Release Notes for Cisco LTE PDN Gateway Release 1.2 on the Cisco SAMI, Cisco IOS Software Release 12.4 T3b

January 7, 2011
Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b

This release note describes the requirements, dependencies, and caveats for the Cisco Long Term Evolution (LTE) Packet Data Network (PDN) Gateway (PGW) Release 1.x on the Cisco Service and Application Module for IP (SAMI). These release notes are updated as needed.

For a list of the software caveats that apply to Cisco LTE PGW, Cisco IOS Release 12.4(24)T3 releases, see the “Caveats” section on page 13 and Caveats for Cisco IOS Release 12.4 T. The caveats document is updated for every maintenance release and is located on Cisco.com and the Documentation CD-ROM.

Use these release notes with Cross-Platform Release Notes for Cisco IOS Release 12.4 located on Cisco.com.

Contents

Cisco LTE PGW Overview

The following sections provide a brief overview of the Cisco LTE PGW:

- LTE Evolved Packet Core, page 2
- Cisco LTE PGW Description, page 4

LTE Evolved Packet Core

The Cisco LTE PGW is a service designed for LTE Evolved Packet Core (EPC). The EPC is the main component of the System Architecture Evolution (SAE). 3GPP designed SAE as a migration path for 3GPP systems. The SAE is the core network architecture of LTE communication.

The SAE is an evolution of the General Packet Radio Service (GPRS) and Universal Mobile Telecommunication System (UMTS) that provides a migration path for 3GPP systems with the following differences:

- Simplified architecture
- All IP network
- Support for higher throughput and lower latency radio access networks (RANs)
- Support for and mobility between 3GPP (GPRS, UMTS, and LTE) and non-3GPP access technologies.

The LTE EPC is made up of the following primary elements:

- Mobility Management Entity (MME)
- Serving Gateway (SGW)
- Packet Data Network (PDN) Gateway (PGW)
Figure 1 shows the interworking (and interfaces) of the LTE EPC with different radio access technologies.

Note Cisco LTE PGW Release 1.x does not support the paths represented by dashed lines.

Figure 1  LTE Network Components with SGWs and PGWs Implemented on the Cisco Service and Application Module for IP in the Cisco 7600 Series Router

The following is a list of acronyms used in Figure 1.

- Serving GPRS Support Node (SGSN)
- UMTS Terrestrial Radio Access Network (UTRAN)
- GSM EDGE Radio Access Network (GERAN)
- Evolved UTRAN (E-UTRAN)
- Mobility Management Entity (MME)
- Serving Gateway (SGW)
- PDN Gateway (PGW)
- Charging Gateway Function (CGF)
- Home Subscriber Server (HSS)
- Policy and Charging Rules Function (PCRF)
- Online Charging System (OCS)
- Authentication, Authorization, and Accounting (AAA)
- Diameter Credit Control Application (DCCA)
Cisco LTE PGW Description

For each UE associated with the EPC, there is at least one PGW providing access to the requested PDN. If a UE is accessing multiple PDNs, there could be more than one PGW for that UE.

For each UE associated with the EPS, there is at least one PDN gateway (PGW) providing access to the requested PDN. If a UE is accessing multiple PDNs, there could be more than one PGW for that UE.

The Cisco LTE PGW Release 1.0 and later provides the following support:

- **Mobility and Roaming**
  - GTP-based S5/S8 interfaces
  - Gn/Gp interface support for pre Release 8 SGSNs

- **IP Addressing and Transport**
  - IP Version 4 (IPv4) and IP Version 6 (IPv6) UEs
  - IPv4 and IPv6 transport
  - Stateless Address Autoconfig (SLAAC)
  - Local pools, static IP, and RADIUS
  - Overlapping IPv4 addresses

- **Authentication and Authorization**
  - RADIUS AAA interface
  - RADIUS CoA and POD
  - AAA user profiles (for example, Quality of Service [QoS] and access control list [ACL])
  - AAA load balancing and failover

- **Policy and QoS**
  - Gx interface for Dynamic Policy and Charging Control (PCC)
  - Static (local) policies
  - Bearer level QoS parameters (QoS Class Identifier [QCI], Address Resolution Protocol [ARP], guaranteed bit rate [GBR], maximum bit rate [MBR], APN-AMBR [APN Aggregate Maximum Bit Rate])
  - Gating, rate limiting and marking
  - Call Admission Control
  - Cisco CSG2 policy interfacing
  - Enhanced PCC for CSG2

- **Charging**
  - GTP' offline charging
  - RADIUS off-line charging
  - Load balancing, failover, and local redirect of charging data
  - Application-based charging
  - Local storage of charging data
Security
- Access Control Lists (per interface, per-APN)
- Source and destination address verification
- Duplicate IP address protection
- Traffic redirection
- Virtual Routing and Forwarding (VRF)-based traffic segregation
- Control Plane Policing
- Security events logging

High Reliability and Availability
- 99.999% service availability
- Intra- and inter-chassis session redundancy (1:1, hot standby)
- Hot swappable components
- In service software upgrade
- External gateway availability monitoring
- Manual and automatic failovers

Overload Handling
- Control plane throttling
- Traps on high resource usage
- Overload (degraded) mode of operation

Lawful Intercept
- Content intercept (UDP-based)
- SNMP Version 3 based install

Enterprise Features
- VRF support
- Per-enterprise authentication, authorization, and accounting
- Enterprise-assigned IP-address

Operation, Management, and Performance
- Command line interface and SNMP-based management
- SNMP Version 1, Version 2, and SNMPv3 support
- Key performance indicators and bulk statistics
- Subscriber and call-based tracing and logging
- Event-based diagnostics
- Platform and feature MIBs

The Cisco LTE PGW runs on the Cisco Service and Application Module for IP (SAMI), a new-generation high performance service module for the Cisco 7600 Series Router platforms.

For more information about the Cisco SAMI, see the Cisco Service and Application Module for IP User Guide.
System Requirements

This section describes the system requirements for Cisco LTE PGW Release 1.x and includes the following sections:

- Memory Recommendations, page 6
- Hardware and Software Requirements, page 6
- Determining the Software Version, page 8
- Upgrading to a New Software Release, page 8

For hardware requirements, such as power supply and environmental requirements and hardware installation instructions, see the *Cisco Service and Application Module for IP User Guide*.

Memory Recommendations

Hardware and Software Requirements

Implementing a Cisco LTE PGW Release 1.2 and later on the Cisco 7600 series internet router platform requires the following hardware and software.

- Any module that has ports to connect to the network.
- A Cisco 7600 Series Router and one of the following supervisor engines running Cisco IOS Release 15.0(1)S or later:
  - Cisco 7600 Series Supervisor Engine 720 with a Multiplayer Switch Feature Card 3 (WS-SUP720)
  - Cisco 7600 Series Supervisor Engine 720 with a Multilayer Switch Feature Card 3 and Policy Feature Card 3B (WS-SUP720-3B)
  - Cisco 7600 Series Supervisor Engine 720 with a Multilayer Switch Feature Card 3 and Policy Feature Card 3BXL (WS-SUP720-3BXL)
  - Cisco 7600 Series Supervisor Engine 32 with a Multiplayer Switch Feature Card (WS-SUP32-GE-3B) with LCP ROMMON Version 12.2(121) or later on the Cisco SAMI.
  - Cisco 7600 Series Supervisor Engine 32 with a Multilayer Switch Feature Card and 10-Gigabit Ethernet Uplinks (WS-SUP32-10GE-3B) with LCP ROMMON Version 12.2[121] or later on the Cisco SAMI.
Or one of the following Cisco 7600 series Route Switch Processors running Cisco IOS Release 15.0(1)S or later:

- Cisco 7600 Series Route Switch Processor 720 with Distributed Forwarding Card 3C (RSP720-3C-GE)
- Cisco 7600 Series Route Switch Processor 720 with Distributed Forwarding Card 3CXL (RSP720-3CXL-GE)
- Cisco 7600 Series Route Switch Processor 720 with 10-Gigabit Ethernet Uplinks with Distributed Forwarding Card 3CXL (RSP720-3CXL-10GE)

For details on upgrading the Cisco IOS release running on the supervisor engine, refer to the “Upgrading to a New Software Release” section in the *Release Notes for Cisco IOS Release 15.0S*. For information about verifying and upgrading the LCP ROMMON image on the Cisco SAMI, refer to the *Cisco Service and Application Module for IP User Guide*.

**Note**  
The Cisco IOS Software required on the supervisor engine is dependent on the supervisor engine being used and the Cisco mobile wireless application running on the Cisco SAMI processors.

**Note**  
The Cisco LTE PGW Release 1.x software application supports both the Cisco SAMI 1-GB memory default and the 2-GB memory option (Cisco Product Number: MEM-SAMI-6P-2GB[=])

- For security, the IPSec VPN Services Module.
- For GTP-Session Redundancy, in addition to the required hardware and software, implementing GTP-Session Redundancy (GTP-SR) requires at minimum:
  - In a one-router implementation, two Cisco SAMIs in the Cisco 7600 Series Router, or
  - In a two-router implementation, one Cisco SAMI in each of the Cisco 7600 Series Routers.
Determining the Software Version

To determine the version of Cisco IOS Software running on your Cisco SAMI, log in to PPC3 and enter the `show version` EXEC command:

```
Pgw# show version
Cisco IOS Software, SAMI Software (SAMI-L3IK9S-M), Experimental Version
12.4(20100928:164957)
Copyright (c) 1986-2010 by Cisco Systems, Inc.

Pgw#
```

Upgrading to a New Software Release

For information on upgrading to a new software release, see the product bulletin *Cisco IOS Software Upgrade Ordering Instructions* at:

Upgrading the Cisco SAMI Software

For information on upgrading the Cisco SAMI software, see the *Cisco Service and Application Module for IP User Guide*:

**Note**

The image download process automatically loads the Cisco IOS image onto the six SAMI processors.

MIBs

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to:

Limitations, Restrictions, and Important Notes

When configuring the Cisco LTE PGW, note the following:

- The Cisco LTE PGW does not support the Cisco Express Forwarding (CEF) neighbor resolution optimization feature, which is enabled by default. Therefore, to avoid the possibility of incomplete adjacency on VLAN interfaces for the redirected destination IP address and an impact to the upstream traffic flow for bearers/PDP sessions upon bootup, ensure that you configure the `no ip cef optimize neighbor resolution` command.

- The number of bearer/PDP contexts supported on a PGW is dependent on the memory and platform in use and the PGW configuration (for example, whether Dynamic Feedback Protocol [DFP] is being used or the memory protection feature is enabled, and what rate of bearer creation is supported).

  Table 2 lists the maximum number the Cisco SAMI with the 2-GB memory option can support:

<table>
<thead>
<tr>
<th>Bearer/PDP Type</th>
<th>Maximum Number per SAMI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GTPv2 bearer (IPv4 and IPv6)</td>
<td>380,000</td>
</tr>
<tr>
<td>GTPv1 PDP (IPv4 and IPv6)</td>
<td>800,000</td>
</tr>
</tbody>
</table>

Note: When the maximum allowable number of bearers/PDP contexts is reached, the PGW refuses new mobile sessions until sessions are available.

- To avoid issues with high CPU usage, we recommend the following configurations:
  - To reduce the CPU usage during bootup, disable logging to the console terminal by configuring the `no logging console` global configuration command.
  - To ensure that the HSRP interface does not declare itself active until it is ready to process a peer’s hello packets, configure the delay period before the initialization of HSRP groups with the `standby delay minimum 100 reload 100` interface configuration command under the HSRP interface.
  - To minimize issues with high CPU usage for additional reasons, such as periods of high PPP PDP processing (creating and deleting), disable the notification of interface data link status changes on all virtual template interfaces of the GGSN using the `no logging event link-status` interface configuration command.

```
! interface Virtual-Template1
description GGSN-VT
ip unnumbered Loopback0
encapsulation gtp
no logging event link-status
gprs access-point-list gprs
end
```

- For Mobile Express Forwarding (MEF) support, the `redirect all` command must be configured under the APN.
- Ensure that `radius-server source ports extended` command is configured (to enable 200 ports in the range from 21645 to 21844 to be used as the source ports for sending out RADIUS requests).
New and Changed Information

The following sections list new features and behavior changes in the Cisco IOS 12.4(24)T3 releases:
- New Implementations and Behavior Changes in Cisco IOS Release 12.4(24)T3b, page 10
- New Implementations and Behavior Changes in Cisco IOS Release 12.4(24)T3a1, page 10

New Implementations and Behavior Changes in Cisco IOS Release 12.4(24)T3b

Per CR 225, with Cisco LTE PGW Release 1.2, the Tracking Area Identity (TAI) and User Location Information (ECGI) are included in the change report action information element (IE), according to the received event trigger, in the following messages:
- Create Session Response
- Create Bearer Request
- Modify Bearer Response
- Update Bearer Request
- Change Notification Response
(CSCth92541)

New Implementations and Behavior Changes in Cisco IOS Release 12.4(24)T3a1

The following new feature and compliance change have been introduced in Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1:
- Configuring Local Service Record Information Generation, page 10
- Configuring Specification Conformance, page 11

Configuring Local Service Record Information Generation

By default, the Cisco LTE PGW obtains service record information from the Cisco CSG2. With Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1, service record information can be generated locally, without the Cisco CSG2.

Service Record Generation with a Cisco CSG2

When generating service record information with a Cisco CSG2, the following configuration must exist:
- Service aware billing is enabled on the APN using the service-aware access-point configuration command.
- The charging record type is set to pcdr using the charging record type access-point configuration command.
- Traffic is redirected to the Cisco CSG2 using the redirect all access-point configuration command.

With the service record generation with a Cisco CSG2 implementation, the Cisco CSG2 sends the service record information to the Cisco LTE PGW, which then adds it to the CDR.
Service Record Generation without a Cisco CSG2

When generating service record information without a Cisco CSG2, the following configuration must exist:

- Service aware billing is not enabled on the APN.
- The charging record type is set to `pcdr` using the `charging record type` access-point configuration command.
- Traffic is redirected directly to the Gi interface using the `redirect all` access-point configuration command.

With the service record without a Cisco CSG2 implementation, the PGW generates the service information and adds it to the CDR.

**Note**

Service record information added by the PGW for non service aware APNs does not include information for the following fields that are defined as optional by the 3GPP specifications: time of last usage, time of last usage, and time usage.

To enable the PGW to generate service record information locally, complete the following tasks while in charging profile configuration mode.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Router(ch-prof-conf)# service id num</code></td>
<td>Configures the default service identifier for the service record information locally generated and added to the P-CDR by the PGW. The service identifier is used to identify the service or the service component to which the service data flow relates. (See Service-Identifier AVP as defined in TS 29.212.) A valid value is a number from 1 through 4294967295. The default is 1.</td>
</tr>
<tr>
<td><code>Router(ch-prof-conf)# rating id num</code></td>
<td>Configures the default IP service flow identity. (See Rating-Group AVP as defined in TS 32.299.) A valid value is a number from 1 through 4294967295. The default is 1.</td>
</tr>
</tbody>
</table>

**Note**

For more information about configuring charging profiles, see the *Cisco LTE PGW Configuration Guide*.

Configuring Specification Conformance

Support for the following 3GPP specification change requests (CRs) records for 29.274 has been introduced in Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1:

- CR 267—Serving Network
- CR 358—Bearer QoS in modify bearer request
- CR 430—UE Timezone and user location information (ULI) included in bearer response messages
• CR 433—Correcting misaligned information element (IE) presence type statements
• CR 451—Charging characteristics value for active PDN connections
• CR 154—Offending IE in the cause IE

Additionally, commands to configure backward compliance have been added for the following 29.274 CRs:

• CR 308—LBI clarifications for Gn/Gp handovers. By default, compliance for this CR 308 is enabled on the PGW, but by default is disabled on the SGW.
• CR 324—APN-AMBR in the create/delete bearer request. Compliance must be enabled on the PGW and SGW. By default, compliance for this CR is disabled.
• CR 137—Combined uplink and downlink traffic flow template (TFT) IEs. CR 137 Compliance must be enabled on the PGW and SGW. By default, compliance for CR 137 is disabled.

To configure compliance for the above CR, complete the following tasks:

• Creating a Compliance Profile, page 12
• Creating a Remote Path Group, page 13

Creating a Compliance Profile

Operators can create a compliance profile in which they configure CR compliance. Once a compliance profile has been created, it can be applied to a path group to a remote node. For information on creating a path group to a remote node, see “Creating a Remote Path Group” section on page 13.

To create a compliance profile and its CR configuration, complete the following tasks, beginning in global configuration mode:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1  gprs compliance profile name</td>
<td>Creates or modifies a compliance profile, where name is the name of the compliance profile.</td>
</tr>
<tr>
<td>Step 2  cr 29.274-0308</td>
<td>Configures the gateway to comply with CR 308 (LBI clarifications for Gn/Gp handovers). On the PGW, CR 308 compliance is enabled by default. On the SGW, compliance is disabled by default.</td>
</tr>
<tr>
<td>Step 3  cr 29.274-0324</td>
<td>Configures the gateway to comply with CR 324 (APN-AMBR in the create/delete bearer request). On the PGW and SGW, CR 324 compliance is disabled by default.</td>
</tr>
<tr>
<td>Step 4  cr 29.274-0137</td>
<td>Configures the gateway to comply with CR 137 (combine uplink and downlink TFT IEs). On the PGW and SGW, compliance is disabled by default.</td>
</tr>
</tbody>
</table>
Creating a Remote Path Group

Once a compliance profile has been configured, operators can create a path group. In the path group, the address of the remote node is configured and as well as the compliance profile to use.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
</table>
| Step 1  | Router(config)# gprs remote group name  
|         | Creates or modifies a remote path group, where name is the name of the group. |
| Step 2  | Router(config-remote-group)# compliance name  
|         | Applies a preconfigured compliance profile to the path group. |
| Step 3  | Router(config-remote-group)# ip address {v4 start_ipv4_addr end_ipv4_addr | v6 start_ipv6_addr end_ipv6_addr}  
|         | Configures an IP address range in the remote path group, where:  
|         |  
|         | • v4 start_ipv4_addr end_ipv4_addr—IPv4 address range.  
|         | • v6 start_ipv6_addr end_ipv6_addr—IPv6 address range. |

Caveats

This section contains the caveats for the following releases:

- Caveats - Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1, page 17
- Caveats - Cisco LTE PGW Release 1.0, Cisco IOS Release 12.4(24)T3a, page 20

Caveats describe unexpected behavior in Cisco IOS Software releases. Severity 1 caveats are the most serious caveats; severity 2 caveats are less serious. Severity 3 caveats are moderate caveats, and only select severity 3 caveats are included in the caveats document.

All caveats in Cisco IOS Release 12.4 and Cisco IOS Release 12.4 T are also in Cisco IOS Release 12.4(22)YE.

For information on caveats in Cisco IOS Release 12.4, see Caveats for Cisco IOS Release 12.4.

For information on caveats in Cisco IOS Release 12.4 T, see Caveats for Cisco IOS Release 12.4T, which lists severity 1 and 2 caveats and select severity 3 caveats and is located on Cisco.com and the Documentation CD-ROM.

Using the Bug Navigator II

If you have an account with Cisco.com, you can use Bug Navigator II to find caveats the most current list of caveats of any severity for any software release. To reach Bug Navigator II, log in to Cisco.com and click Software Center: Cisco IOS Software: Cisco Bugtool Navigator II. Another option is to go directly to http://www.cisco.com/support/bugtools.
Caveats - Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b

This section contains open and resolved caveats that pertain to Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b.

Open Caveats

Note: Caveats open in one release are also open in prior releases.

The following sections document possible unexpected behavior and describe only severity 1 and 2 caveats and select severity 3 caveats.

Cisco LTE PGW Caveats

There are no known Cisco LTE PGW caveats open in Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b.

Cisco SAMI Caveats

This section lists the SAMI caveats that are open with Cisco LTE SPW Release 1.2, Cisco IOS Release 12.4(24)T3b.

- CSCti31555
  For dual stack sessions belonging to APNs with Mobile Express Forwarding (MEF) switching enabled, the “MEF uplink packets / links” field displays some non zero values immediately after the sessions come up.
  This condition occurs when sessions belonging to an APN, which has dual stack configured (using the `gtp bearer dual-addr` access-point configuration command) and has MEF switching enabled. The `show gprs gtp pdp-context tid` command output displays some non zero values in the “MEF uplink packets / links” field.
  Workaround: There is currently no known workaround.

Resolved Caveats

The following sections list the caveats that have been resolved with Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b.

Cisco LTE PGW Caveats

This section lists the PGW caveats that are resolved with Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b.

- CSCth54731
  During a GTPv2 to GTPv1 handoff, the radio access technology (RAT) type from the GTPv2 session is copied into the GTPv1 session without verifying if the GTPv2 RAT type is valid for the GTPv1 session. Therefore, the interim accounting messages are sent with an invalid RAT type for the GTPv1 session.
  This condition occurs when the RAT type is E-UTRAN and a handover from GTPv2 to GTPv1 occurs.
Caveats

- **CSCti93827**
  The following error message displays on the console and some IPv6 addresses are not released into the pool after a session deletion, however, the addresses are assigned in subsequent session creations.

  IPC-3-SAMI_IPV6_POOL_FAIL: Unexpected condition: Malloc Failure for IPv6 Pool Mgmt Module

  This condition occurs when the Cisco LTE PGW is configured with 500 APNs, all of which have different VRFs and accounting and charging enabled, and the PGW receives continuous session create, modify, and delete requests at 750 calls per second (cps).

- **CSCtj06869**
  A Traffic and Control Plane Processor (TCOP) spikes for a long time during an SNMP query with 192K static traffic, 192K create/delete requests, and 192K create at 1200 cps.

  This condition occurs with the following sequence of events:
  
  a. Reload gateways
  b. Create 192K static dual-stack sessions with traffic
  c. Create/delete 192K at 1200CPS in a loop
  d. Create 192K at 120CPS with same International Mobile Subscriber Identity (IMSI) as in Step c
  e. On the SNMP server, do an `snmpwalk` and `getmany` on cGgsnExtMIB

  Issue the `show processor cpu` command to display that the Proxy Control Processor (PCOP) stays at 98% for a long time.

- **CSCtj09958**
  Some sessions are not synchronized to the standby Cisco LTE PGW when Gx is enabled for dual stack sessions with the DHCP option.

  When the PGW is configured with 500 APNs, all of which have different VRFs, Policy and Charging Control (PCC), accounting, charging, and DHCP proxy address allocation for IPv4 addresses, and redundancy configured, this condition occurs after approximately 38,000 sessions are created.

- **CSCtj29343**
  The Cisco LTE PGW reports that the Dynamic Feedback Protocol (DFP) high threshold has been reached and is congested due to low processor memory.

  This condition occurs after a switchover with 800K GTPv1 Gx sessions with charging enabled (time trigger set at five minutes and the volume trigger 1 Mb).

- **CSCtj42310**
  When the Cisco LTE PGW dynamically assigns IPv6 prefixes to the UEs from a local pool or from a RADIUS pool name or RADIUS prefix in response to an IPv6 router solicitation from the UE, the PGW must send an IPv6 router advertisement with the UE’s prefix information with the lower 64 bits of the IPv6 address in the prefix extension set to zero. The PGW incorrectly sends the non zero UE’s interface ID in the lower 64 bits.

  This condition occurs with an IPv6 solicitation from a UE using an IPv6 address.
• CSCtj45011
Lawful Intercept does not intercept GTPv0 Intercept Related Information (IRI) and Content of Communication (CC) packets. A show wire issued on the Cisco LTE PGW displays that no packets are being intercepted for the generic stream. The mediation device (MD) also does not show any HI2_IRI or HI3_CC packets intercepted when context requests and date were sent to a specific International Mobile Subscriber Identity (IMSI) session.

• CSCtj79577
When IPv6 primary and secondary DNS addresses are configured under an APN in the Active PGW, and an IPv6 session is created, the primary and secondary DNS addresses for that session are not synchronized to Standby PGW.
This condition occurs when IPv6 DNS addresses are configured in the APN in the Active PGW, and an IPv6 session is synchronized to the Standby PGW.

• CSCtj83311
The charging characteristics received in a GTPv2 message do not get synchronized from the Active to the Standby Cisco LTE PGW.
This condition applies to all GTPv2 PDP contexts.

• CSCtk01630
In compliance with the Release 8.2.0 Create Session Request, the first byte of the mobile station ISDN (MSISDN) number is removed.

• CSCtk05719
Downstream traffic fails at the Cisco LTE PGW for IPv6 PDP contexts.
This issue is seen in all Cisco LTE PGW and Cisco GGSN releases when the IPv6 address is dynamically allocated, and the UE modifies the interface ID.

• CSCtk82421
The Cisco LTE PGW clears the Autonomous bit while installing the MS prefix in the Interface Data Block (IDB), which causes the IPv6 ND RA message to be sent with the Autonomous bit not set.
This condition occurs only when the UE requests dynamic IPv6 prefix allocation from the Cisco LTE PGW.
Caveats - Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1

This section contains open and resolved caveats that pertain to Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1.

- Open Caveats, page 17
- Resolved Caveats, page 19

Open Caveats

Note

Caveats open in one release are also open in prior releases.

The following sections document possible unexpected behavior and describe only severity 1 and 2 caveats and select severity 3 caveats.

- Cisco LTE PGW, page 18
- Cisco SAMI, page 18

Cisco SAMI Caveats

This section lists the Cisco SAMI caveats that are resolved with Cisco LTE PGW Release 1.2, Cisco IOS Release 12.4(24)T3b.

- CSCth91677
  The UE is unable to acquire an IPv6 address.
  This condition occurs when the Cisco LTE PGW dynamically assigns IPv6 prefixes from the UEs from a local pool or from a RADIUS pool name or RADIUS prefix. The IPv6 router solicitation from the UE is lost and therefore, the UE is unable to acquire its IPv6 address.

- CSCti63031
  Data packets to or from the MSs are dropped for APNs with VRFs when IXP switching is enabled (the default).
  This condition occurs when the Cisco LTE PGW is configured with 500 APNs, all of which are configured with a different VRF and the redirect all ip command. Traffic for MSs from some of the 500 APNs is dropped at the IXP. The show mef access-point command displays an all zeros MAC address, for example, Redirect MAC Address: 0000.0000.0000.

- CSCti79332
  When the PGW is switching traffic at a high data rate (approximately 1.2 mpps) for more than 48 hours, the following error message along with a traceback is seen,

  %PLATFORM-3-SAMI_INTRHOG: DMA interrupt is running for (xxx)usecs, more than (xxx)usecs.

  This condition occurs when the PGW is connected to a Cisco CSG2 and there are 380K enabled sessions distributed over 500 APNs, all of which are configured with a different VRF, and the Gx and PCC features enabled, and the PGW is switching upstream and downstream data to these sessions at a high rate (1.2 million packets per second [mpps]) for more than 48 hours.
Cisco LTE PGW

The following PGW caveats are open in Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1.

- CSCti93827
  The following error message displays on the console and some IPv6 addresses are not released into the pool after a session deletion, however, the addresses are assigned in subsequent session creations.
  
  IPC-3-SAMI_IPV6_POOL_FAIL: Unexpected condition: Malloc Failure for IPv6 Pool Mgmt Module

  This condition occurs when the Cisco LTE PGW is configured with 500 APNs, all of which have different VRFs and accounting and charging enabled, and the PGW receives continuous session create, modify, and delete requests at 750 cps.

  **Workaround:** There is currently no known workaround, however, the addresses that were not deleted in the pool are not leaked since they are assigned to new users on subsequent session creations.

- CSCtj09958
  Some sessions are not synchronized to the standby PGW, when Gx is enabled for dual stack sessions with the DHCP option.

  When the PGW is configured with 500 APNs, all of which have VRF, Policy and Charging Control (PCC), accounting, charging, and DHCP proxy address allocation for IPv4 addresses, and redundancy configured, this condition occurs after approximately 38,000 sessions are created.

  **Workaround:** There is currently no known workaround.

Cisco SAMI

This section lists the SAMI caveats that are open with Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1.

- CSCti31555
  For dual stack sessions belonging to APNs with MEF switching enabled, “MEF uplink packets / links” field displays some non zero values immediately after the session comes up.

  This condition occurs when sessions belonging to an APN, which has dual stack configured (using the `gtp bearer dual-addr` access-point configuration command) and has MEF switching enabled (using the `redirect all ip` access-point command). The `show gprs gtp pdp-context tid` command output displays some non zero values in the “MEF uplink packets / links” field.

  **Workaround:** There is currently no known workaround.
• CSCti63031
  Data packets to or from the mobiles are dropped for APNs with VRF when IXP switching is enabled (the default).
  This condition occurs when the PGW is configured with 500 APNs, all of which are configured with a different VRF and the redirect all ip command. Traffic for mobiles from some of the 500 APNs is dropped at the IXP. The show mef access-point command displays an all zeros MAC address, for example, Redirect MAC Address: 0000.0000.0000.
  **Workaround:** Before any sessions are open for mobiles under an APN, issuing the ping command to the redirect addresses configured under the affected APNs triggers an Address Resolution Protocol (ARP) request that resolve the issue. Alternately, if there are a huge number of APNs with redirect addresses configured, saving the configuration and reloading the PGW resolves the issue.

• CSCti79332
  When the PGW is switching traffic at a high data rate (approximately 1.2 million packets per seconds [mpps]) for more than 48 hours, the following error message along with a traceback is seen,

  %PLATFORM-3-SAMI_INTRHOG: DMA interrupt is running for (xxx)usecs, more than (xxx)usecs.

  This condition occurs when the PGW is connected to a Cisco CSG2 and there are 380K enabled sessions distributed over 500 APNs, all of which are configured with a different VRF, and the Gx and PCC features enabled, and the PGW is switching upstream and downstream data to these sessions at a high rate (1.2 mpps) for more than 48 hours.
  **Workaround:** There is currently no known workaround.

## Resolved Caveats

The following sections list caveats that have been resolved with Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1. Only severity 1 and 2 caveats and select severity 3 caveats are listed.

- Cisco LTE PGW, page 19
- Cisco SAMI, page 20

### Cisco LTE PGW

The following PGW caveats are resolved in Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1.

- CSCth24607
  A fatal error occurs on the active PGW after the virtual-template interface is modified and sessions are cleared using the clear gprs gtp pdp-context command.

- CSCth45430
  A traceback is seen on the Cisco LTE PGW. This condition occurs with downstream traffic greater than 1500 over IPv6 PDPs.
Caveats

- CSCth52695
  The `show sami sm imsi` output fails to display existing PDP sessions. Additionally, after some time, the `gprs gtp pdp tid` command output also displays nothing.
  This condition occurs with IPv6 create requests with different restart counters.

- CSCth55339
  Tracebacks are observed with GTP Version 0 (GTPv0) PDPs on IPv6 transport handoffs to GTPv1 on IPv4 transport, and again with handoffs to GTPv0 on IPv4 transport.
  This condition occurs only when the handoff is between different IPv6/IPv4 transport.

Cisco SAMI

There are no SAMI caveats resolved with Cisco LTE PGW Release 1.1, Cisco IOS Release 12.4(24)T3a1.

Caveats - Cisco LTE PGW Release 1.0, Cisco IOS Release 12.4(24)T3a

This section contains the following types of caveats that pertain to Cisco LTE PGW Release 1.0, Cisco IOS Release 12.4(24)T3a.

- Open Caveats—Cisco LTE PGW, page 20
- Open Caveats—Cisco SAMI, page 21

Open Caveats—Cisco LTE PGW

This section documents possible unexpected behavior by Cisco LTE PGW Release 1.0, Cisco IOS Release 12.4(24)T3a and describes only severity 1 and 2 caveats and select severity 3 caveats.

- CSCth20123
  Some sessions are deleted on the new standby PGW during the bulk synchronization after a switchover occurs.
  This condition occurs with IPv6 transport, and IPv6 neighbor discovery for the next hop fails for approximately three minutes after the reload.
  **Workaround:** Configure a static neighbor-to-IPv6 address mapping for the next-hop address for all GTP paths (for example `ipv6 1:1:1:1::1 GigabitEthernet0/0.100 0022.3344.5566`).

- CSCth24607
  A fatal error occurs on the active PGW after the virtual-template interface is modified and sessions are cleared using the `clear gprs gtp pdp-context` command.
  **Workaround:** There is currently no known workaround.

- CSCth45430
  A traceback is seen on the Cisco LTE PGW. This condition occurs with downstream traffic greater than 1500 over IPv6 PDPs.
  **Workaround:** There is currently no known workaround.
- CSCth52695

The `show sami sm imsi` output fails to display existing PDP sessions. Additionally, after some time, the `gprs gtp pdp tid` command output also displays nothing.

This condition occurs with IPv6 create requests with different restart counters.

**Workaround:** There is currently no known workaround.

- CSCth55339

Tracebacks are observed with GTP Version 0 (GTPv0) PDPs on IPv6 transport handoffs to GTPv1 on IPv4 transport, and again with handoffs to GTPv0 on IPv4 transport.

This condition occurs only when the handoff is between different IPv6/IPv4 transport.

**Workaround:** There is currently no known workaround.

### Open Caveats—Cisco SAMI

This section lists the SAMI caveats that are open with Cisco LTE PGW Release 1.0, Cisco IOS Release 12.4(24)T3a.

- CSCtg64608

The Cisco LTE gateway allows out of sequence traffic. This condition occurs when sending upstream traffic with the sequence number set to FFFF only with Mobile Express Forwarding (MEF). With Cisco Express Forwarding (CEF), the packets are dropped as designed.

**Workaround:** Use CEF instead of MEF.

### Related Documentation

Except for feature modules, documentation is available as printed manuals or electronic documents. Feature modules are available online on Cisco.com.

Use these release notes with these documents:

- Release-Specific Documents, page 22
- Platform-Specific Documents, page 22
- Cisco IOS Software Documentation Set, page 22
Release-Specific Documents

The following documents are specific to Cisco IOS Release 12.4 and are located at Cisco.com:

- Cisco IOS Release 12.4 Mainline Release Notes
  Documentation > Cisco IOS Software > Cisco IOS Software Releases 12.4 Mainline > Release Notes

- Cisco IOS Release 12.4 T Release Notes
  Documentation > Cisco IOS Software > Cisco IOS Software Releases 12.4 T > Release Notes

Note: If you have an account with Cisco.com, you can use Bug Navigator II to find caveats of any severity for any release. You can reach Bug Navigator II on Cisco.com at http://www.cisco.com/support/bugtools.

- Product bulletins, field notices, and other release-specific documents on Cisco.com at:
  Documentation > Cisco IOS Software > Cisco IOS Software Releases 12.4 Mainline

Platform-Specific Documents

These documents are available for the Cisco 7600 series router platform on Cisco.com and the Documentation CD-ROM:

- Cisco Service and Application Module for IP User Guide

- Cisco 7600 series routers documentation:
  - Cisco 7600 Series Internet Router Installation Guide
  - Cisco 7600 Series Internet Router Module Installation Guide
  - Cisco 7609 Internet Router Installation Guide

  Cisco 7600 series router documentation is available at:

- Cisco IOS Software Documentation Set

  The Cisco IOS software documentation set consists of the Cisco IOS configuration guides, Cisco IOS command references, and several other supporting documents that are shipped with your order in electronic form on the Documentation CD-ROM, unless you specifically ordered the printed versions.
Documentation Modules

Each module in the Cisco IOS documentation set consists of two books: a configuration guide and a corresponding command reference guide. Chapters in a configuration guide describe protocols, configuration tasks, Cisco IOS Software functionality, and contain comprehensive configuration examples. Chapters in a command reference guide list command syntax information. Use each configuration guide with its corresponding command reference. On Cisco.com at:

Documentation > Cisco IOS Software > Cisco IOS Software Releases 12.4 Mainline > Command References

Documentation > Cisco IOS Software > Cisco IOS Software Releases 12.4 Mainline > Command References > Configuration Guides

Implementing a Cisco LTE PGW Release 1.0 on the Cisco SAMI

The following sections list related documentation (by category and then by task) to use when you implement a Cisco LTE PGW on the Cisco SAMI platform.

General Overview Documents

Core Cisco 7609 Router Documents

Documentation List by Task

For the most up-to-date list of documentation on the Cisco 7600 Series Router, refer to the Cisco 7600 Series Routers Documentation Roadmap on Cisco.com at:

Getting Started

- Cisco 7600 Series Internet Router Essentials
- Regulatory Compliance and Safety Information for the Cisco 7600 Series Internet Routers

Unpacking and installing the Cisco 7600 router:

- Cisco 7600 Internet Router Installation Guide
Installing the supervisor module and configuring the router (basic configuration, such as VLANs, IP):

- Cisco 7600 Series Internet Router Module Installation Guides

- Cisco IOS Software Configuration Guide that applies to the latest release at the time of FCS

Installing and completing the Cisco SAMI configuration:

- Cisco 7600 Series Internet Router Module Installation Guides

- Cisco Service and Application Module for IP User Guide

Obtaining Documentation and Submitting a Service Request
