Information About Flexible Radio Assignment

Flexible Radio Assignment (FRA) takes advantage of the dual-band radios included in APs. The FRA is a new feature added to the RRM to analyze the Neighbor Discovery Protocol (NDP) measurements, which manages the hardware used to determine the role of the new flexible radio (2.4 GHz, 5 GHz, or monitor) in your network.

Traditional legacy dual-band APs always had 2 radio slots, (1 slot per band) and were organized by the band they were serving, that is slot 0= 802.11b,g,n and slot 1=802.11a,n,ac.

XOR Support in 2.4-GHz or 5-GHz Bands

The flexible radio (XOR) offers the ability to serve the 2.4-GHz or the 5-GHz bands, or passively monitor both bands on the same AP. The AP models that are offered are designed to support dual 5-GHz band operations, with the Cisco APs i model supporting a dedicated Macro/Micro architecture, and the e and p models supporting Macro/Macro architecture.

When using FRA with the internal antenna (*i* series models), two 5-GHz radios can be used in a Micro/Macro cell mode. When using FRA with external antenna (*e* and *p* models) the antennas may be placed to enable the creation of two completely separate macro (wide-area cells) or two micro cells (small cells) for HDX or any combination.

FRA calculates and maintains a measurement of redundancy for 2.4-GHz radios and represents this as a new measurement metric called COF (Coverage Overlap Factor).

This feature is integrated into existing RRM and runs in mixed environments with legacy APs. The **AP MODE** selection sets the entire AP (slot 0 and slot1) into one of several operating modes, including:

- Local Mode
- Monitor Mode
- FlexConnect Mode
- · Sniffer Mode
- Spectrum Connect Mode

Before XOR was introduced, changing the mode of an AP propagated the change to the entire AP, that is both radio slot 0 and slot 1. The addition of the XOR radio in the slot 0 position provides the ability to operate a single radio interface in many of the previous modes, eliminating the need to place the whole AP into a mode. When this concept is applied to a single radio level, its is called *role*. Three such roles can be assigned now:

- Client Serving
- Either 2.4 GHz(1) or 5 GHz(2)
- Monitor-Monitor mode (3)

Note

- MODE: Assigned to a whole AP (slot 0 and slot 1)
- ROLE: Assigned to a single radio interface (slot 0)

Benefits of the FRA

- Solves the problem of 2.4–GHz over coverage.
- Creating two diverse 5–GHz cells doubles the airtime that is available.
- Permits one AP with one Ethernet drop to function like two 5–GHz APs.
- Introduces the concept of Macro/Micro cells for airtime efficiency.
- Allows more bandwidth to be applied to an area within a larger coverage cell.
- · Can be used to address nonlinear traffic.
- Enhances the High-Density Experience (HDX) with one AP.
- XOR radio can be selected by the corresponding user in either band–servicing client mode or monitor mode.

Configuring an FRA Radio (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable	Enters privileged EXEC mode.
	Example:	
	Device# enable	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	Device# configure terminal	

	Command or Action	Purpose
Step 3	[no] ap fra	Enables or disables FRA on the AP.
	Example:	
	Device(config)# [no] ap fra	
Step 4	ap fra interval Example:	Configures the FRA interval in hours. The range is 1 to 24 hours.
	Device(config)# ap fra interval 3	Note The FRA interval has to be more than the configured RRM interval.
Step 5	ap fra sensitivity {high medium low}	Configures the FRA sensitivity.
	<pre>Example: Device(config)# ap fra sensitivity high</pre>	• high: Sets the FRA Coverage Overlap Sensitivity to high.
		• medium: Sets the FRA Coverage Overlap Sensitivity to medium.
		• low: Sets the FRA Coverage Overlap Sensitivity to low.
Step 6	end	Returns to privileged EXEC mode.
	Example:	Alternatively, you can also press Ctrl-Z to exit global configuration mode.
	Device(config)# end	giobai configuration mode.
Step 7	ap fra revert {all auto-only} {auto static}	Rolls back the XOR Radio state.
	Example:	• all: Reverts all XOR Radios
	Device# ap fra revert all auto	• auto-only: Revert only XOR radios currently in automatic band selection.
		• auto: Sets the XOR radios in automatic band selection.
		• static: Sets the XOR radio in static 2.4-GHz band.
Step 8	show ap dot11 {24ghz 5ghz} summary	Shows the configuration and statistics of
	Example:	802.11 Cisco APs
	Device# show ap dot11 5ghz summary	
Step 9	Device# show ap fra	Shows the current FRA configuration.
	Example:	
	Device# show ap fra	
	FRA State	
	: Disabled FRA Sensitivity	
	: medium (95%)	

	Command or Action	Purpose
	FRA Interval : 1 Hour(s)	
	AP Name MAC Address Slot ID Current-Band COF % Suggested Mode	
	AP00A6.CA36.295A 006b.f09c.8290 0 2.4GHz None 2.4GHz	
	COF : Coverage Overlap Factor	
	test_machine#	
Step 10	show ap name ap-name config dot11 dual-band	Shows the current 802.11 dual-band parameters in a given AP.
	Example:	
	Device# show ap name config dot11 dual-band	

Configuring an FRA Radio (GUI)

Procedure

- **Step 1** Choose Configuration > Radio Configurations > RRM > FRA.
- Step 2 In the Flexible Radio Assignment window, enable FRA status and determine the overlapping 2.4 GHz or 5 GHz coverage for each AP, choose Enabled in the FRA Status field. By default, the FRA status is disabled.
- Step 3 Under the From the FRA Interval drop-down list, choose the FRA run interval. The interval values range from 1 hour to 24 hours. You can choose the FRA run interval value only after you enable the FRA status.
- **Step 4** From the **FRA Sensitivity** drop-down list, choose the percentage of Coverage Overlap Factor (COF) required to consider a radio as redundant. You can select the supported value only after you enable the FRA status.

The supported values are as follows:

- Low: 100 percent
- Medium (default): 95 percent
- High: 90 percent

The Last Run and Last Run Time fields will show the time FRA was run last and the time it was run.

Step 5 Check the **Client Aware** check box to take decisions on redundancy.

When enabled, the **Client Aware** feature monitors the dedicated 5-GHz radio and when the client load passes a pre-set threshold, automatically changes the Flexible Radio assignment from a monitor role into a 5-GHz role, effectively doubling the capacity of the cell on demand. Once the capacity crisis is over and Wi-Fi load returns to normal, the radios resume their previous roles.

Step 6 In the **Client Select** field, enter a value for client selection. The valid values range between 0 and 100 percent. The default value is 50 percent.

This means that if the dedicated 5-GHz interface reaches 50% channel utilization, this will trigger the monitor role dual-band interface to transition to a 5-GHz client-serving role.

Step 7 In the Client Reset field, enter a reset value for the client. The valid values range between 0 and 100 percent. The default value is 5 percent.

Once the AP is operating as a dual 5-GHz AP, this setting indicates the reduction in the combined radios' overall channel utilization required to reset the dual-band radio to monitor role.

Step 8 Click **Apply** to save the configuration.

Configuring an FRA Radio (GUI)
