# CONTENTS

PREFACE

**Preface** xiii

About This Guide xiii

Audience xiii

Additional Support xiv

Conventions (all documentation) xiv

Communications, Services, and Additional Information xv

Important Notes xvi

CHAPTER 1

**CPS Basic Operations** 1

Starting and Stopping CPS 1

Starting VMs Using VMware GUI 1

Shutting Down the Cisco Policy Server Nodes 1

Policy Director (LB) or Policy Server (QNS) Nodes 1

OAM (pcrfclient) Nodes 2

sessionmgr Nodes 2

Restarting the Cisco Policy Server 3

Restarting Database Services 3

Restarting Policy Server Services 4

Restarting All Policy Server Services 4

Restarting All Policy Server Services on a Specific VM 4

Restarting Individual Policy Server Services on a Specific VM 4

Restarting Services Managed by Monit 5

Restarting Other Services 5

Restarting Subversion 5

Restarting Policy Builder 5

Restarting Control Center 5

Restarting Services on Policy Director (lb01 and lb02) 5
Recovering After a Power Outage 6
Recovery Control 7
Cluster State Monitoring 7
Controlled Startup 8
Switching Active and Standby Policy Directors 9
Determining the Active Policy Director 9
Switching Standby and Active Policy Directors 10
Backing Up and Restoring 10
Adding or Replacing Hardware 10
Export and Import Service Configurations 11

CHAPTER 2 **Managing CPS Disks** 13
Adding a New Disk 13
Prerequisites 13
ESX Server Configuration 13
Target VM Configuration 14
Update the collectd process to use the new file system to store KPIs 14
Mounting the Replication Set from Disk to tmpfs After Deployment 15
Scenario 1 – Mounting All Members of the Replication Set to tmpsf 15
Scenario 2 – Mounting Specific Members of the Replication Set to tmpfs 16
Manage Disks to Accommodate Increased Subscriber Load 16
Clone Sessionmgr01 VM 16
Disk Repartitioning of Sessionmgr01 VM 17
Cloning and Disk Repartitioning of Sessionmgr02 VM 20

CHAPTER 3 **Managing CPS Licenses** 21
Smart Software Licensing 21
Classic Licensing 21
Comparison between Licensing Models 22
Smart Accounts/Virtual Accounts 23
Request a Cisco Smart Account 24
Cisco Smart Software Manager 24
License Conversion 24

Enable Smart Licensing for CPS 25
Product ID Tags 27
Smart Licensing CLI Commands 27
License Usage Threshold 29
Configuration 29
Validation Steps 30

CHAPTER 4 **Managing CPS Interfaces and APIs** 31
CPS Interfaces and APIs 31
Control Center GUI Interface 31
CRD REST API 32
Grafana 35
HAProxy 35
JMX Interface 36
Logstash 36
LDAP SSSD 38
Configure Policy Builder 40
Configure Grafana 40
Mongo Database 43
Adding New Replica-set Members 44
Replica Set Arbiter: Security 48
Admin Database 48
OSGi Console 50
Policy Builder GUI 55
REST API 55
Rsyslog 56
Rsyslog Customization 56
SVN Interface 56
CPS 7.0 and Higher Releases 58
CPS Versions Earlier than 7.0 58
TACACS+ Interface 59
Unified API 60
Accessing the CPS CLI 60
Support for Multiple User Login Credentials 61

Multi-user Policy Builder 62
Create Users 62
Revert Configuration 63
Publishing Data 64
Control Center Access 64
Add a Control Center User 64
Update Control Center Mapping 65
Multiple Concurrent User Sessions 66
Configure Session Limit 68
Configure Session Timeout 68
Important Notes 68
Enable Authentication for Unified API 69
Unified API Security: Access Privileges 70
Enable Authentication for Unified API 70
WSDL and Schema Documentation 72
Enabling Unified API Access on HTTP Port 8080 72
TACACS+ 75
Overview 75
TACACS+ Service Requirements 75
Caching of TACACS+ Users 76
Reading Log Files 77
CRD APIs 78
Limitations 78
Setup Requirements 78
Policy Server 78
Policy Builder 78
Architecture 83
MongoDB 83
Caching 83
API Endpoints and Examples 84
Query API 84
Create API 85
Update API 86
Delete API 86

Data Comparison API 87
Table Drop API 88
Export API 89
Export Golden CRD API 90
Import API 91
Import Single File API 92
Snapshot POST API 93
Snapshot GET API 94
Revert API 95
Tips for Usage 95
View Logs 95
Policy Builder Publish and CRD Import/Export Automation 96
Remove Traces of Old Policy Director (LB) VIPs 98

CHAPTER 5 **Tracking CPS GUI and API Usage** 99
Track Usage 99
Capped Collection 99
PurgeAuditHistoryRequests 99
AuditRequests 99
Operation 100
Initial Setup 100
Read Requests 100
APIs 101
Querying 101
Purging 101
Purge History 102
Control Center 102
PurgeAuditHistoryRequest 102
QueryAuditHistoryRequest 103
Policy Builder 105
Reporting 105
Audit Configuration 106
Pre-configured auditd 110

CHAPTER 6 **Graphite/Prometheus and Grafana** 113

Overview 113

Prometheus 113

Enable Prometheus 114

Add Datasource in Grafana for Prometheus 115

Graphite 118

Additional Graphite Documentation 119

Grafana 119

Additional Grafana Documentation 120

Configure Grafana Users using CLI 120

Add User 120

Delete User 121

Connect to Grafana 121

Grafana Administrative User 122

Log in as Grafana Admin User 122

Change Grafana Admin User Credentials 123

Add a Grafana User 123

Change the Role of Grafana User 125

Add an Organization 126

Move Grafana User to another Organization 127

Configure Grafana for First Use 128

Migrate Existing Grafana Dashboards 128

Configuring Graphite User Credentials in Grafana 130

Accessing Graphite Database Using CLI 131

Changing Default graphite_default User Password 131

Manual Dashboard Configuration using Grafana 132

Create a New Dashboard Manually 132

Configure Data Points for the Panel 134

Configure Useful Dashboard Panels 137

Updating Imported Templates 139

Copy Dashboards and Users to pcrfclient02 139

Configure Garbage Collector KPIs 140

Backend Changes 140

Frontend Changes 141
Export and Import Dashboards 142
Export Dashboard 142
Import Dashboard 143
Export Graph Data to CSV 144
Session Consumption Report 145
Introduction 145
Data Collection 145
Logging 146
Performance 146
Log Rotation 146
Sample Report 146
Resync Member of a Replica Set 147

CHAPTER 7 Managing High Availability in CPS 149
HAProxy 149
HAProxy Service Operations 149
Diagnostics 149
Service Commands 150
HAProxy Statistics 150
Changing HAProxy Log Level 150
Expanding an HA Deployment 151
Typical Scenarios When Expansion is Necessary 151
Hardware Approach to Expanding 151
High Availability Consequences 152
Adding a New Blade 152
Component (VM Node) Approach to Expanding 152
Adding Additional Component 152
Enable SSL 153

CHAPTER 8 CPS Statistics 155
Bulk Statistics Overview 155
Grafana 156
CPS Statistics 156

Overview 156
CPS Statistic Types 158
Diameter Statistics 158
LDAP Statistics 158
System Statistics 158
Engine Statistics 159
Error Statistics Definitions 159
Bulk Statistics Collection 159
Retention of CSV Files 160
Configuring Logback.xml 160
Restarting the Collectd Service 161
Adding Realm Names to Diameter Statistics 161
CPS KPI Monitoring 162
System Health Monitoring KPIs 162
Session Monitoring KPIs 165
Diameter Monitoring KPIs 167
Database Fragmentation Monitoring KPIs 184
Configure Custom Database Fragmentation Threshold Percentage 186
Example CPS Statistics 186
Sample CSV Files 186
Sample Output 187

CHAPTER 9 **Working with CPS Utilities** 189
Policy Tracing and Execution Analyzer 189
Architecture 189
Administering Policy Traces 189
Managing Trace Rules using trace_ids.sh 190
Managing Trace Results using trace.sh 191
Policy Trace Database 193
Configure Traces Database in Policy Builder 193
Network Cutter Utility 193
Policy Builder Configuration Reporter 194
CRD Generator Conversion Tool 195
Policy Builder Configuration Converter Conversion Tool 197

Modifying Audit Rule File 199
Support for CPS Auto Healing in Case of Endpoint Heart Beat Failures 200
Log Collector 202

CHAPTER 10 CPS Commands 203
about.sh 204
adduser.sh 204
auditrpms.sh 205
build_all.sh 205
build_etc.sh 207
build_set.sh 208
capture_env.sh 208
change_passwd.sh 209
cleanup_license.sh 210
component_alarm_reports.py 210
copytoall.sh 211
diagnostics.sh 212
deploy_all.py 220
dump_utility.py 221
generate_encrypted_password.sh 225

- Important Notes, on page xvi

## About This Guide

**Note** The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. While any existing biased terms are being substituted, exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

This document overrides the same document available in the 22.1.0. For other functionality refer to the 22.1.0 documentation at Cisco.com.

This document is a part of the Cisco Policy Suite documentation set.

For information about available documentation, see the *CPS Documentation Map* for this release at Cisco.com.

## Audience

This guide is best used by these readers:

- Network administrators
- Network engineers
- Network operators
- System administrators

This document assumes a general understanding of network architecture, configuration, and operations.

# Additional Support

For further documentation and support:

- Contact your Cisco Systems, Inc. technical representative.
- Call the Cisco Systems, Inc. technical support number.
- Write to Cisco Systems, Inc. at support@cisco.com.
- Refer to support matrix at https://www.cisco.com/c/en/us/support/index.html and to other documents related to Cisco Policy Suite.

# Conventions (all documentation)

This document uses the following conventions.

| Conventions | Indication |
|---|---|
| **bold** font | Commands and keywords and user-entered text appear in **bold** font. |
| *italic* font | Document titles, new or emphasized terms, and arguments for which you supply values are in *italic* font. |
| [ ] | Elements in square brackets are optional. |
| {x \| y \| z } | Required alternative keywords are grouped in braces and separated by vertical bars. |
| [ x \| y \| z ] | Optional alternative keywords are grouped in brackets and separated by vertical bars. |
| string | A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks. |
| courier font | Terminal sessions and information the system displays appear in courier font. |
| < > | Nonprinting characters such as passwords are in angle brackets. |
| [ ] | Default responses to system prompts are in square brackets. |
| !, # | An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line. |

**Note** Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

**Caution** Means reader be careful. In this situation, you might perform an action that could result in equipment damage or loss of data.

**Warning** IMPORTANT SAFETY INSTRUCTIONS.

Means danger. You are in a situation that could cause bodily injury. Before you work on any equipment, be aware of the hazards involved with electrical circuitry and be familiar with standard practices for preventing accidents. Use the statement number provided at the end of each warning to locate its translation in the translated safety warnings that accompanied this device.

SAVE THESE INSTRUCTIONS

**Note** Regulatory: Provided for additional information and to comply with regulatory and customer requirements.

# Communications, Services, and Additional Information

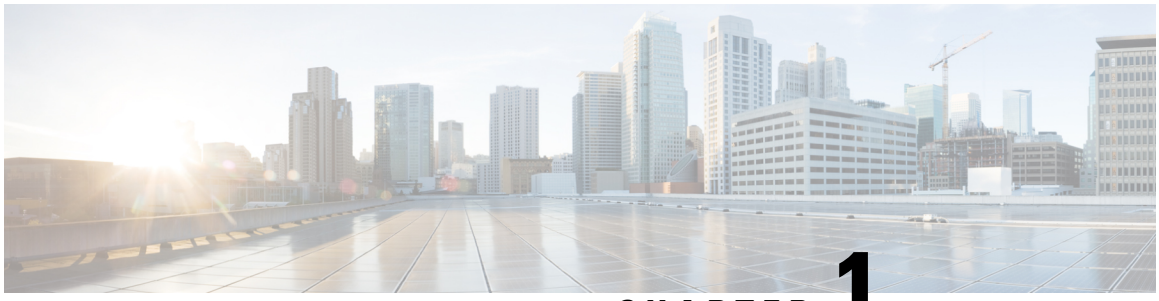
- To receive timely, relevant information from Cisco, sign up at Cisco Profile Manager.
- To get the business impact you're looking for with the technologies that matter, visit Cisco Services.
- To submit a service request, visit Cisco Support.
- To discover and browse secure, validated enterprise-class apps, products, solutions and services, visit Cisco Marketplace.
- To obtain general networking, training, and certification titles, visit Cisco Press.
- To find warranty information for a specific product or product family, access Cisco Warranty Finder.

### Cisco Bug Search Tool

Cisco Bug Search Tool (BST) is a web-based tool that acts as a gateway to the Cisco bug tracking system that maintains a comprehensive list of defects and vulnerabilities in Cisco products and software. BST provides you with detailed defect information about your products and software.

# Important Notes

**Important** Any feature or GUI functionality that is not documented may not be supported in this release or may be customer specific, and must not be used without consulting your Cisco Account representative.



CHAPTER 1

# CPS Basic Operations

- Starting and Stopping CPS, on page 1
- Restarting the Cisco Policy Server, on page 3
- Recovering After a Power Outage, on page 6
- Backing Up and Restoring, on page 10
- Adding or Replacing Hardware, on page 10
- Export and Import Service Configurations, on page 11

# Starting and Stopping CPS

This section describes how to start and stop Cisco Policy Server nodes, VMs, and services.

## Starting VMs Using VMware GUI

**Step 1** Start a VMware vSphere session.

**Step 2** Right-click the VM and select **Power** > **Power On**.

**Important** If the Policy Server (QNS) VM was previously powered off, it must be powered on only during Maintenance Window or low traffic time. If the VM is powered on during high traffic, then when the qns java process comes up and it immediately starts taking up load. As a result there can be timeouts and high CPU until around 60 seconds from the Policy Server (QNS) VM during the JVM hotspot warmup time. Once the JVM warmup phase is completed, the VM must be able to handle traffic smoothly.

**Step 3** After the VM has started, log into the VM from Cluster Manager and verify that the processes are running.

## Shutting Down the Cisco Policy Server Nodes

The following sections describe the commands to shut down the Cisco Policy Server nodes:

### Policy Director (LB) or Policy Server (QNS) Nodes

**Step 1** SSH to the lbxx or qnsxx node from Cluster Manager:

`ssh lbxx` or `ssh qnsxx`

**Step 2** Stop all CPS processes on the node:

```
/usr/bin/monit stop all
```

**Step 3** Check the status of all the processes. Verify that all processes are stopped before proceeding.

```
/usr/bin/monit summary
```

**Step 4** Stop the monit process:

```
service monit stop
```

**Step 5** Shut down lbxx/qnsxx:

```
shutdown -h now
```

## OAM (pcrfclient) Nodes

**Step 1** SSH to the pcrfclient*xx* node from Cluster Manager:

`ssh pcrfclient`*xx*

**Step 2** Stop all CPS processes on the node:

```
/usr/bin/monit stop all
```

**Step 3** Check the status of all the processes. Verify that all processes are stopped before proceeding:

```
/usr/bin/monit summary
```

**Step 4** Stop the monit process:

```
service monit stop
```

**Step 5** Stop the licenses process:

```
service lmgrd stop
```

**Step 6** Shut down pcrfclient*xx*:

```
shutdown -h now
```

## sessionmgr Nodes

**Step 1** SSH to the sessionmgr*xx* node from Cluster Manager:

`ssh sessionmgr`*xx*

**Step 2** Stop all CPS processes on the node:

```
/usr/bin/monit stop all
```

**Step 3** Check the status of all the processes. Verify that all processes are stopped before proceeding:

```
/usr/bin/monit summary
```

**Step 4** Stop the monit process:

```
service monit stop
```

**Step 5** For CPS nodes, such as sessionMgrs, there are mongo processes running that require special steps to stop. First, determine which processes are running by executing:

```
ls /etc/init.d/sessionmgr*
```

**Step 6** Make sure the mongo replica set is in secondary:

```
/usr/bin/mongo --port $PORT --eval "rs.stepDown(10)"
```

where, PORT is the port number found in the previous step, such as 27717.

**Step 7** Stop the MongoDB processes.

For example:

```
systemctl stop sessionmgr-27717
```

**Step 8** Shut down sessionmgr*xx*:

```
shutdown -h now
```

# Restarting the Cisco Policy Server

CPS is composed of a cluster of nodes and services. This section describes how to restart the different services running on various CPS nodes.

## Restarting Database Services

Each database port and configuration is defined in the `/etc/broadhop/mongoConfig.cfg` file.

The scripts that start/stop the database services can be found in the `/usr/bin` directory on the CPS nodes.

To stop and start a database, log into each Session Manager VM and execute the commands as shown below. For example, to restart the sessionmgr 27717 database, execute:

```
systemctl stop sessionmgr-27717
```

```
systemctl start sessionmgr-27717
```

or:

```
systemctl restart sessionmgr-27717
```

**Note** It is important not to stop and start all of the databases in the same replica-set at the same time. As a best practice, stop and start databases one at a time to avoid service interruption.

# Restarting Policy Server Services

If the Policy Server (QNS) VM was previously powered off, it must be powered on only during Maintenance Window or low traffic time. If the VM is powered on during high traffic, then when the qns java process comes up and it immediately starts taking up load. As a result there can be timeouts and high CPU until around 60 seconds from the Policy Server (QNS) VM during the JVM hotspot warmup time. Once the JVM warmup phase is completed, the VM must be able to handle traffic smoothly.

## Restarting All Policy Server Services

To restart all Policy Server (QNS) services on all VMs, execute the following from the Cluster Manager:

**/var/qps/bin/control/restartall.sh**

**Note** This script only restarts the Policy Server (QNS) services. It does not restart any other services.

**Caution** Executing `restartall.sh` will cause messages to be dropped.

Use `summaryall.sh` or `statusall.sh` to see details about these services.

## Restarting All Policy Server Services on a Specific VM

To restart all Policy Server (QNS) services on a single CPS VM, execute the following from the Cluster Manager:

`/var/qps/bin/control/restartqns.sh <hostname>`

where <*hostname*> is the CPS node name of the VM (qns01, qns02, lb01, pcrfclient01, and so on).

## Restarting Individual Policy Server Services on a Specific VM

**Step 1** Log into the specific VM.

**Step 2** To determine what Policy Server (QNS) services are currently running on the VM, execute:

```
monit summary
```

Output similar to the following appears:

```
The Monit daemon 5.5 uptime: 1d 17h 18m

Process 'qns-4' Running
Process 'qns-3' Running
Process 'qns-2' Running
Process 'qns-1' Running
```

**Step 3** Execute the following commands to stop and start the individual Policy Server (QNS) process:

```
monit stop qns-<instance id>
```

```
monit start qns-<instance id>
```

# Restarting Services Managed by Monit

The Monit service manages many of the services on each CPS VM.

To see a list of services managed by `monit` on a VM, log in to the specific VM and execute:

```
monit summary
```

To stop and start all services managed by `monit`, log in to the specific VM and execute the following commands:

```
monit stop all
```

```
monit start all
```

To stop and start a specific service managed by Monit, log in to the specific VM and execute the following commands:

```
monit stop <service_name>
```

```
monit start <service_name>
```

where <*service_name*> is the name as shown in the output of the `monit summary` command.

# Restarting Other Services

## Restarting Subversion

To restart Subversion (SVN) on OAM (pcrfclient) nodes, execute:

```
service httpd restart
```

## Restarting Policy Builder

To restart Policy Builder on OAM (pcrfclient) nodes (pcrfclient01/pcrfclient02), execute:

```
monit stop qns-2
```

```
monit start qns-2
```

## Restarting Control Center

To restart Control Center on OAM (pcrfclient) nodes (pcrfclient01/pcrfclient02), execute:

```
monit stop qns-1
```

```
monit start qns-1
```

# Restarting Services on Policy Director (lb01 and lb02)

The following commands are used to restart the services on the Policy Director (lb) nodes only (lb01 and lb02).

**Step 1** Login to lb01/lb02.

**Step 2** To restart the service that controls the virtual IPs (lbvip01 and lbvip02 are virtual IP addresses shared between lb01 and lb02 for High Availability), execute the following command:

```
monit restart corosync
```

**Step 3** To restart the service that balances and forwards IP traffic (port forwarding service) from lb01/lb02 to other CPS nodes, execute:

```
monit restart haproxy
```

# Recovering After a Power Outage

If there is a controlled or uncontrolled power outage, the following power ON procedures should be followed to bring the system up properly.

**Step 1** Power ON the Cluster Manager.

**Step 2** Power ON Policy Director (lb) VMs.

**Step 3** Stop qns processes on the Policy Director (lb) VMs by running the following command:

```
for i in {1..4}; do monit stop qns-$i; done
```

If there are more than 4 qns processes on Policy Director (lb) VMs, change the number in the loop accordingly.

For example, for 7 qns processes, the command will be:

```
for i in {1..7}; do monit stop qns-$i; done
```

**Step 4** Power ON pcrfclient01 VM.

**Step 5** Stop mon_db script on pcrfclient01 VM by running the following commands:

```
monit stop mon_db_for_call_model
monit stop mon_db_for_lb_failover
```

**Step 6** Power ON sessionmgr VMs.

**Note** Make sure all the replica-sets are UP with primary member available on each replica-set.

**Note** If a member is shown in an unknown state, it is likely that the member is not accessible from one of other members, mostly an arbiter. In that case, you must go to that member and check its connectivity with other members.

Also, you can login to mongo on that member and check its actual status.

**Step 7** Power ON Policy Server (QNS) VMs.

**Note** Make sure qns processes on Policy Server (QNS) VMs are UP in monit summary output.

**Step 8** Start qns process on all Policy Director (lb) VMs by running the following command:

```
for i in {1..4}; do monit start qns-$i; done
```

If there are more than 4 qns processes on Policy Director (lb) VMs, change the number in the loop accordingly.

For example, for 7 qns processes, the command will be:

```
for i in {1..7}; do monit start qns-$i; done
```

**Step 9** Start mon_db script pn pcrfclient01 VM by running the following commands:

```
monit start mon_db_for_call_model
monit start mon_db_for_lb_failover
```

**Step 10** Power ON pcrfclient02 VM and repeat Step 5, on page 6 to Step 9, on page 7.

# Recovery Control

Due to the operational inter-dependencies within the CPS, it is necessary for some CPS services and components to become active before others.

CPS can monitor the state of the cluster through the various stages of startup. It also includes functionality to allow the system to gracefully recover from unexpected outages.

## Cluster State Monitoring

CPS can monitor the state of the services and components of the cluster from the OAM (pcrfclient) VMs. By default, this functionality is disabled.

This functionality can be enabled by setting the cluster_state_monitor option to true in the CPS Deployment Template (Excel spreadsheet).

To update an existing deployment to support this functionality, modify this setting in your CPS Deployment Template and redeploy the csv files as described in the *CPS Installation Guide for VMware*.

This monitoring system reports the state of the system as an integer value as described in the following table:

***Table 1: Cluster State Monitoring***

| Cluster State | Description | Values |
|---|---|---|
| 0 | unknown state/pre-inspection state | The system will report ‘0’ until both conditions have been met under ‘1’: lbvip02 is UP AND databases are accessible.<br>Various systems can be coming online while a ‘0’ state is being reported and does not automatically indicate an error.<br>Even if the system cannot proceed to ‘1’ state, Policy Builder and Control Center UIs should be available in order to manage or troubleshoot the system. |

| Cluster State | Description | Values |
|---|---|---|
| 1 | lbvip02 is alive<br>and<br>all databases in `/etc/broadhop/mongoConfig.cfg` have an accessible primary | All backend databases must be available and the lbvip02 interface must be UP for the system to report this state. |
| 2 | lbvip02 port 61616 is accepting TCP connections | Backend Policy Server (QNS) processes access lbvip02 on this port. When this port is activated, it indicates that Policy Server (QNS) processes can proceed to start. |
| 3 | at least 50% of backend Policy Server (QNS) processes are alive | Once sufficient capacity is available from the backend processes, the Diameter protocol endpoint processes are allowed to start. |

The current cluster state is reported in the following file on the OAM (pcrfclient): `/var/run/broadhop.cluster_state`

The `determine_cluster_state` command logs output of the cluster state monitoring process into `/var/log/broadhop/determine_cluster_state.log`.

## Controlled Startup

In addition to the monitoring functionality, CPS can also use the cluster state to regulate the startup of some of the CPS services pending the appropriate state of the cluster.

By default this functionality is disabled. It can be enabled for the entire CPS cluster, or for troubleshooting purposes can be enabled or disabled on a per-VM basis.

**Note** Cluster State Monitoring must be enabled for Controlled Startup to function.

### Enable/Disable For All VMs in Cluster

The Controlled Startup functionality is enabled by the presence of the `/etc/broadhop/cluster_state` file.

To enable this feature on all CPS VMs in the cluster, execute the following commands on the Cluster Manager VM to create this file and to use the syncconfig.sh script to push those changes out to the other VMs.

```
touch /etc/broadhop/cluster_state

syncconfig.sh
```

To disable this feature on all VMs in the cluster, remove the cluster_state file on the Cluster Manager VM and sync the configuration:

```
rm /etc/broadhop/cluster_state

syncconfig.sh
```

### Enable/Disable For Specific VM

To enable this feature on a specific VM, create a `/etc/broadhop/cluster_state` file on the VM:

```
touch /etc/broadhop/cluster_state
```

To disable this feature again on a specific VM, delete the `/etc/broadhop/cluster_state` file on the VM:

```
rm /etc/broadhop/cluster_state
```

**Note** This is temporary measure and should only be used for diagnostic purposes. Local modifications to a VM can be overwritten under various circumstances, such as running **syncconfig.sh**.

# Switching Active and Standby Policy Directors

In CPS, the active and standby strategy applies only to the Policy Directors (lb). The following are the two Policy Directors in the system:

- lb01
- lb02

## Determining the Active Policy Director

**Step 1** Log in to the pcrfclient01 VM.

**Step 2** Run the following command to SSH to the active Policy Director (typically lb01):

```
ssh lbvip01
```

**Step 3** You can also confirm an active Policy Director by ensuring it has the virtual IP (VIP) associated with it by running the following command:

```
ifconfig -a
```

If you see the eth0:0 or eth1:0 interfaces present in the list and marked as “UP” then that is the active Policy Director.

For example:

```
eth0:0   Link encap:Ethernet  HWaddr 00:0C:29:CD:7E:4C
         inet addr:172.26.241.240  Bcast:172.26.241.255  Mask:255.255.254.0
     --> UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1 The passive or standby load balancer will
 not have active VIPs
    shown in the
    ifconfig -a output (no eth0:0 and eth1:0).
```

## Switching Standby and Active Policy Directors

**Step 1** Log in to the active Policy Director (lb) VM. See Determining the Active Policy Director, on page 9 for details to determine which Policy Director is active.

**Step 2** Restart the Heartbeat service using the following command:

```
monit restart corosync
```

This command will force the failover of the VIP from the active Policy Director to the standby Policy Director.

**Step 3** To confirm the switchover, SSH to the other Policy Director VM and run the following command to determine if the VIP is now associated with this VM:

```
ifconfig -a
```

If you see the eth0:0 or eth1:0 interfaces in the list and marked as "UP" then that is the active Policy Director.

# Backing Up and Restoring

As a part of routine operations, it is important to make backups so that if there are any failures, the system can be restored. Do not store backups on system nodes.

For detailed information about backup and restore procedures, see the *CPS Backup and Restore Guide*.

# Adding or Replacing Hardware

Hardware replacement is usually performed by the hardware vendor with whom your company holds a support contract.

Hardware support is not provided by Cisco. The contact persons and scheduling for replacing hardware is made by your company.

Before replacing hardware, always make a backup. See the *CPS Backup and Restore Guide*.

Unless you have a readily available backup solution, use VMware Data Recovery. This solution, provided by VMware under a separate license, is easily integrated into your CPS environment.

The templates you download from the Cisco repository are partially pre-configured but require further configuration. Your Cisco technical representative can provide you with detailed instructions.

**Note** You can download the VMware software and documentation from the following location:

http://www.vmware.com/

# Export and Import Service Configurations

You can export and import service configurations for the migration and replication of data. You can use the export/import functions to back up both configuration and environmental data or system-specific information from the configuration for lab-to-production migration.

**Important** While exporting the Policy Builder configurations, CPS excludes stale/unreferenced objects.

You can import the binary in the following two ways:

- Import the binary produced by export - All configuration exported will be removed (If environment is included, only environment will be removed. If environment is excluded, environment will not be removed). The file passed is created from the export API.
- Additive Import - Import the package created manually by adding configuration. The new configurations get added into the server without impacting the existing configurations. The import is allowed only if the CPS running version is greater than or equal to the imported package version specified in the configuration.

**Step 1** In a browser, navigate to the export/import page, available at the following URLs:

**HA/GR:** https://<<*lbvip01*>:7443/doc/import.html

**Step 2** Enter the API credentials.

**Step 3** Select the file to be imported/exported.

The following table describes the export/import options:

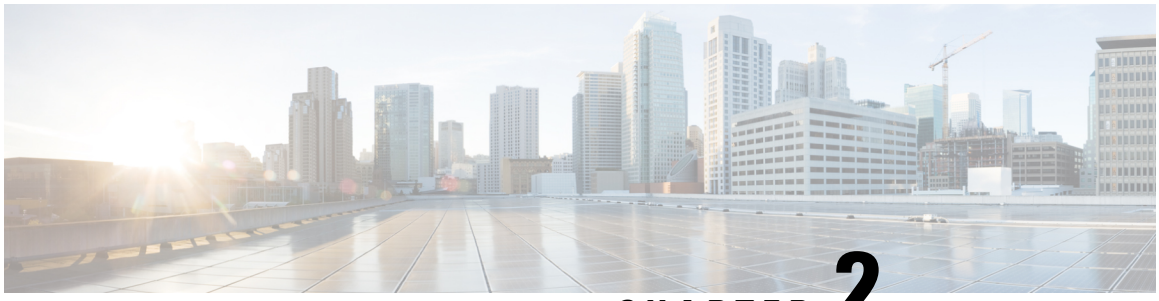
***Table 2: Export and Import Options***

| Option | Description |
|---|---|
| **Export** | |
| All data | Exports service configuration with environment data, which acts as a complete backup of both service configurations and environmental data. |
| Exclude environment | Exports without environment data, which allows exporting configuration from a lab and into another environment without destroying the new system's environment-specific data. |
| Only environment | Exports only environment data, which provides a way to back up the system-specific environmental information. |
| Export URL | Found in Policy Builder or viewed directly in Subversion. |

| Option | Description |
|---|---|
| Export File Prefix | Provide a name (prefix) for the export file.<br>**Note:** The exported filename automatically includes the date and time when the export was performed, for example: *prefix*_2016-01-12_11-03-56_3882276668.cps<br>**Note:** The file extension **.cps** is used so that the file is not opened or modified by mistake by another application. The file should be used for export/import purposes only. |
| Use 'Zip' file extension | Enable the check box for an easier view of exported content of data in a zip file format. |
| **Import** | |
| File to Import | Add configuration zip file to import. |
| Import URL | URL is updated/created. We recommend importing to a new URL and use Policy Builder to verify/publish. |
| Commit Message | Message recorded with the import. Provide details that are useful to record. |
| Allow Import Excluding Environment | Allow to import PB configuration excluding the environment data. |
| Force import even if checksums doesn't match | Allow import even when the checksums mismatch in the configuration zip file. |

After you select the file, the file's information is displayed.

**Step 4** Select **Import** or **Export**.
CPS displays response messages that indicate the status of the export/import.



CHAPTER 2

# Managing CPS Disks

- Adding a New Disk, on page 13
- Mounting the Replication Set from Disk to tmpfs After Deployment, on page 15
- Manage Disks to Accommodate Increased Subscriber Load, on page 16

# Adding a New Disk

This section describes the procedures needed to add a new disk to a VM.

## Prerequisites

- All the VMs were created using the deployment process.
- This procedure assumes the datastore that will be used to have the virtual disk has sufficient space to add the virtual disk.
- This procedure assumes the datastore has been mounted to the VMware ESX server, regardless of the backend NAS device (SAN or iSCSI, etc).

## ESX Server Configuration

**Step 1** Login to the ESX server shell, and make sure the datastore has enough space:

```
vmkfstools -c 4g /vmfs/volumes/datastore_name/VMNAME/xxxx.vmdk -d thin
```

**Step 2** Execute `vim-cmd vmsvc/getallvms` to get the vmid of the VM where the disk needs to be added.

```
Vmid Name                          File                      Guest OS    Version Annotation
173  vminstaller [datastore5] vminstaller/vminstaller.vmx centos64Guest vmx-08
```

**Step 3** Assign the disk to the VM.

The *xxxx* is the disk name, and 0 and 1 indicate the SCSI device number.

In this example, this is the second disk:

```
vim-cmd vmsvc/device.diskaddexisting vmid /vmfs/volumes/path to xxxx.vmdk 0 1
```

# Target VM Configuration

**Step 1** Log in as root user on your Linux virtual machine.

**Step 2** Open a terminal session.

**Step 3** Execute the `df` command to examine the current disks that are mounted and accessible.

**Step 4** Create an ext4 file system on the new disk:

```
mkfs -t ext4 /dev/sdb
```

**Note** `b` in `/dev/sdb` is the second SCSI disk. It warns that you are performing this operation on an entire device, not a partition. That is correct, since you created a single virtual disk of the intended size. This is assuming you have specified the correct device. Make sure you have selected the right device; there is no undo.

**Step 5** Execute the following command to verify the existence of the disk you created:

```
# fdisk -l
```

**Step 6** Execute the following command to create a mount point for the new disk:

```
# mkdir /<NewDirectoryName>
```

**Step 7** Execute the following command to display the current `/etc/fstab`:

```
# cat /etc/fstab
```

**Step 8** Execute the following command to add the disk to `/etc/fstab` so that it is available across reboots:

```
/dev/sdb /<NewDirectoryName> ext4 defaults 1 3
```

**Step 9** Reboot the VM.

```
shutdown -r now
```

**Step 10** Execute the `df` command to check the file system is mounted and the new directory is available.

## Update the collectd process to use the new file system to store KPIs

After the disk is added successfully, **collectd** can use the new disk to store the KPIs.

**Step 1** SSH into pcrfclient01/pcrfclient02.

**Step 2** Execute the following command to open the logback.xml file for editing:

```
vi /etc/collectd.d/logback.xml
```

**Step 3** Update the file element <*file*> with the new directory that was added in the `/etc/fstab`.

**Step 4** Execute the following command to restart `collectd`:

```
monit restart collectd
```

**Note** The content of logback.xml will be overwritten to the default path after a new upgrade. Make sure to update it after an upgrade.

# Mounting the Replication Set from Disk to tmpfs After Deployment

You can mount all of the members of the Replication set to tmpfs, or you can mount specific members to tmpfs. These scenarios are described in the following sections.

## Scenario 1 – Mounting All Members of the Replication Set to tmpsf

**Step 1** Modify `mongoConfig.cfg` file using the vi editor on cluster manager. Change the DBPATH directory for the SPR Replication set that needs to be put on tmpfs.

**Note** Make sure you change the path to `/var/data/sessions.1`, which is the tmpfs filesystem. Also, make sure to run diagnostics.sh before and after the activity.

The following example shows the contents of `mongoConfig.cfg` file before modification:

```
[SPR-SET1]
SETNAME=set06
OPLOG_SIZE=5120
ARBITER1=pcrfclient01a:27720
ARBITER_DATA_PATH=/var/data/sessions.6
MEMBER1=sessionmgr04a:27720
MEMBER2=sessionmgr03a:27720
MEMBER3=sessionmgr04b:27720
MEMBER4=sessionmgr03b:27720
DATA_PATH=/var/data/sessions.4
[SPR-SET1-END]
```

The following example shows the contents of `mongoConfig.cfg` file after modification:

```
[SPR-SET1]
SETNAME=set06
OPLOG_SIZE=5120
ARBITER1=pcrfclient01a:27720
ARBITER_DATA_PATH=/var/data/sessions.6
MEMBER1=sessionmgr04a:27720
MEMBER2=sessionmgr03a:27720
MEMBER3=sessionmgr04b:27720
MEMBER4=sessionmgr03b:27720
DATA_PATH=/var/data/sessions.1/set06
[SPR-SET1-END]
```

**Step 2** Run `build_etc.sh` to update the modified files.

**Step 3** Verify that the sessionmgr-27720 files on sessionmgr VMs are updated with new DB_PATH by using `vi` or `cat` command.

**Step 4** Stop and start the mongo databases one by one using the following commands:

```
systemctl stop sessionmgr-<port>
```

```
systemctl start sessionmgr-<port>
```

**Step 5** Run `diagnostics.sh`.

**Step 6** If this is an Active/Active GEOHA setup, scp the `mongoConfig.cfg` file to Site-B Cluster Manager, and run `build_etc.sh` to update puppet files.

## Scenario 2 – Mounting Specific Members of the Replication Set to tmpfs

**Step 1** Ssh to the respective session manager.

**Step 2** Edit the mongoDB startup file using the vi editor. In this example we are modifying the SPR member.

```
[root@sessionmgr01 init.d]# vi /etc/init.d/sessionmgr-27720
```

**Step 3** Change the DBPATH directory from `DBPATH=/var/data/sessions.4` to `DBPATH=/var/data/sessions.1/set06`.

**Step 4** Save and exit the file (using !wq).

**Step 5** Enter the following commands to stop and start the SPR DB member:

```
/usr/bin/systemctl stop sessionmgr-27720
/usr/bin/systemctl start sessionmgr-27720
```

**Step 6** Wait for the recovery to finish.

# Manage Disks to Accommodate Increased Subscriber Load

If you need to prepare CPS for an increased number of subscribers (> 10 million), you can clone and repartition the sessionmgr disks as per your requirement.

## Clone Sessionmgr01 VM

Downtime: No downtime

### Before you begin

- Before disk repartition, clone sessionmgr01. This step is optional but to reduce the risk of losing the data during disk repartitioning, the customer can take the backup of sessionmgr01 VM. If the customer does not have enough space to take the backup this step can be ignored.
- Blade with enough space to hold cloned image of sessionmgr01.

**Step 1** Login to vSphere Client on sessionmgr01 blade with administrator credentials.

**Step 2** Right-click sessionmgr01 and select **Clone** > Choose appropriate inventory in which blade resides > Choose the blade with enough space to hold sessionmgr01 image > **Next** > **Next** > **Finish**.

**Step 3** Cloning starts. Wait for it to finish the process.

# Disk Repartitioning of Sessionmgr01 VM

Downtime: During this procedure Sessionmgr01 is shut down 2 times. Estimate approximately 30 minutes of downtime for sessionmgr01.

CPS continues to operate using the other sessionmgr02 while sessionmgr01 is stopped as part of procedure.

### Before you begin

None

**Step 1** Login to sessionmgr01 as a root user.

**Step 2** The following commands may be executed to help identify which partition requires additional space.

```
 synph# df -h/synph
synphFilesystem                       Size  Used Avail Use% Mounted on/synph
synph/dev/mapper/vg_shiprock-lv_root  7.9G  1.5G  6.0G  20% //synph

```

- (df -h): /var is /dev/mapper/vg_shiprock-lv_var. This is equivalent to device /dev/vg_shiprock/lv_var.
- (pvdisplay): vg_shiprock (used by lv_var which is /var) is on /dev/sda2.

**Step 3** Execute the fdisk command to check the disk size.

```
# fdisk -l /dev/sda

Disk /dev/sda: 107.4 GB, 107374182400 bytes
255 heads, 63 sectors/track, 13054 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
Sector size (logical/physical): 512 bytes / 512 bytes
I/O size (minimum/optimal): 512 bytes / 512 bytes
Disk identifier: 0x0008dcae

   Device Boot      Start         End      Blocks   Id  System
/dev/sda1   *           1          64      512000   83  Linux
Partition 1 does not end on cylinder boundary.
/dev/sda2              64       13055   104344576   8e  Linux LVM
```

**Step 4** Power down the Virtual Machine.

```
# shutdown -h now
```

**Note** If cloning is not possible because of space limitation on Blade, backup of sessionmgr01 VM can be taken by saving OVF of sessionmgr01 VM to local storage like Laptop, Desktop. (Both cloning and OVF backup are optional steps, but either one of them is highly recommended.)

**Step 5** Log in using the VMware vSphere Client as an administrator (e.g. root) to the ESXi host which has your Linux Virtual Machine on it.

**Step 6** Right-click on the Virtual Machine and select Edit Settings > Click Hard Disk 1 > Increase the Provisioned Size of the Hard Disk.

**Step 7** Power ON the Virtual Machine.

**Step 8** Login (ssh) to the Virtual Machine as root user.

**Step 9** Confirm that disk space has been added to the /dev/sda partition.

```
# fdisk -l /dev/sda

Disk /dev/sda: 70.5 GB, 79529246720 bytes
255 heads, 63 sectors/track, 9668 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
```

**Step 10** Execute the following commands (Bold Characters indicates actual inputs from user (all of them are in lower case).

```
# fdisk /dev/sda
The number of cylinders for this disk is set to 7832.
There is nothing wrong with that, but this is larger than 1024,
and could in certain setups cause problems with:
1) software that runs at boot time (e.g., old versions of LILO)
2) booting and partitioning software from other OSs
   (e.g., DOS FDISK, OS/2 FDISK)
Command (m for help): p
Disk /dev/sda: 64.4 GB, 64424509440 bytes
255 heads, 63 sectors/track, 7832 cylinders
Units = cylinders of 16065 * 512 = 8225280 bytes
   Device Boot      Start         End      Blocks   Id  System
/dev/sda1   *           1          13      104391   83  Linux

The partition table has been altered!
Calling ioctl() to re-read partition table.
WARNING: Re-reading the partition table failed with error 16: Device or resource busy.
The kernel still uses the old table.
The new table will be used at the next reboot.
Syncing disks.
```

**Step 11** Reboot the sessionmgr01 VM by executing the following command:

```
# reboot
```

This ensures that the new setting match up with the kernel.

**Step 12** After reboot, execute following command:

```
# pvresize /dev/sda2
Physical volume "/dev/sda2" changed
1 physical volume(s) resized / 0 physical volume(s) not resized
```

**Step 13** Confirm that the additional free space is added in sessionmgr VM.

```
# vgdisplay
  --- Volume group ---
  VG Name               vg_shiprock
  System ID
  Format                lvm2

  Metadata Sequence No  5
  VG Access             read/write
  VG Status             resizable
  MAX LV                0
  Cur LV                4
  Open LV               4
  Max PV                0
  Cur PV                1
  Act PV                1
VG Size             129.51 GiB
PE Size              4.00 MiB
Total PE             32974
Alloc PE / Size     25474 / 99.51 GiB
Free PE / Size     7500 / 30.00 GB
VG UUID              pPSNBU-FRWO-z3aC-iAxS-ewaw-jOFT-dTcBKd
```

**Step 14** Verify that the /var partition is mounted on /dev/mapper/vg_shiprock-lv_var.

```
#df -h
Filesystem           Size Used Avail Use% Mounted on
/dev/mapper/vg_shiprock-lv_root
      18G 2.5G    15G 15% /
/dev/mapper/vg_shiprock-lv_home
```

```
      5.7G 140M 5.3G   3% /home
/dev/mapper/vg_shiprock-lv_var
      85G   16G   65G   20% /var
/dev/sda1              99M   40M   55M  43% /boot
tmpfs                  16G     0   16G   0% /dev/shm
tmpfs                 8.0G  1.1G  7.0G  14% /data/sessions.1
```

**Step 15** Extend /var partition to take up additional free space.

```
#lvextend -l +100%FREE /dev/mapper/vg_shiprock-lv_var
 Extending logical volume lv_var to 120.00 GB
 Logical volume lv_var successfully resized
```

**Step 16** Check the newly added space in /dev/mapper/vg_shiprock-lv_var.

```
# lvdisplay
```

**Step 17** Add space to VM file system.

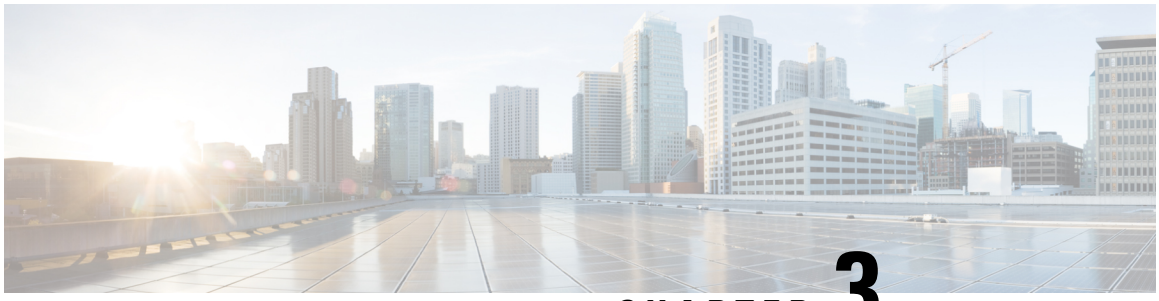
```
# resize2fs /dev/mapper/vg_shiprock-lv_var
resize2fs 1.39 (29-May-2006)
Filesystem at /dev/mapper/vg_shiprock-lv_var is mounted on /var; on-line resizing required
Performing an on-line resize of /dev/mapper/vg_shiprock-lv_var to 6553600 (4k) blocks.
The filesystem on /dev/mapper/vg_shiprock-lv_var is now 6553600 blocks long.
```

**Step 18** Check the increased size of /var partition.

```
# df -h
Filesystem            Size  Used Avail Use% Mounted on
/dev/mapper/vg_shiprock-lv_root
                       23G  2.1G   20G  10% /
/dev/mapper/vg_shiprock-lv_home
                      5.7G  140M  5.3G   3% /home
/dev/mapper/vg_shiprock-lv_var
                      130G   16G   95G  12% /var
/dev/sda1              99M   40M   55M  43% /boot
tmpfs                 2.0G     0  2.0G   0% /dev/shm
```

# Cloning and Disk Repartitioning of Sessionmgr02 VM

Repeat Clone Sessionmgr01 VM, on page 16 and Disk Repartitioning of Sessionmgr01 VM, on page 17 on sessionmgr02 for cloning and disk repartitioning of sessionmgr02 VM.



CHAPTER 3

# Managing CPS Licenses

- Smart Software Licensing, on page 21
- Classic Licensing, on page 21
- Comparison between Licensing Models, on page 22
- Smart Accounts/Virtual Accounts, on page 23
- License Conversion, on page 24
- Enable Smart Licensing for CPS, on page 25
- Product ID Tags, on page 27
- Smart Licensing CLI Commands, on page 27
- License Usage Threshold, on page 29

## Smart Software Licensing

CPS 10.0.0 and its later releases support Smart Licensing. It is a cloud-based approach to licensing that simplifies the purchase, deployment, and management of Cisco software assets. Entitlements are purchased through your Cisco account via Cisco Commerce Workspace (CCW) and immediately deposited into your Virtual Account for usage. This eliminates the need to install license files on every device. Products that are smart enabled communicate directly to Cisco to report consumption. A single location is available to customers to manage Cisco software licenses—the Cisco Smart Software Manager (CSSM). License ownership and consumption are readily available to help make better purchase decision based on consumption or business need.

## Classic Licensing

Classic Licensing is Cisco's legacy licensing model based on Product Activation Keys (PAK) and Unique Device Identifiers (UDI). On most IOS devices, a determination of bandwidth needs is assessed prior to obtaining and installing a tar file on the platform to retrieve the UDI. A PAK is ordered and typically emailed to the customer. The combination of a UDI and PAK are used to receive a license file, which is installed in the boot directory to complete the installation of IOS on the platform. The License Registration Portal (LRP) is available to help migrate Classic Licenses to Smart Licenses. To access the LRP, and to obtain training and manage licenses, visit http://tools.cisco.com/SWIFT/LicensingUI/Home.

# Comparison between Licensing Models

The following sections provide a comparison of the existing CPS SWIFT-based licensing model, the Cisco Smart Software Licensing model, and Cisco Smart Software Licensing as it is implemented in CPS 10.0.0 and later releases.

### CPS SWIFT-Based Licensing

For CPS versions prior to 10.0.0, CPS licensing is SWIFT "lmgrd" based, and the license is tied to the MAC address of the device on which CPS is installed. The following list summarizes the CPS SWIFT-based licensing model:

- The License count that is purchased by the customer is defined in the `license.lic` file and is read into the CPS application using the lmgrd/cisco processes.
- License compliance is determined and tracked by CPS. CPS periodically compares the current session count with the licensed count at a predefined interval.
- CPS creates and logs license statuses: adhere, "RATE_LIMITED" and "VALID" statuses are logged with proper messages, and traps are generated accordingly.

### Cisco Smart Software Licensing

The following list summarizes the Cisco Smart Software License model:

- Smart Licensing maintains and tracks license information including license quantity, license surplus, and shortage usages.
- There is no API for returning the number of licenses (entitlements) purchased by the customer.
- License compliance is determined and tracked by Cisco Smart Software License. Entitlement enforcement mode notifications will send out when it is changed upon the request.
- License (entitlement) expiration is tracked by Cisco Smart Software License. There is no API for returning the license expiration date.
- Smart Licensing does not support license version.
- Utility/Metering is not supported.
- An entitlement consumption request is allowed once every 24 hours maximum.
- Smart Licensing supports high availability. For Smart Agent clusters, one Smart Agent is active and the rest are standbys. This means that for a given cluster, only one Smart Agent is active, and it will register to the Smart Licensing portal at any time. (Smart License is a combination of Smart Agent and Smart Call Home, which is responsible for communicating to Cisco Smart Software Licensing.)

### CPS Cisco Smart Software License Based Model

The following list summarizes the Cisco Smart Software License model for CPS 10.0.0 and greater:

- For a CPS high availability installation, only the active client (either pcrfclient01 or pcrfclient02) is registered to the Smart Licensing Portal at any given time, and it uses the same identify for the registration.

- CPS uses the Smart Licensing API to request the entitlement (license) consumption amount based on the pre-defined maximum licensed concurrent session amount.
- The predefined maximum licensed concurrent session amount is defined in the `features.properties` file for each CPS feature.
- One licensed entitlement count is equivalent to one CPS Policy concurrent session count.
- Smart Licensing Entitlement notifies CPS about the requested entitlement conformance (enforce mode) if the requested entitlement consumption is InCompliance or OutCompliance or Eval, meaning that the product instance is not registered to the Smart Licensing Portal and is running in evaluation mode. CPS populates license data into mongoDB: `shardding/licensedfeats <SITEID>` collection based on the received entitlement compliance status.
- The Smart Agent (SA) is embedded in CPS+SL (SA+SCH) integration. A CLI is supported.
- CPS Orchestration API-based installation is not supported.
- Dynamically switching the license manager from lmgrd to Smart Licensing or vise versa is supported. Switching the licensing manager requires a restart of CPS OAM (pcrfclient).
- CPS Smart Licensing integration follows the CPS In-Service Software Upgrade process.

In summary, CPS 10.0.0 and later releases support the same functionality as CPS SWIFT imgrd-based licensing with the following exceptions:

- There is no API to return the license amount available for the virtual account. A new “complianceMode” attribute has been added to indicate the requested feature entitlement compliance status with the following value options:
  - InCompliance – The requested feature entitlement maximum licensed amount is in surplus status.
  - OutOfCompliance – The requested feature entitlement maximum licensed amount is in shortage status.
  - Eval – The product is not yet registered to Cisco Smart License Cloud.
- There is no API to return the license expiration date. The license expiration date value will set to “current date + 10 years future date” in CPS 10.0.0 and later releases.
- Smart Licensing does not support license version. Currently, the license version is set to “V1.0” in CPS.

# Smart Accounts/Virtual Accounts

A Smart Account provides a single location for all Smart-enabled products and entitlements. It helps speed procurement, deployment, and maintenance of Cisco Software. When creating a Smart Account, you must have the authority to represent the requesting organization. After submitting, the request goes through a brief approval process.

A Virtual Account exists as a sub-account within the Smart Account. Virtual Accounts are a customer-defined structure based on organizational layout, business function, geography or any defined hierarchy. They are created and maintained by the Smart Account administrator.

See http://software.cisco.com to learn about, set up, or manage Smart Accounts.

# Request a Cisco Smart Account

A Cisco Smart Account is an account where all products enabled for Smart Licensing are deposited. A Cisco Smart Account allows you to manage and activate your licenses to devices, monitor license use, and track Cisco license purchases. Through transparent access, you have a real-time view into your Smart Licensing products. IT administrators can manage licenses and account users within your organization's Smart Account through the Smart Software Manager.

**Step 1** In a browser window, enter the following URL:

```
http://software.cisco.com
```

**Step 2** Log in using your credentials, and then click **Request Smart Account** in the **Administration** area under **Smart Account Management**.

The **Smart Account Request** window is displayed.

**Step 3** Under **Create Account**, select one of the following options:

- **Yes, I have authority to represent my company and want to create the Smart Account** – If you select this option, you agree to authorization to create and manage product and service entitlements, users, and roles on behalf of your organization.
- **No, the person specified below will create the account** – If you select this option, you must enter the email address of the person who will create the Smart Account.

**Step 4** Under **Account Information**:

a) Click **Edit** beside **Account Domain Identifier**.

b) In the **Edit Account Identifier** dialog box, enter the domain, and click **OK**. By default, the domain is based on the email address of the person creating the account and must belong to the company that will own this account.

c) Enter the **Account Name** (typically, the company name).

**Step 5** Click **Continue**.

The Smart Account request will be in pending status until it has been approved by the Account Domain Identifier. After approval, you will receive an email confirmation with instructions for completing the setup process.

# Cisco Smart Software Manager

Cisco Smart Software Manager (CSSM) enables the management of software licenses and Smart Account from a single portal. The interface allows you to activate your product, manage entitlements, and renew and upgrade software. A functioning Smart Account is required to complete the registration process. To access the Cisco Smart Software Manager, see https://software.cisco.com/.

# License Conversion

Using the License Registration Portal, you can convert classic licenses that are associated with Product Activation Keys (PAKs) to smart entitlements.

**Step 1** To access the License Registration Portal:

a) Login to the **Cisco Software Central** page at software.cisco.com.

b) Under **License**, click **Traditional Licensing**.

On the **Welcome to the Product License Registration Portal** window, you can choose to watch training videos, or you can go directly to the Product License Registration Portal.

c) Select the **Product License Registration Portal** option.

The **Product License Registration** page opens.

**Step 2** Select the **PAKs/Tokens** tab to access your classic licenses.

**Step 3** On the **PAKs/Tokens** tab, check the box next to the PAK/Token ID for which you want to convert licenses.

**Step 4** From the **Actions** drop-down list, select **Convert to Smart Entitlements**.

In the **Convert to Smart Entitlements** dialog box, you can change to a different Virtual Account if needed.

**Step 5** Check the box next to the PAK.

**Step 6** Enter the **Quantity to Convert**, and click **Submit**.
You will receive a message when the conversion has completed successfully.

**Step 7** Login to the Cisco Smart Software Manager (CCSM), and view the converted Smart Entitlements as follows:

a) Select the Virtual Account, and click the **License Conversion** tab.

b) Click the **Event Log** tab to see the confirmation message that the licenses were converted.

# Enable Smart Licensing for CPS

You can enable smart licensing after upgrading CPS, or after a new CPS deployment.

**Note** These steps must be performed on the Cluster Manager VM.

**Step 1** Log in to the Cluster Manager VM.

**Step 2** Enter the following commands to create `license_sl_data` and `license_sl_conf` directories:

```
mkdir -p /etc/broadhop/license_sl_data
mkdir -p /etc/broadhop/license_sl_conf
```

**Step 3** Create the following license configuration files in the `/etc/broadhop/license_sl_conf` directory on the Cluster Manager:

a) Create a file named `features.properties`, and add the required PID and count. For example:

```
LicenseFeature=<PID>:<COUNT>
```

b) Create a file named `sl.properties` with the following content from the CSSM account:

```
TRANSPORT_URL=https://smartreceiver.cisco.com/licservice/license
```

c) Create a file named `conf.properties` with the following content from the CSSM account. For example:

```
PRODUCT_SN=10999
PRODUCT_ID_TAG=CPS
SOFTWARE_ID_TAG=regid.2016-06.com.cisco.CPS10,1.0_e454cefa-5e10-4af4-81d8-3f76260485fb
USE_PROD_ROOT_CERT=true
RENEW_AUTH=false
TAC_PROFILE_NAME=CiscoTAC-1
HTTP_TRANSPORT_FLAG=true
HTTP_URL=https://smartreceiver.cisco.com/licservice/license
PRODUCT_NAME=Cisco Policy Suite
SOFTWARE_VERSION=10.0
SYSTEM_DESCRIPTION=Cisco Policy Suite for Mobile is a carrier-grade policy, charging, and
subscriber data management solution.
PRODUCT_SERIES=Cisco Policy Suite Series
```

**Step 4** Enter the following command to rebuild the `/etc/broadhop/license_sl_data` and `license_sl_conf` directory in the Cluster Manager VM:

```
/var/qps/install/current/scripts/build/build_etc.sh
```

**Step 5** Enter the following commands to push the license to pcrfclient01 and pcrfclient02:

```
ssh pcrfclient01
   /etc/init.d/vm-init

ssh pcrfclient02
   /etc/init.d/vm-init
```

**Step 6** Enter the following commands to map the Smart License server hostname to the IP address and to synchronize the `/etc/hosts` files across the VMs:

```
echo "64.101.38.11 smartreceiver.cisco.com" >> /etc/hosts
/var/qps/bin/update/synchosts.sh
```

**Step 7** Configure CPS to use Smart Licensing as follows:

a) Open the `qns.conf` file by entering the following command:

```
vi /etc/broadhop/qns.conf
```

b) Edit the `qns.conf` file, and add the following argument:

```
-Dcom.broadhop.license.approach=sl
```

c) Save and close the `qns.conf` file.

d) Enter the following commands to copy the modified `qns.conf` file from Cluster Manager to all of the VMs:

```
copytoall.sh /etc/broadhop/qns.conf /etc/broadhop/qns.conf
restartall.sh
```

**Caution** Executing `restartall.sh` causes messages to be dropped.

**Step 8** To view license related logs, see the following log file:

`/var/log/broadhop/license.log`

**Step 9** Access the Cisco Smart Software Manager (CSSM) at the following location:

https://software.cisco.com/

**Step 10** Select the appropriate virtual account, and then click **New Token** in the **General** tab.

**Step 11** In the **Create Token** dialog box, enter the required information, accept the terms and responsibilities, and then click **Create Token**.

**Step 12** Select the token text, and copy it to your clipboard.

**Step 13** Enter the following command, pasting the token that you copied in place of <*token*>:

```
license smart register idtoken <token> [force]
```

# Product ID Tags

Tags for the following PIDs have been created to enable the proper product IDs to be identified, reported, and enforced.

***Table 3: PID Tags***

| PID | Entitlement Tag | Entitlement name in CSSM |
|---|---|---|
| POLICY-VALUE | regid.2016-06.com.cisco.POLICY-VALUE, 1.0_7f667e53-11e1-40e2-9480-ff7eb064561c | CPS Value Plus Feature Pack |
| POLICY-ALL | regid.2016-06.com.cisco.POLICY-ALL, 1.0_65566461-0788-4c92-8ffa-f9a02e9843e8 | CPS All Inclusive Feature Pack |
| POLICY-UPGRADE | regid.2016-06.com.cisco.POLICY-UPGRADE, 1.0_8fa236bc-e481-4673-aa4d-7da8f707647c | CPS Upgrade from Value Plus to All Inclusive Feature Pack |
| POLICY-ADD | regid.2016-06.com.cisco.PCRF-ADD, 1.0_676d51ca-4e14-40b3-81e7-1a600d726ce7 | CPS PCRF Application License - Additional Applications |

# Smart Licensing CLI Commands

The following sections describe the commands that you can use to register, view information for, and manage Smart Licenses on your CPS systems.

**Note** These commands must be run on the active pcrfclient.

### Register your Smart License

You must issue the following command to register your Smart License:

```
license smart register idtoken <token> [force]
```

This command registers the device with Cisco using an ID token that you obtain from the CSSM. The agent will register this product with Cisco and receive back an identity certificate. This certificate is saved and automatically used for all future communications with Cisco. After registration it will send the current license usage information to Cisco. Every 180 days the agent will automatically renew the registration information with Cisco. The ID token is not saved on the device.

This only needs to be done once per device.

The force option will cause the device to attempt registration even if it thinks it is already registered.

### Show Smart License Information

You can use the following commands to view information related to your Smart License:

- `show license status`
- `show license summary`
- `show license UDI`
- `show license usage`
- `show license all`
- `show license tech support`

### Manage your Smart License

You can use the following commands to manage your Smart License:

- `license smart renew ID`

  Dependency – Before using this command, Smart Licensing must be registered using the **license smart register idtoken** command.

  This command initiates a manual update of the license registration information with Cisco. Since the registration renewal is automatically done by the agent every 6 months, the customer will probably never need to use this command. It is available if for some reason the user needs to renew the registration information manually.

- `license smart renew auth`

  Dependency – Before using this command, Smart Licensing must have been registered using the **license smart register idtoken** command.

  This command manually refreshes license authorization information with Cisco. Since the license authorization is renewed automatically by the agent every 30 days, the customer will probably never need to use this command. It is available if for some reason the user needs to renew the license authorization information manually.

- `license smart deregister`

  Dependency – Before using this command, Smart Licensing must have been registered using the **license smart register idtoken** command.

  This command unregisters the device. The agent will try to contact the Cisco licensing cloud and unregister itself. All Smart Licensing entitlements and certificates on the platform will be removed. All certificates and registration information will be removed from the trusted store. This is true even if the agent is unable to communicate with Cisco to unregister. If the customer wants to use Smart Licensing again, they must run the **license smart register idtoken** command again.

# License Usage Threshold

The Fault list configuration in Policy Builder allows configuring the thresholds at which License Usage Threshold Exceeded traps are sent out. The default recommended values are: Critical 95, Major 90, Minor 85 and Warning 80 which would result in traps being sent at 80, 85, 90 and 95 percent for License Usage Threshold Limits.

For example, if the license limit is 10000 sessions and there are 9600 active sessions, configuring the threshold at 95 and type as Critical would generate a Critical trap whose message is Session Count License Usage at 96%, exceeding threshold: 95%.

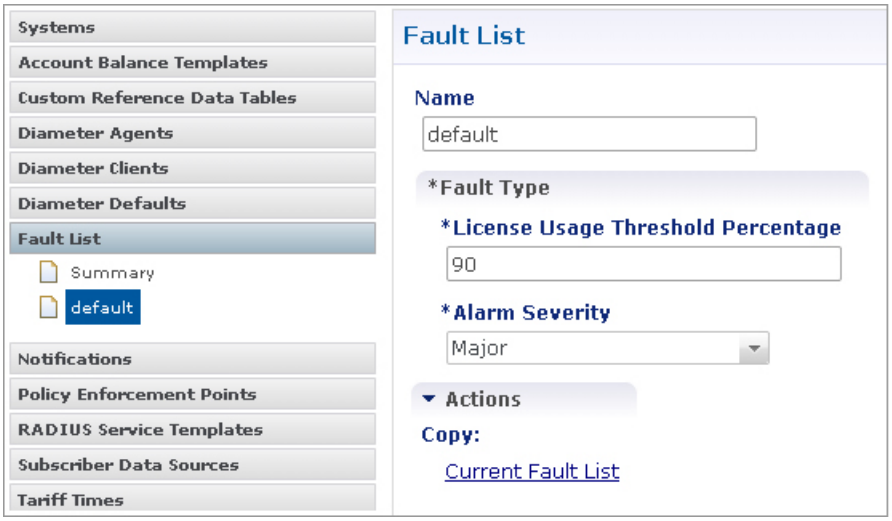
## Configuration

**Step 1** Open the Policy Builder GUI.

**Step 2** Go to **Reference Data** tab and select **Fault List** from the left pane.

**Step 3** Under **Create Child**, click **Fault List** to create a **License Usage Threshold Fault** as below.

***Figure 1: License Usage Threshold Fault***



**Step 4** Choose a **Name** for the Fault List. Currently, only License Usage Threshold Percentage fault type is supported. The **Alarm Severity** can be configured to be one of **Critical**, **Major**, **Minor** or **Warning**.

The recommended values for License Usage Threshold Percentage are:

- Critical 95
- Major 90
- Minor 85
- Warning 80

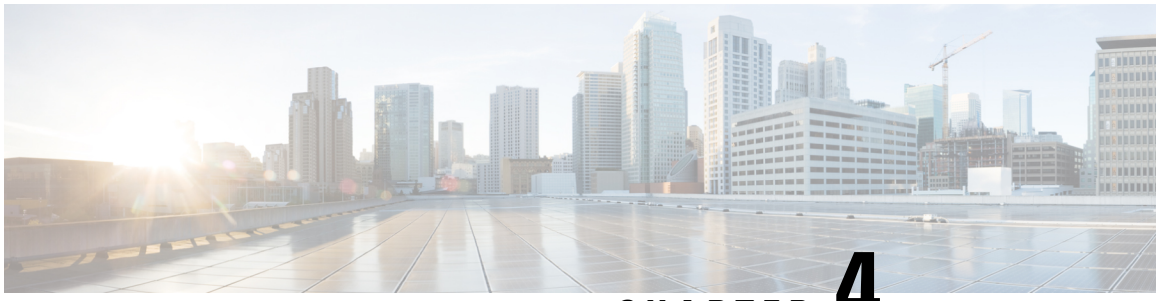
The above PB configuration when saved and published would trigger an application trap of type MAJOR when the 90% threshold configuration is crossed. One example of a trap sent would be number of licenses exceeded.

## Validation Steps

**Step 1** Configure a Threshold Limit as explained above in PB.

**Step 2** Generate active sessions exceeding the configured threshold limit.

**Step 3** Validate the Traps are received on the configured trap receiver for the defined limit and Severity.



CHAPTER 4

# Managing CPS Interfaces and APIs

- CPS Interfaces and APIs, on page 31
- Multi-user Policy Builder, on page 62
- Control Center Access, on page 64
- Enable Authentication for Unified API, on page 69
- Unified API Security: Access Privileges, on page 70
- Enabling Unified API Access on HTTP Port 8080, on page 72
- TACACS+, on page 75
- CRD APIs, on page 78
- Policy Builder Publish and CRD Import/Export Automation, on page 96
- Remove Traces of Old Policy Director (LB) VIPs, on page 98

# CPS Interfaces and APIs

CPS includes southbound interfaces to various policy control enforcement functions (PCEFs) in the network, and northbound interfaces to OSS/BSS and subscriber applications, IMSs, and web applications.

## Control Center GUI Interface

### Purpose

Cisco Control Center enables you to do these tasks:

- Manage subscriber data, that is, find or create and edit information about your subscribers.
- View subscriber sessions.
- View system sessions.
- Populate custom reference data (CRD) tables.

### URL and Port

HA: https://<*lbvip01*>:443

### Protocol

HTTPS/HTTP

### Accounts and Roles

There are two levels of administrative roles supported for Control Center: Full Privilege and View Only. The logins and passwords for these two roles are configurable in LDAP or in /etc/broadhop/authentication-password.xml.

- Full Privilege Admin Users: These users can view, edit, and delete information and can perform all tasks. Admin users have access to all screens in Control Center.
- View Only Admin Users: These users can view information in Control Center, but cannot edit or change information. View only administrators have access to a subset of screens in the interface.

# CRD REST API

### Purpose

The Custom Reference Data (CRD) REST API enables the query of, creation, deletion, and update of CRD table data without the need to access the Control Center GUI. The CRD APIs are available using an HTTP REST interface. The specific APIs are outlined in a later section in this guide.

### URL and Port

HA: https:// <*lbvip01*>:443/custrefdata

A validation URL is:

HA: https:// <*lbvip01*>:8443/custrefdata

### Protocol

HTTPS/HTTP

### Accounts and Roles

Security and account management is accomplished by using the haproxy mechanism on the platform Policy Director (LB) by defining user lists, user groups, and specific users.

On Cluster Manager: `/etc/puppet/modules/qps/templates/etc/haproxy/haproxy.cfg`

### Configure HAProxy

Update the HAProxy configuration to add authentication and authorization mechanism in the CRD API module.

1. Back up the `/etc/haproxy/haproxy.cfg` file.
2. Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 and add a userlist with at least one username and password as shown:

```
userlist <userlist name>
user <username1> password <encrypted password>
```

Use the following step to generate a encrypted password hash:

**a.** Execute `/var/qps/install/current/scripts/bin/support/generate_encrypted_password.sh` script to get encrypted password.

**b.** After script execution the encrypted password will be like below.

```
+-------------------------------------------------------------------------------------------------------+
| Fri May 29 11:43:47 UTC 2020
                                          |
| Encrypted key
                                                          |
|
$6$bc732ffd2a5ad85e$dYuQfGowAsAS6E2mQyWgGtcSUY4IKss11.4AY1u852gGwZzr4Y54rBdkHG6zQytFPXXDJGwknx.IYIeDeW.jP.

                          |
+-------------------------------------------------------------------------------------------------------+
```

**3.** Add the following line in frontend `https-api` to enable Authentication and Authorization for CRD REST API and create a new backend server as `crd_api_servers` to intercept CRD REST API requests:

```
mode http
acl crd_api path_beg -i /custrefdata/
use_backend crd_api_servers if crd_api
backend crd_api_servers
       mode http
       balance roundrobin
       option httpclose
       option abortonclose
       server qns01_A qns01:8080 check inter 30s
       server qns02_A qns02:8080 check inter 30s
```

**4.** Update frontend `https_all_servers` by replacing `api_servers` with `crd_api_servers` for CRD API as follows:

```
acl crd_api path_beg -i /custrefdata/

use_backend crd_api_servers if crd_api
```

**5.** Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 as follows:

**a.** Add at least one group with user in userlist created in *Step 2* as follows:

```
group qns-ro users readonly

group qns users apiuser
```

**b.** Add the following lines to the `backend crd_api_servers`:

```
acl authoriseUsers http_auth_group(<cps-user-list>) <user-group>

http-request auth realm CiscoApiAuth if !authoriseUsers
```

Map the group created in *Step 5* with the acl as follows:

```
acl authoriseUsers http_auth_group(<cps-user-list>) <user-group>
```

**6.** Add the following in the `backend crd_api_servers` to set read-only permission (GET HTTP operation) for group of users:

```
http-request deny if !METH_GET authoriseUsers
```

**HAProxy Configuration Example:**

```
userlist cps_user_list
       group qns-ro users readonly
       group qns users apiuser
     user readonly password
$6$xRtThhVpS0w4lOoS$pyEM6VYpVaUAxO0Pjb61Z5eZrmeAUUdCMF7D75B

XKbs4dhNCbXjgChVE0ckfLDp4T2CsUzzNkoqLRdn7RbAAU1
     user apiuser password
$6$xRtThhVpS0w4lOoS$pyEM6VYpVaUAxO0Pjb61Z5eZrmeAUUdCMF7D75B

XKbs4dhNCbXjgChVE0ckfLDp4T2CsUzzNkoqLRdn7RbAAU1
frontend https-api
   description API
   bind lbvip01:8443 ssl crt /etc/ssl/certs/quantum.pem

   mode http
   acl crd_api path_beg -i /custrefdata/
   use_backend crd_api_servers if crd_api

   default_backend api_servers
   reqadd X-Forwarded-Proto:\ https if { ssl_fc }

frontend https_all_servers
description Unified API,CC,PB,Grafana,CRD-API,PB-AP
bind lbvip01:443 ssl crt /etc/ssl/certs/quantum.pem no-sslv3 no-tlsv10

aNULL:!eNULL:!LOW:!     3DES:!MD5:!EXP:!PSK:!SRP:!DSS
mode http
acl crd_api path_beg -i  /custrefdata/
use_backend crd_api_servers if crd_api
backend crd_api_servers
       mode http
       balance roundrobin
       option httpclose
       option abortonclose
       server qns01_A qns01:8080 check inter 30s
       server qns02_A qns02:8080 check inter 30s
       acl authoriseReadonlyUsers http_auth_group(cps_user_list) qns-ro
       acl authoriseAdminUsers http_auth_group(cps_user_list) qns
       http-request auth realm CiscoApiAuth if !authoriseReadonlyUsers
!authoriseAdminUsers
       http-request deny if !METH_GET authoriseReadonlyUsers
```

**Note** The `haproxy.cfg` file is generated by the Puppet tool. Any manual changes to the file in lb01/lb02 would be reverted if the pupdate or vm-init scripts are run.

# Grafana

### Purpose

Grafana is a metrics dashboard and graph editor used to display graphical representations of system, application KPIs, bulkstats of various CPS components.

### URL and Port

HA: https://<*lbvip01*>:9443/grafana

### Protocol

HTTPS/HTTP

### Accounts and Roles

An administrative user account must be used to add, modify, or delete Grafana dashboards or perform other administrative actions.

Refer to the *Graphite and Grafana* and *Prometheus and Grafana* chapters in this guide for details on adding or deleting these user accounts.

# HAProxy

### Purpose

Haproxy is a frontend IP traffic proxy process in lb01/lb02 that routes the IP traffic for other applications in CPS. The details of individual port that haproxy forwards is already described in other individual sections.

As per the Diameter configuration done, haproxy-diameter statistics will bind to one of the configurations and that URL will be displayed in `about.sh` output. For various options for Diameter configuration, refer to *Diameter Related Configuration* section in *CPS Installation Guide for VMware*.

More information about HAProxy is provided in the HAProxy, on page 149.

Documentation for HAProxy is available at: http://www.haproxy.org/#docs

### URL and Port

To view statistics, open a browser and navigate to the following URL:

- **For HAProxy Statistics**: http://<diameterconfig>:5540/haproxy?stats
- **For HAProxy Diameter Statistics**: http://<diameterconfig>:5540/haproxy-diam?stats

### Accounts and Roles

Not applicable.

# JMX Interface

### Purpose

Java Management Extension (JMX) interface can be used for managing and monitoring applications and system objects.

Resources to be managed / monitored are represented by objects called managed beans (mbeans). MBean represents a resource running in JVM and external applications can interact with mbeans through the use of JMX connectors and protocol adapters for collecting statistics (pull); for getting/setting application configurations (push/pull); and notifying events like faults or state changes (push).

### CLI Access

External applications can be configured to monitor application over JMX. In addition to this, there are scripts provided by application that connects to application over JMX and provide required statistics/information.

### Port

pcrfclient01/pcrfclient02:

- Control Center: 9045
- Policy Builder: 9046

lb01/lb02:

- iomanager: 9045
- Diameter Endpoints: 9046, 9047, 9048...

qns01/qns02/qns... : 9045

Ports should be blocked using firewall to prevent access from outside the CPS system.

### Accounts and Roles

Not applicable.

# Logstash

### Purpose

Logstash is a process that consolidates the log events from CPS nodes into pcrfclient01/pcrfclient02 for logging and alarms. The logs are forwarded to CPS application to raise necessary alarms and the logs are stored at `/var/log/logstash/logstash.log`.

If logstash in not monitoring, then check the Policy Server (qns) process using `monit summary`.

```
monit summary
Monit 5.25.1 uptime: 19h 45m
```

| Service Name | Status | Type |
|---|---|---|
| sav-pcrfclient01 | OK | System |

| | | |
|---|---|---|
| whisper | OK | Process |
| stale-session-cleaner-helper | Initializing | Process |
| stale-session-cleaner | Initializing | Process |
| snmpd | OK | Process |
| qns-2 | OK | Process |
| qns-1 | OK | Process |

**Note** On pcrfclient node, if Policy Server (qns) process is not running, 'logstash_process_status' program stops the logstash process so that the alarm is raised from another pcrfclient node.

### CLI Access

There is no specific CLI interface for logstash.

### Protocol

TCP and UDP

### Ports

TCP: 5544, 5545, 7546, 6514

UDP: 6514

### Accounts and Roles

Not applicable.

# LDAP SSSD

### Purpose

In CPS 14.0.0 and higher releases, SSSD based authentication is supported, allowing users to authenticate against an external LDAP server and gain access to the CPS CLI. SSSD RPMs and default `sssd.conf` file is installed on each CPS VM when you perform a new installation or upgrade CPS.

For more information, refer to the *CPS Installation Guide for VMware*.

`/etc/monit.d/sssd` file has been added with the following content so that SSSD is monitored by monit:

```
check process sssd with pidfile /var/run/sssd.pid
start program = "/etc/init.d/sssd start" with timeout 30 seconds
stop program = "/etc/init.d/sssd stop" with timeout 30 seconds
```

Also `/etc/logrotate.d/sssd` file has been added to rotate the SSSD log files. Here is the default configuration:

```
"
/var/log/sssd/*.log {
    daily
    missingok
    notifempty
    sharedscripts
```

```
    nodateext
    rotate 5
    size 100M
    compress
    delaycompress
    postrotate
        /bin/kill -HUP `cat /var/run/sssd.pid 2>/dev/null` 2> /dev/null || true
    endscript
}
"
```

Use the `monit summary` command to view the list of services managed by monit. Here is an example:

```
monit summary
The Monit daemon 5.17.1 uptime: 4d 2h 22m

Process 'whisper'                   Running
Process 'sssd'                      Running
Process 'snmptrapd'                 Running
Process 'snmpd'                     Running
Program 'vip_trap'                  Status ok
Program 'gr_site_status_trap'       Status ok
Process 'redis'                     Running
Process 'qns-4'                     Running
Process 'qns-3'                     Running
Process 'qns-2'                     Running
Process 'qns-1'                     Running
File 'monitor-qns-4'                Accessible
File 'monitor-qns-3'                Accessible
File 'monitor-qns-2'                Accessible
File 'monitor-qns-1'                Accessible
Process 'memcached'                 Running
Process 'irqbalance'                Running
Process 'haproxy-diameter'          Running
Process 'haproxy'                   Running
Process 'cutter'                    Running
Process 'corosync'                  Running
Program 'cpu_load_monitor'          Status ok
Program 'cpu_load_trap'             Status ok
Program 'gen_low_mem_trap'          Status ok
Process 'collectd'                  Running
Process 'auditrpms.sh'              Running
System 'lb01'                       Running
```

**Important** Setting of other configuration files to support LDAP based authentication and the changes required in `sssd.conf` file as per the customer deployment is out of scope of this document. For more information, consult your Cisco Technical Representative.

**Restriction** Grafana support LDAP authentication over httpd and does not use SSSD feature. Due to this, if LDAP server is down then grafana is not accessible for LDAP users.

### CLI Access

No CLI is provided.

**Port**

Port number is not required.

## Configure Policy Builder

**Step 1** To provide admin access, enter username in the following file:

`/var/www/svn/users-access-file`

**Note** This action should be performed on pcrfclient and not on policy server (qns).

```
[groups]
admins = qns,qns-svn,sssd_pb_2
nonadmins = qns-ro
[/]
@admins = rw
@nonadmins = r
* = r
```

**Step 2** Verify if you can export CRD data from the following link:

https://<server_ip>:443/central/

## Configure Grafana

**Step 1** Bypass the first level authentication by updating the `/etc/httpd/conf.d/grafana-proxy.conf` file as follows:

```
LoadModule proxy_module modules/mod_proxy.so
LoadModule proxy_balancer_module modules/mod_proxy_balancer.so
LoadModule proxy_ftp_module modules/mod_proxy_ftp.so
LoadModule proxy_http_module modules/mod_proxy_http.so
LoadModule proxy_ajp_module modules/mod_proxy_ajp.so
LoadModule proxy_connect_module modules/mod_proxy_connect.so
# Set root to <ip address>/grafana
ProxyPass /grafana http://127.0.0.1:3000
ProxyPassReverse /grafana http://127.0.0.1:3000
# Set authentication for Grafana
# 1) Use httpd authentication as a front-end to Grafana
# 2) Remove header since Grafana is configured for anonymous
# authentication and will fail with a pass-thru header
#
# Notice: scope of authentication and header is limited to Grafana
# to avoid conflicts with other applications. Apache configuration
# in this file is global unless contained in the directive below.
<Location "/grafana">
    LoadModule headers_module modules/mod_headers.so
    Header set Access-Control-Allow-Origin "*"
    Header set Access-Control-Allow-Methods "GET, OPTIONS"
    Header set Access-Control-Allow-Headers "origin, authorization, accept"
    Header set Access-Control-Allow-Credentials true
    # Do not pass credentials to Grafana's anonymous authorization
    RequestHeader unset Authorization
    Satisfy Any
    #AuthName "Authentication Required"
    #AuthUserFile "/var/broadhop/.htpasswd"
    #Require valid-user
```

```
    #Order allow,deny
    # This is used for local calls to the API during puppet bring up
    Allow from 127.0.0.1
    #Satisfy Any
</Location>
```

**Step 2** Restart httpd by running the following command:

```
/usr/bin/systemctl restart httpd
```

If `port already in use error` is displayed, execute the following steps:

a) Run the following command to get process ID:

```
ps -eaf | grep httpd
```

b) Run the following command to kill the pid:

```
kill -9 <pid>
```

**Step 3** Update `/etc/grafana/grafana.ini` file to point to LDAP authentication instead of Basic Auth as follows:

```
################################### Basic Auth ##########################
[auth.basic]
# For CPS, trusted API requests come here and need local authentication
;enabled = true
################################### Auth LDAP ##########################
[auth.ldap]
enabled = true
config_file = /etc/grafana/ldap.toml
```

**Step 4** Modify `/etc/grafana/ldap.toml` file to provide LDAP details (for example, search base dn, bind dn, group search base dn, member_of attribute) as follows:

```
# Set to true to log user information returned from LDAP
verbose_logging = true
[[servers]]
# Ldap server host (specify multiple hosts space separated)
host = "ldap_1.cisco.com"
# Default port is 389 or 636 if use_ssl = true
port = 10648
# Set to true if ldap server supports TLS
use_ssl = true
# set to true if you want to skip ssl cert validation
ssl_skip_verify = true
# set to the path to your root CA certificate or leave unset to use system defaults
#root_ca_cert = "/etc/openldap/certs/ldap_local.cer"

# Search user bind dn
bind_dn = "uid=admin,ou=system"
# Search user bind password
bind_password = 'secret'

# User search filter, for example "(cn=%s)" or "(sAMAccountName=%s)" or "(uid=%s)"
search_filter = "(uid=%s)"

# An array of base dns to search through
search_base_dns = ["ou=users,dc=sprint,dc=com"]
#search_base_dns = ["ou=groups,dc=sprint,dc=com"]

# In POSIX LDAP schemas, without memberOf attribute a secondary query must be made for
groups.
# This is done by enabling group_search_filter below. You must also set member_of= "cn"
# in [servers.attributes] below.
# Users with nested/recursive group membership and an LDAP server that supports
```

```
LDAP_MATCHING_RULE_IN_CHAIN
# can set group_search_filter, group_search_filter_user_attribute, group_search_base_dns
and member_of
# below in such a way that the user's recursive group membership is considered.
#
# Nested Groups + Active Directory (AD) Example:
#
# AD groups store the Distinguished Names (DNs) of members, so your filter must
# recursively search your groups for the authenticating user's DN. For example:
#
# group_search_filter = "(member:1.2.840.113556.1.4.1941:=%s)"
# group_search_filter_user_attribute = "distinguishedName"
# group_search_base_dns = ["ou=groups,dc=grafana,dc=org"]
#
# [servers.attributes]
# ...
# member_of = "distinguishedName"

## Group search filter, to retrieve the groups of which the user is a member (only set if
memberOf attribute is not available)
#group_search_filter = "(cn=%s)"
#group_search_filter = "(&(objectClass=*)(cn=%s))"
## Group search filter user attribute defines what user attribute gets substituted for %s
in group_search_filter.
## Defaults to the value of username in [server.attributes]
## Valid options are any of your values in [servers.attributes]
## If you are using nested groups you probably want to set this and member_of in
## [servers.attributes] to "distinguishedName"
group_search_filter_user_attribute = "cn"
## An array of the base DNs to search through for groups. Typically uses ou=groups
group_search_base_dns = ["ou=groups,dc=sprint,dc=com"]
#group_search_base_dns = ["cn=Roles,ou=groups,dc=sprint,dc=com"]

# Specify names of the ldap attributes your ldap uses
[servers.attributes]
name = "cn"
surname = "sn"
username = "uid"
member_of = "cn"
email = "email"

# Map ldap groups to grafana org roles
[[servers.group_mappings]]
group_dn = "cn=Admin,ou=groups,dc=sprint,dc=com"
org_role = "Admin"
# The Grafana organization database id, optional, if left out the default org (id 1) will
be used
# org_id = 1

[[servers.group_mappings]]
group_dn = "cn=User,ou=groups,dc=sprint,dc=com"
org_role = "Editor"

#[[servers.group_mappings]]
# If you want to match all (or no ldap groups) then you can use wildcard
#group_dn = "*"
#org_role = "Viewer"
```

**Step 5** Restart Grafana server by running the following command:

```
service grafana-server restart
```

**Step 6** Log in to Grafana using LDAP user credentials.

# Mongo Database

### Purpose

MongoDB is used to manage session storage efficiently and address key requirements: Low latency reads/writes, high availability, multi-key access and so on.

CPS support different models of mongo database based on CPS deployment such as, HA or Geo-redundancy. The database list is specific to your deployment.

To rotate the MongoDB logs on the Session Manager VM, open the MongoDB file by executing the following command:

**cat /etc/logrotate.d/mongodb**

You will have output as similar to the following:

```
{
daily
rotate 5
copytruncate
create 640 root root
sharedscripts
postrotate
endscript
}
```

In the above script the MongoDB logs are rotated daily and it ensures that it keeps the latest 5 backups of these log files.

### HA

The standard definition for supported replica-set defined in configuration file. This configuration file is self-explanatory which contains replica-set, set-name, hostname, port number, data file path and so on.

Location: `/etc/broadhop/mongoConfig.cfg`

***Table 4: HA MongoDB***

| Database Name | Port Number | Primary DB Host | Secondary DB Host | Arbiter | Purpose |
|---|---|---|---|---|---|
| session_cache | 27717 | sessionmgr01 | sessionmgr02 | pcrfclient01 | Session database |
| balance_mgmt | 27718 | sessionmgr01 | sessionmgr02 | pcrfclient01 | Quota/Balance database |
| audit | 27725 | sessionmgr01 | sessionmgr02 | pcrfclient01 | Reporting database |
| spr | 27720 | sessionmgr01 | sessionmgr02 | pcrfclient01 | USuM database |
| cust_ref_data | 27717 | sessionmgr01 | sessionmgr02 | pcrfclient01 | Custom Reference Data |

**Note** The list provided in the Table 4: HA MongoDB, on page 43 is for reference purposes only.

**Note** The port number configuration is based on what is configured in each of the respective Policy Builder plug-ins. Refer to the *Plug-in Configuration* chapter of the *CPS Mobile Configuration Guide* for correct port number and ports defined in mongo configuration file.

#### CLI Access

Use the following commands to access the MongoDB CLI:

**HA**

Login to pcrfclient01 or pcrfclient02 and run: `diagnostics.sh --get_replica_status`

This command will output information about the databases configured in the CPS cluster.

**Note** If a member is shown in an unknown state, it is likely that the member is not accessible from one of other members, mostly an arbiter. In that case, you must go to that member and check its connectivity with other members.

Also, you can login to mongo on that member and check its actual status.

#### Protocol

Not applicable.

#### Port

Not applicable.

#### Accounts and Roles

Restrict MongoDB access for Readonly Users: If firewall is enabled on system, then on all VMs for all readonly users, IP table rule will be created for outgoing connections to reject outgoing traffic to MongoDB replica sets.

For example, rule similar to the following is created.

```
REJECT tcp -- anywhere sessionmgr01 tcp dpt:27718 owner GID match qns-ro reject-with
icmp-port-unreachable
```

With this, qns-ro user has restricted MongoDB access on sessionmgr01 on port 27718. Such rules are added for all readonly users who are part of qns-ro group for all replica sets.

## Adding New Replica-set Members

**Caution** The following procedure must be performed only during a planned Maintenance Window (MW).

**Note** The procedure is for reference purposes only. Contact your Cisco Account representative before running the procedure.

**Step 1** Update the `mongoConfig.cfg` file with the new replica-set members to be configured.

**Step 2** Login to the Cluster Manager VM of the site where you want to add new replica-set members.

**Step 3** Take the backup of the current `/etc/broadhop/mongoConfig.cfg` file.

```
/bin/cp /etc/broadhop/mongoConfig.cfg /etc/broadhop/mongoConfig.cfg.$(date +\%Y-\%m-\%d).backup
```

**Step 4** Copy the updated `mongoConfig.cfg` file to `/etc/broadhop/`.

If the file is located on a remote machine, then `scp <user@vm:updated mongoConfig.cfg file_path> /etc/broadhop/`

If the file is present on the current VM but at a different location, then `/bin/cp <updated mongoConfig.cfg file_path> /etc/broadhop/`

**Step 5** Verify that the Session Manager and arbiter VMs have sufficient space available to create the new replica-set member.

The verification command depends on where all the new replica-set members will get created. Here is an example in case all the Session Managers VMs are updated.

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "df -h";done
```

For arbiter VM, you have to login to each VM and use `- df -h` command to verify space availability.

**Step 6** Verify if there are existing `/var/tmp/stopped-<PORT>` entries on Session Managers and arbiter VMs.

The verification command depends on where all the new replica-set members will get created. Here is an example in case all the Session Managers VMs are updated.

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/tmp/stopped-*"; done
```

For arbiter VM, you have to login to each VM and use `ls -ltrh /var/tmp/stopped-*` command to see if any file exists.

a) If there is an existing `/var/tmp/stopped-<PORT>` file entry, delete those entries.

Here is an sample command to delete the entries from Session Manager VM:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -rf /var/tmp/stopped-*"; done
```

For arbiter VM, you have to login to each VM and use `"rm -rf /var/tmp/stopped-*"` command to remove the file entries

**Step 7** Verify whether `mongoConfig.cfg -*` files exists under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to verify whether `mongoConfig.cfg -*` files exists:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use `"ls -ltrh /var/aido/*"` command.

a) Delete all `mongoConfig.cfg -*` files that exists under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to delete `mongoConfig.cfg -*` files that exist:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -f /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use `"/bin/rm -f /var/aido/*"` command to remove `mongoConfig.cfg -*` files.

**Step 8** Execute `copytoall.sh` to copy the updated `/etc/broadhop/mongoConfig.cfg` from Cluster Manager to all the VMs.

```
copytoall.sh /etc/broadhop/mongoConfig.cfg
```

**Step 9** SSH to remote Site2/Cluster2 and take the backup of `mongoConfig.cfg` file.

**Step 10** Copy the `mongoConfig.cfg file` from local Site1/Cluster1 to remote Site2/Cluster2 on `/etc/broadhop`.

```
scp root@<local_site_cluman_ip>:/etc/broadhop/mongoConfig.cfg /etc/broadhop/
```

**Step 11** Verify if there are existing `/var/tmp/stopped-<PORT>` entries on Session Managers and arbiter VMs.

The verification command depends on where all the new replica-set members will get created. Here is an example in case all the Session Managers VMs are updated.

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/tmp/stopped-*"; done
```

For arbiter VM, you have to login to each VM and use `ls -ltrh /var/tmp/stopped-*` command to see if any file exists.

a) If there is an existing `/var/tmp/stopped-<PORT>` file entry, delete those entries.

Here is an sample command to delete the entries from Session Manager VM:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -rf /var/tmp/stopped-*"; done
```

For arbiter VM, you have to login to each VM and use `"rm -rf /var/tmp/stopped-*"` command to remove the file entries

**Step 12** Verify the `mongoConfig.cfg -*` files under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to verify whether `mongoConfig.cfg -*` files exists:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use `"ls -ltrh /var/aido/*"` command.

a) Delete all `mongoConfig.cfg -*` files that exists under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to delete `mongoConfig.cfg -*` files that exist:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -f /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use `"/bin/rm -f /var/aido/*"` command to remove `mongoConfig.cfg -*` files.

**Step 13** Execute `copytoall.sh` to copy the updated `/etc/broadhop/mongoConfig.cfg` from Cluster Manager to all the VMs.

```
copytoall.sh /etc/broadhop/mongoConfig.cfg
```

**Step 14** On local Site1/Cluster1, execute `build_etc.sh` command to apply the new `mongoConfig.cfg` file to add the new replica-sets.

```
/var/qps/install/current/scripts/build/build_etc.sh
```

**Step 15** On remote Site2/Cluster2, execute `build_etc.sh` command to apply the new `mongoConfig.cfg` file to add the new replica-sets.

```
/var/qps/install/current/scripts/build/build_etc.sh
```

**Step 16** Wait for sometime (approx 5 minutes) and verify the new replica-set status by executing the following command.

```
diagnostics.sh --get_replica_status
```

## Rollback Replica-set Members

**Caution** The following procedure must be performed only during a planned Maintenance Window (MW).

**Note** The procedure is for reference purposes only. Contact your Cisco Account representative before running the procedure.

**Step 1** Prepare a list of the replica-sets and setnames that you want to remove from the local and remote site.

**Step 2** Execute the following command to remove the all the replica-sets identified in Step 1, on page 47.

```
build_set.sh --session --remove-replica-set --setname setxx --force
```

where, *setxx* with set name identified in Step 1, on page 47.

**Step 3** Verify that the new replica-sets have been removed using `diagnostics.sh --get_replica_status` command.

**Step 4** Copy the `mongoConfig.cfg` backup file saved in *Adding New Replica-set* earlier to `/etc/broadhop` on Cluster Manager VM of local site.

```
/bin/cp /etc/broadhop/mongoConfig.cfg.*.backup /etc/broadhop/
```

**Step 5** Verify that the file `mongoConfig.cfg` has older configuration.

**Note** You need to verify that the `mongoConfig.cfg` has older configuration manually.

**Step 6** Execute `copytoall.sh` to copy the updated `/etc/broadhop/mongoConfig.cfg` from Cluster Manager to all the VMs.

```
copytoall.sh /etc/broadhop/mongoConfig.cfg
```

**Step 7** Verify whether `mongoConfig.cfg -*` files exists under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to verify whether `mongoConfig.cfg -*` files exists:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use `"ls -ltrh /var/aido/*"` command.

a) Delete all `mongoConfig.cfg -*` files that exists under `/var/aido/` on each Session Manager and arbiter VM.

Here is an sample command to delete `mongoConfig.cfg -*` files that exist:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -f /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use "/bin/rm -f /var/aido/*" command to remove mongoConfig.cfg -* files.

**Step 8** SSH to remote site and rollback a mongoConfig.cfg from backup.

**Step 9** Execute copytoall.sh to copy the updated /etc/broadhop/mongoConfig.cfg from Cluster Manager to all the VMs.

```
copytoall.sh /etc/broadhop/mongoConfig.cfg
```

**Step 10** Verify whether mongoConfig.cfg -* files exists under /var/aido/ on each Session Manager and arbiter VM.

Here is an sample command to verify whether mongoConfig.cfg -* files exists:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "ls -ltrh /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use "ls -ltrh /var/aido/*" command.

a) Delete all mongoConfig.cfg -* files that exists under /var/aido/ on each Session Manager and arbiter VM.

Here is an sample command to delete mongoConfig.cfg -* files that exist:

```
for i in $(hosts-sessionmgr.sh); do echo $i; ssh $i "rm -f /var/aido/*"; done
```

For arbiter VM, you have to login to each VM and use "/bin/rm -f /var/aido/*" command to remove mongoConfig.cfg -* files.

**Step 11** On local site, apply the previous version of mongoConfig.cfg file by executing the following command .

```
/var/qps/install/current/scripts/build/build_etc.sh
```

**Step 12** On remote site, apply the previous version of mongoConfig.cfg file by executing the following command.

```
/var/qps/install/current/scripts/build/build_etc.sh
```

**Step 13** Verify the health check using diagnostics.sh command on local and remote site.

## Replica Set Arbiter: Security

As arbiters do not replicate any data, including user/role details, they just participate when voting happens for electing new primary. Thus, when the authentication is enabled, the only way to login to them is through the localhost exception.

For more information, refer to https://docs.mongodb.com/v3.6/core/replica-set-arbiter/#security.

A few commands (such as, isMaster, ping, connectionStatus, and authenticate) do not require any authentication even if authentication is enabled. This is because these are used to support to connect to a deployment. On the other hand, majority of commands (including rs.status(), show dbs, show collections and so on) requires authentication if authentication is enabled.

For detailed command list, refer to https://docs.mongodb.com/v3.6/reference/command/

# Admin Database

### Purpose

By default, admin replica-set holds the following databases:

- **sharding:** This database holds the following information:
  - Session sharding: Session shard seeds and its databases.
  - Session type counters: Session statistics information. For example, number of sessions present in each shard for Gx, Rx, Sy, and so on.
  - Session compression dictionary data: Compression object data of session fields data.
  - Memcache rings data: Memcached rings and their sets data. Every set has two sessionmgr VMs followed with memcached port number.
  - Secondary Key sharding: Secondary Key shards seeds and its databases.
  - License data: Session license information.
- **scheduler:** This database holds the information about rebuilding the secondary key tasks data. When you execute `rebuild sk rings` or `rebuild sk db`, application creates the scheduled tasks to the "tasks" collection in this database. Once tasks are created, application pulls the information from the collection and execute those taks.
- **diameter:** This database holds the information about connected peers (inbound and outbound) connected to which load balance instance. This also holds the history of peers connected (start) and disconnected (stop) followed with timestamps.
- **queueing:** This database holds the information about internal TCP connection between the Policy Director (LB) and Policy Server (QNS) VMs in and out queue data.
- **clusters:** This database holds the information about sitenames and IP address of the ADMIN replica-set members in `hosts` collections.
- **policy_trace:** This database holds the information about the particular subscriber traces. To view the traces, you need to enable the trace for a particular subscriber.
- **Keystore:** This database holds the information about the redis key store configuration.

**Note** There are separate configurations available for the Trace Database and Endpoint Database in Cluster configuration under Policy Builder.

- If Trace Database is configured, "policy_trace" database is stored in configured replica-set.
- If Endpoint Database is configured, "diameter, and queueing" databases are stored in configured replica-set.

For more information on Trace Database and Endpoint Database configuration, see *Adding an HA Cluster* section in *CPS Mobile Configuration Guide*.

**Note** In GR deployment, if any site looses the connectivity (Internal/Replication) to the ADMIN replica-set, then the following impact is observed:

- If Admin/Endpoint databases are shared across all the sites.
  - There can be communication issue between the Policy Server (QNS) and Policy Director (LB) VMs. As the application is not able to get to the connected peers to send the processing messages, timeouts or drops can be observed.
  - Cross site messaging of stale session RARs from Policy Director (LB) of failed site to Policy Director (LB) of peer of running site fails.
- If Endpoint databases are not shared (co-located locally ) across all the sites.
  - There is no communication issue between the Policy Server (QNS) and Policy Director (LB) VMs. As the application is able to get to the connected peers information locally to send the processing messages.
  - Cross site messaging of stale session RARs from Policy Director (LB) of failed site to Policy Director (LB) of peer running site fails and vice versa.
- Grafana does not display the session counters properly.
- If subscriber trace is enabled, the policy_trace cannot insert the trace information about the configured subscribers.

### Protocol

Not applicable.

### Port

Not applicable.

### Accounts and Roles

Not applicable.

# OSGi Console

### Purpose

CPS is based on Open Service Gateway initiative (OSGi) and OSGi console is a command-line shell which can be used for analyzing problems at OSGi layer of the application.

### CLI Access

Use the following command to access the OSGi console:

`telnet` <*ip*> <*port*>

The following commands can be executed on the OSGi console:

`ss` : List installed bundle status.

`start` <*bundle-id*> : Start the bundle.

`stop` <*bundle-id*> : Stop the bundle.

`diag` <*bundle-id*> : Diagnose the bundle.

### Sharding Commands

Use the following OSGi commands to add or remove shards:

***Table 5: Sharding Commands***

| Command | Description |
|---|---|
| `listshards` | Lists all the shards. |
| `removeshard <shard id>` | Marks the shard for removal.<br>If shard is non-backup, rebalance is required for shard to be removed fully.<br>If shard is backup, it does not require rebalance of sessions and hence would be removed immediately. |
| `rebalance <rate limit>` | Rebalances the buckets and migrates session with rate limit.<br>Rate limit is optional. If rate limit is passed, it is applied at rebalance. |
| `rebalancebg <rate limit>` | Rebalances the buckets and schedules background task to migrate sessions.<br>Rate limit is optional. If rate limit is passed, it is applied at rebalance. |
| `rebalancestatus` | Displays the current rebalance status.<br>Status can be one of the following:<br>• Rebalance is running (Remaining buckets: <pending count>)<br>• Rebalance is required<br>• Rebalanced |
| `rebuildAllSkRings` | In order for CPS to identify a stale session from the latest session, the secondary key mapping for each site stores the primary key in addition to the bucket ID and the site ID, that is, Secondary Key = <Bucket Id>; <Site Id>; <Primary Key>.<br>To enable this feature, add the flag `-Dcache.config.version=1` in the `/etc/broadhop/qns.conf` file.<br>Enabling this flag and running `rebuildAllSkRings` starts the data migration for the new version so that CPS can load the latest version of the session. |
| `skRingRebuildStatus` | Displays the status of the migration and the current cache version. |

| Command | Description |
|---|---|
| `listskshard` | List the SK shards. |
| `addskshard seed1[,seed2] port db-index [backup]` | Adds new SK shard. For backup shard, pass the backup option. |
| `removeskshard shardid [confirm]` | Mark SK shard for deletion. |
| `rebalancesk [rate limit]` | Rebalance SK buckets across SK shards in foreground. |
| `migratesk [rate limit]` | Migrate SK data in foreground. If data is already migrated it will query and skip. |
| `rebalanceskbg [rate limit]` | Rebalance SK buckets across SK shards and schedule the distribute task to migrate SK data in background on multiple QNS |
| `migrateskbg [rate limit]` | Schedule the distribute task to migrate SK data in background on multiple QNS. If data is already migrated it will query and skip. |
| `rebalanceskstatus` | Show SK DB shard rebalance status. |
| `rebuildskdb [rate limit]` | Rebuild SK DB from Session DB. Default rate limit is 1000. |
| `rebuildskdbstatus` | Show current SK DB rebuild status. |
| `getskorder` | Get current caching system priority order. |
| `setskorder skcache1 [skcache2]` | • Change secondary key caching system priority order<br>• skcache1[2] can be MEMCACHE or SK_DB<br>• skcache1 and skcache2 must not be same<br>• skcache2 is optional, If skcache2 is not provided it will be disabled<br>Example:<br>• setskorder SK_DB: Enables SK_DB and disables MEMCACHE<br>• setskorder MEMCACHE SK_DB: Enables MEMCACHE as PRIMARY and SK_DB as FALLBACK |
| `listskshard siteId` | Lists the SK shards for corresponding site ID. |
| `addskshard seed1[,seed2] port db-index siteid [backup]` | Adds new SK shard for mentioned site. For backup shard, add the backup option. |
| `rebalances siteid [rate limit]` | Rebalance SK buckets across SK shards in foreground for the mentioned site. |
| `migratesk siteid [rate limit]` | Migrate SK data in foreground for the mentioned site. If data is already migrated it will query and skip. |

| Command | Description |
|---|---|
| `rebalanceskbg siteid [rate limit]` | Rebalance SK buckets across SK shards for the mentioned site ID and schedule the distribute task to migrate SK data in background on multiple Policy Servers (QNS). |
| `migrateskbg siteid [rate limit]` | Schedule the distribute task to migrate SK data in background on multiple Policy Servers (QNS) for the mentioned site. If data is already migrated it will query and skip. |
| `rebalanceskstatus siteid` | Show SK database shard rebalance status for the mentioned site. |
| `rebuildskdb siteid [rate limit]` | Rebuild SK database from Session database for the mentioned site.<br>Default rate limit is 1000. |
| `rebuildskdbstatus siteid` | Show current SK database rebuild status for the mentioned site ID. |

### CPS Alarm Commands

Use the following OSGi command to get the information related to open application alarms in CPS:

***Table 6: Alarm Commands***

| Command | Description |
|---|---|
| `listalarms` | To list the open/active application alarms since last restart of policy server (QNS) process on pcrfclient01/02 VM. |

**Example:**

```
osgi> listalarms
Active Application Alarms
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,10:47:34,
051+0000  msg="3001:Host: site-host-gx Realm: site-gx-client.com is down"
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,10:47:34,
048+0000  msg="3001:Host: site-host-sd Realm: site-sd-client.com is down"
id=1000 sub_id=3001  event_host=lb01  status=down date=2017-11-22,10:45:17,
927+0000  msg="3001:Host: site-server Realm: site-server.com is down"
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,10:47:34,
091+0000  msg="3001:Host: site-host-rx Realm: site-rx-client.com is down"
id=1000 sub_id=3002  event_host=lb02  status=down date=2017-11-22,10:47:34,
111+0000  msg="3002:Realm: site-server.com:applicationId: 7:all peers are down"
```

### Memcache Commands

Use the following OSGi commands to get the information related to memcache:

**Note** The memcache commands have been deprecated in CPS 20.1.0 and later releases.

*Table 7: Memcache Commands*

| Command | Description |
|---|---|
| `disableCacheAudit` | Used to disable the complete memcached audit.<br>Default: enable |
| `enableCacheAudit` | Used to enable the regular memcached audit.<br>Default: enable |
| `cacheAuditStatus` | Used to display the current regular memcached audit status. |
| `enableFtsBasedCacheAudit` | Used to enable Full Table Scan (FTS) threshold based audit. This works only when audit feature is enabled.<br>Default: true |
| `disableFtsBasedCacheAudit` | Used to disable the FTS Threshold based audit. |
| `ftsBasedCacheAuditStatus` | Used to display the current FTS based memcached audit status. |
| `currentCacheAuditInterval` | Used to display current periodic memcached audit interval. |
| `updateCacheAuditInterval`<br>`Audi Interval[Integer]` | Used to update the regular memcached audit interval.<br>Audit interval cannot be less than 360 minutes. |
| `currentFTSCacheAuditThreshold` | Used to provide the current FTS threshold for FTS based memcached audit. |
| `setFTSCacheAuditThreshold`<br>`ThresholdVal[Integer]` | Used to specify the FTS threshold value for FTS based memcached audit. This value cannot be less than 25% of total allowed FTS per qns. |
| `nextCacheAuditSchedule` | Used to display next regular memcached audit schedule when memcache audit is done. |

### Ports

pcrfclientXX:

- Control Center: 9091
- Policy Builder: 9092

lbXX:

- iomanager: 9091
- Diameter Endpoints: 9092, 9093, 9094 ...

qnsXX: 9091

Ports should be blocked using a firewall to prevent access from outside the CPS cluster.

### Accounts and Roles

Not applicable.

## Policy Builder GUI

### Purpose

Policy Builder is the web-based client interface for the configuration of policies in Cisco Policy Suite.

### URL and Port

HA: https://<*lbvip01*>:7443/pb

### Protocol

HTTPS/HTTP

### Accounts and Roles

Initial accounts are created during the software installation. Refer to the *CPS Operations Guide* for commands to add users and change passwords.

## REST API

### Purpose

To allow initial investigation into a Proof of Concept API for managing a CPS System and Custom Reference Data related through an HTTPS accessible JSON API.

### CLI Access

This is an HTTPS/Web interface and has no Command Line Interface.

### URL and Port

API: http://<*Cluster Manager IP*>:8458

Documentation: http://<*Cluster Manager IP*>:7070/doc/index.html

### Accounts and Roles

Initial accounts are created during the software installation. Refer to the *CPS Operations Guide* for commands to add users and change passwords.

# Rsyslog

### Purpose

Enhanced log processing is provided using Rsyslog.

Rsyslog logs Operating System (OS) data locally (`/var/log/messages` etc.) using the `/etc/rsyslog.conf` and `/etc/rsyslog.d/*conf` configuration files.

rsyslog outputs all WARN level logs on CPS VMs to `/var/log/warn.log` file.

On all nodes, Rsyslog forwards the OS system log data to lbvip02 via UDP over the port defined in the logback_syslog_daemon_port variable as set in the CPS deployment template (Excel spreadsheet). To download the most current CPS Deployment Template (`/var/qps/install/current/scripts/deployer/templates/QPS_deployment_config_template.xlsm`), refer to the *CPS Installation Guide for VMware* or *CPS Release Notes* for this release.

Additional information is available in the Logging chapter of the *CPS Troubleshooting Guide*. Refer also to http://www.rsyslog.com/doc/ for the Rsyslog documentation.

### CLI Access

Not applicable.

### Protocol

UDP

### Port

6514

### Accounts and Roles

Account and role management is not applicable.

## Rsyslog Customization

CPS provides the ability to configure forwarding of consolidated syslogs from rsyslog-proxy on Policy Director VMs to remote syslog servers (refer to *CPS Installation Guide for VMware*). However, if additional customizations are made to rsyslog configuration to forward logs to external syslog servers in customer's network for monitoring purposes, such forwarding must be performed via dedicated action queues in rsyslog. In the absence of dedicated action queues, when rsyslog is unable to deliver a message to the remote server, its main message queue can fill up which can lead to severe issues, such as, preventing SSH logging, which in turn can prevent SSH access to the VM.

Sample configuration for dedicated action queues is available in the *Logging* chapter of the *CPS Troubleshooting Guide*. Refer to rsyslog documentation on http://www.rsyslog.com/doc/v5-stable/concepts/queues.html for more details about action queues.

# SVN Interface

Apache™ Subversion (SVN) is the versioning and revision control system used within CPS. It maintains all the CPS policy configurations and has repositories in which files can be created, updated and deleted. SVN

maintains the file difference each time any change is made to a file on the server and for each change it generates a revision number.

In general, most interactions with SVN are performed via Policy Builder.

### CLI Access

Use the following commands to access SVN:

From a remote machine with the SVN client installed, use the following commands to access SVN:

Get all files from the server:

```
svn checkout --username <username> --password <password> <SVN Repository URL> <Local Path>
```

Example:

```
svn checkout --username broadhop --password broadhop
http://pcrfclient01/repos/configuration/root/configuration
```

If <*Local Path*> is not provided, files are checked out to the current directory.

Store/check-in the changed files to the server:

```
svn commit --username <username> --password <password> <Local Path> -m "modified config"
```

Example:

```
svn commit --username broadhop --password broadhop /root/configuration -m "modified config"
```

Update local copy to latest from SVN:

```
svn update <Local Path>
```

Example:

```
svn update /root/configuration/
```

Check current revision of files:

```
svn info <Local Path>
```

Example:

```
svn info /root/configuration/
```

**Note** Use `svn --help` for a list of other commands.

### Protocol

HTTP

### Port

80

### Accounts and Roles

## CPS 7.0 and Higher Releases

#### Add User with Read Only Permission

From the pcrfclient01 VM, run **adduser.sh** to create a new user.

```
/var/qps/bin/support/adduser.sh
```

**Note** This command can also be run from the Cluster Manager VM, but you must include the OAM (PCRFCLIENT) option:

```
/var/qps/bin/support/adduser.sh pcrfclient
```

Example:

```
[root@pcrfclient01 /]# /var/qps/bin/support/adduser.sh
Enter username: <username>
Enter group for the user: <any group>
Enter password:
Re-enter password:
```

#### Add User with Read/Write Permission

By default, the **adduser.sh** script creates a new user with read-only permissions. For read-write permission, you must assign the user to the **qns-svn** group and then run the **vm-init** command.

From the pcrfclient01 VM, run the **adduser.sh** script to create the new user.

Run the following command on both pcrfclient01 and pcrfclient02 VMs:

```
/etc/init.d/vm-init
```

You can now login and commit changes as the newly created user.

#### Change Password

From the pcrfclient01 VM, run the **change_passwd.sh** script to change the password of a user.

```
/var/qps/bin/support/change_passwd.sh
```

Example:

```
[root@pcrfclient01 /]# /var/qps/bin/support/change_passwd.sh
Enter username whose password needs to be changed: user1
Enter current password:
Enter new password:
Re-enter new password:
```

## CPS Versions Earlier than 7.0

Perform all of the following commands on both the pcrfclient01 and pcrfclient02 VMs.

#### Add User

Use the htpasswd utility to add a new user

```
htpasswd -mb /var/www/svn/.htpasswd <username> <password>
```

Example:

```
htpasswd -mb /var/www/svn/.htpasswd user1 password
```

In some versions, the password file is `/var/www/svn/password`

### Provide Access

Update the user role file /var/www/svn/users-access-file and add the username under `admins` (for read/writer permissions) or `nonadmins` (for read-only permissions). For example:

```
[groups]
admins = broadhop
nonadmins = read-only, user1
[/]
@admins = rw
@nonadmins = r
```

### Change Password

Use the htpasswd utility to change passwords.

```
htpasswd -mb /var/www/svn/.htpasswd <username> <password>
```

Example:

```
htpasswd -mb /var/www/svn/.htpasswd user1 password
```

# TACACS+ Interface

### Purpose

CPS 7.0 and above has been designed to leverage the Terminal Access Controller Access Control System Plus (TACACS+) to facilitate centralized management of users. Leveraging TACACS+, the system is able to provide system-wide authentication, authorization, and accounting (AAA) for the CPS system.

Further the system allows users to gain different entitlements based on user role. These can be centrally managed based on the attribute-value pairs (AVP) returned on TACACS+ authorization queries.

### CLI Access

No CLI is provided.

### Port

CPS communicates to the AAA backend using IP address/port combinations configured by the operator.

### Account Management

Configuration is managed by the Cluster Management VM which deploys the `/etc/tacplus.conf` and various PAM configuration files to the application VMs. For more account management information, refer to TACACS+ Service Requirements, on page 75.

For more information about TACACS+, refer to the following links:

- TACAC+ Protocol Draft: http://tools.ietf.org/html/draft-grant-tacacs-02

- Portions of the solution reuse software from the open source pam_tacplus project hosted at: https://github.com/jeroennijhof/pam_tacplus

For information on CLI commands, refer to Accessing the CPS CLI, on page 60.

# Unified API

### Purpose

Unified APIs are used to reference customer data table values.

### URL and Port

HA: https://<*lbvip01*>:8443/ua/soap

### Protocol

HTTPS/HTTP

### Accounts and Roles

Currently there is no authorization for this API

# Accessing the CPS CLI

sudo supports a plugin architecture for security policies and input/output logging. The default security policy is *sudoers*, which is configured via the file `/etc/sudoers`, contains the rules that users must follow when using the sudo command.

sudo allows a system administrator to delegate authority to give certain users (or groups of users) the ability to run some (or all) commands as root or another user while providing an audit trail of the commands and their arguments.

For example: `%adm ALL=(ALL) NOPASSWD: ALL`

This means that any user in the administrator group on any host may run any command as any user without a password. The first ALL refers to hosts, the second to target users, and the last to allowed commands.

When an authenticated user has one of the above group permissions, they can access the CPS CLI and run predefined commands available to that user role. A list of commands available after authentication can be viewed using the `sudo -l` command (-l for list), or any user with root privileges can use `sudo -l -U <qns-role>` to see the available command for a specific Policy Server (qns) role.

The `/etc/sudoers` file contains user specifications that define the commands that users may execute. When sudo is invoked, these specifications are checked in order, and the last match is used. A user specification looks like this at its most basic:

```
User Host = (Runas) Command
```

Read this as "User may run Command as the Runas user on Host". Any or all of the above may be the special keyword ALL, which always matches. User and Runas may be usernames, group names prefixed with %, numeric UIDs prefixed with #, or numeric GIDs prefixed with %#. Host may be a hostname, IP address, or a whole network (for example, 192.0.2.0/24), but not 127.0.0.1.

### Group Identifiers

gid

The group identifier of the TACACS+ authenticated user on the VM nodes. This value should reflect the role assigned to a given user, based on the following values:

- group id=500 (qns)

  The group identifier used by Policy Server (qns) user in application.

- group id=501 (qns-su)

  This group identifier should be used for users that are entitled to attain superuser (or 'root') access on the CPS VM nodes.

- group id=504 (qns-admin)

  This group identifier should be used for users that are entitled to perform administrative maintenance on the CPS VM nodes.

**Note** To execute administrative scripts from qns-admin, prefix the command with `sudo`. For example

```
sudo stopall.sh
```

- group id=505 (qns-ro)

  This group identifier should be used for users that are entitled to read-only access to the CPS VM nodes.

When an authenticated user has one of the above group permissions, they can access the CPS CLI and run predefined commands available to that user role. A list of commands available after authentication can be viewed using the `sudo -l` command (-l for list), or any user with root privileges can use `sudo -l -U <qns-role>` to see the available command for a specific Policy Server (qns) role.

For more information, refer to https://www.sudo.ws/intro.html.

home

The user's home directory on the CPS VM nodes. To enable simpler management of these systems, the users should be configured with a pre-deployed shared home directory based on the role they are assigned with the gid.

- home=/home/qns-su should be used for users in the 'qns-su' group (gid=501)
- home=/home/qns-admin should be used for users in the 'qnsadmin' group (gid=504)
- home=/home/qns-ro should be used for users in the 'qns-ro' group (gid=505)

# Support for Multiple User Login Credentials

CPS supports multiple user login credentials with different privileges for all non-cluman vms.

Add `allow_user_for_cluman` flag in configuration.csv file, to update sudoers file. This flag functionality supports the following different privileges accessible for cluman.

- When `allow_user_for_cluman` flag is set to true, sudoers file is updated with CPS users and they are able to access cluman according to their privilege.
- When `allow_user_for_cluman` flag is set to false or not defined, CPS users are not able to execute any commands from cluman.

The following table describes CSV based configuration parameters.

***Table 8: CSV Based Configuration Parameters***

| Parameters | Description |
|---|---|
| allow_user_for_cluman | Used to update the `/etc/sudoers` with CPS entries on cluman. |

This feature is supported only in VMware.

# Multi-user Policy Builder

Multiple users can be logged into Policy Builder at the same time.

In the event that two users attempt to make changes on same screen and one user saves their changes to the client repository, the other user may receive errors. In such cases the user must return to the login page, revert the configuration, and repeat their changes.

This section covers the following topics:

- Create Users, on page 62
- Revert Configuration, on page 63

## Create Users

**Step 1** Log in to the Cluster Manager.

**Step 2** Add a user to CPS by executing:

```
adduser.sh
```

**Step 3** When prompted for the user's group, set 'qns-svn' for read-write permissions or 'qns-ro' for read-only permissions.

- To check if a user already exists, login in as root and enter `su username`.
- To check a user's 'groups', enter `groups username`.
- To change a user's password, use the `change_passwd.sh` command.

**Note** The `change_passwd.sh` script changes the password on all the VMs temporarily. You also need to generate an encrypted password. To generate encrypted password, refer to *System Password Encryption* in *CPS Installation Guide for VMware*. The encrypted password must be added in the `Configuration.csv` spreadsheet. To make the new password persisent, execute `import_deploy.sh`. If the encrypted password is not added in the spreadsheet and `import_deploy.sh` is not executed, then after running `reinit.sh` script, the qns-svn user takes the existing default password from `Configuration.csv` spreadsheet.

Refer to CPS Commands, on page 203 for more information about these commands.

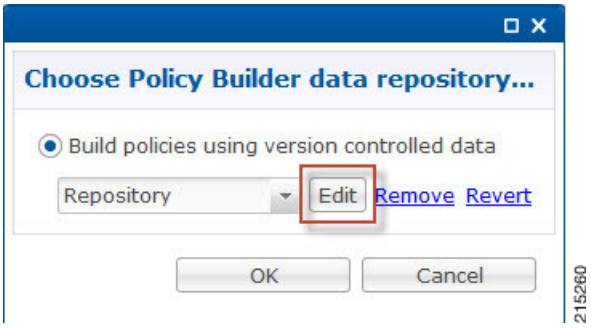
# Revert Configuration

The user can revert the configuration if changes since the last publish/save to client repository are not wanted.

This can also be necessary in the case of a 'syn conflict' error where both pcrfclient01 and pcrfclient02 are in use at the same time by different users and publish/save to client repository changes to the same file. The effect of reverting changes is that all changes since the publish/save to client repository will be undone.

**Step 1** On the Policy Builder login screen, verify the user for which changes need to be reverted is correct. This can be done by clicking **Edit** and verifying that the Username and Password fields are correct.

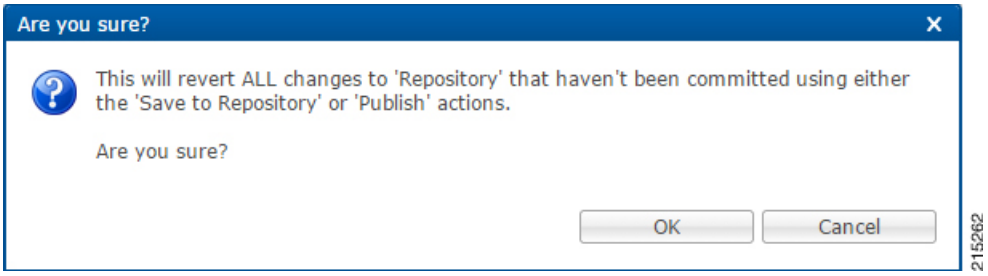
***Figure 2: Verifying the User***



**Step 2** Click **Revert**.

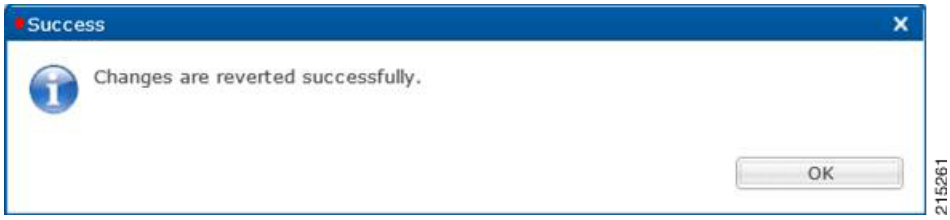
The following confirmation dialog opens.

***Figure 3: Revert Confirmation Message***



**Step 3** Click **OK** to revert back to the earlier configuration. The following dialog confirms that the changes are reverted successfully.

*Figure 4: Success Confirmation Message*



# Publishing Data

This section describes publishing Cisco Policy Builder data to the Cisco Policy Server. Publishing data occurs in the Cisco Policy Builder client interface, but affects the Cisco Policy Server. Refer to the *CPS Mobile Configuration Guide* for steps to publish data to the server.

Cisco Policy Builder manages data stored in two areas:

- The Client Repository stores data captured from the Policy Builder GUI in Subversion. This is a place where trial configurations can be developed and saved without affecting the operation of the Cisco Policy Builder server data.

  The default URL is http://pcrfclient01/repos/configuration.

- The Server Repository is where a copy of the client repository is created/updated and where the CPS picks up changes. This is done on Publish from Policy Builder.

**Note** Publishing will also do a Save to Client Repository to ensure the Policy Builder and Server configurations are not out of sync.

The default URL is http://pcrfclient01/repos/run.

# Control Center Access

After the installation is complete, you need to configure the Control Center access. This is designed to give the customer a customized Control Center username.

**Note** Tacacs+ users can access control center by enabling TACACS authentication along with `tacacs_on_ui` flag.

# Add a Control Center User

**Step 1** Login to the Cluster Manager VM.

**Step 2** Execute the following script to add a Control Center user.

```
/var/qps/bin/support/adduser.sh
```

**Note** To add a user with 'read/write' access to Control Center, their group should be 'qns'. To add a user with 'read' access to Control Center, their group should be 'qns-ro'.

Example:

```
/var/qps/bin/support/adduser.sh
Enter username: username
Enter group for the user: groupname
Enter password: password
Re-enter password: password
```

This example adds *username* to all the VMs in the cluster.

# Update Control Center Mapping

This section describes updating Control Center mapping of read-write/read-only to user groups (Default: qns and qns-ro respectively).

**Step 1** Login to the Cluster Manager VM.

**Step 2** Update `/etc/broadhop/authentication-provider.xml` to include the group mapping for the group you want to use.

**Note** Make sure that this group exists on at least the Policy Server (QNS) VMs or adding users will fail due to no group available (there should be an entry in `/etc/group`).

In the following example, the 'test' group has been added as an read-write mapping for Control Center - updated line in bold:

```
<beans:beans xmlns="http://www.springframework.org/schema/security"
  xmlns:beans="http://www.springframework.org/schema/beans"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.springframework.org/schema/beans
classpath:/org/springframework/beans/factory/xml/spring-beans-3.0.xsd
  http://www.springframework.org/schema/security
classpath:/org/springframework/security/config/spring-security-3.0.xsd">
<beans:bean id="authenticationProvider"
class="com.broadhop.ui.security.server.pam.PamAuthenticationProvider">
    <!-- change the key value to be the customer's role that maps to the cisco role. -->
    <beans:property name="roleMap">
      <beans:map>
        <beans:entry key="qns" value="ROLE_SUMADMIN" />
        <beans:entry key="test" value="ROLE_SUMADMIN" />
        <beans:entry key="qns-ro" value="ROLE_READONLY" />
      </beans:map>
    </beans:property>
  </beans:bean>

  <authentication-manager>
    <authentication-provider ref="authenticationProvider" />
  </authentication-manager>

</beans:beans>
```

**Step 3** Run `syncconfig.sh` to put this file on all VMs.

**Step 4** Restart the CPS system, so that the changes done above are reflected in the VMs:

```
restartall.sh
```

**Caution** Executing `restartall.sh` will cause messages to be dropped.

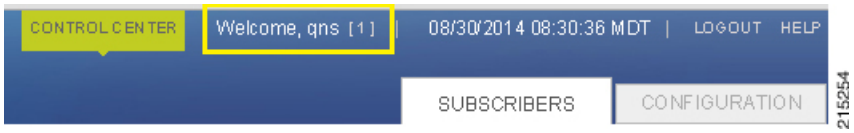
To add a new user to Control Center and specify the group you have specified in the configuration file above, refer to Add a Control Center User, on page 64.

# Multiple Concurrent User Sessions

CPS Control Center supports session limits per user. If the user exceeds the configured session limit, they are not allowed to log in. CPS also provides notifications to the user when other users are already logged in.

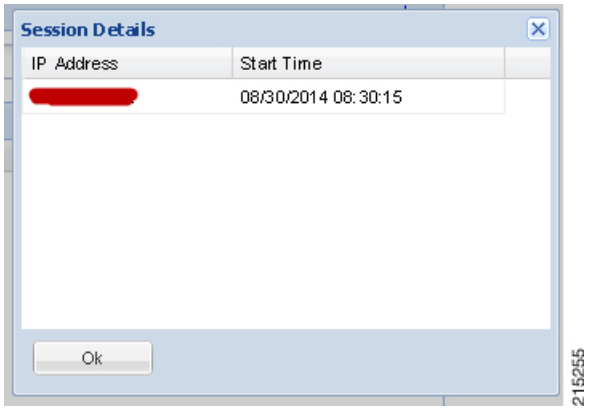
When a user logs in to Control Center, a Welcome message displays at the top of the screen. A session counter is shown next to the username. This represents the number of login sessions for this user. In the following example, this user is logged in only once ( [1] ).

*Figure 5: Welcome Message*



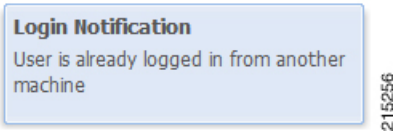
The user can click the session counter ([1]) link to view details for the session(s), as shown below.

*Figure 6: Viewing Session Details*



When another user is already logged in with the same username, a notification displays for the second user in the bottom right corner of the screen, as shown below.

*Figure 7: Login Notification for a Second User*



The first user also receives a notification, as shown, and the session counter is updated to [2].

*Figure 8: Login Notification for First User*

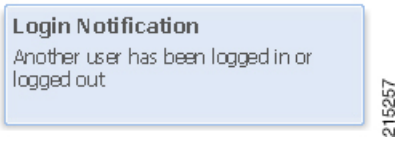


*Figure 9: Indication of Two Users with Same Username*

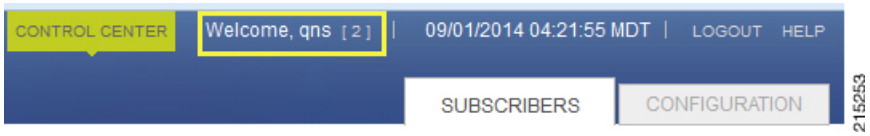


These notifications are not displayed in real time; CPS updates this status every 30 seconds.

# Configure Session Limit

The session limit can be configured by the runtime argument, which can be configured in the qns.conf file.

-Dcc.user.session.limit=3 (default value is 5)

# Configure Session Timeout

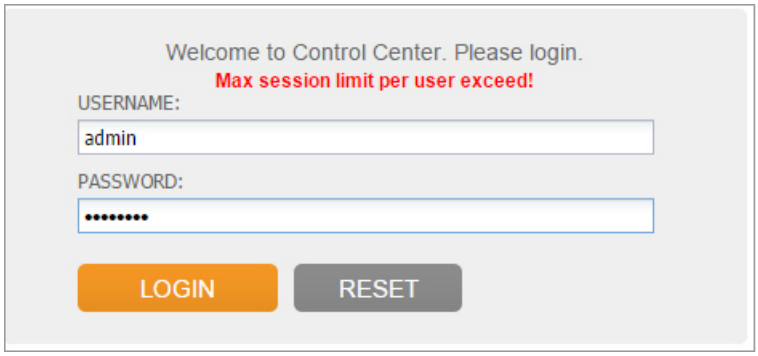
The default session timeout can be changed by editing the following file on the Policy Server (QNS) instance:

```
./opt/broadhop/qns-1/plugins/com.broadhop.ui_3.5.0.release/war/WEB-INF/web.xml

<!-- timeout after 15 mins of inactivity -->
<session-config>
<session-timeout>15</session-timeout>
    <cookie-config>
<http-only>true</http-only>
</cookie-config>
</session-config>
```

**Note** The same timeout value must be entered on all Policy Server (QNS) instances.

When the number of sessions of the user exceeds the session limit, the user is not allowed to log in and receives the message "`Max session limit per user exceed!`"



# Important Notes

If a user does not log out and then closes their browser, the session remains alive on the server until the session times out. When the session timeout occurs, the session is deleted from the memcached server. The default session timeout is 15 minutes. This is the idle time after which the session is automatically deleted.

When a Policy Server (QNS) instance is restarted, all user/session details are cleared.

When the memcached server is restarted without also restarting the Policy Server (QNS) instance, all http sessions on the Policy Server (QNS) instance are invalidated. In this case the user is asked to log in again and after that, the new session is created.

# Enable Authentication for Unified API

HAProxy is used to secure and balance calls to the CPS Unified API.

**Step 1** Back up the `/etc/haproxy/haproxy.cfg` file before making modifications in the following steps.

**Step 2** Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 and add a userlist with at least one username and password.

Use the following syntax:

```
userlist <userlist name>

user <username1> password <encrypted password>
```

Use the following steps to generate a password hash:

**a.** Execute `/var/qps/install/current/scripts/bin/support/generate_encrypted_password.sh` script to get encrypted password.

**b.** After script execution the encrypted password will be like below.

```
+-------------------------------------------------------------------------------------------------------------------+
| Fri May 29 11:43:47 UTC 2020
                              |
| Encrypted key
                                          |
|
$6$bc732ffd2a5ad85e$dYuQfGowAsAS6E2mQyWgGtcSUY4IKss11.4AY1u852gGwZzr4Y54rBdkHG6zQytFPXXDJGwknx.IYIeDeW.jP.

          |
+-------------------------------------------------------------------------------------------------------------------+
```

**Step 3** Run the following command to generate an encrypted password:

```
openssl passwd -1 <your-password>
```

**Example:**

```
openssl passwd -1 'password'
$1$u/fEW7/p$e//MBCq7AHQArNo61Qvy20
```

**Step 4** Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 to configure HAProxy to require authentication. Add the following 4 lines to the `haproxy.cfg` file:

```
acl validateAuth http_auth(<userlist_name>)
acl unifiedAPI path_beg -i /ua/soap
http-request allow if !unifiedAPI
http-request auth unless validateAuth
```

The userlist created in Step 2, on page 69 needs to be mapped with the acl in the following line:

```
acl validateAuth http_auth(<userlist name>)
```

For example:

```
frontend https-api
description Unified API
bind lbvip01:8443 ssl crt /etc/ssl/certs/quantum.pem
default_backend api_servers
reqadd X-Forwarded-Proto:\ https if { ssl_fc }
```

```
backend api_servers
mode http
balance roundrobin
option httpclose
option abortonclose
option httpchk GET /ua/soap/keepalive
server qns01_A qns01:8080 check inter 30s
server qns02_A qns02:8080 check inter 30s
server qns03_A qns03:8080 check inter 30s
server qns04_A qns04:8080 check inter 30s
acl validateAuth http_auth(L1)
acl unifiedAPI path_beg -i /ua/soap
http-request allow if !unifiedAPI
http-request auth unless validateAuth
```

The configuration above applies authentication on context /ua/soap, which is the URL path of the Unified API.

**Note** The `haproxy.cfg` file is generated by the Puppet tool. Any manual changes to the file in lb01/lb02 would be reverted if the pupdate or vm-init scripts are run.

# Unified API Security: Access Privileges

By default, the CPS Unified API does not require username and password authentication. To enable authentication, refer to Enable Authentication for Unified API.

There are two options to include a username and password in an API request:

- Include the username and password directly in the request. For example:

  **https://<username>:<password>@<lbvip02>:8443/ua/soap**

- Add an authentication header to the request:

  `Authorization: Basic <base64 encoded value of username:password>`

  For example:

  ```
  wget -d -O - --header="Authorization: Basic cG9ydGFXNjbzEyMwo="
  https://lbvip02:8443/ua/soap/keepalive
  ```

## Enable Authentication for Unified API

HAProxy is used to secure and balance calls to the CPS Unified API.

**Step 1** Back up the `/etc/haproxy/haproxy.cfg` file before making modifications in the following steps.

**Step 2** Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 and add a userlist with at least one username and password.

Use the following syntax:

`userlist <userlist name>`

`user <username1> password <encrypted password>`

Use the following steps to generate a password hash:

**a.** Execute `/var/qps/install/current/scripts/bin/support/generate_encrypted_password.sh` script to get encrypted password.

**b.** After script execution the encrypted password will be like below.

```
+-----------------------------------------------------------------------------------------------------------------------+
| Fri May 29 11:43:47 UTC 2020
                            |
| Encrypted key
                                          |
|
$6$bc732ffd2a5ad85e$dYuQfGowAsAS6E2mQyWgGtcSUY4IKss11.4AY1u852gGwZzr4Y54rBdkHG6zQytFPXXDJGwknx.IYIeDeW.jP.

           |
+-----------------------------------------------------------------------------------------------------------------------+
```

**Step 3** Run the following command to generate an encrypted password:

```
openssl passwd -1 <your-password>
```

**Example:**

```
openssl passwd -1 'password'
$1$u/fEW7/p$e//MBCq7AHQArNo61Qvy20
```

**Step 4** Edit `/etc/haproxy/haproxy.cfg` on lb01/lb02 to configure HAProxy to require authentication. Add the following 4 lines to the `haproxy.cfg` file:

```
acl validateAuth http_auth(<userlist_name>)
acl unifiedAPI path_beg -i /ua/soap
http-request allow if !unifiedAPI
http-request auth unless validateAuth
```

The userlist created in Step 2, on page 70 needs to be mapped with the acl in the following line:

```
acl validateAuth http_auth(<userlist name>)
```

For example:

```
frontend https-api
description Unified API
bind lbvip01:8443 ssl crt /etc/ssl/certs/quantum.pem
default_backend api_servers
reqadd X-Forwarded-Proto:\ https if { ssl_fc }
backend api_servers
mode http
balance roundrobin
option httpclose
option abortonclose
option httpchk GET /ua/soap/keepalive
server qns01_A qns01:8080 check inter 30s
server qns02_A qns02:8080 check inter 30s
server qns03_A qns03:8080 check inter 30s
server qns04_A qns04:8080 check inter 30s
acl validateAuth http_auth(L1)
acl unifiedAPI path_beg -i /ua/soap
http-request allow if !unifiedAPI
http-request auth unless validateAuth
```

The configuration above applies authentication on context /ua/soap, which is the URL path of the Unified API.

**Note** The `haproxy.cfg` file is generated by the Puppet tool. Any manual changes to the file in lb01/lb02 would be reverted if the pupdate or vm-init scripts are run.

## WSDL and Schema Documentation

In order to access the Unified API WSDL while using authentication change the following line:

```
acl unifiedAPI path_beg -i /ua/soap
```

to

```
acl unifiedAPI path_beg -i /ua/.
```

The default address for the WSDL is `https://<lbvip01>:8443/ua/wsdl/UnifiedApi.wsdl`

The Unified API contains full documentation in an html format that is compatible with all major browsers.

The default address is `https://<HA-server-IP>:8443/ua/wsdl/UnifiedApi.xsd`

**Note** Run the **about.sh** command from the Cluster Manager to display the actual addresses as configured in your deployment.

# Enabling Unified API Access on HTTP Port 8080

CPS 7.x onward uses HTTPS on port 8443 for Unified API access. To enable HTTP support (like pre-7.0) on port 8080, perform the following steps:

**Note** Make sure to open port 8080 if firewall is used on the setup.

**Step 1** Create the following directories (ignore File exists error), on Cluster Manager:

```
/bin/mkdir -p /var/qps/env_config/modules/custom/templates/etc/haproxy
/bin/mkdir -p /var/qps/env_config/modules/custom/templates/etc/monit.d
/bin/mkdir -p /var/qps/env_config/nodes
```

**Step 2** Create the file `/var/qps/env_config/modules/custom/templates/etc/haproxy/haproxy-soaphttp.erb` with the following contents on Cluster Manager:

- Change XXXX with the Unified API interface hostname or IP
- In this example, we are adding 10 Policy Servers (QNS). You can add/remove the number of Policy Servers (QNS) depending on your network requirements.

```
global
  daemon
  nbproc       1          # number of processing cores
```

```
  stats socket /tmp/haproxy-soaphttp
defaults
  timeout client    60000ms       # maximum inactivity time on the client side
  timeout server    180000ms      # maximum inactivity time on the server side
  timeout connect   60000ms       # maximum time to wait for a connection attempt to a server to
succeed

  log             127.0.0.1       local1 err

listen pcrf_proxy XXXX:8080 ----------- > where, XXXX, is Unified API interface hostname or IP
        mode http
        balance roundrobin
        option httpclose
        option abortonclose
        option httpchk GET /ua/soap/KeepAlive
        server qns01_A qns01:8080 check inter 30s
        server qns02_A qns02:8080 check inter 30s
        server qns03_A qns03:8080 check inter 30s
        server qns04_A qns04:8080 check inter 30s
        server qns05_A qns05:8080 check inter 30s
        server qns06_A qns06:8080 check inter 30s
        server qns07_A qns07:8080 check inter 30s
        server qns08_A qns08:8080 check inter 30s
        server qns09_A qns09:8080 check inter 30s
        server qns10_A qns10:8080 check inter 30s
```

**Step 3** Create the file `/var/qps/env_config/modules/custom/templates/etc/monit.d/haproxy-soaphttp` with the following contents on Cluster Manager:

```
check process haproxy-soaphttp with pidfile /var/run/haproxy-soaphttp.pid
start = "/usr/bin/systemctl start haproxy-soaphttp"
stop = "/usr/bin/systemctl stop haproxy-soaphttp"
```

**Step 4** Create or modify the `/var/qps/env_config/nodes/lb.yaml` file with the following contents on Cluster Manager:

If the file exists then just add `custom::soap_http:`

```
classes:
  qps::roles::lb:
  custom::soap_http:
```

**Step 5** Create the file `/var/qps/env_config/modules/custom/manifests/soap_http.pp` with the following contents on Cluster Manager.

Change ethX with the Unified API IP interface like eth0/eth1/eth2.

```
class custom::soap_http(
  $haproxytype = "-soaphttp",
)
{
  service { "haproxy-soaphttp":
    enable => false,
    require => [Package [ "haproxy" ],File ["/etc/haproxy/haproxy-soaphttp.cfg"],
File['/etc/init.d/haproxy-soaphttp'], Exec["sysctl_refresh"]],
  }
  file { "/etc/init.d/haproxy-soaphttp":
    owner => "root",
    group => "root",
    content => template('qps/etc/init.d/haproxy'),
    require => Package [ "haproxy" ],
    notify => Service['haproxy-soaphttp'],
    mode => 0744
  }
  file { "/etc/haproxy/haproxy-soaphttp.cfg":
```

```
    owner => "root",
    group => "root",
    content => template('custom/etc/haproxy/haproxy-soaphttp.erb'),
    require => Package [ "haproxy" ],
    notify => Service['haproxy-soaphttp'],
  }
  file { "/etc/monit.d/haproxy-soaphttp":
    content => template("custom/etc/monit.d/haproxy-soaphttp"),
    notify => Service["monit"],
  }
  exec { "remove ckconfig for haproxy-soaphttp":
    command => "/sbin/chkconfig --del haproxy-soaphttp",
    require => [Service['haproxy-soaphttp']],
  }
  firewall { '100 allow soap http':
    port => 8080,
    iniface => "ethX",
    proto => tcp,
    action => accept,
  }
}
```

**Step 6** Validate the syntax of your newly created Puppet script on Cluster Manager:

```
/usr/bin/puppet parser validate /var/qps/env_config/modules/custom/manifests/soap_http.pp
```

**Step 7** Rebuild your Environment Configuration on Cluster Manager:

```
/var/qps/install/current/scripts/build/build_env_config.sh
```

**Step 8** Reinitialize your lb01/02 environments on Cluster Manager:

The following commands will take few minutes to complete.

```
ssh lb01 /etc/init.d/vm-init
ssh lb02 /etc/init.d/vm-init
```

**Step 9** Validate SOAP request on http:

a) Verify the haproxy services are running on lb01 and lb02 by executing the commands on Cluster Manager:

```
ssh lb01 monit summary | grep haproxy-soaphttp
Process 'haproxy-soaphttp'                  Running
ssh lb01 service haproxy-soaphttp status
haproxy (pid  11061) is running...
ssh lb02 monit summary | grep haproxy-soaphttp
Process 'haproxy-soaphttp'                  Running
ssh lb02 service haproxy-soaphttp status
haproxy (pid  13458) is running...
```

b) Verify the following URLs are accessible:

```
Unified API WSDL: http://<IP address>:8080/ua/wsdl/UnifiedApi.wsdl
Unified API XSD: http://<IP address>:8080/ua/wsdl/UnifiedApi.xsd
```

where, *<IP address>* is the IP address set in Step 2, on page 72.

# TACACS+

This section covers the following topics:

- Overview, on page 75
- TACACS+ Service Requirements, on page 75
- Caching of TACACS+ Users, on page 76

## Overview

Cisco Policy Suite (CPS) is built around a distributed system that runs on a large number of virtualized nodes. Previous versions of the CPS software allowed operators to add custom accounts to each of these virtual machines (VM), but management of these disparate systems introduced a large amount of administrative overhead.

CPS has been designed to leverage the Terminal Access Controller Access Control System Plus (TACACS+) to facilitate centralized management of users. Leveraging TACACS+, the system is able to provide system-wide authentication, authorization, and accounting (AAA) for the CPS system.

Further the system allows users to gain different entitlements based on user role. These can be centrally managed based on the attribute-value pairs (AVP) returned on TACACS+ authorization queries.

## TACACS+ Service Requirements

To provide sufficient information for the Linux-based operating system running on the VM nodes, there are several attribute-value pairs (AVP) that must be associated with the user on the ACS server used by the deployment. User records on Unix-like systems need to have a valid “passwd” record for the system to operate correctly. Several of these fields can be inferred during the time of user authentication, but the remaining fields must be provided by the ACS server.

A standard “passwd” entry on a Unix-like system takes the following form:

```
<username>:<password>:<uid>:<gid>:<gecos>:<home>:<shell>
```

When authenticating the user via TACACS+, the software can assume values for the username, password, and gecos fields, but the others must be provided by the ACS server. To facilitate this need, the system depends on the ACS server provided these AVP when responding to a TACACS+ Authorization query for a given username:

- uid

  A unique integer value greater than or equal to 501 that serves as the numeric user identifier for the TACACS+ authenticated user on the VM nodes. It is outside the scope of the CPS software to ensure uniqueness of these values.

- gid

  The group identifier of the TACACS+ authenticated user on the VM nodes. This value should reflect the role assigned to a given user, based on the following values:

  - `gid=501 (qns-su)`

This group identifier should be used for users that are entitled to attain superuser (or 'root') access on the CPS VM nodes.

- `gid=504 (qns-admin)`

  This group identifier should be used for users that are entitled to perform administrative maintenance on the CPS VM nodes.

**Note** For stopping/starting the Policy Server (QNS) process on node, the qns-admin user should use `monit`:

For example,

```
sudo monit stop qns-1
sudo monit start qns-1
```

- `gid=505 (qns-ro)`

  This group identifier should be used for users that are entitled to read-only access to the CPS VM nodes.

- home

  The user's home directory on the CPS VM nodes. To enable simpler management of these systems, the users should be configured with a pre-deployed shared home directory based on the role they are assigned with the gid.

  - home=/home/qns-su should be used for users in the `qns-su` group (gid=501)
  - home=/home/qns-admin should be used for users in the `qnsadmin` group (gid=504)
  - home=/home/qns-ro should be used for users in the `qns-ro` group (gid=505)

- shell

  The system-level login shell of the user. This can be any of the installed shells on the CPS VM nodes, which can be determined by reviewing the contents of `/etc/shells` on one of the CPS VM nodes. Typically, this set of shells is available in a CPS deployment:

  - /bin/sh
  - /bin/bash
  - /sbin/nologin
  - /bin/dash
  - /usr/bin/sudosh

  The `/usr/bin/sudosh` shell can be used to audit user's activity on the system.

# Caching of TACACS+ Users

The user environment of the Linux-based VMs needs to be able to lookup a user's `passwd` entry via different columns in that record at different times. The TACACS+ NSS module provided as part of the CPS solution

however is only able to query the Access Control Server (ACS) for this data using the `username`. For this reason the system relies upon the Name Service Cache Daemon (NSCD) to provide this facility locally after a user has been authorized to use a service of the ACS server.

More details on the operations of NSCD can be found by referring to online help for the software (nscd --help) or in its man page (nscd(8)). Within the CPS solution it provides a capability for the system to lookup a user's `passwd` entry via their `uid` as well as by their `username`.

To avoid cache coherence issues with the data provided by the ACS server the NSCD package has a mechanism for expiring cached information.

The default NSCD package configuration on the CPS VM nodes has the following characteristics:

- Valid responses from the ACS server are cached for 600 seconds (10 minutes)
- Invalid responses from the ACS server (user unknown) are cached for 20 seconds
- Cached valid responses are reloaded from the ACS server 5 times before the entry is completely removed from the running set -- approximately 3000 seconds (50 minutes)
- The cache are persisted locally so it survives restart of the NSCD process or the server

It is possible for an operator to explicitly expire the cache from the command line. To do so the administrator need to get the shell access to the target VM and execute the following command as a root user:

```
# nscd -i passwd
```

The above command will invalidate all entries in the passwd cache and force the VM to consult with the ACS server for future queries.

There may be some unexpected behaviors of the user environment for TACACS+ authenticated users connected to the system when their cache entries are removed from NSCD. This can be corrected by the user by logging out of the system and logging back into it or by issuing the following command, which forces the system to query the ACS server:

```
# id -a "$USER"
```

# Reading Log Files

Only qns-ro and qns-admin users are allowed to view log files at specific paths according to their role and maintenance requirement. Access to logs are allowed only using the following paths:

- /var/log/
- /var/log/broadhop/scripts/
- /var/log/httpd
- /var/log/redis
- /var/log/broadhop

Commands such as `cat`, `less`, `more`, and `find` cannot be executed using sudo in CPS 10.0.0 or higher releases.

To read any file, execute the following script using sudo:

```
$ sudo /var/qps/bin/support/logReader.py -r h -n 2 -f /var/log/puppet.log
```

where,

- `-r`: Corresponds to tail (t) ,tailf (tf), and head (h) respectively
- `-n`: Determines number of lines to be read. It works with the -r option. This is an optional parameter.
- `-f`: Determines the complete file path to be read.

**Note**

- Non-root users cannot view the sudosh logs.
- Support to read gunzipped files is also available.

# CRD APIs

You use Custom Reference Data (CRD) APIs to query, create, delete, and update CRD table data without the need to utilize the Control Center interface. The CRD APIs are available via a REST interface.

## Limitations

These APIs allow maintenance of the actual data rows in the table. They do not allow the creation of new tables or the addition of new columns. Table creation and changes to the table structure must be completed via the Policy Builder application.

Table names must be all in lowercase alphanumeric to utilize these APIs. Neither spaces nor special characters are allowed in the table name.

- Table names containing uppercase characters will return code 400 Bad Request.
- Spaces in the name are also not allowed and will be flagged as an error in Policy Builder.
- Special characters even when escaped or encoded in ASCII cause problems with the APIs and should not be used.

## Setup Requirements

### Policy Server

The feature com.broadhop.custrefdata.service.feature needs to be installed on the Policy Server.

In a High Availability (HA)/Distributed CPS deployment, this feature should be installed on the QNS0x nodes.

### Policy Builder

The feature `com.broadhop.client.feature.custrefdata` needs to be installed in Policy Builder.

**Step 1** Login into Policy Builder.

**Step 2** Select **Reference Data** tab.

**Step 3** From the left pane, select **Systems**.

**Step 4** Select and expand your system name.

**Step 5** Select **Plugin Configurations** (or a sub cluster or instance), a Custom Reference Data Configuration plugin configuration is defined.

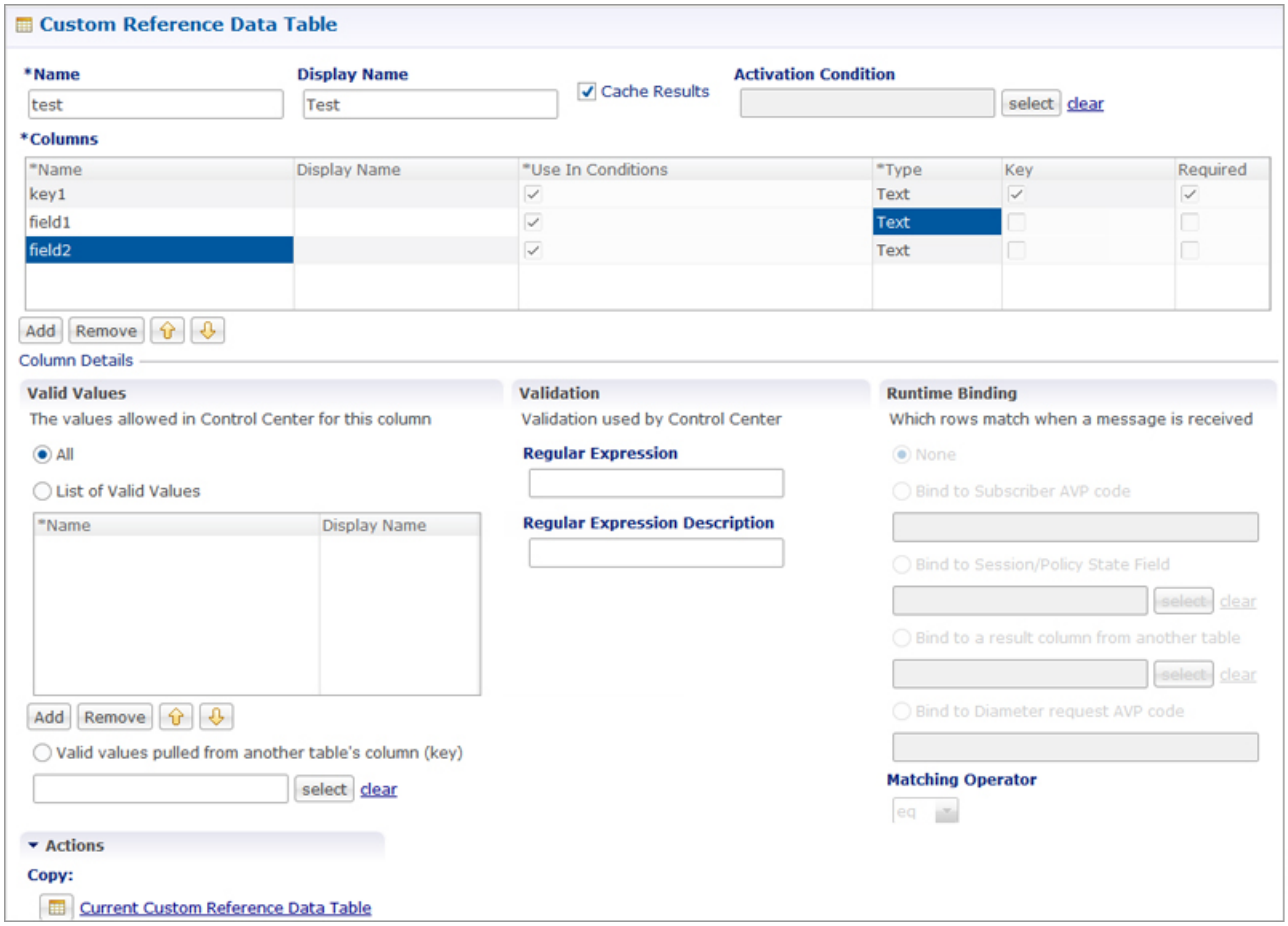
The following parameters can be configured under **Custom Reference Data Configuration**:

***Table 9: Custom Reference Data Configuration***

| Parameter | Description |
|---|---|
| Primary Database IP Address | IP address of the primary sessionmgr database. |
| Secondary Database IP Address | Optional, this field is the IP address of a secondary, backup, or failover sessionmgr database. |
| Database Port | Port number of the sessionmgr. It should be the same for both the primary and secondary databases. |
| Db Read Preference | Read preference describes how sessionmgr clients route read operations to members of a replica set. You can select from the following drop-down list:<br>• Primary: Default mode. All operations read from the current replica set primary.<br>• PrimaryPreferred: In most situations, operations read from the primary but if it is unavailable, operations read from secondary members.<br>• Secondary: All operations read from the secondary members of the replica set.<br>• SecondaryPreferred: In most situations, operations read from secondary members but if no secondary members are available, operations read from the primary.<br>For more information, refer to http://docs.mongodb.org/manual/core/read-preference/. |
| Connection Per Host | Number of connections that are allowed per database host.<br>Default value is 100. |

**Step 6** In **Reference Data** tab > **Custom Reference Data Tables**, at least one Custom Reference Data Table must be defined.

*Figure 10: Custom Reference Data Table*



The following parameters can be configured under Custom Reference Data Table:

*Table 10: Custom Reference Data Table Parameters*

| Parameter | Description |
|---|---|
| Name | This is the name of the table that will be stored in the database. It should start with alphanumeric characters, should be lowercase OR uppercase but not MixedCase, and should not start with numbers, no special characters are allowed, use "_" to separate words. For example, logical_apn = GOOD, logicalAPN = BAD, no_spaces.<br>For more information, refer to Limitations, on page 78. |
| Display Name | This is the name of the table that will be displayed in Control Center. |
| Cache Results | This indicates whether the tables should be cached in memory. This should be checked for production.<br>For more information, refer to Caching, on page 83. |

| Parameter | Description |
|---|---|
| Activation Condition | This is the Custom Reference Data Trigger which needs to be true before evaluating this table. This can be used to have multiple tables create the same data depending on conditions or to improve performance if tables don't need to be evaluated based on an initial condition(s). |
| Best Match | If checked, this allows '*' to be used in the values of the data and the best matching row is returned. |
| Evaluation Order | This indicates the order the tables within the search table group should be evaluated. Starting with 0 and increasing. |
| Columns | Columns correspond to the 'schema' for each column we're creating for this Custom Reference Data table.<br>• Name: The name of the column in the database.<br>• Display Name: A more readable display name.<br>• Use In Conditions: This represents whether this row will be available for conditions in Policies or Use Case Templates. There is a performance cost to having these checked, so we recommend to uncheck unless they are required.<br>Default value is checked (true).<br>• Type: the type determines what values will be allowed when creating them in control center.<br>• Text: The value is allowed to be any characters. For example, example123!.<br>• Number: The value is allowed to be any whole number. For example, 1234.<br>• Decimal: The value is allowed to be any number (including decimals). For example, 1.234.<br>• True/False: The value needs to be 'true' or 'false'. For example, true.<br>• Date: The value is a date without a time component (May 17th, 2020).<br>• DateTime: The value is a date + time (May 17th, 2020 5:00pm).<br>• Key: This indicates that this column is all or part of the 'key' for the table that makes this row unique. By default, a key is required. Keys also are allowed set the Runtime Binding fields to populate this data from the current message/session. Typically, keys are bound to data from the current session (APN, RAT Type) and other values are derived from them. Keys can also be set to a value derived from another Custom Reference Data table.<br>• Required: This indicates whether this field will be marked required in Control Center. A key is always required. |

| Parameter | Description |
|---|---|
| Valid Values | These are the valid values which will be allowed in Control Center (creates a list box).<br>• List of Valid Values: A list of name/display name pairs which will be used to create the list. Valid values can also contain a 'name' which will be the actual value of the column and a display value which allows Control Center to display an easier to use name.<br>• Valid Values pulled from another Table: This allows initializing the list based on another Custom Reference Data table. The 'name' value will be pulled from another table. There is no way to customize a 'display' name in this manner. |
| Validation | The validation set here will be checked by Control Center before allowing a row to be added.<br>• Regular Expression: This is the Java regular expression that will be run on the proposed new cell value to validate it as described in http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html.<br>• Regular Expression Description: This is a message to the user indicating what the regular expression is trying to check. |
| Runtime Binding | Runtime binding is how key column data gets filled out ('bound') from data in the current session. There are multiple ways to bind this data and it is also possible to set an operator to define what should match (equals, less than, etc).<br>• Bind to Subscriber AVP Code: This pulls the value from an AVP on the subscriber. It will also pull values from a session AVP or a Policy Derived AVP.<br>• Bind to Session/Policy State Field: This pulls the value from a Policy State Data Retriever which knows how to retrieve a single value for a session<br>• Bind to a Result Column from another Table: This allows the key to be filled out from a columns value from another table. This allows 'normalizing' the table structure and not having on giant table with a lot of duplicated values.<br>• Bind to Diameter Request AVP code: This allows the key be filled out from an AVP on the Diameter request.<br>• Matching Operator: This allows the row to be 'matched' in other ways than having the value be 'equals'. Default value is equals.<br>  • eq: Equal<br>  • ne: Not Equal<br>  • gt: Greater than<br>  • gte: Greater than or equal<br>  • lt: Less than<br>  • lte: Less than or equal |

# Architecture

## MongoDB

The MongoDB database containing the CRD tables and the data is located in the MongoDB instance specified in the CRD plugin configuration.

The database is named cust_ref_data.

Two system collections exist in that database and do not actually contain CRD data:

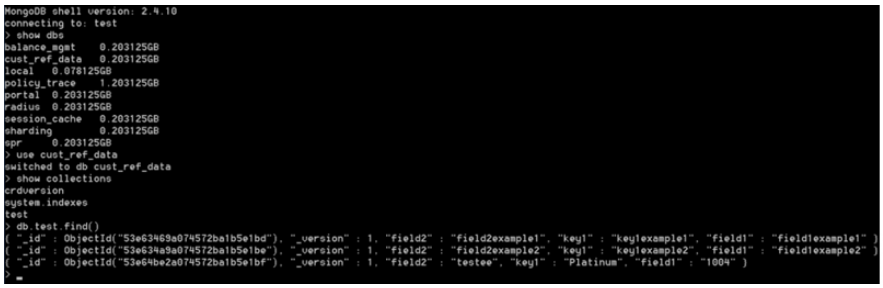
- system.indexes — used by MongoDB. These are indices set on the database.
- crdversion — contains a document indicating the version of all the CRD tables you have defined. The version field increments by 1 every time you make a change or add data to any of your CRD tables.

A collection is created for each CRD table defined in Policy Builder.

- This collection contains a document for each row you define in the CRD table.
- Each document contains a field for each column you define in the CRD table.
- The field contains the value specified for the column for that row in the table.
- Additionally, there is a _id field which contains the internal key used by MongoDB and _version which is used by CPS to provide optimistic locking protection, essentially to avoid two threads overwriting the other's update, on the document.

An example is shown below:

***Figure 11: CRD Table in Policy Builder***



## Caching

Setting the Cache Results to true (checked) is the default and recommended settings in most cases as it yields the best performance. Use of the cached copy also removes the dependency on the availability of the CRD database, so if there is an outage or performance issue, policy decisions utilizing the CRD data won't be impacted.

The cached copy of the table is refreshed on CPS restart and whenever the API writes a change to the CRD table, otherwise the cached copy is used and the database is not accessed.

# API Endpoints and Examples

The URL used to access the CRD API are different depending on the type of deployment (High Availability or All-in-One):

High Availability (HA): https://<lbvip01>:8443/custrefdata/<tablename>/_<operation>

The examples in the following sections refer to the HA URL.

## Query API

### Purpose

Returns all rows currently defined in the specified table.

### HTTP Operation Type

GET

### Example URL

https://<lbvip01>:8443/custrefdata/test/_query

https://<master or control ip>:8443/custrefdata/test/_query

### Example URL with Filtering

https://<lbvip01>:8443/custrefdata/test/_query?key1=Platinum

https://<master or control ip>:8443/custrefdata/test/_query?key1=Platinum

### Payload

None, although parameters can be specified on the URL for filtering.

### Response

Success returns code 200 Ok; XML indicating rows defined is returned. If there are no records in the table, 200 Ok is returned with empty rows in it.

If the table does not exist, code 400 Bad Request is returned.

### Example Response without Filtering

```
<rows>
  <row>
    <field code=”field1” value=”1004”/>
    <field code=”field2” value=”testee”/>
    <field code=”key1” value=”Platinum”/>
  </row>
  <row>
    <field code=”field1” value=”1004”/>
    <field code=”field2” value=”testee”/>
    <field code=”key1” value=”Platinum99”/>
  </row>
  <row>
    <field code=”field1” value=”field1example1”/>
    <field code=”field2” value=”field2example1”/>
```

```
    <field code=”key1” value=”key1example1”/>
  </row>
  <row>
    <field code=”field1” value=”field1example2”/>
    <field code=”field2” value=”field2example2”/>
    <field code=”key1” value=”key1example2”/>
  </row>
</rows>
```

### Example Response with Filtering

```
<rows>
<rows>
  <row>
    <field code=”field1” value=”1004”/>
    <field code=”field2” value=”testee”/>
    <field code=”key1” value=”Platinum”/>
  </row>
</rows>
```

The response returns keys with the tag “field code”. If you want to use the output of Query as input to one of the other APIs, the tag needs to be changed to “key code”. Currently using “field code” for a key returns code 404 Bad Request and a java.lang.NullPointerException.

## Create API

### Purpose

Create a new row in the specified table.

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/test/_create

https://<master or control ip>:8443/custrefdata/test/_create

### Example Payload

```
<row>
  <key code=”key1” value=”Platinum”/>
  <field code=”field1” value=”1004”/>
  <field code=”field2” value=”testee”/>
</row>
```

### Response

Success returns code 200 Ok; no data is returned. The key cannot already exist for another row; submission of a duplicate key returns code 400 Bad Request.

If creating a row fails, API returns 400 Bad Request.

**Note** Create API does not support SVN CRD table operations and displays the following error message when Snv Crd Data checkbox is enabled in CRD table configuration:

**Create operation is not allowed for subversion table**

## Update API

### Purpose

Updates the row indicated by the key code in the table with the values specified for the field codes.

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/test/_update

https://<master or control ip>:8443/custrefdata/test/_update

### Example Payload

```
<row>
  <key code="key1" value="Platinum"/>
  <field code="field1" value="1005"/>
  <field code="field2" value="tester"/>
</row>
```

### Response

Success returns code 200 Ok; no data is returned. The key cannot be changed. Any attempt to change the key returns code 404 Not Found.

If updating a row fails, API returns 400 Bad Request.

**Note** Update API does not support SVN CRD table operations and displays the following error message when Snv Crd Data checkbox is enabled in CRD table configuration:

**Update operation is not allowed for subversion table**

## Delete API

### Purpose

Removes the row indicated by the key code from the table.

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/test/_delete

https://<master or control ip>:8443/custrefdata/test/_delete

### Example Payload

```
<row>
<key code="key1" value="Platinum"/>"/>
</row>
```

### Response

Success returns code 200 Ok; no data is returned. If the row to delete does not exist, code 404 Not Found is returned.

If deleting a row fails, API returns 400 Bad Request.

**Note** Delete API does not support SVN CRD table operations and displays the following error message when Snv Crd Data checkbox is enabled in CRD table configuration:

**Delete operation is not allowed for subversion table**

## Data Comparison API

### Purpose

Determines whether the same CRD table data content is being used at different data centers.

The following three optional parameters can be provided to the API:

- tableName: Returns the checksum of a specified CRD table `tableName` indicating if there is any change in the specified table. If the value returned is same on different servers, it means there is no change in the configuration and content of that table.
- includeCrdversion: Total database checksum contains combination of checksum of all CRD tables configured in Policy Builder. If this parameter is passed as true in API, then total database checksum includes the checksum of "crdversion" table. Default value is false.
- orderSensitive: Calculates checksum of the table by utilizing the order of the CRD table content. By default, it does not sort the row checksums of the table and returns order sensitive checksum of every CRD table. Default value is true.

### custrefdata/_checksum

Database level Checksum API returns checksum details for all the CRD tables and the database. If the value returned is same on different servers, there will be no change in the configuration and content of any CRD table configured in Policy Builder.

### HTTP Operation Type

GET

#### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_checksum

https://<master or control ip>:8443/custrefdata/_checksum

#### Response

```
<response>
    <checksum><all-tables-checksum></checksum>
    <tables>
        <table name="<table-1-name>" checksum="<checksum-of-table-1>"/>
        <table name="<table-2-name>" checksum="<checksum-of-table-2>"/>

        <table name="<table-n-name>" checksum="<checksum-of-table-n>"/>
   </tables>
</response>
```

#### /custrefdata/_checksum?tableName=<user-provided-table-name>

Table specific Checksum API returns the checksum details for the specific CRD table. If the value returned is same on different servers, there will be no change in the configuration and content of that table.

#### HTTP Operation Type

GET

#### Example Endpoint URL

https://<lbvip01>:8443 /custrefdata/_checksum?tableName=<user-provided-table-name>

https://<master or control ip>:8443 /custrefdata/_checksum?tableName=<user-provided-table-name>

#### Response

```
<response>
    <tables>
        <table name="<user-provided-table-name>" checksum="<checksum-of-specified-table"/>
    </tables>
</response>
```

**Note** Table specific Checksum API does not support SVN CRD table operations and displays the following error message when Snv Crd Data checkbox is enabled in CRD table configuration:

**Checksum operation is not allowed for subversion table**

## Table Drop API

#### Purpose

Drops custom reference table from MongoDB to avoid multiple stale tables in the system.

The Table Drop API is used in the following scenarios:

- If a CRD table does not exist in Policy Builder but exists in the database, the API can be used to delete the table from the database.
- If a CRD table exists in Policy Builder and database, the API cannot delete the table from the database. If this is attempted the API will return an error: “Not permitted to drop this table as it exists in Policy Builder”.
- If a CRD table does not exist in Policy Builder and database, the API will also return an error `No table found:<tablename>`.

#### /custrefdata/<table_name>/_drop

#### HTTP Operation Type

POST

#### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/<table_name>/_drop

https://<master or control ip>:8443/custrefdata/<table_name>/_drop

**Note** Drop API does not support SVN CRD table operations and displays the following error message when Snv Crd Data checkbox is enabled in CRD table configuration:

**Drop operation is not allowed for subversion table**

## Export API

#### Purpose

Exports single and multiple CRD table and its data.

#### /custrefdata/_export?tableName=<table_name>

Exports single CRD table and its data.

Returns an archived file containing csv file with information of specified CRD table `table_name`.

#### HTTP Operation Type

GET

#### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_export?tableName=<table_name>

https://<master or control ip>:8443/custrefdata/_export?tableName=<table_name>

#### /custrefdata/_export

Exports all CRD tables and its data.

Returns an archived file containing csv file with information for each CRD Table.

#### HTTP Operation Type

GET

#### Example Endpoint URL

https://<lbvip01>:8443 /custrefdata/_export

https://<master or control ip>:8443 /custrefdata/_export

**Note** Export API does not support Svn CRD tables and displays the following warning message in the Response Header "Export-Warning":

**Datasource for tables [table1, table2,...] is subversion. Response will not contain data for these tables and skipped SVN CRD tables to be a part of archive.**

## Export Golden CRD API

#### Purpose

Exports Golden CRD data to SVN.

**Note** CPS supports backing up of the existing CRD data and push it to SVN location(s). This backup can be used to restore `cust_ref_data` in case of error scenario(s) after import all.

If there is any kind of error during import all, then CPS stops the process, sets the system in BAD state and blocks CRD APIs execution. CPS also sends error response to the client stating that the system is in BAD state. If system is in BAD state and user restarts QNS/UDC server then CRD cache is built by using golden-crd data. If system BAD state is FALSE, then CRD cache is built using MongoDB.

This enhancement alerts the user about the system state and if the system state is in BAD state, then user has to restore `cust_ref_data` with old and working CRD by using import all API.

Default repository location for golden-crd is: `http://<IP | Hostname>/repos/golden-crd`.

where, <*IP* | *Hostname*> is the IP addresses or hostnames for all the SVN destinations while executing export all proxy API to push existing and working CRD data into SVN.

To know the CRD version from golden-crd's metadata, execute the following command:

```
$ svn cat http://<IP | hostname>/repos/golden-crd/.metadata
```

#### HTTP Operation Type

GET

#### Endpoint URL

https://<lbvip01>:8443/custrefdata/_export?goldenCrdHost=<comma separated SVN_HOST>

### Example Payload

### Response

Success response of API contains the following:

```
Response message: Golden CRD exported successfully

Response Code: 200
```

Failure Response Message:

If Credentials are not correct, the error response is *{"error": "401 Unauthorized"}* and response code is *"401"*.

In case of exceptions, response message is sent to client withresponse code as *"500"*.

## Import API

### Purpose

Imports CRD table and its data.

It takes an archived file as an input which contains one or more csv files containing CRD tables information.

**Note** If you try to import multiple CRD tables during traffic it may have call flow impact. It is recommended to import multiple CRD tables during Maintenance Window (MW).

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_import

https://<master or control ip>:8443/custrefdata/_import

https://<lbvip01>:8443/custrefdata/_import?batchOperation=true

https://<lbvip01>:8443/custrefdata/_import?batchOperation=false&duplicateValidation=true

**Note**

1. The "batchOperation" flag is used to insert CRD data in the batch. The default value is true and if you do not provide it in the request parameter the default value is taken.
2. The "duplicateValidation" flag is used to validate or invalidate duplicate data in the archive. The default value is true and if you do not provide it in the request parameter the default value is taken which means it will always validate your data as duplicate.
3. If "batchOperation" is true, the API will validate your data as duplicate data regardless of the value provided for "duplicateValidation".

**Note** Import API supports SVN CRD table operations in the following scenarios:

- If the archive contains only mongodb tables, success message is displayed in the response.
- If the archive contains only SVN tables, success and warning messages are displayed in the response.
- If the archive contains both mongodb and SVN tables, success and warning messages are displayed in the response.

# Import Single File API

### Purpose

Imports bulk CRD data by sending any supported file in the API request.

Supports only CSV and XLS file formats.

**Note** If you try to import single CRD table during traffic it may have call flow impact. It is recommended to import single CRD table during Maintenance Window (MW).

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_importsinglefile

**Note**

1. Error responses are thrown in the following scenarios:
   - When the attached file is of a different format other than CSV and XLS.
   - When an empty file is attached.
   - When the attached file has wrong headers.
   - When the attached file does not have the same file as that of the Policy Builder table name.
   - When the attached file has duplicate records.
   - When no file is attached.
2. Ensure your .xls file does not contain any extra empty and colored header. If the .xls file contains any colored and empty header (header with color but no title), it is considered as a part of the Policy Builder table column. During import file operation, this type of header causes the API to send `Mismatch found between imported csv headers and policy builder table columns` error in response. This is because the empty header is considered as a column from Policy Builder but the Policy Builder table does not contain this empty column.
3. Import Single File API does not support import of SVN CRD table data and displays the following error message:

   **Single file import is not allowed for subversion table**

## Snapshot POST API

### Purpose

Creates a snapshot of the CRD tables on the system. The created snapshot will contain CRD table data, policy configuration and checksum information for all CRD tables.

### /custrefdata/_snapshot?userId=<user_id>&userComments=<user_comments>

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_snapshot?userId=<user_id>&userComments=<user_comments>

https://<master or control ip>:8443/custrefdata/_snapshot?userId=<user_id>&userComments=<user_comments>

### Optional Parameters

userComments

**Note** Snapshot POST API does not support export of the contents of Svn CRD tables. The API returns the following warning message if there are any Svn CRD tables present while creating snapshot:

**Datasource for tables [table_1, table_2…] is subversion. Data for these tables will not come from database (mongodb)**

# Snapshot GET API

### Purpose

Enables you to get the list of all valid snapshots in the system.

The following information is available in the list of snapshots:

- Snapshot name
- Snapshot path
- Date and time of snapshot creation
- User comments provided on creation of the snapshot
- Checksum information of CRD tables
- Policy configuration SVN version number

### /custrefdata/_snapshot

### HTTP Operation Type

GET

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_snapshot

https://<master or control ip>:8443/custrefdata/_snapshot

### Example Response

```
<snapshots>
    <snapshot>
        <name><date-and-time>_<user-id></name>
        <snapshotPath>/var/broadhop/snapshot/20160620011825306_qns</snapshotPath>
        <creationDateAndTime>20/06/2016 01:18:25:306</creationDateAndTime>
        <comments>snapshot-1 june</comments>
        <policyVersion>903</policyVersion>
        <checksum checksum="60f51dfd4cd4554910da44a776c66db1">
            <table name=<table-name-1> checksum="<table-checksum-1>"/>
                …
            <table name=<table-name-n> checksum="<table-checksum-n>"/>
        </checksum>
    </snapshot>
    <snapshot>
                …
```

```
    </snapshot>
</snapshots>
```

**Note** Snapshot GET API does not return checksum information of Svn CRD tables as they are not part of created snapshots.

## Revert API

### Purpose

Enables you to revert the CRD data to a specific snapshot. If the specific snapshot name is not provided, the API will revert to the latest snapshot.

### /custrefdata/_revert?snapshotName=<snapshot_name>

### HTTP Operation Type

POST

### Example Endpoint URL

https://<lbvip01>:8443/custrefdata/_revert?snapshotName=<snapshot_name>

https://<master or control ip>:8443/custrefdata/_revert?snapshotName=<snapshot_name>

### Optional Parameter

snapshotName

**Note** Revert API does not support reverting of CRD data for Svn CRD tables. For Svn CRD table, it clears the mongodb table and displays the following warning message:

**Datasource for tables [table_1, table_2…] is subversion. Data for these tables will be reverted using svn datasource not from database (mongodb)**

## Tips for Usage

The Query API is a GET operation which is the default operation that occurs when entering a URL into a typical web browser.

The POST operations, Create, Update, and Delete, require the use of a REST client so that the payload and content type can be specified in addition to the URL. REST clients are available for most web browsers as plug-ins or as part of web service tools, such as SoapUI. The content type when using these clients should be specified as application/xml or the equivalent in the chosen tool.

## View Logs

You can view the API logs in the OAM (pcrfclient) VM at the following location:

`/var/log/broadhop/consolidated-qns.log`

You can view the API logs with the following commands:

- monitor log application – tail the current application log
- monitor log engine – tail the current engine log
- monitor log container – tail a specific container log
- show log application - view the current application log
- show log engine – view the current engine log

# Policy Builder Publish and CRD Import/Export Automation

Steps for Policy Builder CRD Publish using API:

**PB Import to configuration repository** > **GET Repository ID (configuration)** > **Reload Repository (configuration)** > **PB Publish to run repository (Using configuration repository ID)** > **Golden CRD Import** > **CRD Import**

### SVN Export

**Syntax:**

```
curl -v -S -k -u <username>:<password> -H Content-Type:application/octet-stream -X
GET http://<server-ip>:<port>/api/repository/actions/export?exportUrl=<svn-url>
-o <cps-extension-file-name>
```

**Example:**

```
curl -v -S -k -u qns-svn:cisco123 -H Content-Type:application/octet-stream -X
GET http://pcrfclient01:7070/api/repository/actions/export?exportUrl=
http://lbvip02/repos/run/ -o WorkingPB_Backup_run.zip
```

### CRD Export

**Syntax:**

```
curl -v http://lbvip02:8080/custrefdata/_export -o <cps-extension-file-name>
```

**Example:**

```
curl -v http://lbvip02:8080/custrefdata/_export -o WorkingCRD_Backup.zip
```

### SVN Import

**Syntax:**

```
curl -s -S -k -u <username>:<password> -H Content-Type:application/octet-stream
-data-binary @<cps-extension-file-name> -X POST http://<server-ip>:<port>
/api/repository/actions/import?importUrl=<svn-url>&commitMessage=<message>
```

**Example:**

```
curl -s -S -k -u qns-svn:cisco123 -H Content-Type:application/octet-stream --trace-ascii
/tmp/dump.txt --data-binary @WorkingPB_Backup_run.zip -X POST
http://pcrfclient01:7070/api/repository/actions/import?importUrl=
http://pcrfclient01/repos/configuration&commitMessage=Importing
```

### Create Repositories API

**Syntax:**

```
curl -v -X POST --progress-bar -H "Content-Type:application/json" --insecure -u
<username>:<password> --data '{"localDirectory":"/var/broadhop/pb/workspace/tmp-<reponame>/","
name":"<reponame>","url":"<svn-url>"}'
"http://lbvip02:7070/api/repository/repositories"
```

**Example:**

```
curl -v -X POST --progress-bar -H "Content-Type:application/json" --insecure -u
qns-svn:cisco123 --data '{"localDirectory":"/var/broadhop/pb/workspace/tmp-test/",
"name":"test","url":"http://lbvip02/repos/test/"}'
"http://lbvip02:7070/api/repository/repositories"
```

### GET Repositories API

**Syntax:**

```
curl -X GET --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
<username>:<password> "http://pcrfclient01:7070/api/repository/repositories"
```

**Example:**

```
curl -X GET --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
qns-svn:cisco123 "http://pcrfclient01:7070/api/repository/repositories"
```

### Repositiry Reload API

**Syntax:**

```
curl -v -X PUT --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
<username>:<password> "http://pcrfclient01:7070/api/repository/actions/reload?repository=
<repository_id>"
```

**Example:**

```
curl -v -X PUT --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
qns-svn:cisco123 "http://pcrfclient01:7070/api/repository/actions/reload?repository=
233bfc09-131e-408a-bdfe-46b70cd72475-49115"
```

### PB Publish API

**Syntax:**

```
curl -v -X PUT --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
<username>:<password> "http://pcrfclient01:7070/api/repository/actions/publish?publishUrl=
http://lbvip02/repos/run&commitMessage=publishing&repository=<repository_ID>"
```

**Example:**

```
curl -v -X PUT --progress-bar -H "Content-Type:application/octet-stream" --insecure -u
qns-svn:cisco123 "http://pcrfclient01:7070/api/repository/actions/publish?publishUrl=
http://pcrfclient01/repos/run&commitMessage=publishing&repository=
233bfc09-131e-408a-bdfe-46b70cd72475-49115"
```

### Golden CRD Export API

**Syntax:**

```
curl -s -S -k -u <username>:<password> -H Content-Type:application/json -X
GET https://<PB IP>/proxy/custrefdata/_export?goldenCrdHost=lbvip02
```

**Example:**

```
curl -s -S -k -u qns-svn:cisco123 -H Content-Type:application/json -X
GET https://lbvip01/proxy/custrefdata/_export?goldenCrdHost=lbvip02
```

### CRD Import API

**Syntax:**

```
curl -v -S -k -H Content-Type:application/octet-stream --data-binary
@<name-for-exported-file> -X POST http://lbvip02:8080/custrefdata/
_import?batchOperation=true
```

**Example:**

```
curl -v -S -k -H Content-Type:application/octet-stream --data-binary
@WorkingCRD_Backup.zip -X POST http://lbvip02:8080/custrefdata/
_import?batchOperation=true
```

# Remove Traces of Old Policy Director (LB) VIPs

To remove old lbvips which are not needed, perform the following steps:

### Before you begin

Take a backup of the following two files for future reference.

`/var/qps/config/deploy/csv/VLANs.csv`

`/var/qps/config/deploy/csv/AdditionalHosts.csv`

**Step 1** From Cluster Manager:

a) Remove the entries for the lbvips which are not required from `VLANs.csv` and `AdditionalHosts.csv` file.

- Sample `VLANs.csv` entry to be removed.

  ```
  Gy,VM Network,255.255.255.0,NA,lbvip05,,eth3
  ```
- Sample `AdditionalHosts.csv` entry to be removed.

  ```
  lbvip05,lbvip05,123.45.67.89
  ```

b) Execute the following commands to import the updated files to all the VMs:

```
/var/qps/install/current/scripts/import/import_deploy.sh
/var/qps/install/current/scripts/build_all.sh
/var/qps/install/current/scripts/upgrade/reinit.sh
```

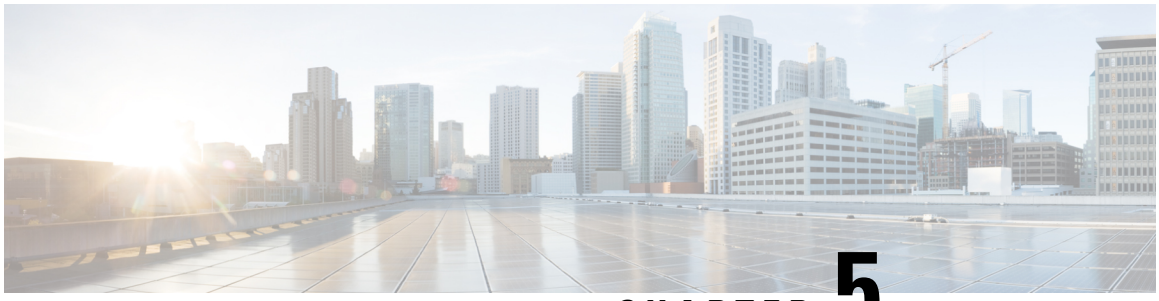
**Step 2** From Policy Director (LB):

a) Execute the following command to delete th extra VIP:

```
pcs resource delete RESOURCE_ID
```

where, is the *RESOURCE_ID* of the lbvip which you want to remove.

Example: `pcs resource delete lbvip05`



CHAPTER 5

# Tracking CPS GUI and API Usage

- Track Usage, on page 99

# Track Usage

Use the Audit History to track usage of the various GUIs and APIs.

If enabled, each request is submitted to the Audit History database for historical and security purposes. The user who made the request, the entire contents of the request and if it is subscriber-related (a network ID value), all network IDs are also stored in a searchable field.

## Capped Collection

By default, the Audit History uses a 1 GB capped collection in MongoDB. The capped collection automatically removes documents when the size restriction threshold is hit. The oldest document is removed as each new document is added. For customers who want more than 1 GB of audit data, contact the assigned Cisco Advanced Services Engineer to get more information.

Configuration in Policy Builder is done in GB increments. It is possible to enter decimals, for example, 9.5 will set the capped collection to 9.5 GB.

## PurgeAuditHistoryRequests

When using a capped collection, MongoDB places a restriction on the database and does not allow the deletion of data from the collection. Therefore, the entire collection must be dropped and re-created. This means that the PurgeAuditHistory queries have no impact on capped collections.

## AuditRequests

As a consequence of the XSS defense changes to the API standard operation, any XML data sent in an AuditRequest must be properly escaped even if inside CDATA tags.

For example, <ExampleRequest>...</ExampleRequest>

For more information on AuditType, refer to Cisco Policy Suite Unified API 2.3.0 Guide.

# Operation

By default, Audit History is ON but it can be turned OFF.

- `ua.client.submit.audit=true` — property used by Policy Builder and set in /etc/broadhop/pb/pb.conf
- `Submit Requests to Audit Log` — Unified API plug-in configuration in Policy Builder.

# Initial Setup

There are three parts to the Audit History:

- Server — database and Unified API
- Policy Builder
- Audit Client — bundle that the Policy Builder uses to send Audit requests

**Step 1** Start the Policy Builder with the following property:

`-Dua.client.submit.audit=false` (set in `/etc/broadhop/pb/pb.conf`)

**Step 2** Add and configure the appropriate plug-in configurations for Audit History and Unified API.

**Step 3** Publish the Policy Builder configuration.

**Step 4** Start the CPS servers.

**Step 5** Restart the Policy Builder with the following property:

```
-Dua.client.submit.audit=true
```

```
-Dua.client.server.url=https://lbvip02:8443/ua/soap
```

or

```
-Dua.client.server.url=http://lbvip02:8080/ua/soap
```

# Read Requests

The Audit History does not log read requests by default.

- GetRefDataBalance
- GetRefDataServices
- GetSubscriber
- GetSubscriberCount
- QueryAuditHistory
- QueryBalance
- QuerySession

- QueryVoucher
- SearchSubscribers

The Unified API also has a Policy Builder configuration option to log read requests which is set to false by default.

# APIs

All APIs are automatically logged into the Audit Logging History database, except for QueryAuditHistory and KeepAlive. All Unified API requests have an added Audit element that should be populated to provide proper audit history.

# Querying

The query is very flexible - it uses regex automatically for the id and dataid, and only one of the following are required: id, dataid, or request. The dataid element typically will be the networkId (Credential) value of a subscriber.

**Note** Disable Regex. The use of regular expressions for queries can be turned off in the Policy Builder configuration.

The id element is the person or application who made the API request. For example, if a CSR log into Control Center and queries a subscriber balance, the id will be that CSR's username.

The dataid element is typically the subscriber's username. For example, if a CSR log into Control Center and queries a subscriber, the id will be that of CSR's username, and the dataid will be the subscriber's credential (networkId value). For queries, the dataid value is checked for spaces and then tokenized and each word is used as a search parameter. For example, “networkId1 networkId2” is interpreted as two values to check.

The fromDate represents the date in the past from which to start the purge or query. If the date is null, the api starts at the oldest entry in the history.

The toDate represents the date in the past to which the purge or query of data includes. If the date is null, the api includes the most recent entry in the purge or query.

# Purging

By default, the Audit History database is capped at 1 GB. Mongo provides a mechanism to do this and then the oldest data is purged as new data is added to the repository. There is also a PurgeAuditHistory request which can purge data from the repository. It uses the same search parameters as the QueryAuditHistory and therefore is very flexible in how much or how little data is matched for the purge.

**Note** Regex Queries! Be very careful when purging records from the Audit History database. If a value is given for dataid, the server uses regex to match on the dataid value and therefore will match many more records than expected. Use the QueryAuditHistory API to test the query.

# Purge History

Each purge request is logged after the purge operation completes. This ensures that if the entire repo is destroyed, the purge action that destroyed the repo will be logged.

# Control Center

The Control Center version 2.0 automatically logs all requests.

# PurgeAuditHistoryRequest

This API purges the Audit History.

The query is very flexible - it uses regex automatically for the id and dataid, and only one of the following are required: id, dataid, or request. The dataid element typically will be the networkId (Credential) value of a subscriber.

The id element is the person or application who made the API request. For example, if a CSR logs into Control Center and queries a subscriber balance, the id will be that CSR's username.

The dataid element is typically the subscriber's username. For example, if a CSR logs into Control Center and queries a subscriber, the id will be that CSR's username, and the dataid will be the subscriber's credential (networkId value). For queries, the dataid value is checked for spaces and then tokenized and each word is used as a search parameter. For example, “networkId1 networkId2” is interpreted as two values to check.

The fromDate represents the date in the past from which to start the purge or query. If the date is null, the api starts at the oldest entry in the history.

The toDate represents the date in the past to which the purge or query of data includes. If the date is null, the api includes the most recent entry in the purge or query.

**Note** Size-Capped Database

If the database is capped by size, then the purge request ignores the request key values and drops the entire database due to restrictions of the database software.

Schema

```
<PurgeAuditHistoryRequest>
<key> AuditKeyType </key> [1]
</PurgeAuditHistoryRequest>
```

Example

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <PurgeAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>username</id>
        <dataid>subscriber</dataid>
        <request>API Name</request>
        <fromDate>2011-01-01T00:00:00Z</fromDate>
        <toDate>2011-01-01T00:00:00Z</toDate>
      </key>
    </PurgeAuditHistoryRequest>
```

```
  </se:Body>
</se:Envelope>
```

To purge all CreateSubscriberRequest:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <PurgeAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <request>CreateSubscriberRequest</request>
      </key>
    </PurgeAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

To purge all CreateSubscriberRequest by CSR:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <PurgeAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>csrusername</id>
        <request>CreateSubscriberRequest</request>
      </key>
    </PurgeAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

To purge all actions by CSR for a given subscriber for a date range:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <PurgeAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>csrusername</id>
        <dataid>subscriber@gmail.com</dataid>
        <fromDate>2010-01-01T00:00:00Z</fromDate>
        <toDate>2012-11-01T00:00:00Z</toDate>
      </key>
    </PurgeAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

# QueryAuditHistoryRequest

This API queries the Audit History.

The query is very flexible - it uses regex automatically for the id and dataid, and only one of the following are required: id, dataid, or request. The dataid element typically will be the networkId (Credential) value of a subscriber.

The id element is the person or application who made the API request. For example, if a CSR logs into Control Center and queries a subscriber balance, the id will be that CSR's username.

The dataid element is typically the subscriber's username. For example, if a CSR logs into Control Center and queries a subscriber, the id will be that CSR's username, and the dataid will be the subscriber's credential (networkId value). For queries, the dataid value is checked for spaces and then tokenized and each word is used as a search parameter. For example, "networkId1 networkId2" is interpreted as two values to check.

The fromDate represents the date in the past from which to start the purge or query. If the date is null, the api starts at the oldest entry in the history.

The toDate represents the date in the past to which the purge or query of data includes. If the date is null, the api includes the most recent entry in the purge or query.

Schema:

```
<QueryAuditHistoryRequest>
<key> AuditKeyType </key> [1]
</QueryAuditHistoryRequest>
```

Example:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <QueryAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>username</id>
        <dataid>subscriber</dataid>
        <request>API Name</request>
        <fromDate>2011-01-01T00:00:00Z</fromDate>
        <toDate>2011-01-01T00:00:00Z</toDate>
      </key>
    </QueryAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

To find all CreateSubscriberRequest:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <QueryAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <request>CreateSubscriberRequest</request>
      </key>
    </QueryAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

To find all CreateSubscriberRequest by CSR:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <QueryAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>csrusername</id>
        <request>CreateSubscriberRequest</request>
      </key>
    </QueryAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

To find all actions by CSR for a given subscriber for a date range:

```
<se:Envelope xmlns:se="http://schemas.xmlsoap.org/soap/envelope/">
  <se:Body>
    <QueryAuditHistoryRequest xmlns="http://broadhop.com/unifiedapi/soap/types">
      <key>
        <id>csrusername</id>
        <dataid>subscriber@gmail.com</dataid>
        <fromDate>2010-01-01T00:00:00Z</fromDate>
```

```
        <toDate>2012-11-01T00:00:00Z</toDate>
      </key>
    </QueryAuditHistoryRequest>
  </se:Body>
</se:Envelope>
```

# Policy Builder

The Policy Builder automatically logs all save operations (Publish and Save to Client) to the Audit History database and also to a log file.

- Policy Builder Publish submits an entry to the Audit Logging Server (goes to database).
- Policy Builder Save to Client Repository submits an entry to the Audit Logging Server (goes to database).
- Whenever a screen is saved locally (Save button) XML is generated and logged for that user in `/var/log/broadhop/qns-pb.log`.

Example log in `qns-pb.log` from Local Save in Policy Builder:

```
2013-02-06 11:57:01,214 [UIThread [vt75cjqhk7v4noguyc9c7shp]] DEBUG
c.b.c.r.BroadhopResourceSetAudit -
Audit: Local file change made by: broadhop. Updated File:
file:/var/broadhop/pb/workspace/tmp-ITC2/checkout/ConfiguredExtensionPoint-43730cd7-b238-4b29-a828-d9b4
47e5a64f-33851.xmi
```

XML Representation of changed screen:

```
<?xml version="1.0" encoding="UTF-8"?>
<policy:ConfiguredExtensionPoint xmlns:policy="http://broadhop.com/policy"
id="43730cd7-b238-4b29-a828-d9b447e5a64f-33851">
  <extensionPoint
    href="virtual:URI#_vxG4swK1Ed-M48DL9vicxQ"/>
  <policies
    href="Policy-default-_sY__4L_REeGCdakzuzzlAg.xmi#_sY__4L_REeGCdakzuzzlAg"/>
</policy:ConfiguredExtensionPoint>
```

Controlling Local Save output:

In the logback.xml file that controls Policy Builder logging, add `com.broadhop.client.resourceset.BroadhopResourceSetAudit` as a category and set it to the desired level.

# Reporting

For reporting purposes the following is the database structure in Mongo:

```
{
  "_id" :
  ObjectId("5097d75be4b0d5f7ab0d90fe"),
  "_id_key" :
  "username",
  "comment_key" :
  "comment",
"data_id_key" : [
  "networkId11921" ],
"timestamp_key" :
  ISODate("2012-11-05T15:12:27.673Z"),
  "request_key" :
  "DeleteQuotaRequest",
```

```
  "data_key" :
"<DeleteQuotaRequest><audit><id>username</id></audit><networkId><![CDATA
[networkId11921]]></networkId><balanceCode>DATA</balanceCode><code>Recurring</code>
<hardDelete>false</hardDelete></DeleteQuotaRequest>
"}
```

The following table describes the various Reporting Keys.

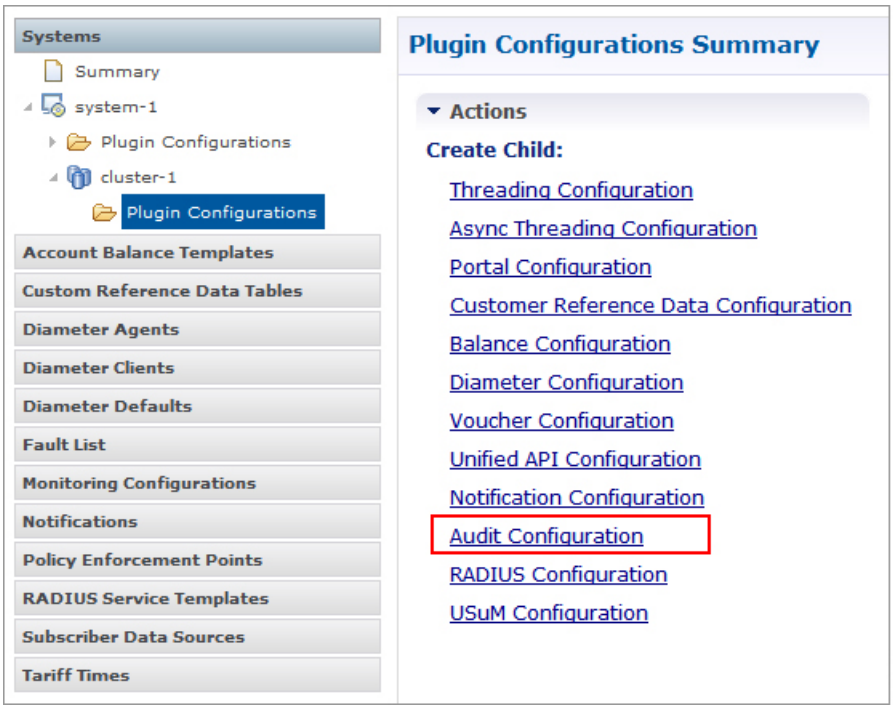
***Table 11: Reporting Keys***

| Field | Description |
|---|---|
| _id | The database unique identifier. |
| _id_key | the username of person who performed the action. In the above example the CSR who issued the debit request. |
| comment_key | Some description of the audit action. |
| data_id_key | The credential of the subscriber. It is a list and so, if the subscriber has multiple credentials, then they will all appear in this list. Please note that, it is derived from the request data and so, for a CreateSubscriber request, there may be multiple credentials sent in the request and each will be saved in the data_id_key list. In the DebitRequest case, only one credential is listed because the request only has the single networkId field. |
| timestamp_key | The time the request was logged. If the timestamp value is null in the request then the Audit module automatically populates this value. |
| request_key | The name of the request. This provides a way to search on type of API request. |
| data_key | The actual request XML. |

# Audit Configuration

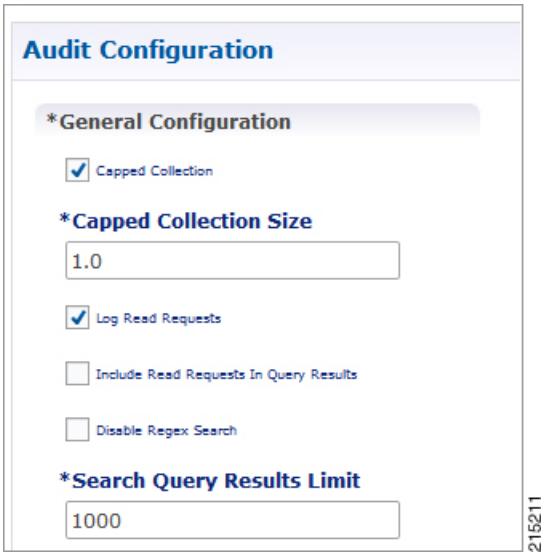
**Step 1** Click the **Reference Data** tab, and then click **Systems** > ***system name*** > **Plugin Configurations**.

*Figure 12: Plugin Configurations Summary*



**Step 2** Click **Audit Configuration** in the right pane to open the **Audit Configuration** dialog box.

*Figure 13: Audit Configuration dialog box*



**Step 3** Under **Audit Configuration** there are different panes: **General Configuration**, **Queue Submission Configuration**, **Database Configuration**, and **Shard Configuration**. An example configuration is provided in the following figures:

*Figure 14: Queue Submission Configuration pane*

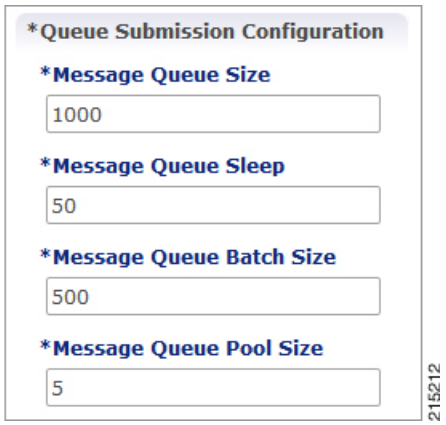


*Figure 15: Database Configuration pane*

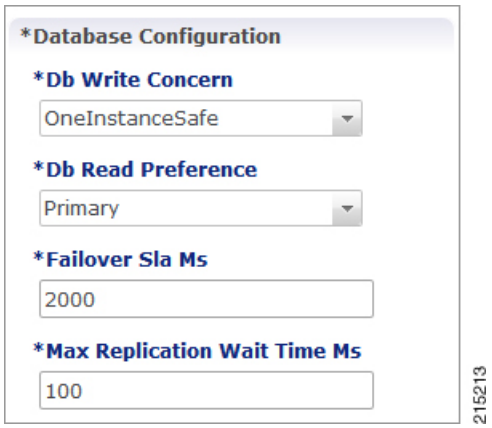

*Figure 16: Shard Configuration pane*

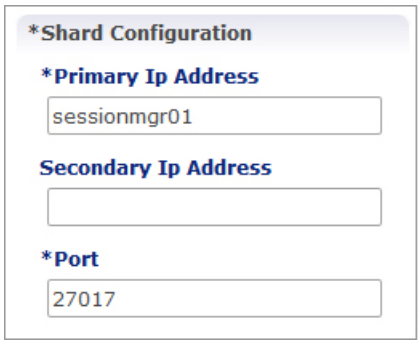

The following parameters are used to size and manage the internal queue that aids in the processing of Audit messages. The application offloads message processing to a queue to speed up the response time from the API.

*Table 12: Audit Configuration Parameters*

| Parameter | Description |
|---|---|
| **General Configuration** | |
| Capped Collection | Select this check-box to activate capped collection function. |
| Capped Collection Size | By default, the Audit History uses a 1 GB capped collection in MongoDB. The capped collection automatically removes documents when the size restriction threshold is hit.<br>Configuration in Policy Builder is done in GB increments. It is possible to enter decimals, for example, 9.5 will set the capped collection to 9.5 GB. |
| Log Read Requests | Select this check-box if you want read requests to be logged. |
| Include Read Requests in Query Results | Select this check-box only if you want to include read requests to be displayed in query results. |
| Disable Regex Search | If you select this check-box, the use of regular expressions for queries is turned off in the Policy Builder configuration. |
| Search Query Results Limit | This parameter limits the search results. |
| Queue Submission Configuration | |
| Message Queue Size | Total number of messages the queue can hold at any given time. |
| Message Queue Sleep | The amount of time for the runnable to sleep between batch processing. The time is in milliseconds. |
| Message Queue Batch Size | The number of messages to process in a given wake cycle. |
| Message Queue Pool Size | The number of threads in the execution pool to handle message processing. |
| **Database Configuration** | |
| Db Write Concern | Controls the write behavior of sessionMgr and for what errors exceptions are raised. Default option is OneInstanceSafe. |
| Db Read Preference | Read preference describes how sessionMgr clients route read operations to members of a replica set. The recommended option is typically Secondary Preferred.<br>http://docs.mongodb.org/manual/core/read-preference/ |
| Failover Sla Ms | This parameter is used to enter the amount of time to wait before starting failover database handling. The time is in milliseconds. |

| Parameter | Description |
|---|---|
| Max Replication Wait time Ms | This option specifies a time limit, in milliseconds, for the write concern. This parameter is applicable only if you select TwoInstanceSafe in Db Write Concern.<br>This parameter causes write operations to return with an error after the specified limit, even if the required write concern eventually succeeds. When these write operations return, MongoDB does not undo successful data modifications performed before the write concern exceeded the replication wait time limit. This time is in milliseconds. |
| **Shard Configuration** | |
| Primary Ip Address | The IP address of the sessionmgr node hosting the Audit database. |
| Secondary Ip Address | The IP address of the sessionmgr node that provides fail over support for the primary database.<br>This is the mirror of the database specified in the Primary IP Address field. Use this only for replication or replica pairs architecture.<br>This field is present but deprecated to maintain backward compatibility. |
| Port | Enter the Port number of the Audit database as defined in /etc/broadhop/mongoConfig.cfg.<br>The default value in Policy Builder is 27017.<br>For All-In-One deployments, the default Audit database port number is configured as 27017 (no update is needed to this field).<br>For HA or GR deployments, the default Audit database port is 27725. You must update this field to match the Audit database port (27725) or as defined in /etc/broadhop/mongoConfig.cfg. |

According to your network requirements, configure the parameters in Audit Configuration and save the configuration.

# Pre-configured auditd

In the `/usr/share/doc/audit-version/` directory, the audit package provides a set of pre-configured rules files.

The Linux Audit system provides a way to track security-relevant information on your system. Based on pre-configured rules, Audit generates log entries to record as much information about the events that are happening on your system as possible.

In the `/usr/share/doc/audit-version/` directory, the audit package provides a set of pre-configured rules files.

To use these pre-configured rule files, create a backup of your original `/etc/audit/audit.rules` file and copy the configuration file of your choice over the `/etc/audit/audit.rules` file:

```
cp /etc/audit/audit.rules /etc/audit/audit.rules_backup
cp /usr/share/doc/audit-version/stig.rules /etc/audit/audit.rules
```

For more information on auditd process, refer to the link.

- Session Consumption Report , on page 145
- Resync Member of a Replica Set, on page 147

## Overview

CPS system and application statistics and Key Performance Indicators (KPI) are collected by the system and can be displayed using a browser-based graphical metrics tool. This chapter provides a high-level overview of the tools CPS uses to collect and display these statistics.

The list of statistics available in CPS is consolidated in an Excel spreadsheet. After CPS is installed, this spreadsheet can be found in the following location on the Cluster Manager VM:

```
/var/qps/install/current/scripts/documents/QPS_statistics.xlsx
```

## Prometheus

Prometheus is an application which is a part of monitoring solution in CPS. It is used to actively gather statistics from the running virtual machines and application services.

Prometheus application resides on both pcrfclient VMs. It scrapes statistics from collectd exporter after every configured interval and stores in `/var/data/Prometheus` directory on pcrfclient VMs.

To learn more about Prometheus, refer to: https://prometheus.io/docs/introduction/overview/.

# Enable Prometheus

This following sections provides information on how to enable Prometheus on CPS system.

- By default, Prometheus is disabled on system. You need to configure Prometheus to start its operation.
- You can configure Prometheus using CSV based configurations or API based configurations.
- By default, statistics granularity is set to 10 seconds. To change it, you need to configure statistics granularity. Support is present for both CSV/API based installations.

**Note** It is recommended to keep the default statistics granularity. If you want to change the value, contact your Cisco Technical representative.

- After enabling Prometheus, you must add Prometheus data source in Grafana.
- When Prometheus is enabled on the system, existing dashboards created with graphite will not work. You must use Prometheus queries to create new dashboard on the system.

## CSV Based Installation Configuration Parameters

*Table 13: CSV Based Installation Parameters*

| Parameter | Description |
|---|---|
| enable_prometheus | This parameter is used to enable/disable Prometheus in CPS.<br>Default: disabled<br>Possible Values: enabled, disabled |
| stats_granularity | This parameter is used to configure statistics granularity in seconds.<br>Default: 10 seconds<br>Possible Values: Positive Number |

For example, in case of CSV based installations, you can configure **Configuration.csv** with the following parameters to enable Prometheus on Cluster Manager:

```
cat /var/qps/config/deploy/csv/Configuration.csv | tail -5
db_authentication_admin_passwd,72261348A44594381D2E84ADDD1E6D9A,
db_authentication_passwd_encryption,true,
db_authentication_readonly_passwd,72261348A44594381D2E84ADDD1E6D9A,
enable_prometheus,enabled,
stats_granularity,10,
```

After configuring the parameters, run the following commands to import the new configuration to VMs:

```
/var/qps/install/current/scripts/import/import_deploy.sh
/var/qps/install/current/scripts/upgrade/reinit.sh
```

### API Based Installation Parameters

*Table 14: API Based Installation Parameters*

| Parameter | Description |
|---|---|
| enablePrometheus | This parameter is used to enable/disable Prometheus in CPS.<br>Default: disabled<br>Possible Values: enabled, disabled |
| statsGranularity | This parameter is used to configure statistics granularity in seconds.<br>Default: 10 seconds<br>Possible Values: Positive Number |

In case of API based installations, you need to use `api/system/config/config` PATCH API from Cluster Manager.

For example:

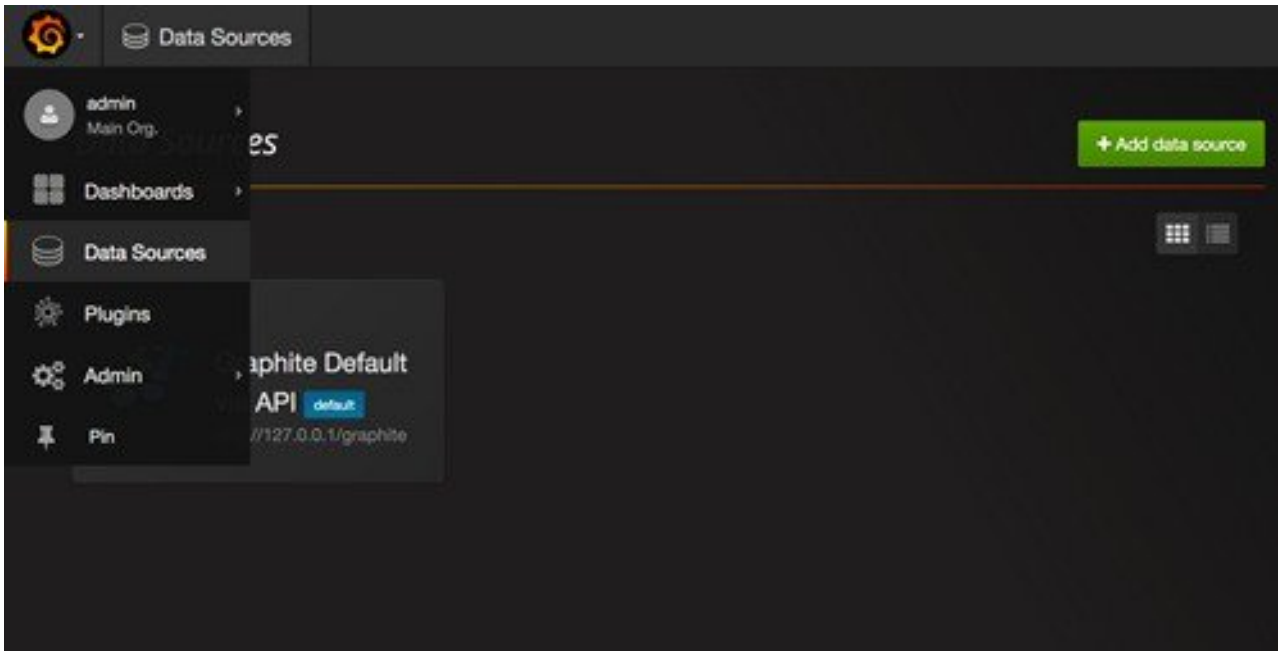
```
cat prom.yaml
 enablePrometheus: "enabled"
 statsGranularity: "10"
curl -i -X PATCH http://installer:8458/api/system/config/config -H "Content-Type:
application/yaml" --data-binary @prom.yaml
 HTTP/1.1 200 OK
  Date: Fri, 20 Apr 2018 08:38:20 GMT
  Content-Length: 0
```

## Add Datasource in Grafana for Prometheus

**Step 1** Login to Grafana with admin credentials.

**Step 2** Click on the Grafana logo to open the sidebar menu.

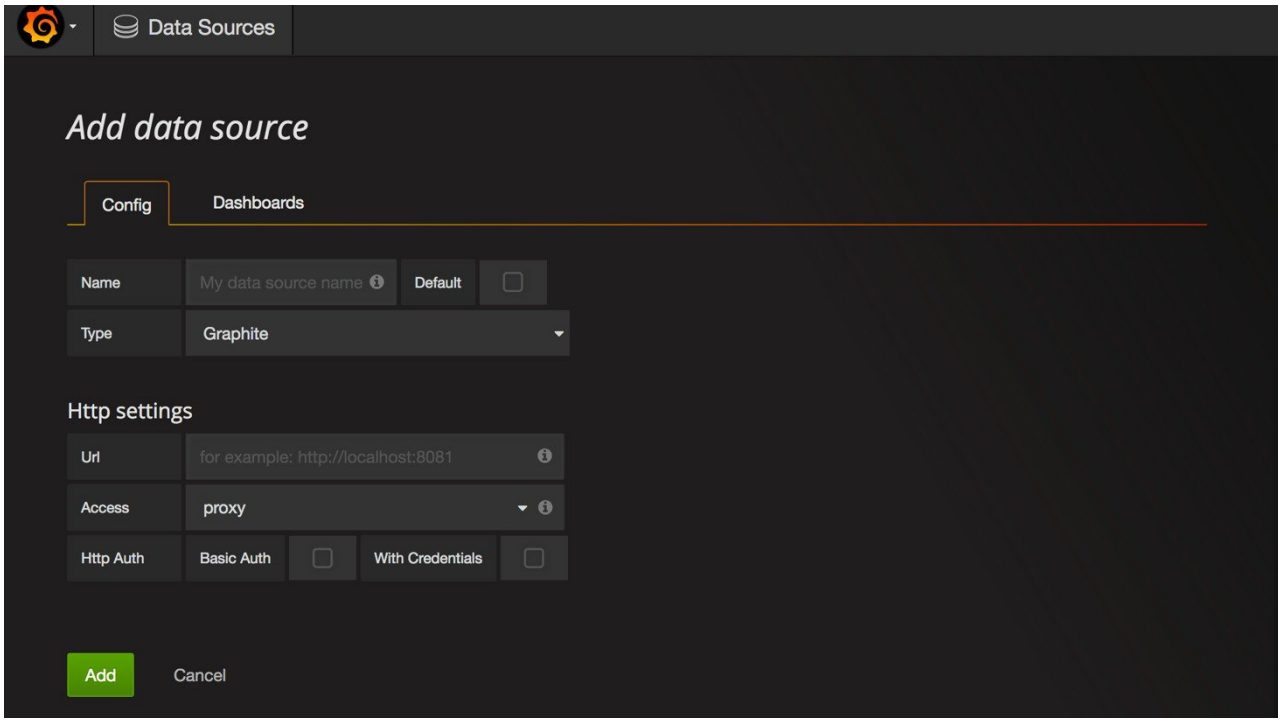
*Figure 17: Sidebar Menu*



**Step 3** Click on **Data Sources** in the sidebar.

**Step 4** Click on **Add data source**.

*Figure 18: Add data source*



**Step 5** From **Type** drop-down list, select **Prometheus**.

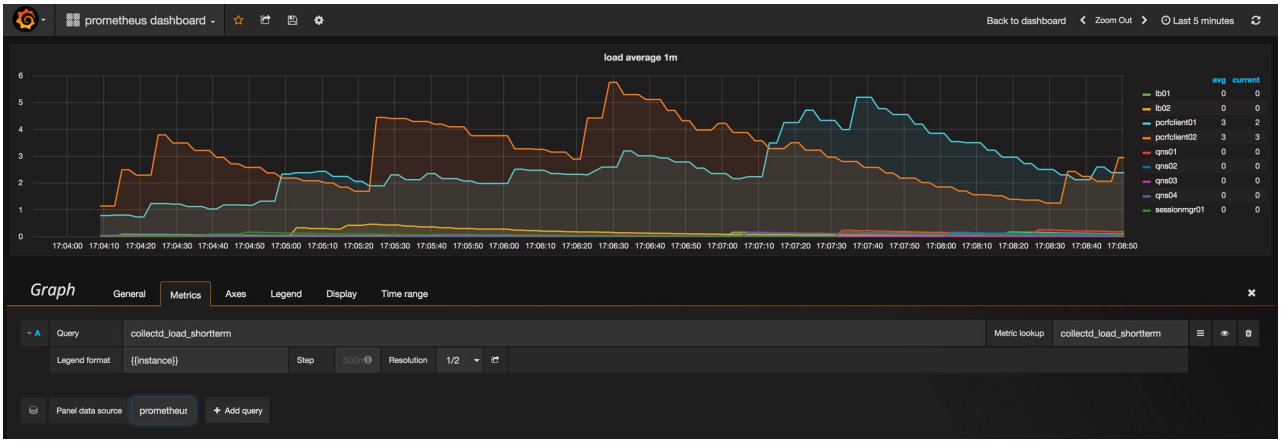
**Step 6** Set the appropriate Prometheus server URL (for example, http://localhost:9090/).

**Step 7** Click **Add** to save the new data source.

**Step 8** Create graph with Prometheus as a data source.

For example, sample graph which gives 1 min load average of VMs.

***Figure 19: Sample Graph***



**Note** Legend format: The legend format needs to be modified for the upgraded version of Grafana:

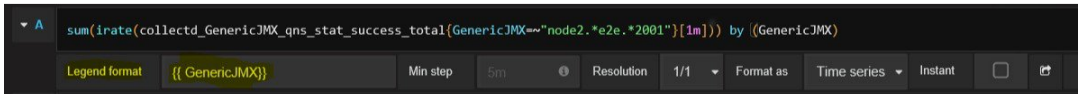
- `Replace {{ GenericJMX.replace('nodeX.messages.e2e_', 'nodeX-') }} with {{GenericJMX}}`

  where, node*X* is node1/node2/node3/node4.

  **Example:**

  From

  To

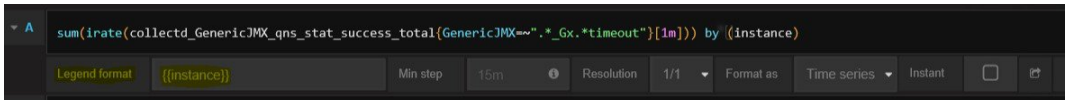


- `Replace {{instance.replace("instance=","")}} with {{instance}}`

  **Example:**

  From

  To

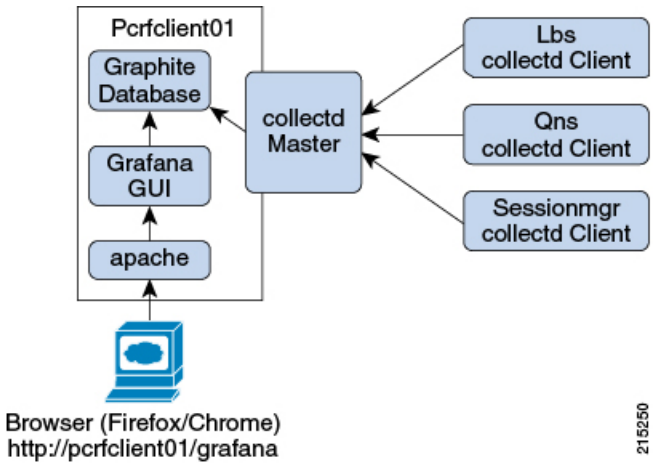


# Graphite

Collected clients running on all CPS Virtual Machines (such as Policy Server (QNS), Policy Director (LB), and sessionmgr) push data to the Collected master on the pcrfclient01. The Collected master node in turn forwards the collected data to the Graphite database on the pcrfclient01.

The Graphite database stores system-related statistics such as CPU usage, memory usage, and Ethernet interface statistics, as well as application message counters such as Gx, Gy, and Sp.

*Figure 20: Graphite*



Pcrfclient01 and pcrfclient02 collect and store these bulk statistics independently.

As a best practice, always use the bulk statistics collected from pcrfclient01. Pcrfclient02 can be used as a backup if pcrfclient01 fails.

In the event that pcrfclient01 becomes unavailable, statistics will still be gathered on pcrfclient02. Statistics data is not synchronized between pcrfclient01 and pcrfclient02, so a gap would exist in the collected statistics while pcrfclient01 is down.

**Note** It is normal to have slight differences between the data on pcrfclient01 and pcrfclient02. For example, pcrfclient01 generates a file at time *t* and pcrfclient02 generates a file at time t +/- clock drift between the two machines.

**Note** Based on the retention period configured in `/etc/carbon/storage-schemas.conf` in pcrfclient VMs, same time period graph may look different after some time.

Default retention period is 10s:1d,60s:60d (10 seconds data points for 1 day and 60 seconds data points for 60 days). As per the default retention, first day 6 data points are available for each minute and after that, those 6 data points are aggregated and only one data point is available for a minute in Graphite.

## Additional Graphite Documentation

To learn more about Graphite, refer to: http://graphite.readthedocs.org/en/latest/

For a list of all functions that can be used to transform, combine and perform computations on data stored in Graphite, refer to: http://graphite.readthedocs.org/en/latest/functions.html

# Grafana

Grafana is a third-party metrics dashboard and graph editor.

Grafana provides a graphical or text-based representation of statistics and counters collected in the Prometheus database. To use Prometheus in Grafana, refer to http://docs.grafana.org/features/datasources/prometheus/.

## Additional Grafana Documentation

This chapter provides information about the CPS implementation of Grafana. For more information about Grafana, or access the general Grafana documentation, refer to: http://docs.grafana.org.

# Configure Grafana Users using CLI

In CPS 7.0.5 and higher releases, users must be authenticated to access Grafana. No default users are provided. In order to access Grafana, you must add at least one user as described in the following sections.

The steps mentioned in the sections describe how to add and delete users who are allowed view-only access of Grafana. In order to create or modify dashboards, refer to Grafana Administrative User, on page 122.

After adding or deleting a Grafana user, manually copy the `/var/broadhop/.htpasswd` file from the pcrfclient01 VM to the pcrfclient02 VM.

Also, run `/var/qps/bin/support/grafana_sync.sh` to synchronize the information between two OAM (pcrfclient) VMs.

There is no method to change the password for a Grafana user; you can only add and delete users. The `change_passwd.sh` script cannot be used to change the password for Grafana users.

**Note** The `change_passwd.sh` script changes the password on all the VMs temporarily. You also need to generate an encrypted password. To generate encrypted password, refer to *System Password Encryption* in *CPS Installation Guide for VMware*. The encrypted password must be added in the `Configuration.csv` spreadsheet. To make the new password persisent, execute `import_deploy.sh`. If the encrypted password is not added in the spreadsheet and `import_deploy.sh` is not executed, then after running `reinit.sh` script, the qns-svn user takes the existing default password from `Configuration.csv` spreadsheet.

Log on to the pcrfclient01 VM to perform any of the following operations.

## Add User

Run the following command on Cluster Manager VM:

```
/usr/bin/htpasswd -s /var/www/html/htpasswd <username>
```

When prompted for a password, enter and reenter the password. This step updates htpasswd file and forces SHA encryption of the password.

After creating graphite/grafana user, CPS user needs to execute `/var/broadhop/sync_htpasswd.sh` on pcrfclient VMs or `reinit.sh` on Cluster Manager VM to synchronize created user with pcrfclient VMs.

**Note** Any Grafana user created using CLI on pcrfclient VM (using old method) gets overwritten after Puppet execution.

**Note** This user is for Grafana authentication, which you will see when you open Grafana URL https://<lbvip01>:443/grafana.

This user has nothing to do with Grafana administrative user **admin**. By default, Grafana user **admin** is reserved only for administrative activities.

**Note** This user can be used in Basic Authentication in Configuring Graphite User Credentials in Grafana, on page 130.

## Delete User

Run the following command to delete Graphite or Grafana user:

```
/usr/bin/htpasswd -D /var/www/html/htpasswd <username>
```

After deleting graphite/grafana user, CPS user needs to execute `/var/broadhop/sync_htpasswd.sh script` on pcrfclient VMs or `reinit.sh` on Cluster Manager VM to synchronize deleted user with pcrfclient VMs.

**Note** Any Grafana user created or deleted using CLI on pcrfclient VM (using old method) gets overwritten after Puppet execution.

# Connect to Grafana

Use the following URL to access Grafana.

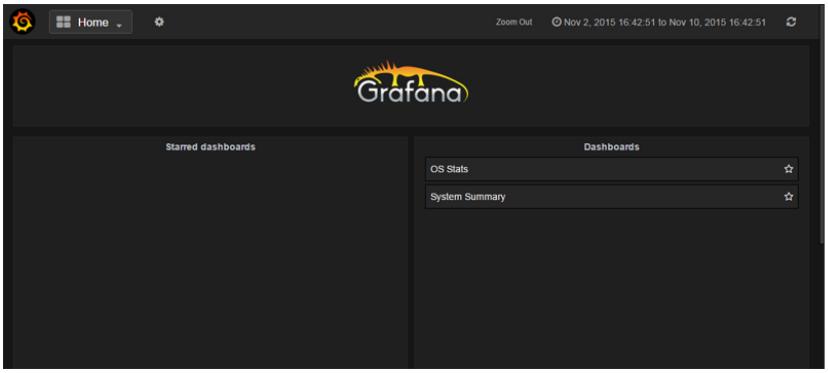
- HA: https://<*lbvip01*>:443/grafana

  Deprecated URL: https://<*lbvip01*>:9443/grafana

- All in One: http://<*ip*>:80/grafana

When prompted, enter the username and password of a user you created in Configure Grafana Users using CLI, on page 120.

*Figure 21: Grafana Home Screen*



# Grafana Administrative User

**Note**

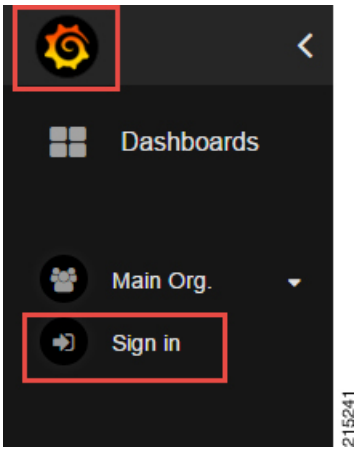
- Grafana administrative user **admin** is independent user stored in `grafana.db`. The admin user is used for administrative tasks such as:
  - Adding/updating data source for Graphite or Prometheus.
  - Adding another administrative user.
  - Change password of existing administrative users.
- You can add user using `htpasswd` utility that is used for authentication for logging into Grafana for normal use.Grafana administrative user has nothing to do with any user added using `htpasswd` utility.

## Log in as Grafana Admin User

To create or modify dashboards in Grafana, you must log in as the Grafana administrative user.

**Step 1** Click the Grafana logo in the upper left corner of your screen.

*Figure 22: Grafana Logo*



**Step 2** Click **Sign In**.

**Step 3** Enter the administrative username and password: `admin/admin`

# Change Grafana Admin User Credentials

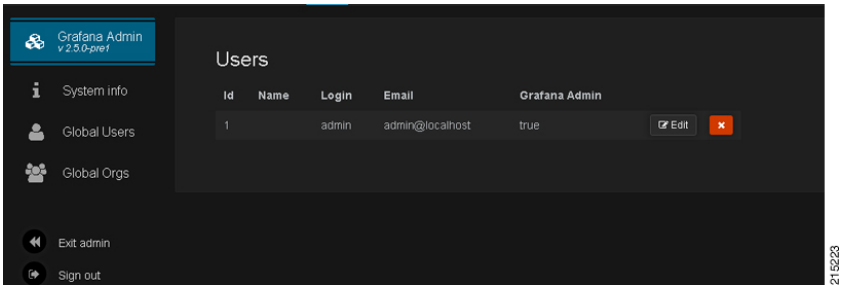
**Step 1** Log in as the administrative user (`admin/admin`).

**Step 2** Click the Grafana logo, then click **Grafana admin**.

**Step 3** Click **Global Users**.

**Step 4** Click **Edit**.

*Figure 23: Changing Grafana Admin User Credentials*



# Add a Grafana User

**Note** The steps mentioned here can be performed only by **administrative** user.

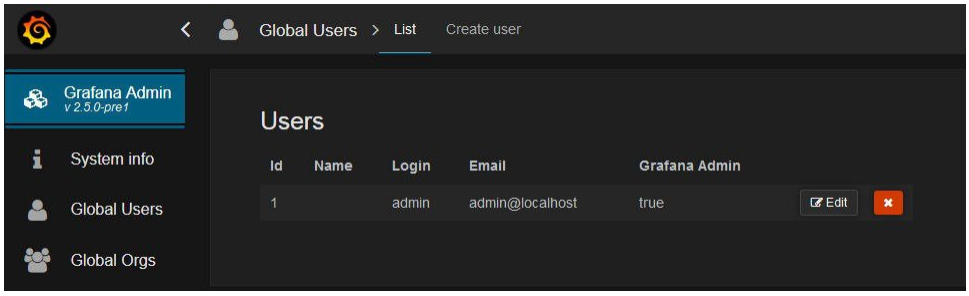
**Step 1** Click the Grafana logo in the upper left corner of your screen.

**Step 2** Click **Sign in**. Enter the administrative username and password.

**Step 3** Click **Grafana admin** from the left side to open the **System info** pane on the right side.

**Step 4** Click **Global Users** to open a pane. By default, the **List** tab appears displaying the list of users currently configured in Grafana.

***Figure 24: List Tab***



**Step 5** Click **Create user** at the top to open **Create a new user** pane.

***Figure 25: Create a new user***

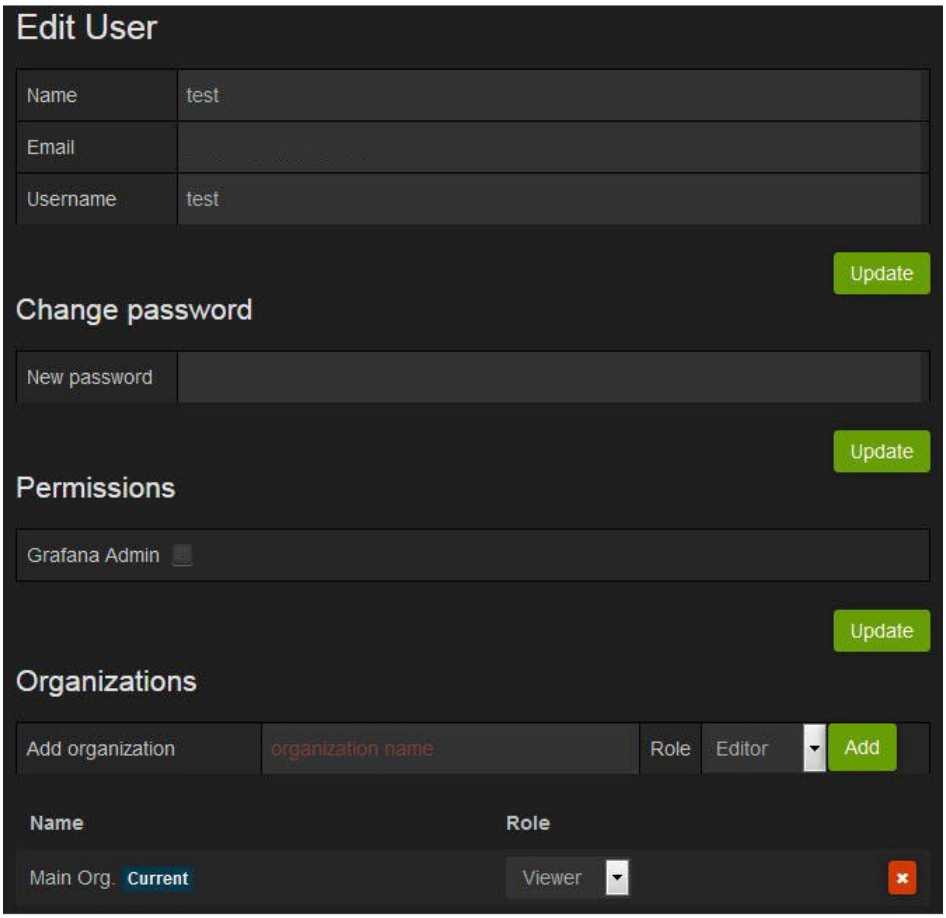
**Step 6** Enter the required parameters in *Name*, *Email*, *Username* and *Password* fields.

**Step 7** Click **Create** to create the grafana user.

**Step 8** You will see the newly added user in the **List** tab. By default, the new user will have only **Viewer** rights.

**Step 9** Click **Edit** to open **Edit User** pane. Only administrative user can update/modify the user properties.

*Figure 26: Edit User Information*



## Change the Role of Grafana User

You can also change the rights of the user from the main page.

**Note** The steps mentioned here can be performed only by **administrative** user.

Click **Main Org.** drop-down list to select **Users**. This will open **Organization users** pane, where you can change the role of a user from **Role** drop-down list.

The user can have Admin/Viewer/Editor/Read Only Editor roles.

- **Admin:** An admin user can view, update and create dashboards. Also the admin can edit and add data sources and organization users.
- **Viewer:** A viewer can only view dashboards, not save or create them.

- **Editor:** An editor can view, update and create dashboards.
- **Read Only Editor:** This role behaves just like the Viewer role. The only difference is that you can edit graphs and queries but not save dashboards. The Viewer role has been modified in Grafana 2.1 so that users assigned this role can no longer edit panels.

# Add an Organization

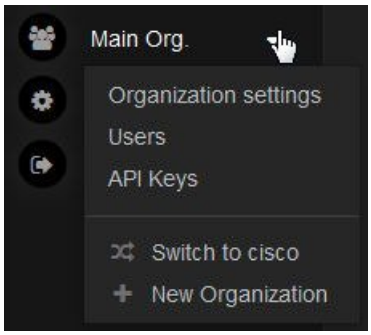
Grafana supports multiple organizations in order to support a wide variety of deployment models, including using a single Grafana instance to provide service to multiple potentially untrusted Organizations.

In many cases, Grafana will be deployed with a single Organization. Each Organization can have one or more Data Sources. All Dashboards are owned by a particular Organization.

**Note** The steps mentioned here can be performed only by **administrative** user.

**Step 1** Click **Main Org.** drop-down list to select **New Organization**.

***Figure 27: New Organization***



**Step 2** This will open a new pane **Add Organization**. Enter organization name in *Org. name* field. For example, test.

**Step 3** After adding the name, click **Create** to open **Organization** pane.

*Figure 28: Organization*

In this pane, you can modify the organization name and other organization information. After modifying the information, click **Update** to update the information.

# Move Grafana User to another Organization

**Note** The steps mentioned here can be performed only by **administrative** user.

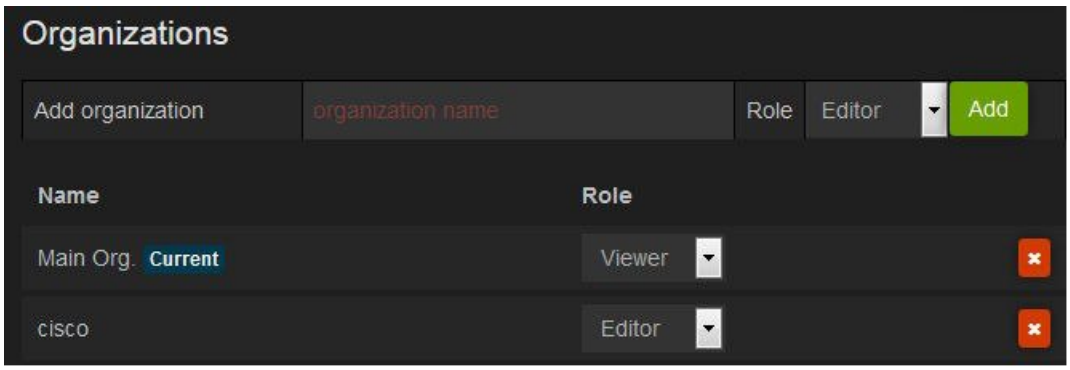
**Step 1** Click **Grafana admin** from the main page to **System Info** page.

**Step 2** Click **Global Users** from the left pane to open **Users** pane on the right.

**Step 3** Click **Edit** against the user for whom you want to make the changes.

**Step 4** Under **Organizations** section, you can add the user to some other organizations.

*Figure 29: Move User to another Organization*



**Step 5** In *Add organization* field, you need to enter the name of the new organization.

**Step 6** You can also change the role of the user from the **Role** drop-down list.

**Step 7** After adding the required information, click **Add** to add the user into a new organization.

**Step 8** In the above example, you can see that the user is added to the new organization. If you want to remove the user from pervious organization, click the **red cross** at the end.

# Configure Grafana for First Use

After an initial installation or after upgrading an existing CPS deployment which used Grafana, you must perform the steps in the following sections to validate the existing data sources.

## Migrate Existing Grafana Dashboards

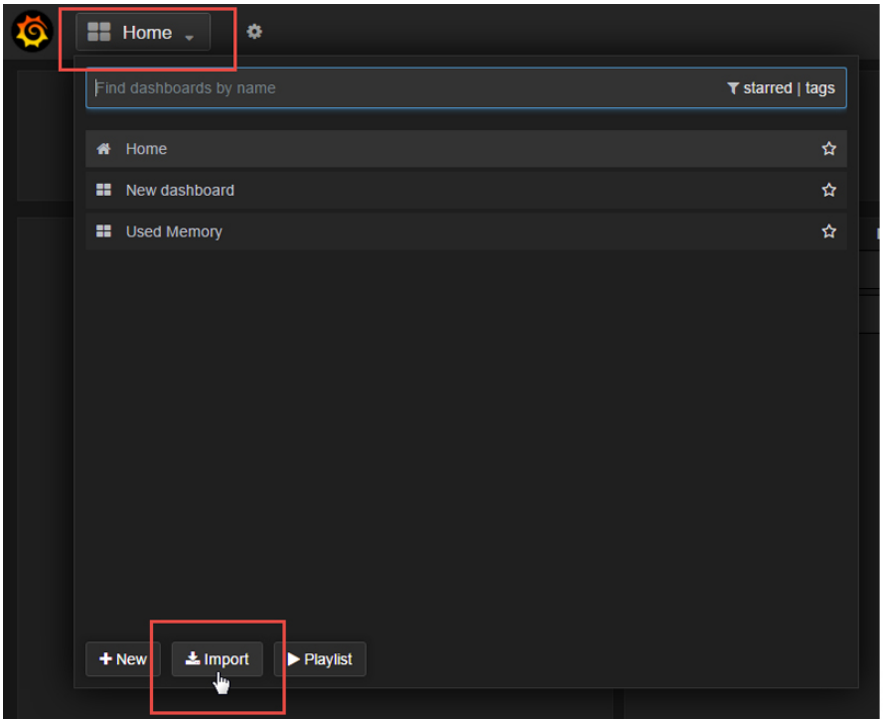
During an upgrade of CPS (and Grafana), saved dashboard templates remain intact.

After upgrading an existing CPS deployment, you must manually migrate any existing Grafana dashboards.

**Step 1** Sign in as the Grafana Administrative User. For more information, refer to Grafana Administrative User, on page 122.

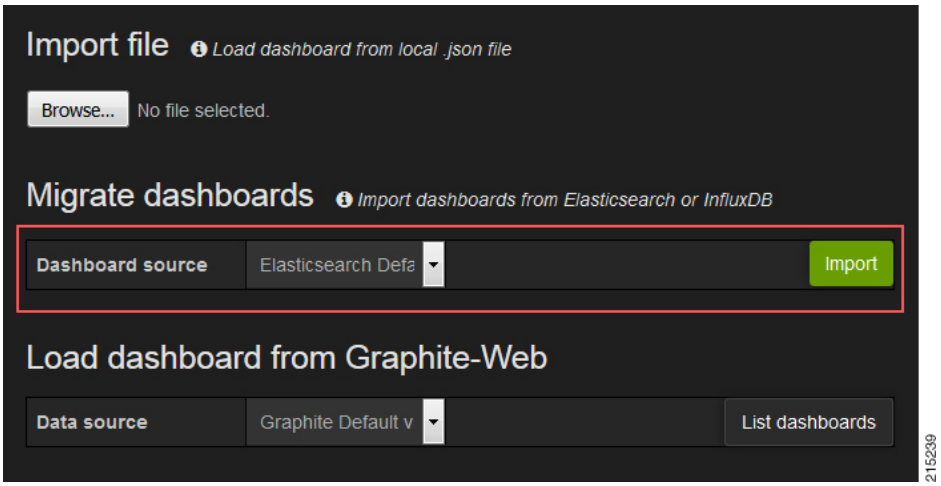
**Step 2** Click **Home** at the top of the Grafana window and then click **Import** as shown below:

*Figure 30: Import*



**Step 3** In the Migrate dashboards section, verify that **Elasticsearch Def** (Elasticsearch Default via API) is listed, then click **Import**.

*Figure 31: Import File*



**Step 4** All existing dashboards are imported and should now be available.

# Configuring Graphite User Credentials in Grafana

**Step 1** Log into Grafana with admin credentials.

**Step 2** Click Grafana home icon.

**Step 3** Select Data Sources.

**Note** Default link to datasources is https://<LB VIP>/grafana/datasources.

**Step 4** Select Graphite default table is added.

**Step 5** In HTTP Auth table, select basic auth.

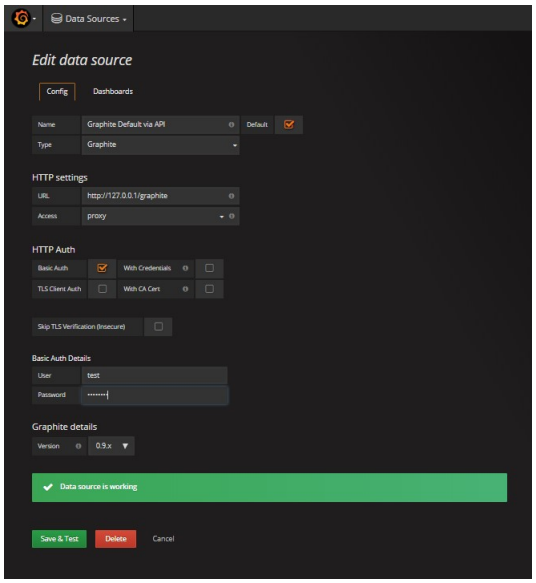
After selected new **Basic Auth Details** table is added.

**Note** Add/update username/password, which you created using htpasswd Add User, on page 120.

**Step 6** Enter Graphite DB credentials.

**Step 7** Click **Save and Test**.

After successful testing, "Data source is working message" message is displayed:



**Note**

- The above graphite configuration screenshot is a sample configuration. The options can vary depending on the CPS version installed.
- Grafana supports Graphite data source credential configuration capability. Graphite data source requires common data source credential to be configured using Grafana for Grafana user. Data source credential must be configured before upgrade/migration starts or after fresh installation. If you fail to add the user, then Grafana will not have an access to Graphite database and you will get continuous prompts for Graphite/Grafana credentials.
- All Grafana users configured will be available after migration/upgrade or fresh installation. However, you need to configure the graphite data source in Grafana UI.

# Accessing Graphite Database Using CLI

All requests to Graphite database require a valid username and password. You need to use `-u` flag in the request followed by the username and password.

```
curl -u <username>:<password> -G http://< GRAPHITEURL>
```

**Note** Password must be provided in plain text format.

# Changing Default graphite_default User Password

`graphite_default` user is created during the fresh installation. Currently, CPS doesn't automatically sychronize the `graphite_default` user password change, once CPS is deployed. If you want to change the password for `graphite_default` user, peform the following steps. The steps must be executed from Cluster Manager.

### Before you begin

Take the backup of old password files for future reference.

`/var/www/html/htpasswd`

`/root/.graphite_default`

**Step 1** Remove old password entry for the default user (graphite_default).

```
/usr/bin/htpasswd -D /var/www/html/htpasswd graphite_default
```

**Step 2** Create new password for the default user.

```
/usr/bin/htpasswd -s /var/www/html/htpasswd graphite_default
```

**Step 3** Create encrypted password.

```
/var/qps/bin/support/mongo/encrypt_passwd.sh NEW_PASSWORD
```

where, *NEW_PASSWORD* is the password used for `/usr/bin/htpasswd -s /var/www/html/htpasswd graphite_default`

**Step 4** Update `/root/.graphite_default` with the encrypted password.

```
echo <encryptedpassword> > /root/.graphite_default
```

where, <*encryptedpassword*> is the encrypted password for `graphite_default` user.

**Step 5** Check the facter parameter graphite_default before updating.

The following is a sample output.

```
facter | grep graphite_default
graphite_default => 458B2FE273EAA3A93450B186227C8543
```

**Step 6** Update the facter parameters to change `graphite_default` with the latest password.

For OpenStack: `/var/qps/bin/support/config_cluman.sh`

For VMware: `/var/qps/install/current/scripts/import/import_deploy.sh`

**Step 7** Build the changes.

```
/var/qps/bin/build/build_all.sh
```

**Step 8** Verify the facter parameter for `graphite_default` is updated with the latest `/root/.graphite_default` content.

The following is a sample output.

```
facter | grep graphite
graphite_default => 238B2FE273EAA3A93450B186227C8143
```

**Step 9** Run `vm-init` on pcrfclient01 and pcrfclient02 VMs to update `graphite_default` for all the users.

```
ssh pcrfclient01 "/etc/init.d/vm-init"
ssh pcrfclient02 "/etc/init.d/vm-init"
```

# Manual Dashboard Configuration using Grafana

Grafana enables you to create custom dashboards which provide graphical representations of data by fetching information from the Prometheus database. Each dashboard is made up of panels spread across the screen in rows.

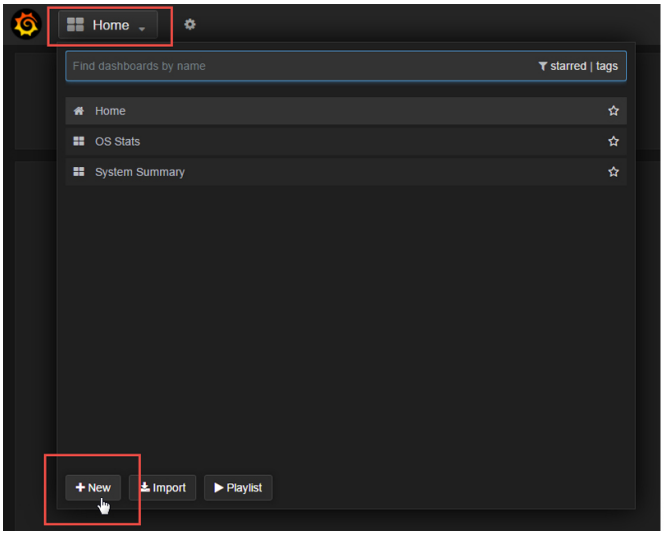
**Note** CPS includes a series of preconfigured dashboard templates. To use these dashboards, refer to Updating Imported Templates.

## Create a New Dashboard Manually

**Step 1** Sign-in as a Grafana Administrative user. For more information, see Grafana Administrative User, on page 122.

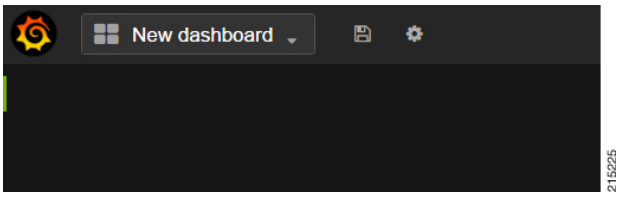
**Step 2** Click **Home** at the top of the Grafana window and select **New** as shown below:

*Figure 32: Home*



A blank dashboard is created.

*Figure 33: Blank Dashboard*



**Step 3** At the top of the screen, click the gear icon, then click **Settings**.

*Figure 34: Gear Icon*

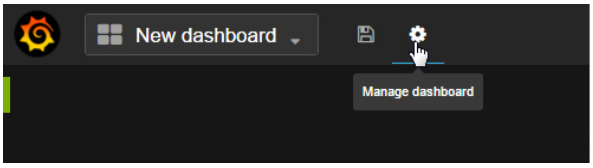


*Figure 35: Settings*

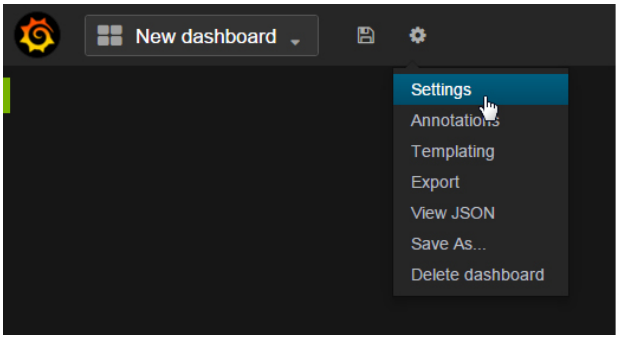
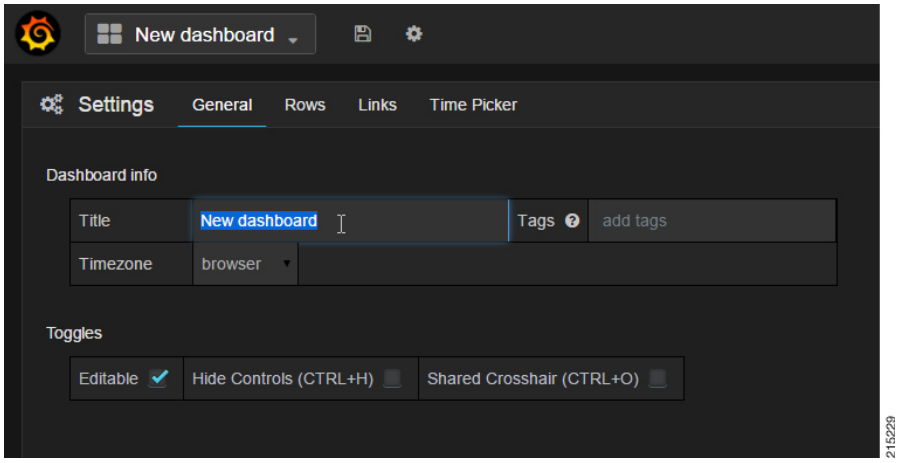


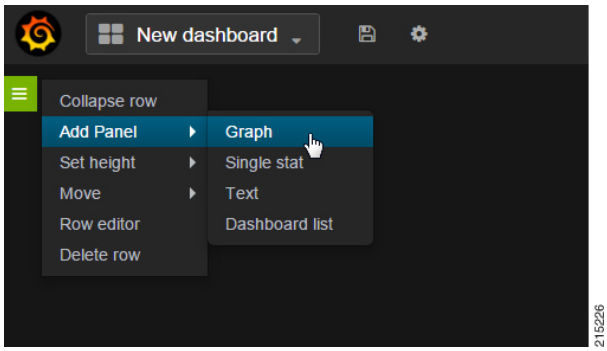
**Step 4** Provide a name for the dashboard and configure any other Dashboard settings. When you have finished, click the **X** icon in the upper right corner to close the setting screen.

***Figure 36: Name for Dashboard***



**Step 5** To add a graph to this dashboard, hover over the green box on the left side of the dashboard, then point to **Add Panel**, then click **Graph**.

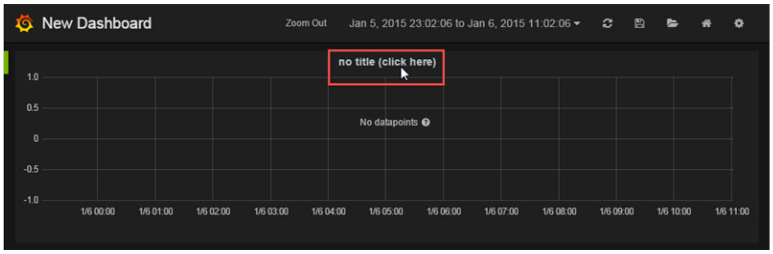
***Figure 37: Add Graph to Dashboard***



# Configure Data Points for the Panel

**Step 1** Click the panel title, as shown below, then select **Edit**.

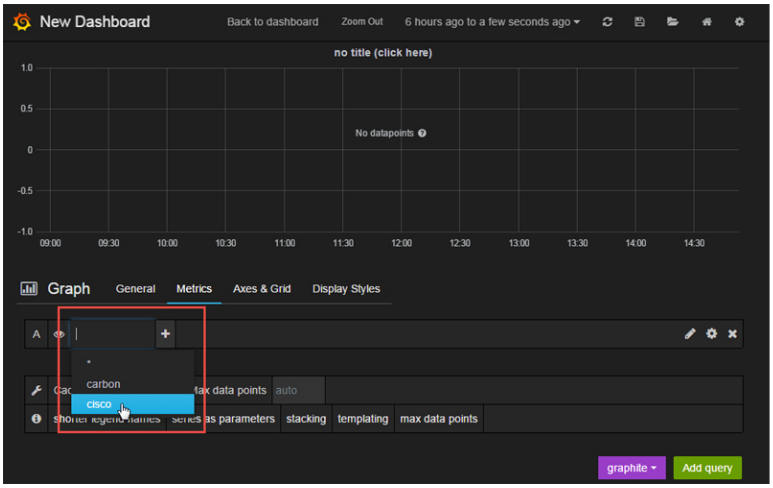
*Figure 38: Edit*



**Step 2** Select the necessary metrics by clicking on the select metric option provided in the query window. A drop-down list appears from which you can choose the required metrics.

Select metrics by clicking select metric repeatedly until the lowest level of the hierarchy.

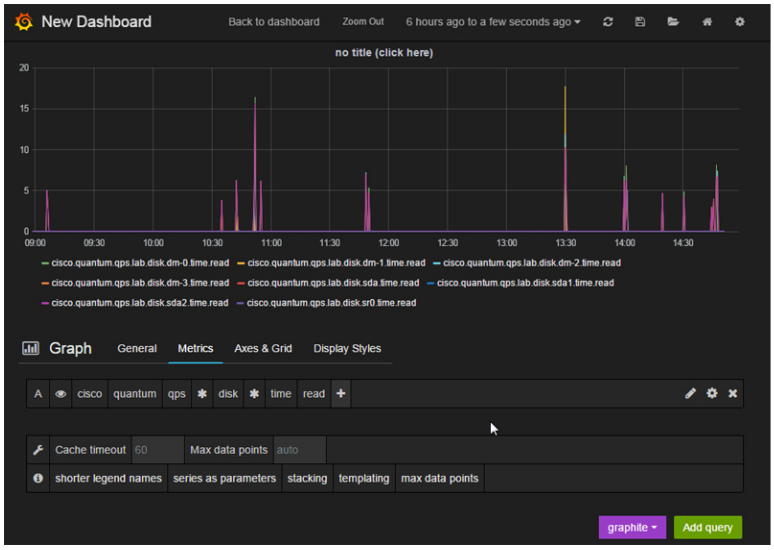
*Figure 39: Metric Selection*



**Note** Clicking the '*' option in the drop-down list selects all the available metrics.

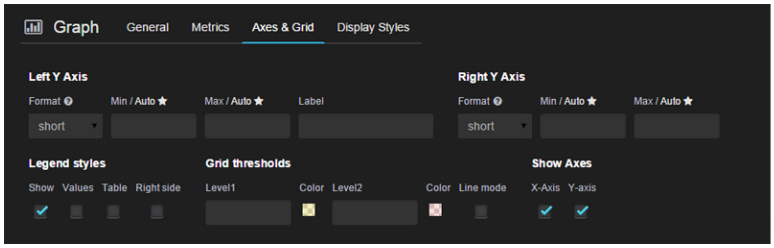
**Step 3** Click the '+' tab to add aggregation functions for the selected metrics. the monitoring graph is displayed as shown below.

*Figure 40: Aggregation Functions*



**Step 4** The x-axis and y-axis values can be configured in the **Axes & Grid** tab.

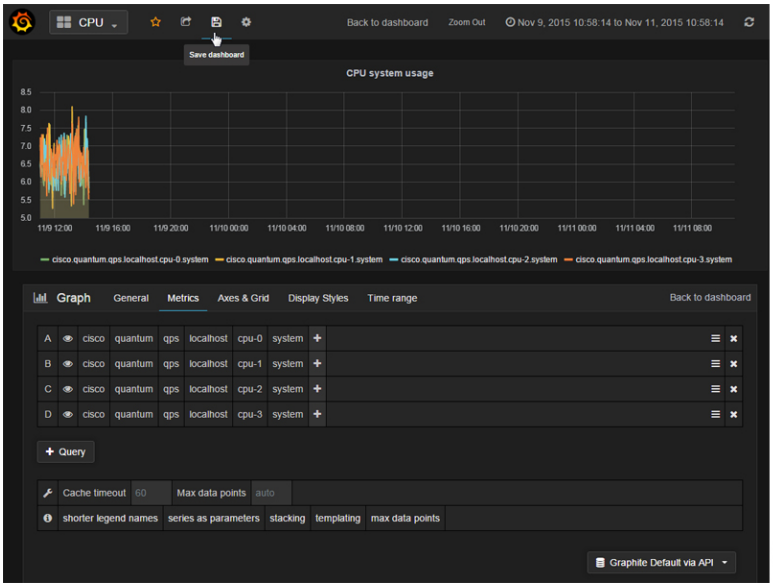
*Figure 41: Axes and Grid*



**Step 5** Click the disk icon (Save dashboard) at the top of the screen, as shown in the following image.

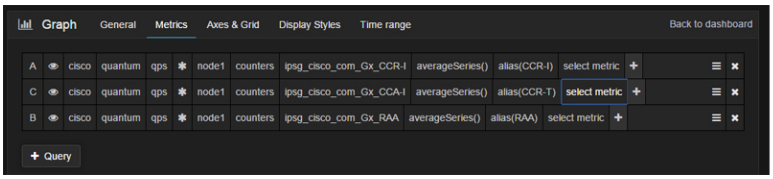
**Note** The changes to this dashboard are lost if you do not click the **Save** icon.

*Figure 42: Save*



Graphical representation of application-messages such as - CCR, CCA, Gx, Gy, LDAP, Rx messages and so on, can be configured in the dashboard panel by using the queries shown in the below figure.

*Figure 43: Graphical Representation*



# Configure Useful Dashboard Panels

The following section describes the configuration of several useful dashboard panels that can be used while processing Application Messages. Configure the dashboard panel as shown in the screens below.

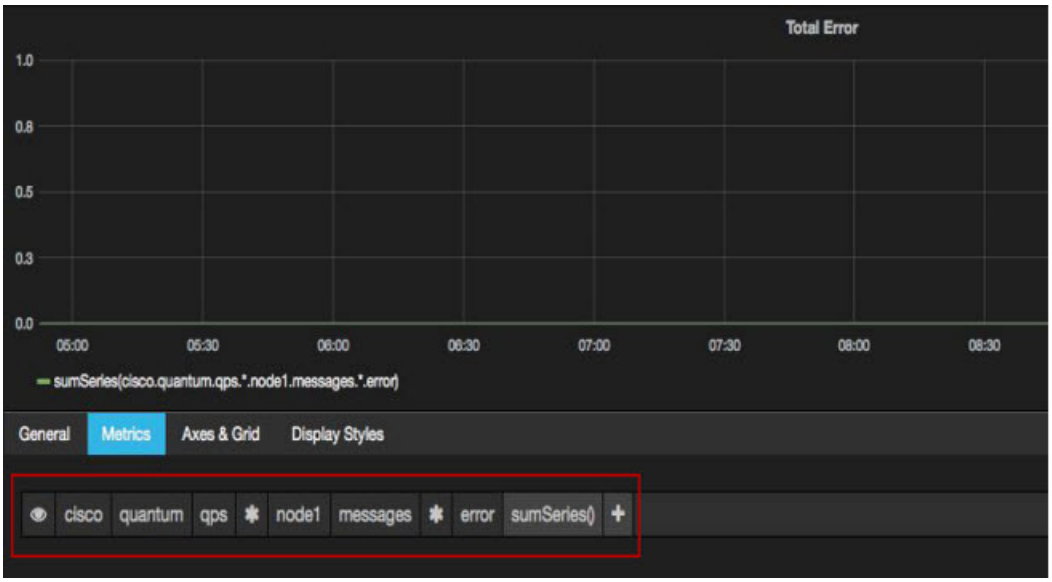
For more information on panels, see http://docs.grafana.org/features/panels/dashlist/.

**Note** It is recommended to have panel option in Grafana dashboard. This is required so that when the dashboard is loaded only necessary graphs can be expanded for which statistics need to be seen. This reduces load on pcrfclient VMs as they do not need to fetch lot of statistics.

### Total Error:

This dashboard panel lists the errors found during the processing of Application Messages. To configure Total Error dashboard panel, create a panel with name 'Total Error' and configure its query as shown:

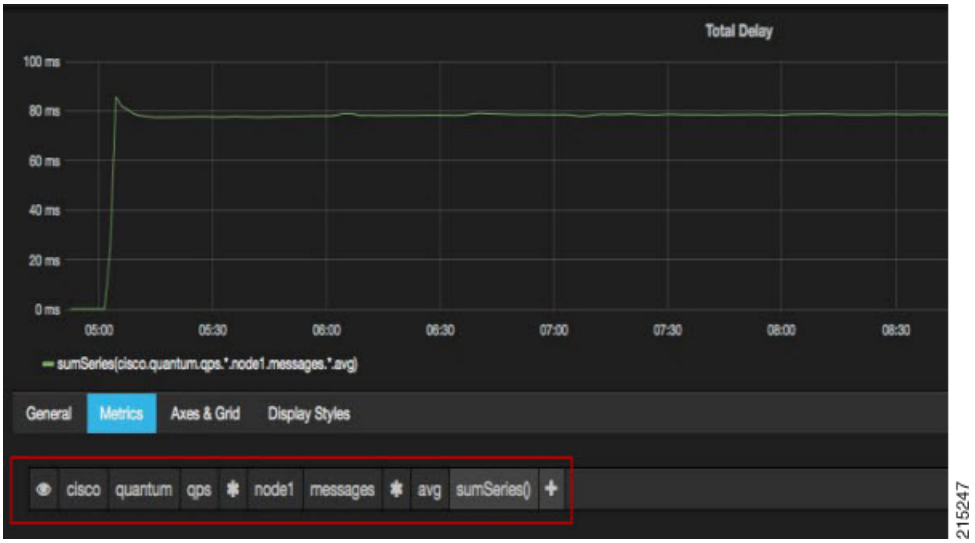
*Figure 44: Total Error Dashboard*



### Total Delay:

This dashboard panel displays the total delay in processing various Application Messages. To configure Total Delay dashboard panel, create a panel with name Total Delay and configure its query as shown:

*Figure 45: Total Delay Dashboard*



### Total TPS:

This panel displays the total TPS of CPS system. Total TPS count includes all Gx, Gy, Rx, Sy, LDAP and so on. The panel can be configured as shown below:

*Figure 46: Total TPS*

# Updating Imported Templates

Some of the preconfigured templates (such as Diameter statistics panels) have matrices configured which are specific to a particular set of Diameter realms. These panels need to be reconfigured to match customer specific Diameter realms.

For example, the Gx P-GW panel in the Diameter Statistics dashboard does not fetch the stats and displays the message “No Datapoints”. The probable reasons could be:

- Matrices used in query uses matrices specific to particular Diameter realm which is different on customer setup.
- No application call of such type has ever landed on CPS Policy Directors (LBs) (no Diameter call from the P-GW has ever landed on Policy Director after the Grafana setup).

# Copy Dashboards and Users to pcrfclient02

As a best practice, the internal Grafana database should be kept in sync between pcrfclient01 and pcrfclient02. This sync operation should be performed after any dashboard or Grafana user is migrated, updated, added or removed.

Under normal operating conditions, all Grafana operations occur from pcrfclient01. In the event of a pcrfclient01 failure, pcrfclient02 is used as backup, so keeping the database in sync provides a seamless user experience during a failover.

The following steps copy all configured Grafana dashboards, Grafana data sources, and Grafana users configured on pcrfclient01 to pcrfclient02.

Log in to the pcrfclient01 VM and run the following command:

```
/var/qps/bin/support/grafana_sync.sh
```

As a precaution, the existing database on pcrfclient02 is saved as a backup in the `/var/lib/grafana` directory.

# Configure Garbage Collector KPIs

The following sections describe the steps to configure Garbage Collector (GC) KPIs in Grafana:

- Backend changes: Changes in the collectd configuration so that GC related KPIs will be collected by collectd and stored in graphite database.
- Frontend changes: Changes in Grafana GUI for configuring metrics for GC graph.

## Backend Changes

Check if the following changes are already present in the jmxplugin.conf file. If already configured, then skip this section and move to configuring the Grafana dashboard.

**Step 1** Edit `/etc/puppet/modules/qps/templates/collectd_worker/collectd.d/jmxplugin.conf` on the Cluster Manager VM as described in the following steps.

**Step 2** Verify that the JMX plugin is enabled. The following lines must be present in the `jmxplugin.conf` file.

```
JVMARG has path for jmx jar

JVMARG

-Djava.class.path=/usr/share/collectd/java/collectd-api.jar/usr/share/collectd/java/generic-jmx.jar

And GenericJMX plugin is loaded

LoadPlugin org.collectd.java.GenericJMX
```

**Step 3** Add an Mbean entry for garbage collector mbean in GenericJMX plugin so that statistics from this mbean will be collected.

```
  # Garbage collector information
<MBean "garbage_collector">
      ObjectName "java.lang:type=GarbageCollector,*"
      InstancePrefix "gc-"
      InstanceFrom "name"
<Value>
        Type "invocations"
        #InstancePrefix ""
        #InstanceFrom ""
        Table false
        Attribute "CollectionCount"
</Value>
<Value>
        Type "total_time_in_ms"
        InstancePrefix "collection_time"
        #InstanceFrom ""
        Table false
        Attribute "CollectionTime"
</Value>
</MBean>
```

**Step 4** For every “Connection” block in `jmxplugin.conf` file add the entry for garbage collector mbean.

For example:

```
<Connection>
  InstancePrefix "node1."
ServiceURL "service:jmx:rmi:///jndi/rmi://localhost:9053/jmxrmi"
Collect "garbage_collector"
Collect "java-memory"
Collect "thread"
Collect "classes"
Collect "qns-counters"
Collect "qns-actions"
Collect "qns-messages"
</Connection>]
```

**Step 5** Save the changes to the `jmxplugin.conf` file then synchronize the changes to all CPS VMs as follows:

a) Go to the `/var/qps/install/current/scripts/build/` directory on the Cluster Manager and execute the following script:

```
./build_puppet.sh
```

b) Go to the `/var/qps/install/current/scripts/upgrade/` directory on the Cluster Manager and execute the following command:

```
./reinit.sh
```

c) Restart the collectd service on all VMs by running the following command on each VM in the CPS cluster:

```
monit restart collectd
```

# Frontend Changes

The frontend changes must be done in the Grafana GUI.

**Step 1** Create a new Grafana dashboard. For more information, see Manual Dashboard Configuration using Grafana, on page 132.

**Step 2** In the **Metrics** tab of the new dashboard, configure queries for GC related KPIs.

The query needs to be configured in the following format:

```
cisco.quantum.qps.<hostname>.node*. gc*.total_time_in_ms-collection_time
cisco.quantum.qps.<hostname>.node*.gc*.invocations
```

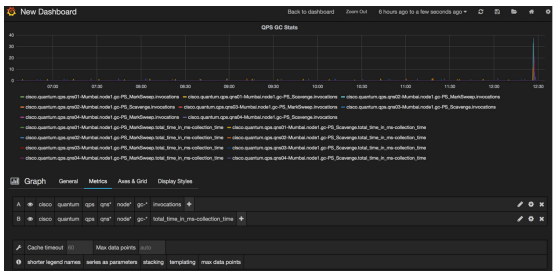
where, <*hostname*> is regular expression for the name of hosts from which KPI needs to be reported.

If this is a High Availability (HA) CPS deployment, KPIs need to be reported from all Policy Server (QNS) VMs.

Assuming the Policy Server (QNS) VMs have “qns” in their hostname, then a regular expression would be *qns*. This would report data for all VMs that have a hostname containing “qns” (qns01 qns02 and so on).

- HA Setup

*Figure 47: On HA Setup*



An example statistics graph is shown below.

*Figure 48: Example Graph*

**Step 3** Save the dashboard by clicking on Save icon.

# Export and Import Dashboards

Existing dashboard templates can be exported and imported between environments. This is useful for sharing Grafana dashboards with others.

## Export Dashboard

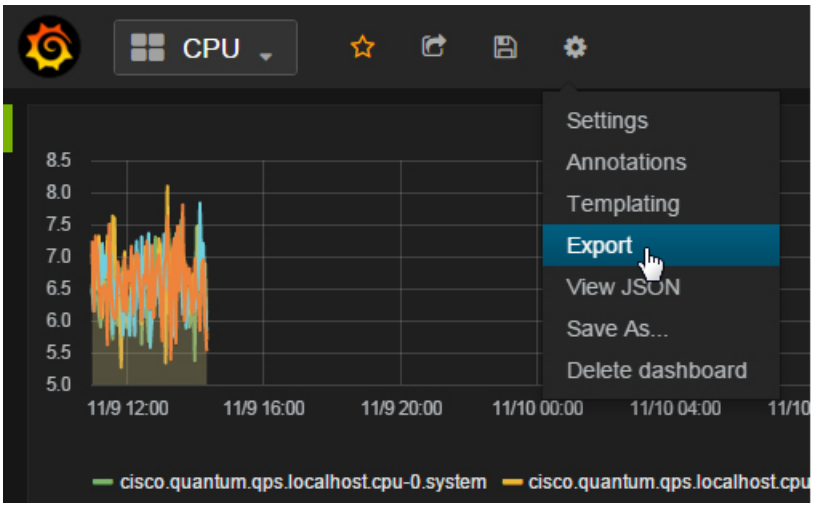
This topic describes how to export a dashboard configuration to a file.

**Step 1** Sign-in as a Grafana Administrative User.

**Step 2** Open the dashboard to be exported.

**Step 3** Click the gear icon at the top of the page, and then select **Export** to save the dashboard configuration on your local system.

*Figure 49: Export*



**Step 4** If prompted, select the location on your local system to save the dashboard template, and click **OK**.

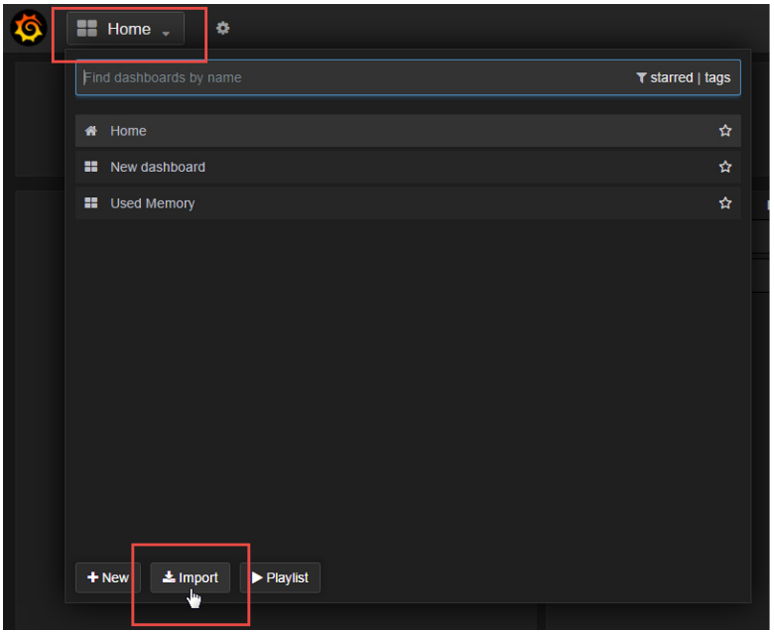
# Import Dashboard

This topic describes how to import a dashboard from a file.

**Step 1** Sign-in as a Grafana Administrative User.

**Step 2** Click **Home** at the top of the Grafana window, and then click **Import** as shown below.

*Figure 50: Import*



**Step 3** Click **Choose File**.

**Step 4** Select the file on your local system to save the dashboard template and click **Open**.

**Step 5** After the dashboard is loaded, click the disk icon (Save dashboard) at the top of the screen to save the dashboard.

**Note** Your changes to this dashboard are lost if you do not save the dashboard.

The data to be imported in the dashboard should be in the correct format. Grafana does not throw any error if incorrectly formatted data is loaded.

# Export Graph Data to CSV

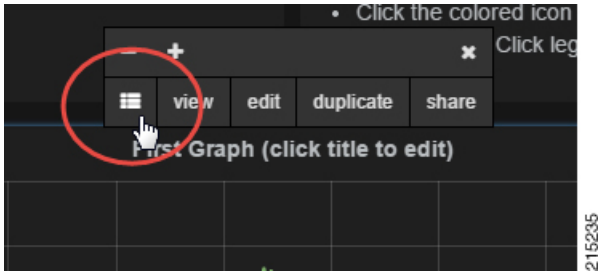
This topic describes how to export the data in a graph panel to a CSV file.

**Step 1** Click the title of the graph as shown below to open the graph controls.

***Figure 51: Title***

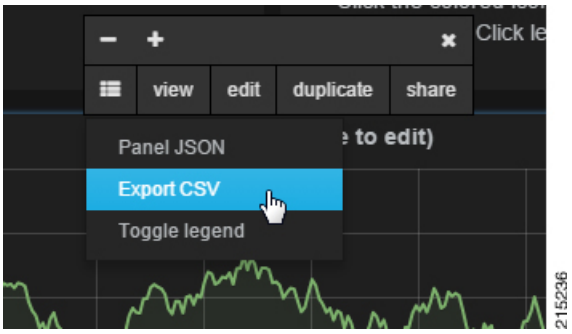
**Step 2** Click the rows button to open another menu.

***Figure 52: Rows***



**Step 3** Click **Export CSV**.

*Figure 53: Export*



A `grafana_data_export.csv` file is downloaded by your browser.

# Session Consumption Report

## Introduction

This feature generates the session consumption report and stores the data into a separate log. The total number of sessions limited by the license, the total number of active sessions, and total transactions per second are documented at regular time intervals into the log. The core license number is derived from the license file that has the total number of sessions limited by the license. The active session count and the transaction count has been taken from Grafana using the graphite query. A single entity of the feature mainly prints the current time stamp with the statistics values.

## Data Collection

The session and TPS count is collected from the graphite API with a JSON response. The JSON response is then parsed to get the counter, which is then logged into the consolidated log. The sample URL and the JSON response are given below:

```
> curl
-u graphite_default:$graphite_default_passwd -G "http://localhost/graphite/render?
target=cisco.quantum.qps.pcrfclient01.set_session_count_total.records&from=-20second&until=-0hour&format=json"
> [{"target":
"cisco.quantum.qps.localhost.set_session_count_total.records", "datapoints": [[3735.42,
1455148210], [3748.0, 1455148220]]}]
> curl
-u graphite_default:$graphite_default_passwd -G "http://localhost/graphite/render?
target=sumSeries(cisco.quantum.*.*.node*.messages.e2e*.success)&from=-20second&until=-0hour&format=json"
> [{"target":
"sumSeries(cisco.quantum.*.*.node*.messages.e2e*.success)", "datapoints": [[2345.34324,
1455148210], [2453.23445453,
1455148220]]}]
```

# Logging

Data logging is done using the logback mechanism. The consolidated data that is generated is stored in a separate log file named `consolidated-sessions.log` inside the `/var/log/broadhop` directory along with other logs. The data entries are appended to the log every 90 seconds. The logs generated are detailed and have the counter name and the current value with the time stamp.

# Performance

The codebase pulls the JSON response from the Graphite API. The overhead by the codebase adds an average of 350 ms of time.

# Log Rotation

A log rotation policy is applied on the logs generated for the session Consumption Report. The file size limitation for each log file is 100 MB. The limitation on number of log files is 5. The logs get rotated after reaching the limitations. One file contains a little more than two years of data, so five such files can contain 10 years of data until the first file get replaced.

# Sample Report

```
2016-02-15 20:30:01 - TPS_COUNT: 6440.497603         SESSION_COUNT: 200033.0

# Resync Member of a Replica Set

This procedure can be performed if any one of the members is not in a healthy state. Un-healthy state means that the replica-member is in RECOVERING or other unhealthy state for a longer duration and unable to recover on its own. Additionally, this procedure can be performed to reclaim the disk-space in order to reduce the database fragmentation.

**Note** Make sure PRIMARY member is available while performing this procedure.

**Step 1** Verify the status of primary and secondary member by running the following command:

```
diagnostics.sh --get_replica_status
```

**Step 2** Stop Mongo AIDO client by running the following command on sessionmgr VM:

```
monit stop aido_client
```

**Step 3** Stop Mongo server from sessionmgr VM by running the following command (portNum is the port number of fragmented member):

```
/etc/init.d/sessionmgr-<portNum> stop
```

**Step 4** Clean database directory by removing data directory from path mentioned against `--dbpath` attribute of mongo command. The value can be retrieved by running the following command (using the portNum of the fragmented member):

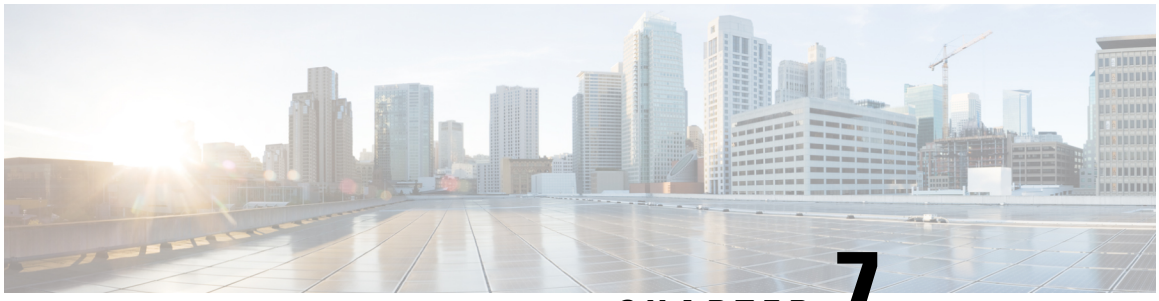
```
grep -w DBPATH= /etc/init.d/sessionmgr-<portNum>
```

**Step 5** Start Mongo AIDO client from Sessionmgr VM by running the following command:

```
/etc/init.d/sessionmgr-<portNum> start
```

**Step 6** Start AIDO client on sessionmgr VM by running the following command:

```
monit start aido_client
```



CHAPTER 7

# Managing High Availability in CPS

- HAProxy, on page 149
- Expanding an HA Deployment, on page 151
- Enable SSL, on page 153

# HAProxy

HAProxy is an opensource load balancer used in High Availability (HA) and Geographic Redundancy (GR) CPS deployments. It is used by the CPS Policy Directors (lbs) to forward IP traffic from lb01/lb02 to other CPS nodes. HAProxy runs on the active Policy Director VM.

Documentation for HAProxy is available at http://www.haproxy.org/#docs.

## HAProxy Service Operations

### Diagnostics

For a general diagnostics check of the HAProxy service, run the following command from any VM in the cluster (except sessionmgr):

**diagnostics.sh --ha_proxy**

```
QPS Diagnostics Multi-Node Environment
--------------------------
Ping Check for qns01...[PASS]
Ping Check for qns02...[PASS]
Ping Check for qns03...[PASS]
Ping Check for qns04...[PASS]
Ping Check for lb01...[PASS]
Ping Check for lb02...[PASS]
Ping Check for sessionmgr01...[PASS]
Ping Check for sessionmgr02...[PASS]
Ping Check for sessionmgr03...[PASS]
Ping Check for sessionmgr04...[PASS]
Ping Check for pcrfclient01...[PASS]
Ping Check for pcrfclient02...[PASS]
HA Multi-Node Environment
--------------------------
Checking HAProxy status...[PASS]
```

## Service Commands

The following commands must be issued from the lb01 or lb02 VM.

To check the status of the HAProxy services, run the following command:

```
monit status haproxy
```

```
[root@host-lb01 ~]# service haproxy status
haproxy (pid 10005) is running...
```

To stop the HAProxy service, run the following command:

```
monit stop haproxy
```

To restart the HAProxy service, run the following command:

```
monit restart haproxy
```

## HAProxy Statistics

To view statistics, open a browser and navigate to the following URL:

- **For HAProxy Statistics**: http://<diameterconfig>:5540/haproxy?stats
- **For HAProxy Diameter Statistics**: http://<diameterconfig>:5540/haproxy-diam?stats

# Changing HAProxy Log Level

To change HAProxy log level in your CPS deployment, you must make changes to the HAProxy configuration files on the Cluster Manager and then push the changes out to the Policy Director (lb) VMs.

Once deployed, the HAProxy configuration files are stored locally on the Policy Director VMs at `/etc/haproxy/haproxy.cfg.erb` and `/etc/haproxy/haproxy-diameter.erb`.

**Note** Whenever you upgrade with latest ISO, the log level will be set to default level (err).

**Step 1** Log in to the Cluster Manager.

**Step 2** Create a backup of the HAProxy configuration file before continuing:

```
cp /var/qps/install/current/puppet/modules/qps/templates/etc/haproxy/haproxy.cfg.erb
/var/qps/install/current/puppet/modules/qps/templates/etc/haproxy/haproxy.cfg.erb-bak-<date>
```

**Step 3** Edit the HAProxy files as needed.

By default, the logging level is set as error (err) in `/var/qps/install/current/puppet/modules/qps/templates/etc/haproxy/haproxy-diameter.erb`:

```
log         127.0.0.1       local1 err
```

By default, the logging level in `/var/qps/install/current/puppet/modules/qps/templates/etc/haproxy/haproxy.cfg.erb`:

```
log             127.0.0.1   local3 emerg alert crit err warning
```

The log level can be adjusted to any of the following log levels as needed:

*emerg alert crit err warning notice info debug*

**Step 4** Run `build_all.sh` to rebuild the CPS VM packages.

**Step 5** Run `reinit.sh` to trigger all VMs to download the latest software and configuration from the Cluster Manager.

# Expanding an HA Deployment

For future installations and network upgrades, this section proposes what hardware and components you should consider as you grow your network. The CPS solution is a robust and scalable software-based solution that can be expanded by adding additional hardware and software components. The following sections explain typical scenarios of when to expand the hardware and software to effect such growth.

## Typical Scenarios When Expansion is Necessary

Your network may grow for the following reasons:

- The subscriber base has grown or will grow beyond the initial installation specifications.

  In this case, the number of active or non-active subscribers becomes larger than the initial deployment. This can cause one or more components to reach capacity. New components must be added to accommodate the growth.

- The services or subscriber scenarios have changed, or new services have been introduced, and the transactions per second on a component no longer meet requirements.

  When a new service or scenario occurs, often there is a change in the overall Transactions Per Second (TPS), or in the TPS on a specific component. When this occurs, new components are necessary to handle the new load.

- The operator notices that there are factors outside of the initial design that are causing either the overall system or a specific component to have a high resource load.

  This may cause one or multiple components to reach its capacity for TPS. When this occurs, new components are necessary to handle the new factors.

## Hardware Approach to Expanding

Adding a new component may require adding additional hardware. However, the addition of more hardware depends on the physical resources already available, plus what is needed for the new component.

If the number of subscribers exceeds 10 million, then the customer needs to Clone and Repartition sessionmgr Disks. See Manage Disks to Accommodate Increased Subscriber Load, on page 16.

## High Availability Consequences

When adding more hardware, the design must take into consideration the high availability (HA) needs of the system. The HA design for a single-site system is N+1 at the hardware and application level. As a result, adding a new blade incrementally increases the HA capacity of the system.

For example, in a basic installation there are 2 Cisco Policy Server blades handling the traffic. The solution is designed so that if one of the blades fails, the other blade can handle the entire capacity of the system. When adding a third blade for capacity expansion, there are now 2 blades to handle the system load if one of the blades fails. This allows for a more linear scaling approach because each additional blade can be accountable for being able to use its full capacity.

**Note** When adding new blades to a cluster, the blades in the cluster must be co-located to achieve the proper throughput between other components.

## Adding a New Blade

**Step 1** Install ESX server to the blade.

**Step 2** Open the CPS Deployment Template spreadsheet. This spreadsheet should have been created and maintained during the initial deployment.

**Step 3** In the Additional Hosts sheet, add an entry for the new ESX server with IP, Host name and Alias.

**Step 4** Save the CSV file and transfer it to the following directory on the Cluster Manager /var/qps/config/deploy/csv

**Step 5** Run `/var/qps/install/current/scripts/import/import_deploy.sh` to convert the csv to json.

# Component (VM Node) Approach to Expanding

The most common components to be expanded are on the Cisco Policy Servers. As your system begins to scale up, you will need to add more CPS nodes and more SessionMgrs. Expansion for other components can follow the same pattern as described here. The next sections discuss the configurations needed for those specific components to be active in the system.

## Adding Additional Component

**Step 1** Modify the CPS Deployment Template spreadsheet (this spreadsheet should have been created and maintained during the initial deployment).

**Step 2** In the Hosts sheet, add the new VM node with the parameters. See the *CPS Installation Guide for VMware* for details about each column.

**Step 3** Save the CSV file and transfer it to the following directory on the Cluster Manager: `/var/qps/config/deploy/csv`.

**Step 4** Run `/var/qps/install/current/scripts/import/import_deploy.sh` to convert the csv to json.

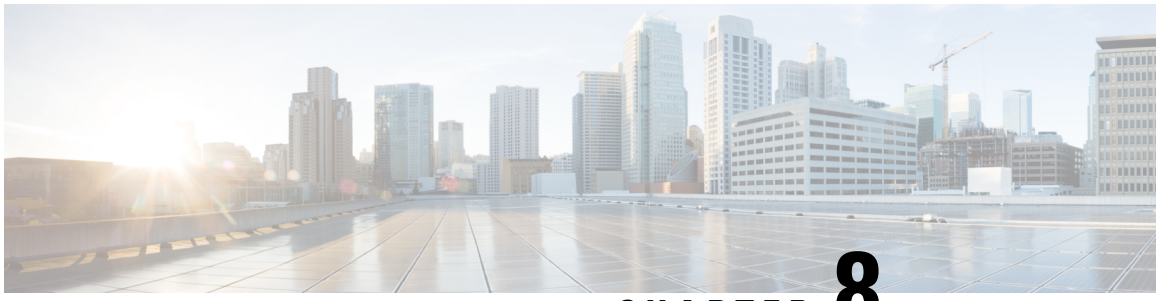
**Step 5** Deploy the new VM using `/var/qps/install/current/scripts/deployer/deploy.sh` xxx, where xxx is the alias of the new VM to be deployed.

Refer to the *CPS Installation Guide for VMware* for more details about using `deploy.sh`.

# Enable SSL

CPS uses encryption on all appropriate communication channels in HA deployments. No additional configuration is required.

Default SSL certificates are provided with CPS but we recommend that you replace these with your own SSL certificates. Refer to Replace SSL Certificates in the *CPS Installation Guide for VMware* for more information.



CHAPTER 8

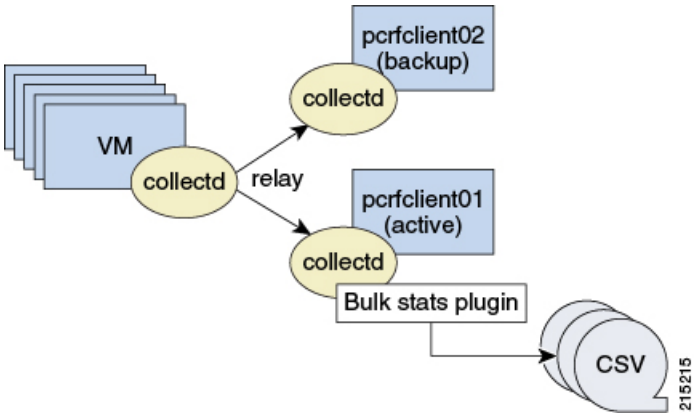
# CPS Statistics

- Bulk Statistics Overview, on page 155
- CPS Statistics, on page 156
- Bulk Statistics Collection, on page 159
- CPS KPI Monitoring, on page 162
- Example CPS Statistics, on page 186

## Bulk Statistics Overview

Bulk Statistics are the statistics that are gathered over a given time period and written to a set of files. These statistics can be used by external analytic processes and/or network management systems. The architecture of CPS bulk statistic collection is shown below.

***Figure 54: CPS Bulk Statistic Collection Architecture***



The collection utility collectd is used for collecting and storing statistics from each VM. Detailed collectd documentation can be found on http://collectd.org/.

Collectd within CPS is deployed with nodes relaying data using the collectd network plug-in (https://collectd.org/wiki/index.php/Plugin:Network) to the centralized collection nodes on the pcrfclient01 and pcrfclient02 virtual machines. The centralized collector writes the collected data to output CSV files.

**Note** pcrfclient01 and pcrfclient02 collect bulk statistics independently. As a result, it is normal to have slight differences between the two files. For example, pcrfclient01 generates a file at time t and pcrfclient02 generates a file at time t +/- the clock drift between the two machines.

As a best practice, always use the bulk statistics collected from pcrfclient01. pcrfclient02 can be used as a backup if pcrfclient01 fails.

If pcrfclient01 becomes unavailable, statistics is still gathered on pcrfclient02. Statistics data is not synchronized between pcrfclient01 and pcrfclient02, so a gap exists in the collected statistics while pcrfclient01 is down.

**Note** Statistics value in csv files is displayed in E notation format depending on value and data source type. For example, for Gauge type of data source, statistics value is converted to E notation if value is greater than $10^7$.

# Grafana

# CPS Statistics

The list of statistics available in CPS is consolidated in an Excel spreadsheet. After CPS is installed, this spreadsheet can be found in the following location on the Cluster Manager VM:

`/var/qps/install/current/scripts/documents/QPS_statistics.xlsx`

## Overview

The following diagram represents the various statistic gathering points for incoming and outgoing messages.

***Figure 55: Various Statistic Gathering Points for Incoming and Outgoing Messages***

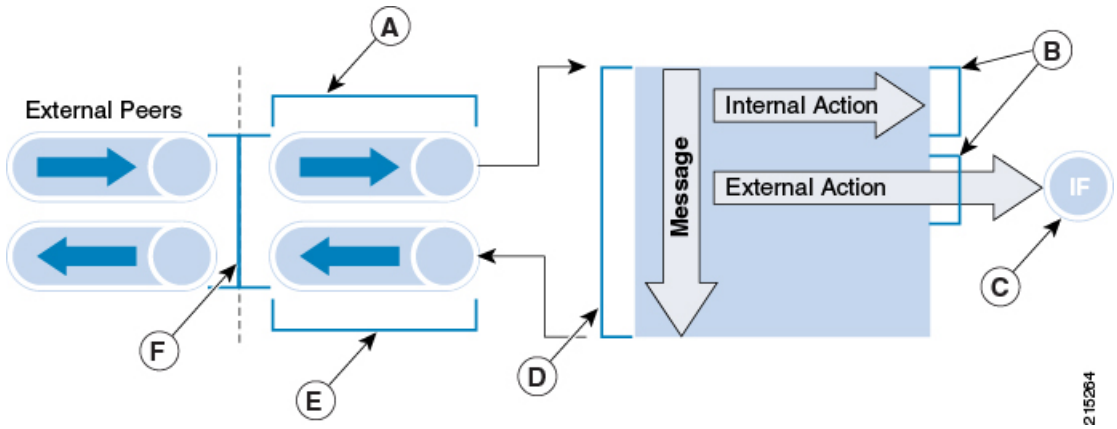


*Table 15: Measurement Legend*

| Legend | Description |
|---|---|
| A | Inbound queue counts and times* |
| B | Policy action counts and times |
| C | Interface specific counts and times |
| D | Policy message counts and times |
| E | Outbound queue counts and times* |
| F | Round trip counts and times* |
| where, * – statistics only apply to Diameter messages | |

A brief description of each statistic gathering points is given below:

- Upon receipt of a message on the Policy Director (lb) node, the message is registered as received and forwarded to a middle tier processing node.
- This middle tier processing node tracks the inbound message counts and time spent within the inbound processing queue. If a message is discarded due to SLA violation, then counters are incremented at this point. This occurs at point A within the diagram.
- Upon arrival within the policy engine all messages are counted and timers are started to measure the duration of processing.
- Any internal or external actions are tracked at this point and the round trip time is measured from the policy engine invocation of the action and success or failure of the action. This occurs at point B within the diagram.
- For external actions (for example, LDAP), interface specific statistics maybe captured. This occurs at point C in the diagram and is gathered from the Policy Director nodes.
- Upon completion of the message in the policy engine, the total elapsed time is measured and whether success or failure occurred in processing.

**Note** A message is considered a success even if the policy returns an error (such as 5002). These application errors are tracked at point D within the diagram.

- Outbound messages are tracked from the policy engine to the Policy Directors at point E within the diagram.
- Upon receipt of outbound messages, the Policy Directors tracks either end to end completion time for inbound requests OR starts a timer and counts outbound requests. This occurs at point F within the diagram.

# CPS Statistic Types

This section describes various forms of statistics generated by CPS.

## Diameter Statistics

In Diameter statistics, Monitoring Areas are defined on the basis of Queues maintained in it. Diameter statistics can also be defined based on whether the statistic is related to a counter or gauge or derived or absolute.

- Counter: Counter type represents a non-negative integer which monotonically increases until it reaches a maximum value of 2^32-1 (4294967295 decimal), when it resets and starts increasing again from zero.

  Counters have no defined “initial” value, and thus, a single value of a Counter has (in general) no information content. You must take a delta of multiple readings to understand anything.

- Gauge: Gauge type represents a non-negative number, which can increase or decrease, but can never fall below a minimum value. The minimum value cannot be smaller than 0.

- Derived: It is intended to store the derivative of the line going from the last to the current value of the data source. Such data sources are very common with events that can be counted. Internally, derive works exactly like COUNTER but without overflow checks. So if your counter does not reset at 32 or 64 bit you might want to use DERIVE and combine it with a MIN value of 0.

- Absolute: It is intended for counters which get reset upon reading. In effect, the type is very similar to GAUGE except that the value is an (unsigned) integer and is divided by the time since the last reading. This is used for fast counters which tend to overflow. So instead of reading them normally you reset them after every read to make sure you have a maximum time available before the next overflow. Another usage is for things you count like number of messages since the last update.

## LDAP Statistics

CPS tracks LDAP statistics for general LDAP actions, LDAP query counters, LDAP connection counters, as well as message counters.

Categories:

- Action
- Messages

## System Statistics

System statistics are defined based on six categories:

- CPU
- File System Usage
- Disk Performance
- Interface
- CPU Load
- Memory

## Engine Statistics

Engine statistics are defined based on three categories:

- Session Count
- Session Operation
- Internal messages

# Error Statistics Definitions

About error statistics, here are the definitions of each error suffix:

***Table 16: Error Statistics Definitions***

| Error Statistics | Description |
|---|---|
| node1.messages.*.error | Failure processing a message |
| e2e*_qns_stat.error | Count of occurrence for given Diameter result code |
| pe-submit-error | Error submitting to policy engine |
| _bypass | Message not sent to policy engine due to successful response (2001) |
| _drop | Message dropped due to SLA violation |
| rate-limit | Message dropped due to rate limiting violation |

**Note** The Diameter E2E statistics with the suffix “error” always have a value of 0 (zero) unless they have “_late” in the statistic name.

# Bulk Statistics Collection

By default, CPS outputs a bulk statistics CSV file to the /var/broadhop/stats/ directory on the pcrfclient01 and pcrfclient02 VMs in five minute intervals.

The default naming standard is bulk-hostname-YYYY-MM-DD-HH-MI.csv

These CSV files include all statistics collected from all VMs during the 5 minute interval.

**Note** If a statistic is generated by the system multiple times within the 5 minute interval, only the last measured statistic is collected in the CSV file.

The following list is a sample of the file names created in the /var/broadhop/stats/ directory on the pcrfclient01 VM.

```
[root@pcrfclient01 stats]# pwd
/var/broadhop/stats
[root@pcrfclient01 stats]# ls
bulk-pcrfclient01-201510131350.csv
bulk-pcrfclient01-201510131355.csv
bulk-pcrfclient01-201510131400.csv
bulk-pcrfclient01-201510131405.csv
bulk-pcrfclient01-201510131410.csv
bulk-pcrfclient01-201510131415.csv
bulk-pcrfclient01-201510131420.csv
bulk-pcrfclient01-201510131425.csv
bulk-pcrfclient01-201510131430.csv
bulk-pcrfclient01-201510131435.csv
bulk-pcrfclient01-201510131440.csv
bulk-pcrfclient01-201510131445.csv
bulk-pcrfclient01-201510131450.csv
bulk-pcrfclient01-201510131455.csv
bulk-pcrfclient01-201510131500.csv
bulk-pcrfclient01-201510131505.csv
bulk-pcrfclient01-201510131510.csv
bulk-pcrfclient01-201510131515.csv
bulk-pcrfclient01-201510131520.csv
bulk-pcrfclient01-201510131525.csv
bulk-pcrfclient01-201510131530.csv
bulk-pcrfclient01-201510131535.csv
bulk-pcrfclient01-201510131540.csv
bulk-pcrfclient01-201510131545.csv
bulk-pcrfclient01-201510131550.csv
bulk-pcrfclient01-201510131555.csv
bulk-pcrfclient01-201510131600.csv
bulk-pcrfclient01-201510131605.csv
bulk-pcrfclient01-201510131610.csv
bulk-pcrfclient01-201510131615.csv
bulk-pcrfclient01-201510131620.csv
bulk-pcrfclient01-201510131625.csv
bulk-pcrfclient01-201510131630.csv
```

# Retention of CSV Files

CPS retains each bulk statistic CSV file on the pcrfclient01/02 VM for 2 days, after which the file is automatically removed. If you need to preserve these CSV files, you must back up or move them to an alternate system.

# Configuring Logback.xml

Configuration of the CPS application statistics is controlled in the `/etc/collectd.d/logback.xml` file.

Refer to http://logback.qos.ch/manual/appenders.html for more information about the configuration of the `logback.xml` file.

Collectd is configured in the following files:

- `/etc/collectd.conf`
- `/etc/collectd.d/jmxplugin.conf`
- `/etc/collectd.d/exec.conf`

# Restarting the Collectd Service

After making any configuration changes to logback.xml, restart the collectd service:

```
monit restart collectd
```

# Adding Realm Names to Diameter Statistics

By default, the Diameter statistics that are generated do not include the realm names. To include realms in the statistics collected, add the following line in the qns.conf file (comma separated auth-appl-id).

```
-Ddiameter.appid.realm.stats=Auth-Appl-Id-1,Auth-Appl-Id-2,… Auth-Appl-Id-n
```

where each Auth-Appl-Id refers to the specific protocol's Auth-Application-Id for which realms are needed in the statistics.

For example, to add Gx, Gy, Rx and Sy realms to the statistic names, use the following Auth-Appl-Ids:

```
-Ddiameter.appid.realm.stats=16777238,16777235,16777236,9
```

where

- Gx Auth-Application-ID = 16777238
- Rx Auth-Application-ID = 16777236
- Gy Auth-Application-ID = 4
- Sy Auth-Application-ID = 7

**Note** Adding a realm will increase the number of statistics generated/collected. Add realms only when necessary.

As an example, statistic names with and without the realms are shown below for reference for the following statistic:

e2e_<domain>_[realm_][alias_]<message id>

**Counter name with Realm (with qns.conf file modification):**

C,lb02,node2.messages.e2e_PHONE_sy-ac.cisco.com_AC_Syp_AAR_2001.qns_stat.success,528

C,lb02.node2.messages.e2e_PHONE_sy-bm.cisco.com_BM_Syp_AAR_2001.qns_stat.success,1221

**Counter name without Realm (without qns.conf file modification):**

C,lb01,node2.messages.e2e_PHONE_AC_Syp_AAR_2001.qns_stat.success,1495

C,lb01,node2.messages.e2e_PHONE_BM_Syp_AAR_2001.qns_stat.success,4

Each statistic field has a fixed maximum length of 63 characters. Based on the current syntax, the length of the realm should not exceed 16 characters, otherwise it will lead to truncation of the counter name.

# CPS KPI Monitoring

This section provides a list of Key Performance Indicators (KPIs), useful for tracking the overall health of CPS.

The complete list of CPS statistics is available in a spreadsheet format in the following location on the Cluster Manager VM:

`/var/qps/install/current/scripts/documents/QPS_statistics.xlsx`

The KPIs highlighted in the following sections are also included on the **Stats Recommended to Monitor** tab in the `QPS_statistics.xlsx` spreadsheet.

## System Health Monitoring KPIs

The following table lists the KPIs and thresholds to track the overall performance of the CPS deployment, including information about the underlying hardware.

***Table 17: System Health Monitoring KPIs***

| Name/Description | Statistics/Formula | Warning Threshold | Major Threshold |
|---|---|---|---|
| CPU Utilization<br>CPU is a critical system resource. When the demand increases and CPU utilization exceeds 80% utilization, the efficiency of the CPU is reduced. When CPU utilization exceeds 80%, the application processing time will increase, message response will increase, and drops and timeouts will be seen. | 100 - cpu.<*cpuid*>.idle | > 60% utilization over 60 second period<br>(assuming that idle is less than 40%) | > 80% utilization over 60 second period<br>(assuming idle is less than 20%) |
| CPU Steal<br>If multiple VMs on the same hypervisor and same hardware have concurrent CPU demands, the hypervisor will “steal” CPU from one VM to satisfy another VM CPU needs. If the CPU Steal statistic is non-zero, there is not enough CPU allocated for the VMs. | cpu.<*cpuid*>.steal | - | > 2% over 60 second period |
| CPU I/O Wait<br>This monitors CPU I/O wait time. High CPU wait times may indicate CPUs waiting on disk access. | cpu.<*cpuid*>.wait | > 30 for more than 5 min | > 50 for more than 10 min |

| Name/Description | Statistics/Formula | Warning Threshold | Major Threshold |
|---|---|---|---|
| Memory utilization<br>Memory is a system resource, which needs to be less than 80%. The swap threshold has been reduced for CPS, and swapping should occur when the system resources are exhausted and memory utilization hits 99%. | (memory.used / (memory.used + memory.free + memory.buffered + memory.cached)) * 100 | > 70% utilization over 60 second period | > 80% utilization over 60 second period |
| Disk Utilization<br>Disk storage is a critical system resource, and when file system utilization exceeds 90% utilization the system can become less efficient. When the file system utilization hits 100%, then application can stop functioning. | df.<fs>.df_complex.free<br>- df.<fs>.df_complex.used | > 80% utilization | > 90% utilization |
| Session Store utilization<br>This KPI monitors the amount of database storage available. The data is evenly distributed across all shards, so any specific shard will have the same utilization rate as all shards. | var-data-sessions_1-free<br>- var-data-sessions_1-used | > 70% utilization | > More than 80% utilization |
| In Queue<br>These statistics monitors how long a message waits in the application queue, waiting to be serviced. The value should be 0 all the time. Non-zero values indicate the application is too slow, short of resources, or overwhelmed. | node1.messages.in_q*.avg | - | More than 1 ms over 60 seconds |
| Diameter 3xxx errors<br>Diameter Too Busy 3xxx message indicate that the PCRF is overwhelmed, or responding too slowly. This can be related to In Queue issues, system resources, database problems, network latency, or issues with SPR or other external nodes in the call flow. | messages.e2e_*_<br>3xxx.success<br>(and exclude the late statistics)<br>as a percentage of *.node*.messages.<br>e2e_*2001.success | > 0.5% of *.node*.messages.<br>e2e_*2001.success<br>Over 30 minute period | > 1% of *.node*.messages.<br>e2e_*2001.success<br>Over 30 minute period |

| Name/Description | Statistics/Formula | Warning Threshold | Major Threshold |
|---|---|---|---|
| Diameter 5xxx errors<br>Session Not Found and other Diameter 5xxx errors indicate a critical problem with the ability to process the incoming diameter message. This can be related to exhausted PCRF system resources, invalid session id or bad message structure, length, or content, or even database corruption. | messages.e2e_*_<br>5xxx.success<br>(and exclude the late statistics)<br>as a percentage of *.node*.messages.<br>e2e_*2001.success | > 0.5% of *.node*.messages.<br>e2e_*2001.success<br>Over 5 minute period | > 1% of *.node*.messages.<br>e2e_*2001.success<br>Over 5 minute period |
| Diameter Message Response Time | - | > 100 ms for more than 30 minutes | > 300 ms for more than 15 minutes |
| Active Session Count | set_session_count_total.<br>records | >80% of the lessor of the dimensioned or licensed capacity for more than 1 hour<br>or<br>= 0 for more than 5 minutes | >80% of the lessor of the dimensioned or licensed capacity for more than 10 minutes<br>or<br>= 0 for more than 10 minutes |
| Policy Execution Count (Internal TPS) | - | > 80% of the lessor of the dimensioned TPS capacity for more than 1 hour<br>or<br>= 0 for more than 5 minutes | > 80% of the lessor of the dimensioned TPS capacity for more than 10 minutes<br>or<br>= 0 for more than 10 minutes |
| Policy Errors | - | > 0 | > 20 within 5 minutes |

| Name/Description | Statistics/Formula | Warning Threshold | Major Threshold |
|---|---|---|---|
| Dedicated Bearer Errors | node1.counters.<*domain*><br>_[realm_]<br>Gx_bearer_setup_qci_<*qci*><br>_fail_<*failure-code*><br>.qns_count<br>as a percentage of node1.counters.<br><*domain*><br>_[realm_]<br>Gx_bearer_setup_qci_<*qci*>.<br>qns_count | > .1 | > .5 |
| % of failed VoLTE calls due to resource allocation<br>This KPI monitors failed VoLTE calls due to resource allocation errors on the PCEF. A spike in this measurement does not indicate a CPS issue, but may flag an issue in the mobile network that should be investigated. | - | > .1 | > .5 |
| % of Messages dropped due to SLA timeout<br>Messages dropped due to SLA timeouts indicate that the PCRF is overwhelmed, or responding too slowly. This can be related to In Queue issues, system resources, database problems, network latency, or issues with SPR or other external nodes in the call flow. | node1.counters.[realm_]*<br>_drop.qns_count as a percentage<br>of *.node*.messages.<br>e2e_*2001.success | > 0.5% of *.node*.messages.<br>e2e_*2001.success | > 1% of *.node*.messages.<br>e2e_*2001.success |

# Session Monitoring KPIs

The following KPIs enable you to monitor CPS session operation volumes, error counts and other useful statistics.

**Note** As each deployment is unique, no recommended ranges are provided. Cisco recommends monitoring these KPIs for a period of time (1-3 months) to establish a baseline. Deviations can then be monitored from the baseline values.

*Table 18: Session Monitoring KPIs*

| Category | Name/Description | Statistics/Formula | Availability/ Node |
|---|---|---|---|
| Session Operation | Errored session creation count | node1.actions.CreateEntry. qns_stat.error | Policy Server (qns) |
| Session Operation | Successful session creation count | node1.actions.CreateEntry. qns_stat.success | Policy Server (qns) |
| Session Operation | Total milliseconds of successful session creations | node1.actions.CreateEntry. qns_stat.total_time_in_ms | Policy Server (qns) |
| Session Operation | Errored session deletion count | node1.actions.DeleteEntry. qns_stat.error | Policy Server (qns) |
| Session Operation | Successful session deletion count | node1.actions.DeleteEntry. qns_stat.success | Policy Server (qns) |
| Session Operation | Total milliseconds of successful session deletions | node1.actions.DeleteEntry. qns_stat.total_time_in_ms | Policy Server (qns) |
| Session Operation | Errored session retrieval count | node1.actions. GetSessionAction. qns_stat.error | Policy Server (qns) |
| Session Operation | Successful session retrieval count | node1.actions. GetSessionAction. qns_stat.success | Policy Server (qns) |
| Session Operation | Total milliseconds of successful session retrievals | node1.actions. GetSessionAction. qns_stat.total_ time_in_ms | Policy Server (qns) |
| Session Operation | Errored session update count | node1.actions.UpdateEntry. qns_stat.error | Policy Server (qns) |
| Session Operation | Successful session update count | node1.actions.UpdateEntry. qns_stat.success | Policy Server (qns) |
| Session Operation | Total milliseconds of successful session updates | node1.actions.UpdateEntry. qns_stat.total_ time_in_ms | Policy Server (qns) |

| Category | Name/Description | Statistics/Formula | Availability/ Node |
|---|---|---|---|
| Internal Messages | Errored timer messages | node1.messages. TimerExpired. qns_stat.error | Policy Server (qns) |
| Internal Messages | Successful timer messages | node1.messages. TimerExpired. qns_stat.success | Policy Server (qns) |
| Session | Gauge count of lock percentage | <*set_name*>. lock.percent | sessionmgr |
| Session | Gauge count of delete operations | <*set_name*>. op_delete.gauge | sessionmgr |
| Session | Gauge count of insert operations | <*set_name*>. op_insert.gauge | sessionmgr |
| Session | Gauge count of update operations | <*set_name*>. op_update.gauge | sessionmgr |
| Secondary Key Operations | Per ring count of failed lookup for primary key using the secondary key in cache ring | node1.counters.skcache_ring <*1\|2*>_cache_miss. qns_count | Policy Server (qns) |
| Session Type Count | Count of session types (GX_TGPP/RX_TGPP/ SY_PRIME/SD_V11 … etc) in active session DB partition per admin set | <*setid*>.set_ <*set number of admin db*> _session_type_ <*session_type*>.records | sessionmgr |
| Session Count | Count of sessions in all active session DB partitions<br>Threshold: > 80% of dimensioned or licensed capacity for more than 1 hour, or = 0 (zero) for more than 5 minutes | set_session_count_ total.records | Policy Server (qns) |

# Diameter Monitoring KPIs

The following CPS KPIs are useful for monitoring Diameter message traffic.

**Note** As each deployment is unique, no recommended ranges are provided. Cisco recommends monitoring these KPIs for a period of time (1-3 months) to establish a baseline. Deviations can then be monitored from the baseline values.

*Table 19: Diameter Monitoring KPIs*

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Gx/F | Diameter Round Trip | node[x].messages.e2e_<domain>_[realm_]Gx_CCR-I_2001.qns_stat.success | Success message count for return code 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages.e2e_<domain>_[realm_]Gx_CCR-I_2001.qns_stat.total_time_in_ms | Total milliseconds of successful messages with return code matching 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages.e2e_<domain>_[realm_]Gx_CCR-I_3xxx.qns_stat.success | Success count of messages with return code matching 3XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages.e2e_<domain>_[realm_]Gx_CCR-I_4xxx.qns_stat.success | Success count of messages with return code matching 4XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages.e2e_<domain>_[realm_]Gx_CCR-I_5xxx.qns_stat.success | Success count of messages with return code matching 5XXX | Policy Director |

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Gx/A | Diameter Input Queue | node1.counters. [realm_] Gx_CCR-I.qns_count | Count of messages successful sent to the policy engine | Policy Server (qns) |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_2001. qns_stat.success | Success message count for return code 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_2001. qns_stat.total_ time_in_ms | Total milliseconds of successful messages with return code matching 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_3xxx. qns_stat.success | Success count of messages with return code matching 3XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_4xxx. qns_stat.success | Success count of messages with return code matching 4XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_5xxx. qns_stat.success | Success count of messages with return code matching 5XXX | Policy Director |

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Gx/A | Diameter Input Queue | node1.counters. [realm_] Gx_CCR-U. qns_count | Count of messages successful sent to the policy engine | Policy Server (qns) |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_2001. qns_stat.success | Success message count for return code 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_2001. qns_stat. total_time_in_ms | Total milliseconds of successful messages with return code matching 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_3xxx. qns_stat.success | Success count of messages with return code matching 3XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_4xxx. qns_stat.success | Success count of messages with return code matching 4XXX | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-U_5xxx. qns_stat.success | Success count of messages with return code matching 5XXX | Policy Director |

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Gx/A | Diameter Input Queue | node1.counters. [realm_] Gx_CCR-U. qns_count | Count of messages successful sent to the policy engine | Policy Server (qns) |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-T_2001. qns_stat.success | Success message count for return code 2001 | Policy Director |
| Gx/F | Diameter Round Trip | node[x].messages. e2e_<domain>_ [realm_] Gx_CCR-T_2001. qns_stat.total_ time_in_ms | Total milliseconds of successful messages with return code matching 2001 | Policy Director |

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Sy/F | Diameter Round Trip | node[x].messages.<br>e2e_<domain>_<br>[realm_]<br>Sy_STR_3xxx.<br>qns_stat.success | Success count of messages with return code matching 3XXX | Policy Director |
| Sy/F | Diameter Round Trip | node[x].messages.<br>e2e_<domain>_<br>[realm_]<br>Sy_STR_4xxx.<br>qns_stat.success | Success count of messages with return code matching 4XXX | Policy Director |
| Sy/F | Diameter Round Trip | node[x].messages.<br>e2e_<domain>_<br>[realm_]<br>Sy_STR_5xxx.<br>qns_stat.success | Success count of messages with return code matching 5XXX | Policy Director |
| Sy/A | Diameter Input Queue | node1.counters.<br>[realm_]<br>Sy_STA_bypass.<br>qns_count | Count of message that do not require processing by the policy engine | Policy Server (qns) |
| Sy/A | Diameter Input Queue | node1.counters.<br>[realm_]<br>Sy_STA.qns_count | Count of messages successful sent to the policy engine | Policy Server (qns) |
| Sy/A | Diameter Input Queue | node1.counters.<br>[realm_]<br>Sy_STA_drop.<br>qns_count | Count of messages dropped due to exceeding SLA | Policy Server (qns) |
| Sy/A | Diameter Input Queue | node1.messages.<br>in_q_Sy_STA.<br>qns_stat.success | Count of messages successfully sent to the policy engine | Policy Server (qns) |

| AppId/ Monitoring Area | Category | Statistic | Description | Availability/ Node |
|---|---|---|---|---|
| Sy/A | Diameter Input Queue | node1.messages. in_q_Sy_STA. qns_stat.total_ time_in_ms | Total milliseconds of messages successfully sent to the policy engine | Policy Server (qns) |
| Sy/D | Engine Message | node1.messages. diameter_Sy_STA. qns_stat.success | Success message count | Policy Server (qns) |
| Sy/D | Engine Message | node1.messages. diameter_Sy_STA. qns_stat. total_time_in_ms | Total milliseconds of successful messages | Policy Server (qns) |
| Sy/B | Diameter Action | node1.actions.send. diameter_Sy_STR. qns_stat.success | Success actions count | Policy Server (qns) |
| Sy/B | Diameter Action | node1.actions.send. diameter_ Sy_STR.qns_stat. total_time_in_ms | Total milliseconds of successful actions | Policy Server (qns) |
| Sy/E | Diameter Output Queue | node1.counters. [realm_] Sy_STR.qns_count | Count of messages successfully sent to the Policy Director (LB) | Policy Server (qns) |

# Database Fragmentation Monitoring KPIs

CPS supports KPIs to monitor MongoDB level fragmentation using Grafana and generate an SNMP alarm when MongoDB fragment percentage exceeds a specified value.

The following databases are monitored for fragmentation statistics:

***Table 20: List of Databases for Monitoring Fragmentation***

| Replica Set Type | Database Name | Collections | Comment |
|---|---|---|---|
| Session | session_cache, session_cache_2… | session | Session and UDC |
| Session | sk_cache, sk_cache_2… | secondary_key | Secondary Key DB |

| Replica Set Type | Database Name | Collections | Comment |
|---|---|---|---|
| ADMIN or SESSION | diameter | endpoints | - |
| SPR | spr | subscriber | - |
| BALANCE | balance_mgmt,balance_mgmt_2… | account | Covers all the shards |

### Fragmentation KPI

1. The following query must be configured in Grafana dashboard to view different statistics:

   **Fragmentation Percent**

   `cisco.quantum.qps.<hostName>.<replicaSetName>_<hostName>_<port>_<dbName>.mongo_frag.fragPercent`

   **File Size**

   `cisco.quantum.qps.<hostName>.<replicaSetName>_<hostName>_<port>_<dbName>.mongo_frag.fileSize`

   **Index Size**

   `cisco.quantum.qps.<hostName>.<replicaSetName>_<hostName>_<port>_<dbName>.mongo_frag.indexSize`

   **Data Size**

   `cisco.quantum.qps.<hostName>.<replicaSetName>_<hostName>_<port>_<dbName>.mongo_frag.dataSize`

   **Derived File Size**

   `cisco.quantum.qps.<hostName>.<replicaSetName>_<hostName>_<port>_<dbName>.mongo_frag.derivedFileSize`

   Statistics once gathered are published to Grafana via collectd.

2. Bulk statistics CSV files are created in `/var/broadhop/stats/` directory on pcrfclient01 host. Statistics from `agg-stats.0.csv` are:

```
[root@pcrfclient01 ~]# grep -Eo ".*sessionmgr01.*?set01_*?27717_session_cache\.mongo.*"
 /var/broadhop/stats/agg-stats.0.csv
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.indexSize,429665152.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.storageSize,5336334224.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.fileSize,5886181376.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.documentCountInColl,646142.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.dataSize,5282857696.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.derivedFileSize,5349310464.0
2020-01-27T05:29:26.158+0000,G,sessionmgr01.set01_sessionmgr01_27717_session_cache.mongo_frag.fragPercent,3.0
```

3. The script generates the following log file for troubleshooting purpose on sessionmgr VMs:

   `/var/log/mongodb-frag-check.log`

4. The script generates a replica set wise temporary csv files local to host. The files are of the following pattern:

   `/var/tmp/<replicaSetName>_frag_stats.csv`

5. The statistics for session_cache, sk_cache, diameter, and SPR databases (using primary members) can be checked using the following command:

   `diagnostics.sh --get_frag_status`

**Note** The `diagnostics.sh --get_frag_status` like `diagnostics.sh --get_session_shard_health` is supported with root user only for multi-cluster HA and GR setups.

### Alarm Generation

- The script reads `/var/tmp/<replicaSetName>_frag_stats.csv` files to decide whether to send up or down alarm.
- The following trap generation script also logs the data to log file:

  `/var/log/broadhop/scripts/gen-frag-trap.log`

## Configure Custom Database Fragmentation Threshold Percentage

The `/etc/collectd.d/dbMonitorList.cfg` file present on sessionmgr VMs contains the list of databases and their corresponding fragmentation threshold percentage values. By default, the fragmentation threshold value is 40 %. If a different threshold value needs to be updated, perform the following steps:

**Step 1** Update the `Configuration.csv` file with the required database name and their corresponding threshold percentage value. The format to provide the custom threshold percentage value is as follows (where, *XX* is numeric value of percentage).

```
session_cache,XX,
sk_cache,XX,
diameter,XX,
spr,XX,
balance_mgmt,XX,
```

**Step 2** Execute the following commands to update the `/etc/collectd.d/dbMonitorList.cfg` file so that it has the new threshold values from `Configuration.csv` file:

```
/var/qps/install/current/scripts/import/import_deploy.sh
/var/qps/install/current/scripts/upgrade/reinit.sh
```

# Example CPS Statistics

## Sample CSV Files

The following list is a sample of the file names created in the /var/broadhop/stats directory on the pcrfclient01 VM.

```
[root@pcrfclient01 stats]# pwd
    /var/broadhop/stats
    [root@pcrfclient01 stats]# ls
    bulk-pcrfclient01-201510131350.csv
    bulk-pcrfclient01-201510131355.csv
    bulk-pcrfclient01-201510131400.csv
    bulk-pcrfclient01-201510131405.csv
```

```
bulk-pcrfclient01-201510131410.csv
bulk-pcrfclient01-201510131415.csv
bulk-pcrfclient01-201510131420.csv
bulk-pcrfclient01-201510131425.csv
bulk-pcrfclient01-201510131430.csv
bulk-pcrfclient01-201510131435.csv
bulk-pcrfclient01-201510131440.csv
bulk-pcrfclient01-201510131445.csv
bulk-pcrfclient01-201510131450.csv
bulk-pcrfclient01-201510131455.csv
bulk-pcrfclient01-201510131500.csv
bulk-pcrfclient01-201510131505.csv
bulk-pcrfclient01-201510131510.csv
bulk-pcrfclient01-201510131515.csv
bulk-pcrfclient01-201510131520.csv
bulk-pcrfclient01-201510131525.csv
bulk-pcrfclient01-201510131530.csv
bulk-pcrfclient01-201510131535.csv
bulk-pcrfclient01-201510131540.csv
bulk-pcrfclient01-201510131545.csv
bulk-pcrfclient01-201510131550.csv
bulk-pcrfclient01-201510131555.csv
bulk-pcrfclient01-201510131600.csv
bulk-pcrfclient01-201510131605.csv
bulk-pcrfclient01-201510131610.csv
bulk-pcrfclient01-201510131615.csv
bulk-pcrfclient01-201510131620.csv
bulk-pcrfclient01-201510131625.csv
bulk-pcrfclient01-201510131630.csv
```

# Sample Output

C,<*VM_name*>,node1.actions.send.diameter_Gx_CCA-I.qns_stat.success,19

where, the <*VM_Name*> indicates which VM the statistics has been collected on.

A sample bulk statistics .csv file is shown below:

```
C,qns01,node1.actions.SaveSubscriberActionImpl.qns_stat.error,0
C,qns01,node1.actions.SaveSubscriberActionImpl.qns_stat.success,6
C,qns01,node1.actions.send.diameter_Gx_CCA-I.qns_stat.error,0
C,qns01,node1.actions.send.diameter_Gx_CCA-I.qns_stat.success,19

- Log Collector, on page 202

# Policy Tracing and Execution Analyzer

Cisco Policy Server comes with a set of utilities to actively monitor and trace policy execution. These utilities interact with the core policy server and the mongo database to trigger and store traces for specific conditions.

## Architecture

The policy tracing and execution analyzer is 3-tier architecture:

- Tier 1 — command line utilities to manage the policy trace generation and extract policy traces.
- Tier 2 — policy server creation of policy traces using triggers defined in Tier 1.
- Tier 3 — storage of the policy traces in a MongoDB.

## Administering Policy Traces

All commands are located on the Control Center virtual machine within `/var/qps/bin/control` directory. There are two main scripts which can be used for tracing: `trace_ids.sh` and `trace.sh`.

- The `trace_ids.sh` script maintains all rules for activating and deactivating traces within the system.
- The `trace.sh` script allows for the real time or historical retrieval of traces.

Before running `trace_ids.sh` and `trace.sh`, confirm which database you are using for traces. For more information, refer to Policy Trace Database, on page 193. If no database has been configured, then by default the scripts connects to primary database member of SPR-SET1.

# Managing Trace Rules using trace_ids.sh

Running `trace_ids.sh` with *-h* arguments produces a help text describing the capabilities of the script.

```
/var/qps/bin/control/trace_ids.sh -h
```

Usage:

```
/var/qps/bin/control/trace_ids.sh -i <specific id> -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace_ids.sh -i <specific id> -c <command code> -d
sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace_ids.sh -r <specific id> -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace_ids.sh -x -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace_ids.sh -l -d sessionmgr01:27719/policy_trace
```

**Note** By default , if *-d* option is not provided then the script connects to primary database member of SPR-SET1. If you are not using the SPR database, you need to find out the which database you are using. To find out which database you are using, refer to Policy Trace Database, on page 193. Make sure to update the commands mentioned in Step 1, on page 190 to Step 5, on page 190 accordingly.

This script starts a selective trace and outputs it to standard out.

**Step 1** Specific audit ID tracing:

```
/var/qps/bin/control/trace_ids.sh -i <specific id>
```

**Step 2** Specific audit ID tracing with specific command codes:

```
/var/qps/bin/control/trace_ids.sh -i <specific id> -c <command code>
```

*<command code>* is case sensitive and is used to trace specific control command message. For example, Gx_CCR-I, Sh_UDR and so on. You can add multiple command code separated by comma.

**Step 3** Remove trace for specific audit ID:

```
/var/qps/bin/control/trace_ids.sh -r <specific id>
```

**Step 4** Remove trace for all IDs:

```
/var/qps/bin/control/trace_ids.sh -x
```

**Step 5** List all IDs under trace:

```
/var/qps/bin/control/trace_ids.sh -l
```

Adding a specific audit ID for tracing requires running the command with the *-i* argument and passing in a specific ID. The policy server matches the incoming session with the ID provided and compares this against the following network session attributes:

- Credential ID
- Framed IPv6 Prefix
- IMSI
- MAC Address
- MSISDN

- User ID

If an exact match is found then the transaction are traced. Spaces and special characters are not supported in the audit ids.

- Removing a specific audit id from active tracing requires specifying the *-r* argument with id to remove.
- Removing all ids requires sending in the *-x* argument and this will remove all ids from the database.
- Listing all ids requires sending in the *-l* argument.

**Usage:**

Usage with SPR-SET as database:

```
#./trace_ids.sh -l
MongoDB shell version: 2.6.3
connecting to: sessionmgr01:27720/policy_trace
112345
MongoDB shell version: 2.6.3
connecting to: sessionmgr01:27720/policy_trace
null
```

Usage with *-d* option:

```
#./trace_ids.sh -l -d sessionmgr01:27717/policy_trace
MongoDB shell version: 2.6.3
connecting to: sessionmgr01:27717/policy_trace
874838
MongoDB shell version: 2.6.3
connecting to: sessionmgr01:27717/policy_trace
null
```

### Situations where traces are generated automatically

The following criteria cause the system to generate a trace regardless of whether the id is present in the trace database or not:

- If there is an AVP with the code: audit_id, audit-id, auditid. In this case, the traces are stored in the database with the value of the AVP.
- If there is a subscriber attribute (USuM AVP) with a code of audit-policy and a value of “true”. In this case, the traces are stored using the credentials stored for the subscriber.
- If an error is triggered internally.

**Note** An error is defined as an internal processing error (e.g. database failure or other failure) and is not a failure message code.

## Managing Trace Results using trace.sh

Running `trace.sh` with *-h* arguments produce a help text describing the capabilities of the script:

```
/var/qps/bin/control/trace.sh -h
```

Usage:

```
 /var/qps/bin/control/trace.sh -i <specific id> -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace.sh -x <specific id> -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace.sh -a -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace.sh -e -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace.sh -f -d sessionmgr01:27719/policy_trace
    /var/qps/bin/control/trace.sh -h
```

**Note** By default , if *-d* option is not provided then the script connects to primary database member of SPR-SET1. If you are not using the SPR database, you need to find out the which database you are using. To find out which database you are using, refer to Policy Trace Database, on page 193. Make sure to update the commands mentioned in Step 1, on page 192 to Step 4, on page 192 accordingly.

This script starts a selective trace and outputs it to standard out.

**Step 1** Specific audit ID tracing:

```
/var/qps/bin/control/trace.sh -i <specific id>
```

Specifying the *-i* argument for a specific ID causes a real time policy trace to be generated while the script is running. Users can redirect this to a specific output file using standard Linux commands.

**Step 2** Dump all traces for specific audit ID:

```
/var/qps/bin/control/trace.sh -x <specific id>
```

Specifying the *-x* argument with a specific ID, dumps all historical traces for a given ID. Users can redirect this to a specific output file using standard Linux commands.

**Step 3** Trace all:

```
/var/qps/bin/control/trace.sh -a
```

Specifying the *-a* argument causes all traces to output in real time policy trace while the script is running. Users can redirect this to a specific output file using standard Linux commands.

**Step 4** Trace all errors:

```
/var/qps/bin/control/trace.sh -e
```

Specifying the *-e* argument causes all traces triggered by an error to output in real time policy trace while the script is running. Users can redirect this to a specific output file using standard Linux commands.

**Step 5** Flush out the trace collection:

```
/var/qps/bin/control/trace.sh -f -d <DB>
```

# Policy Trace Database

The default location of the policy trace database is the administrative database and can be optionally specified in the trace database fields. These fields are defined at the cluster level in the system configurations.

**Note** Make sure to run all trace utility scripts from `/var/qps/bin/control` directory only.

## Configure Traces Database in Policy Builder

**Step 1** Log in to the Policy Builder.

**Step 2** From left pane, open up the *name of your system* and select the required cluster.

**Step 3** From right pane, select the check box for **Trace Database**.

The following table provides the parameter descriptions under **Trace Database** check box:

***Table 21: Trace Database Parameters***

| Parameter | Description |
|---|---|
| Primary Database IP Address | The IP address of the sessionmgr node that holds trace information which allows for debugging of specific sessions and subscribers based on unique primary keys. |
| Secondary Database IP Address | The IP address of the database that provides fail over support for the primary database.<br>This is the mirror of the database specified in the Primary IP Address field. Use this only for replication or replica pairs architecture. This field is present but deprecated to maintain downward compatibility. |
| Database Port | Port number of the database for Session data.<br>Default value is 27717. |

# Network Cutter Utility

CPS supports a new network cutter utility, which keeps monitoring Policy Server (QNS) VMs failures. When any of the Policy Server VMs are down, utility cuts those unnecessary connections to avoid sending traffic to Policy Server VMs that are down, and this also results in avoiding timeouts.

This utility is started by `monit` on Policy Director (lb) VMs and keeps monitoring policy server VMs failures.

Utility stores log on `/var/log/broadhop/network-cutter.log` file.

You can verify the status of network cutter utility on lb01/02 VMs using `monit summary` and `network-cutter` status command:

```
monit summary | grep cutter
Process 'cutter' Running
```

```
service network-cutter status
network-cutter (pid 3735) is running
```

You can verify if network cutter utility has been started using `ps -ef | grep cutter` command:

```
ps -ef | grep cutter
root 6496 1 0 Feb18 ? 00:16:22 /usr/java/default/bin/java -jar
/var/broadhop/images/network-cutter.jar
```

**Note** In CPS, CPU% consumption is high for the Policy Director (lb) that has lbvip configured than the Policy Director (lb) where lbvip is not present. This is due to netstat commands running for the network-cutter feature.

# Policy Builder Configuration Reporter

The Configuration-Reporter utility processes CPS Policy Builder configuration and report any missing cross-reference files and stale files. An option has also been provided to remove the stale files and missing cross-references in the XMI files from the configuration data in the utility.

**Important** This utility can be used before or after installation to check if customers have all the configuration files needed.

This reporting utility address the following concerns:

- Reports if there are any missing PB configuration files (.xmi files) and a summary of what those files are.
- Reports if there are any stale files and a summary of the same.

  Stale files are Service Option files whose corresponding Use Case Template files are missing.
- It also shows the missing configuration files on a per-file basis, showing the files that are referencing the missing files.
- Additionally, the customer can see all the different configuration objects and their quantity to see the variety of configurations they are using.
- Using -r option, utility creates a new archive file with cleaned XMI files (removes the stale files and missing cross-references from XMI files from the original configuration data).

To run the utility, perform the following steps:

1. Mount ISO on Cluster Manager if you unmounted the ISO after completing the CPS installation or upgrade.
2. Extract the release train into the temp directory:

   ```
   cd /tmp
   ```

   ```
   tar -zxvf /mnt/iso/app/install/release-train-xxx.tar.gz
   ```

   where, `release-train-xxx.tar.gz` is the release train version.
3. Go into Configuration-Reporter directory which is present inside utility directory of extracted utility.

   ```
   cd release-train-xxx/Utility/Configuration-Reporter
   ```

4. Execute jar using the following command:

   ```
   java -jar configuration-reporter.jar <pb-configuration-xmi-files-in-archive-form> [-r]
   ```

   where,

   - *<pb-configuration-xmi-files-in-archive-form>* is the name of the configuration file.
   - `[-r]` is an optional parameter and if specified will remove all the references of missing files from XMI files and stale files in the archive file and outputs the corrected archive as `filename_cleaned.zip|cps` (output file will have same extension as input file) on the same path where command runs.

# CRD Generator Conversion Tool

CPS provides a CRD conversion tool which converts existing Balance and Quota templates PB configuration data to CRD Data. You can provide XMI files to the tool in the following ways:

- Use Import/Export tool to export CPS configuration as an archive file (.cps extension archive) and provide the same to the tool.
- Archive set of XMI files to .zip extension archive file.
- Provide directory path where XMI files are present as an input to the tool.

**Important** The conversion tool is used to convert all Balance and Quota template configuration data to CRD data. This helps to reduce the number of XMI files in the system and improves the performance.

**Prerequisites:**

The feature `com.broadhop.balance.crdbalance.feature` must be enabled so that CRD tables for Balance and Quota Template details are displayed in Policy Builder (as readonly) and Control Center. These CRD tables need to be present for importing the Balance and Quota CRD data which will be converted using the tool and Balance and Quota Templates XMIs present in Policy Builder.

To enable `com.broadhop.balance.crdbalance.feature`, add the feature in `/var/qps/current_config/etc/broadhop/pb/features` and `/var/qps/current_config/etc/broadhop/pcrf/features` files. For more information, refer to *Customize Features in the Deployment* section in *CPS Installation Guide for VMware*.

To run the utility, perform the following steps:

1. Mount ISO on Cluster Manager.
2. Extract release train into temp directory:

   ```
   tar -zxvf /mnt/iso/app/install/xxx.tar.gz /tmp/
   ```

3. Go to `CRD_generator_Utility` directory which is inside the utility directory of the extracted release train:

   ```
   cd /tmp/release-train-xxx/Utility/CRD_generator_Utility
   ```

4. Execute jar using the following command:

```
java –jar com.broadhop.customreferencedata.generator-<svn-revision-number>-full.jar [-a
 <archive-file> | -d <directory>]
```

The following table describes the various command line options:

| Command Line Options | Description |
|---|---|
| -a | Option for passing zip archive file which contains XMI files. |
| -d | Option for passing directory path where XMI files are present. |
| -e | Generates .exportCrdInfo file with specified exportCRDversion. Valid Values 1 and 2 are described as follows:<br>**a.** 1 : Data-type validations will happen only during import of generated archive into CPS.<br>**b.** 2 : All validations will happen during import of generated archive into CPS and is the default value. |
| -h | Prints help. |
| -o | Object type for which CRD conversion needs to be performed. Default value is AccountBalanceTemplate. |
| -r | Removes duplicate CRD data. Valid Values 0 and 1 are described as follows:<br>**a.** 0 : De-duplication is disabled by default which means duplicate data will be part of generated CRD data files.<br>**b.** 1 : Keeps the first record is retained and skips the rest. De-duplication is enabled which means duplicate data will be not be part of generated CRD data. |
| -v | Validates CRD data against the schema (required field constraint validation).<br>Default value is true which means validation of schema is enabled and CRD data record with missing required field value will not be part of generated CRD data files. |
| -xls | Generates XLS format files for CRD data. Default option is CSV format CRD data files. |

The tool generates a ".crd" extension archive file containing ".exportCrdInfo" file and CRD tables data in CSV/XLS format which can be used by Import/Import All CRD functionality in CPS to import the CRD data into the system.

5. To view or edit the csv files, perform the following optional steps:
   a. View-only using Excel : In Excel, you can only view the csv files present in generated ".crd" archive where non-ASCII characters are present in it. In order to view non-ASCII characters which might be present in CRD Data, perform the following steps:
      1. Open a blank Excel file.
      2. Go to Menu option **Data** > **From Text File** and import the CRD table CSV file in which non-ASCII is present.
      3. A "Text Import Wizard" is displayed. Perform the following steps:
         a. Select Unicode (UTF-8) in File origin drop-down.
         b. Check **Comma** as delimiters.
         c. Do not perform any changes and click **Finish**.
         d. Click **Ok**.
      4. All non-ASCII characters are displayed correctly.

**Note** It is not recommended to edit generated CRD Table csv files containing non-ASCII characters in excel view.

   b. View and edit using other editors (vi editor): You can view and edit csv files present in ".crd" archive file using editors such as vi editor even if the CRD data contains non-ASCII characters.

6. The generated ".crd" extension archive file needs to be imported as CRD Data into CPS which can be performed using the following options:
   - Use "_import" CRD API to import CRD data in CSV format.
   - Use "Import All" option in Control Center to import CRD data in CSV format.
   - Use "Import" option in Control Center to import CRD data in XLS format. This option enables you to import single XLS CRD data at a time.

**Note** If you try to import multiple CRD tables during traffic it may have call flow impact. It is recommended to import multiple CRD tables during Maintenance Window (MW).

# Policy Builder Configuration Converter Conversion Tool

CPS provides a conversion tool to convert the balance references in the existing service configuration to CRD data string value to adopt the CRD table driven configuration solution. The tool can perform the following:

- Convert Account Balance template references present in existing Customer's PB Service configuration to CRD Data "Dynamic Reference Data Key" string value.
- An "-r" option is provided to clean up the following converted referenced data:
  - References to Account Balance template in Service Options, Use Case Templates and Use Case Options is removed in the output archive file configuration data.
  - Account Balance template and all Quota templates present in the original PB configuration data will not be part of output archive file.

**Important** This conversion tool is used to convert balance references in existing configuration data and clean Balance and Quota templates as part of result archive file. This helps in reducing the number of XMI files in configuration data.

To run the utility, perform the following steps:

1. Mount ISO on Cluster Manager.
2. Extract release train into temp directory:

   ```
   tar -zxvf /mnt/iso/app/install/xxx.tar.gz /tmp/
   ```

3. Go to `PB-Configuration-Converter_Utility` directory which is inside the utility directory of the extracted release train:

   ```
   cd /tmp/release-train-xxx/Utility/PB-Configuration-Converter_Utility
   ```

4. Execute jar using the following command:

   ```
   java –jar pb-configuration-converter-<svn-revision-number>-full.jar [-a <archive-file>
   | -d <directory> ] [-r]
   ```

   a. You have the option to provide the XMI files input as an archive file or directory path in which all Policy Builder created XMI files are present. Select any one of the following mandatory options to run the command:
      - -a : Option for passing Archive file (.zip or .cps extension archive file).
      - -d : Option for passing directory path containing XMI files to process.

   b. You can use "-r" option to perform cleanup operation for reducing the XMI files as follows:
      - Removes Account Balance template references from Service Option XMIs once the update of “Dynamic Reference Data Key” is performed.
      - Removes Account Balance template references from Use Case Template and Use Case Option XMI files.
      - Removes Account Balance template , One Time Quota template, Recurring Quota template and Rollover Quota template XMI files from PB configuration data in resulting archive file.

The tool generates an archive file named as “<input-file-name>_updated.<input-file-extension>” if it is an archive file input or "<input-directory-name>_updated.zip" if it is a directory file input.. It contains all the XMI files in the input file along with updated Service Option XMI files with a new field “dynamicRefDataKey” if there are references to Account Balance template object type.

**Note** The output archive file might not contain ".exportInfo" and ".exportRepositoryInfo" files as the tool only works on conversion of Service configuration balance reference data present in user input and copies all other input files in the output archive.

# Modifying Audit Rule File

You need to modify the `audit.rules` file as described in the following section.

**Step 1** Add new rules to `etc/audit/rules.d/audit.rules` file.

Sample Audit Rule File

```
cat audit.rules:
-D
-b 8192
-w /etc/group -p wa -k identity
-w /etc/passwd -p wa -k identity
-w /etc/shadow -p wa -k identity
```

**Step 2** Restart the auditd service by executing the following command:

```
service auditd restart
```

After restart, the audit files are loaded in the `audit.rules` file `/etc/audit` location.

**Step 3** Execute the following command to view all the implemented audit rules:

```
auditctl -l
```

**Step 4** Execute the following command to verify if the audit rule file is correct and error-free:

```
auditctl -R /etc/audit/audit.rules
```

If the audit.rule file has any error, it is highlighted in the output.

**Step 5** Monitoring of logging for critical file is done in the following location on cluster manager:

```
/var/log/audit/ audit.log
```

**Step 6** Execute the following command to validate particular audit logs:

```
ausearch -i -k <key to moniter>
e.g. ausearch -i -k "identity"
---
time->Fri Aug 24 11:29:19 2018
type=PROCTITLE
msg=audit(1535110159.513:18131):proctitle=7573657264656C00736F6D61
type=PATH msg=audit(1535110159.513:18131): item=0 name="/etc/passwd"
inode=2886645 dev=08:02 mode=0100644 ouid=0 ogid=0 rdev=00:00 objtype=NORMAL
type=CWD msg=audit(1535110159.513:18131):  cwd="/root"
type=SYSCALL msg=audit(1535110159.513:18131): arch=c000003e syscall=2 success=yes
exit=5 a0=5595b6cd69e0 a1=20902 a2=0 a3=8 items=1 ppid=25552 pid=26946 auid=0 uid=0
gid=0 euid=0 suid=0 fsuid=0 egid=0 sgid=0 fsgid=0 tty=pts1 ses=984 comm="userdel"
exe="/usr/sbin/userdel" key="identity"
```

```
time->Fri Aug 24 11:45:23 2018
----
type=CONFIG_CHANGE msg=audit(1535111123.222:18175): auid=4294967295 ses=4294967295
op=remove_rule key="identity" list=4 res=1
```

**Note** You can add the following rules to the audit file to montior each file:

```
-w /var/run/utmp -p wa -k session

-w /var/log/wtmp -p wa -k session

-w /var/log/btmp -p wa -k session

-w /etc/login.defs -p wa -k password

-w /etc/group -p wa -k identity

-w /etc/passwd -p wa -k identity

-w /etc/shadow -p wa -k identity

-w /etc/sudoers -p wa -k identity

-w /etc/fstab -p wa -k quota_rate_limit

-w /etc/iptables -p wa -k network
```

`Identity`, `quota_rate_limit`, and `network` are keywords used to search the respective log.

# Support for CPS Auto Healing in Case of Endpoint Heart Beat Failures

CPS supports an auto healing and auto correction in case of endpoint heart beat failures between the Policy Director (LB) and Policy Server (QNS) VMs IPC connections. When there is a heart beat failure, application generates the down counter for the same.

To support the auto correction of the qns process, two python scripts are utilized which runs through monit to monitor failure counters continuously. Depending on the heal option available, you need to enable or disable it to take necessary actions.

There are two scripts which monitor the counts and take the necessary actions:

- Auto heal client script which runs on Policy Server (QNS) and Policy Director (LB) VMs via monit collect the IPC connection down counters and if the IPC connection continue fails then the VM details are stored in the same VM.
- Auto heal server script which runs on pcrfclient (OAM) VMs via monit collects the details of the failed VM that are generated by the auto heal client script and sends the alarm for the same.

If the script is running with auto heal enabled, then the script sends an alarm and recovers the system by restarting the qns process. Before restarting the process, the script ensures that there is no other issues (such as, network connectivity or manual stop of qns process) on the VM. If present then the script skips the recover process for that qns process.

If the script is running with auto heal disabled, then it skips to recover the qns process but it sends an alarm.

The following section describes two scripts:

### auto_heal_server.py

Server script runs on pcrfclient VMs.

```
usage: auto_heal_server.py [-h] [--maxRestartCount MAXRESTARTCOUNT]
                           [--restartPeriod RESTARTPERIOD]
                           [--enableMode ENABLEMODE]
                           [--maxLogfileSize MAXLOGFILESIZE]
                           [--maxLogfilesCount MAXLOGFILESCOUNT]
                           [--waittime WAITTIME]
CPS Auto Healing
optional arguments:
  -h, --help            show this help message and exit
required named arguments:
  --maxRestartCount MAXRESTARTCOUNT, -m MAXRESTARTCOUNT
                        Maximum number of allowed restarts of QNS process
                        within a period
  --restartPeriod RESTARTPERIOD, -p RESTARTPERIOD
                        Period in seconds in which script allowed to be wait
                        next restart of qns process in case process not came
                        up.
  --enableMode ENABLEMODE, -e ENABLEMODE
                        Enabling the auto healing function, when flag true it
                        will restart QNS process
  --maxLogfileSize MAXLOGFILESIZE, -ls MAXLOGFILESIZE
                        Maximum size of the log file in bytes
  --maxLogfilesCount MAXLOGFILESCOUNT, -lc MAXLOGFILESCOUNT
                        Maximum number of logs to be keep in the log path
  --waittime WAITTIME, -w WAITTIME
                        Wait time in sec to get the process status from QNS
                        and LB VMs from client, if client still running.
```

### auto_heal_client.py

Client script runs on all LB and QNS VMs.

```
usage: auto_heal_client.py [-h] [--intervalSleep INTERVALSLEEP]
                           [--maxLogfileSize MAXLOGFILESIZE]
                           [--maxLogfilesCount MAXLOGFILESCOUNT]
                           [--waittime WAITTIME]

CPS Auto Healing

optional arguments:
  -h, --help            show this help message and exit

required named arguments:
  --intervalSleep INTERVALSLEEP, -i INTERVALSLEEP
                        Failure counter fetch interval sleep time in sec
  --maxLogfileSize MAXLOGFILESIZE, -ls MAXLOGFILESIZE
                        Maximum size of the log file in bytes
  --maxLogfilesCount MAXLOGFILESCOUNT, -lc MAXLOGFILESCOUNT
                        Maximum number of logs to be keep in the log path
  --waittime WAITTIME, -w WAITTIME
                        Wait time in sec to get the process status from QNS
                        and LB VMs from client, if client still running.
```

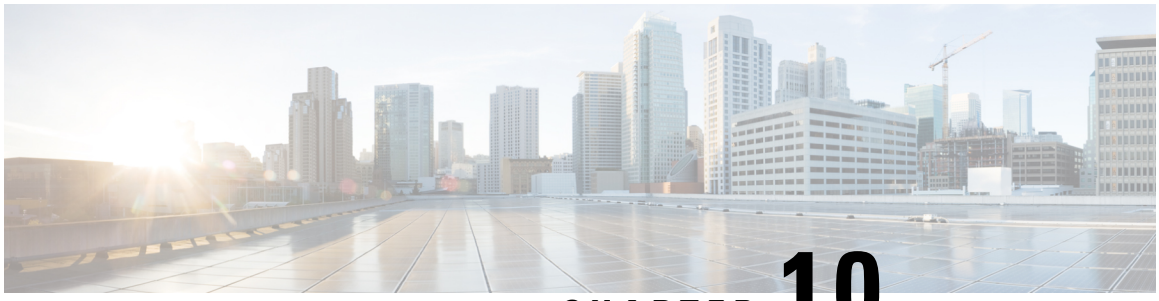
# Log Collector

The `logCollector.sh` script provides the following operations:

- Provides options to enable and disable the log levels for specific components, class, and interfaces.
- Provides the timer function in the script to collect specific logs for certain log level. Once the timer expires, the logs revert to the default log level.
- Provides an option to store the logs at a specified path or default path.
- Provides option to collect the application logs and MongoDB logs.

**Script location:** `/var/qps/bin/support/logCollector.sh`

For more information on the `logCollector.sh` script, refer to logcollector.sh, on page 228.



CHAPTER 10

# CPS Commands

**Note** If you want to save the output of any command on any of the CPS VMs, then the output should be redirected to a file.

- about.sh, on page 204

- terminatesessions, on page 256
- top_qps.sh, on page 259
- vmutilities.py, on page 260
- vm-init.sh, on page 262

# about.sh

This command displays:

- Core version
- Patch installed
- ISO version
- Feature version
- URLs to the various interfaces
- APIs for the deployment

### Syntax

```
/var/qps/bin/diag/about.sh [-h]
```

### Executable on VMs

- Cluster Manager
- pcrfclient01/02

# adduser.sh

This utility adds a new user to the specified nodes that are part of the CPS deployment. These accounts will be provisioned without shell access and, as such, they're only useful for authenticating against the various web-based GUIs used to administrate CPS.

The hosts that get provisioned with these new accounts can be selected using the 'node-regex' option. The default regular expression used by the script is:

```
node-regex ::= ^(pcrfclient|qns|lb[0-9]+|sessionmgr)
```

### Syntax

```
/var/qps/bin/support/adduser.sh [-h] [node-regex]
```

When prompted for the user’s group, set ‘qns-svn’ for read-write permissions or ‘qns-ro’ for read-only permissions.

To add a user with 'read/write' access to Control Center, their group should be 'qns'.

- To check if a user already exists, login in as root and enter ‘su <username>’.
- To check a user’s ‘groups’, enter ‘groups <username>’.

### Executable on VMs

All

### Example

```
[root@host /]# /var/qps/bin/support/adduser.sh
Enter username: username
Enter group for the user: groupname
Enter password: password
Re-enter password: password
The above example adds username to all the VMs in the cluster.
```

# auditrpms.sh

This script runs in background on all VMs except Cluster Manager. This script/daemon should be always running and is monitored via monit. No intervention from end user is required. Corresponding logs are generated at individual nodes in `/var/log/broadhop/audit/audit_rpms.log`.

**Note** All successful attempts i.e. installation or removal are tracked in this file. In case package is upgraded there would be two entries seen in log file, one for removal of old package and one for installation of new package.

### Executable on VMs

On all VMs except Cluster Manager

### Example

```
[root@lb01 ~]# monsum | grep auditrpms
Process 'auditrpms.sh' Running
```

# build_all.sh

This command is executed from Cluster Manager to rebuild CPS package.

### Syntax

- `/var/qps/install/current/scripts/build_all.sh`
- `/var/qps/install/current/scripts/build/build_all.sh`

### Executable on VMs

Cluster Manager

### Example

```

```

# build_etc.sh

This command is executed from Cluster Manager to rebuild etc.tar.gz in /etc/broadhop/ directory.

### Syntax

```
/var/qps/install/current/scripts/build/build_etc.sh
```

### Executable on VMs

Cluster Manager

### Example

```
[root@host /]# /var/qps/install/current/scripts/build/build_etc.sh
Building /etc/broadhop...
Copying to /var/qps/images/etc.tar.gz...
Creating MD5 Checksum...
```

# build_set.sh

This command is used to rebuild replica sets. This command is normally only run the first time the environment starts, but can be used if CPS databases must be rebuilt.

### Syntax

```
/var/qps/bin/support/mongo/build_set.sh [--help]
```

### Executable on VMs

All

### Example

To create replica-sets for SPR:

```
[root@host /]# /var/qps/bin/support/mongo/build_set.sh --spr --create
Starting Replica-Set Creation
Please select your choice: replica sets sharded (1) or non-sharded (2):
2
```

# capture_env.sh

This command collects most of the debug logs to debug an issue.

### Syntax

```
/var/qps/bin/support/env/capture_env.sh
```

### Executable on VMs

pcrfclient01/02

### Output

This command provides the following information to collect logs:

- -h|--help: Show usage
- -q|--qns: For capturing qns logs (default is to skip qns logs)
- -t|--trap: For capturing trap logs (default is to skip trap logs)
- -m|--mongo: For capturing mongo logs (default is to skip mongo logs)
- -v|--var-log: For capturing /var/log/messages (default is to skip the log)
- -a|--age: Should be followed by maximum age of log based on last modification time (defaults to 1 day)
- -n|--host: Should be followed by common separated list of hostnames for capturing logs (defaults to all hosts)

### Example

```
[root@host /]# /var/qps/bin/support/env/capture_env.sh
Creating archive of QPS environment information...
---------------------------
Capturing /etc/broadhop...
Capturing logs...
Capturing Policy Builder data...
Capturing installed software versions...
```

# change_passwd.sh

Used to change the user (Linux user) password on all VMs.

**Note** The `change_passwd.sh` script changes the password on all the VMs temporarily. You also need to generate an encrypted password. To generate encrypted password, refer to *System Password Encryption* in *CPS Installation Guide for VMware*. The encrypted password must be added in the `Configuration.csv` spreadsheet. To make the new password persisent, execute `import_deploy.sh`. If the encrypted password is not added in the spreadsheet and `import_deploy.sh` is not executed, then after running `reinit.sh` script, the qns-svn user takes the existing default password from `Configuration.csv` spreadsheet.

### Syntax

```
/var/qps/bin/support/change_passwd.sh [-h]
```

### Executable on VMs

All

### Example

```
Enter username whose password needs to be changed: root
Enter current password:
Enter new password:
Re-enter new password:
Trying to change password for root on
qns02,qns01,sessionmgr02,sessionmgr01,pcrfclient02,pcrfclient01,lb02,lb01, nodes

Done.
Disconnecting from pcrfclient02... done.
Disconnecting from lb01... done.
Disconnecting from lb02... done.
Disconnecting from qns01... done.
Disconnecting from sessionmgr02... done.
Disconnecting from pcrfclient01... done.
Disconnecting from qns02... done.
Disconnecting from sessionmgr01... done.
Successfully updated password on this host
```

**Note** Add `-f` or `--force` option to the script to reset the forgotten password only from the root user.

# cleanup_license.sh

Cleans up the records related to license in the licensedfeats collection in the sharding database. This command must be run as root user when license file is updated on the OAM (pcrfclient) machine.

### Syntax

```
/var/qps/bin/support/mongo/cleanup_license.sh [-h]
```

### Executable on VMs

- Cluster Manager
- pcrfclient01/02

# component_alarm_reports.py

This command is used to store or retrieve the open/active component alarms in CPS.

- For clear alarms, it removes the alarms matching the clear alarm.
- For active alarms, it clears old alarms if any and adds the latest alarm.

### Syntax

```
component_alarm_reports.py -h
usage: component_alarm_reports.py [-h] --action {update,report}
                                  [--eventhost EVENTHOST] [--date DATE]
                                  [--name NAME] [--facility FACILITY]
                                  [--severity SEVERITY] [--info INFO]

CPS Update/Report Component Alarm(s) to/from Mongo DB
optional arguments:
  -h, --help            show this help message and exit
  --action {update,report}, -a {update,report}
                        Action value update : Update an alarm. report : Report
                        active alarms
  --eventhost EVENTHOST, -e EVENTHOST
                        Event Host Name
  --date DATE, -d DATE  Date of event
  --name NAME, -n NAME  Name of alarm
  --facility FACILITY, -f FACILITY
                        Facility of alarm
  --severity SEVERITY, -s SEVERITY
                        Severity of alarm
  --info INFO, -i INFO  Info of alarm
```

**Attention** The `--action update` parameter is for Cisco Internal Use Only.

**Path:**

On Cluster Manager: `/var/qps/install/current/scripts/modules/component_alarm_reports.py`

On pcrfclient and policy director VMs:
`/var/qps/bin/install/current/scripts/modules/component_alarm_reports.py`

### Executable on VMs

Cluster Manager, Policy Director and OAM (pcrfclient) nodes

### Examples

To retrieve the active alarms:

```
component_alarm_reports.py –a report
event_host=lb02 name=ProcessDown severity=critical facility=operatingsystem
date=2017-22-11,10:13:49,310329511,+00:00 info=corosync process is down
```

# copytoall.sh

Prior to 7.0.5 release, in order to propagate the changes done in Cluster Manager, user used to execute `reinit.sh` which in turn triggers each CPS VM to download and install the updated VM images from the Cluster Manager and it time consuming process.

In CPS 7.0.5 and higher releases, if minor changes are made to any file in Cluster Manager, instead of executing `reinit.sh` script, use this command to synchronize the modified files from Cluster Manager to all other VMs.

### Syntax

```
copytoall.sh
```

### Executable on VMs

Cluster Manager

**Note** In case executing `copytoall.sh` command from qns-admin, prefix sudo before the command.

### Example

1. If the user updated `/etc/broadhop/logback.xml` file in Cluster Manager.
2. Build etc directory on each cluster by executing `build_all.sh` from Cluster Manager to rebuild CPS package script.

   `/var/qps/install/current/scripts/build_all.sh`
3. Execute the following command to copy the file:

   `SSHUSER_PREFERROOT=true copytoall.sh /etc/broadhop/logback.xml /etc/broadhop/logback.xml`

# diagnostics.sh

Runs a set of diagnostics and displays the current state of the system. If any components are not running, red failure messages are displayed.

**Note** RADIUS-based policy control is no longer supported in CPS 14.0.0 and later releases as 3GPP Gx Diameter interface has become the industry-standard policy control interface.

### Syntax

```
/var/qps/bin/diag/diagnostics.sh -h
Usage: /var/qps/bin/diag/diagnostics.sh [options]
This script runs checks (i.e. diagnostics) against the various access, monitoring, and
configuration points of a running CPS system.
In HA/GR environments, the script always does a ping check for all VMs prior to any other
checks and adds any that fail the ping test to the IGNORED_HOSTS variable. This helps reduce
 the possibility for script function errors.
NOTE: See /var/qps/bin/diag/diagnostics.ini to disable certain checks for the HA/GR env
persistently. The use of a flag will override the diagnostics.ini value.
Examples:
    /var/qps/bin/diag/diagnostics.sh -q
    /var/qps/bin/diag/diagnostics.sh --basic_ports --clock_skew -v
--ignored_hosts='portal01,portal02'

Options:
    --basic_ports : Run basic port checks

        For HA/GR: 80, 11211, 7070, 8080, 8081, 8090, 8182, 9091, 9092, and Mongo DB ports
 based on /etc/broadhop/mongoConfig.cfg
    --clock_skew : Check clock skew between lb01 and all vms (Multi-Node Environment only)
    --diskspace : Check diskspace
    --get_active_alarms : Get the active alarms in the CPS
    --get_frag_status : Get fragmentation status for Primary members of DBs viz.
session_cache, sk_cache, diameter, spr, and balance_mgmt.

    --get_replica_status : Get the status of the replica-sets present in environment.
(Multi-Node Environment only)
    --get_shard_health : Get the status of the sharded database information present in
environment. (Multi-Node Environment only)
   --get_sharding_status : Get the status of the sharding information present in environment.
 (Multi-Node Environment only)
    --get_session_shard_health : Get the session shard health status information present
in environment. (Multi-Node Environment only).
    --get_peer_status: Get the diameter peers present in the environemt.
    --get_sharded_replica_status : Get the status of the shards present in environment.
(Multi-Node Environment only)
   --ha_proxy : Connect to HAProxy to check operation and performance statistics, and ports
 (Multi-Node Environment only)
        http://lbvip01:5540/haproxy?stats
        http://lbvip01:5540//haproxy-diam?stats
    --help -h : Help - displays this help

    --ignored_hosts : Ignore the comma separated list of hosts. For example
--ignored_hosts='portal01,portal02'
        Default is 'portal01,portal02,portallb01,portallb02' (Multi-Node Environment only)
    --ping_check : Check ping status for all VM
    --policy_revision_status : Check the policy revision status on all QNS,LB,UDC VMs.
```

```
    --lwr_diagnostics : Retrieve diagnostics from CPS LWR kafka processes
    --qns_diagnostics : Retrieve diagnostics from CPS java processes
    --qns_login : Check qns user passwordless login
    --quiet -q : Quiet output - display only failed diagnostics
    --radius : Run radius specific checks
    --redis  : Run redis specific checks
    --whisper  : Run whisper specific checks
    --aido : Run Aido specific checks
   --svn : Check svn sync status between pcrfclient01 & pcrfclient02 (Multi-Node Environment
 only)
    --tacacs : Check Tacacs server reachability
    --swapspace : Check swap space
   --verbose -v : Verbose output - display *all* diagnostics (by default, some are grouped
 for readability)
    --virtual_ips : Ensure Virtual IP Addresses are operational (Multi-Node Environment
only)
    --vm_allocation : Ensure VM Memory and CPUs have been allocated according to
recommendations
```

**Note** If IPv6 address is more than 23 characters, due to the restriction in the column width, only 23 characters are displayed in the `diagnostics.sh --get_replica_status` output for IPv6 address. The host name present in the `diagnostics.sh --get_replica_status` can be used to identify IP address.

The test for swap memory usage must have the following criteria :

- The test passes if the swap space used is less than 200 MB.
- The script issues a warning if the swap space used is between 200 MB and 1000 MB.
- The status fails if the swap memory used exceeds 1000 MB.

### Executable on VMs

Cluster Manager and OAM (pcrfclient) nodes

### Example

```
[root@pcrfclient01 ~]# diagnostics.sh
QNS Diagnostics
Checking basic ports (80, 7070, 27017, 27717-27720, 27749, 8080, 9091)...[PASS]
Checking qns passwordless logins on all boxes...[PASS]
Validating hostnames...[PASS]
Checking disk space for all VMs...[PASS]
Checking swap space for all VMs...[PASS]
Checking for clock skew...[PASS]
Retrieving QNS diagnostics from qns01:9045...[PASS]
Retrieving QNS diagnostics from qns02:9045...[PASS]
Checking HAProxy status...[PASS]
Checking VM CPU and memory allocation for all VMs...[PASS]
Checking Virtual IPs are up...[PASS]
[root@pcrfclient01 ~]#
```

### List of Active Alarms

To get the list of active alarms, execute the `diagnostics.sh --get_active_alarms` command. Here is a sample output:

```
#diagnostics.sh --get_active_alarms

CPS Diagnostics HA Multi-Node Environment
--------------------------
Active Application Alarm Status
-------------------------------------------------------------------------------
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,
10:47:34,051+0000  msg="3001:Host: site-host-gx Realm: site-gx-client.com is down"
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,
10:47:34,048+0000  msg="3001:Host: site-host-sd Realm: site-sd-client.com is down"
id=1000 sub_id=3001  event_host=lb01  status=down date=2017-11-22,
10:45:17,927+0000  msg="3001:Host: site-server Realm: site-server.com is down"
id=1000 sub_id=3001  event_host=lb02  status=down date=2017-11-22,
10:47:34,091+0000  msg="3001:Host: site-host-rx Realm: site-rx-client.com is down"
id=1000 sub_id=3002  event_host=lb02  status=down date=2017-11-22,
10:47:34,111+0000  msg="3002:Realm: site-server.com:applicationId: 7:all peers are down"
Active Component Alarm Status
-------------------------------------------------------------------------------
event_host=lb02 name=ProcessDown severity=critical facility=operatingsystem
date=2017-22-11,10:13:49,310329511,+00:00 info=corosync process is down
```

**Attention**

- Due to the limitation of architecture of the CPS SNMP implementation, if the SNMP deamon or policy server (QNS) process on pcrfclient VM restarts, there can be gap between active alarms displayed by the `diagnostics.sh` and active alarms in NMS.
- The date printed for application alarm status is when the alarm was seen at pcrfclient VM. The time for the alarm at NMS is the time before the alarm is received from Policy Director (LB) VM. So there can be a difference in the dates for the same alarm reported in `diagnostics.sh` and in NMS.

The following table list the type of SNMP alarms:

***Table 22: IDs - Type of SNMP Alarms***

| Alarm ID | Type |
|---|---|
| 1000 | Application Alarm |
| 7100 | Database Alarm |
| 7200 | Failover Alarm |
| 7300 | Process Alarm |
| 7400 | VM Alarm |
| 7700 | GR Alarm |

For more information on SNMP alarms, refer to *CPS SNMP, Alarms and Clearing Procedures Guide*.

### Sample Output of --get_sharding_status

```
diagnostics.sh --get_sharding_status
CPS Diagnostics HA Multi-Node Environment
--------------------------
|-------------------------------------------------------------------------------------------------------|
|                            SHARDING STATUS INFORMATION
```

```
Date : 2019-01-08 01:01:05         |
|-------------------------------------------------------------------------------------------------------------|

[root@#localhost ~]#
```

# deploy_all.py

Deploy multiple VMs in parallel.

### Syntax

```
deploy_all.py - Deploy multiple VMs in Parallel
Usage:
    ./deploy_all.py
    ./deploy_all.py --vms <vms-file>
 --help             Print usage information
 -h
 --vms              Deploy VMs, which is defined in this file
 --provision        Provision VM for future deployment
 --cleanupprovision Cleanup provisioned vmdk image
 --cleanupbackup    Cleanup backed up vmdk image
 --useprovision     Restart VM using provisioned vmdk image
 --usebackup        Restart VM using backed up vmdk image
 --poweroffvm       Power off VM
 --poweronvm        Power on VM
 --nossh            Deploy VMs using VMWare Rest API

 if no option is provided then deploy all VMs
```

### Executable on VMs

Cluster Manager

### Example

To deploy multiple VMs in parallel:

```
python /var/qps/install/current/scripts/deployer/support/deploy_all.py
```

To deploy a selective list of VMs in parallel in the CPS deployment.

```
python /var/qps/install/current/scripts/deployer/support/deploy_all.py --vms <filename-of-vms>
```

where <*filename-of-vms*> is the name of the file containing the list of VMs such as:

```
pcrfclient01
lb01
qns01
```

To deploy VMs using VMware Rest API.

```
python deploy_all.py --nossh
```

### Option to Delete VMs

Delete VM is supported in the REST API model. You must use the following command:

```
python deploy_all.py --vms=vms_file_name --nossh -deletevm
```

where, `vms_file_name` contains the list of the VMs that needs to be deleted

### Attach and Detach External Disk to VM

- The following commands must be used to attach or detach the external disks to the hosts or VMs:

  ```
  python vm_utilities.py --attachDisk <hostname>
  ```

```
python vm_utilities.py --detachDisk <hostname>
```

- To use attach/detach service, you must provide the datastore details in the `Configuration.csv` as shown:

  ```
  datastore_<hostName>,datastore13
  ```

  The hostName must be same as the hosts we are planning to attach the external disk.

  When datastoreId is not provided in the `Configuration.csv`, script prompts you to enter the datastoreId manually.

vCenter password[1]. You need to add the encrypted password.

To encrypt the password,

```
cd /var/qps/bin/support
./encrypt_pass.sh vcenter <vcenter_passwd>
```

where, *<vcenter_passwd>* is the vCenter password in plain text format.

**Note** The `./encrypt_pass.sh vcenter <vcenter_passwd>` command must be run on every Cluster Manager and the `Configuration.csv` file should have the password generated for the respective Cluster Manager. The encrypted passwords cannot be reused on other Cluster Managers or setups.

**Note** The encrypted password must be added in the `Configuration.csv` spreadsheet. To make the new password persisent, execute `import_deploy.sh`.

# dump_utility.py

This collection utility is used to collect standard information from the CPS system in case of issues (system, application, database). This utility collects such information from VM, depending on type of information and VMs selected in the input.

This utility can be executed from anywhere from the terminal. Logs are printed on terminal and written to a log file: `/var/tmp/dumputility-<date_time_when_executed>.log`.

**Important** Warning messages related to the files that does not exist in the system will not be displayed on the terminal but will be logged only to the log file (`/var/tmp/dumputility-<date_time_when_executed>.log`).

**Caution** Running the dump utility can be CPU intensive.

[1] If user misses to add vcenter_hostname, vcenter_user and vcenter_passwd in the `Configuration.csv` file, after executing `deploy_all.py` script, the user is prompted to enter the vcenter information in the command line. User has to enter the unencrypted vcenter_passwd.

**Important** The dump utility should be run from the Cluster Manager wherever possible.

The following types of information can be collected:

- **Common Information:** This information is common for all type of issues. Information is collected from pcrfclient01 VM. If pcrfclient01 is down, information is collected from pcrfclient02 VM. If both VMs are down, information is collected from Cluster Manager VM. The following information can be fetched:
  - `about.sh` output
  - `diagnostics.sh` output
  - `list_installed_features.sh` output
  - Facter output
  - Consolidated logs
  - Bulkstats files
  - SVN dump from PB config
- **System Information:** This information is useful in troubleshooting system related issues. The following information can be fetched:
  - `sysctl -a` output
  - Information about processes running
  - Firewall configuration
  - Netstat statistics
  - Complete lsof output
  - Total number of open files
  - `ifconfig` output
  - Routing table information
  - Disk usage
  - Monit status
  - Monit summary
  - System logs
  - Sar logs
  - Dmesg logs
  - Secure logs
  - Yum logs
  - Whisper logs

    - Puppet logs

- **Application Information:** This information is useful in troubleshooting application-related issues. The following information can be fetched:
    - Contents of `/etc/broadhop` directory
    - `/var/log/broadhop` logs
    - monit status
    - monit summary

- **Database Information:** This information is useful in troubleshooting database related issues. The following information can be fetched:
    - MongoDB logs
    - Mongostat output
    - `rs.status()` output
    - `rs.conf()` output
    - `/var/qps/bin/support/mongo/session_cache_ops.sh -count` output
    - `top_qps.sh` output for 10 seconds
    - `mongotop` output for 3 seconds

- **OAM (PCRFCLIENT) Specific Data:** The following information can be fetched from OAM (pcrfclient) VMs:
    - carbon logs
    - httpd logs
    - `pcs resource show` output

- **Policy Director (lb) Specific Data:** The following information can be fetched from policy director (load balancer) VMs:
    - SNMP trap logs
    - HAproxy logs
    - `pcs resource show` output

- **Policy Server (QNS) Specific Data:** The following information can be fetched from policy server (QNS) VMs:
    - Thread level CPU/memory usage of java process
    - `jstack` output of java process
    - Policy Server (QNS) logs
    - Policy Server service logs

### Syntax

```
dump_utility.py
```

The following options are supported:

- `-v,--vm-type`: Specifies type of VM or single VM name from which information has to be fetched. Multiple VMs are separated by colon. For example, `--vm-type qns:sessionmgr01`.
- `-i,--info-type`: Specifies type of information to be collected. Possible values are application, db, system, vm_specific. Multiple values are separated by colon. For example, `--info-type application:system`.
- `-o,--output-file-name`: Name of the tar file to store fetched information.
- `-h,--help`: Displays help.

### Executable on VMs

- Cluster Manager
- pcrfclient01/02

### Example

- To fetch system information from Policy Director (lb) VMs:

  ```
  dump_utility.py --info-type system --vm-type lb
  ```

- To fetch application and VM specific information from qns01:

  ```
  dump_utility.py --info-type application:vm_specific --vm-type qns01
  ```

  OR

  ```
  dump_utility.py --info-type application:vm_specific --vm-type sav-qns01
  ```

  where, *sav-qns01* is hostname of qns01 VM.

- To fetch database specific information from all replica sets:

  ```
  dump_utility.py --info-type db --vm-type pcrfclient:sessionmgr
  ```

Sample output:

```
dump_utility.py --info-type application --vm-type sav-qns01
Logs are also getting stored in /var/tmp/dumputility-07-06-2016-04-07-47.log
**********************************************
Collecting information, please wait...
**********************************************
Fetching common information like about.sh/list_installed_features/diagnostics etc from
pcrfclient01
This step takes time, please wait...
Fetching command outputs from pcrfclient01
Fetching files hosts file from pcrfclient01
Fetching files consolidated logs from pcrfclient01
Fetching files Bulkstats file from pcrfclient01
Fetching command outputs from qns01
Fetching files Broadhop dir from qns01
Fetching files Broadhop logs from qns01
**********************************************
```

```
Information is collected at  : /var/tmp/07-06-2016-04-07-47.tar.gz
**********************************************
Disconnecting from pcrfclient01... done.
```

**Important** For non-root users, certain CPS scripts (`about.sh`, `diagnostics.sh` and so on) expects sudo password. For such scripts, output is displayed on terminal and is saved in the file. Also for some data which can only be accessed by root user, permission denied related warning is displayed.

# generate_encrypted_password.sh

Used to generate encrypted passwords.

### Syntax

```
/var/qps/install/current/scripts/bin/support/generate_encrypted_password.sh
```

### Executable on VMs

Cluster Manager

### Example

```
generate_encrypted_password.sh
[root@installer ~]#  generate_encrypted_password.sh
                       ##########################################
                       #         CISCO SYSTEMS PVT LTD          #
                       ##########################################

Hello, user! You are attempting to change your password.
Great! A few ground rules:

1. No short passwords. The longer your password is, the harder it is for someone
   to guess or figure out with brute force. Minimum password length is 8.

2. There needs to be at least: one uppercase letter, one lowercase letter, one
   digit and one special character. This increases the search space and makes
   brute force guessing more difficult.
```

# grafana_update_query.sh

This script is used to update the Grafana queries. As part of Python3 upgrade activity, graphitepackage is upgraded to add an escape char ('\') before pipe ('|') for the graphs to get displayed. This script replaceds the "|" with "\|" to make the query work. The default credentials will be taken as admin:admin.

### Syntax

```
/var/qps/bin/support/grafana_update_query.sh
/var/qps/bin/support/grafana_update_query.sh [-h]
/var/qps/bin/support/grafana_update_query.sh [-c]
```

### Options

-h [ --help ] - Displays the help and exits.

-c [ --credentials ]- This is an optional parameter that takes user and password in the format "user:password". If credentials are not provided then, the default credentials are "admin:admin".

### Executable on VMs

pcrfclient01/02

### Example

```
[root@pcrfclient01 ~]# /var/qps/bin/support/grafana_update_query.sh -c admin:admin
Detail log available at /var/log/broadhop/scripts/grafana_update_query.log.
 Using admin:admin as the password for grafana dashboard as provided by the user.

```

# list_installed_features.sh

Displays the features and versions of the features that are installed on each VM in the environment.

### Syntax

```
/var/qps/bin/diag/list_installed_features.sh
```

### Executable on VMs

All

### Example

```
[root@host /]# /var/qps/bin/diag/list_installed_features.sh
Features installed on lb01:9045
```

```

# logcollector.sh

This utility can be used to:

- Enable/disable log level for application and database components.
- Collect the logs from various VMs or specific VMs and copy them to the default /user-defined directory.
- Enable log level for a user-specified duration (optional) ( automatically disables after timer expires).
- Specify VM names from which logs needs to be collected (optional).

### Syntax

```
/var/qps/bin/support/logCollector.sh

Usage:

The script enables/disables logs of Database and Application and also collects logs.

--component               : component name in application level.
--duration                : specifies at what duration of time user need the logs
--log-level               : specifies debug/info/warning/error
--application             : log operaration on Application level
--database                : log operaration on database level
--on-vm                   : vm name
--enable-log              : enable logs on application level or database level
--disable-log             : enable logs on application level or database level
--collect-log             : enable logs on application level or database level
--dblogdir                : log directory where DB logs are collected
--applogdir               : log directory where Applicaion logs are collected

optionals:
option1: --on-vm
option2: --dblogdir
option3: --applogdir
option4: --duration
```

### Executable on VMs

- Cluster Manager
- pcrfclient01/02

### Examples

- Enable log level for component in all VMs:

  ```
  logCollector.sh --enable-log --component Balance --application level debug
  ```

- Enable log level for a component in a specifed VM:

  ```
  logCollector.sh --enable-log --component Balance --application level debug --on-vm
  vmname
  ```

- Automatic enable and disable of logs for specified time interval in seconds:

  ```
  logCollector.sh --enable-log --component Balance --application level debug --time 10
  ```

- Remove component from all VMs:

  ```
  logCollector.sh --disable-log --component Balance --application
  ```

- Remove component from specified VM:

  ```
  logCollector.sh --disable-log --component Balance --application --on-vm vmname
  ```

- Collect consolidated qns and engine logs:

  ```
  logCollector.sh --collect-log --application
  ```

- Collect consolidated qns and engine logs and qns-* logs from specified VM:

  ```
  logCollector.sh --collect-log --application --on-vm vmname
  ```

- Enable log level for specifed replicaset database in specified instance:

```
logCollector.sh --enable-log --instance sessionmgr01:27017 --dbop query --database level
 debug
```

- Automatic enable and disable log level for specified replicaset database value in seconds:

```
logCollector.sh --enable-log --instance sessionmgr01:27017 --dbop query --database level
 debug --time 10
```

- Disable log level for specified database instance:

```
logCollector.sh --disable-log --instance sessionmgr01:27017 --dbop query --database
```

- Collect log from specifed database instance:

```
logCollector.sh --collect-log --instance sessionmgr01:27017 --database
```

# reinit.sh

This command is executed from Cluster Manager. It SSHs to all the CPS VMs and triggers the `/etc/init.d/vm-init.sh` script on each VM to download all the Puppet scripts, CPS softwares, /etc/hosts files and updates the VM with the new software from Cluster Manager to the VM.

Refer to vm-init.sh, on page 262, to trigger this process for a single VM as opposed to all VMs.

### Syntax

```
/var/qps/install/current/scripts/upgrade/reinit.sh
```

### Executable on VMs

Cluster Manager

### Example

```
[root@host /]# /var/qps/install/current/scripts/upgrade/reinit.sh
Running pupdate on lab
Updating /etc/hosts file from installer VM...
Updating /etc/facter/facts.d/bxb1-lb01...
Updating /etc/puppet from installer VM...
```

# restartall.sh

This command is executed from Cluster Manager. It stops and restarts all of the Policy Server (QNS) services on all VMs in the CPS cluster. This command is also executed when new software is installed on VMs.

**Caution** `restartall.sh` should be executed only during Maintenance Window in production deployment. As the qns process in pcrfclient VM is brought down, alarms generated during this activity may not be able to reach the SNMP server. Due to this there could be some gap in active alarms list displayed in NMS which can be ignored.

Refer to restartqns.sh, on page 231 to restart Policy Server (QNS) services on a specific VM as opposed to all VMs.

### Syntax

```
/var/qps/bin/control/restartall.sh
```

### Executable on VMs

Cluster Manager

**Note** When executing restartall.sh command from qns-admin, prefix sudo before the command.

**Caution** Executing `restartall.sh` will cause messages to be dropped.

### Example

```
/var/qps/bin/control/restartall.sh
Currently active LB: lb01

This process will restart all QPS software on the nodes in this order:

lb02 pcrfclient02 qns01 qns02 pcrfclient01 lb01
```

# restartqns.sh

This command stops and restarts all Policy Server (QNS) services on the target VM.

### Syntax

```
/var/qps/bin/control/restartqns.sh hostname
```

### Executable on VMs

Cluster Manager

**Note** When executing restartqns.sh command from qns-admin, prefix sudo before the command.

### Example

```
/var/qps/bin/control/restartqns.sh qns01
/var/qps/bin/control/restartqns.sh pcrfclient01
```

# runonall.sh

Executes a command, as provided as an argument, on all of the VMs listed in the servers file. These commands must be run as the CPS user on the remote VMs, or they will fail to execute properly.

### Syntax

```
/var/qps/bin/control/runonall.sh <executable command>
```

### Executable on VMs

All

**Note** In case executing runonall.sh command from qns-admin, prefix sudo before the command.

### Example

```
/var/qps/bin/control/runonall.sh ntpdate -u
```

# service

This command is used to control individual services on each VM.

### Syntax

```
service < option > | --status-all | [ service_name [ command | --full-restart ] ]
```

**Caution** Do not use this command for any services managed by the monit service. Use the monit summary command to view the list of services managed by monit. The list of services managed by monit is different on each CPS VM.

# session_cache_ops.sh

This command provides information about, and performs operations on the session and SK databases.

# Syntax

```
/var/qps/bin/support/mongo/session_cache_ops.sh <Argument1> <Argument2> <Argument3>
 <Argument1>: --count or --remove
     --count session     : Will print the number of sessions present in session_cache* db
     --count skdb        : Will print the number of sessions present in sk_cache* db
     --remove session    : Will remove the sessions from the session_cache* dbs
     --remove skdb       : Will remove the sessions from the sk_cache* dbs
     --statistics-count  : Will print the number of sessions types present in all
session_cache* db
     --add-shard session : Will support to configure session sharding and also support the
 hot standby session sharding
     --add-shard skdb    : Will support to configure session sharding and also support the
 hot standby sk_cache sharding
     --add-ringset       : Will add new set to the ring
     --db-shrink session : Will shrink session_cache* dbs data files
     --db-shrink skdb    : Will shrink sk_cache* dbs data files
```

```
 <Argument2>: session or skdb database
 <Argument3>: site1 or site2 or site3 ... siten
                This argument for GR only, in GR setup user need to pass the site
number(site1 or site2 ...) as second argument

Example for HA setup
 sh session_cache_ops.sh --count session/skdb
 sh session_cache_ops.sh --remove session/skdb
 sh session_cache_ops.sh --db-shrink session/skdb

Example for GR setup
 sh session_cache_ops.sh --count session/skdb site1
 sh session_cache_ops.sh --remove session/skdb site1
```

# Options

### --count session/--count skdb

`--count session`: This option prints the number of sessions present in session_cache* database.

`--count skdb`: This option prints the number of sessions present in sk_cache* database.

**Example 1:**

For HA setup: `session_cache_ops.sh --count session`

For GR setup: `session_cach_options.sh --count session <siteName>`

**Example 2:**

For HA setup: `session_cache_ops.sh --count skdb`

For GR setup: `session_cach_options.sh --count skdb <siteName>`

### --remove session/--remove skdb

`--remove session`: This option removes the sessions from the session_cache* databases.

`--remove skdb`: This option removes the sessions from the sk_cache* databases.

**Warning** You will be prompted to confirm this action after running this command. If you proceed, this will remove existing sessions/SKDB in the replica-set.

**Example1:**

For HA setup: `session_cach_options.sh --remove session`

For GR setup: `session_cach_options.sh --remove session <siteName>`

**Example 2:**

For HA setup: `session_cach_options.sh --remove skdb`

For GR setup: `session_cach_options.sh --remove skdb <siteName>`

### --statistics-count

This option prints statistics count of the sessions (types if the session Gx, Rx, and so on) in all available session_cache* databases.

**Example**

```
# session_cache_ops.sh --statistics-count
Session cache operation script
Tue Dec 22 02:28:38 MST 2015
-----------------------------------------------------
Sessions statistic counter on Genaral
-----------------------------------------------------
  Session Type         : Session Count
-----------------------------------------------------
ADMIN-SET1
  EDR                  : 5
  GX_SCE               : 10
-----------------------------------------------------
```

### --add-shard session/--add-shard skdb

`--add-shard session`: Adds session shards to the session database, either normal shards or hot standby shards.

`--add-shard skdb`: Adds session shards to the sk_cache database, either normal shards or hot standby shards.

**Example 1:**

For HA setup: `session_cache_ops.sh --add-shard`

```
# session_cache_ops.sh --add-shard
Session cache operation script
Tue Dec 22 02:22:24 MST 2015
            Session Sharding
-----------------------------------------------------

Select type of session shard  Default      [*]
                              Hot Standby  [ ]

Sessionmgr pairs : sessionmgr01:sessionmgr02:27717

Session shards per pair : 4

Creating Session sharding [ Done ]

-----------------------------------------------------
Note :
- Press 'y' to select the shard type
- If sharding needed for multiple sessionmgr vms with port
  please provide sessionmge vm with port separated by ':',
  and pair separated by ','
(Ex: sessionmgr01:sessionmgr02:27717,sessionmgr03:sessionmgr04:27717)
```

For GR setup: `session_cach_options.sh --add-shard session <siteName>`

**Note** If sharding is required for GR setup, then add *site_id* at end of sessionmgr VM and port, separated by colon (:) in sessionmgr pairs parameter.

For example, `sessionmgr01:sessionmgr02:27717:SITE1`

**Example 2:**

For HA setup: `session_cach_options.sh --add-shard skdb`

For GR setup: `session_cach_options.sh --add-shard skdb <siteName>`

### --add-ringset

This option adds a new set to the ring.

**Example**

```
# session_cache_ops.sh --add-ringset
Session cache operation script
 Wed Jun  8 18:23:15 EDT 2016
Session cache operation script: addRingSet
 The progress of this script can be monitored in the following log:
/var/log/broadhop/scripts/session_cache_ops_08062016_182315.log
Note :
 Please provide sessionmgr vm separated by ':' and pair separated by ','

 (Ex HA: sessionmgr01-lab:sessionmgr02-lab)
 (Ex GR: sessionmgr01-site1:sessionmgr02-site1,sessionmgr01-site2:sessionmgr02-site2)
Enter cache servers: sessionmgr01,sessionmgr02
Verifying Qnses processes is running
 Adding set sessionmgr01,sessionmgr02 to ring
 Executing OSGI Command> setSkRingSet 1 4 sessionmgr01:11211,
 Executing OSGI Command> setSkRingSet 1 4 sessionmgr02:11211,
 Executing OSGI Command> rebuildSkRing 1
 Ringset added successfully
```

### --db-shrink session/--db-shrink skdb

This option is used after clean of all sessions from session_cache* and sk_cache* databases. It performs a synchronization operation by removing session cache database files and copying data files from primary member. This reduces the database size and compact database files and/or reclaim disk space. Currently, this operation does not support specific to replica-set.

**Note** Currently, this operation is supported only for HA setups.

This option must be performed in maintenance window (if required in production) and when there is no session data.

**Example1:**

```
session_cache_ops.sh --db-shrink session
Session cache operation script
Fri May 13 06:17:42 EDT 2016
-----------------------------------------------------------
Session DB Shrink Replica-set
-----------------------------------------------------------
CAUTION: This option must performed in maintenance window and no session data
Are you sure you want to continue (y/yes or n/no)? : yes
Verify log /var/log/broadhop/scripts/session_cache_ops_13052016_061742.log

DB Shrink operation completed successfully for set - SESSION-SET1
    DB File count before Shrink: 36
    DB File count after  Shrink: 16
    DB Size before Shrink: 4.2G
    DB Size after  Shrink: 256M
```

```
DB Shrink operation completed successfully for set - SESSION-SET2
    DB File count before Shrink: 28
    DB File count after  Shrink: 8
    DB Size before Shrink: 4.0G
    DB Size after  Shrink: 128M
```

**Example 2:**

```
session_cache_ops.sh --db-shrink skdb
```

# Executable on VMs

pcrfclient01/02

# set_priority.sh

This command sets the priorities of replica-sets, and replica-set members for High Availability (HA) or Geo-Redundant (GR) CPS deployments.

By default, priority of mongo databases, replica-sets, and members are set in order (with higher priority) as defined in the Mongo Config (mongoConfig.cfg).

Use the `diagnostics.sh --get_replica_status` command to view the status and current priorities of all databases replica-sets.

**Note** If a member is shown in an unknown state, it is likely that the member is not accessible from one of other members, mostly an arbiter. In that case, you must go to that member and check its connectivity with other members.

Also, you can login to mongo on that member and check its actual status.

### Syntax

```
/var/qps/bin/support/mongo/set_priority.sh
```

The following options are supported:

- **Mandatory Options:**

  ```
  --db <db_name>
       [all|session|spr|admin|balance|report|portal|audit|bindings]
  ```

  The `set_priority --db all` command would set the priority of all replica-sets listed in mongoConfig.cfg in descending order. The member that is listed first in the configuration would be assigned the highest priority.

  The `set_priority --db session` command would set the priority of all replica-sets of db type SESSION. By default, priorities are set in descending order.

- **General Options:**

  ```
  --h [ --help ]                show syntax and usage information for this script
  --version                     show version information of this script
  --asc                         Set priority in ascending order (default is descending)
  --dsc                         Set priority in descending order
  ```

```
--priority <0|1000>           Set specific priority
--force [false|true]         forces the new priority to be applied (default is false).
```

**Note** The `--priority <0|1000>` option is not currently supported. Do not use.

**Caution** Do not use the `--force` option unless instructed by a Cisco representative. By default, the `set_priority.sh` script will only attempt to set the priorities when all members of a replica set are in a healthy state. The `--force` option can be used when the members are NOT in a healthy state.

- **Specific Replica-set Options:**

  `--replSet <setname>` specifies the replica-set name

  This option enables you to specify priority for a particular replica-set. You must provide the *<setname>*.

- **Geo-Redundancy Options:**

  `--sitename [site1|site2]` specifies the GR site to which the operation applies

  This option enables you to specify a GR site. The mongoConfig.cfg must have relevant start and end tags (like #SITE1_START and #SITE1_END).

### Executable on VMs

Cluster Manager

### Examples

High Availability Options:

```
set_priority.sh --db all
set_priority.sh --db session
set_priority.sh --db session --asc
set_priority.sh --db session --replSet set01
```

Geo-Redundancy Options:

```
set_priority.sh --db session --replSet set01 --sitename <site1|site2>
set_priority.sh --db session --replSet set01 --sitename <site1|site2>
set_priority.sh --db session --replSet set01 --sitename <site1|site2> --force true
```

# startall.sh

This command is executed from Cluster Manager. It starts all Policy Server (QNS) services on all VMs in the CPS cluster. This command is also executed when a new software is installed on VMs.

**Caution** `startall.sh` should be executed only during Maintenance Window in production deployment. As the qns process in pcrfclient VM is brought down, alarms generated during this activity may not be able to reach the SNMP server. Due to this there could be some gap in active alarms list displayed in NMS which can be ignored.

Refer to startqns.sh, on page 238 to start services on a specific VM as opposed to all VMs.

### Syntax

```
/var/qps/bin/control/startall.sh
```

**Note** When executing startall.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

Cluster Manager

### Example

```
/var/qps/bin/control/startall.sh
```

# startqns.sh

This command is executed from Cluster Manager. It starts all Policy Server (QNS) services on the specified VM.

### Syntax

```
/var/qps/bin/control/startqns.sh hostname
```

**Note** When executing startqns.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

Cluster Manager

### Example

```
/var/qps/bin/control/startqns.sh qns01
/var/qps/bin/control/startqns.sh pcrfclient01
```

# statusall.sh

This command displays whether the services managed by monit are stopped or running on all VMs. This script can be executed from Cluster Manager or OAM (pcrfclient).

### Syntax

```
/var/qps/bin/control/statusall.sh
```

**Note** When executing statusall.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

- Cluster Manager
- pcrfclient01/02

### Output

For each process or program, the command displays:

- **Status**
  - Running – the process/Program is healthy and running
  - Does not exist – the process id specified in the /var/run/processname-pid does not exist. This is a cause for concern if recurring.
  - Waiting – This is normal for a program /process monitored by monit
  - Status ok – This is normal for a program monitored by monit
- **Monitoring Status**
  - Monitored – The process/program is being monitored
  - Not Monitored – The process/program is not under the control of monit
  - Waiting – A transient state which reports as waiting depending upon when the statusall.sh command is run which internally uses monit status command.

**Note** For more details, see: https://bitbucket.org/tildeslash/monit/issue/114/.

- **Uptime**

  The number of days, hours, and minutes the process or program has been running.

### Example

```
[root@host /]# /var/qps/bin/control/statusall.sh

```

# stopall.sh

This command is executed from Cluster Manager. It stops the Policy Server (QNS) services on each VMs in the CPS cluster.

**Caution** `stopall.sh` should be executed only during Maintenance Window in production deployment. As the qns process in pcrfclient VM is brought down, alarms generated during this activity may not be able to reach the SNMP server. Due to this there could be some gap in active alarms list displayed in NMS which can be ignored.

Refer to stopqns.sh, on page 241 to stop Policy Server (QNS) services on a specific VM as opposed to all VMs.

### Syntax

```
/var/qps/bin/control/stopall.sh
```

**Note** When executing stopall.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

Cluster Manager

### Example

```
/var/qps/bin/control/stopall.sh
```

# stopqns.sh

This command is executed from Cluster Manager. It stops all Policy Server (QNS) services on the specified VM.

### Syntax

```
/var/qps/bin/control/stopqns.sh hostname
```

**Note** When executing stopqns.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

Cluster Manager

### Example

```
/var/qps/bin/control/stopqns.sh qns01
```

# summaryall.sh

This command provides a brief status of the services managed by monit on all VMs in the CPS cluster.

### Syntax

```
/var/qps/bin/control/summaryall.sh
```

**Note** When executing summaryall.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

Cluster Manager

### Example

```
/var/qps/bin/control/summaryall.sh

```

# sync_times.sh

This command synchronizes the time between all CPS VMs.

### Syntax

For High Availability deployments:

```
/var/qps/bin/support/sync_times.sh ha
```

For Geographic Redundancy deployments:

```
/var/qps/bin/support/sync_times.sh gr
```

### Executable on VMs

Cluster Manager

To check the current clock skew of the system, execute the following command:

```
diagnostics.sh --clock_skew -v
```

The output numbers are in seconds. Refer to the following sample output:

```
CPS Diagnostics Multi-Node Environment
--------------------------
Checking for clock skew...
Clock skew not detected between qns01 and lb01. Skew: 1...[PASS]
Clock skew not detected between qns02 and lb01. Skew: 0...[PASS]
Clock skew not detected between lb01 and lb01. Skew: 0...[PASS]
Clock skew not detected between lb02 and lb01. Skew: 0...[PASS]
Clock skew not detected between sessionmgr01 and lb01. Skew: 0...[PASS]
Clock skew not detected between sessionmgr02 and lb01. Skew: 0...[PASS]
Clock skew not detected between pcrfclient01 and lb01. Skew: 0...[PASS]
Clock skew not detected between pcrfclient02 and lb01. Skew: 0...[PASS]
```

# syncconfig.sh

This command is executed to synchronize the changes to the VM nodes. The files in the `/var/qps/current_config/etc/broadhop` are zipped to a file and stored in `/var/www/html`. The Puppet scripts in VM downloads the file to the VM and applies the changes to the VM.

### Syntax

```
/var/qps/bin/update/syncconfig.sh
/var/qps/install/currentfolder/scripts/bin/update/syncconfig.sh
```

where, currentfolder is version of the current installation.

For example, for CPS 7.0.5, it is 7.0.5.

```
/var/qps/install/7.0.5/scripts/bin/update/syncconfig.sh
```

### Executable on VMs

All

### Example

```
[root@host /]# /var/qps/bin/update/syncconfig.sh
Building /etc/broadhop...
Copying to /var/qps/images/etc.tar.gz...
Creating MD5 Checksum...
```

# terminatesessions

This utility submits bulk session terminate requests.

**Note** For fresh installations of CPS 10.1.0, this feature is enabled by default. However, for upgrades from systems prior to CPS 10.1.0, this feature needs to be enabled as follows:

In the `/etc/broadhop/pcrf/features` file, add **`com.broadhop.policy.command.feature`**. For more information, refer to "Customize Features" in the "Deployment" section in *CPS Installation Guide for VMware*

**Important** To eliminate the impact of TPS and session count in the system, add the following entry in the `/etc/broadhop/qns.conf` file on the Cluster Manager VM:

```
-Ddistribution.blocked.duration=1800000
```

The entry value is in milliseconds, which converts to 30 minutes. The recommended value is multiples of 30 minutes.

After configuring the above values, run the following commands:

```
copytoall.sh /etc/broadhop/qns.conf
stopall.sh
startall.sh
```

### Syntax

```
/var/qps/bin/support/command --username <USERNAME> --password <PASSWORD> terminatesessions
--criteria <criteria> [--disable_signaling <y/n - default n>] [--rate <throttling rate -
default 100>]
```

Where,

- --username and --password are the user's Control Center credentials.
- --criteria: Identifies the session. Following are some examples:
  - ALL
  - APN eq SOS
  - APN except SOS
  - IMSIRANGE A-B

**Remember** For the termination of sessions without any criteria (ALL) and termination of sessions with IMSI range as criteria (IMSIRANGE A-B), CPS must be configured to create sessions with **tags** field having **ImsiKey:imsi:<imsivalue>** as element. If this element is not configured, the command does not terminate sessions for ALL and IMSI range as criteria.

- --disable_signaling: Disables signaling on external interface.
- --rate: Defines the throttling rate.

`/var/qps/bin/support/command terminatesessions -h` shows help related to the command option.

### Executable on VMs

pcrfclient01/02

### Example

```
/var/qps/bin/support/command -u testuser -p cisco123 terminatesessions -c "ALL" -d y
Do you want to proceed with delete command? [y]|n: y
 deleteBulkSession testuser "ALL" false 100
User is : testuser
Criterion is : ALL
Command Criteria type   : ALL
Command Criteria value   : null
Signalling is set to : false
Rate-Limiter value is set to : 100
CommandId submitted successfully : 1471941788159
```

# show

This utility shows the status of the submitted command(s).

### Syntax

```
/var/qps/bin/support/command --username <USERNAME> --password <PASSWORD> show [--all <All>]
[--id <ID>]
```

Where,

- --username and --password are the user's Control Center credentials.

- --all: Shows the status of all the command requests submitted.
- --id: Shows the status of the submitted command.

### Executable on VMs

pcrfclient01/02

### Example

```
/var/qps/bin/support/command -u testuser -p cisco123 show
 getCommands

```

# cancel

This utility cancels the further execution of the submitted command.

### Syntax

```
/var/qps/bin/support/command --username <USERNAME --password <PASSWORD> cancel --id <ID>
```

Where,

- --username and --password are the user's Control Center credentials.
- --id: ID of the submitted command.

### Executable on VMs

pcrfclient01/02

### Example

```
/var/qps/bin/support/command -u testuser -p cisco123 cancel --id 1471941788159
Do you want to proceed with cancel command? [y]|n: y
 cancelCommand 1471941788159
Command Already completed: 1471941788159
```

# top_qps.sh

This command displays performance statistics of CPS VMs.

### Syntax

```
/var/qps/bin/control/top_qps.sh <time>
```

where <time> is the number of seconds for which the statistics are to be captured.

**Note** When executing top_qps.sh command from qns-admin, prefix sudo before the command.

### Executable on VMs

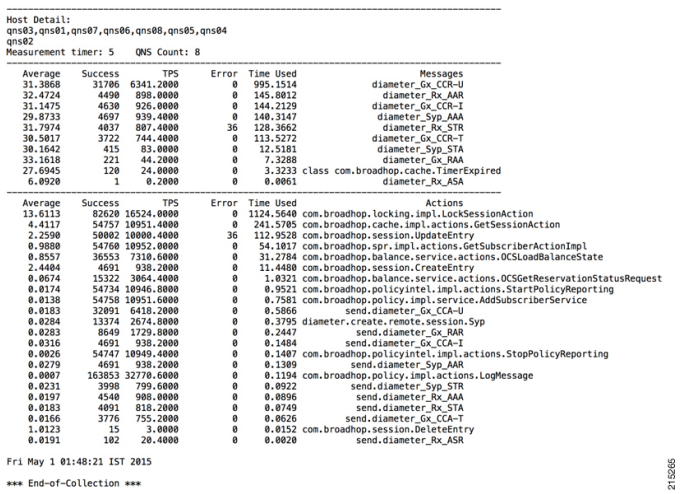
pcrfclient01/02

### Output

- Average time in ms.
- Number of message transactions processed during n seconds, where n is an integer value in seconds.
- Transactions per second (TPS) is messages/n.
- Error shows any error occurred during execution on the Policy Server (QNS) VM. It could be database error, authentication failure and so on. Details of the error can be seen in the consolidated engine or in the consolidated Policy Server (QNS) log.
- Times used is how much total time it took to process the message.

### Example

***Figure 56: Example for top_qps.sh***



```

# Diameter Synchronization Message Behavior

Some Diameter messages (like UDR) are synchronous Diameter calls, which means that the Policy Server (QNS) will be waiting for a response after sending the Diameter request.

Response of these Diameter message is not captured in top_qps as those message are not processed in policy engine separately.

Average time 3.3676 shown below is round trip time (from UDR sent to UDA received)

Sample Top_Qns

```
------------------------------------------------------------------------------------------

   Average    Success        TPS      Error  Time Used                    Messages
    9.7211       2910   727.5000          0    28.2883             diameter_Gx_CCR-I
------------------------------------------------------------------------------------------

   Average    Success        TPS      Error  Time Used                     Actions
    3.6854       2924   731.0000          0    10.7761
com.broadhop.cache.impl.actions.GetSessionAction
    3.3676       2922   730.5000          0     9.8400      send.sync.diameter_Sh_UDR
    0.7908       2919   729.7500          0     2.3083 com.broadhop.session.CreateEntry
    0.1981       2924   731.0000          0     0.5793
com.broadhop.locking.impl.LockSessionAction
    0.0480       2919   729.7500          0     0.1400         send.diameter_Gx_CCA-I
    0.0126       2924   731.0000          0     0.0370 diameter.create.remote.session.Sh
```

Average time is not applicable for these response messages. However, number of response messages (UDA) received can be seen from Grafana.

# vmutilities.py

This utility is used to:

- Attach the external disk to the VM.

- Detach the external disk from the VM.
- Display the VM power state

### Syntax

```
[root@installer ~]# cd /var/qps/install/current/scripts/deployer/support/
[root@installer support]# python vm_utilities.py --help
usage: vm_utilities.py [-h] [--attachDisk ATTACHDISK]
                       [--detachDisk DETACHDISK] [--vmPowerstate]

Additional VM Services

optional arguments:
  -h, --help            show this help message and exit

required named arguments:
  --attachDisk ATTACHDISK
                        Attach the external disk to the VM
  --detachDisk DETACHDISK
                        Detach the external disk to the VM
  --vmPowerstate        Display the VM Power state
```

### Executable on VMs

Cluster Manager

### Example

The following is an example to display the VM power state.

**Note** `python vm_utilities.py --vmPowerstate` works only with vCenter 6.5 or 6.7.

```
[root@localhost support]# python vm_utilities.py --vmPowerstate
esxi-host-1.cisco.com is reachable
esxi-host-2.cisco.com is reachable
Found a valid certificate file [/var/tmp/combined.crt] to establish a secure communication
Validated the hostname/username/password of the vCenter
Host                        Vmname                        Status
qns01                     ssh-qns01                     POWERED_ON
sessionmgr02              ssh-sessionmgr02              POWERED_ON
qns02                     ssh-qns02                     POWERED_ON
sessionmgr01              ssh-sessionmgr01              POWERED_ON
lb02                      ssh-lb02                      POWERED_ON
lb01                      ssh-lb01                      POWERED_ON
pcrfclient02              ssh-pcrfclient02              POWERED_ON
pcrfclient01              ssh-pcrfclient01              POWERED_ON
```

### Attach and Detach External Disk to VM

- The following commands must be used to attach or detach the external disks to the hosts or VMs:

  ```
  python vm_utilities.py --attachDisk <hostname>

  python vm_utilities.py --detachDisk <hostname>
  ```

- To use attach/detach service, you must provide the datastore details in the `Configuration.csv` as shown:

`datastore_<hostName>,datastore13`

The hostName must be same as the hosts we are planning to attach the external disk.

When datastoreId is not provided in the `Configuration.csv`, script prompts you to enter the datastoreId manually.

# vm-init.sh

This command is executed from the VM nodes from `/etc/init.d`, (starts up automatically if VM reboots too). It downloads all the Puppet script, CPS software, /etc/hosts files and updates the VM with the new software.

This command only updates the software and does not restart the CPS software. The new software will be run only after process restart (for example, by executing `/var/qps/bin/control/restartall.sh` script from Cluster Manager).

**Caution** Executing `restartall.sh` will cause messages to be dropped.

### Syntax

```
/etc/init.d/vm-init.sh
```

### Executable on VMs

Any CPS VM

### Example

```
/etc/init.d/vm-init.sh
```
