Cisco Workgroup Bridges

A workgroup bridge (WGB) is an Access Point (AP) mode to provide wireless connectivity to wired clients that are connected to the Ethernet port of the WGB AP. A WGB connects a wired network over a single wireless segment by learning the MAC addresses of its wired clients on the Ethernet interface and reporting them to the WLC through infrastructure AP using Internet Access Point Protocol (IAPP) messaging. The WGB establishes a single wireless connection to the root AP, which in turn, treats the WGB as a wireless client.

Figure 1: Example of a WGB

357624

Starting from Cisco IOS XE Cupertino 17.8.1, WGB is supported on the following Cisco Catalyst 9100 Series Access Points.

- Cisco Catalyst 9105
- Cisco Catalyst 9115
- Cisco Catalyst 9120

Starting from Cisco IOS XE Dublin 17.10.1, WGB is supported on the following Cisco Catalyst 9100 Series Access Points.

- Cisco Catalyst 9124
- Cisco Catalyst 9130

From Cisco IOS XE Cupertino 17.9.1 onwards, WGB supports one radio for uplink (backhaul) connectivity and another radio for serving wireless clients. This feature is supported on the Cisco 11AX APs such as Cisco Catalyst 9105 APs, Cisco Catalyst 9115 APs, Cisco Catalyst 9120 APs.

OPEN and PSK security (WPA2 Personal) based wireless clients can be associated to WGB independent of its uplink connectivity, but they will not be able to pass traffic unless WGB has uplink connectivity. Radius server must be configured and the WGB should have uplink connectivity for authentication of wireless clients to 802.1x security (WPA2 Enterprise) WLAN. Both IPv4 and IPv6 traffic forwarding is supported for wireless clients. Static IP and Passive Client support is enabled by default on these WLANs.

The following features are supported for use with a WGB:

Table 1: WGB Feature Matrix

Feature	Cisco Wave 1 APs	Cisco Wave 2 and 11AX APs
802.11r	Supported	Supported
QOS	Supported	Supported
UWGB mode	Supported	Supported on Wave 2 APs Not supported on 11AX APs
IGMP Snooping or Multicast	Supported	Supported
802.11w	Supported	Supported
PI support (without SNMP)	Supported	Not supported
IPv6	Supported	Supported
VLAN	Supported	Supported
802.11i (WPAv2)	Supported	Supported
Broadcast tagging/replicate	Supported	Supported
Unified VLAN client	Implicitly supported (No CLI required)	Supported
WGB client	Supported	Supported

Feature	Cisco Wave 1 APs	Cisco Wave 2 and 11AX APs
802.1x – PEAP, EAP-FAST, EAP-TLS	Supported	Supported
NTP	Supported	Supported
Wired client support on all LAN ports	Supported in Wired-0 and Wired-1 interfaces	Supported in all Wired-0, 1 and LAN ports 1, 2, and 3
Second radio wireless client support	Supported	Supported on Cisco 11AX APs only.

The following table shows the supported and unsupported authentication and switching modes for Cisco APs when connecting to a WGB.

Note Workgroup Bridge mode is supported on the WiFi6 Pluggable Module from Cisco IOS XE Bengaluru 17.6.1.

Table 2: Supported Access Points and Requirements

Access Points	Requirements
Cisco Aironet 2700, 3700, and 1572 Series	Requires autonomous image.
Cisco Aironet 2800, 3800, 4800, 1562, and Cisco Catalyst 9105, 9115, 9120, 9124, and 9130, IW6300 and ESW6300 Series	CAPWAP image starting from Cisco AireOS 8.8 release.

Table 3: WGB Support on APs

WGB WLAN Support	Cisco Wave 1 APs	Cisco Wave 2 APs	Cisco Catalyst 9100 Series APs
Central Authentication	Supported	Supported	Supported
Central Switching	Supported	Supported	Supported
Local Authentication	Supported	Not Supported	Not Supported
Local Switching	Not Supported	Supported	Supported

- MAC filtering is not supported for wired clients.
- Idle timeout is not supported for both WGB and wired clients.
- Session timeout is not applicable for wired clients.
- Web authentication is not supported.
- The total number of clients supported by WGB (wired + wireless) is limited to 20 clients.
- If you want to use a chain of certificates, copy all the CA certificates to a file and install it under a trust point on the WGB, else server certificate validation may fail.

- Wired clients connected to a WGB inherit the WGB's QoS and AAA override attributes.
- To enable the WGB to communicate with the root AP, create a WLAN and make sure that Aironet IE is enabled under the Advanced settings.
- WPA2 Enterprise security works only if the uplink WLAN is enabled for FlexConnect local switching or Fabric enabled WLAN.
- Radius override is not supported for wireless clients that are associated with WGB WLANs.
- WGB does not support dot1x wired client authentication when used with power injector.

The power-injector drops all EAPOL packets received from the wired client and does not forward it to the WGB's wired0 interface. In such cases, use PoE plus hub behind the wired0 interface and connect the wired clients to the hub.

- After WGB reload, the WGB dot1x wired clients behind a hub do not trigger authentication automatically, unless done manually.

After WGB is reloaded the WGB dot1x wired clients which are behind a hub remain authenticated or connected on their side and do not get notified that the WGB is reloaded. Clients are also not shown on the WGB bridge table. The client interfaces must be manually disabled and enabled back to trigger authentication.

- When the dot1x wired client Ethernet interface is disabled and then enabled again, client authentication might fail for some of dot1x wired clients, at times.

Configuring Workgroup Bridge on a WLAN

Follow the procedure given below to configure a WGB on a WLAN:

For WGB to join a wireless network there are specific settings on the WLAN and on the related policy profile.

Note For the configuration given below, it is assumed that the WLAN security is already configured.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: Device# configure terminal	Enters global configuration mode.
Step 2	wlan profile-name Example: Device(config)# wlan WGB_Test	Enters WLAN configuration submode. The <i>profile-name</i> is the profile name of the configured WLAN.

	Command or Action	Purpose
Step 3	ccx aironet-iesupport Example: Device(config-wlan)# ccx aironet-iesupport	Configures the Cisco Client Extensions option and sets the support of Aironet IE on the WLAN.
Step 4	exit Example: Device(config-wlan)# exit	Exits the WLAN configuration submode.
Step 5	wireless profile policy <i>profile-policy</i> Example: Device(config)# wireless profile policy test-wgb	Configures WLAN policy profile and enters the wireless policy configuration mode.
Step 6	description <i>description</i> Example: Device(config-wireless-policy)# description "test-wgb"	Adds a description for the policy profile.
Step 7	vlan <i>vlan-no</i> Example: Device(config-wireless-policy)# vlan 48	Assigns the profile policy to the VLAN.
Step 8	wgb vlan Example: Device(config-wireless-policy)# wgb vlan	Configures WGB VLAN client support.
Step 9	wgb broadcast-tagging Example: Device(config-wireless-policy)# wgb broadcast-tagging	Configures WGB broadcast tagging on a WLAN.
Step 10	no shutdown Example: Device(config-wireless-policy)# no shutdown	Restarts the policy profile.
Step 11	exit Example: Device(config-wireless-policy)# exit	Exits the wireless policy configuration mode.
Step 12	wireless tag policy <i>policy-tag</i> Example: Device(config)# wireless tag policy WGB_Policy	Configures policy tag and enters policy tag configuration mode.

	Command or Action	Purpose
Step 13	wlan <i>profile-name</i> policy <i>profile-policy</i> Example: Device(config-policy-tag)# wlan WGB_Test policy test-wgb	Maps a policy profile to a WLAN profile.
Step 14	end Example: Device(config-policy-tag)# end	Exits policy tag configuration mode, and returns to privileged EXEC mode.

Verifying the Status of a Workgroup Bridge on the Controller

Use the following commands to verify the status of a WGB.

To display the wireless-specific configuration of active clients, use the following command:

```
Device# show wireless client summary
```

To display the WGBs on your network, use the following command:

```
Device# show wireless wgb summary
```

To display the details of wired clients that are connected to a particular WGB, use the following command:

```
Device# show wireless wgb mac-address 00:0d:ed:dd:25:82 detail
```

Configuring Access Points as Workgroup Bridge

Turning Cisco Aironet 2700/3700/1572 Series AP into Autonomous Mode

Before you begin

Download the autonomous image for the specific access point from software.cisco.com and place it on a TFTP server.

Procedure

	Command or Action	Purpose
Step 1	debug capwap console cli Example: Device# debug capwap console cli	Enables the console CLI.
Step 2	archive download-sw force-reload overwrite tftp:ipaddress filepath filename Example:	Downloads the autonomous image to the access point.

	Command or Action	Purpose
	<pre>Device(config)# archive download-sw force-reload overwrite tftp://10.10.10.1/tftp/cl800.tar</pre>	

Configuring Cisco Wave 2 APs or 11AX APs in Workgroup Bridge or CAPWAP AP Mode (CLI)

Procedure

	Command or Action	Purpose
Step 1	enable Example: <pre>Device# enable</pre>	Enters in to the privileged mode of the AP.
Step 2	ap-type workgroup-bridge Example: <pre>Device# ap-type workgroup-bridge</pre>	Moves the AP in to the Workgroup Bridge mode.
Step 3	configure ap address ipv4 dhcp or configure ap address ipv4 staticip-address netmask gateway-ipaddress Example: DHCP IP Address <pre>Device# configure ap address ipv4 dhcp</pre> Static IP Address <pre>Device# configure ap address ipv4 static 10.10.10.2 255.255.255.234 192.168.4.1</pre>	Configures DHCP or Static IP address.
Step 4	configure ap management add username username password password secret secret Example: <pre>Device# configure ap management add username xyz-user password ***** secret cisco</pre>	Configures an username for the AP management.
Step 5	configure ap hostnamehost-name Example: <pre>Device# configure ap hostname xyz-host</pre>	Configures the AP hostname.

Configure an SSID Profile for Cisco Wave 2 and 11AX APs (CLI)

This procedure is an AP procedure. The CLIs listed in the procedure given below work only on the AP console and not on the controller.

Procedure

	Command or Action	Purpose
Step 1	<p>configure ssid-profile <i>ssid-profile-name</i> ssid <i>radio-serv-name</i> authentication {open psk <i>preshared-key</i> key-management {dot11r wpa2 dot11w {optional required } } } eap <i>profile eap-profile-name</i> key-management {dot11r wpa2 dot11w {optional required } }</p> <p>Example:</p> <p>SSID profile with open authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication open</pre> <p>SSID profile with PSK authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication psk 1234 key-management dot11r optional</pre> <p>SSID profile with EAP authentication.</p> <pre>Device# configure ssid-profile test WRT s1 authentication eap profile test2 key-management dot11r optional</pre>	Choose an authentication protocol (Open, PSK, or EAP) for the SSID profile.
Step 2	<p>configure dot11radio <i>radio-interface</i> mode wgb ssid-profile <i>profile-name</i></p> <p>Example:</p> <pre>Device# configure dot11radio r1 mode wgb ssid-profile doc-test</pre>	Attaches an SSID profile to a radio interface.
Step 3	<p>configure ssid-profile <i>profile-name</i> ssid <i>ssid-name</i> dtim-period <i>value in beacon intervals</i></p> <p>Example:</p> <pre>Device# configure ssid-profile test ssid s1 dtim-period 50</pre>	<p>Configures the DTIM period.</p> <p>Note This command is supported for wireless clients from Cisco IOS XE Cupertino 17.9.1 onwards.</p>
Step 4	<p>configure qos profile <i>qos-profile-name</i> {bronze gold platinum silver}</p> <p>Example:</p> <pre>Device# configure qos profile qos-profile gold</pre>	Creates a gold QoS profile.
Step 5	<p>configure ssid-profile <i>profile-name</i> ssid <i>ssid-name</i> qos profile <i>qos-profile-name</i></p> <p>Example:</p> <pre>Device# configure ssid-profile test ssid s1 qos profile qos-profile</pre>	<p>Maps the QoS profile to the SSID profile.</p> <p>Note This command is supported for wireless clients from Cisco IOS XE Cupertino 17.9.1 onwards.</p>

	Command or Action	Purpose
Step 6	configure ssid-profile <i>profile-name</i> delete Example: Device# configure ssid-profile doc-test delete	(Optional) Deletes an SSID profile.
Step 7	show wgb ssid Example: Device# show wgb ssid	(Optional) Displays summary of configured and connected SSIDs.
Step 8	show wgb packet statistics Example: Device# show wgb packet statistics	(Optional) Displays management, control, and data packet statistics.

Configuring the Authentication Server (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure radius authentication <primary secondary> add <ipv4 ipv6> address <i>radius-server-ip-address</i> port <i>radius-server-port-number</i> secret <i>radius-secret</i> Example: Device# configure radius authentication primary add ipv4 192.168.1.2 port 1812 secret Cisco123	Configures a primary and (or) secondary radius server with an IPv4 or IPv6 IP, port, and secret.

Configuring a Dot1X Credential (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure dot1x credential <i>profile-name</i> username <i>name</i> password <i>password</i> Example: Device# configure dot1x credential test1 username XYZ password *****	Configures a dot1x credential.
Step 2	configure dot1x credential <i>profile-name</i> delete Example: Device# configure dot1x credential test1 delete	Removes a dot1x profile.

	Command or Action	Purpose
Step 3	clear wgb client {all single <i>mac-addr</i> } Example: <pre>Device# clear wgb client single xxxx.xxxx.xxxx.xxxx</pre>	Deauthenticates a WGB client.

Configuring an EAP Profile (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure eap-profile <i>profile-name</i> method {fast leap peap tls} Example: <pre>Device# configure eap-profile test-eap method fast</pre>	Configures an EAP profile.
Step 2	configure eap-profile <i>profile-name</i> trustpoint default or configure eap-profile <i>profile-name</i> trustpoint name <i>trustpoint-name</i> Example: EAP Profile to Trustpoint with MIC Certificate. <pre>Device# configure eap-profile test-eap trustpoint default</pre> EAP Profile to Trustpoint with CA Certificate. <pre>Device# configure eap-profile test-eap trustpoint cisco</pre>	Configures an EAP profile with a trustpoint.
Step 3	configure eap-profile <i>profile-name</i> trustpoint {default name <i>trustpoint-name</i> } Example: <pre>Device# configure eap-profile test-eap trustpoint default</pre>	Attaches the CA trustpoint. Note With the default profile, WGB uses the internal MIC certificate for authentication.
Step 4	configure eap-profile <i>profile-name</i> dot1x-credential <i>profile-name</i> Example: <pre>Device# configure eap-profile test-eap dot1x-credential test-profile</pre>	Configures the 802.1X credential profile.
Step 5	configure eap-profile <i>profile-name</i> delete Example: <pre>Device# configure eap-profile test-eap delete</pre>	(Optional) Deletes an EAP profile.

	Command or Action	Purpose
Step 6	show wgb eap dot1x credential profile Example: Device# show wgb eap dot1x credential profile	(Optional) Displays the WGB EAP dot1x profile summary.
Step 7	show wgb eap profile Example: Device# show wgb eap profile	(Optional) Displays the EAP profile summary.
Step 8	show wgb eap profile all Example: Device# show wgb eap profile all	(Optional) Displays the EAP and dot1x profiles.

Configuring Manual-Enrollment of a Trustpoint for Workgroup Bridge (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure crypto pki trustpoint <i>ca-server-name</i> enrollment terminal Example: Device# configure crypto pki trustpoint ca-server-US enrollment terminal	Configures a trustpoint in WGB.
Step 2	configure crypto pki trustpoint <i>ca-server-name</i> authenticate Example: Device# configure crypto pki trustpoint ca-server-US authenticate	Authenticates a trustpoint manually. Enter the base 64 encoded CA certificate and end the certificate by entering quit in a new line.
Step 3	configure crypto pki trustpoint <i>ca-server-name</i> key-size <i>key-length</i> Example: Device# configure crypto pki trustpoint ca-server-US key-size 60	Configures a private key size.
Step 4	configure crypto pki trustpoint <i>ca-server-name</i> subject-name <i>name</i> [<i>2ltr-country-code</i> <i>state-name</i> <i>locality</i> <i>org-name</i> <i>org-unit</i> <i>email</i>] Example:	Configures the subject name.

	Command or Action	Purpose
	Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com	
Step 5	configure crypto pki trustpoint ca-server-name enrol Example: Device# configure crypto pki trustpoint ca-server-US enroll	Generates a private key and Certificate Signing Request (CSR). Afterwards, create the digitally signed certificate using the CSR output in the CA server.
Step 6	configure crypto pki trustpoint ca-server-name import certificate Example: Device# configure crypto pki trustpoint ca-server-US import certificate	Import the signed certificate in WGB. Enter the base 64 encoded CA certificate and end the certificate by using quit command in a new line.
Step 7	configure crypto pki trustpoint ca-server-name delete Example: Device# configure crypto pki trustpoint ca-server-US delete	(Optional) Delete a trustpoint.
Step 8	show crypto pki trustpoint Example: Device# show crypto pki trustpoint	(Optional) Displays the trustpoint summary.
Step 9	show crypto pki trustpoint trustpoint-name certificate Example: Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.

Configuring Auto-Enrollment of a Trustpoint for Workgroup Bridge (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure crypto pki trustpoint ca-server-name enrollment url ca-server-url Example: Device# configure crypto pki trustpoint	Enrolls a trustpoint in WGB using the server URL.

	Command or Action	Purpose
	<pre>ca-server-US enrollment url https://cisco/certsrv</pre>	
Step 2	configure crypto pki trustpoint <i>ca-server-name</i> authenticate Example: <pre>Device# configure crypto pki trustpoint ca-server-US authenticate</pre>	Authenticates a trustpoint by fetching the CA certificate from CA server automatically.
Step 3	configure crypto pki trustpoint <i>ca-server-name</i> key-size <i>key-length</i> Example: <pre>Device# configure crypto pki trustpoint ca-server-US key-size 60</pre>	Configures a private key size.
Step 4	configure crypto pki trustpoint <i>ca-server-name</i> subject-name <i>name</i> [2ltr-country-code state-name locality org-name org-unit email] Example: <pre>Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com</pre>	Configures the subject name.
Step 5	configure crypto pki trustpoint <i>ca-server-name</i> enroll Example: <pre>Device# configure crypto pki trustpoint ca-server-US enroll</pre>	Enrolls the trustpoint. Request the digitally signed certificate from the CA server.
Step 6	configure crypto pki trustpoint <i>ca-server-name</i> auto-enroll enable <i>renew-percentage</i> Example: <pre>Device# configure crypto pki trustpoint ca-server-US auto-enroll enable 10</pre>	Enables auto-enroll of the trustpoint. You can disable auto-enrolling by using the disable option in the command.
Step 7	configure crypto pki trustpoint <i>trustpoint-name</i> delete Example: <pre>Device# configure crypto pki trustpoint ca-server-US delete</pre>	(Optional) Deletes a trustpoint.

	Command or Action	Purpose
Step 8	show crypto pki trustpoint Example: Device# show crypto pki trustpoint	(Optional) Displays the trustpoint summary.
Step 9	show crypto pki trustpoint <i>trustpoint-name</i> certificate Example: Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.
Step 10	show crypto pki timers Example: Device# show crypto pki timers	(Optional) Displays the PKI timer information.

Configuring Manual Certificate Enrolment Using TFTP Server (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure crypto pki trustpoint <i>ca-server-name</i> enrollment tftp <i>addr/file-name</i> Example: Device# configure crypto pki trustpoint ca-server-US enrollment tftp://10.8.0.6/all_cert.txt	Specifies the enrolment method to retrieve the CA certificate and client certificate for a trustpoint in WGB.
Step 2	configure crypto pki trustpoint <i>ca-server-name</i> authenticate Example: Device# configure crypto pki trustpoint ca-server-US authenticate	Retrieves the CA certificate and authenticates it from the specified TFTP server. If the file specification is included, the wgb will append the extension “.ca” to the specified filename.
Step 3	configure crypto pki trustpoint <i>ca-server-name</i> key-size <i>key-length</i> Example: Device# configure crypto pki trustpoint ca-server-Us key-size 60	Configures a private key size.
Step 4	configure crypto pki trustpoint <i>ca-server-name</i> subject-name <i>name</i> [<i>2ltr-country-code</i> <i>state-name</i> <i>locality</i> <i>org-name</i> <i>org-unit</i> <i>email</i>]	Configures the subject name.

	Command or Action	Purpose
	Example: <pre>Device# configure crypto pki trustpoint ca-server-US subject-name test US CA abc cisco AP test@cisco.com</pre>	
Step 5	configure crypto pki trustpoint <i>ca-server-name</i> enrol Example: <pre>Device# configure crypto pki trustpoint ca-server-US enroll</pre>	Generate a private key and Certificate Signing Request (CSR) and writes the request out to the TFTP server. The filename to be written is appended with the extension “.req”.
Step 6	configure crypto pki trustpoint <i>ca-server-name</i> import certificate Example: <pre>Device# configure crypto pki trustpoint ca-server-US import certificate</pre>	Import the signed certificate in WGB using TFTP at the console terminal, which retrieves the granted certificate. The WGB will attempt to retrieve the granted certificate using TFTP using the same filename and the file name append with “.crt” extension.
Step 7	show crypto pki trustpoint Example: <pre>Device# show crypto pki trustpoint</pre>	(Optional) Displays the trustpoint summary.
Step 8	show crypto pki trustpoint <i>trustpoint-name</i> certificate Example: <pre>Device# show crypto pki trustpoint ca-server-US certificate</pre>	(Optional) Displays the content of the certificates that are created for a trustpoint.

Importing the PKCS12 Format Certificates from the TFTP Server (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure crypto pki trustpoint <i>ca-server-name</i> import pkcs12 tftp <i>addr/file-name</i> password <i>pwd</i> Example: <pre>Device# configure crypto pki trustpoint ca-server-US enrollment tftp://10.8.0.6/all_cert.txt password *****</pre>	Imports PKCS12 format certificate from the TFTP server.
Step 2	show crypto pki trustpoint Example:	(Optional) Displays the trustpoint summary.

	Command or Action	Purpose
	Device# show crypto pki trustpoint	
Step 3	show crypto pki trustpoint <i>trustpoint-name</i> certificate Example: Device# show crypto pki trustpoint ca-server-US certificate	(Optional) Displays the content of the certificates that are created for a trustpoint.

Configuring Radio Interface for Workgroup Bridges (CLI)

From the available two radio interfaces, before configuring WGB or UWGB mode on one radio interface, configure the other radio interface to root AP mode.

Procedure

	Command or Action	Purpose
Step 1	configure dot11radio <i>radio-int</i> mode root-ap Example: Device# configure dot11Radio 0/3/0 mode root-ap	Maps a radio interface as root AP. Note When an active SSID or EAP profile is modified, you need to reassociate the profile to the radio interface for the updated profile to be active.
Step 2	configure dot11Radio <0 1> wlan add <i>ssid-profile-name</i> <i>ssid-number</i> Example: Device# configure dot11radio 1 wlan add ssid-profile-name ssid-number	Configures the WLAN at the root AP mode radio. Enter the SSID profile name and SSID number between 1 and 16.
Step 3	configure dot11Radio <0 1> wlan delete <i>ssid-profile-name</i> Example: Device# configure dot11radio 1 wlan delete ssid-profile-name	Deletes WLAN from the radio configuration. Enter the SSID profile name.
Step 4	configure dot11Radio <0 1> channel <i>channel-number</i> <i>width</i> Example: Device# configure dot11radio 1 channel 36 80	Configures a radio channel to broadcast the SSID. The channel numbers are between 1 and 173. The channel width values are 20, 40, 80, and 160.

	Command or Action	Purpose
		Note <ul style="list-style-type: none"> Only 20MHz channel width is supported on radio 0 (2.4-GHz band). If radar is detected on a configured channel on radio 1, then the channel automatically changes to a non-DFS channel with a channel width of 20MHz. The administrator must reset the radio to bring it back to the configured channel.
Step 5	configure dot11Radio <0 1> beacon-period <i>beacon-interval</i> Example: <pre>Device# configure dot11radio 1 beacon-period 120</pre>	Configures the periodic beacon interval in milli-seconds. The value range is between 2 and 2000 milli-seconds.
Step 6	configure dot11Radio radio-int mode wgb <i>ssid-profile ssid-profile-name</i> Example: <pre>Device# configure dot11Radio 0/3/0 mode wgb ssid-profile bgl18</pre>	Maps a radio interface to a WGB SSID profile.
Step 7	configure dot11Radio radio-int mode uwgb <i>mac-addr ssid-profile ssid-profile-name</i> Example: <pre>Device# configure dot11Radio 0/3/0 mode uwgb 0042.5AB6.0EF0 ssid-profile bgl18</pre>	Maps a radio interface to a WGB SSID profile.
Step 8	configure dot11Radio radio-int {enable disable} Example: <pre>Device# configure dot11Radio 0/3/0 mode enable</pre>	Configures a radio interface. Note After configuring the uplink to the SSID profile, we recommend that you disable and enable the radio for the changes to be active.
Step 9	configure dot11Radio radio-int antenna {a-antenna ab-antenna abc-antenna abcd-antenna} Example: <pre>Device# configure dot11Radio 0/3/0 antenna a-antenna</pre>	Configures a radio antenna.
Step 10	configure dot11Radio radio-int encryption mode ciphers aes-ccm {	Configures the radio interface.

	Command or Action	Purpose
	Example: <pre>Device# configure dot11Radio radio-int encryption mode ciphers aes-ccm</pre>	
Step 11	configure wgb mobile rate {basic 6 9 18 24 36 48 54 mcs mcs-rate} Example: <pre>Device# configure wgb mobile rate basic 6 9 18 24 36 48 54</pre>	Configures the device channel rate.
Step 12	configure wgb mobile period <i>secondsthres-signal</i> Example: <pre>Device# configure wgb mobile period 30 -50</pre>	Configure the threshold duration and signal strength to trigger scanning.
Step 13	configure wgb mobile station interface dot11Radio radio-int scan channel-number add Example: <pre>Device# configure wgb mobile station interface dot11Radio 0/3/0 scan 2 add</pre>	Configures the static roaming channel.
Step 14	configure wgb mobile station interface dot11Radio radio-int scan channel-number delete Example: <pre>Device# configure wgb mobile station interface dot11Radio 0/3/0 scan 2 delete</pre>	(Optional) Delete the mobile channel.
Step 15	configure wgb mobile station interface dot11Radio radio-int scan disable Example: <pre>Device# configure wgb mobile station interface dot11Radio 0/3/0 scan disable</pre>	(Optional) Disable the mobile channel.
Step 16	configure wgb beacon miss-count value Example: <pre>Device# configure wgb beacon miss-count 12</pre>	(Optional) Configure the beacon miss-count. By default, this is set to disabled. Note When you set the beacon miss-count value to 10 or lower, then the beacon miss-count gets disabled. Set the value to 11 or higher to enable this function.

	Command or Action	Purpose
Step 17	show wgb wifi <i>wifi-interface</i> stats Example: Device# show wgb wifi 0/3/0 stats	(Optional) Displays the Wi-Fi station statistics.
Step 18	show controllers dot11Radio <i>radio-interface</i> antenna Example: Device# show controllers dot11Radio 0/3/0 antenna	(Optional) Displays the radio antenna statistics.
Step 19	show wgb mobile scan channel Example: Device# show wgb mobile scan channel	(Optional) Displays the mobile station channels scan configuration.
Step 20	show configuration Example: Device# show configuration	(Optional) Displays the configuration that is stored in the NV memory.
Step 21	show running-config Example: Device# show running-config	(Optional) Displays the running configuration in the device.

Configuring Workgroup Bridge Timeouts (CLI)

Procedure

	Command or Action	Purpose
Step 1	configure wgb association response timeout <i>response-millisecs</i> Example: Device# configure wgb association response timeout 4000	Configures the WGB association response timeout. The default value is 5000 milliseconds. The valid range is between 300 and 5000 milliseconds.
Step 2	configure wgb authentication response timeout <i>response-millisecs</i> Example: Device# configure wgb authentication response timeout 4000	Configures the WGB authentication response timeout. The default value is 5000 milliseconds. The valid range is between 300 and 5000 milliseconds.
Step 3	configure wgb uclient timeout <i>timeout-secs</i> Example: Device# configure wgb uclient timeout 70	Configure the Universal WGB client response timeout. The default timeout value is 60 seconds. The valid range is between 1 and 65535 seconds..

	Command or Action	Purpose
Step 4	configure wgb eap timeout <i>timeout-secs</i> Example: Device# configure wgb eap timeout 20	Configures the WGB EAP timeout. The default timeout value is 3 seconds. The valid range is between 2 and 60 seconds.
Step 5	configure wgb channel scan timeout { fast medium slow } Example: Device# configure wgb channel scan timeout slow	Configures the WGB channel scan timeout.
Step 6	configure wgb dhcp response timeout <i>timeout-secs</i> Example: Device# configure wgb dhcp response timeout 70	Configures the WGB DHCP response timeout. The default value is 60 seconds. The valid range is between 1000 and 60000 milliseconds.
Step 7	show wgb dot11 association Example: Device# show wgb dot11 association	Displays the WGB association summary.

Configuring Bridge Forwarding for Workgroup Bridge (CLI)

Before you begin

The Cisco Wave 2 and 11AX APs as Workgroup Bridge recognizes the Ethernet clients only when the traffic has the bridging tag.

We recommend setting the WGB bridge client timeout value to default value of 300 seconds, or less in environment where change is expected, such as:

- Ethernet cable is unplugged and plugged back.
- Endpoint is changed.
- Endpoint IP is changed (static to DHCP and vice versa).

If you need to retain the client entry in the WGB table for a longer duration, we recommend you increase the client WGB bridge timeout duration.

Procedure

	Command or Action	Purpose
Step 1	configure wgb bridge client add <i>mac-address</i> Example: Device# configure wgb bridge client add F866.F267.7DFB-	Adds a WGB client using the MAC address.

	Command or Action	Purpose
Step 2	configure wgb bridge client timeout <i>timeout-secs</i> Example: <pre>Device# configure wgb bridge client timeout 400</pre>	Configures the WGB bridge client timeout. Default timeout value is 300 seconds. The valid range is between 10 and 1000000 seconds.
Step 3	show wgb bridge Example: <pre>Device# show wgb bridge</pre>	Displays the WGB wired clients over the bridge.
Step 4	show wgb bridge wired gigabitEthernet <i>interface</i> Example: <pre>Device# show wgb bridge wired gigabitEthernet 0/1</pre>	Displays the WGB Gigabit wired clients over the bridge.
Step 5	show wgb bridge dot11Radio <i>interface-number</i> Example: <pre>Device# show wgb bridge dot11Radio 0/3/1</pre>	Displays the WGB bridge radio interface summary.

Information About Simplifying WGB Configuration

From Cisco IOS XE Cupertino 17.8.1, it is possible to configure WGB in multiple Cisco access points (APs) simultaneously. By importing a running configuration, you can deploy multiple WGBs in a network and make them operational quicker. When new Cisco APs are added to the network, you can transfer an existing or working configuration to the new Cisco APs to make them operational. This enhancement eliminates the need to configure multiple Cisco APs using CLIs, after logging into them.

A network administrator can onboard Cisco APs using either of the following methods:

- Upload the working configuration from an existing Cisco AP to a server and download it to the newly deployed Cisco APs.
- Send a sample configuration to all the Cisco APs in the deployment.

This feature is supported only on the following Cisco APs:

- Cisco Aironet 1562 Access Points
- Cisco Aironet 2800 Access Points
- Cisco Aironet 3800 Access Points
- Cisco Catalyst 9105 Access Points
- Cisco Catalyst 9115 Access Points
- Cisco Catalyst 9120 Access Points

- Cisco Catalyst IW6300 Series Heavy Duty Access Points

For latest support information on various features in Cisco Wave 2 and 802.11ax (Wi-Fi 6) Access Points in Cisco IOS XE releases, see the [Feature Matrix for Wave 2 and 802.11ax \(Wi-Fi 6\) Access Points](#) document.

Configuring Multiple WGBs (CLI)

Perform the following procedure on the APs in WGB mode.

Procedure

	Command or Action	Purpose
Step 1	enable Example: Device# enable	Enters privileged EXEC mode.
Step 2	copy configuration upload {sftp tftp:} ip-address [directory] [file-name] Example: Device# copy configuration upload sftp: 10.10.10.1 C:sample.txt	Creates upload configuration file and uploads to the SFTP or TFTP server using the specified path.
Step 3	copy configuration download {sftp tftp:} ip-address [directory] [file-name] Example: Device# copy configuration download sftp: 10.10.10.1 C:sample.txt	Downloads the configuration file and replaces the old configuration in the AP and reboots the WGB. When the device restarts, new configuration is applied.
Step 4	show wgb dot11 association Example: Device# show wgb dot11 association	Lists the WGB uplink information.
Step 5	show version Example: Device# show version	Displays the AP software information.

Verifying WGB Configuration

After completing the configuration download and reboot of the AP, the WGB rejoins the network. Use the **show logging** command to list and verify the download events that are captured in the debug logs:

```
Device# show logging
```
