Introduction to mDNS Gateway

Multicast Domain Name System (mDNS) is an Apple service discovery protocol which locates devices and services on a local network with the use of mDNS service records.

The Bonjour protocol operates on service announcements and queries. Each query or advertisement is sent to the Bonjour multicast address ipv4 224.0.0.251 (ipv6 FF02::FB). This protocol uses mDNS on UDP port 5353.

The address used by the Bonjour protocol is link-local multicast address and therefore is only forwarded to the local L2 network. As, multicast DNS is limited to an L2 domain for a client to discover a service it has to be part of the same L2 domain, This is not always possible in any large scale deployment or enterprise.

In order to address this issue, the Cisco Catalyst 9800 Series Wireless Controller acts as a Bonjour Gateway. The controller then listens for Bonjour services, caches these Bonjour advertisements (AirPlay, AirPrint, and so on) from the source or host. For example, Apple TV responds back to Bonjour clients when asked or requested for a service. This way you can have sources and clients in different subnets.

By default, the mDNS gateway is disabled on the controller. To enable mDNS gateway functionality, you must explicitly configure mDNS gateway using CLI or Web UI.

The source IP address of all outgoing mDNS packets use the mDNS source interface VLAN SVI IP address. By default, wireless management interface will be the source interface.

Guidelines and Restrictions for Configuring mDNS AP

- Cisco recommends deploying scalable Wide Area Bonjour to route mDNS service between Wired and Wireless networks. Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) introduces a new mDNS gateway called Service-Peer mode to replace the classic mDNS flood-n-learn to support Enterprise-grade scalable, stateful, and reliable complete unicast-based mDNS service-routing with upstream gateway Cisco Catalyst 9000 Series Switches. For more information, see [Part: Cisco DNA Service for Bonjour](#).
- The mDNS AP (classic flood-n-learn based feature) is enhanced with complete unicast-based service-routing using Cisco Wide Area Bonjour supporting flood-free Wired and Wireless networks to overcome several operational, scalable, and service resiliency challenges.
- The mDNS AP extends the mDNS flood from Wired VLANs to AP and further extends over the CAPWAP tunnel to WLC for central processing across Core network. Cisco recommends that the mDNS AP must be considered only for small network environments.
- The mDNS AP is supported only in Local and Monitor modes. If Cisco Wireless AP is in FlexConnect mode, the Fabric mode AP does not support mDNS AP feature. For more information on how to enable the mDNS service-routing for various distributed Wireless modes, see [Part: Cisco DNA Service for Bonjour](#).
- Wireless users connected to mDNS AP may not be able to browse the Wired mDNS services across flooded Wired VLAN to mDNS AP.
- The Wired mDNS service-provider VLANs must be extended to flood the mDNS traffic up to mDNS AP ethernet port in trunk mode settings. The Wired VLAN extension to mDNS AP may include other Wired flood traffic, such as Broadcast, Unknown Unicast, and Layer 2 Multicast that impacts the mDNS AP scale and performance.

- It is recommended to have minimum one mDNS AP for each Layer 3 Access switch. All Wired mDNS traffic is flooded using alternate L2 methods, if single mDNS AP is shared between multiple Layer 3 Access switch.
- The maximum mDNS AP scale limit for each Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) is limited.
- The maximum mDNS Wired VLAN count for each WLC is limited.
- The old Wired mDNS service entry continues to be advertised to all Wireless users up to 4500 seconds based on the mDNS cache timers on WLC. The stale entries require manual clearing from local cache in WLC.
- The mDNS AP does not support mDNS Query packet suppression or rate-limiter in AP. The Wired mDNS flood from all Wired VLAN is extended to WLC for central processing of policy enforcement.
- The maximum number of flooded packets for each second processing from Wired VLANs to mDNS AP is limited. The mDNS AP performance and reliability may get compromised in large network environments.
- A maximum of 10 Wired VLANs' mDNS flood can be extended to mDNS AP. Combined large Wired VLAN and mDNS AP scale may impact scale and performance in AP and WLC.
- Only one mDNS AP is supported for each Wired VLAN. Multiple mDNS APs cannot be configured to map the same Wired VLAN ID as it causes service instability and duplicate processing.
- High Availability is not supported in multiple mDNS AP. The mDNS services across Wired and Wireless network gets disrupted when connectivity to mDNS AP is lost due to any kinds of failures.
- Only one Wired mDNS service-policy is supported for all network-wide mDNS AP.
- The following limitations hold true when mDNS AP introduces LSS-based mDNS service filtering between flooded Wired VLANs to Wireless:
 - A single mDNS AP with LSS enabled can distribute Wired mDNS services only to nearby limited APs in neighbor list. The Wireless users connected to the non-neighbor list may not be able to discover any Wired mDNS services.
 - Only one mDNS AP can be deployed in each Wired VLAN. The Wired VLANs need to be reconfigured across LAN network to enable unique LSS-based mDNS AP in locations. For instance, to achieve mDNS service discovery in each floor, the Wired VLAN or Subnet must be on each floor with one mDNS AP per floor to discover all other APs as neighbor in the same floor.
- The mDNS AP do not support IPv6 for Wired mDNS service-provider or service-receiver. Only IPv4 is supported.
- The mDNS AP do not support role-based mDNS service filtering between Wired and Wireless networks.
- The mDNS AP do not detect and auto-resolve duplicate mDNS service-instance names across Wired VLANs. The Cisco Catalyst 9800 Series Wireless LAN Controller (WLC) discovers and records the first service instance with unique name in its local cache database. If a duplicate service instance name is discovered, the WLC rejects the duplicate name and does not distribute it to the Wireless clients.
- Wireless multicast link-local is enabled by default. When wireless link-local is enabled, only mDNS Bridging mode is supported. If you require mDNS Gateway for wired services, disable wireless link-local.

- In the mDNS gateway mode, controller does not support service discovery from the mDNS messages using multiple IP fragments.
- If you have a FlexConnect AP as an mDNS gateway, ensure that you do not use "." in the service provider name, as it is not supported.

Enabling mDNS Gateway (GUI)

Procedure

- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **Global** section, toggle the slider to enable or disable the **mDNS Gateway**.
- Step 3** From the **Transport** drop-down list, choose one of the following types:
- **ipv4**
 - **ipv6**
 - **both**
- Step 4** Enter an appropriate timer value in **Active-Query Timer**. The valid range is between 1 to 120 minutes. The default is 30 minutes.
- Step 5** From the **mDNS-AP Service Policy** drop-down list, choose an mDNS service policy.
- Note** Service policy is optional only if mDNS-AP is configured. If mDNS-AP is not configured, the system uses default-service-policy.
- Step 6** Click **Apply**.
-

Enabling or Disabling mDNS Gateway (GUI)

Procedure

- Step 1** Choose **Configuration > Services > mDNS > Global**.
- Step 2** Enable or disable the **mDNS Gateway** toggle button.
- Step 3** Choose **ipv4** or **ipv6** or **both** from the **Transport** drop-down list.
- Step 4** Enter the **Active-Query Timer**.
- Step 5** Click **Apply**.
-

Enabling or Disabling mDNS Gateway (CLI)

- Note**
- mDNS gateway is disabled by default globally on the controller.
 - You need both global and WLAN configurations to enable mDNS gateway.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd gateway Example: Device(config)# mdns-sd gateway	Enables mDNS gateway.
Step 4	location {ap-location ap-name location-group lss regex site-tag ssid} Example: Device(config-mdns-sd)# location site-tag	Filters mDNS gateway based on location. Here, <ul style="list-style-type: none"> • ap-location signifies location-based filtering using AP location. • ap-name signifies location-based filtering using AP name. • location-group signifies location-based filtering using location group. • lss signifies location-based filtering using Location Specific Services (LSS). • regex signifies location-based filtering using Regular Expression. • site-tag signifies location-based filtering using site tag. • ssid signifies location-based filtering using SSID.

	Command or Action	Purpose
		<p>Note The lss is the default location filter, if mDNS gateway is configured globally.</p>
Step 5	<p>transport {ipv4 ipv6 both}</p> <p>Example:</p> <pre>Device(config-mdns-sd)# transport ipv4</pre>	<p>Processes mDNS message on a specific transport.</p> <p>Here,</p> <p>ipv4 signifies that the IPv4 mDNS message processing is enabled. This is the default value.</p> <p>ipv6 signifies that the IPv6 mDNS message processing is enabled.</p> <p>both signifies that the IPv4 and IPv6 mDNS message is enabled for each network.</p>
Step 6	<p>active-query timer <i>active-query-periodicity</i></p> <p>Example:</p> <pre>Device(config-mdns-sd)# active-query timer 15</pre>	<p>Changes the periodicity of mDNS multicast active query.</p> <p>Note An active query is a periodic mDNS query to refresh dynamic cache.</p> <p>Here,</p> <p><i>active-query-periodicity</i> refers to the active query periodicity in Minutes. The valid range is from 1 to 120 minutes. Active query runs with a default periodicity of 30 minutes.</p>
Step 7	<p>source-interface vlan <i>vlan-id</i></p> <p>Example:</p> <pre>Device(config-mdns-sd)# source-interface vlan 101</pre>	<p>Configures the source interface to communicate between SDG agent and service peer. By default, wireless management interface is used. The interface that you configure will be used for all mDNS transactions.</p>
Step 8	<p>exit</p> <p>Example:</p> <pre>Device(config-mdns-sd)# exit</pre>	<p>Returns to global configuration mode.</p>

Creating Default Service Policy

When the mdns gateway is enabled on any of the WLANs by default, mdns-default-service-policy is associated with it. Default service policy consists of default-service-list and their details are explained in this section. You can override the default service policy with a custom service policy.

Procedure

-
- Step 1** Create a service-definition if the service is not listed in the preconfigured services.
 - Step 2** Create a service list for IN and OUT by using the service-definitions.
 - Step 3** Use the existing service list to create a new service. For more information, refer to *Creating Service Policy* section.
 - Step 4** Attach the mdns-service-policy to the profile or VLAN that needs to be enforced.
 - Step 5** To check the default-mdns-service list, use the following command:
show mdns-sd default-service-list
-

Creating Custom Service Definition (GUI)

Procedure

-
- Step 1** Choose **Configuration > Services > mDNS**.
 - Step 2** In the **Service Definition** section, click **Add**.
 - Step 3** In the **Quick Setup: Service Definition** page that is displayed, enter a name and description for the service definition.
 - Step 4** Enter a service type and click + to add the service type.
 - Step 5** Click **Apply to Device**.
-

Creating Custom Service Definition

Service definition is a construct that provides an admin friendly name to one or more mDNS service types or A pointer (PTR) Resource Record Name.

By default, few built-in service definitions are already predefined and available for admin to use.

In addition to built-in service definitions, admin can also define custom service definitions.

You can execute the following command to view the list of all the service definitions (built-in and custom):

```
Device# show mdns-sd master-service-list
```

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd service-definition <i>service-definition-name</i> Example: Device(config)# mdns-sd service-definition CUSTOM1	Configures mDNS service definition. Note <ul style="list-style-type: none"> • All the created custom service definitions are added to the primary service list. • Primary service list comprises of a list of custom and built-in service definitions.
Step 4	service-type <i>string</i> Example: Device(config-mdns-ser-def)# service-type _custom1._tcp.local	Configures mDNS service type.
Step 5	exit Example: Device(config-mdns-ser-def)# exit	Returns to global configuration mode.

Creating Service List (GUI)

Procedure

-
- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **Service List** section, click **Add**.
- Step 3** In the **Quick Setup: Service List** page that is displayed, enter a name for the service list.
- Step 4** From the **Direction** drop-down list, choose **IN** for inbound filtering or **OUT** for outbound filtering.
- Step 5** From the **Available Services** drop-down list, choose a service type to match the service list.
- Note** To allow all services, choose the **all** option.
- Step 6** Click **Add Services**.
- Step 7** From the **Message Type** drop-down list, choose the message type to match from the following options:
- **any**—To allow all messages.
 - **announcement**—To allow only service advertisements or announcements for the device.
 - **query**—To allow only a query from the client for a service in the network.

Step 8 Click **Save** to add services.

Step 9 Click **Apply to Device**.

Creating Service List

mDNS service list is a collection of service definitions.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd service-list <i>service-list-name</i> {IN OUT} Example: Device(config)# mdns-sd service-list Basic-In IN Device(config)# mdns-sd service-list Basic-Out OUT	Configures mDNS service list. <ul style="list-style-type: none"> • IN: Provides inbound filtering. • Out: Provides outbound filtering.
Step 4	match <i>service-definition-name</i> message-type {announcement any query} Example: Device(config-mdns-sl-in)# match CUSTOM1 message-type query	Matches the service to the message type. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. Note To add a service, the service name must be part of the primary service list. If the mDNS service list is set to IN, you get to view the following command: match <i>service-definition-name</i> message-type {announcement any query} . If the mDNS service list is set to Out, you get to view the following command: match <i>service-definition-name</i> .

	Command or Action	Purpose
		(OR)
Step 5	match all message-type {announcement any query} Example: <pre>Device(config-mdns-sl-in)# match all message-type query</pre>	<p>Matches all services to the message type.</p> <p>Note To add a service, the service name must be part of the primary service list.</p> <p>If the mDNS service list is set to IN, you get to view the following command: match all message-type {announcement any query}.</p> <p>If the mDNS service list is set to OUT, you get to view the following command: match all.</p> <p>In case of IN or OUT filter, if any of the service contains the same or subset of the message type (query or announcement), the match all is not allowed unless the existing services are removed.</p>
Step 6	show mdns-sd service-list {direction name }	<p>Displays inbound or outbound direction list of the configured service-list to classify matching service-types for service-policy. The list can be filtered by name or specific direction.</p>
Step 7	exit Example: <pre>Device(config-mdns-sl-in)# exit</pre>	<p>Returns to global configuration mode.</p>

Creating Service Policy (GUI)

Procedure

-
- Step 1** Choose **Configuration > Services > mDNS**.
 - Step 2** In the **Service Policy** section, click **Add**.
 - Step 3** In the **Quick Setup: Service Policy** page that is displayed, enter a name for the service policy.
 - Step 4** From the **Service List Input** drop-down list, choose one of the types.
 - Step 5** From the **Service List Output** drop-down list, choose one of the types.
 - Step 6** From the **Location** drop-down list, choose the location you want to associate with the service list.
 - Step 7** Click **Apply to Device**.
-

Creating Service Policy

mDNS service policy is used for service filtering while learning services or responding to queries.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy mdns-policy1	Enables mDNS service policy.
Step 4	location { ap-location ap-name location-group lss regex site-tag ssid } Example:	Filters mDNS service types based on location filter.

	Command or Action	Purpose
	<pre>Device(config-mdns-ser-pol)# location lss</pre>	<p>Note</p> <ul style="list-style-type: none"> • If location filter is not applied during service policy, the global location filter (default=lss) will be considered. • The location filter from the service policy takes precedence even if the global location filter is configured. • In Location Specific Services (LSS) based filtering, the mDNS gateway responds with the service instances learnt from the neighboring APs of the querying client AP. Other service instances for the rest of APs are filtered. • In Site tag based filtering, the mDNS gateway responds with the service instances that belong to the same site-tag as that of querying client. • The mDNS gateway responds back with wired services even if the location based filtering is configured.
Step 5	<p>service-list <i>service-list-name</i> {IN OUT}</p> <p>Example:</p> <pre>Device(config-mdns-ser-pol)# service-list VLAN100-list IN</pre>	<p>Configures various service-list names for IN and OUT directions.</p> <p>Note</p> <p>If an administrator decides to create or use a custom service policy, then the custom service policy must be configured with service-lists for both directions (IN and OUT); otherwise, the mDNS Gateway will not work (will not learn services if there is no IN service-list, or will not reply or announce services learned if there is no OUT service-list).</p>
Step 6	<p>exit</p> <p>Example:</p>	<p>Returns to global configuration mode.</p>

	Command or Action	Purpose
	<code>Device(config-mdns-ser-pol)# exit</code>	

Configuring a Local or Native Profile for an mDNS Policy

When an administrator configures local authentication and authorization and does not expect to get any mDNS policy from the AAA server, the administrator can configure a local or native profile to select a mDNS policy based on user, role, or device type. When this local or native profile is mapped to the wireless profile policy, mDNS service policy is applied on the mDNS packets that are processed on that WLAN.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <code>Device# configure terminal</code>	Enters global configuration mode.
Step 2	service-template <i>template-name</i> Example: <code>Device(config)# service-template mdns</code>	Configures the service-template or identity policy.
Step 3	mdns-service-policy <i>mdns-policy-name</i> Example: <code>Device(config-service-template)# mdns-service-policy mdnsTV</code>	Configures the mDNS policy.
Step 4	exit Example: <code>Device(config-service-template)# exit</code>	Returns to global configuration mode.

Configuring an mDNS Flex Profile (GUI)

Procedure

- Step 1** Choose **Configuration > Services > mDNS**.
- Step 2** In the **mDNS Flex Profile** section, click **Add**. The **Add mDNS Flex Profile** window is displayed.
- Step 3** In the **Profile Name** field, enter the flex mDNS profile name.
- Step 4** In the **Service Cache Update Timer** field, specify the service cache update time. The default value is 1 minute. The valid range is from 1 to 100 minutes.
- Step 5** In the **Statistics Update Timer** field, specify the statistics update timer. The default value is 1 minute. The valid range is from 1 to 100 minutes.

- Step 6** In the **VLANS** field, specify the VLAN ID. You can enter multiple VLAN IDs separated by commas, or enter a range of VLAN IDs. Maximum number of VLANs allowed is 16.
- Step 7** Click **Apply to Device**.

Configuring an mDNS Flex Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd flex-profile <i>mdns-flex-profile-name</i> Example: Device(config)# mdns-sd flex-profile <i>mdns-flex-profile-name</i>	Enters the mDNS Flex Profile mode.
Step 3	update-timer service-cache <i>service-cache timer-value <1-100></i> Example: Device(config-mdns-flex-profile)# update-timer service-cache 60	Configures the mDNS update service cache timer for the flex profile. The default value is 1 minute. Value range is between 1 minute and 100 minutes.
Step 4	update-timer statistics <i>statistics timer-value <1-100></i> Example: Device(config-mdns-flex-profile)# update-timer statistics 65	Configures the mDNS update statistics timer for the flex profile. The default value is 1 minute. The valid range is from 1 to 100 minutes.
Step 5	wired-vlan-range <i>wired-vlan-range value</i> Example: Device(config-mdns-flex-profile)# wired-vlan-range 10 - 20	Configures the mDNS wired VLAN range for the flex profile. The default value is 1 minute. The valid range is from 1 minute to 100 minutes.

Applying an mDNS Flex Profile to a Wireless Flex Connect Profile (GUI)

Procedure

- Step 1** Choose **Configuration > Tags & Profiles > Flex**.

- Step 2** Click **Add**.
The **Add Flex Profile** window is displayed.
- Step 3** Under the **General** tab, from the **mDNS Flex Profile** drop-down list, choose a flex profile name from the list.
- Step 4** Click **Apply to Device**.

Applying an mDNS Flex Profile to a Wireless Flex Connect Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	wireless profile flex <i>wireless-flex-profile-name</i> Example: Device# <code>wireless profile flex wireless-flex-profile-name</code>	Enters wireless flex profile configuration mode.
Step 3	mdns-sd <i>mdns-flex-profile</i> Example: Device(config-wireless-flex-profile)# <code>mdns-sd mdns-flex-profile-name</code>	Enables the mDNS features for all the APs in the profile

Enabling the mDNS Gateway on the VLAN Interface

This procedure configures the mDNS service policy for a specific VLAN. This allows the administrator to configure different settings to the mDNS packets on per VLAN interface basis and not on per WLAN basis.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.
Step 2	interface vlan <i>vlan-interface-number</i> Example: Device(config)# <code>interface vlan 200</code>	Configures a VLAN ID and enters interface configuration mode.

	Command or Action	Purpose
Step 3	ip address <i>ip-address subnet-mask</i> Example: <pre>Device(config-if)# ip address 111.1.1.1 255.255.255.0</pre>	Configures the IP address for the interface.
Step 4	mdns-sd gateway Example: <pre>Device(config-if)# mdns-sd gateway</pre>	Enables mDNS configuration on a VLAN interface.
Step 5	service-policy <i>service-policy-name</i> Example: <pre>Device(config-if-mdns-sd)# service-policy test-mDNS-service-policy</pre>	Configures the service policy. Note If specific <i>service-policy-name</i> is not defined, the VLAN will use the default-mdns-service-policy by default. By default, default-mDNS-service-policy gets created in the system and it will use default-mDNS-service-list configuration for filtering mDNS service announcement and queries.
Step 6	end Example: <pre>Device(config-if-mdns-sd)# end</pre>	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Location-Based Service Filtering

Prerequisite for Location-Based Service Filtering

You need to create the Service Definition and Service Policy. For more information, see [Creating Custom Service Definition](#) section and [Creating Service Policy](#) section.

Configuring mDNS Location-Based Filtering Using SSID

When a service policy is configured with the SSID as the location name, the response to the query will be the services that were learnt on that SSID.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
Step 3	location ssid Example: Device(config-mdns-ser-pol)# location ssid	Configures location-based filtering using SSID.
Step 4	end Example: Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring mDNS Location-Based Filtering Using AP Name

When a service policy is configured with the AP name as the location, the response to the query will be the services that were learnt on that AP.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
Step 3	location ap-name Example: Device(config-mdns-ser-pol)# location ap-name	Configures location-based filtering using an AP name.
Step 4	end Example: Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring mDNS Location-Based Filtering Using AP Location

When a service policy is configured with location as the AP-location, the response to the query will be the services that were learnt on all the APs using the same AP "location" name (not to be confused with "site-tag").

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy mdns-policy1	Configures the service policy.
Step 3	location ap-location Example: Device(config-mdns-ser-pol)# location ap-location	Configures location-based filtering using the AP location.
Step 4	end Example: Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring mDNS Location-Based Filtering Using Regular Expression

- When a service policy is configured with the location as a regular expression that matches the corresponding AP name, the response to the query will be the services that were learnt on a group of APs based on the AP name.
- When a service policy is configured with the location as a regular expression that matches the corresponding AP location, the response to the query will be the services that were learnt on a group of APs based on the AP location.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd service-policy <i>service-policy-name</i> Example:	Configures the service policy.

	Command or Action	Purpose
	Device(config)# mdns-sd service-policy mdns-policy1	
Step 3	<p>location regex {ap-location <i>regular-expression</i> ap-name <i>regular-expression</i>}</p> <p>Example:</p> <pre>Device(config-mdns-ser-pol)# location regex ap-location dns_location Device(config-mdns-ser-pol)# location regex ap-name dns_name</pre>	Configures location-based filtering using regular expression.
Step 4	<p>end</p> <p>Example:</p> <pre>Device(config-mdns-ser-pol)# end</pre> <p>Note To filter the services for which AP names have the specific keyword such as <i>AP-2FLR-SJC-123</i>, you can use the regex AP name as <i>AP-2FLR-</i> to match the services that are learnt from the set of access points.</p>	<p>Returns to privileged EXEC mode.</p> <p>Alternatively, you can also press Ctrl-Z to exit global configuration mode.</p>

Configuring mDNS Location-Based Filtering Using Location Group

Feature History for mDNS Location-Based Filtering Using Location Group (Microlocation)

This table provides release and related information for the feature explained in this module.

This feature is also available in all the releases subsequent to the one in which they are introduced in, unless noted otherwise.

Table 1: Feature History for mDNS Location-Based Filtering Using Location Group (Microlocation)

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.9.1	mDNS Location-Based Filtering Using Location Group (Microlocation)	<p>The controller is enhanced to support microlocation from wireless clients tagged with the location group (mDNS Group ID) tag. From Cisco IOS-XE 17.3 onwards, location grouping is done based on AP names.</p> <p>From Cisco IOS-XE 17.9 onwards, location grouping is extended to AP location.</p>

Information About mDNS Location-Based Filtering Using Location Group (Microlocation)

In the context of Apple Bonjour, Microlocation refers to the smaller subset of a wireless location. This is also referred to as mDNS AP Group or Location Group.

To create an mDNS AP location group, perform the following procedure:

1. Define multiple rules with priority in the wireless rule-based mDNS application.

Note The rules have AP microlocation grouping as AP name or AP location.

2. Match the highest priority rule-based on the configured regular expression with AP name and AP location-based grouping.
3. Map an AP to a location group (mDNS Group ID).

Note When you delete or modify a rule, the corresponding APs are revalidated (using the **capwap restart** command) to apply the updated configuration.

AP Microlocation Support Based on AP Location

From Cisco IOS-XE 17.3 onwards, AP location is configured using the **ap name name location location** command.

From Cisco IOS-XE 17.9 onwards, AP location is leveraged to group APs belonging to a location to form a location group.

By default, AP microlocation, based on either AP name or AP location, is disabled.

Use Cases for mDNS Location-Based Filtering Using Location Group (Microlocation)

- Restricts services across departments.
- Shares files across building or sites.
- Teachers or students, doctors or patients, employees or groups need service visibility in contained environment without intervening with IT to change to L2 or L3 networks.

Prerequisites for mDNS Location-Based Filtering Using Location Group (Microlocation)

You must have configured the mDNS rule. By default, the AP name-based microlocation grouping is used.

Enabling Location Group (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# <code>configure terminal</code>	Enters global configuration mode.

	Command or Action	Purpose
Step 2	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy mdns-policy1	Configures mDNS service policy.
Step 3	service-list <i>service-list-name</i> { in out } Example: Device(config-mdns-ser-pol)# service-list VLAN100-list in Device(config-mdns-ser-pol)# service-list VLAN300-list out	Configures service lists for IN and OUT directions.
Step 4	location location-group Example: Device(config-mdns-ser-pol)# location location-group	Configures location-based filtering using location group.
Step 5	end Example: Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode.

Adding APs to a Location Group (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	wireless rule application mdns Example: Device(config)# wireless rule application mdns	Configures wireless rule-based MDNS application.
Step 3	rule-priority <i>rule_priority</i> rule-name <i>rule_name</i> Example: Device(config-app-rule)# rule-priority 2011 rule-name R2011	Configures rule priority. Here, <ul style="list-style-type: none"> <i>rule_priority</i>: The valid range is from 0 to 4096. <p>Note 0 is the lower priority number and 4096 is the higher priority number.</p>

	Command or Action	Purpose
		<ul style="list-style-type: none"> <i>rule_name</i>: The rule name can be between 1 to 32 characters. <p>Note When you configure the rule priority, you will be prompted as follows:</p> <p>Changing <code>regex string</code> or other rule configuration may cause associated APs to rejoin</p> <p>When you see this prompt, enter Y to continue with the configuration.</p>
Step 4	regex <i>regular_expression_string</i> Example: Device(config-rule-params)# regex AP_Name	Configures rule-based on AP name or AP location to match the regular expression.
Step 5	action-type grouping Example: Device(config-rule-params)# action-type grouping	Groups APs based on the filter string.
Step 6	group-id <i>location_group_identifier</i> Example: Device(config-rule-action-mdns)# group-id 44	Configures the mDNS location group identifier. Valid range for <i>location_group_identifier</i> is 1 to 4096.
Step 7	group-method ap location Example: Device(config-rule-action-mdns)# group-method ap location	Configures AP location-based grouping. Note If you consider group-method as ap location , the regex captures the <i>AP_LOC_NAME</i> . By default, the group-method is configured with <i>AP_NAME</i> .
Step 8	group-name <i>location_group_name</i> Example: Device(config-rule-action-mdns)# group-name G2011	Configures mDNS location group name.
Step 9	end Example: Device(config-rule-action-mdns)# end	Returns to privileged EXEC mode.

Verifying AP Location

To verify the mDNS location Group ID associated with an AP, use the following command:

```
Device# show ap config general | sec MDNS | AP Name
Cisco AP Name      : AP2800
MDNS Group Id      : 101
MDNS Rule Name     : R101
MDNS Group Method  : AP Location
```

To verify all the APs associated with the configured mDNS rule name, use the following command:

```
Device# show wireless associated-ap mdns-rule-name R1
AP MAC              AP Name
-----
0cd0.f894.a840      APOCD0.F894.083C
4001.7a03.8560      APA023.9F66.4F96
-----
```

To verify all the APs associated with the configured mDNS location group ID, use the following command:

```
Device# show wireless associated-ap mdns-group-id 1
AP MAC              AP Name
-----
0cd0.f894.a840      APOCD0.F894.083C
4001.7a03.8560      APA023.9F66.4F96
-----
```

To verify the mDNS group method detail for each AP, use the following command:

```
Device# show ap config general | inc MDNS|AP Name|Location
Cisco AP Name      : AP-1
MDNS Group Id      : 100
MDNS Rule Name     : R100
MDNS Group Method  : AP Location
```

To verify the mDNS group method detail for each rule, use the following command:

```
Device# show wireless rule application mdns
Rule Name          : R100
Rule Priority       : 100
Regular Expression : AP0
Action Type        : MDNS Grouping
  MDNS Group ID    : 100
MDNS Group Name    : G100
MDNS Group Method  : AP Location
```

Nearest mDNS-Based Wired Service Filtering

Feature History for Nearest mDNS-Based Wired Service Filtering

This table provides release and related information for features explained in this module.

These features are available on all releases subsequent to the one they were introduced in, unless noted otherwise.

Table 2: Feature History for Nearest mDNS-Based Wired Service Filtering

Release	Feature	Feature Information
Cisco IOS XE Cupertino 17.8.1	Nearest mDNS-Based Wired Service Filtering	<p>This feature supports the following functionalities:</p> <ul style="list-style-type: none"> • Nearest mDNS based wired service filtering. (Supported in Central switched Local mode.) • Custom wired service policy support for FlexConnect mode. • VLAN and MAC based wired service filtering. (Supported in Central switched Local mode.)

Information About Nearest mDNS-Based Wired Service Filtering

Prior to Cisco IOS XE 17.8.1 release, the wireless clients discover the following:

- All wired services from mDNS-AP.
- Service providers on VLANs visible to the controller.

Note The current filtering is supported only for wireless services.

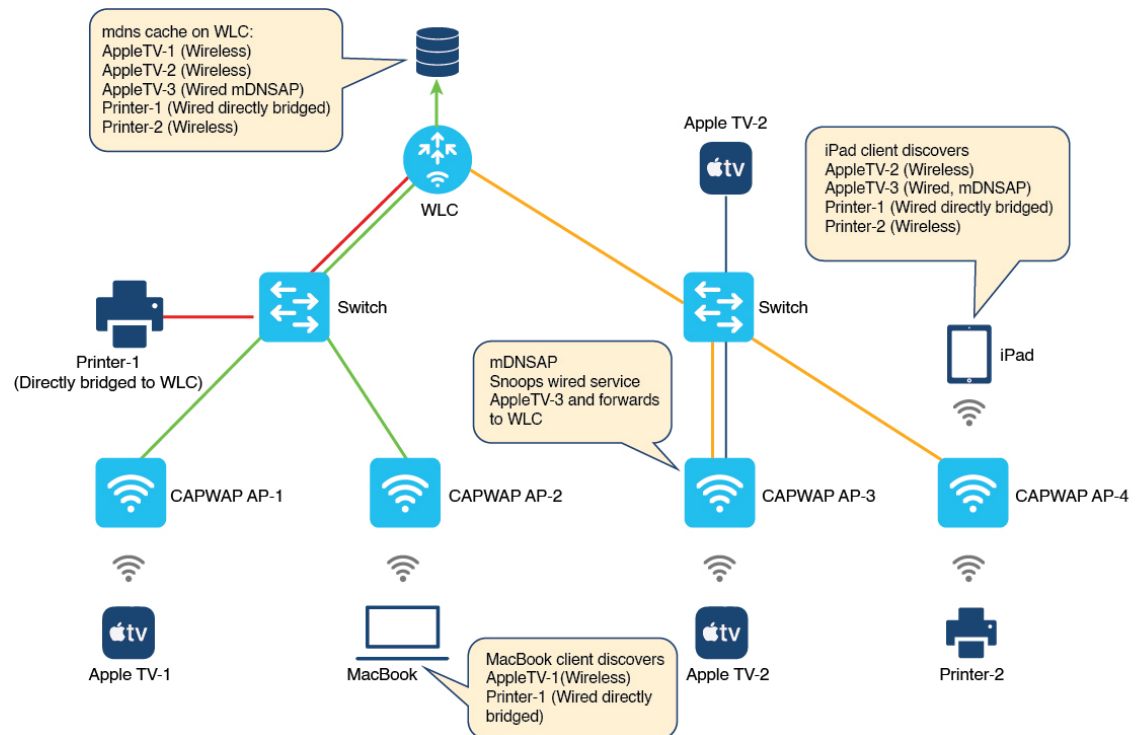

From Cisco IOS XE 17.8.1 onwards, the wireless clients are enhanced to support filter-based on the nearest wired service provider.

Note The controller classifies the wired services as the nearest wired services once the LSS is enabled. The mDNS-AP forwards or advertises the nearest wired services.

The following figure illustrates the nearest wired service provider and discovery:

Figure 1: Nearest Wired Service Provider and Discovery

As per the figure, the controller is associated with the following four APs:

- CAPWAP AP-1
- CAPWAP AP-2
- CAPWAP AP-3
- CAPWAP AP-4

The client connected to CAPWAP AP-1 is wireless and advertises the service Apple TV-1.

Similarly, the client connected to CAPWAP AP-2 is wireless and advertises the service MacBook query client.

The CAPWAP AP-3 is enabled as an mDNS-AP. This AP then discovers the wired services on VLANs and forwards them to the controller. In this case, the client advertising the service AppleTV-3 is a wired service. The client is then discovered by CAPWAP AP-3 and forwarded to the controller. You will also view another client connected to CAPWAP AP-3 that is wireless and advertises the service AppleTV-2.

The client connected to CAPWAP AP-4 is wireless and advertises the service Printer-2 and iPad query client.

Also, a client is connected directly to the controller, which advertises the Printer-1.

The controller covers cache populated from both wireless and wired service providers.

The controller populates the following cache:

- AppleTV-1 (Wireless service from CAPWAP AP-1)
- AppleTV-2 (Wireless service from CAPWAP AP-3)
- AppleTV-3 (Wired service from mDNS-AP enabled AP-3)

- Printer-1 (Wired service from directly bridged service provider)
- Printer-2 (Wireless service from AP-4)

When LSS is enabled, AP-1 and AP-2 discover each other as LSS neighbors. Similarly, AP-3 and AP-4 discover each other as LSS neighbors.

MacBook discovers the following services:

- AppleTV-1 (Wireless service from AP-1)
- Printer-1 (Wired service from the directly bridged service provider)

Note MacBook does not discover the wired service AppleTV-3 (forwarded by mDNS-AP AP-3). The AP-2 does not see AP-3 as the LSS neighbor. Thus, the controller does not classify the wired service AppleTV-3 as nearby.

iPad discovers the following services:

- AppleTV-2 (Wireless service from AP-3)
- AppleTV-3 (Wired service from mDNS-AP enabled AP-3)
- Printer-1 (Wired service from directly bridged service provider)
- Printer-2 (Wireless service from AP-4)

Note iPad discovers the wired service AppleTV-3 (forwarded by mDNS-AP AP-3). The AP-4 sees AP-3 as the LSS neighbor. Thus, the controller classifies the wired service AppleTV-3 as nearby.

Note This feature supports only the wired services advertised by mDNS-AP in centrally switched local mode.

Information About Custom Wired Service Policy Support for FlexConnect Mode

From Cisco IOS XE 17.8.1 release onwards, the custom service policy for wired services is supported in a Flex profile. Here, the service policy refers to the mDNS service policy.

Information About VLAN and MAC Based Wired Service Filtering

Prior to Cisco IOS XE 17.8.1 release, service filtering was based on service types, location type, and location filter. These filters are applicable for wireless services. However, they are not supported for wired services.

From Cisco IOS XE 17.8.1 release onwards, the VLAN and MAC based filtering is supported for wired services.

**Note**

- In case of wired services, the VLAN and MAC based filtering is applicable for OUT direction filter advertised by mDNS-AP and directly bridged wired services.
- The VLAN and MAC based filtering is applicable for centrally switched local mode.

Prerequisite for Nearest mDNS-Based Wired Service Filtering

- Enable the mDNS gateway on the controller.

Use Cases

The following are the use cases:

- Nearest mDNS-Based Wired Service Filtering.
- Custom Wired Service Policy Support for FlexConnect Mode.
- VLAN and MAC Based Wired Service Filtering.

While migrating from AireOS wireless controllers to the Cisco Catalyst 9800 Series Wireless Controllers, the following limitations occur:

- The wireless clients discover all the wired services and not just the nearby service from the wired service provider when central switched local mode and LSS is enabled.

The wired services belong to the forwarded mDNS-AP and directly bridged ones.

- There is no provision to apply the custom service policy for wired services when locally switched FlexConnect mode is enabled.

The mDNS flex profile must have the custom wired service policy as well.

- There is no provision to filter based on the VLAN and MAC address for wired services in centrally switched local mode.

Configuring Wired Service Policy Support in Flex Profile

Creating Service List (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.

	Command or Action	Purpose
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd service-list <i>service-list-name</i> IN Example: Device(config)# mdns-sd service-list srcv_list_in IN	Configures mDNS service list for inbound filtering.
Step 4	match <i>service-definition-name</i> Example: Device(config)# match airplay Example: Device(config)# match printer_ipp	Matches the service to the service definition name. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. Note To add a service, the service name must be part of the primary service list. The same set of service list will be used for both IN and OUT filters.
Step 5	mdns-sd service-list <i>service-list-name</i> OUT Example: Device(config)# mdns-sd service-list srcv_lst_out OUT	Configures mDNS service list for outbound filtering.
Step 6	match <i>service-definition-name</i> Example: Device(config-mdns-sl-out)# match airplay	Matches the service to the service definition name. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on. Note To add a service, the service name must be part of the primary service list. The same set of service list will be used for both IN and OUT filters.
Step 7	exit Example: Device(config-mdns-sl-out)# exit	Exits mDNS service list configuration mode.

Creating Service Policy (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd service-policy service-policy-name Example: Device(config)# mdns-sd service-policy custom_wired_policy	Configures mDNS service policy.
Step 4	service-list service-list-name {in out} Example: Device(config-mdns-ser-pol)# service-list svc_list_in IN Device(config-mdns-ser-pol)# service-list svc_list_out OUT	Configures service lists for IN and OUT directions.
Step 5	location lss Example: Device(config-mdns-ser-pol)# location lss	Enables Location Specific Services (LSS) for the mDNS service.
Step 6	exit Example: Device(config-mdns-ser-pol)# exit	Exits mDNS service policy configuration mode.

Configuring an mDNS Flex Profile (GUI)

Procedure

-
- Step 1** Choose **Configuration > Services > mDNS**.
 - Step 2** In the **mDNS Flex Profile** section, click **Add**.
 - Step 3** In the **Add mDNS Flex Profile** window that is displayed, enter the Flex mDNS profile name in the **Profile Name** field.
 - Step 4** In the **Service Cache Update Timer** field, specify the service cache update time. The value range is between 1 and 100 minutes.

- Step 5** In the **Statistics Update Timer** field, specify the statistics update timer. The value range is between 1 and 100 minutes.
- Step 6** In the **VLANs** field, specify the VLAN ID. You can enter multiple VLAN IDs separated by commas or enter a range of VLAN IDs. Maximum number of VLANs allowed is 16.
- Step 7** Enter or select a **Wired Service Policy** from the drop-down list to associate a Wired filter to mDNS Flex-Profile. In addition to filtering mDNS service queries based on the static default service list, wired filter will support filtering based on custom service lists.

The new wired service-policy will be added to flex-profile construct to support the custom wired service-policy. The AP will apply this configuration for wired services and the respective IN and OUT filters will be used for advertisements and queries only if the custom wired service-policy is configured in mDNS flex-profile.

In case a custom service-policy is removed from the mDNS flex-profile, the AP will remove the custom service-policy and apply the default service-policy for wired services. This feature is supported only in locally switched FlexConnect mode.

- Step 8** Click **Apply to Device**.

Configuring an mDNS Flex Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd flex-profile <i>mdns-flex-profile-name</i> Example: Device(config)# mdns-sd flex-profile custom_flex_profile	Configures an mDNS Flex profile.
Step 4	update-timer service-cache <i>timer-value</i> <1-100> Example: Device(config-mdns-flex-prof)# update-timer service-cache 15	Configures the mDNS update service cache timer for the flex profile. The default value is 1 minute. Value range is between 1 minute and 100 minutes.
Step 5	update-timer statistics <i>statistics timer-value</i> <1-100> Example: Device(config-mdns-flex-prof)# update-timer statistics 10	Configures the mDNS update statistics timer for the flex profile. The default value is 1 minute. The valid range is from 1 to 100 minutes.

	Command or Action	Purpose
Step 6	wired-vlan-range <i>wired-vlan-range value</i> Example: Device(config-mdns-flex-prof)# wired-vlan-range 30	Configures the mDNS wired VLAN range for the flex profile. The default value is 1 minute. The valid range is from 1 minute to 100 minutes.
Step 7	wired-service-policy <i>service-policy-name</i> Example: Device(config-mdns-flex-prof)# wired-service-policy custom_wired_policy	Associates the wired service policy with mDNS flex profile. Note Here, <i>service-policy-name</i> refers to the mDNS service policy created earlier. For more information, refer to Creating Service Policy (CLI).
Step 8	end Example: Device(config-mdns-flex-prof)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Configuring VLAN and MAC Based Wired Service Filtering (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device> enable	Enables privileged EXEC mode. Enter your password, if prompted.
Step 2	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 3	mdns-sd wired-filter <i>wired-filter-name</i> Example: Device(config)# mdns-sd wired-filter WIRED_FILTER_APPLE_TV	Configures an mDNS wired filter.
Step 4	match mac <i>service-provider-mac-address1</i> Example: Device(config-mdns-wired-filter)# match mac a886.ddb2.05e9	Matches the wired filter with the MAC address of the wired service.
Step 5	match vlan <i>range</i> Example: Device(config-mdns-wired-filter)# match vlan 100	Matches the wired filter with the VLAN of the wired service.

	Command or Action	Purpose
Step 6	exit Example: Device(config-mdns-wired-filter)# exit	Exits mDNS gateway configuration mode.
Step 7	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 8	mdns-sd service-list <i>service-list-name</i> IN Example: Device(config)# mdns-sd service-list srvc_lst_in IN	Configures mDNS service list for inbound filtering.
Step 9	match <i>service-definition-name</i> Example: Device(config)# match airplay	Matches the service to the names of the services. Here, <i>service-definition-name</i> refers to the names of services, such as, airplay, airserver, airtunes, and so on.
Step 10	mdns-sd service-list <i>service-list-name</i> OUT Example: Device(config)# mdns-sd service-list srvc_lst_out OUT	Configures mDNS service list for outbound filtering.
Step 11	match apple-tv wired-filter <i>wired-filter-name</i> Example: Device(config-mdns-sl-out)# match apple-tv wired-filter WIRED_FILTER_APPLE_TV	Matches the Apple TV related wired filter.
Step 12	mdns-sd service-policy <i>service-policy-name</i> Example: Device(config)# mdns-sd service-policy custom_policy	Enables mDNS service policy.
Step 13	service-list <i>service-list-name</i> {IN OUT} Example: Device(config-mdns-ser-pol)# service-list srvc_lst_in IN Device(config-mdns-ser-pol)# service-list srvc_lst_in OUT	Configures various service-list names for IN and OUT directions. Note If an administrator decides to create or use a custom service policy, then the custom service policy must be configured with service-lists for both directions (IN and OUT); otherwise, the mDNS Gateway will not work (will not learn services if there is no IN service-list, or will not reply or announce services learned if there is no OUT service-list).

	Command or Action	Purpose
Step 14	location ap-group Example: Device(config-mdns-ser-pol)# location ap-group	Configures AP location based filtering.
Step 15	end Example: Device(config-mdns-ser-pol)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Verifying mDNS-Based Wired Service Filtering

To view the wired service list IN and OUT details, use the following command:

```
Device# show mdns status

Global mDNS gateway:Enabled

vap_id      ssid mdns_mode
  0 myFisaiC Bridge
  1 rquestcpC Bridge
  2 RK-FLEX  Bridge
  3 RK-MDNS  Gateway
  4 GUHOAsaiC Bridge
  5 -        Bridge
  6 -        Bridge
  7 -        Bridge
  8 -        Bridge
  9 -        Bridge
 10 -        Bridge
 11 -        Bridge
 12 -        Bridge
 13 -        Bridge
 14 -        Bridge
 15 -        Bridge
Active query interval:30
vap          service_list_in      service_list_out location
  0 default-mdns-service-list_IN default-mdns-service-list_OUT 0
  1 default-mdns-service-list_IN default-mdns-service-list_OUT 0
  2 default-mdns-service-list_IN default-mdns-service-list_OUT 0
  3 default-mdns-service-list_IN default-mdns-service-list_OUT 0
  4 default-mdns-service-list_IN default-mdns-service-list_OUT 0
Wired vlan configuration:
mdns stats timer: 1
mdns cache timer: 1
AP Sync VLAN: 1
Wired service list IN: RK-IN_IN
Wired service list OUT: RK-OUT_OUT
```

Note This command must be executed on the Flex AP. Also, this applies to the custom wired service policy support in FlexConnect mode.

To verify the VLAN and MAC based wired service filtering, use the following command:

```
Device# show running-config mdns-sd wired-filter
mdns-sd wired-filter WIRED_FILTER_APPLE_TV
match mac a886.ddb2.05e9
match vlan 100
!
```

To verify the wired service policy support in Flex Profile, use the following command:

```
Device# show running-config mdns-sd flex-profile
mdns-sd flex-profile custom_flex_profile
update-timer service-cache 15
update-timer statistics 10
wired-vlan-range 30
wired-service-policy custom_wired_policy
!
```

To verify whether LSS is configured or not, use the following command:

```
Device# show running-config mdns-sd service-policy
mdns-sd service-policy custom_policy
service-list srvc_lst_in IN
service-list srvc_lst_out OUT
location lss
!
mdns-sd service-list srvc_lst_in IN
match apple-tv
!

mdns-sd service-list srvc_lst_out OUT
match apple-tv wired-filter WIRED_FILTER_APPLE_TV
!
```

Configuring mDNS AP

In most of the deployments, the services may be available in VLANs that the APs can hear in the wired side (allowed in the switchport where the AP is directly connected: its own VLAN, or even more VLANs if switchport is a trunk).

The following procedure shows how to configure mDNS AP:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	mdns-sd gateway Example: Device(config)# mdns-sd gateway	Configures the mDNS gateway.
Step 3	ap name <i>ap-name</i> mdns-ap enable vlan <i>vlan-id</i> Example:	Enables mDNS on the AP, and configures a VLAN for the mDNS AP.

	Command or Action	Purpose
	Device# ap name ap1 mdns-ap enable vlan 22	
Step 4	ap name <i>ap-name</i> mdns-ap vlan add <i>vlan-id</i> Example: Device# ap name ap1 mdns-ap vlan add 200	Adds a VLAN to the mDNS AP. <i>vlan-id</i> ranges from 1 to 4096.
Step 5	ap name <i>ap-name</i> mdns-ap vlan del <i>vlan-id</i> Example: Device# ap name ap1 mdns-ap vlan del 2	Deletes a VLAN from the mDNS AP.
Step 6	ap name <i>ap-name</i> mdns-ap disable Example: Device# ap name ap1 mdns-ap disable	(Optional) Disables the mDNS AP.
Step 7	end Example: Device# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode. Note You can configure a maximum of 10 VLANs per AP.

Enabling mDNS Gateway on the RLAN Interface

By configuring the mDNS gateway mode on the RLAN interface, you can configure the mDNS service policy for a specific RLAN.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	ap remote-lan profile-name <i>remote-lan-profile-name rlan-id</i> Example: Device(config)# ap remote-lan profile-name rlan_test_1 1	Configures a remote LAN profile. <ul style="list-style-type: none"> <i>remote-lan-profile</i>: Remote LAN profile name. Range is from 1 to 32 alphanumeric characters. <i>rlan-id</i>: Remote LAN identifier. Range is from 1 to 128.

	Command or Action	Purpose
		Note You can create a maximum of 128 RLANs. Also, you cannot use the <i>rlan-id</i> of an existing RLAN while creating another RLAN.
Step 3	mdns-sd-interface {gateway drop} Example: mdns-sd-interface Device(config-remote-lan)# mdns-sd-interface gateway	Enables mDNS configuration on an RLAN interface.
Step 4	no shutdown Example: Device(config-remote-lan)# no shutdown	Restarts the RLAN profile.
Step 5	exit Example: Device(config-remote-lan)# exit	Exits remote LAN configuration mode.
Step 6	ap remote-lan-policy policy-name profile name Example: Device(config)# ap remote-lan-policy policy-name rlan_named_ppl	Configures the RLAN policy profile and enters wireless policy configuration mode.
Step 7	mdns-sd service-policy service-policy-name Example: Device(config-remote-lan-policy)# mdns-sd service-policy mdnsTV6	Enables an mDNS service policy.
Step 8	central switching Example: Device(config-remote-lan-policy)# central switching	Configures the RLAN for central switching.
Step 9	central dhcp Example: Device(config-remote-lan-policy)# central dhcp	Configures the central DHCP for centrally switched clients.
Step 10	vlan vlan-name Example: Device(config-remote-lan-policy)# vlan 141	Assigns the profile policy to a VLAN.

	Command or Action	Purpose
Step 11	no shutdown Example: <pre>Device(config-remote-lan-policy)# no shutdown</pre>	Restarts the RLAN profile.
Step 12	wireless tag policy <i>policy-tag-name</i> Example: <pre>Device(config)# wireless tag policy rlan_pt_1</pre>	Configures a policy tag.
Step 13	remote-lan <i>remote-lan-profile-name</i> policy <i>rlan-policy-profile-name</i> port-id <i>port-id</i> Example: <pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 1</pre> <pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 2</pre> <pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 3</pre> <pre>Device(config-policy-tag)# remote-lan rlan_test_1 policy rlan_named_pp1 port-id 4</pre>	Maps the RLAN policy profile to the RLAN profile. <ul style="list-style-type: none"> • <i>remote-lan-profile-name</i>: Name of the RLAN profile. • <i>rlan-policy-profile-name</i>: Name of the policy profile. • <i>port-id</i>: LAN port number on the access point. Range is from 1 to 4.
Step 14	exit Example: <pre>Device(config-policy-tag)# exit</pre>	Returns to global configuration mode.
Step 15	ap <i>mac-address</i> Example: <pre>Device (config)# ap 0042.5AB6.0EF0</pre>	Configures the AP and enters the AP tag configuration mode. Note Use the Ethernet MAC address.
Step 16	policy-tag <i>policy-tag-name</i> Example: <pre>Device (config-ap-tag)# policy-tag rlan_pt_1</pre>	Maps a policy tag to the AP.
Step 17	end Example: <pre>Device(config-guest-lan)# end</pre>	Returns to privileged EXEC mode.

Enabling mDNS Gateway on Guest LAN Interface

By configuring the mDNS gateway mode on a Guest LAN interface, you can configure the mDNS service policy for a specific Guest LAN interface.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	guest-lan profile-name <i>guest_lan_profile_name num wired-vlan</i> <i>wired_vlan_num</i> Example: Device(config)# guest-lan profile-name open 1 wired-vlan 666	Configures guest LAN profile with a wired VLAN. Note Configures the wired VLAN only for the Guest Foreign controller. <ul style="list-style-type: none"> • <i>num</i>: Guest LAN identifier. The valid range is from 1 to 5. • <i>wired_vlan_num</i>: Wired VLAN number. The valid range is from 1 to 4094.
Step 3	guest-lan profile-name <i>guest_lan_profile_name num</i> Example: Device(config)# guest-lan profile-name open 1	Configures the guest LAN profile without a VLAN for the Guest Anchor controller.
Step 4	mdns-sd-interface {gateway drop} Example: Device(config-guest-lan)# mdns-sd gateway	Configures the mDNS gateway for a Guest LAN. Note You need to enable mDNS gateway globally for the Guest LAN to work.
Step 5	end Example: Device(config-guest-lan)# end	Returns to privileged EXEC mode. Alternatively, you can also press Ctrl-Z to exit global configuration mode.

Associating mDNS Service Policy with Wireless Profile Policy (GUI)

Procedure

-
- Step 1** Choose **Configuration > Tags & Profiles > Policy**.
 - Step 2** Click the **policy profile** name.
 - Step 3** In the **Advanced** tab, choose the mDNS service policy from the **mDNS Service Policy** drop-down list.
 - Step 4** Click **Update & Apply to Device**.
-

Associating mDNS Service Policy with Wireless Profile Policy

Note You must globally configure the mDNS service policy before associating it with the wireless profile policy.

A default mDNS service policy is already attached once the wireless profile policy is created. You can use the following commands to override the default mDNS service policy with any of your service policy:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	wireless profile policy <i>profile-policy</i> Example: Device(config)# wireless profile policy default-policy-profile	Configures wireless profile policy. Here, <i>profile-policy</i> refers to the name of the WLAN policy profile.
Step 3	mdns-sd service-policy <i>custom-mdns-service-policy</i> Example: Device(config-wireless-policy)# mdns-sd service-policy custom-mdns-service-policy	Associates an mDNS service policy with the wireless profile policy. The default mDNS service policy name is default-mdns-service-policy .

	Command or Action	Purpose
		Note

	Command or Action	Purpose																		
		<p>The default-mdns-profile-policy uses default-mdns-service-list configuration for filtering mDNS service announcement and queries.</p> <p>In wireless network, the mDNS packets are consumed by the mDNS gateway and clients or device is deprived of learning this service. To share the service with the device and provide ease of configuration to the administrator, a list of few standard service types are shared by default on the wireless network. The list of such standard service types is termed as default service policy that comprises a set of service types.</p> <p>The table covers a sample service list in the default service policy.</p> <p>Table 3: Default Name and mDNS Service Type</p> <table border="1" data-bbox="1159 1050 1520 1869"> <thead> <tr> <th data-bbox="1159 1050 1338 1136">Default Name</th> <th data-bbox="1338 1050 1520 1136">mDNS Service Type</th> </tr> </thead> <tbody> <tr> <td data-bbox="1159 1136 1338 1241">Apple TV</td> <td data-bbox="1338 1136 1520 1241">_airplay._tcp.local _raop._tcp.local</td> </tr> <tr> <td data-bbox="1159 1241 1338 1327">Apple HomeSharing</td> <td data-bbox="1338 1241 1520 1327">_hmesharing._tcp.local</td> </tr> <tr> <td data-bbox="1159 1327 1338 1388">Printer-IPPS</td> <td data-bbox="1338 1327 1520 1388">_ipp._tcp.local</td> </tr> <tr> <td data-bbox="1159 1388 1338 1493">Apple-airprint</td> <td data-bbox="1338 1388 1520 1493">_ipp._tcp.local _universal._ipp._tcp.local</td> </tr> <tr> <td data-bbox="1159 1493 1338 1640">Google-chromecast</td> <td data-bbox="1338 1493 1520 1640">_googlecast._tcp.local _googlepc._tcp.local _googlezone._tcp.local</td> </tr> <tr> <td data-bbox="1159 1640 1338 1745">Apple-remote-login</td> <td data-bbox="1338 1640 1520 1745">_sftp-ssh._tcp.local _ssh._tcp.local</td> </tr> <tr> <td data-bbox="1159 1745 1338 1806">Apple-screen-share</td> <td data-bbox="1338 1745 1520 1806">_rfb._tcp.local</td> </tr> <tr> <td data-bbox="1159 1806 1338 1869">Google-expeditions</td> <td data-bbox="1338 1806 1520 1869">_googleexpeditions._tcp.local</td> </tr> </tbody> </table>	Default Name	mDNS Service Type	Apple TV	_airplay._tcp.local _raop._tcp.local	Apple HomeSharing	_hmesharing._tcp.local	Printer-IPPS	_ipp._tcp.local	Apple-airprint	_ipp._tcp.local _universal._ipp._tcp.local	Google-chromecast	_googlecast._tcp.local _googlepc._tcp.local _googlezone._tcp.local	Apple-remote-login	_sftp-ssh._tcp.local _ssh._tcp.local	Apple-screen-share	_rfb._tcp.local	Google-expeditions	_googleexpeditions._tcp.local
Default Name	mDNS Service Type																			
Apple TV	_airplay._tcp.local _raop._tcp.local																			
Apple HomeSharing	_hmesharing._tcp.local																			
Printer-IPPS	_ipp._tcp.local																			
Apple-airprint	_ipp._tcp.local _universal._ipp._tcp.local																			
Google-chromecast	_googlecast._tcp.local _googlepc._tcp.local _googlezone._tcp.local																			
Apple-remote-login	_sftp-ssh._tcp.local _ssh._tcp.local																			
Apple-screen-share	_rfb._tcp.local																			
Google-expeditions	_googleexpeditions._tcp.local																			

	Command or Action	Purpose										
		<table border="1"> <thead> <tr> <th>Default Name</th> <th>mDNS Service Type</th> </tr> </thead> <tbody> <tr> <td>Multifunction-printer</td> <td>_fax-ipp._tcp.local</td> </tr> <tr> <td></td> <td>_ipp._tcp.local</td> </tr> <tr> <td></td> <td>_scanner._tcp.local</td> </tr> <tr> <td>AppleWindowsShare</td> <td>_smb._tcp.local</td> </tr> </tbody> </table> <p>Note</p> <ul style="list-style-type: none"> • Location would be disabled on mDNS default service policy. • You cannot change the contents of the mDNS default service policy. However, you can create separate mDNS service policies and associate them under the wireless policy profile. 	Default Name	mDNS Service Type	Multifunction-printer	_fax-ipp._tcp.local		_ipp._tcp.local		_scanner._tcp.local	AppleWindowsShare	_smb._tcp.local
Default Name	mDNS Service Type											
Multifunction-printer	_fax-ipp._tcp.local											
	_ipp._tcp.local											
	_scanner._tcp.local											
AppleWindowsShare	_smb._tcp.local											
Step 4	<p>exit</p> <p>Example:</p> <pre>Device(config-wireless-policy)# exit</pre>	Returns to global configuration mode.										

Enabling or Disabling mDNS Gateway for WLAN (GUI)

Procedure

-
- Step 1** Choose **Configuration > Tags & Profiles > WLANs**.
- Step 2** Click on the WLAN.
- Step 3** In the **Advanced** tab, choose the mode in **mDNS Mode** drop-down list.
- Step 4** Click **Update & Apply to Device**.
-

Enabling or Disabling mDNS Gateway for WLAN

Note Bridging is the default behaviour. This means that the mDNS packets are always bridged.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	wlan profile-name wlan-id ssid-name Example: Device(config)# wlan test 24 ssid1	Specifies the WLAN name and ID. <ul style="list-style-type: none"> • <i>profile-name</i> is the WLAN name which can contain 32 alphanumeric characters • <i>wlan-id</i> is the wireless LAN identifier. The valid range is from 1 to 4096. • <i>ssid-name</i> is the SSID which can contain 32 alphanumeric characters. Note Global configuration must be in place for mDNS gateway to work.
Step 3	mdns-sd-interface {gateway drop} Example: Device(config-wlan)# mdns-sd gateway Device(config-wlan)# mdns-sd drop	Enables or disables mDNS gateway and bridge functions on WLAN.
Step 4	exit Example: Device(config-wlan)# exit	Returns to global configuration mode.
Step 5	show wlan name wlan-name show wlan all Example: Device# show wlan name test show wlan all	Verifies the status of mDNS on WLAN.
Step 6	show wireless profile policy Example: Device# show wireless profile policy	Verifies the service policy configured in WLAN.

mDNS Gateway with Guest Anchor Support and mDNS Bridging

When mDNS Gateway is enabled on both Anchor and Foreign controller, the mDNS gateway functionality is supported in guest anchor deployment where clients on guest LAN or WLAN with guest anchor enabled will be responded with any services or cache from export foreign controller itself. All advertisements received on Guest LAN or WLAN on export foreign are learnt on the export foreign itself. All queries received on guest LAN or WLAN are responded by the export foreign itself.

When mDNS Gateway is enabled on Anchor and Disabled on Foreign controller [Bridging Mode], the mDNS gateway functionality is supported in guest anchor deployment where clients on guest LAN or WLAN with guest anchor enabled will be responded with any services or cache from export Anchor even though the clients are connected on Foreign. All advertisements received on guest LAN or WLAN on export foreign is forwarded to Anchor and the cache is stored on the Anchor itself. All queries received on guest LAN or WLAN are responded by the export Anchor itself.

Note

- You must configure the guest-LAN to a wireless profile policy which is configured with the required mDNS service-policy.
- To configure non guest LAN mDNS gateway, see the [mDNS Gateway](#) chapter.

Configuring mDNS Gateway on Guest Anchor

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	guest-lan profile-name <i>guest-lan-profile-name</i> <i>guest-lan-id</i> Example: Device(config)# guest-lan profile-name g-lanpro 2	Configures the guest LAN profile with a wired VLAN.
Step 3	mdns-sd gateway Example: Device(config-guest-lan)# mdns-sd gateway	Enables mDNS gateway on the guest LAN.

Configuring mDNS Gateway on Guest Foreign (Guest LAN)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	guest-lan profile-name <i>guest-lan-profile-name</i> <i>guest-lan-id</i> wired-vlan <i>vlan-id</i> Example: Device(config)# guest-lan profile-name g-lanpro 2 wired-vlan 230	Configures guest LAN profile with a wired VLAN. Note Configure the wired VLAN only for the Guest Foreign controller.
Step 3	mdns-sd gateway Example: Device(config-guest-lan)# mdns-sd gateway	Enables mDNS gateway on the guest LAN.
Step 4	exit Example: Device(config-wireless-policy)# exit	Returns to global configuration mode.

Configuring mDNS Gateway on Guest Anchor

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	guest-wlan profile-name <i>guest-lan-profile-name</i> <i>guest-wlan-id</i> Example: Device(config)# guest-wlan profile-name g-lanpro 2	Configures the guest WLAN profile with a wired VLAN.
Step 3	mdns-sd gateway Example: Device(config-guest-wlan)# mdns-sd gateway	Enables mDNS gateway on the guest WLAN.

Configuring mDNS Gateway on Guest Foreign (Guest WLAN)

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	guest-wlan profile-name <i>guest-lan-profile-name guest-wlan-id</i> wired-vlan vlan-id Example: Device(config)# guest-wlan profile-name g-lanpro 2 wired-vlan 230	Configures guest WLAN profile with a wired VLAN. Note Configure the wired VLAN only for the Guest Foreign controller.
Step 3	mdns-sd gateway Example: Device(config-guest-wlan)# mdns-sd gateway	Enables mDNS gateway on the guest WLAN.
Step 4	exit Example: Device(config-wireless-policy)# exit	Returns to global configuration mode.

Verifying mDNS Gateway Configurations

To verify the mDNS summary, use the following command:

```
Device# show mdns-sd summary
mDNS Gateway: Enabled
Active Query: Enabled
  Periodicity (in minutes): 30
Transport Type: IPv4
```

To verify the mDNS cache, use the following command:

```
Device# show mdns-sd cache
----- PTR Records -----
-----
RECORD-NAME                               TTL      WLAN  CLIENT-MAC      RR-RECORD-DATA
-----
_airplay._tcp.local                       4500    30    07c5.a4f2.dc01  CUST1._airplay._tcp.local
_ipp._tcp.local                           4500    30    04c5.a4f2.dc01  CUST3._ipp._tcp.local2
_ipp._tcp.local                           4500    15    04c5.a4f2.dc01  CUST3._ipp._tcp.local4
```

```

_ipp._tcp.local          4500    10    04c5.a4f2.dc01    CUST3._ipp._tcp.local6
_veer_custom._tcp.local 4500    10    05c5.a4f2.dc01

To verify the default service list details, use the following command:

```

Device# show mdns-sd default-service-list
-----
mDNS Default Service List
-----

Service Definition: apple-tv
Service Names: _airplay._tcp.local
               _raop._tcp.local

Service Definition: homesharing
Service Names: _home-sharing._tcp.local

Service Definition: printer-ipp
Service Names: _ipp._tcp.local

Service Definition: apple-airprint
Service Names: _ipp._tcp.local
               _universal._sub._ipp._tcp.local

Service Definition: google-chromecast
Service Names: _googlecast._tcp.local
               _googlerpc._tcp.local
               _googlezone._tcp.local

Service Definition: apple-remote-login
Service Names: _sftp-ssh._tcp.local
               _ssh._tcp.local

Service Definition: apple-screen-share
Service Names: _rfb._tcp.local

Service Definition: google-expeditions
Service Names: _googexpeditions._tcp.local

Service Definition: multifunction-printer
Service Names: _fax-ipp._tcp.local
               _ipp._tcp.local
               _scanner._tcp.local

Service Definition: apple-windows-fileshare
Service Names: _smb._tcp.local

```

To verify the primary service list details, use the following command:

```

Device# show mdns-sd master-service-list
-----
mDNS Master Service List
-----

Service Definition: fax
Service Names: _fax-ipp._tcp.local

```

```

Service Definition: roku
Service Names: _rsp._tcp.local

Service Definition: airplay
Service Names: _airplay._tcp.local

Service Definition: scanner
Service Names: _scanner._tcp.local

Service Definition: spotify
Service Names: _spotify-connect._tcp.local

Service Definition: airtunes
Service Names: _raop._tcp.local

Service Definition: airserver
Service Names: _airplay._tcp.local
                _airserver._tcp.local

.
.
.

```

```

Service Definition: itune-wireless-devicesharing2
Service Names: _apple-mobdev2._tcp.local

```

To verify the mdns-sd service statistics on the controller, use the following command:

```
Device# show mdns-sd service statistics
```

Service Name	Service Count
_atc._tcp.local	137
_hap._tcp.local	149
_ipp._tcp.local	149
_rfb._tcp.local	141
_smb._tcp.local	133
_ssh._tcp.local	142
_daap._tcp.local	149
_dpap._tcp.local	149
_eppc._tcp.local	138
_adisk._tcp.local	149

To verify the mDNS-AP configured on the controller and VLAN(s) associated with it, use the following command:

```
Device# show mdns-sd ap
```

```
Number of mDNS APs..... 1
```

AP Name	Ethernet MAC	Number of Vlans	Vlanidentifiers
AP3600-1	7069.5ab8.33d0	1	300

Further Debug

To debug mDNS further, use the following procedure:

1. Run this command at the controller:

```
set platform software trace wncd <0-7> chassis active R0 mdns debug
```

2. Reproduce the issue.

3. Run this command to gather the traces enabled:

```
show wireless loadbalance ap affinity wncd 0
```

AP MAC	Discovery Timestamp	Join Timestamp	Tag	Vlanidentifiers
0cd0.f894.0600	06/30/21 12:39:48	06/30/21 12:40:021	default-site-tag	300
