ha [{detail | event | dump | {filter [{none [switch switch] | filter_name
[filter_value [switch switch]]}] | filteredswitchlevel {defaulttrace_level} [switch switch]}}]

Syntax Description	detail	(Optional) Specifies the wireless CAPWAP HA	letails.
	event	(Optional) Specifies the wireless CAPWAP HA e	events.
	dump	(Optional) Specifies the wireless CAPWAP HA	output.
	filter mac	Specifies the MAC address.	
	switch switch number	Specifies the switch number.	
	none	(Optional) Specifies the no filter option.	
	switch switch	(Optional) Specifies the device number.	
	filter name	Trace adapted flag filter name.	
	filter_value	(Optional) Value of the filter.	
	switch switch	(Optional) Specifies the device number.	
	filtered	Specifies the filtered traces messages.	
	switch	Specifies the switch number.	
	level	Specifies the trace level.	
	default	Specifies the unset trace level value.	
	trace_level	Specifies the trace level.	
	switch switch	(Optional) Specifies the device number.	
Command Default	None		
Command History	Release		Modification
	Cisco IOS XE Gibralt	or 16 10 1	This command was introduced.

Device# set trace capwap ap ha detail filter mac WORD switch number

set trace mobility ha

To debug the wireless mobility high availability in the , use the set trace mobility ha command.

set trace mobility ha [{event | detail | dump}] {filter[mac WORD switch switch number] [{none
[switch switch] | filter_name [filter_value [switch switch]]}] | level {defaulttrace_level} [switch
switch]{filteredswitch}}

Syntax Description	event	(Optional) Specifies the wireless mobility high availability events.
	detail	(Optional) Specifies the wireless mobility high availability details.
	dump	(Optional) Specifies the wireless mobility high availability output.
	filter	Specifies to trace adapted flag filter
	mac	Specifies the MAC address.
	WORD switch	Specifies the switch.
	switch number	Specifies the switch number. The value ranges from one to four.
	none	Specifies no trace adapted flag filter.
	switch switch	(Optional) Specifies the device number.
	filter_name	Trace adapted flag filter name.
	filter_value	Trace adapted flag filter value.
	switch switch	Specifies the device number.
	level	Specifies the trace level value.
	default	Specifies the un-set trace level value.
	trace_level	Specifies the trace level value.
	switch switch	Specifies the device number.
	filtered	Specifies the filtered trace messages.
	switch	Specifies the switch.

Command Default	None			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		
	This example shows how to display wireless mobility high availability details:			
	Device# set trace mobility ha detail filter mac Wo [08/27/13 10:38:35.349 UTC 1 8135] Inval [08/27/13 10:38:35.349 UTC 2 8135] Inval tunnels.	lid src ip: 169.254.1.1

			This command was introduced.		

Device# set trace QOS ap ha

sgt-tag

To SGT tag for a fabric profile, use the sgt-tag command.

	sgt-tag value	
Syntax Description	walue SGT tag value. Valid rang	e is 2 to 65519.
Command Default	The default SGT tag value is 0.	
Command Modes	config-wireless-fabric	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure an SGT tag value:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile fabric fabric-profile-name
Device(config-wireless-fabric)# sgt tag 8
```

To map a site tag to the AP, use the **site-tag**command.

	site-tag site-tag	-name	
Syntax Description	site-tag-name	Name of the si tag.	te
Command Default	None		
Command Modes	config-ap-tag		
Command History	Release		Modification
	Cisco IOS XE C	Gibraltar 16.10.1	This command was introduced.
Usage Guidelines	The AP will dis	connect and rejo	oin after running this command.
	Example		now to configure a site tag:

Device(config-ap-tag)# site-tag sitetag1

site-tag

snmp-server enable traps wireless

To enable wireless notifications for a host, use the snmp-server enable traps wireless command.

snmp-server enable traps wireless [AP | bsnMobileStation | MESH | bsnAutoRF | rogue | wireless_mobility | RRM | bsnGeneral]

AP	Enables wireless SNMP traps for APs
bsnMobileStation	Enables wireless client traps
MESH	Enables wireless mesh traps
bsnAutoRF	Enables wireless RF related traps
rogue	Enables traps for wireless rogue
wireless_mobility	Enables traps for wireless mobility
RRM	Enables traps for wireless RRM
bsnGeneral	Enables general controller traps
None	
Global Configuration	n (config)

C	ple shows how to enable wireless notif
Device# snmp-serv	er enable traps wireless MESH
	bsnMobileStation MESH bsnAutoRF rogue wireless_mobility RRM bsnGeneral None Global Configuration Release Cisco IOS XE Benga The following example

snmp-server group

To configure a new Simple Network Management Protocol (SNMP) group, use the **snmp-server group** command in global configuration mode. To remove a specified SNMP group, use the **no** form of this command.

```
snmp-server group group-name \{v1 | v2c | v3\} [access [ipv6 named-access-list] [\{acl-numberacl-name\}]] [context context-name] [notify notify-view] [read read-view] [write write-view]
```

no snmp-server group group-name $\{v1 \mid v2c \mid v3 \mid auth \mid noauth \mid priv\}\}$ [context context-name]

Syntax Description	group-name	Name of the group.
	v1	Specifies that the group is using the SNMPv1 security model. SNMPv1 is the least secure of the possible SNMP security models.
	v2c	Specifies that the group is using the SNMPv2c security model.
		The SNMPv2c security model allows informs to be transmitted and supports 64-character strings.
	v3	Specifies that the group is using the SNMPv3 security model.
		SMNPv3 is the most secure of the supported security models. It allows you to explicitly configure authentication characteristics.
	context	(Optional) Specifies the SNMP context to associate with this SNMP group and its views.
	context-name	(Optional) Context name.
	read	(Optional) Specifies a read view for the SNMP group. This view enables you to view only the contents of the agent.
	read-view	(Optional) String of a maximum of 64 characters that is the name of the view.
		The default is that the read-view is assumed to be every object belonging to the Internet object identifier (OID) space (1.3.6.1), unless the read option is used to override this state.
	write	(Optional) Specifies a write view for the SNMP group. This view enables you to enter data and configure the contents of the agent.
	write-view	(Optional) String of a maximum of 64 characters that is the name of the view.
		The default is that nothing is defined for the write view (that is, the null OID). You must configure write access.
	notify	(Optional) Specifies a notify view for the SNMP group. This view enables you to specify a notify, inform, or trap.

	notify-view	(Optional) String of a maximum of 64 characters that is the name of the view.
		By default, nothing is defined for the notify view (that is, the null OID) until the snmp-server host command is configured. If a view is specified in the snmp-server group command, any notifications in that view that are generated will be sent to all users associated with the group (provided a SNMP server host configuration exists for the user).
		Cisco recommends that you let the software autogenerate the notify view. See the "Configuring Notify Views" section in this document.
	access	(Optional) Specifies a standard access control list (ACL) to associate with the group.
	ipv6	(Optional) Specifies an IPv6 named access list. If both IPv6 and IPv4 access lists are indicated, the IPv6 named access list must appear first in the list.
	named-access-list	(Optional) Name of the IPv6 access list.
	acl-number	(Optional) The <i>acl-number</i> argument is an integer from 1 to 99 that identifies a previously configured standard access list.
	acl-name	(Optional) The <i>acl-name</i> argument is a string of a maximum of 64 characters that is the name of a previously configured standard access list.
Command Default	No SNMP server gr	roups are configured.
Command Modes	Global configuration	n (config)

For information about specifying a Message Digest 5 (MD5) occumentation of the snmp-server user command. w Views tion is available for two reasons: a notify view that is set using SNMP, you may need to change the notify view. wer host command may have been configured before the snmp-server group command.

• Modifying the group's notify view will affect all users associated with that group.

Instead of specifying the notify view for a group as part of the **snmp-server group** command, use the following commands in the order specified:

- 1. snmp-server user -- Configures an SNMP user.
- 2. snmp-server group -- Configures an SNMP group, without adding a notify view .
- **3.** snmp-server host -- Autogenerates the notify view by specifying the recipient of a trap operation.

SNMP Contexts

SNMP contexts provide VPN users with a secure way of accessing MIB data. When a VPN is associated with a context, that VPN's specific MIB data exists in that context. Associating a VPN with a context enables service providers to manage networks with multiple VPNs. Creating and associating a context with a VPN enables a provider to prevent the users of one VPN from accessing information about users of other VPNs on the same networking device.

Use this command with the **context** *context-name* keyword and argument to associate a read, write, or notify SNMP view with an SNMP context.

Create an SNMP Group

The following example shows how to create the SNMP server group "public," allowing read-only access for all objects to members of the standard named access list "Imnop":

Device(config) # snmp-server group public v2c access lmnop

Remove an SNMP Server Group

The following example shows how to remove the SNMP server group "public" from the configuration:

Device(config) # no snmp-server group public v2c

Associate an SNMP Server Group with Specified Views

The following example shows SNMP context "A" associated with the views in SNMPv2c group "GROUP1":

```
Device(config) # snmp-server context A
Device(config) # snmp mib community commA
Device(config) # snmp mib community-map commA context A target-list commAVpn
Device(config) # snmp-server group GROUP1 v2c context A read viewA write viewA notify viewB
```

snmp-server subagent cache

To prevent CPU spikes in the controller during Simple Network Management Protocol (SNMP) polling, use the **snmp-server subagent cache** command. To disable the subagent cache, use the **no** form of this command.

snmp-server subagent cache [timeout seconds]

snmp-server subagent cache [timeout seconds]

Syntax Description	timeout Specifie	s the subagent cache timeout.	
	seconds The serv	er timeout value, in seconds. The valid	values range from 1 to 100, with a default of 60.
Command Default	None		
Command Modes	Global configuration	n (config)	
Command History	Release	Modification	
	Cisco IOS XE Dubl	in 17.11.1 This command was introduced.	
Usage Guidelines	Use this command t	o prevent CPU spikes in the controller	by clearing the cache at regular intervals.
Examples	The following exam	ple shows how to prevent CPU spikes	in the controller during SNMP polling:
	Device# configure Device(config)# s	e terminal snmp-server subagent cache	

software auto-upgrade enable

To enable Auto-Upgrade feature, use the software auto-upgrade enable command.

-		using the no form of the command, you need to manually at mand in priveledged EXEC mode.	ito-upgrade using the
	software auto-upgrade enable	e	
Syntax Description	This command has no keyword	ds or arguments.	
Command Default	None		
Command Modes	Global Configuration		
Command History	Release	Modification	
	Cisco IOS XE Bengaluru 17.5.1	1 This command was introduced.	
Usage Guidelines	— This example shows how to ena	able Auto-Upgrade feature:	
	Device# configure terminal Device(config)# software a Device(config)# end	1	

source-interface

To configure the source interface to communicate with the controller, use the **source-interface** command. To remove the source interface, use the **no** form of this command.

source-interface interface-name interface-number

no source-interface

Syntax Description	interface-name	Name of the interface.		
	interface-number	Interface number.		
Command Default	Source interface is	s not configured.		
Command Modes	SD Service Contro	oller Configuration	(config-sd-service-con	troller)
Command History	Release	Мо	dification	
	Cisco IOS XE Cu	pertino 17.7.1 This intro	s command was oduced.	
Examples	The following exa controller:	mple shows how to	o configure the source	interface to communicate with the
	Device (config) # Device (config-s	tion commands, c avc sd-service d-service)# cont	ne per line. End wi roller ller)# source-inter	

ssid broadcast persistent

To enable the SSID broadcast mode, use the **ssid broadcast persistent** command. Use the **no** form of the command to disable the feature.

ssid broadcast persistent

no ssid broadcast persistent

Syntax Description	This command has no keywords	or arguments.
Command Default	None	
Command Modes	AP profile configuration (config	g-ap-profile)
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.
Usage Guidelines	Enabling or disabling this featur	re causes the AP to re-join.
Examples	The following example shows h	ow to enable the SSID broadcast mode:
	Device# configure terminal Device(config)# ap profile Device(config-ap-profile)#	

static-ip-mobility

To configure static IP mobility, use the **static-ip-mobility** command in wireless-policy configuration mode. To disable the configuration, use the **no** form of this command.

static-ip-mobility

Syntax Description	This command has no argument	ts or keywords.
Command Default	None	
Command Modes	wireless-policy configuration m	node
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

This example shows how to enable static IP mobility:

Device# configure terminal Device(config)# wireless profile policy test-policy Device(config-wireless-policy)# static-ip-mobility

Configuration Commands: g to z

statistics ap-system-monitoring alarm-enable

To enable alarms for AP real-time statistics (CPU and Memory), use the **statistics ap-system-monitoring alarm-enable** command. Use the **no** form of this command to disable the feature.

[no] statistics ap-system-monitoring alarm-enable

Syntax Description	statistics	Configures the AP statistics.
	ap-system-monitoring alarm-en	nable Enables alarms for AP real-time statistics (CPU and Memory).
Command Default	None	
Command Modes	AP Profile Configuration (config-	-ap-profile)
Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.

Example

The following example shows how to enable alarms for AP real-time statistics (CPU and Memory):

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring alarm-enable

statistics ap-system-monitoring alarm-hold-time

To define the hold time interval before triggering the alarm, use the **statistics ap-system-monitoring alarm-hold-time** command.

statistics ap-system-monitoring alarm-hold-time 0-3600

Syntax Description	statistics	Configures the A	P statistics.
	ap-system-monitoring alarm-	hold-time Enables alarms fo	or AP real-time statistics (CPU and Memory).
	0-3600	Specifies the alar	m hold time interval in seconds.
Command Default	None		
Command Modes	AP Profile Configuration (config	g-ap-profile)	
Command History	Release	Modification	_
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.	
			—

Example

The following example shows how to define the hold time interval before triggering the alarm:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring alarm-hold-time 60

statistics ap-system-monitoring alarm-retransmit-time

To define the interval between retransmissions of the trap alarm, use the **statistics ap-system-monitoring alarm-retransmit-time**

statistics ap-system-monitoring alarm-retransmit-time 0-65535

statistics	Configures the AP statistics.
ap-system-monitoring alarm-retransmit-time	Define the interval between retransmissions of the trap alarm.
0-65535	Specifies the interval between retransmissions of the trap alarm, in seconds.
None	
AP Profile Configuration (config	g-ap-profile)
Release	Modification
Cisco IOS XE Bengaluru 17.5.1	This command was
	alarm-retransmit-time 0-65535 None AP Profile Configuration (configuration (configuration))

Example

The following example shows how to define the interval between retransmissions of the trap alarm:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring alarm-retransmit-time 60

statistics ap-system-monitoring cpu-threshold

To define the threshold precentage for CPU usage on the AP to trigger alarms, use the **statistics ap-system-monitoring cpu-threshold** command.

statistics ap-system-monitoring cpu-threshold ()-1()0
-------------------------------------------------	------	----

Syntax Description	statistics	Configures the AP statis	stics.
	ap-system-monitoring cpu-thr	reshold Defines the threshold for	or CPU usage on AP to trigger alarms.
	0-100	Specifies the percentage alarms.	of threshold for CPU usage on AP to trigger
Command Default	None		
Command Modes	AP Profile Configuration (config-ap-profile)		
Command History	Release	Modification	
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.	

Example

The following example shows how to define the threshold precentage for CPU usage on the AP to trigger alarms:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring cpu-threshold 70

statistics ap-system-monitoring enable

To enable monitoring of AP real-time statistics (CPU and Memory), use the **statistics ap-system-monitoring enable** command. Use the **no** form of this command to disable the feature.

[no] statistics ap-system-monitoring enable

Syntax Description	statistics	Configures the AP statistics.
	ap-system-monitoring enable	Enables monitoring of AP real-time statistics (CPU and Memory)
Command Default	None	
Command Modes	AP Profile Configuration (config-ap-profile)	
Command History	Release	Modification
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.

Example

The following example shows how to enable monitoring of AP real-time statistics (CPU and Memory):

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring enable

statistics ap-system-monitoring mem-threshold

To define the threshold percentage for memory usage on the AP, to trigger alarms.

statistics ap-system-monitoring mem-threshold 0-100

Syntax Description	statistics	Configures the AP stat	istics.
	ap-system-monitoring mem-th	reshold Defines the threshold f	for memory usage on AP to trigger alarms.
	0-100	Specifies the percentag trigger alarms.	e of threshold for memory usage on AP to
Command Default	None		
Command Modes	AP Profile Configuration (config-ap-profile)		
Command History	Release	Modification	-
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.	-
			-

Example

The following example shows how to define the threshold precentage for memory usage on the AP to trigger alarms:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring mem-threshold 60

statistics ap-system-monitoring sampling-interval

To define the sampling interval, use the statistics ap-system-monitoring sampling-interval

statistics ap-system-monitoring sampling-interval 2-900

Syntax Description	statistics	Configures the AP statistics.	
	ap-system-monitoring sampli	ng-interval Defines the sampling interval.	
	2-900	Specifies the sampling interval, in seconds.	
Command Default	None		
Command Modes	AP Profile Configuration (config-ap-profile)		
Command History	Release	Modification	
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.	
	Cisco IOS XE Bengaluru 17.5.1		

Example

The following example shows how to define the sampling interval:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring sampling-interval 100

statistics ap-system-monitoring stats-interval

To define the statistics interval, which gives more weight in the calculations to the statistics received in the last statistic interval seconds, use the **statistics ap-system-monitoring stats-interval**

 statistics ap-system-monitoring stats-interval
 120-900

 Syntax Description
 statistics

 Configures the AP statistics.

 ap-system-monitoring stats-interval

 Defines the statistics interval which gives more weight in the

	ap-system-monitoring stats-intervar	calculations to the statistics received in the last statistic interval seconds.
	120-900	Specifies the statistics interval, in seconds.
Command Default	None	

Command Modes AP Profile Configuration (config-ap-profile)

Command History	Release	Modification		
	Cisco IOS XE Bengaluru 17.5.1	This command was introduced.		

Example

The following example shows how to define the statistics interval:

Device(config)# ap profile default-ap-profile Device(config-ap-profile)# statistics ap-system-monitoring stats-interval 120 m

1 0

1.

.1

1 00

. ..

stopbits

	To configure the stop bits for the console port, use the stopbits command. To revert to the default values, use the no form of this command.		
	stopbits { <i>1</i> <i>2</i> }		
	no stopbits $\{1 \mid 2\}$		
Syntax Description	1 Specifies one stop bit.		
	2 Specifies two stop bits.		
Command Default	1 stop bit		
Command Modes	Line configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	
Usage Guidelines	You can configure the console ports only from a session on the console port.		
Examples	The following example shows how to configure the stop bits for the console port:		
	Device# configure terminal Device(config)# line console 0 Device(config-line)# stopbits 1		

switchport

To put an interface that is in Layer 3 mode into Layer 2 mode for Layer 2 configuration, use the **switchport** command in interface configuration mode. To put an interface in Layer 3 mode, use the **no** form of this command.

switchport no switchport

Syntax Description	Thi	This command has no arguments or keywords.		
Command Default	By	By default, all interfaces are in Layer 2 mode.		
Command Modes	Inte	erface configuration		
Command History	Re	lease	Modification	
	Ci	sco IOS XE Gibraltar 16.10.1	This command was introduced.	
Usage Guidelines		erase all Layer 2 configurations. You must use t	ters) to set the interface to the routed-interface status and his command before assigning an IP address to a routed	
	Note	This command is not supported on devices ru	nning the LAN Base feature set.	
	Entering the no switchport command shuts the port down and then reenables it, which might generate mess on the device to which the port is connected. When you put an interface that is in Layer 2 mode into Layer 3 mode (or the reverse), the previous configur- information related to the affected interface might be lost, and the interface is returned to its default configuration.		down and then reenables it, which might generate messages	
-	Note	• •	face, you must first enter the switchport command to configure ter the switchport access vlan and switchport mode commands.	
	The switchport command is not used on platforms that do not support Cisco-routed ports. All physical ports on such platforms are assumed to be Layer 2-switched interfaces.			
	You	a can verify the port status of an interface by ente	ring the show running-config privileged EXEC command.	
Examples	This example shows how to cause an interface to cease operating as a Layer 2 port and become a Cisco-routed port:			
	Dee	iss (see fig. if) # as suitsback		

Device(config-if) # no switchport

This example shows how to cause the port interface to cease operating as a Cisco-routed port and convert to a Layer 2 switched interface:

Device(config-if) # switchport

switchport access vlan

To configure a port as a static-access port, use the **switchport access vlan** command in interface configuration mode. To reset the access mode to the default VLAN mode for the device, use the **no** form of this command.

switchport access vlan {vlan-id }
no switchport access vlan

Syntax Description	vlan-id VLAN ID of the access mode VLAN; the range is 1 to 4094.		
Command Default	The default access VLAN and trunk interface or interface hardware.	native VLAN is a default VLAN corresponding to the platform	
Command Modes	Interface configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	
Usage Guidelines	The port must be in access mode before the s	witchport access vlan command can take effect.	
	If the switchport mode is set to access vlan <i>vlan-id</i> , the port operates as a member of the specif An access port can be assigned to only one VLAN.		
	The no switchport access command resets the device.	ne access mode VLAN to the appropriate default VLAN for the	
Examples	This example shows how to change a switch operate in VLAN 2 instead of the default VL Device (config-if) # switchport access		

L

switchport mode

To configure the VLAN membership mode of a port, use the **switchport mode** command in interface configuration mode. To reset the mode to the appropriate default for the device, use the **no** form of this command.

switchport mode {access | dynamic | {auto | desirable} | trunk} noswitchport mode {access | dynamic | {auto | desirable} | trunk}

Syntax Description	access	Sets the port to access mode (either static-acces	ss or dynamic-access depending on the	
		setting of the switchport access vlan interface set to access unconditionally and operates as a n sends and receives nonencapsulated (non-tagged to only one VLAN.	nontrunking, single VLAN interface that	
	dynamic auto	Sets the port trunking mode dynamic parameter convert the link to a trunk link. This is the defau	1 1	
	dynamic desirable	Sets the port trunking mode dynamic parameter to desirable to specify that the interface actively attempt to convert the link to a trunk link.		
	trunk	Sets the port to trunk unconditionally. The port is a trunking VLAN Layer 2 interface. The port sends and receives encapsulated (tagged) frames that identify the VLAN of origination. A trunk is a point-to-point link between two devices or between a device and a router.		
Command Default	The default mode is dynamic auto .			
Command Modes	Interface configuration			
Command History	Release		Modification	
	Cisco IOS XE G	ibraltar 16.10.1	This command was introduced.	
	_			

Note Although visible in the CLI, the dot1q-tunnel keyword is not supported.

A configuration that uses the **access**, or **trunk** keywords takes effect only when you configure the port in the appropriate mode by using the switchport mode command. The static-access and trunk configuration are saved, but only one configuration is active at a time.

When you enter access mode, the interface changes to permanent nontrunking mode and negotiates to convert the link into a nontrunk link even if the neighboring interface does not agree to the change.

When you enter **trunk** mode, the interface changes to permanent trunking mode and negotiates to convert the link into a trunk link even if the interface connecting to it does not agree to the change.

When you enter **dynamic auto** mode, the interface converts the link to a trunk link if the neighboring interface is set to **trunk** or **desirable** mode.

When you enter **dynamic desirable** mode, the interface becomes a trunk interface if the neighboring interface is set to **trunk**, **desirable**, or **auto** mode.

To autonegotiate trunking, the interfaces must be in the same VLAN Trunking Protocol (VTP) domain. Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP), which is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly, which could cause misconfigurations. To avoid this problem, configure interfaces connected to devices that do not support DTP to not forward DTP frames, which turns off DTP.

- If you do not intend to trunk across those links, use the **switchport mode access** interface configuration command to disable trunking.
- To enable trunking to a device that does not support DTP, use the **switchport mode trunk** and **switchport nonegotiate** interface configuration commands to cause the interface to become a trunk but to not generate DTP frames.

Access ports and trunk ports are mutually exclusive.

The IEEE 802.1x feature interacts with switchport modes in these ways:

- If you try to enable IEEE 802.1x on a trunk port, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to trunk, the port mode is not changed.
- If you try to enable IEEE 802.1x on a port set to **dynamic auto** or **dynamic desirable**, an error message appears, and IEEE 802.1x is not enabled. If you try to change the mode of an IEEE 802.1x-enabled port to **dynamic auto** or **dynamic desirable**, the port mode is not changed.
- If you try to enable IEEE 802.1x on a dynamic-access (VLAN Query Protocol [VQP]) port, an error message appears, and IEEE 802.1x is not enabled. If you try to change an IEEE 802.1x-enabled port to dynamic VLAN assignment, an error message appears, and the VLAN configuration is not changed.

You can verify your settings by entering the **show interfaces** *interface-id* **switchport** privileged EXEC command and examining information in the *Administrative Mode* and *Operational Mode* rows.

Examples

This example shows how to configure a port for access mode:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode access
```

This example shows how set the port to dynamic desirable mode:

```
Device (config) # interface gigabitethernet2/0/1
Device (config-if) # switchport mode dynamic desirable
```

This example shows how to configure a port for trunk mode:

```
Device(config)# interface gigabitethernet2/0/1
Device(config-if)# switchport mode trunk
```

To configure a policy tag for an AP filter, use the tag rf command.

	tag rf rf-tag	
Syntax Description	<i>rf-tag</i> RF tag name.	
Command Default	None	
Command Modes	config-ap-filter	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure a policy tag for an AP filter:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ap filter name ap-filter-name
Device(config-ap-filter)# rf tag rf-tag-name
```

tag site

To configure a site tag for an AP filter, use the tag site site-tag command.

	tag site site-tag		
Syntax Description	site-tag	Name of the site tag.	
Command Default	None		
Command Modes	config-ap-filter		
Command History	tory Release Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure a site tag for an AP filter:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# ap filter name ap-filter-name
Device(config-ap-filter)# site tag site-tag-name
```

terms-conditions

To configure the terms and conditions parameters for a Access Network Query Protocol (ANQP) server, use the **terms-conditions** command. To disable the terms and conditions, use the **no** form of this command.

terms-conditions { filename filename | timestamp date time | urlfilter list url-filter-list }

Syntax Description	filename	Name of the term	s and conditions file.	
	date	Timestamp date, i	n yyyy-mm-dd format.	
	time	Timestamp time,	in hh:mm:ss format.	
	url-filter-list	Name of the URI	L filter list.	
Command Default	Terms and cor	nditions are not con	figured.	
Command Modes	Wireless ANQ	P Server Configur	ation (config-wireless-	anqp-server)
Command History	Release		Modification	
	Cisco IOS XE	Amsterdam 17.3.1	This command was introduced.	

Example

The following example shows how to configure the timestamp:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# terms-conditions timestamp 2020-02-20 20:20:20

tertiary (ap prime)

To configure a tertiary controller for AP fallback, use the **tertiary** command. To remove the tertiary controller from being used for AP priming, use the **no** form of this command.

tertiary controller-name ip-address

no tertiary controller-name ip-address

Syntax Description	controller-name	Name of the	e tertiary controller.	
	ip-address	IPv4 or IPv	6 address of the controller.	
Command Default	None			
Command Modes	AP prime configur	ation (config	-priming)	
Command History	Release		Modification	
	Cisco IOS XE Cup	pertino 17.9.2	This command was introduced.	
Examples	The following exa	mple shows h	now to configure a tertiary c	ontroller for AP fallback
	Device# configu Device(config)#		rofile ap priming Prime-	-FX

Device (config-priming) # tertiary cccc 209.165.201.4

timezone delta

To configure timezone offset for an AP, use the **timezone delta** command. To remove the timezone offset for an AP, use the **no timezone** command.

timezone delta hour offset-hour minute offset-minute

Syntax Description	hour offset-hour	Local hour difference from Coordinated Universal Time (UTC). Valid range is from -12 to 14.		
	minute offset-minute Local minute difference from UTC. Valid range is from 0 to 59.			
Command Default	AP timezone is not se	et.		
Command Modes	AP profile configurat	tion (config-ap-profile)		
Command History	Release	Modification	-	
	Cisco IOS XE Benga	luru 17.6.1 This command was introduced.	-	
Usage Guidelines	-	timezone, either apply the current controll	ou cannot configure the AP timezone for each er timezone or the time difference. By default,	
Examples	The following examp	ble shows how to configure timezone offse	et for AP:	
	Device# configure Device(config)# ap Device(config-ap-p		inute 2	

timezone use-controller

To configure AP timezone using the controller timezone, use the **timezone use-controller** command. To remove the controller timezone, use the **no timezone** command.

timezone use-controller

Syntax Description	This command has no arguments or keywords.		
Command Default	AP timezone is not set.		
Command Modes	AP profile configuration (config	g-ap-profile)	
Command History	Release	Modification	-
	Cisco IOS XE Bengaluru 17.6.1	This command was introduced.	-
Usage Guidelines	You can configure the AP timezone only for each AP profile. You cannot configure timezone for each A To configure the timezone, you either apply the current controller timezone or use the time difference. B default, timezone is disabled.		-
Examples	The following example shows how to configure AP timezone using the controller timezone: Device# configure terminal Device(config)# ap profile test Device(config-ap-profile)# timezone use-controller		using the controller timezone:

transport application-updates

To configure transport protocols to communicate with the controller, use the **transport** command. To disable transport protocols used to communicate with the controller, use the **no** form of this command.

transport application-updates { http | https } url-prefix url-prefix-name

no transport application-updates

Syntax Description	http	Enables HTTP protocol.	
	https	Enables HTTPS protocol.	
	url-prefix	Enables URL prefix for application updates.	
	url-prefix-nan	ne URL prefix name.	
Command Default	Transport com	munication protocols are not configured.	
Command Modes	SD Service Co	ontroller Configuration (config-sd-service-control	roller)
Command History	Release	Modification	
	Cisco IOS XE	Cupertino 17.7.1 This command was introduced.	
Usage Guidelines	The transport	protocol for application updates is used only fo	r Cisco DNA Center.
Examples	The following example shows how to configure transport protocols for communicating with the controller:		
	Enter config Device(confi Device(confi	igure terminal muration commands, one per line. End wit g)# avc sd-service g-sd-service)# controller g-sd-service-controller)# transport app	h CNTL/Z. lication-updates https url-prefix cisco

transition-disable

To enable Transition Disable, use the transition-disable command.

transition-disable

Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	Global Configuration			
Command History	Release	Modification		
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.		

Usage Guidelines

This example shows how to enable Transition Disable:

Device# configure terminal Device(config)# wlan WPA3 1 WPA3 Device(config-wlan)# transition-disable Device(config-wlan)# end

trapflags ap ap-stats

To enable or disable the transmission of AP related traps, which are to be sent when the statistics are past the threshold, use the **trapflags ap ap-stats**. Use the **no** form of this command to disable the feature.

[no] trapflags ap ap-stats

Syntax Description	trapflags Enables or disables the transmission of AP related trapflags.			
	ap ap-stats Specifies the traps to be sent when the stats are past the threshold.			
Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS X	E Bengaluru 17.5.1 This command was introduced.		

Example

The following example shows how to enable or disable the transmission of AP related traps:

```
Device# configure terminal
Device(config)# trapflags ap ap-stats
```

trapflags ap broken-antenna

To enable an SNMP trap that is to be sent when antenna fails in any supported Cisco access point, use the **trapflags ap broken-antenna** command. To disable SNMP trap, use the **no** form of this command.

trapflags ap broken-antenna

no trapflags ap broken-antenna

Syntax Description This command has no keywords or arguments.			
Command Default SNMP trap is not enabled.			
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Bengaluru 17.4.1	This command was introduced.	

Usage Guidelines Antennas are coded with letters A, B, C, D, E, F, G, H, and so on. The Inter-Access Point Protocol (IAPP) report contains the letters of the antennas that are broken, and is copied to the syslog and to the SNMP trap.

Example

The following example shows how to enable a broken antenna SNMP trap:

Device# configure terminal Device(config)# trapflags ap broken-antenna

trusted-port

To configure a port to become a trusted port, use the **trusted-port** command in IPv6 snooping policy mode or ND inspection policy configuration mode. To disable this function, use the **no** form of this command.

trusted-port no trusted-port

Syntax Description This command has no arguments or keywords.

Command Default No ports are trusted.

Command Modes ND inspection policy configuration

IPv6 snooping configuration

Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

Usage Guidelines When the trusted-port command is enabled, limited or no verification is performed when messages are received on ports that have this policy. However, to protect against address spoofing, messages are analyzed so that the binding information that they carry can be used to maintain the binding table. Bindings discovered from these ports will be considered more trustworthy than bindings received from ports that are not configured to be trusted.

This example shows how to define an NDP policy name as policy1, place the switch in NDP inspection policy configuration mode, and configure the port to be trusted:

Device(config)# ipv6 nd inspection policy1
Device(config-nd-inspection)# trusted-port

This example shows how to define an IPv6 snooping policy name as policy1, place the switch in IPv6 snooping policy configuration mode, and configure the port to be trusted:

Device(config)# ipv6 snooping policy policy1
Device(config-ipv6-snooping)# trusted-port

tunnel eogre source

To configure tunnel source interface when a specific per-tunnel configuration of tunnel source is not present, use the **tunnel eogre source** command.

tunnel eogre source {gigabitethernet | loopback | vlan } interface-number

Syntax Description	<i>interface-number</i> Interface number.		
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	_
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.	-
Usage Guidelines	If a specific per-tunnel configura	ation of tunnel source is presen	- t, that one will be used

Example

This example shows how to configure tunnel source interface:

Device(config) # tunnel eogre source vlan 21

tunnel eogre heartbeat

To configure tunnel keepalive heartbeat ping parameters, use the tunnel eogre heartbeat command.

tunnel eogre heartbeat { interval interval | max-skip-count tolerable-heartbeats }

Syntax Description	interval	Heartbeat interval, in seconds.
	tolerable-heartbeats	Tolerable dropped heartbeats.
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Gibralt	ar 16.11.1 This command was introduced.

Example

This example shows how to configure tunnel keepalive heartbeat ping parameters:

Device(config) # tunnel eogre heartbeat 80

tunnel mode ethernet

To configure tunnel encapsulation method as Ethernet over GRE, use the tunnel mode ethernet command.

tunnel mode ethernet {gre {ipv4 | ipv6} [p2p] | manual }

Syntax Description	gre	Ethernet over GRE.	
	l2tpv3	L2TPv3 encapsulation.	
	p2p	Provides point-to-point encapsulation over IPv4 or IPv6.	
	manual	Manually configures L2TP parameters.	
Command Default	None		
Command Modes	Interface	configuration	
	Interface of Release	configuration Modification	
Command Modes Command History	Release		a release earlier than Cisco IOS XE

Example

This example shows how to configure tunnel encapsulation method as Ethernet over GRE:

Device(config-if)# tunnel mode ethernet gre ipv4 p2p

tunnel eogre domain

To configure EoGRE redundancy domain, use the tunnel eogre domain command.

tunnel eogre domain domain-name

Syntax Description	domain-name	Domain name.	
Command Default	None		
Command Modes	Global configur	ration	
Command History	Release		Modification
	Cisco IOS XE	Gibraltar 16.11.1	This command was introduced.

Example

This example shows how to configure EoGRE redundancy domain:

Device(config) # tunnel eogre domain domain1

tunnel eogre interface tunnel

To set the AAA-proxy key for the EoGRE tunnel interface, use the **tunnel eogre interface tunnel** command.

tunnel eogre interface tunnel *tunnel-inft-number* **aaa proxy key** {**0** | **8**}*key-string* **auth-port** *auth_port* **acct-port** *acct_port*

Syntax Description	tunnel-inft-number	Tunnel interface number.		
	aaa	AAA configuration.		
	proxy	AAA proxy configuration.		
	key	AAA proxy key configuration.		
		0-Specifies the string as an UNENCRYPTED key.		
		8-Specifies the string as an AES encrypted key.		
	key-string	String for the key.		
	auth-port auth_port Authorization port number.			
	acct-port acct_port	Accounting port number.		
Command Default	None			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS XE Gibral	Itar 16.11.1 This command was introduced.		
	Cisco IOS XE Amster	rdam 17.3.1 This command was modified. The following keywords and variables were added:		
		auth-portauth_port acct-portacct_port		
		<pre>auth-portauth_port acct-portacct_port</pre>		

Example

This example shows how to set the proxy key for the EoGRE tunnel interface:

Device(config) # tunnel eogre interface tunnel 21 aaa proxy key 0 test

This example shows how to change the AAA ports:

Device(config)# tunnel eogre interface Tunnell aaa proxy key 0 test auth-port 24 acct-port 36

L

tunneled-eap-credential

To set tunneled Extensible Authentication Protocol (EAP) credential authentication, use the **tunneled-eap-credential** command. To remove the tunneled EAP credential authentication, use the **no** form of this command.

tunneled-eap-credential {anonymous | certificate | hw-token | nfc | sim | softoken | username-password | usim }

Syntax Description	anonymous	Anonymous authentication.
	certificate	Authentication using certificate.
	hw-token	Authentication using hardware token.
	nfc	Authentication using Near-Field-Communication (NFC).
	sim	Authentication using SIM card.
	softoken	Authentication using soft token.
	username-password	Authentication using a username and password.
	usim	Authentication using USIM.
Command Default	None	
Command Modes	ANQP NAI EAP Autho	entication (config-anqp-nai-eap-aut)
Command History	Release	Modification
	Cisco IOS XE Amsterd	am 17.3.1 This command was introduced.

Example

The following example shows how to configure tunneled EAP credential authentication:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless hotspot anqp-server my_anqp
Device(config-wireless-anqp-server)# nai-realm myvenue.cisco.com
Device(config-anqp-nai-eap)# eap-method eap-aka
Device(config-anqp-nai-eap-auth)# tunneled-eap-credential anonymous
```

type

	To display the contents of one or more files, use the type command in boot loader mode.			
	type filesystem:/file-url			
Syntax Description	<i>filesystem:</i> Alias for a file system. Use flash: for the system board flash device; use usbflash0: for USB memory sticks.			
	/file-url Path (directory) and name of the files to display. Separate each filename with a space.			
Command Default	No default behavior or values.			
Command Modes	Boot loader			
Command History	Release Modification			
	Cisco IOS XE Gibraltar 16.10.1 This command was introduced.			
Usage Guidelines	Filenames and directory names are case sensitive.			
	If you specify a list of files, the contents of each file appear sequentially.			
Examples	This example shows how to display the contents of a file:			
	<pre>Device: type flash:image_file_name version_suffix: universal-122-xx.SEx version_directory: image_file_name image_system_type_id: 0x0000002 image_name: image_file_name.bin ios_image_file_size: 8919552 total_image_file_size: 11592192 image_feature: IP LAYER_3 PLUS MIN_DRAM_MEG=128 image_family: family stacking_number: 1.34 board_ids: 0x00000068 0x00000069 0x0000006a 0x0000006b info_end:</pre>			

udp-timeout

To configure timeout value for UDP sessions, use the udp-timeout command.

udp-timeout timeout_value

Syntax Description	<i>timeout_value</i> Is the timeout value for UDP sessions.		
	The range is	from 1 to 30 seconds.	
		The <i>public-key</i> and <i>resolver</i> paran with the default values. So, you r	neter-map options are automatically populated need not change them.
Command Default	None		
Command Modes	Profile configuration		
Command History	Release	Modification	_
	Cisco IOS XE Gibraltar 16.10	0.1 This command was introduced.	_
	Example		
	This example shows how to c	configure timeout value for UDP	sessions:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# parameter-map type umbrella global
Device(config-profile)# token 57CC80106C087FB1B2A7BAB4F2F4373C00247166
Device(config-profile)# local-domain dns_wl
Device(config-profile)# udp-timeout 2
Device(config-profile)# end
```

umbrella-param-map

To configure the Umbrella OpenDNS feature for WLAN, use the **umbrella-param-map** command.

umbrella-param-map umbrella-name

Syntax Description	umbrella-name	
Command Default	None	
Command Modes	config-wireless-policy	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

This example shows how to configure the Umbrella OpenDNS feature for WLAN:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy default-policy-profile
Device(config-wireless-policy)# umbrella-param-map global
Device(config-wireless-policy)# end
```

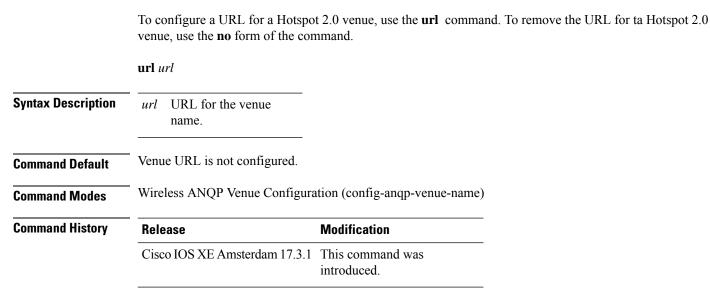

update-timer

To configure the mDNS update timers for flex profile, use the **update-timer** command. To disable the command, use the **no** form of this command.

	update-timer { service-	cache <1-100> statistics <1-100> }
	update-timer { service-	cache $<1-100>$ statistics $<1-100>$ }
Syntax Description	update-timer	Configures the mDNS update timers for flex profile.
	service-cache <1-100>	Specifies the mDNS update service-cache timer for flex profile. The default value is one minute,
	statistics <1-100>	Specifies the mDNS update statistics timer for flex profile. The default value is one minute,
Command Default	None	
Command Modes	mDNS flex profile config	uration
Command History	Release	Modification
	Cisco IOS XE Amsterdan	n 17.3.1 This command was introduced.
Examples	C 1	nows how to configure the mDNS update timers for flex profile:

url

url

Example

The following example shows how to configure a URL for a a Hotspot 2.0 venue:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless hotspot angp-server my-server
Device(config-wireless-angp-server)# venue test eng
Device(config-angp-venue-name)#url www.cisco.com
```

username

To add a user who can access the Cisco ISE-3315 using SSH, use the **username** command in configuration mode. If the user already exists, the password, the privilege level, or both change with this command. To delete the user from the system, use the **no** form of this command.

[no] username username password {hash | plain} password role {admin | user] [disabled [email email-address]] [email email-address]

For an existing user, use the following command option:

username username password role {admin | user} password

Syntax Description	username	You should enter only one word which can include hyphen (-), underscore (_) and period (.).
		Note Only alphanumeric characters are allowed at an initial setup.
	password	The command to use specify password and user role.
	password	Password character length up to 40 alphanumeric characters. You must specify the password for all new users.
	hash plain	Type of password. Up to 34 alphanumeric characters.
	role admin user	Sets the privilege level for the user.
	disabled	Disables the user according to the user's email address.
	email email-address	The user's email address. For example, user1@example.com.
	wlan-profile-name	Displays details of the WLAN profile.
Command Default	The initial user during s	etup.
Command Modes	Configuration	
Usage Guidelines	The username comman admin / user options.	d requires that the username and password keywords precede the hash / plain and the
	Example 1	
	ncs/admin(config)# u ncs/admin(config)#	sername admin password hash ###### role admin
	Example 2	
	ncs/admin(config)# u ncs/admin(config)#	sername admin password plain Secr3tp@swd role admin
	Example 3	
	ncs/admin(config)# u	username admin password plain Secr3tp0swd role admin email

I

admin123@example.com
ncs/admin(config)#

venue

To configure a 802.11u venue information, use the **venue** command. To remove the venue, use the **no** form of the command.

venue *venue-name language-code* [*venue-url*]

Syntax Description	venue-name	Name of the venue.
		Should not exceed 220 characters.
	language-code	A three character language code for the operator. Use only the first three letters of the language, in lower case, for the language code. For example, use <i>eng</i> for English.
		To see the full list of language codes, go to: http://www.loc.gov/standards/iso639-2/php/code_list.php.
	venue-url	URL of the venue.
Command Default	None	
Command Modes	Wireless ANQP	Server Configuration (config-wireless-anqp-server)
Command History	Release	Modification
	Cisco IOS XE G	bibraltar 16.12.1 This command was introduced.

Example

The following example shows how to configure 802.11u venue information:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# venue test eng cisco.com

vnid

To add a VXLAN network identifier (VNID) under the service template, use the vnid command.

Syntax Description	<i>vnid-name</i> Name of the VNID.	
	-	
Command Default	VNID is not configured.	
Command Default Command Modes	VNID is not configured. Service Template Configuration	(config-service-template
	-	n (config-service-template Modification

Examples

The following example shows how to configure a VNID:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# service-template template Device(config-service-template)# vnid vnid-name

violation

To configure stream violation policy on periodic reevaluation, use the violation command.

	violation {drop fallback}	
Syntax Description	Parameter Description	
	drop Stream will be drop	pped on periodic reevaluation.
	fallback Stream will be dem	oted to BestEffort class on periodic reevaluation.
Command Default	None	
Command Modes	config-media-stream	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.	1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure stream violation policy on periodic reevaluation:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless media-stream group my-media-group 224.0.0.0 224.0.0.223
Device(config-media-stream)# violation drop
```

I

vlan

		enter the VLAN configuration mode, use the vlan command in global configuration AN, use the no form of this command.
		<pre>ounting { input output } configuration vlan-id group word vlan-list ocation policy { ascending descending } }</pre>
Syntax Description	vlan-id	ID of the VLAN to be added and configured. The range is 1 to 4094. You can enter a single VLAN ID, a series of VLAN IDs separated by commas, or a range of VLAN IDs separated by hyphens.
	group word vlan-list	Enables creation of the VLAN group. The VLAN group name may contain up to 32 characters and must commence with a letter.
	accounting	VLAN accounting configuration.
	configuration	VLAN feature configuration mode for advanced service parameters. One or more VLANs can be created for the same settings. <i>id</i> refers to the VLAN configuration ID. For example, 1-10 or 15.
	internal	Internal VLAN allocation policy. It can be ascending or descending.
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Gibralta	r 16.10.1 This command was introduced.
	This example shows how	

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# vlan 12

vlan configuration

To enter the VLAN configuration mode to configure VLAN features, use the vlan configuration command.

	vlan configuration	
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enter the VLAN configuration mode to configure VLAN features, with the VLAN ID being 2:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# vlan configuration 2

vlan access-map

To create or modify a VLAN map entry for VLAN packet filtering, and change the mode to the VLAN access-map configuration, use the **vlan access-map** command in global configuration mode on the switch stack or on a standalone switch. To delete a VLAN map entry, use the **no** form of this command.

vlan access-map name [number]
no vlan access-map name [number]

-	Note Thi	is command is not supported on switches r	running the LAN Base feature set.		
Syntax Description	name	Name of the VLAN map.			
	number	If you are creating a VLAN map and th	map entry that you want to create or modify (0 to 65535). The sequence number is not specified, it is automatically from 10. This number is the sequence to insert to, or delete		
Command Default	There are	re no VLAN map entries and no VLAN m	aps applied to a VLAN.		
Command Modes	Global c	configuration			
Command History	Release	8	Modification		
	Cisco IO	OS XE Gibraltar 16.10.1	This command was introduced.		
Usage Guidelines	mode to to specif	VLAN access-map configuration, where y	o create or modify a VLAN map. This entry changes the you can use the match access-map configuration command match and use the action command to set whether a match		
	In VLAN access-map configuration mode, these commands are available:				
	• action—Sets the action to be taken (forward or drop).				
	• default —Sets a command to its defaults.				
	• exit—Exits from VLAN access-map configuration mode.				
	• match—Sets the values to match (IP address or MAC address).				
	• no-	-Negates a command or set its defaults.			
	When yo	ou do not specify an entry number (sequer	nce number), it is added to the end of the map.		
	There can be only one VLAN map per VLAN and it is applied as packets are received by a VLAN.				
	You can entry.	use the no vlan access-map name [num	<i>uber</i>] command with a sequence number to delete a single		

Use the vlan filter interface configuration command to apply a VLAN map to one or more VLANs.

For more information about VLAN map entries, see the software configuration guide for this release.

This example shows how to create a VLAN map named vac1 and apply matching conditions and actions to it. If no other entries already exist in the map, this will be entry 10.

```
Device(config)# vlan access-map vac1
Device(config-access-map)# match ip address acl1
Device(config-access-map)# action forward
```

This example shows how to delete VLAN map vac1:

Device(config) # no vlan access-map vac1

vlan encryption osen

To specify the VLAN that a client should use while choosing Online Subscription with Encryption (OSEN) encryption on a single SSID during the association and authentication process, use the **vlan encryption osen** command. To remove the VLAN id, use the **no** form of this command.

vlan-id vlan-id encryption osen

Syntax Description	<i>vlan-id</i> VLAN identifier.	
Command Default	VLAN ID is not configured.	
Command Modes	Wireless Policy Configuration (co	onfig-wireless-policy)
Command Modes Command History	Wireless Policy Configuration (configuration)	onfig-wireless-policy) Modification

Example

The following example shows how to configure a VLAN that a client should use when it chooses OSEN encryption on a single SSID during the association and authentication process:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy rr-xyz-policy-1
Device(config-wireless-policy)# vlan 10 encryption osen
```

vlan filter

To apply a VLAN map to one or more VLANs, use the **vlan filter** command in global configuration mode on the switch stack or on a standalone switch. To remove the map, use the **no** form of this command.

vlan filter mapname vlan-list {list | all} no vlan filter mapname vlan-list {list | all}

-	Note This c	ommand is not supported on switches	running the LAN Base feature set.	
Syntax Description	mapname	Name of the VLAN map entry.		
	vlan-list	Specifies which VLANs to apply the	e map to.	
	list	The list of one or more VLANs in the and dashes are optional. The range i	ne form tt, uu-vv, xx, yy-zz, where spaces around commas s 1 to 4094.	
	all	Adds the map to all VLANs.		
Command Default	There are n	o VLAN filters.		
Command Modes	Global cont	figuration		
Command History	Release		Modification	
	Cisco IOS	XE Gibraltar 16.10.1	This command was introduced.	
Usage Guidelines	To avoid accidentally dropping too many packets and disabling connectivity in the middle of the configuration process, we recommend that you completely define the VLAN access map before applying it to a VLAN.			
	For more information about VLAN map entries, see the software configuration guide for this release.			
	This example applies VLAN map entry map1 to VLANs 20 and 30:			
	Device(config) # vlan filter map1 vlan-list 20, 30			
	This examp	This example shows how to delete VLAN map entry mac1 from VLAN 20:		
	Device(config)# no vlan filter map1 vlan-list 20			
	You can ver	rify your settings by entering the show	v vlan filter privileged EXEC command.	

vlan group

To create or modify a VLAN group, use the **vlan group** command in global configuration mode. To remove a VLAN list from the VLAN group, use the **no** form of this command.

vlan group group-name vlan-list vlan-list no vlan group group-name vlan-list vlan-list

Syntax Description	<i>group-name</i> Name of the VLAN group. The group name may contain up to 32 characters and must begin with a letter.				
	vlan-list <i>vlan-list</i> Specifies one or more VLANs to be added to the VLAN group. The <i>vlan-list</i> argument can be a single VLAN ID, a list of VLAN IDs, or VLAN ID range. Multiple entries are separated by a hyphen (-) or a comma (,).				
Command Default	None				
Command Modes	Global configuration	n			
Command History	Release		Modification		
	Cisco IOS XE Gib	raltar 16.10.1	This command was introduced.		
Usage Guidelines			Dup command creates the group and maps the specified kists, the specified VLAN list is mapped to the group.		
	The no form of the vlan group command removes the specified VLAN list from the VLAN group. When you remove the last VLAN from the VLAN group, the VLAN group is deleted.				
	A maximum of 100 VLAN groups can be configured, and a maximum of 4094 VLANs can be mapped to a VLAN group.				
	This example shows how to map VLANs 7 through 9 and 11 to a VLAN group:				
	Device(config)# vlan group group1 vlan-list 7-9,11				
	This example shows how to remove VLAN 7 from the VLAN group:				
	Device(config)# no vlan group group1 vlan-list 7				

vlan-id

To configure a FlexConnect profile VLAN ID, use the **vlan-id** command. To remove the FlexConnect profile VLAN ID, use the **no** form of this command.

vlan-id vlan-id

Syntax Description	<i>vlan-id</i> VLAN identifier.		
Command Default	VLAN ID is not configured.		
Command Modes	Wireless Flex Profile VLAN Cor	figuration (config-wireless-flex-profile-v	lan)
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Example

The following example shows how to configure a flex profile VLAN ID:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile flex default-flex-profile
Device(config-wireless-flex-profile)# vlan-name test
Device(config-wireless-flex-profile-vlan)#vlan-id 12
```

vlan-name

To configure a FlexConnect profile VLAN, use the **vlan-name** command. To remove the FlexConnect profile VLAN, use the **no** form of this command.

vlan-name

Syntax Description	This command has no keywords or arguments.		
Command Default	VLAN is not configured.		
Command Modes	Wireless Flex Profile Configuration (config-wireless-flex-profile)		
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Example

The following example shows how to configure a FlexConnect profile VLAN:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile flex default-flex-profile Device(config-wireless-flex-profile)# vlan-name test

vrf

I

	To enable the virtual routing and forwarding (VRF) label, use the vrf command. To remove the V use the no form of this command.			
	vrf vrf-nar	ne		
	no vrf			
Syntax Description	vrf-name	Name of the VRF.		
Command Default	VRF label	is not enabled.		
Command Modes	SD Service	e Controller Configur	ation (config-sd-service-contro	oller)
Command History	Release		Modification	_
	Cisco IOS	XE Cupertino 17.7.1	This command was introduced.	_
Examples	The follow	ving example shows h	ow to enable VRF label:	
	Enter con Device(cc Device(cc	onfig)# avc sd-serv onfig-sd-service)#		CNTL/Z.

wan-metrics

To configure Hotspot 2.0 WAN metrics, use the **wan-metrics** command. Use the **no** form of the command to remove the WAN.

wan-metrics {downinksbad|downinkspeed|fulcapacity-ink|inkstatus{down|notconfigured|teststate|up}|badmasurement-duration|upinksbad|upinkspeed}

Syntax Description	downlink-load	Sets the WAN downlink load. Valid range is from 0-255. Values are scaled linearly with 255 representing 100 percent.				
	downlink-speed	Sets the WAN downlink speed, in kbps. Valid range is from 0-4294967295.				
	full-capacity-link	Operates WAN link at its maximum capacity.				
	link-status	Sets the WAN link status.				
		Options are:				
	• down: Link down					
	 not-configured: Link is not configured. 					
	• test-state: Link is in test state.					
		 up: Link is up. Sets the duration of the uplink or downlink load measurement. Valid range is from 0-65535. Sets the WAN uplink load. Valid range is from 0-255. Values are scaled linearly with 255 representing 100 percent. 				
	load-measurement-duration					
	uplink-load					
	uplink-speedSets the WAN uplink speed, in kbps. Valid range is from 0-429496729					
Command Default	None					
Command Modes	Wireless ANQP Server Configu	ration (config-wireless-anqp-server)				
Command History	Release	Modification				
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.				

Example

The following example shows how to configure Hotspot 2.0 WAN uplink speed:

Device(config)# wireless hotspot anqp-server my-server Device(config-wireless-anqp-server)# wan-metrics uplink-load 23

webauth-http-enable

To enable HTTP server for web authentication in the global parameter-map parameters mode, use the **webauth-http-enable**. Use the **no** form of the command to disable the command.

webauth-http-enable

no webauth-http-enable

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes Global parameter-map mode			
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Example

This example shows how to enable HTTP server for web authentication:

Device(config-params-parameter-map)# webauth-http-enable

wgb broadcast-tagging

To configure WGB broadcast tagging for a wireless policy profile, use the wgb broadcast-tagging command.

	wgb broadcast-tagging			
Command Default	None			
Command Modes	config-wireless-policy			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to enable WGB broadcast tagging for a wireless policy profile:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy profile-policy-name Device(config-wireless-policy)# wgb broadcast-tagging

wgb vlan

To configure WGB VLAN client support for a WLAN policy profile, use the wgb vlan command.

	wgb vlan	
Command Default	None	
Command Modes	config-wireless-policy	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to enable WGB VLAN client support for the WLAN policy profile named *wlan1-policy-profile*:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy wlan1-policy-profile
Device(config-wireless-policy)# wgb vlan
```

whitelist acl

	To configure the whitelist ACL, use the whitelist acl command.				
	<pre>whitelist acl {standard_acl_value extended_acl_value acl_name}</pre>				
Syntax Description	standard_acl_value	Specifies t	he standard access lis	st. Range is fr	om 1 to 199.
	extended_acl_value	Specifies the	he extended access lis	st. Range is fro	om 1300 to 2699.
	acl_name	Specifies t	he named access list.		
Command Default	None				
Command Modes	ET-Analytics configuration				
Command History	Release		Modification		
	Cisco IOS XE Gibral	ltar 16.10.1	This command was introduced.		
	This example shows how to enable in-active timer in the ET-Analytics configuration mode: Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device (config)# et-analytics Device (config-et-analytics)# whitelist acl				
	eta-whitelist Device((config-et- extended eta-white	-)# ip access-list		

Device(config-ext-nacl) # permit udp any any eq tftp Device(config-ext-nacl) # end

wired-vlan-range

To configure wired VLANs on which mDNS service discovery should take place, use the **wired-vlan-range** command. To disable the command, use the **no** form of this command.

	wired-vlan-range wire	ed-vlan-range-value	
Syntax Description	wired-vlan-range	Configures wired VLANs on which	mDNS service discovery should take place.
	wired-vlan-range-value	Specifies the wired VLAN range va	lue.
Command Default	None		
Command Modes	mDNS flex profile configuration		
Command History	Release	Modification	_
	Cisco IOS XE Amsterdar	m 17.3.1 This command was introduced.	_
Examples	should take place:	hows how to configure wired VLANs	
	Device(config-mdns-fl	ex-prof)# wired-vlan-range <i>range</i>	e-value

config wlan assisted-roaming

To configure assisted roaming on a WLAN, use the config wlan assisted-roaming command.

	config wlan ass	sisted-roaming {neighbor-list dual-list prediction} {enable disable} wlan_id
Syntax Description	neighbor-list	Configures an 802.11k neighbor list for a WLAN.
	dual-list	Configures a dual band 802.11k neighbor list for a WLAN. The default is the band that the client is currently associated with.
	prediction	Configures an assisted roaming optimization prediction for a WLAN.
	enable	Enables the configuration on the WLAN.
	disable	Disables the configuration on the WLAN.
	wlan_id	Wireless LAN identifier between 1 and 512 (inclusive).
Command Default	The 802.11k ne	eighbor list is enabled for all WLANs.
	By default, dua	I band list is enabled if the neighbor list feature is enabled for the WLAN.
Usage Guidelines	•	ble the assisted roaming prediction list, a warning appears and load balancing is disabled for load balancing is already enabled on the WLAN.
	The following	example shows how to enable an 802.11k neighbor list for a WLAN:
	(Cisco Contro	oller) >config wlan assisted-roaming neighbor-list enable 1

wireless aaa policy

To configure a wireless AAA policy, use the wireless aaa policy command.

 wireless aaa policy aaa-policy

 Syntax Description
 aaa-policy Name of the wireless AAA policy.

 Command Default
 None

 Command Modes
 Global configuration (config)

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure a wireless AAA policy named *aaa-policy-test*

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless aaa policy aaa-policy-test

wireless aaa policy

To configure a new AAA policy, use the wireless aaa policy command.

wireless aaa policy aaa-policy-name

Syntax Description *aaa-policy-name* AAA policy name.

Command Default None

Command ModesGlobal configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE
		Gibraltar 16.10.1.

Examples

The following example shows how to configure a AAA policy name:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless aaa policy my-aaa-policy

wireless autoqos policy-profile

To enable the **autoqos** wireless policy with an executable command, use the autoqos command. Use the **disable** command to disable wireless AutoQos.

wireless autoqos policy-profilepolicy-profile-name default_policy_profile mode { clear |
enterprise-avc | fastlane | guest | voice }

wireless autoqos disable

Syntax Description	autoqos	Configures wireless Auto QoS.				
	mode	Specifies the wireless AutoQoS mode.				
	enterprise-avc	E Enables AutoQos wireless enterprise AVC policy.				
	clear	Clears the configured wireless policy.				
	fastlane	Enables the AutoQos fastlane policy. This will disable and enable the 2.4GHz or 5GHz 802.11 network.				
	guest	Enables AutoQos wireless guest policy.				
	voice	Enables AutoQos wireless voice policy. This w 802.11 network.	ill disable and enable the 2.4GHz or 5GHz			
Command Default	None					
Command Modes	Privilege EXEC mode					
Command History	Release	Modification	-			
	Cisco IOS XE C	bibraltar 16.12.2s This command was introduced.	-			

Example

This example shows how to enable AutoQoS wireless enterprise policy:

Device# wireless autoqos policy-profile default-policy-profile mode enterprise-avc

wireless broadcast vlan

To enable broadcast support on a VLAN, use the **wireless broadcast vlan** command in global configuration mode. To disable Ethernet broadcast support, use the **no** form of the command.

wireless broadcast vlan [vlan-id] no wireless broadcast vlan [vlan-id]

 Syntax Description
 vlan-id
 (Optional) Specifies the VLAN ID to enable broadcast support to that VLAN. The value ranges from 1 to 4095.

 Command Default
 None

Command Modes	Global configuration mode	iguration mode		
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.		
Usage Guidelines	Use this command in the global of	configuration mode only.		
	This example shows how to enab	ble broadcasting on VLAN 20:		

Device(config) # wireless broadcast vlan 20

wireless client

To configure client parameters, use the wireless client command in global configuration mode.

wireless client {association limit assoc-number interval interval | band-select {client-mid-rssi rssi | client-rssi rssi | cycle-count count | cycle-threshold threshold | expire dual-band timeout | expire suppression timeout} | fast-ssid-change | max-user-login max-user-login | notification {interval time | join-failure aaathresholdpercentage | roam-failure threshold percentage} | timers auth-timeout seconds | user-timeout user-timeout}

Syntax Description	association limit assoc-number interval interval	Enables association request limit per access point slot at a given interval and configures the association request limit interval.			
		You can configure number of association request per access point slot at a given interval from one through 100.			
		You can configure client association request limit interval from 100 through 10000 milliseconds. Configures the band select options for the client.			
	band-select				
	client-mid-rssi rssi	Sets the client mid-rssi threshold for band select.			
		The minimum dBm of a client RSSI to respond to probe is between -90 and -20.			
	client-rssi rssi	Sets the client received signal strength indicator (RSSI) threshold for band select.			
		The minimum dBm of a client RSSI to respond to probe is between and -20.			
	cycle-count count	Sets the band select probe cycle count.			
		You can configure the cycle count from 1 to 10.			
	cycle-threshold threshold	Sets the time threshold for a new scanning cycle.			
		You can configure the cycle threshold from 1 to 1000 milliseconds.			
	expire dual-band timeout	Sets the timeout before stopping to try to push a given client to the 5-GHz band.			
		You can configure the timeout from 10 to 300 seconds, and the default value is 60 seconds.			
	expire suppression timeout	Sets the expiration time for pruning previously known dual-band clients.			
		You can configure the suppression from 10 to 200 seconds, and the default timeout value is 20 seconds.			
	fast-ssid-change	Enables the fast SSID change for mobile stations.			
	max-user-login max-user-login	Configures the maximum number of login sessions for a user.			

	notification	Configures notifications.		
	interval time	Configures notifications for an interval.		
		The valid time ranges from 1 to 1440 seconds.		
	join-failure aaa threshold	Configures notifications for client join failures.		
	percentage	You can configure the threshold percentage to trigger an alert. The vali threshold percentage ranges from 1 to 100.		
	roam-failure threshold	Configures notifications for client roam failures.		
	percentage	You can configure the threshold for notifications. The valid threshold percentage ranges from 1 to 100.		
	timers auth-timeout seconds	Configures the client timers.		
	user-timeout user-timeout	Configures the idle client timeout.		
Command Default	No default behavior or values.			
Command Modes	Global configuration			
Command History	Release	Modification		
Command History		Modification This command was introduced.		
Command History	Cisco IOS XE Gibraltar 16.10.1

Command History	Cisco IOS XE Gibraltar 16.10.1 Cisco IOS XE Gibraltar 16.10.1 This example shows how to set t Device# configure terminal Device(config)# wireless cl Device(config)# end	This command was introduced. This command was modified. The client-mid-rssi, notification , and fast-ssid-change keywords were added. The user-timeout keyword was deleted.		

This example shows how to suppress dual-band clients from the dual-band database after 70 seconds:

```
Device# configure terminal
Device(config)# wireless client band-select expire suppression 70
Device(config)# end
```

wireless client client-steering client-count

To set the minimum number of clients for client steering on the wireless client, use the wireless client client-steering client-count command. Use the no form of this command to disable the feature. wireless client client-steering client-count 0-200 no wireless client client-steering client-count Syntax Description 0-200 Specifies the minimum number of clients for client steering. The value range is from 0 to 200 clients. The default value is three clients. None **Command Default** Global configuration mode **Command Modes Command History** Modification Release Cisco IOS XE Cupertino 17.7.1 This command was introduced.

Example

The following example shows how to set the minimum number of clients for client steering:

Device(config)# wireless client client-steering client-count 25

wireless client client-steering min-rssi-24ghz

To set the minimum RSSI threshold value for client steering in 2.4-Ghz, use the **wireless client client-steering min-rssi-24ghz -70** command. Use the **no** form of this command to disable the feature.

wireless client client-steering min-rssi-24ghz -70

no wireless client client-steering min-rssi-24ghz -70

Syntax Description	-70 Specifies the minimum R	SSI threshold value for client steering in 2.4-GHz.
Command Default	None	
Command Modes	Global Configuration	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.

Example

The following example shows how to set the minimum RSSI threshold value for client steering in 2.4-Ghz:

Device(config) # wireless client client-steering min-rssi-24ghz -70

wireless client client-steering min-rssi-5ghz

To set the minimum RSSI threshold value for client steering in 5-Ghz, use the **wireless client client-steering min-rssi-5ghz** command. Use the **no** form of this command to disable the feature.

wireless client client-steering min-rssi-5ghz -75

no wireless client client-steering min-rssi-5ghz -75

Syntax Description -75 Specifies the minimum RSSI threshold value for client steering in 5-GHz.

Command Modes Global configuration mode

Command Default

Command History

None

 Release
 Modification

 Cisco IOS XE Cupertino 17.7.1
 This command was introduced.

Example

The following example shows how to set the minimum RSSI threshold value for client steering in 5-Ghz:

Device(config) # wireless client client-steering min-rssi-5ghz -75

wireless client client-steering util-threshold

		n difference for client steering, the no form of this command	use the wireless client client-steering to disable the feature.	
	wireless client client-steering util-threshold 0-100 no wireless client client-steering util-threshold			
Syntax Description	-	um utilization difference for cli ult value is 20 percent.	ent steering. The value range is from 0 to 100	
Command Default	None			
Command Modes	Global configuration mode			
Command History	Release	Modification		
	Cisco IOS XE Cupertino 17.7	.1 This command was introduced.		

Example

The following example shows how to set the maximum utilization difference for client steering:

Device(config)# wireless client client-steering util-threshold 20

wireless client client-steering window-size

 To set the minimum window size for client steering on the wireless client, use the wireless client client-steering window-size command. Use the no form of this command to disable the feature.

 wireless client client-steering window-size

 0-200

 no wireless client client-steering window-size

 Syntax Description

 0-200

 Specifies the minimum client steering window size. The value range is from 0 to 200 clients. The default value is three.

Command Default	None
Command Modes	Global configuration mode

Command History	Release	Modification
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.

Example

The following example shows how to set the minimum window size for client steering:

Device(config)# # wireless client client-steering window-size 25

wireless ipv6 client

To enable IPv6 for clients, use the **wireless ipv6 client** command. To disable IPv6 for clients, use the **no** form of the command.

wireless ipv6 client

no wireless ipv6 client

Syntax Description	This command has no keywords or arguments.		
Command Default	IPv6 is enabled by default.		
Command Modes	Global Config(config)		
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	

Usage Guidelines All client IPv6 traffic is dropped for a client ingress and egress on the controller. Hence, limited to local mode only. If IPv6 is disabled, then client will not get an IPv6 address. The configuration impacts only clients that associate or join after the configuration changes are made. Existing clients are not impacted. The wireless ipv6 client command is applicable only for central switching clients.

Example

The following is an example of how to enable IPv6 for clients:

Device(config)# wireless ipv6 client

wireless client ip-address deauthenticate

To deauthenticate wirelesss clients deauthenticate wirelesss clients based on their IP address, use the **wireless** client **ip-address deauthenticate** command.

wireless client ip-address ip-address deauthenticate **Syntax Description** Client IP ip-address address. None **Command Default** Privileged EXEC(#) **Command Modes Command History** Release Modification Cisco IOS XE Bengaluru 17.6.1 This command was introduced. **Examples** The following example shows how to deauthenticate wirelesss clients based on their IP address: Device# wireless client ip-address 10.2.2.2 deauthenticate

Configuration Commands: g to z

wireless client mac-address

To configure the wireless client settings, use the **wireless client mac-address** command in global configuration mode.

wireless client mac-address *mac-addr* ccx {clear-reports | clear-results | default-gw-ping | dhcp-test | dns-ping | dns-resolve hostname *host-name* | get-client-capability | get-manufacturer-info | get-operating-parameters | get-profiles | log-request {roam | rsna | syslog} | send-message *message-id* | stats-request *measurement-duration* {dot11 | security} | test-abort | test-association *ssid bssid dot11 channel* | test-dot1x [*profile-id*] *bssid dot11 channel* | test-profile {anyprofile-id}}

Syntax Description	mac-addr	MAC address of the client.			
	ccx	Cisco client extension (CCX).			
	clear-reports	Clears the client reporting information.			
	clear-results	Clears the test results on the controller.			
	default-gw-ping	Sends a request to the client to perform the default gateway ping test.			
	dhcp-test	Sends a request to the client to perform the DHCP test.			
	dns-ping	Sends a request to the client to perform the Domain Name System (DNS) server IP address ping test.			
	dns-resolve hostname <i>host-name</i>	Sends a request to the client to perform the Domain Name System (DNS) resolution test to the specified hostname.			
	get-client-capability	Sends a request to the client to send its capability information.			
	get-manufacturer-info	Sends a request to the client to send the manufacturer's information.			
	get-operating-parameters	Sends a request to the client to send its current operating parameters.			
	get-profiles	Sends a request to the client to send its profiles.			
	log-request	Configures a CCX log request for a specified client device.			
	roam	(Optional) Specifies the request to specify the client CCX roaming log			
	rsna	(Optional) Specifies the request to specify the client CCX RSNA log.			
	syslog	(Optional) Specifies the request to specify the client CCX system log.			

send-message message-id

Sends a message to the client.

Message type that involves one of the following:

- 1—The SSID is invalid
- 2—The network settings are invalid.
- 3—There is a WLAN credibility mismatch.
- 4—The user credentials are incorrect.
- 5—Please call support.
- 6—The problem is resolved.
- 7—The problem has not been resolved.
- 8—Please try again later.
- 9—Please correct the indicated problem.
- 10—Troubleshooting is refused by the network.
- 11—Retrieving client reports.
- 12—Retrieving client logs.
- 13—Retrieval complete.
- 14—Beginning association test.
- 15—Beginning DHCP test.
- 16—Beginning network connectivity test.
- 17—Beginning DNS ping test.
- 18—Beginning name resolution test.
- 19—Beginning 802.1X authentication test.
- 20—Redirecting client to a specific profile.
- 21—Test complete.
- 22—Test passed.
- 23—Test failed.
- 24—Cancel diagnostic channel operation or select a WLAN profile to resume normal operation.
- 25—Log retrieval refused by the client.
- 26-Client report retrieval refused by the client.
- 27—Test request refused by the client.
- 28—Invalid network (IP) setting.
- 29—There is a known outage or problem with the network.

Device(config) # end

wireless client syslog-detailed

To enable detailed syslogs for a client event, use the **wireless client syslog-detailed** command. To disable detailed syslogs for a client event, use the **no** form of this command.

wireless client syslog-detailed

no wireless client syslog-detailed

Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	Global configuration (#)			
Command History	Release	Modification		
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.		

Example

The following example shows how to enable detailed syslogs for client events: Device(config) # wireless client syslog-detailed

wireless client username deauthenticate

To deauthenticate wirelesss clients with a given username, use the **wireless client username deauthenticate** command.

wireless client username username deauthenticate **Syntax Description** Client username username. None **Command Default** Privileged EXEC(#) **Command Modes Command History** Modification Release Cisco IOS XE Bengaluru 17.6.1 This command was introduced. **Examples** The following example shows how to deauthenticate wirelesss clients with a given username:

Device# wireless client username Bob deauthenticate

Configuration Commands: g to z

wireless client vlan-persistent

To enable client roaming across different policy profiles, use the wireless client vlan-persistent command.

	wireless client vlan-persistent		
	no wireless client vlan-persisten		
Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Global Configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.	
Examples	The following example shows ho	w to enable client roaming	across different policy profiles:
	Device(config) # wireless cl	ient vlan-persistent	

wireless config validate

To validate whether the wireless configuration is complete and consistent (all the functional profiles and tags are defined, and all the associations are complete and consistent), use the **wireless config validate** command in privileged EXEC mode.

wireless config validate

Syntax Description	This command has no keywords	or arguments.
Command Default	None	
Command Modes	Privileged EXEC (#)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Usage Guidelines In Cisco vEWLC, the wireless configuration is built using a collection of profiles, with each profile defining a functional block. These functional blocks are defined independently and is used to realize well-defined associations through intent based work-flows in building the wireless LAN. Such flexibility of modularizing the functional blocks requires the administrator to ensure that all associations are consistent and complete.

To ensure completeness and consistency of the wireless configuration, a configuration validation library is used to validate the configuration definitions across tables. The **wireless config validate** exec command is introduced from this release to validate the wireless configuration and report inconsistencies, if any, using contextual error message that is visible in btrace infra and on the console (if console logging is enabled). This command calls out any inconsistencies (unresolved associations) enabling you to realize a functional wireless LAN.

Use the following command to direct the output to a file: show logging | redirect bootflash: filename .

The following set of wireless configurations are validated:

RF tag	Site tag	Policy tag	Policy profile	Flex profile
site-tag	flex-profile	wlan profile	IPv4 ACL name	VLAN ACL
poliy-tag	ap-profile	policy profile	Fabric name	ACL-policy
rf-tag			service-policy input and output name	RF Policy (5GHz and 24GHz)
			service-policy input and client output name	

Example

The following is sample output from the wireless config validate command

Device# wireless config validate

Oct 10 18:21:59.576 IST: %CONFIG_VALIDATOR_MESSAGE-5-EWLC_GEN_ERR: Chassis 1 R0/0: wncmgrd: Error in AP: fc99.473e.0a90 Applied site-tag : mysite definitiondoes not exist Oct 10 18:21:59.576 IST: %CONFIG_VALIDATOR_MESSAGE-5-EWLC_GEN_ERR: Chassis 1 R0/0: wncmgrd: Error in AP: fc99.473e.0a90 Applied policy-tag : mypolicy definition does not exist Oct 10 18:21:59.576 IST: %CONFIG_VALIDATOR_MESSAGE-5-EWLC_GEN_ERR: Chassis 1 R0/0: wncmgrd: Error in AP: fc99.473e.0a90 Applied policy-tag : mypolicy definition does not exist Oct 10 18:21:59.576 IST: %CONFIG_VALIDATOR_MESSAGE-5-EWLC_GEN_ERR: Chassis 1 R0/0: wncmgrd: Error in AP: fc99.473e.0a90 Applied rf-tag : myrf definition does not exist

wireless country

To configure one or more country codes for a device, use the wireless country command.

	wireless country country-code	
Syntax Description	<i>country-code</i> Two-letter country code.	
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 17.3.1	This command was introduced.
Usage Guidelines	select the proper country code. Following installation	rator or qualified IT professional and the installer must on, access to the unit should be password protected by the puirements and to ensure proper unit functionality. See the odes and regulatory domains.
	This example shows how to configure country code Device (config) # wireless country IN	e on the device to IN (India):

wireless exclusionlist mac address

To manually add clients to the exclusionlist, use the wireless exclusion list command. To remove the manual entry, use the no form of the command.

wireless exclusionlist mac_address description

Syntax Description	description <i>value</i> Configures the entry description.
Command Default	None
Command Modes	Global Configuration
Command History	Cisco IOS XE Gibraltar 16.10.1 Modification
	This command was introduced in this release.
Usage Guidelines	If a client was added to the exclusion list dynamically, the command to remove it is wireless client mac-address

xxxx.xxxx deauthenticate from enable mode.

Example

This example shows how to manage exclusion entries: Device(config) # wireless exclusion list xxxx.xxxx

wireless fabric control-plane

To configure a control plane name applicable to the wireless fabric mode, use the **wireless fabric control-plane** command.

wireless fabric control-plane control-plane-name

Syntax Description	control-plane-name Control plane name that is applicable to the wireless fabric mode.			
Command Default	None			
Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		
Usage Guidelines	If you do not provide a control j	plane name, the default-control-plane, which is auto-generated, is used.		
	Examples			

The following example shows how to configure a control plane name:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless fabric control-plane test-control-plane

wireless fabric

To enable SD-Access Wireless globally on the controller, use the wireless fabric command.

wireless fabric

Command Default None

Command Modes Global configuration

Command	History	Re
---------	---------	----

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

This example shows how to enable SD-Access wireless globally on the controller:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless fabric

wireless fabric name

To configure wireless fabric name VXLAN ID (VNID) map, use the wireless fabric name command.

wireless fabric [control-plane control-plane-name] | [name vnid-map-name l2-vnid id {control-plane control-plane-name | l3-vnid id } ip {ipv-addr netmask-addr | ipv6-addr netmask-addr} [{control-plane control-plane-name] }]

Syntax Description	control-plane control-plane-	<i>me</i> Configure the control plan	Configure the control plane details.Configure the wireless fabric nameConfigure the Layer 2 VNID. Valid range is 0 to 16777215.	
	name vnid-map-name	Configure the wireless fal		
	l2-vnid id	Configure the Layer 2 VN		
	13-vnid id	Configure the Layer 3 VN	ID. Valid range is 0 to 16777215.	
	ip { <i>ipv4-addr netmask-addr</i> <i>netmask-addr</i> }	<i>w6-addr</i> IP address and netmask ad	ddress details.	
Command Default	None			
Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.	This command was introduced in a release Gibraltar 16.10.1.	e earlier than Cisco IOS XE	

Examples

The following example shows how to configure MAP server per VNID for Layer 2 and Layer 3:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless fabric name vnid-map 12-vnid 2 13-vnid 10 ip 209.165.200.224
255.255.255.224
```

wireless hotspot anqp-server

To configure a wireless Hotspot 2.0 Access Network Query Protocol (ANQP) server, use the **wireless hotspot** anqp-server command. To disable the Hotspot 2.0 server, use the **no** form of the command.

wireless hotspot anqp-server server-name

wireless hotspot anqp-server server-name type open-roaming

Syntax Description	server-name	Name of the Hotspot 2.0 ANQP server.	
	type	ANQP server type.	
	open-roaming	g Open roaming type.	

Command Default None

Command Modes Global Configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.
	Cisco IOS XE Amsterdam 17.2.1	This command was modified. The type and open-roaming keywords were introduced.

Example

The following example shows how to configure a Hotspot 2.0 ANQP server:

Device(config)# wireless hotspot anqp-server my-server

The following example shows how to configure a Hotspot 2.0 ANQP server with open roaming:

Device(config) # wireless hotspot anqp-server my-server type open-roaming

wireless hotspot gas-rate-limit

To limit the maximum number of Generic Advertisement Services (GAS) or Access Network Query Protocol (ANQP) requests processed per second, use the **wireless hotspot gas-rate-limit** command. To disable the limit, use the **no** form of the command.

wireless hotspot gas-rate-limit limit

Syntax Description	<i>limit</i> Number of GAS or ANQ	QP requests to process, per second. Valid range is from 1-2500
Command Default	None	
Command Modes	Global Configuration (config)	
Command History	Release	Modification

Example

The following example shows how to limit the maximum number of GAS or ANQP requests processed per second:

Device(config) # wireless hotspot gas-rate-limit 100

wireless hotspot icon

To configure an icon for Hotspot 2.0, use the **wireless hotspot icon** command. To remove the icon, use the **no** form of the command.

wireless hotspot icon { bootflash:filename | flash:filename } media-type language-code icon-width icon-height

Syntax Description	<i>media-type</i> Media type for this icon file.			
		Note	The icon file should match the t	ypes defined in:
		I	http://www.iana.org/assignment	s/media-types/index.html
	<i>language-code</i> A three character language code for the operator. Use only the first language, in lower case, for the language code. For example, use <i>en</i>			5
	To see the full list of language codes, go to: http://www.loc.gov/standards/iso639-2/php/code_list.php.			
	<i>icon-width</i> Icon width, in pixels. Valid range is from 0-65535.			
	icon-height	Icon height, i	in pixels. Valid range is from 0-	65535.
Command Default	None			
Command Modes	Global Configura	ation (config)		
Command History	Release		Modification	_
	Cisco IOS XE G	ibraltar 16.12.1	This command was	_

Example

The following example shows how to configure an icon for Hotspot 2.0:

Device(config)# wireless hotspot icon flash:test jpeg en 655 400

I

wireless ipv6 nd ns-forward

To enable the forwarding of neighbor solicitation (NS) message to wireless clients, use the **wireless ipv6 nd ns-forward** command. To disable the feature, use the **no** form of this command.

wireless ipv6 nd ns-forward

no wireless ipv6 nd ns-forward

Syntax Description	This command has no arguments or keywords.

Command Default None

Command Modes Global configuration (config)

Release

Command History

Modification

Cisco IOS XE Cupertino 17.9.2 This command is supported from Cisco IOS XE Cupertino 17.9.2 onwards.

Example

The following example shows how to enable the forwarding of neighbor solicitation (NS) message to wireless clients:

Device(config) # wireless ipv6 nd ns-forward

wireless ipv6 ra wired

To enable the forwarding of Router Advertisement message to the wired clients, use the **wireless ipv6 ra wired** command.

wireless ipv6 ra wired { nd { na-forward | ns-forward } | ra-wired }

Syntax Description	nd	Configures wireless IPv6 ND parameters.		
	na-forward	Enables forwarding of Neighbor Advertisement to wireless clients.		
	ns-forward	Enable forwarding of Neighbor Solicitation to wireless clients.		
	ra	Configures wireless IPv6 Router Advertisement parameters.		
	wired Enables forwarding of Router Advertisement message to the wired clients.			
Command Default	None			
Command Modes	Global Configuration (config)			
Command History	Release	Modification		
	Cisco IOS X	E Gibraltar 16.12.3 This command was introduced.		

Example

The following example shows how to enable the forwarding of Router Advertisement message to the wired clients:

Device(config) # wireless ipv6 ra wired

Warning The **wireless ipv6 ra wired** command must be enabled only for certification purpose and not during the deployment.

wireless load-balancing

To globally configure aggressive load balancing on the controller, use the **wireless load-balancing** command in global configuration mode.

wireless load-balancing {denial denial-count | window client-count}

Syntax Description	denial denial-count	Specifies the number of association den	ials during load balancing.			
		Maximum number of association denial the default value is 3.	s during load balancing is from 1 to 10 and			
	window <i>client-count</i> Specifies the aggressive load balancing client window, with the number of clients needed to trigger aggressive load balancing on a given access point.					
		Aggressive load balancing client window with the number of clients is from 0 to 2 and the default value is 5.				
Command Default	Disabled.					
Command Modes	Global configuration					
Command History	Release	Modification				
	Cisco IOS XE Gibralta	ar 16.10.1 This command was introduced.				
Usage Guidelines	Load-balancing-enable roaming delays.	ed WLANs do not support time-sensitive	applications like voice and video because of			
	balancing is disabled o	921 and 7920 Wireless IP Phones with co on the voice WLANs for each controller. O ing a disruption in the audio path.				
	This example shows how to configure association denials during load balancing:					
	Device# configure t Device(config)# wir Device(config)# end	eless load-balancing denial 5				

wireless macro-micro steering transition-threshold

To configure micro-macro transition thresholds, use the **wireless macro-micro steering transition-threshold** command.

wireless macro-micro steering transition-threshold {balancing-window | client count *number-clients* } {macro-to-micro | micro-to-macro *RSSI* in *dBm*}

Syntax Description	balancing-window	Active instance of the configuration in Route-processor slot 0.
	client	Standby instance of the configuration in Route-processor slot 0.
	number-clients	Valid range is 0 to 65535 clients.
	macro-to-micro	Configures the macro to micro transition RSSI.
	micro-to-macro	Configures micro-macro client load balancing window.
	RSSI in dBm	RSSI in dBm. Valid range is –128 to 0.
Command Default	None	
Command Modes	Global configuration	n (config)

Command History

 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure balancing-window:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless macro-micro steering transition-threshold balancing-window number-of-clients

wireless macro-micro steering probe-suppression

To configure micro-macro probe suppressions, use the **wireless macro-micro steering probe-suppression** command.

wireless macro-micro steering probe-suppression {aggressiveness number-of-cycles | | hysteresisRSSI in dBm| probe-auth | probe-only}

Syntax Description	aggressiveness	Configures prob	e cycles to be suppressed. The number of cycles range between 0 - 255.
	hysteresis		uch greater the signal strength of a neighboring access point must be in order oam to it. The RSSI decibel value ranges from -6 to -3.
	probe-auth	Enables mode to	suppress probes and single auth
	probe-only	Enables mode to	suppress only probes
Command Default	None		
Command Modes	Global configu	ration (config)	
Command History	Release		Modification
	Cisco IOS XE		This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.12.1.

Examples

The following example shows how to configure balancing-window:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless macro-micro steering probe-suppression aggressiveness
number-of-cycles
```

wireless management certificate

To create a wireless management certificate details, use the wireless management certificate command.

wireless management certificate ssc { auth-token $\{0 | 8\}$ token | trust-hash hash-key }

Syntax Description	auth-token	Authentication tol	ken.
	token	Token name.	
	trust-hash	Trusted SSC hash	list.
	hash-key	SHA1 fingerprint.	
	0 Specifies an UNENCRYPTED token.		NCRYPTED token.
	8	Specifies an AES	encrypted token.
Command Default	None		
Command Modes	Global Confi	guration(config)	
Command History	Release		Modification
	Cisco IOS X	E Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Example

The following example shows how to configure a wireless management certificate:

Device# configure terminal Device(config)# wireless management certificate ssc trust-hash test

wireless management interface

To create a wireless management interface, use the wireless management interface command.

wireless management interface { GigabitEthernet | Loopback | Vlan } interface-number

Syntax Description	<i>interface-number</i> Interface number.	
Command Default	None	
Command Modes	Global Configuration(config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Example

The following example shows how to configure a wireless management interface:

Device# configure terminal Device(config)# wireless management interface vlan vlan1

wireless management trustpoint

To create a wireless management trustpoint, use the wireless management trustpoint command.

wireless management trustpoint trustpoint-name

Syntax Description	trustpoint-name	Trustpoint name.	
Command Default	None		
Command Modes	Global Configura	tion(config)	
Command History	Release		Modification
	Cisco IOS XE Gi	braltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.
Usage Guidelines		2	Cisco Catalyst 9800 Wireless Controller for Cloud platform and not on the SUDI certificate by default without the need for this command.
	Example		
	The following exa	ample shows h	ow to configure a wireless management trustpoint:

Device# configure terminal Device(config)# wireless management trustpoint test

wireless max-warning period

To configure the periodicity of a wireless client check, use the **wireless max-warning period** command. To disable wireless client check, use the **no** form of this command.

wireless max-warning period interval-in-mins

no wireless max-warning period

Syntax Description	<i>interval-in-mins</i> Wireless client check periodicity. Valid values range from 1 to 60 minutes.		
Command Default	Wireless client check periodicit	y is not set.	
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Bengaluru 17.6.1	This command was introduced.	
Examples	The following example shows h	now to configure the periodicity of a wireless client check:	

Device# configure terminal Device(config)# wireless max-warning period 20

wireless max-warning threshold clients

To configure the warning threshold percentage for the maximum number of wireless clients in a wireless client check, use the **wireless max-warning threshold client** command. To revert to the default values of a wireless client check, use the **no** form of this command.

wireless max-warning threshold clients threshold_percentage

no wireless max-warning threshold clients

Syntax Description		Wireless client check warning thresho 100 percent.	ld percentage. Valid values range from 50 to
Command Default	Threshold percent is set a	it 75 percent.	
Command Modes	Global configuration (cor	nfig)	
Command History	Release	Modification	-
	Cisco IOS XE Bengaluru	17.6.1 This command was introduced.	-
Examples	e i	nows how to configure the warning th s in a wireless client check:	reshold percentage for the maximum
	Device# configure ter	minal	

Device(config)# wireless max-warning threshold clients 90

wireless media-stream

To configure various parameters, use the wireless media-stream command.

wireless media-stream group groupName [startipAddr endipAddr]

wireless media-stream group{ avg-packet-size default exit max-bandwidth no
policy qos}

wireless media-stream {multicast-direct | message [{phone phone | URL URL | Notes Notes | Email Email}]}

yntax Description	group groupName	Configure multicast-direct status for a group.	
	startipAddr	Specifies the start IP Address for the group.	
	endipAddr	Specifies the End IP Address for the group.	
	group avg-packet-size	Configure average packet size.	
		The values can range between 100 to 1500.	
	group default	Set a command to its defaults.	
	group exit	Exit sub-mode.	
	group max-bandwidth	Configure maximum expected stream bandwidth in Kbps.	
		The values can range between 1 to 35000 kbps.	
	group no	Negate a command or set its defaults.	
	group policy	Configure media stream admission policy.	
		You can choose either of these options:	
		• admit - Allow traffic for the media stream group.	
		• deny - Deny traffic for the media stream group.	
	group qos	Configure over the air QoS class, <'video'> ONLY.	
	multicast-direct	Configure multicast-direct status.	
	message	Configure Session Announcement Message.	
	phone phone	Configure Session Announcement Phone number.	
	URL URL	Configure Session Announcement URL.	
	Notes Notes	Configure Session Announcement notes.	
	Email Email	Configure Session Announcement Email.	

Command Default	Disabled	
Command Modes	config	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was modified.
Usage Guidelines	Media-stream multi	icast-direct requires load-based Call Admission Control (CAC) to run.
	Examples	
	0	nple shows how to configure each media stream and its parameters like expected n addresses, stream bandwidth consumption and stream priority parameters.
	-	terminal ion commands, one per line. End with CNTL/Z.

Device(config) #wireless media-stream group GROUP1 231.1.1.1 231.1.1.10

wireless media-stream message

To configure session announcement message, use the wireless media-stream message command.

	wireless media-stream me	ssage {Email Notes URL phone}		
Syntax Description	Email Configure session ann	ouncement e-mail.		
	Notes Configure session ann	ouncement notes.		
	URL Configure session ann	ouncement URL.		
	phone Configure session anno	ouncement phone number.		
Command Default	None			
Command Modes	Global configuration (config)			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10	.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		
Usage Guidelines	parameters configure the mes	eed (due to bandwidth constraints), a message can be sent to the user. These sages to send IT support e-mail address, notes (message to display explaining URL to which the user can be redirected to and the phone number that the user cam.		
	Examples			
	The following example shows how to configure a session announcement URL:			
	-	al ands, one per line. End with CNTL/Z. media-stream message URL www.example.com		

wireless media-stream multicast-direct

To configure multicast-direct status, use the **media-stream multicast-direct** command. To remove the multicast-direct status, use the no form of the command.

	no wireless media-stream multicast-direct
Command Default	None
Command Modes	config
Usage Guidelines	Media stream multicast-direct requires load based Call Admission Control (CAC) to run. WLAN quality of service (QoS) needs to be set to either gold or platinum.

Examples

The following example shows how to configure multicast-direct for a wireless LAN media stream.

Device#configure terminal

Enter configuration commands, one per line. End with CNTL/Z. Device(config)#wireless media-stream multicast-direct

L

wireless mesh alarm association count

To configure the mesh alarm association count, use the wireless mesh alarm association count command.

 wireless mesh alarm association count count

 Syntax Description
 count Number of alarm associations. The vlaid range is between 1 and 30.

 Command Default
 None

 Command Modes
 config

 Command History
 Release
 Modification

 Cisco IOS XE Gibraltar 16.10.1
 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1

Examples

The following example shows how to configure the mesh alarm association count:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy wireless mesh alarm association count 10

wireless mesh alarm high-snr

To configure the mesh alarm high-snr value, use the wireless mesh alarm high-snr command.

wireless mesh alarm high-snr high-snr

Syntax Description	high-snr Set the high-snr value.	The valid range is between 31 and 100.
Command Default	None	
Command Modes	- config	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the mesh high-snr:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile policy wireless mesh alarm high-snr 75
```

wireless mesh alarm low-snr

To configure the mesh alarm low-snr value, use the wireless mesh alarm low-snr command.

wireless mesh alarm low-snr low-snr

Syntax Description	<i>low-snr</i> Set the low-snr value. The valid range is between 1 and 30.			
Command Default	None			
Command Modes	- config			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to configure the mesh high-snr:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless profile policy wireless mesh alarm low-snr 5

wireless mesh alarm max-children map

To configure the mesh alarm max-children map value, use the **wireless mesh alarm max-children map** command.

wireless mesh alarm max-children map max-children

Syntax Description	max-children Set the mesh alar	m max-children map parameter. The valid range is between 1 and 50.
Command Default	None	
Command Modes	config	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the mesh alarm max-children map value:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh alarm max-children map 35
```

Configuration Commands: g to z

wireless mesh alarm max-children rap

To configure the mesh alarm max-children rap value, use the **wireless mesh alarm max-children rap** command.

wireless mesh alarm max-children rap max-children

Syntax Description	<i>max-children</i> Set the mesh alarm max-children rap parameter. The valid range is between 1 and 50.			
Command Default	None			
Command Modes	- config			
Command History	ory Release Modification			
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to configure the mesh alarm max-children rap value:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh alarm max-children rap 40
```

wireless mesh alarm max-hop

To configure the mesh alarm max-hop paramter, use the wireless mesh alarm max-hop command.

wireless mesh alarm max-hop max-hop

Syntax Description	<i>max-hop</i> Set the mesh alarm max-	ax-hop count. Valid range is between 1 and 16.
Command Default	None	
Command Modes	config	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the mesh alarm max-hop parameter:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh alarm max-hop 15
```

wireless mesh alarm parent-change count

To configure the max parent-change count value, use the **wireless mesh alarm parent-change count** command.

wireless mesh alarm parent-change count count

Syntax Description	count Set the max parent-change count value. Valid range is between 1 and 30.			
Command Default	None			
Command Modes	- config			
Command History	Release	Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		

Examples

The following example shows how to configure the alarm parent change count value:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh alarm parent-change count 6
```

wireless mesh backhaul bdomain-channels

To configure and allow the Extended UNII B Domain channels for Outdoor mesh APs backhaul radio, use the **wireless mesh backhaul bdomain-channels** command.

wireless mesh backhaul bdomain-channels			
bdomain-channels	Allows the Extended UNII B Domain channels for Outdoor mesh APs backhaul radio.		
	The [no] form of the command disables the use of the Extended UNII B Domain channels by the mesh APs backhaul radio.		
None			
config			
Release	Modification		
Cisco IOS XE Gibra	altar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.		
	bdomain-channels None config Release		

Examples

The following example shows how to disable the use of Extended UNII B Domain channels by the Outdoor mesh APs backhaul radio:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# no wireless mesh backhaul bdomain-channels

wireless mesh backhaul rrm

To configure the mesh backhaul, use the wireless mesh backhaul command.

Syntax Description	backhaul	Configures the Mesh Backhaul.			
	bdomain-channels	nels Allows Extended UNII B Domain channels for Outdoor mesh APs backhaul radio.			
	rrm	rrm Configures RRM for the mesh backhaul.			
Command Default	None				
Command Modes	config				
Command History	Release		Modification		
	Cisco IOS XE Gibr	altar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE		

Examples

The following example shows how to configure RRM for the mesh backhaul:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh backhaul rrm
```

wireless mesh backhaul rrm auto-dca

To configure auto DCA for radio frequency (RF) Application Specific Integrated Circuit (ASIC) RAPs, use the **wireless mesh backhaul rrm auto-dca** command.

wireless mesh backhaul rrm auto-dca

Syntax Description	This command has no keywords or arguments.			
Command Default	None			
Command Modes	Global configuration			
Command History	Release	Modification		
	Cisco IOS XE Cupertino 17.9.1	This command was introduced.		

Example

This example shows how to configure auto DCA for RF ASIC integrated RAPs:

Device# wireless mesh backhaul rrm auto-dca

wireless mesh cac

To configure the mesh CAC Mode, use the wireless mesh cac command.

	wireless mesh cac				
Syntax Description	ac Configures the mesh CAC Mode.				
Command Default	None				
Command Modes	config				
Command History	Release	Modification			
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.			

Examples

The following example shows how to configure the mesh CAC mode:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless mesh cac

wireless mesh ethernet-bridging allow-bdpu

To configure STP BPDUs for wired mesh uplink, use the **wireless mesh ethernet-bridging allow-bdpu** command.

wireless mesh ethernet-bridging allow-bdpu

Syntax Description	ethernet-bridging	g Configure ethernet bridging.
	allow-bdpu	Configures STP BPDUs towards wired MESH uplink.
Command Default	None	
Command Modes	config	
Command History	Release	Modification
	Cisco IOS XE Gib	braltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure STP BPDUs towards wired MESH uplink:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh ethernet-bridging allow-bdpu
```

wireless mesh security psk provisioning

To provision the mesh security psk parameters, use the wireless mesh security psk provisioning command.

wireless mesh security psk provisioning {**default_psk** | **inuse** *psk-index* | **key** *psk-index* {**0** | **8**}*enter-psk-name psk-description*}

				_
Syntax Description	provisioning	configuring me	sh psk provisioning parameters.	-
	default_psk Set the mesh provisioning to the default-psk set			-
	inuse	Configuring the	e psk inuse index	-
	psk-index	Enter PSK key 5.	index. Valid range is between 1 and	-
	key	Configure a pre	-shared-key	-
	psk-indexEnter PSK key index. Valid range is between 1 and 5.0Choose to enter an UNENCRYPTED password.8Choose to enter an AES encrypted password.enter-psk-nameEnter a name for the configured psk key.			
				-
				-
				-
	psk-description Enter a description for this key.			
Command Default	None			
Command Modes	_ config			
Command History	Release		Modification	
	Cisco IOS XE	Gibraltar 16.10.1	This command was introduced in a r Gibraltar 16.10.1.	release earlier than Cisco IOS XE

Examples

The following example shows how to provision the default psk key for the mesh security:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless mesh security psk provisioning default_psk
```

wireless mesh subset-channel-sync

To configure the subset channel sync for mobility group, use the **wireless mesh subset-channel-sync** command.

wireless mesh subset-channel-sync

Syntax Description	subset-channel-sync Configures the subset channel sync for mobility group	
Command Default	None	
Command Modes	- config	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure subset channel sync for mobility group:

Device# configure terminal Enter configuration commands, one per line. End with CNTL/Z. Device(config)# wireless mesh subset-channel-sync

Configuration Commands: g to z

wireless mobility

To configure the inter mobility manager, use the wireless mobility command.

wireless mobility {dscp value }
dscp <i>value</i> Configures the Mobility inter DSCP value.
The default DSCP value is 48.
Global Configuration
Release Modification
Cisco IOS XE Gibraltar 16.10.1 This command was introduced.

This example shoes how to configure mobility inter DSCP with an value of 20: Device(config) # wireless mobility dscp 20

wireless mobility controller peer-group

To configure mobility peer groups, use the **wireless mobility controller peer-group** command, to remove the configuration, use the **no** form of this command.

wireless mobility controller peer-group peer-group member IP ip-addressmode centralized

Syntax Description	peer group	Name of the peer group.
	member IP	Adds a peer group member.
	ip-address	IP address of the peer group member to be added.
	mode centralized	Configures the management mode of the peer group member as centrally managed.
Command Default	The centralized mo	de is off.
Command Modes	Global configuratio	n
Command History	Release	Modification
	Cisco IOS XE 3.7.	0 E This command was introduced.
	-	e terminal ion commands, one per line. End with CNTL/Z. wireless mobility controller peer-group peer1 member ip 10.0.0.1 mode

wireless mobility group keepalive

To configure the mobility group parameter and keep alive its ping parameters, use the **wireless mobility** group keepalive command. To remove a mobility group parameter, use the **no** form of the command.

wireless mobility group keepalive {count *number* | interval *interval*} **no wireless mobility group keepalive** {count *number* | interval *interval*}

Syntax Description	count number	count numberNumber of times that a ping request is sent to a mobility group member before the member is considered unreachable. The range is from 3 to 20. The default is 3.			
	interval interval	Interval of time between each ping request se is from 1 to 30 seconds. The default value is			
		Note For controllers connected throug controllers have the same keepal	h mobility tunnels, ensure that both ive interval value.		
Command Default	3 seconds for cour	at and 10 seconds for interval.			
Command Modes	Global Configurat	ion.			
Command History	Release	Modification			
	Cisco IOS XE Gil	oraltar 16.10.1 This command was introduced.			
Usage Guidelines	The default values	for <i>interval</i> is ten seconds and the default for <i>n</i>	<i>tetries</i> is set to three.		
	This example show group member to 1	vs how to specify the amount of time between early seconds:	ach ping request sent to a mobility		
	Device(config)#	wireless mobility group keepalive count	= 10		

wireless mobility group mac-address

To configure the MAC address to be used in mobility messages, use the **wireless mobility group mac-address** command.

wireless mobility group mac-address mac-addr

Syntax Description *mac-addr* MAC address to be used in mobility messages.

Command Default None

Command Modes Global configuration (config)

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure a MAC address to be used in mobility messages:

Device(config)# wireless mobility group mac-address 00:0d:ed:dd:25:82

wireless mobility group member ip

To add or delete users from mobility group member list, use the **wireless mobility group member ip** command. To remove a member from the mobility group, use the **no** form of the command.

wireless mobility group member ip ip-address [public-ip public-ip-address] [group group-name
]
no wireless mobility group member ip ip-address

Syntax Description	ip-address	The IP ad	dress of the member controller.
	public-ip public-ip-address	(Optional)) Member controller public IP address.
		Note	This command is used only when the member is behind a NAT. Only static IP NAT is supported.
	group group-name	(Optional)) Member controller group name.
		Note	This command is used only when the member added in not in the same group as the local mobility controller.
Command Default	None.		
Command Modes	Global Configuration.		
Command History	Release	Modifi	cation
	Cisco IOS XE Gibraltar 16.1	0.1 This co	ommand was introduced.
Usage Guidelines	The mobility group can be as	signed with	more than one Mobility Controller (MC) in a given deployment. a name or it can use the default group name. The mobility group e members of the group to roam within the group.
	This example shows how to a Device (config) # mobility		er in a mobility group: ber ip 10.104.171.101 group TestDocGroup

wireless mobility group member mac-address

To form a mobility group member list, use the **wireless mobility group member mac-address** command in global configuration mode. To remove a member from a mobility group, use the **no** form of this command.

wireless mobility group member mac-address *peer_mac* **ip** *peer_private_ip* [**public-ip** *peer_public_ip*] **group** *group_name*

			-
peer_mac	MAC address	of the peer controller.	
peer_private_ip	Private IP addr	ess of the peer controller.	-
peer_public_ip	Public IP addre	ess of the peer controller.	-
group_name	Member contro	oller group name.	-
Mobility peer is not configured.			
Global configurati	ion (config)		
Release		Modification

Example

The following example shows how to create a mobility group member list:

Device(config)# wireless mobility group member mac-address 001e.494b.04ff ip 11.0.0.2
public-ip 4.0.0.112 group dom1

wireless mobility group multicast-address

To configure the multicast IP address for a non-local mobility group, use the **wireless mobility group multicast-address** command.

wireless mobility group multicast-address group-name {ipv4 | ipv6} ip-addr

Syntax Description	group-name	Name of the non-le	ocal mobility group.	-
	ipv4	Option to enter the	e IPv4 address.	-
	ipv6	Option to enter the	e IPv6 address.	-
	ip-addr	IPv4 or IPv6 addre	ss of the non-local mobility group.	_
Command Default	None			
Command Modes	Global con	figuration (config)		
Command History	Release		Modification	
	Cisco IOS	XE Gibraltar 16.10.1	This command was introduced in Gibraltar 16.10.1.	n a release earlier than Cisco IOS XE

Examples

The following example shows how to configure a multicast IPv4 address of the non-local mobility group:

Device(config) # wireless mobility group multicast-address Mygroup ipv4 224.0.0.5

wireless mobility group name

To configure he mobility domain name, use the **wireless mobility group name** command. To remove the mobility domain name, use the **no** form of the command.

	enter the IP add	iguring the mobility group in a network where network address translation (NAT) is endress that is sent to the controller from the NAT device rather than the controller's managers. Otherwise, mobility will fail among controllers in the mobility group.	
	·	group name domain-name pility group name	
Syntax Description		eates a mobility group by entering this command. The domain name can be up to 31 se-sensitive characters.	
Command Default	Default.		
Command Modes	Global Configuratio	on.	
Command History	Release	Modification	
	Cisco IOS XE Gibra	altar 16.10.1 This command was introduced.	
	This anomala shows	a haw to configure a mahility domain name lah l	

This example shows how to configure a mobility domain name lab1:

Device(config) # mobility group domain lab1

wireless mobility multicast ipv4

To configure multicast IPv4 address for the local mobility group, use the **wireless mobility multicast ipv4** command.

wireless mobility multicast ipv4 ipv4-addr

Syntax Description	<i>ipv4-addr</i> Enter the multicast IP	Pv4 address for the local mobility group.
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure multicast IPv4 address for the local mobility group: Device(config) # wireless mobility multicast ipv4 224.0.0.4

wireless mobility mac-address

To configure the MAC address to be used in mobility messages,, use the **wireless mobility mac-address** command.

wireless mobility mac-address mac-address

Syntax Description	mac-address	MAC address to be used in mobility messages.

Command Default None

Comm

Command Modes	Global configuration (config)
---------------	-------------------------------

nand History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE
		Gibraltar 16.10.1.

Examples

The following example shows how to configure a MAC address to be used in mobility messages:

Device(config)# wireless mobility mac-address 00:0d:bd:5e:9f:00

wireless multicast

To configure Ethernet multicast parameters, use the wireless multicast command.

wireless multicast {*ipv4-address* | **ipv6***ipv6-address* | **non-ip** [**vlan***vlan-id*]}

ipv4-address	Multicast IPv4 address.	
ipv6 ipv6-address	Multicast IPv6 address.	
non-ip	Configures non-IP multicast in all VLANs. Wireless multicast must be enabled for the traffic to pass.	
non-ip vlan vlan-id	Configures non-IP multicast per VLAN. Both wireless multicast and wireless multicast non-IP must be enabled for traffic to pass.	
Valid range for VLAN ID is 1 to 4094.		
None		
Global configuratio	n (config)	
Release	Modification	
Cisco IOS XE Gibr	altar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE	
	ipv6 ipv6-address non-ip non-ip vlan vlan-id None Global configuratio	

Examples

The following example shows how to configure a non-IP multicast for a VLAN whose ID is 5:

Device(config) # wireless multicast non-ip vlan 5

wireless profile airtime-fairness

To create a new Cisco ATF policy, use the wireless profile airtime-fairness command.

	wireless profile airtime-fair	ness atf-policy-name atf-profile-id
Syntax Description	atf-policy-name Refers to the	ATF profile name.
	atf-profile-id Refers to the	ATF profile ID. The range is from 0 to 511
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.	This command was introduced.
	This example shows how to cr	eate a new Cisco ATF policy.

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile airtime-fairness <atf-policy-name> 1
Device(config-config-atf)# weight 5
Device(config-config-atf)# client-sharing
Device(config-config-atf)# end
```

wireless profile ap packet-capture

To configure the wireless AP packet capture profile, use the wireless profile ap packet-capture command.

wireless profile ap packet-capture packet-capture-profile-name

Syntax Description	packet-capture-profile-name	AP packet capture profile name.
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

The following example shows how to configure the AP packet capture profile:

Device(config)# wireless profile ap packet-capture test1

wireless profile ap priming

To configure a profile to prime access points (APs), use the **wireless profile ap priming** command. To disable priming, use the **no** form of this command.

wireless profile ap priming profile-name

no wireless profile ap priming profile-name

Syntax Description	<i>profile-name</i> AP priming proname.	ofile	
Command Default	AP priming profile name is not	configured.	
Command Modes	Global configuration (config)		
Command History	Release	Modification	_
	Cisco IOS XE Cupertino 17.9.2	This command was introduced.	_
Usage Guidelines	• An AP filter priming profi	le can contain up to three cont	- rollers. An AP priming profile can either be

applied at the AP MAC level or by using a matching regular expression filter.AP MAC-based AP priming has the highest priority. If AP MAC-based AP priming is not available, the priming profile under the matching regular expression filter having the highest priority with a valid

Examples The following example shows how to configure profile to prime APs:

priming configuration gets appiled.

Device# configure terminal Device(config)# wireless profile ap priming Prime-FX

wireless profile calender-profile name

To configure a calendar profile, use the wireless profile calender-profile name command.

	wireless profile calender-profil	e name name
Syntax Description	name Specifies the name of the c	calendar profile.
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.
Usage Guidelines	This example shows how to con	figure a calendar profile:

Device# configure terminal Device(config)# wireless profile calender-profile name daily_calendar_profile Device(config-calender-profile)# start 09:00:00 end 17:00:00 Device(config-calender-profile)# recurrance daily Device(config-calender-profile)# end

wireless profile fabric

To configure the fabric profile parameters, use the wireless profile fabric command.

wireless profile fabric fabric-profile-name

Syntax Description	fabric-profile-name	P Fabric profile name.
	fabric	Configure Fabric profile parameters.
	profile	Configure profile parameters.
Command Default	None	
Command Modes	Global configuration	on (config)
Command History	Release	Modification
	Cisco IOS XE Gibr	raltar 16.10.1 This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.

Examples

The following example shows how to configure the fabric profile parameters:

```
Device# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)# wireless profile fabric fabric-profile-name
```

wireless profile mesh

To configure the mesh profile on an access point (AP), use the wireless profile mesh profile-name command.

wireless profile mesh profile-name

Syntax Description	profile-name	Name of the profile.
Command Default	- None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.7.1	This command was introduced.

Device# configure terminal
(config)#wireless profile mesh test1

wireless profile policy

To configure WLAN policy profile, use the wireless profile policy command.

wireless profile policy policy-profile

Syntax Description *policy-profile* Name of the WLAN policy profile.

Command Default The default profile name is default-policy-profile.

Command Modes Global configuration (config)

Command History

Release	Modification
Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE
	Gibraltar 16.10.1.

Examples

The following example shows how to configure a WLAN policy profile:

Device(config) # wireless profile policy mywlan-profile-policy

wireless profile power

To configure the wireless power policy profile, use the **wireless profile power** command. Use the **no** form of this command to disable the feature.

wireless profile power power-profile-name

Syntax Description	power-profile-name Specific	es the name of the wireless power policy profile.
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.8.	1 This command was introduced.

Example

The following example shows how to configure wireless power policy profile:

Device(config) # wireless profile power power-profile-name

wireless profile tunnel

To configure tunnel profiles, use the wireless profile tunnel command.

	wireless profile tunnel	
Syntax Description	tunnel-profile-name	Name of the tunnel profile.
	dhcp-opt82 format mac raw/ca	<i>colon-delimited</i> Configures the format of the MAC address in RID and CID field of option 82.
Command Default	None	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.11.1	This command was introduced.

Example

This example shows how to configure tunnel profiles: Device(config) # wireless profile tunnel tun1

wireless profile radio

To configure the wireless radio profile, use the **wireless profile radio** command. Use the **no** form of this command to disable the feature.

wireless profile radio radio-profile-name

no wireless profile radio radio-profile-name

Syntax Description	wireless profile radio	Creates a new	wireless radio profile.	
	radio-profile-name	Specifies the	radio profile name.	
Command Default	None			
Command Modes	Global configuration mo	de		
Command History	Release	Modi	fication	_
	Cisco IOS XE Bengalur	a 17.6.1 This of introd		_
Examples	The following example	hows you how	to configure the wirele	ess radio profile:
	Device# configure te Device(config)# wire		radio <i>radio-profile</i>	-name

wireless rfid

To set the static radio-frequency identification (RFID) tag data timeout value, use the **wireless rfid** command in global configuration mode.

wireless rfid timeout timeout-value

Syntax Description	timeout	Configures the static RFID tag data timeout value.
	timeout-value	RFID tag data timeout value. Valid values range from 60-720
Command Default	None	
Command Modes	Global configu	ration (config)
Command History	Release	Modification
	Cisco IOS XE	Gibraltar 16.10.1 This command was introduced.

Example

This example shows how to set the static RFID tag data timeout value. Device (config) # wireless rfid timeout 70

wireless security dot1x

To configure IEEE 802.1x global configurations, use the wireless security dot1x command.

wireless security dot1x [{eapol-key {retries retries | timeout milliseconds} | group-key interval sec | identity-request {retries retries | timeout seconds} | radius [call-station-id] {ap-macaddress | ap-macaddress-ssid | ipaddress | macaddress} | request {retries retries | timeout seconds} | wep key {index 0 | index 3}}]

Syntax Description	eapol-key	Configures eapol-key related parameters.
	retries retries	(Optional) Specifies the maximum number of times (0 to 4 retries) that the controller retransmits an EAPOL (WPA) key message to a wireless client.
		The default value is 2.
	timeout milliseconds	(Optional) Specifies the amount of time (200 to 5000 milliseconds) that the controller waits before retransmitting an EAPOL (WPA) key message to a wireless client using EAP or WPA/WPA-2 PSK.
		The default value is 1000 milliseconds.
	group-key interval sec	Configures EAP-broadcast key renew interval time in seconds (120 to 86400 seconds).
	identity-request	Configures EAP ID request related parameters.
	retries retries	(Optional) Specifies the maximum number of times (0 to 4 retries) that the controller request the EAP ID.
		The default value is 2.
	timeout seconds	(Optional) Specifies the amount of time (1 to 120 seconds) that the controller waits before retransmitting an EAP Identity Request message to a wireless client.
		The default value is 30 seconds.
	radius	Configures radius messages.
	call-station-id	(Optional) Configures Call-Station Id sent in radius messages.
	ap-macaddress	Sets Call Station Id Type to the AP's MAC Address.
	ap-macaddress-ssid	Sets Call Station Id Type to 'AP MAC address': 'SSID'.
	ipaddress	Sets Call Station Id Type to the system's IP Address.
	macaddress	Sets Call Station Id Type to the system's MAC Address.
	request	Configures EAP request related parameters.

I

	retries retries	tries (Optional) For EAP messages other than Identity Requests or EAPOL (WPA) key messages, specifies the maximum number of times (0 to 20 retries) that the controller retransmits the message to a wireless client.			
		The default value is 2.			
	timeout seconds	(Optional) For EAP messages other than Identity Requests or EAPOL (WPA) key messages, specifies the amount of time (1 to 120 seconds) that the controller waits before retransmitting the message to a wireless client.			
		The default value is 30 seconds.			
	wep key	ep key Configures 802.1x WEP related paramters.			
	index 0	Specifies the WEP key index value as 0			
	index 3	Specifies the WEP key index value as 3			
Command Default	Default for eapol-key-	timeout: 1 second.			
	Default for eapol-key-	retries: 2 retries.			
Command Modes	config				
Command History	Release	Modification			
	Cisco IOS XE Gibralta	ar 16.10.1 This command was introduced.			
Usage Guidelines	None.				
	This example lists all t	the commands under wireless security dot1x.			
		erminal n commands, one per line. End with CNTL/Z. eless security dot1x ?			
	eapol-key group-key	Configure eapol-key related parameters Configures EAP-broadcast key renew interval time in seconds Configure EAP ID request related parameters Configure radius messages Configure EAP request related parameters Configure 802.1x WEP related paramters			

wireless security dot1x radius accounting mac-delimiter

To configure a MAC delimiter for called-station-ID or a calling-station-ID, use the **wireless security dot1x** radius accounting mac-delimiter command.

To remove MAC delimiter for a called-station-ID or a calling-station-ID, use the no form of the command.

wireless security dot1x radius accounting mac-delimiter {colon | hyphen | none | single-hyphen }

colon	Sets the delimiter to colon.
hyphen	Sets the delimiter to hyphen.
none	Disables delimiters.
single-hyphen	Sets the delimiters to single hyphen.
None	
Global Configur	ation Mode
Release	Modification
Cisco IOS XE 3	.6.0 E This command was introduced.
	hyphen none Single-hyphen Global Configur Release

This example shows how to configure a MAC delimiter for called-station-ID or a calling-station-ID to colon:

Device(config) # wireless security dot1x radius accounting mac-delimiter colon

wireless security dot1x radius accounting username-delimiter

To set the delimiter type, use **wireless security dot1x radius accounting username-delimiter** command, to remove the configuration, use the **no** form of this command.

wireless security dot1x radius accounting username-delimiter {colon | hyphen | none | single-hyphen }

Syntax Description	colon	Sets the delimiter to colon.
	hyphen	Sets the delimiter to hyphen.
	none	Disables delimiters.
	single-hyphen	Sets the delimiters to single hyphen.
Command Default	None	
Command Modes	Global Configur	ration Mode.
Command Modes Command History	Global Configur	ation Mode. Modification

This example shows how to sets the delimiter to colon.

Device(config) # wireless security dot1x radius acounting username-delimiter colon

wireless security dot1x radius callStationIdCase

To configure Call Station Id CASE send in RADIUS messages, use the **wireless security dot1x radius** callStationIdCase command.

To remove the Call Station Id CASE send in RADIUS messages, use the no form of the command.

wireless security dot1x radius callStationIdCase {lower|upper}

lower	lower Sends all Call Station Ids to RADIUS in lowercase		
upper	Sends all Call Station Ids to RADIUS in uppercase		
None			
Global C	Configuration Mode		
Release	e Modification		
Cisco IO	OS XE 3.6.0 E This command was introduced.		
	upper None Global C Release		

This example shows how to configure Call Station Id CASE send in RADIUS messages in lowercase:

Device(config)# wireless security dot1x radius callstationIdCase lower

wireless security dot1x radius mac-authentication call-station-id

To configure call station ID type for mac-authentication, use the **wireless security dot1x radius mac-authentication call-station-id** command. To remove the configuration, use the **no** form of it.

wireless security dot1x radius mac-authentication call-station-id ap-ethmac-only | ap-ethmac-ssid | ap-group-name | ap-label-address | ap-label-address-ssid | ap-location | ap-macaddress | ap-macaddress | ap-macaddress | ap-macaddress | ap-macaddress | ap-name | ap-name-ssid | ipaddress | macaddress | vlan-id

Syntax Description	ap-ethmac-only	Sets call station ID type to the AP Ethernet MAC address.				
	ap-ethmac-ssid	Sets call station ID type to the format 'AP Ethernet MAC address':'SSI				
	ap-group-name	Sets call station ID type to the AP Group Name.				
	ap-label-address	Sets call station ID type to the AP MAC address on AP Label.				
	ap-label-address-ssid	Sets call station ID type to the format 'AP Label MAC address': 'SSID'.				
	ap-location	Sets call station ID type to the AP Location.				
	ap-macaddress	Sets call station ID type to the AP Radio MAC Address.				
	ap-macaddress-ssid	Sets call station ID type to the 'AP radio MAC Address':'SSID'.				
	ap-name	Sets call station ID type to the AP name.				
	ap-name-ssid	ap-name-ssid Sets call station ID type to the format 'AP name': 'SSID'.				
	ipaddress	address Sets call station ID type to the system IP Address.				
	macaddress	macaddress Sets call station ID type to the system MAC Address.				
	vlan-id	Sets call station ID type to the VLAN ID.				
Command Default	None					
Command Modes	Global Configuration M	Aode				
Command History	Release	Modification				
	Cisco IOS XE 3.7.2 E	This command was introduced.				

The example show how to set call station ID type to the AP Ethernet MAC address:

Device(config) # wireless security dot1x radius mac-authentication call-station-id ap-ethmac-only

wireless security dot1x radius mac-authentication mac-delimiter

To configure MAC-Authentication attributes, use the **wireless security dot1x radius mac-authentication mac-delimiter** command.

To remove MAC-Authentication attributes, use the no form of the command.

wireless security dot1x radius mac-authentication mac-delimiter {colon | hyphen | none | single-hyphen }

Syntax Description	colon	Sets the delimiter to colon.	
	hyphen	Sets the delimiter to hyphen.	
	none	Disables delimiters.	
	single-hyphen	Sets the delimiters to single hyphen.	
Command Default	None		
Command Modes	Global Configur	ation Mode	
Command History	Release Modification		
	Cisco IOS XE 3.6.0 E This command was introduced.		

This example shows how to configure MAC-Authentication attributes to colon:

Device(config) # Scurity dot1x radius mac-authentication mac-delimiter colon

wireless security web-auth retries

To enable web authentication retry on a particular WLAN, use the **wireless wireless security web-auth retries** command. To disable, use the **no** form of the command.

wireless securityweb-authretries*retries* nowireless securityweb-authretries

Syntax Description	wireless security web-auth Enables web authentication on a particular WLAN.		
	retries retries	Specifies maximum number of is from 0 through 30. The defau	web authentication request retries. The range all value is 3.
Command Default	_		
Command Modes	config		
Command History	Release	Modification	_
	Cisco IOS XE Gibraltar 16.10.	1 This command was introduced.	_
Usage Guidelines	None.		
	This example shows how to en	nable web authentication retry on	a particular WLAN.
	Device# configure terminal Device# wireless security	web-auth retries 10	

wireless tag policy

To configure wireless tag policy, use the wireless tag policy command.

	wireless tag policy policy-tag		
Syntax Description	policy-tag Name of the wireless	tag policy.	
Command Default	The default policy tag is default-policy-tag.		
Command Modes	Global configuration (config)		
Command History	Release Modification		
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced in a release earlier than Cisco IOS XE Gibraltar 16.10.1.	

Examples

The following example shows how to configure a wireless policy tag:

Device(config) # wireless tag policy guest-policy

wireless tag rf

To configure the radio frequency (RF) tag, use the synwireless tag rf command. Use the **no** form of this command to disable the feature.

	wireless tag rf	rf-tg-name	
Syntax Description	wireless tag rf	Configures the	RF tag parameters.
	rf-tg-name	Specifies the r	name of the RF tag.
Command Default	None		
Command Modes	Global configura	ation mode	
Command History	Release		Modification
	Cisco IOS XE B	engaluru 17.6.1	This command was introduced.
Usage Guidelines	None		

Example

The following example shows you how to configure a wireless tag radio frequency (RF):

Device# configure terminal Device(config)# wireless tag rf rf-tag-name

wireless tag site

To configure a wireless site tag, use the wireless tag site *site-tag*command.

	wireless tag site site-tag	
Syntax Description	<i>site-tag</i> Name of the site tag.	
Command Default	None	
Command Modes	Global configuration (config)	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.

Example

The following example shows how to configure a site tag: Device(config) # wireless tag site test-site

wireless wps ap-authentication

To configure the access point neighbor authentication, use the **wireless wps ap-authentication** command. To remove the access point neighbor authentication, use the no form of the command.

wireless wps ap-authentication [threshold *value*] no wireless wps ap-authentication [threshold]

Syntax Description	threshold value	Specifies that the WMM-enabled clients are 255).	e on the wireless LAN. Threshold value (1 to
Command Default	None.		
Command Modes	config		
Command History	Release	Modification	-
	Cisco IOS XE Gil	braltar 16.10.1 This command was introduced.	-
Usage Guidelines	None.		
	This example sho	ws how to set the threshold value for WMM-	enabled clients.

wireless wps ap-authentication threshold

4 1 1 1 0

	To configure the alarm trigger threshold for access point neighbor authentication, use the wireless wps ap-authentication threshold command. To remove the access point neighbor authentication, use the no form of the command.				
	wireless wps ap-authenticati	on threshold value			
	no wireless wps ap-authentio	cation threshold value			
Syntax Description	threshold <i>value</i> Specifies that the WMM-enabled clients are on the wireless LAN. The threshold variance is between 1 and 255. The default value is 1.				
Command Default	None				
Command Modes	Global Configuration mode				
Command History	Release	Modification	-		
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.	-		
Usage Guidelines	- None				

Example

The following example shows you how to configure the alarm trigger threshold for access point neighbor authentication:

Device(config) # wireless wps ap-authentication threshold 1

wireless wps client-exclusion

To configure client exclusion policies, use the **wireless wps client-exclusion** command. To remove the client exclusion policies, use the **no** form of the command.

wireless wps client-exclusion {all | dot11-assoc | dot11-auth | dot1x-auth | dot1x-timeout | ip-theft |
web-auth}
no wireless wps client-exclusion {all | dot11-assoc | dot11-auth | dot1x-auth | dot1x-timeout | ip-theft
| web-auth}

Syntax Description	dot11-assoc	Specifies that the controller excludes clients on the sixth 802.11 association at five consecutive failures.	tempt, after	
	dot11-auth	Specifies that the controller excludes clients on the sixth 802.11 authentication a five consecutive failures.	attempt, after	
	dot1x-auth	Specifies that the controller excludes clients on the sixth 802.11X authentication attempt, after five consecutive failures.		
	dot1x-timeout	eout Enables exclusion on timeout and no response.		
	ip-theft	Specifies that the control excludes clients if the IP address is already assigned to another device.		
		For more information, see the Usage Guidelines section.		
	web-auth	Specifies that the controller excludes clients on the fourth web authentication attempt, after three consecutive failures.		
	all	Specifies that the controller excludes clients for all of the above reasons.		
Command Default	Enabled.			
Command Modes	config			
Command History	Release	Modification		
	Cisco IOS XE C	Gibraltar 16.10.1 This command was introduced.		
Usage Guidelines	In IP-theft scena Denali 16.x rele	arios, there are differences between the older Cisco IOS XE releases and the Ci eases:	sco IOS XE	

Older Cisco IOS XE Releases	Cisco IOS XE Denali 16.x Releases
Priority wise, wired clients have higher priority over wireless clients, and DHCP IP has higher priority over static IP. The client security type is not checked; security of all client types are treated with same priority. If the existing binding is from a higher priority source, the new binding is ignored and an IP-theft is signaled. If the existing binding has the same source-priority as the new binding, the binding is ignored and an IP-theft is signaled. This ensures that the bindings are not toggled if two hosts send traffic using the same IP. Only the initial binding is retained in the software. If the new binding is from a higher priority source, the existing binding is replaced. This results in an IP-theft notification of existing binding and also a new binding notification.	There is not really a fundamental difference between wired and wireless; what matters is the trust (preflevel) of the entry, which is a function on how it was learnt (ARP, DHCP, ND, and so on) and the policy that is attached to the port. When preflevel is equal, the IP takeover is denied if the old entry is still reachable. IP takeover occurs when the update comes from a trusted port or a new entry gets IP from the DHCP server. Otherwise, you must explicitly grant it. The IP-theft is not reported if an old entry is replaced by a new and a more trusted one.

This example shows how to disable clients on the 802.11 association attempt after five consecutive failures.

```
Device#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Device(config)#wireless wps client-exclusion dotll-assoc
```

wireless wps mfp

m

	To configure various Manageme wireless wps mfp ap-imperso	× ×) parameters, use the wireless wps mfp command. terval <i>interval</i>
Syntax Description	<i>interval</i> Specifies the MFP key is 24.	refresh interval in hours.	The valid range is from 1 to 24. The default value
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.12.1	This command was introduced.	
Usage Guidelines	- This example shows how to con	figure various Manageme	nt Frame Protection (MFP) parameters:
	Device# configure terminal		

Device(config) # wireless wps mfp key-refresh-interval 1

Configuration Commands: g to z

wireless wps mfp ap-impersonation

To configure AP impersonation detection, use the **wireless wps mfp ap-impersonation** command. Use the **no** form of this command to disable the configuration.

wireless wps mfp ap-impersonation

no wireless wps mfp ap-impersonation

Syntax Description	ap-impersonation Configures A	AP impersonation detection.
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	
		introduced.

Example

The following example shows you how to configure AP impersonation detection:

Device(config)# wireless wps mfp ap-impersonation

wireless wps rogue

To configure various rouge parameters, use the wireless wps rogue command.

wireless wps rogue {adhoc | client} [{alert mac-addr | contain mac-addr no-of-aps}]

Syntax Description	adhoc	Configures the status of an Independent Basic Service Set (IBSS or ad-hoc) rogue access point.
	client	Configures rogue clients
	alert mac-addr	Generates an SNMP trap upon detection of the ad-hoc rogue, and generates an immediate alert to the system administrator for further action for the MAC address of the ad-hoc rogue access point.
	contain mac-addr no-of-aps	Contains the offending device so that its signals no longer interfere with authorized clients.
		Maximum number of Cisco access points assigned to actively contain the ad-hoc rogue access point (1 through 4, inclusive).
Command Default	None.	
Command Modes	Global configuration	
Command History	Release	Modification
	Cisco IOS XE Gibralta	r 16.10.1 This command was introduced.
Usage Guidelines	None.	
	1	w to generate an immediate alert to the system administrator for further action f the ad-hoc rogue access point.

wireless wps rogue network-assurance enable

To enable the rogue wireless service assurance (WSA) events, use the **wireless wps rogue network-assurance enable** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue network-assurance enable

no wireless wps rogue network-assurance enable

Syntax Description		nables rogue WSA vents.
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.	1 This command was introduced.

Usage Guidelines None

Example

The following example shows you how to enable the rogue wireless service assurance events:

Device(config) # wireless wps rogue network-assurance enable

wireless wps rogue ap aaa

To configure the use of AAA/local database to detect valid AP MAC addresses, use the **wireless wps rogue ap aaa** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap aaa

no wireless wps rogue ap aaa

Command Default None

Command Modes Global Configuration mode

nd History	Release	Modification	
	Cisco IOS XE Amsterdam 16.12.1	This command was	
		introduced.	

Usage Guidelines None

Comman

Example

The following example shows you how to configure the use of AAA/local database to detect valid AP MAC addresses:

Device(config) # wireless wps rogue ap aaa

wireless wps rogue ap aaa polling-interval

To configures Rogue AP AAA validation interval, in seconds, use the **wireless wps rogue ap aaa polling-interval** command. To disable the configuration, use the no form of this command.

wireless wps rogue ap aaa polling-interval 60 - 86400

no wireless wps rogue ap aaa polling-interval 60 - 86400

Syntax Description	aaa	Sets the use of AAA or local database to detect valid AP MAC addresses.		
	polling-interval	Configures the rogue AP AAA validation interval.		
	60 - 86400	Specifies AP AAA validation interval, in seconds.		
Command Default	None			
Command Modes	Global configurati	ion		
Command History	Release		Modification	
	Cisco IOS XE Gi	braltar 16.12.1	This command was introduced.	
Usage Guidelines	None			

Example

This example shows how to configures Rogue AP AAA validation interval, in seconds:

Device(config) # wireless wps rogue ap aaa polling-interval 120

wireless wps rogue ap init-timer

To configure the init timer for rogue APs, use the **wireless wps rogue ap init-timer** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap init-timer

no wireless wps rogue ap init-timer

Syntax Description	init-timer Configures the init ti	mer for rogue APs.
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.
Usage Guidelines	None	

Example

The following example shows you how to configure the init timer for rogue APs:

Device(config) # wireless wps rogue ap init-timer

wireless wps rogue ap mac-address rldp initiate

To initiate and configure Rogue Location Discovery Protocol on rogue APs, use the **wireless wps rogue ap mac-address rldp initiate** command.

Syntax Description Configures the WPS settings. wps Configures the global rogue devices. rogue ap mac-address < MAC Address > The MAC address of the APs. rldp initiate Initiates RLDP on rogue APs. None **Command Default** Privileged EXEC (#) **Command Modes Command History** Release Modification Cisco IOS XE Amsterdam 16.12.1 This command was introduced. None **Usage Guidelines**

Example

The following example shows you how to initiate and configure Rogue Location Discovery Protocol on rogue APs:

Device# wireless wps rogue ap mac-address 10.1.1 rldp initiate

wireless wps rogue ap notify-min-rssi

To configure the minimum RSSI notification threshold for rogue APs, use the **wireless wps rogue ap notify-min-rssi** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap notify-min-rssi

no wireless wps rogue ap notify-min-rssi

Syntax Description notify-min-rssi Configure the minimum RSSI notification threshold for rogue APs.

Command Default None

Command Modes Global Configuration mode

Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	This command was
		introduced.

Usage Guidelines None

Example

The following example shows you how to configure the minimum RSSI notification threshold for rogue APs:

Device(config) # wireless wps rogue ap notify-min-rssi

wireless wps rogue ap notify-rssi-deviation

To configure the RSSI deviation notification threshold for rogue APs, use the **wireless wps rogue ap notify-rssi-deviation** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap notify-rssi-deviation

rogue APs:

no wireless wps rogue ap notify-rssi-deviation

Syntax Description	notify-rssi-deviation Configure	es the RSSI deviation notification threshold for rogue APs.
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.
Usage Guidelines	None	
	Example	
	The following example shows you	how to configure the RSSI deviation notification threshold for

Device(config) # wireless wps rogue ap notify-rssi-deviation

Configuration Commands: g to z

wireless wps rogue ap rldp alarm-only

To set Rogue Location Discovery Protocol (RLDP) and alarm if rogue is detected, use the **wireless wps rogue ap rldp alarm-only** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap rldp alarm-only

no wireless wps rogue ap rldp alarm-only

Syntax Description	alarm-only Sets RLDP and alar	m if rogue is detected
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.
Usage Guidelines	None	

Example

The following example shows you how to set RLDP and alarm if rogue is detected:

Device(config)# wireless wps rogue ap rldp alarm-only

wireless wps rogue ap rldp alarm-only monitor-ap-only

To perform RLDP only on monitor APs, use the **wireless wps rogue ap rldp alarm-only monitor-ap-only** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap rldp alarm-only monitor-ap-only

no wireless wps rogue ap rldp alarm-only monitor-ap-only

Syntax Description	monitor-ap-only Perfo	orms RLDP on monitor APs only.
Command Default	None	
Command Modes	Global Configuration mod	de
Command History	Release	Modification
	Cisco IOS XE Amsterdan	16.12.1 This command was introduced.
Usage Guidelines	None	

Example

The following example shows you how to perform RLDP only on monitor APs,:

Device(config)# wireless wps rogue ap rldp alarm-only monitor-ap-only

wireless wps rogue ap rldp auto-contain

To configure RLDP, alarm and auto-contain if rogue is detected, use **wirelesswps rogueaprldp auto-contain** command. Use the **no** form of the command to disable the alarm.

[no] wireless wps rogue ap rldp auto-contain monitor-ap-only

Syntax Description monitor-ap-only Perform RLDP only on monitor AP

Command Default	None	
Command Modes	Global Configuration	
Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.
	Cisco IOS XE 3.7.3E	The no form of the command was introduced.

Example

This example shows how to configure an alarm for a detected rogue.

Devicewireless wps rogue ap rldp auto-contain

Configuration Commands: g to z

wireless wps rogue ap rldp retries

To configure RLDP retry times on rogue APs, use the **wireless wps rogue ap rldp retries** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap rldp retries

no wireless wps rogue ap rldp retries

Syntax Description	retries Configures RLDP retry times on rogue APs.		
Command Default	None		
Command Modes Global Configuration mode			
Command History	Release	Modification	
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.	

Example

The following example shows you how to configure RLDP retry times on rogue APs:

Device(config) # wireless wps rogue ap rldp retries

wireless wps rogue ap rldp schedule

To configure RLDP scheduling, use the **wireless wps rogue ap rldp schedule** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap rldp schedule

no wireless wps rogue ap rldp schedule

Syntax Description	schedule Configures RLDP scheduling.	
Command Default	None	
Command Modes	Global Configuration mode	
Command History	Release	Modification
	Cisco IOS XE Amsterdam 16.12.1	This command was introduced.
Usage Guidelines	None	

Example

The following example shows you how to configure RLDP scheduling:

Device(config) # wireless wps rogue ap rldp schedule

wireless wps rogue ap rldp schedule day

To configure the day when RLDP scheduling is to be done, use the **wireless wps rogue ap rldp schedule day** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap rldp schedule day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } start [HH:MM:SS] end [HH:MM:SS]

no wireless wps rogue ap rldp schedule day { friday | monday | saturday | sunday | thursday | tuesday | wednesday } start [HH:MM:SS] end [HH:MM:SS]

Syntax Description	day { friday monday satur thursday tuesday wedno	day sunday esday }	Configures the is to be done.	day of the week when RLDP scheduling
	start [HH:MM:SS]		Configures the	start time for RLDP schedule for the day.
	end [HH:MM:SS]		Configures the	end time for RLDP schedule for the day.
Command Default	None			
Command Modes	Global Configuration mode			
Command History	Release	Modification		-
	Cisco IOS XE Amsterdam 16.12.1	This comman introduced.	d was	-
Usage Guidelines	None			-
	Example			
	The following example shows you is to be done:	1 how to config	ure the day of th	e week, when RLDP scheduling

Device (config) # wireless wps rogue ap rldp schedule day friday start 10:10:10 end 15:15:15

wireless wps rogue ap timeout

To configure the expiry time for rogue APs, in seconds, use the **wireless wps rogue ap timeout** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue ap timeout 240-3600

no wireless wps rogue ap timeout 240-3600

Syntax Description	rogue ap timeout Configures the expiry time for rogue APs, in seconds.			
	240-3600	Specifies the number o	f seconds before rogue entries are flushed.	
Command Default	None			
Command Modes	Global configuratio	iguration		
Command History	Release		Modification	
	Cisco IOS XE Gib	caltar 16.12.1	This command was introduced.	
Usage Guidelines	None			

Example

This example shows how to configure the expiry time for rogue APs, in seconds:

Device(config) # wireless wps rogue ap timeout 250

wireless wps rogue auto-contain

To configure the auto contain level and to configure auto containment for monitor AP mode, use the **wireless wps rogue auto-contain** command. To disable the configuration, use the **no** form of this command.

wireless wps rogue auto-contain { level 1 - 4 | monitor-ap-only }

no wireless wps rogue auto-contain { level 1 - 4 | monitor-ap-only }

Syntax Description	auto-contain Configures auto contain for rogue devices.		ces.
	level	Configures auto contain levels.	
	<i>I - 4</i> Specifies the auto containment levels.		
	monitor-ap-only	Configures auto contain for monitor AP	mode.
Command Default	None		
Command Modes	Global configurati	on	
Command History	Release	I	Modification
	Cisco IOS XE Gi	braltar 16.12.1	This command was introduced.
Usage Guidelines	None		
	F		

Example

This example shows how to configure the auto contain level and to configure auto containment for monitor AP mode:

Device(config)# wireless wps rogue auto-contain level 2
Device(config)# wireless wps rogue auto-contain monitor-ap-only

wireless wps rogue client aaa

To configure the use of AAA or local database to detect valid MAC addresses of rogue clients, use the **wireless wps rogue client aaa** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue client aaa

no wireless wps rogue client aaa

Command Default None

Command Modes Global Configuration mode

Example

The following example shows you how to configure Mobility Services Engine (MSE) to detect valid MAC addresses of rogue clients:

introduced.

Device(config) # wireless wps rogue client mse

wireless wps rogue client client-threshold

To configure rogue client per a rogue AP SNMP trap threshold, use the **wireless wps rogue client client-threshold** command. To disable the configuration, use the **no** form of this command.

wireless wps rogue client client-threshold 0 - 256

no wireless wps rogue client client-threshold 0 - 256

Syntax Description	rogue client			
	client-threshold			
	0 - 256	Specifies the client thres	hold.	
Command Default	None			
Command Modes	Global configurati	guration		
Command History	Release		Modification	
	Cisco IOS XE Gi	braltar 16.12.1	This command was introduced.	
Usage Guidelines	None			

Example

This example shows how to configure rogue client per a rogue AP SNMP trap threshold:

Device(config) # wireless wps rogue ap timeout 250

wireless wps rogue client notify-min-rssi

To configure the minimum RSSI notification threshold for rogue clients, use the **wireless wps rogue client notify-min-rssi** command. Use the **no** form of this command to disable the configuration.

wireless wps rogue client notify-min-rssi -128 - -70

no wireless wps rogue client notify-min-rssi -128 - -70

Syntax Description	rogue clients	Configures rogue clients	
	notify-min-rssi	Configures the minimum	RSSI notification threshold for rogue clients.
	-12870	Specifies the RSSI thresh	nold in decibels.
Command Default	None		
Command Modes	Global configurat	tion	
Command History	Release		Modification
			This command was introduced

Example

This example shows how to configure the minimum RSSI notification threshold for rogue clients:

Device(config) # wireless wps rogue client notify-min-rssi -125

wireless wps rogue client notify-rssi-deviation

To configure the RSSI deviation notification threshold for rogue clients, use the **wireless wps rogue client notify-rssi-deviation** command. To disable the configuration, use the **no** form of this command.

wireless wps rogue client notify-rssi-deviation 0 - 10

no wireless wps rogue client notify-rssi-deviation 0 - 10

Syntax Description	notify-rssi-deviation Configures the RSSI deviation notification threshold for rogue clients.		
	0 - 10	Specifies the RSSI threshold in decibels.	
Command Default	None		
Command Modes	Global configuration		
Command History	Release	Modification	
	Cisco IOS XE Gibralta	ar 16.12.1 This command was introduced.	

Example

This example shows how to configure the RSSI deviation notification threshold for rogue clients:

Device(config)# wireless wps rogue client notify-rssi-deviation 6

wireless wps rogue detection

To configure various rouge detection parameters, use the wireless wps rogue detection command.

wireless wps rogue detection [{min-rssi rssi | min-transient-time transtime}]

min-rssi rssiConfigures the minimum RSSI value that rogues should have for Al detect and for rogue entry to be created in the device.		
min-transient-time transtime	Configures the time interval at which rogues have to be consistently scanned for by APs after the first time the rogues are scanned.	
None.		
Global configuration		
Release	Modification	
Cisco IOS XE Gibraltar 16.10.	1 This command was introduced.

wireless wps rogue notify-syslog

To enable syslog notification for rogue events, use the wireless wps rogue notify-syslog command.

wireless wps rogue notify-syslog

Syntax Description	This command has no keywords or arguments.		
Command Default	None		
Command Modes	Global configuration (config)		
Command History	Release	Modification	
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.	

Example

This example shows how to enable syslog notification for rogue events:

Device# configure terminal Device(config)# wireless wps rogue notify-syslog

wireless wps rogue rule

To configure rogue classification rule, use the wireless wps rogue rule command.

Syntax Description	rule rule-name	Specifies a rule name.			
	priority priority	Changes the priority of a specific rule and shifts others in the list accordingly Specifies the classification of a rule.			
	classify				
	friendly	Classifies a rule as friendly.			
	malicious	Classifies a rule as malicious.			
	condition { client-count number duration encryption infrastructure rssi ssid}	Specifies the conditions for a rule that the rogue access point must meet.			
		 Type of the condition to be configured. The condition types are listed below client-count—Requires that a minimum number of clients be associated to a rogue access point. The valid range is 1 to 10 (inclusive). duration—Requires that a rogue access point be detected for a minimum period of time. The valid range is 0 to 3600 seconds (inclusive). 			
		 encryption—Requires that the advertised WLAN does not have encryption enabled. 			
		• infrastructure—Requires the SSID to be known to the controller			
		 rssi—Requires that a rogue access point have a minimum RSSI value. The range is from -95 to -50 dBm (inclusive). 			
		• ssid—Requires that a rogue access point have a specific SSID.			
	default	Sets the command to its default settings.			
	exit	Exits the sub-mode.			
	match {all any}	Configures matching criteria for a rule. Specifies whether a detected rogue access point must meet all or any of the conditions specified by the rule in order for the rule to be matched and the rogue access point to adopt the classification type of the rule.			
	no	Negates a command or set its defaults.			
	shutdown	Shuts down the system.			
Command Default	None.				
Command Modes	- Global configuration				
Sommana Mibues	C				

I

Command History	Release	Modification
	Cisco IOS XE Gibraltar 16.10.1	This command was introduced.
Usage Guidelines	None.	
	This example shows how to create a rule that can organize a	and display rogue access points as Friendly:
	Device# configure terminal Device(config)# wireless wps rogue rule ap1 pric Device(config-rule)# classify friendly	ority 1

wireless wps rogue scale mode hybrid

To configure the rogue scale hybrid mode (unused quota reserved for higher priority rogue APs can be used by rogue APs of lower priority when space available), use the **wireless wps rogue scale mode hybrid** command. Use the **no** form of this command to disable the feature.

wireless wps rogue scale mode hybrid

no wireless wps rogue scale mode hybrid

Syntax Description	This command has no keywords	or arguments.
Command Default	None	
Command Modes	Global Configuration	
Command History	Release	Modification
	Cisco IOS XE Cupertino 17.9.1	This command was introduced.

Example

This example shows how to configure the rogue scale hybrid mode:

Device(config) # wireless wps rogue scale mode hybrid

wireless wps rogue scale priority

To configure the rogue classification priority order, use the **wireless wps rogue scale priority malicious** command. Use the **no** form of this command to disable the feature.

wireless wps rogue scale priority malicious { high | highest | low | medium } custom { high
| highest | low | medium } unclassified { high | highest | low | medium } friendly {
high | highest | low | medium }

no wireless wps rogue scale priority malicious { high | highest | low | medium } custom { high | highest | low | medium } unclassified { high | highest | low | medium } friendly { high | highest | low | medium }

Syntax Description	malicious Configures the priority of		of malicious rogue APs.		
	{ high highest low medium }	Indicates the Rogue AI and Low.	P storage priority as High, Highest, Medium,		
	custom	Configures the priority	of custom classified rogue APs.		
	unclassified	Configures the priority	Configures the priority of unclassified rogue APs.		
	friendly	of friendly rogue APs.			
Command Default	None				
	The default value for malicious is medium , and the default valu		stom is high , the default value for unclassified		
Command Modes	Global Configuration				
Command History	Release	Modification	-		
	Cisco IOS XE Cupertino 17.9.1	This command was introduced.	-		

Example

This example shows how to configure the rogue classification priority order:

Device(config) # wireless wps rogue scale priority malicious highest custom high unclassified medium friendly low

wireless wps rogue scale quota

To configure maximum scale rogue AP prioritisation and quotas, use the **wireless wps rogue scale quota** command. Use the **no** form of this command to disable the feature.

wireless wps rogue scale quota malicious percentage-malicious-rogue-AP **custom** percentage-custom-rogue-AP **unclassified** percentage-unclassified-rogue-AP **friendly** percentage-friendly-rogue-AP

no wireless wps rogue scale quota malicious percentage-malicious-rogue-AP **custom** percentage-custom-rogue-AP **unclassified** percentage-unclassified-rogue-AP **friendly** percentage-friendly-rogue-AP

malicious percentage-malicious-rogue-AP custom percentage-custom-rogue-AP unclassified	Indicates the percentage of the total rogue AP scale reserved for malicious rogue APs. Specifies the value in percentage of the total rogue AP scale reserved for malicious rogue APs. The value range is from 0 to 100. Indicates the percentage of the total rogue AP scale reserved for custom rogue APs. Specifies the value in percentage of the total rogue AP scale reserved for custom rogue APs. Specifies the value in percentage of the total rogue AP scale reserved for custom rogue APs. Indicates the percentage of the total rogue AP scale reserved for custom rogue APs.		
custom percentage-custom-rogue-AP unclassified	 malicious rogue APs. The value range is from 0 to 100. Indicates the percentage of the total rogue AP scale reserved for custom rogue APs. Specifies the value in percentage of the total rogue AP scale reserved for custom rogue APs. The value range is from 0 to 100. Indicates the percentage of the total rogue AP scale reserved for 		
percentage-custom-rogue-AP unclassified	rogue APs. Specifies the value in percentage of the total rogue AP scale reserved for custom rogue APs. The value range is from 0 to 100. Indicates the percentage of the total rogue AP scale reserved for		
unclassified	custom rogue APs. The value range is from 0 to 100. Indicates the percentage of the total rogue AP scale reserved for		
percentage-unclassified-rogue-AP	Specifies the value in percentage of the total rogue AP scale reserved for unclassified rogue APs. The value range is from 0 to 100.		
friendly	Indicates the percentage of the total rogue AP scale reserved for friendly rogue APs.		
percentage-friendly-rogue-AP	Specifies the value in percentage of the total rogue AP scale reserved for friendly rogue APs. The value range is from 0 to 100.		
None
