# Ultra Cloud Core 5G Session Management Function, Release 2021.02 -Release Change Reference

First Published: 2021-08-09 Last Modified: 2022-07-28

## **Americas Headquarters**

Cisco Systems, Inc. 170 West Tasman Drive San Jose, CA 95134-1706 USA http://www.cisco.com Tel: 408 526-4000 800 553-NETS (6387) Fax: 408 527-0883 THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Any Internet Protocol (IP) addresses and phone numbers used in this document are not intended to be actual addresses and phone numbers. Any examples, command display output, network topology diagrams, and other figures included in the document are shown for illustrative purposes only. Any use of actual IP addresses or phone numbers in illustrative content is unintentional and coincidental.

All printed copies and duplicate soft copies of this document are considered uncontrolled. See the current online version for the latest version.

Cisco has more than 200 offices worldwide. Addresses and phone numbers are listed on the Cisco website at www.cisco.com/go/offices.

The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. Exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on standards documentation, or language that is used by a referenced third-party product.

# **About this Guide**

**Note** The documentation set for this product strives to use bias-free language. For purposes of this documentation set, bias-free is defined as language that does not imply discrimination based on age, disability, gender, racial identity, ethnic identity, sexual orientation, socioeconomic status, and intersectionality. While any existing biased terms are being substituted, exceptions may be present in the documentation due to language that is hardcoded in the user interfaces of the product software, language used based on RFP documentation, or language that is used by a referenced third-party product.

This Release Change Reference (RCR) describes new and modified feature and behavior change information for the applicable 5G SMF release(s).

# **Feature Defaults Quick Reference**

The following table indicates what features are enabled or disabled by default.

|   | Feature                        | Default                           |
|---|--------------------------------|-----------------------------------|
| - | APN-AMBR Configuration Support | Disabled – Configuration Required |

| Feature                                                                  | Default                           |  |
|--------------------------------------------------------------------------|-----------------------------------|--|
| Back-off Timer Support                                                   | Disabled – Configuration Required |  |
| Bit Rate Mapping Support                                                 | Disabled – Configuration Required |  |
| Cause IE Support on N11 Interface                                        | Enabled – Always-on               |  |
| Changes to the ULI Data Format—CSCvx66959                                | Enabled – Always-on               |  |
| CHF Trigger-based CDR Generation for 4G<br>Sessions—CSCvy17526           | Enabled – Always-on               |  |
| clear subscriber and show subscriber Command<br>Enhancement              | Disabled – Configuration Required |  |
| Configure DNS Timeout Range—CSCvx74277                                   | Disabled – Configuration Required |  |
| Configure Purge Interval Range—CSCvx74279                                | Disabled – Configuration Required |  |
| Configure Range Values for ICMPv6 Configuration<br>Parameters—CSCvx74188 | Disabled – Configuration Required |  |
| Configure Response Timeout Range—CSCvx74235                              | Disabled – Configuration Required |  |
| Control Event Trace Data—CSCvx81816                                      | Enabled – Always-on               |  |
| DNS Test Query Support                                                   | Enabled – Always-on               |  |
| Download Oam-pod Files from the Web Browser                              | Enabled – Always-on               |  |
| Dynamic Routing by Using BGP                                             | Enabled – Always-on               |  |
| EDR Generation for PDU Session Modification                              | Disabled - Configuration Required |  |
| Enhanced IP Address Quarantine<br>Timer—CSCvx88334                       | Disabled – Configuration Required |  |
| Error Handling with HTTP Error Codes                                     | Enabled – Always-on               |  |
| Event-level EDR Generation                                               | Disabled – Configuration Required |  |
| GTP Cause Code Handling                                                  | Disabled – Configuration Required |  |
| GTPC Load and Overload Control                                           | Disabled – Configuration Required |  |
| GTPC Path Failure Detection Enhancements and<br>Debugging Improvements   | Enabled – Always-on               |  |
| GTPC Peer Restart Detection Support Improvements                         | Enabled – Always-on               |  |
| GTPv2 IE and Cause Codes                                                 | Enabled – Always-on               |  |
| Guard Timer-based Handling of Dedicated Bearer<br>Procedures—CSCvv64995  | Disabled – Configuration Required |  |

| Feature                                                         | Default                           |
|-----------------------------------------------------------------|-----------------------------------|
| Handling Absent Bearers—CSCvx90742                              | Enabled – Always-on               |
| Handling Calls with Static IP Address                           | Disabled – Configuration Required |
| Handling Requests with Handover Indication                      | Disabled – Configuration Required |
| Handling SLA Timer-based Dedicated Bearer<br>Procedure Failures | Disabled – Configuration Required |
| IE Support for GTPC Messages                                    | Enabled – Always-on               |
| Instance-aware Configuration Changes                            | Enabled – Always-on               |
| Instance-aware RADIUS Configuration                             | Enabled – Always-on               |
| IP Address Validation with CDL Configuration—<br>CSCvx83539     | Enabled – Always-on               |
| IPv6 Interface ID Generation—CSCvw93433                         | Disabled – Configuration Required |
| Kubernetes Version Upgrade                                      | Not Applicable                    |
| LI Event Generation for 4G Procedure Failures                   | Enabled – Always-on               |
| Location-based UPF Selection                                    | Disabled – Configuration Required |
| MBR Short Circuit Optimization                                  | Enabled – Always-on               |
| MTU Support in PCO                                              | Enabled – Always-on               |
| NAS Messages Compliance with Invalid Protocol<br>DataHandling   | Enabled – Always-on               |
| New Container Identifier Support                                | Enabled – Always-on               |
| New Procedure Types for vSMF and hSMF Instances                 | Enabled – Always-on               |
| New Radio Dual Connectivity                                     | Enabled – Always-on               |
| New RADIUS Accounting Trigger for TFT Change                    | Disabled – Configuration Required |
| Non-standard QCI Support for Dynamic PCC and Session Rules      | Disabled – Configuration Required |
| NPLI Support for VoLTE and VoNR                                 | Enabled – Always-on               |
| NRF Failure Handling for Profiles                               | Enabled – Always-on               |
| Optimized UPF Selection                                         | Disabled – Configuration Required |
| ProblemDetails JSON Object Support on N11<br>Interface          | Enabled – Always-on               |
| Query Interface IE Support—CSCvx69260                           | Enabled – Always-on               |

| Feature                                                               | Default                           |  |
|-----------------------------------------------------------------------|-----------------------------------|--|
| Reconciliation of Billing Records                                     | Enabled – Always-on               |  |
| Reporting of Deferred Usage with Quota<br>Request—CSCvy31552          | Enabled – Always-on               |  |
| Restoration of Old Deployment CLI for Grafana<br>Dashboard—CSCvx73885 | Disabled – Configuration Required |  |
| Session-level URR Limitation                                          | Disabled – Configuration Required |  |
| Session Setup Timer Support                                           | Disabled – Configuration Required |  |
| Show Subscriber Output Change for<br>ARP—CSCvy54440                   | Disabled – Configuration Required |  |
| show subscriber supi Command Support                                  | Disabled – Configuration Required |  |
| SMF Application Metrics<br>Configuration—CSCvz58341                   | Disabled – Configuration Required |  |
| SMF Interworking with ISE                                             | Disabled – Configuration Required |  |
| SMF Service Node and Replica<br>Configuration—CSCvx45374              | Disabled – Configuration Required |  |
| smf-service Restart—CSCvy02596                                        | Enabled – Always-on               |  |
| Subscriber IMEI Support                                               | Disabled – Configuration Required |  |
| Update on SMF Rolling Upgrade                                         | Not applicable                    |  |
| UPF Interaction while Deleting WPS Dynamic<br>Rule—CSCvx68018         | Enabled – Always-on               |  |
| User Location Information (ULI) Reporting<br>Enhancement              | Enabled – Always-on               |  |

|-----------------------------------------------------------------------------------------------------------------|---------------|
| FB Call Continuity Cause Code Expansion                                                                         | 2021.02.2     |
| Added support for:                                                                                              | 2021.02.0     |
| Configuring APN-AMBR action in Create Session Response                                                          |               |
| • Container field—0005H (Selected Bearer Control Mode) for the PCO, ePCO, or aPCO IE in Create Session Response |               |
| • GTP-C path failure detection and debugging improvements                                                       |               |
| • GTP-C peer restart detection improvements                                                                     |               |
| • Handling the dedicated bearer procedure failures observed at the expiry of procedure SLA timer                |               |
| Introduced procedure to support dynamic configuration of the Access Profile configuration.                      | 2020.03.0     |
| New CLI command in the DNN profile configuration to reject calls from 4G-only UE devices.                       | 2020.02.1     |
| First introduced.                                                                                               | Pre-2020.02.0 |

# **Feature Description**

The SMF provides support to configure the APN-AMBR action for GTPC messages.

As per 3GPP TS 29.274, the SMF sends APN-AMBR in Create Session Response if it is not received in Create Session Request or if the value has changed as part of PCF negotiation. The new CLI command **gtpc message-handling create-session-response action apn-ambr** added under access profile overrides this behavior.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

## **Revision History**

**Table 4: Revision History** 

| Revision Details                                          | Release   |
|-----------------------------------------------------------|-----------|
| Added support for session setup timer and back-off timer. | 2021.02.0 |
| First introduced.                                         | 2020.02.0 |

# **Feature Description**

The SMF uses back-off timer as a mechanism to delay the broadcast of access requests from peer NFs. The SMF provides configuration support for back-off timer.

The SMF sends the configured back-off timer value to AMF during the N4 path failure and the exhaustion of IP addresses. The SMF or PGW-C sends the back-off timer value to S-GW during the exhaustion of IP addresses.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Session Timers chapter.

|---------------------------------------------------------|---------------|
| Introduced support for the following:                   | 2020.03.0     |
| • UPF node selection based on DNN and PDU Session type  |               |
| Modification of authorized default QoS                  |               |
| • Additional session report and UPF node report request |               |
| First introduced.                                       | Pre-2020.02.0 |

# **Feature Description**

The SMF receives Access Point Name Aggregate Maximum Bit Rate (APN-AMBR) for uplink and downlink traffic in bits per seconds (bps) from PCF.

If an interface other than the GTPv2 interface sends APN-AMBR, the SMF converts the received value to kilobits per seconds (kbps). This conversion results in truncation of fractional value to the nearest integer (floor value).

To minimize the bandwidth loss, a new CLI command **bitrates rounded-up** is introduced to control the rounding off of the fractional QoS value to ceiling value or floor value. This behavior is in compliance with the 3GPP TS 29.274, version 12. If the CLI command is enabled within **profile network-element pcf** configuration, the SMF sends the ceiling value over N1, N4, S5, or S8 interface.

By default, the SMF rounds off the bit rate to the floor value during conversion.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

|--------------------------------------------------------------------------------------|---------------|
| Added support for:                                                                   | 2021.02.0     |
| • Cause IE on N11 interface.                                                         |               |
| <ul> <li>NAS messages compliance with invalid protocol data<br/>handling.</li> </ul> |               |
| • ProblemDetails JSON object on N11 interface.                                       |               |
| • Error handling with HTTP error codes.                                              |               |
| • HTTP/2 TLS support for SBA interface.                                              |               |
| First introduced.                                                                    | Pre-2020.02.0 |

# **Feature Description**

SMF supports cause IE on N11 interface messages. With this feature:

- SMF supports sending and handling the received causes, which are available in Cause IE. For this support, SMF complies with the 3GPP TS 29 502 V15.4.0.0, section 6.1.6.3.8.
- SMF supports the following 3GPP Change Requests (CR):
  - 3GPP TS 29 502, CR 0097 to send the new "INSUFFICIENT\_UP\_RESOURCES" cause information.
  - 3GPP TS 29 518 CR 161 not to support the UE\_IN\_NON\_ALLOWED\_AREA cause in N1N2 Message Transfer Error from AMF.
- SMF supports the statistics for the causes on the N11 interface messages.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

# **Behavior Change**

When the SMF receives the EUTRA location from ePDG through GTP messages, it relays the same user location information over N7, N40, N4, and RADIUS interfaces.

**Previous Behavior:** SMF used to send the TAC and CellID (CID) in decimal form to the PCF and CHF through N7 and N40 interfaces respectively.

New Behavior: Now, the SMF sends the TAC and CID in hexadecimal form to the PCF and CHF.

# **Behavior Change**

**Previous Behavior:** Even after receiving the CHF triggers during the exchange of GTPv2 Create Bearer Request message and other GTP messages, SMF did not generate CDR for an empty charging ID list.

**New Behavior:** If the CHF triggers for 4G call are enabled, then the SMF generates charging records after N4 interaction.

| Added support for the following enhancements:                                                                                                                                                                                                                            | 2021.02.2     |
| • The <b>show subscriber nf-service smf</b> <i>smf_url</i> command to show subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                         |               |
| • The <b>clear subscriber nf-service smf</b> <i>smf_url</i> command to clear subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                       |               |
| • The <b>clear subscriber nf-service smf</b> <i>smf_url</i> command to clear subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                       |               |
| • The <b>show subscriber supi</b> <i>supi_idpsid psid_value</i> <b>full</b> command to show detailed subscriber information for roaming-specific use case as hSMF and vSMF.                                                                                              |               |
| • The <b>show subscriber supi</b> <i>supi_idpsid psid_value</i> <b>summary</b> command to show detailed information about subscriber sessions for roaming-specific use case as hSMF and vSMF.                                                                            |               |
| Added support for the following enhancements:                                                                                                                                                                                                                            | 2021.02.0     |
| • The <b>show subscriber supi</b> <i>supi_value</i> <b>psid</b> <i>psid_value</i> <b>summary</b> command to provide detailed information about subscriber sessions.                                                                                                      |               |
| <ul> <li>The clear subscriber nf-service smf and show subscriber<br/>nf-service smf commands with supported keywords and filters.</li> </ul>                                                                                                                             |               |
| • The <b>clear subscriber</b> and <b>clear subscriber nf-service smf</b> commands to support the <b>reactivation</b> keyword to clear sessions when release cause as reactivation-required is configured. This enhancement also supports disconnect and release reasons. |               |
| • The <b>imei</b> keyword for <b>monitor subscriber</b> , <b>clear subscriber</b> , and <b>show subscriber</b> CLI commands.                                                                                                                                             |               |
| First introduced.                                                                                                                                                                                                                                                        | Pre-2020.02.0 |

# **Feature Description**

The clear subscriber and show subscriber commands are enhanced in this release.

The supported enhancements are:

• The **clear subscriber** and **show subscriber** commands support the new **nf-service** keyword. This keyword specifies the network function service (S-GW or SMF).

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |
| Feature Default Setting                  | Disabled – Configuration Required |
| Related Changes in this Release          | Not Applicable                    |
| Related Documentation                    | Not Applicable                    |

## **Revision History**

#### Table 16: Revision History

| Revision Details                                                                       | Release       |
|----------------------------------------------------------------------------------------|---------------|
| Added permissible range values for <b>profile dns-proxy</b><br><b>timeout</b> command. | 2021.01.1     |
| Added support for randomization of P-CSCF addresses from DNS.                          | 2021.01.0     |
| First introduced.                                                                      | Pre-2020.02.0 |

# **Behavior Change**

**Previous Behavior:** SMF did not enforce any range for the **profile dns-proxy timeout** *dns\_timeout\_value* CLI command.

**New Behavior:** SMF now defines a range for the **profile dns-proxy timeout** *dns\_timeout\_value* command. *dns\_timeout\_value* must be an integer in the range of 200-10000.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IMS PDU Sessions for Voice chapter.

# Configure Purge Interval Range—CSCvx74279

# **Behavior Change Summary and Revision History**

#### Summary Data

#### Table 17: Summary Data

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |
| Feature Default Setting                  | Disabled – Configuration Required |

## **Revision History**

#### **Table 18: Revision History**

| Revision Details     | Release   |
|----------------------|-----------|
| First introduced.    | 2021.02.0 |
| CDETS ID: CSCvx74279 |           |

# **Behavior Change**

**Previous Behavior:** SMF did not enforce any range for the **purge-processed-files purge-interval** *purge-interval* CLI command configured within **local-storage** command in GTPP Profile configuration.

**New Behavior:** SMF now defines a range for the **purge-interval** command. *purge-interval* must be an integer in the range of 0-259200. A value of 0 disables the processed file purging functionality.

| Revision Details                                                                                   | Release       |
|----------------------------------------------------------------------------------------------------|---------------|
| Added permissible range values for the following commands in ICMPv6 Profile configuration options. | 2021.02.1     |
| • mtu                                                                                              |               |
| • reachable-time                                                                                   |               |
| • retrans-timer                                                                                    |               |
| First introduced.                                                                                  | Pre-2020.02.0 |

# **Behavior Change**

**Previous Behavior:** SMF did not enforce any range for the following parameters in the ICMPv6 Profile configuration

- MTU
- Retransmission timer
- Reachable time

**New Behavior:** SMF now defines a range for the following commands in ICMPv6 Profile configuration options.

- mtu: Must be an integer in the range of 1280-1500
- reachable-time: Must be an integer in the range of 0-3600
- retrans-timer: Must be an integer in the range of 0-4294968

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IPv6 PDU Sessions chapter.

## **Revision History**

#### **Table 22: Revision History**

| Revision Details                                                                                                                                                                                   | Release       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <ul> <li>Added retransmission support for the following request messages:</li> <li>Namf_Communication EBI Assignment Request</li> <li>Namf_Communication N1 N2 Message Transfer Request</li> </ul> | 2021.02.2     |
| Added permissible range values for <b>response-timeout</b> command in the PCF and UDM configuration                                                                                                | 2021.02.0     |
| RAT type FHT support and graceful timeout handling and its related statistics introduced.                                                                                                          | 2021.01.0     |
| First introduced.                                                                                                                                                                                  | Pre-2020.02.0 |

### **Behavior Change**

**Previous Behavior:** SMF did not enforce any range for the **response-timeout** *response\_timeout\_value* CLI command in the UDM and PCF configuration.

**New Behavior:** SMF now defines a range for the **response-timeout** command. *response\_timeout\_value* must be an integer in the range of 1000-30000.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Failure Handling Support chapter.

# Control Event Trace Data—CSCvx81816

### **Behavior Change Summary and Revision History**

#### **Summary Data**

#### Table 23: Summary Data

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |
| Feature Default Setting                  | Disabled – Configuration Required |
| Related Changes in this Release          | Not Applicable                    |
| Related Documentation                    | Not Applicable                    |

#### **Revision History**

#### **Table 24: Revision History**

| Revision Details                                                                                            | Release       |
|-------------------------------------------------------------------------------------------------------------|---------------|
| Added the procedures for configuration and verification of the event trace data in the CDL database record. | 2021.02.0     |
| First introduced.                                                                                           | Pre-2020.02.0 |

### **Behavior Change**

**Previous Behavior**: SMF stored event trace data in CDL. SMF had no option to avoid storing event trace data in the database.

**New Behavior**: With this release, SMF allows you to enable or disable the storage of event trace data in the CDL database record. Configuring the event trace to disabled saves approximately 1 KB of database storage for each SMF database record.

Use the **system-diagnostics event-trace [ enable | disable ]** CLI command to enable or disable the storage of event trace data in the CDL database record.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Cisco Common Data Layer chapter.

# **DNS Test Query Support**

### **Feature Summary and Revision History**

#### **Summary Data**

| Applicable Product(s) or Functional Area | SMF                 |

| Applicable Platform(s)                   | SMI                 |
| Feature Default Setting                  | Enabled – Always-on |
| Related Changes in this Release          | Not Applicable      |
| Related Documentation                    | Not Applicable      |

#### **Revision History**

Table 25: Revision History

| Revision Details  | Release   |
|-------------------|-----------|
| First introduced. | 2021.02.0 |

### **Feature Description**

DNS Test Client queries and checks the P-CSCF IP address using the FQDN. The DNS Test Client is used as a debug utility for VoNR launch. SMF supports DNS Test queries over SMF operation center command line interface. The DNS client retrieves the results from DNS proxy/server and displays to the user.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IMS PDU Sessions for Voice chapter.

# **Download Oam-pod Files from the Web Browser**

### **Feature Summary and Revision History**

### **Summary Data**

#### Table 26: Feature Summary

| Applicable Product(s) or Functional Area | SMF                 |
|------------------------------------------|---------------------|
| Applicable Platform(s)                   | SMI                 |
| Feature Default Setting                  | Enabled – Always-on |
| Related Changes in this Release          | Not Applicable      |
| Related Documentation                    | Not Applicable      |

#### **Revision History**

#### **Table 27: Revision History**

| Revision Details                                                        | Release       |
|-------------------------------------------------------------------------|---------------|
| In this release, added support to download the following OAM pod files: | 2021.02.0     |
| Monitor Subscriber                                                      |               |
| Monitor Protocols                                                       |               |
| Transaction logs                                                        |               |
| First introduced.                                                       | Pre-2020.02.0 |

### **Feature Description**

The App-infra stores locally generated Monitor Subscriber files and the Transaction log file in the OAM Pod. This feature enables you to access and download the locally generated files by using a web browser after authenticating.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Troubleshooting Information chapter.

# **Dynamic Routing by Using BGP**

|----------------------------------------------------------------|---------------|
| Added support for the following features:                      | 2021.02.0     |
| • New calls with static IP address.                            |               |
| • Quarantine queue size.                                       |               |
| • IP address validation with CDL Configuration and statistics. |               |
| IP Address Validation with CDL Configuration introduced.       | 2021.02.0     |
| Updated quarantine time range to 3600 seconds.                 | 2021.02.0     |
| VRF Support introduced.                                        | 2020.02.5     |
| First introduced.                                              | Pre-2020.02.0 |

### **Feature Description**

Border Gateway Protocol (BGP) allows you to create loop-free inter-domain routing between autonomous systems (AS). An AS is a set of routers under a single technical administration. The routers can use an Exterior Gateway Protocol to route packets outside the AS. The Dynamic Routing by Using BGP feature enables you

to configure the next-hop attribute of a BGP router with alternate local addresses to service IP addresses with priority and routes. The App-Infra BGP speaker pods enable dynamic routing of traffic by using BGP to advertise pod routes.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IP Address Management chapter.

# **EDR Generation for PDU Session Modification**

### **Feature Summary and Revision History**

#### **Summary Data**

#### Table 30: Summary Data

| Revision Details                                                                                    | Release   |
|-----------------------------------------------------------------------------------------------------|-----------|
| Introduced EDR support for PDU session modification procedure for roaming and non-roaming scenarios | 2021.02.2 |
| Provided support for event-level EDR generation                                                     | 2021.02.0 |
| Custom EDR Generation                                                                               | 2021.01.0 |

### **Feature Description**

EDR support was available for both PDU session sreation and deletion scenarios. Now, the SMF extends the support for EDR generation to the PDU session modification procedure for roaming and non-roaming scenarios.

For more details, refer to the UCC 5G SMF Configuration and Administration Guide > Event Detail Records chapter.

#### **Table 33: Revision History**

| Revision Details                                               | Release       |
|----------------------------------------------------------------|---------------|
| Added support for the following features:                      | 2021.02.0     |
| • New calls with static IP address.                            |               |
| • Quarantine queue size.                                       |               |
| • IP address validation with CDL Configuration and statistics. |               |
| IP Address Validation with CDL Configuration introduced.       | 2021.02.0     |
| Updated quarantine time range to 3600 seconds.                 | 2021.02.0     |
| VRF Support introduced.                                        | 2020.02.5     |
| First introduced.                                              | Pre-2020.02.0 |

# **Behavior Change**

**Previous Behavior:** SMF allowed the user to configure **address-quarantine-timer** *quarantine\_timer\_value* in the range of 4-60 seconds.

**New Behavior:** This release allows the user to configure the IP address quarantine timer value in the range of 4-3600 seconds. The timer value has been enhanced to detect and ignore any duplicate release requests.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IP Address Management chapter.

# **Error Handling with HTTP Error Codes**

### **Feature Summary and Revision History**

#### Table 35: Revision History

| Revision Details                                               | Release       |
|----------------------------------------------------------------|---------------|
| Added support for:                                             | 2021.02.0     |
| • Cause IE on N11 interface.                                   |               |
| • NAS messages compliance with invalid protocol data handling. |               |
| • ProblemDetails JSON object on N11 interface.                 |               |
| • Error handling with HTTP error codes.                        |               |
| • HTTP/2 TLS support for SBA interface.                        |               |
| First introduced.                                              | Pre-2020.02.0 |

### **Feature Description**

SMF supports error responses and related HTTP error codes for the SM Policy Update Notify service towards PCF with this release. For this feature, SMF complies with 3GPP TS 29.512, section 4.2.3.2—SM Policy Association Update request.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

# **Event-level EDR Generation**

### **Feature Summary and Revision History**

#### **Summary Data**

#### Table 36: Summary Data

#### **Revision History**

**Table 37: Revision History** 

| Revision Details  | Release       |
|-------------------|---------------|
| First introduced. | Pre-2020.02.0 |

### **Feature Description**

The SMF allows generation of Event Data Records (EDRs) with procedure-level details, event-level details, and field-level details. These granular details help in effective debugging of any errors encountered.

By default, all procedure IDs, event IDs, and field IDs, which were registered by application, are enabled. You can enable or disable the EDRs dynamically during runtime by using **disable procedure-id** *procedure-id procedure-id*.

For more details, refer to the UCC 5G SMF Configuration and Administration Guide > Event Detail Records chapter.

# **GTP Cause Code Handling**

### **Feature Summary and Revision History**

#### **Revision History**

**Table 39: Revision History** 

| Revision Details                            | Release   |
|---------------------------------------------|-----------|
| Added support for:                          | 2021.02.0 |
| GTP cause code handling                     |           |
| • GTPv2 IE and cause codes                  |           |
| Added support for 5GSM cause code handling. | 2020.02.0 |

# **Feature Description**

The SMF supports GTP cause code handling for 4G procedures when it detects any failure with the IEs.

The GTP cause code handling feature supports the following enhancements:

- New cause values in Create Session Request
  - Missing or unknown APN
  - User authentication failed
  - APN access denied no subscription
  - New PDN type due to single address bearer only
  - Late Overlapping Request
  - Timed Out Request

- · New cause values in Delete Bearer Request
  - Reactivation required
  - · PDN connection inactivity timer expires
- RAN/NAS Cause IE in GTP messages—SMF sends the RAN/NAS Cause IE in the ranNasRelCauses attribute to PCF if SMF receives this cause from access network due to QoS flow termination or PDU session termination.

The supported GTP messages are Create Bearer Response, Update Bearer Response, Delete Bearer Command, and Delete Session Request.

- Specification derived (TS 29.524) cause code mapping for 5G messages on UDM and PCF interfaces
- Configuration support for GTP cause codes
  - · Cause to class mapping configuration under cause-map-class profile and network-element profile
  - Class to cause mapping configuration under class-map-cause profile and access profile
- · New disconnect reasons for source interface failures

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

|--------------------------------------------------|-----------|
| Added support for GTPC load and overload control | 2021.02.0 |

| Revision Details                                  | Release   |
|---------------------------------------------------|-----------|
| Added support for message priority configuration. | 2020.04.0 |
| First introduced.                                 | 2020.03.0 |

### **Feature Description**

```
Important
```

**nt** The GTPC Load and Overload Control is an optional feature.

The SMF uses the system load information to determine the operating status of the resources of the GTPC entity. This information, when sent to the GTPC peers, helps to balance the session load adaptively across entities supporting the same function based on their effective load.

To enable the GTPC load Control functionality, use the **interface gtpc action advertise** command within load profile.

A GTPC overload occurs when the number of incoming requests exceeds the maximum request throughput supported by the receiving GTPC entity. The exponential increase of unacknowledged GTPC messages lead to a node congestion or collapse resulting in overall network service degradation.

The GTPC Load and Overload Control feature aims at improving load distribution over the network. To achieve this functionality, the SMF sends Load Control Information (LCI) and Overload Control Information (OCI) to GTPC peers (for example, MME via cnSGWc, and ePDG). The GTPC peers use the LCI and OCI, and the configurations defined in the Load and Overload Control profiles for effective overload control.

To enable the GTPC Overload Control functionality, use the **interface gtpc action advertise** command in node-level within overload profile.

GTPC Load Control denotes a preventive action and GTPC Overload Control indicates a corrective action.

This feature works both in a standalone deployment of SMF and an integrated deployment with cnSGW-C.

The GTPC Load and Overload Control feature is compliant to 3GPP TS 29.807, version 12.0.0, and 3GPP TS 29.274, version 15.4.0.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Overload Management chapter .

|-----------------------------------------------------------------------------------------------------------------|---------------|
| FB Call Continuity Cause Code Expansion                                                                         | 2021.02.2     |
| Added support for:                                                                                              | 2021.02.0     |
| Configuring APN-AMBR action in Create Session Response                                                          |               |
| • Container field—0005H (Selected Bearer Control Mode) for the PCO, ePCO, or aPCO IE in Create Session Response |               |
| • GTP-C path failure detection and debugging improvements                                                       |               |
| • GTP-C peer restart detection improvements                                                                     |               |
| • Handling the dedicated bearer procedure failures observed at the expiry of procedure SLA timer                |               |
| Introduced procedure to support dynamic configuration of the Access Profile configuration.                      | 2020.03.0     |
| New CLI command in the DNN profile configuration to reject calls from 4G-only UE devices.                       | 2020.02.1     |
| First introduced.                                                                                               | Pre-2020.02.0 |

# **Feature Description**

PGW-C/SMF triggers cleanup of PDN sessions when it detects a change in the recovery value of peer or if peer is unreachable. SMF is enhanced to avoid peer restart and path failure detection:

- Restart counter values received in EchoRequest/Resp and restart counter values received in control messages received from peer can be configured to ignore. Configuring "ignore" results in avoiding subscriber session cleanup but new restart counter values are stored.
- Echo timeouts or Echo failures can be configured to ignore. Configuring "ignore" results in avoiding subscriber session cleanup.
- Statistics introduced to collect number of false peer restarts and to display restart-time of peer.

Show output is enhanced to display "MaxRemoteRcChange".

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

| First introduced.                                                                                               | Pre-2020.02.0 |

# **Feature Description**

P-GW-C/SMF can detect that there's a change in recovery value of SGW. P-GW-C/SMF can detect this value from the following messages:

- Create Session Request.
- · Modify Bearer Request.
- Create Bearer Response.
- Echo Response

If P-GW-C/SMF detects that there's a change in recovery value, then it initiates the cleanup of all the PDN connections associated with the S-GW.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

# **GTPv2 IE and Cause Codes**

#### **Revision History**

**Table 47: Revision History** 

| Revision Details                            | Release   |
|---------------------------------------------|-----------|
| Added support for:                          | 2021.02.0 |
| • GTP cause code handling                   |           |
| • GTPv2 IE and cause codes                  |           |
| Added support for 5GSM cause code handling. | 2020.02.0 |

# **Feature Description**

The SMF supports the GPRS Tunneling Protocol, Version 2 (GTPv2) Cause IE for 4G and 5G procedures.

The GTPv2 Cause IE supports the following cause codes and error codes:

- The Cause Source (CS) bit in GTPv2 Cause IE supports the following cause values in Create Session Response, Modify Bearer Response, Modify Bearer Failure Indication (MBFI), and Delete Bearer Failure Indication (DBFI).
  - Context Not Found
  - Missing Or Unknown APN
  - DBFI with cause Context Not Found
  - · Delete Session Response with cause Context Not Found

- The Bearer Context IE Error (BCE) bit in GTPv2 Cause IE supports the following cause values in Delete Session Response, Modify Bearer Response, Modify Bearer Failure Indication (MBFI), and Delete Bearer Failure Indication (DBFI).
  - MBFI with cause Context Not Found
  - DBFI with cause Context Not Found
- Remote Node Errors
  - Context not found
  - Missing or unknown APN
  - PduSessionType
  - Mandatory IE missing
  - Malformed message errors

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

# Guard Timer-based Handling of Dedicated Bearer Procedures—CSCvv64995

### **Behavior Change Summary and Revision History**

#### **Summary Data**

#### Table 48: Summary Data

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |
| Feature Default Setting                  | Disabled – Configuration Required |

| Related Documentation                    | Not Applicable                    |

#### **Revision History**

Table 49: Revision History

| Revision Details     | Release   |
|----------------------|-----------|
| First introduced.    | 2021.02.0 |
| CDETS ID: CSCvv64995 |           |

### **Behavior Change**

The SMF interacts with the peer NFs while processing the 4G dedicated bearer procedure. When the dedicated bearer procedure does not end within predetermined guard timeout value, the graceful clean-up is performed at SMF and peer nodes. This clean-up action is based on the stage at which the dedicated bearer procedure is executing.

**Previous Behavior:** At the expiry of guard timer, dedicated bearer procedure was abruptly terminated without performing necessary clean up.

**New Behavior:** In this release, the SMF gracefully cleans up the dedicated bearer procedure by informing the concerned peer nodes about the procedure failure status.

# Handling Absent Bearers—CSCvx90742

### **Behavior Change Summary and Revision History**

#### **Summary Data**

#### Table 50: Summary Data

| Applicable Product(s) or Functional Area | SMF                 |
|------------------------------------------|---------------------|
| Applicable Platform(s)                   | SMI                 |

|----------------------|-----------|
| First introduced.    | 2021.02.0 |
| CDETS ID: CSCvx90742 |           |

### **Behavior Change**

**Previous Behaviour**: The SMF handled the absent bearers incorrectly in the Modify Bearer Request. This problem led to sending the Update Bearer Request instead of Create Bearer Request during PCF-initiated bearer creation for such bearers.

The absent bearers were mishandled in the following scenarios:

- MBR with only absent bearer
- MBR with absent bearer and ULI change

**New Behaviour**: This release supports absent bearer handling for Modify Bearer Request. For such bearers, the SMF gracefully cleans up and informs the bearer removal to PCF, CHF, and UPF.

|----------------------------------------------------------|---------------|
| IP Address Validation with CDL Configuration introduced. | 2021.02.0     |
| Updated quarantine time range to 3600 seconds.           | 2021.02.0     |
| VRF Support introduced.                                  | 2020.02.5     |
| First introduced.                                        | Pre-2020.02.0 |

### **Feature Description**

The SMF+IWK supports calls with static IP address and validates if the IP address belongs to the static pool.

In this release, the SMF supports Create Session Request with static IP address and also handles Create Session Request received with PAA. The SMF validates if the requested IP address is configured under static pool and assigns the same IP address for the session. If the IP address is not configured under static pool, then SMF rejects the session.

The following behavior is applicable only to sessions with static IP address.

- If the SMF receives static IP in Subscription Response from UDM during the 5G Session Create procedure, it assigns the same IP address to the UE session if the IP is configured under static pool. If the IP address is not configured under static pool, then SMF rejects the session.
- If the RADIUS interface is enabled and if the RADIUS server returns the static IP address, then SMF ignores the IP address received in Create Session Request or Subscription Response.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IP Address Management chapter.

# Handling Requests with Handover Indication

| Revision Details                                                                                                                                             | Release       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| FB Call Continuity Cause Code Expansion                                                                                                                      | 2021.02.2     |
| Added support for:                                                                                                                                           | 2021.02.0     |
| • Configuring calls with handover indication.                                                                                                                |               |
| • UE Local IP Address and UE UDP Port IEs in GTPC messages.                                                                                                  |               |
| TFT Handling for Wi-Fi Handovers is supported.                                                                                                               | 2021.01.0     |
| The Wi-Fi to 5GS Handover with EPS Fallback feature is fully qualified in this release.                                                                      | 2020.02.2     |
| The Wi-Fi to 5GS Handover with EPS Fallback feature is not fully qualified in this release. For more information, contact your Cisco Account representative. | 2020.02.1     |
| First introduced.                                                                                                                                            | Pre-2020.02.0 |

### **Feature Description**

The SMF+IWK rejects the Create Session Request received with handover (HO) indication even if the session is not present.

With the previous behavior, the SMF accepts S5/S8 Create Session Request with HO indication even when the session is not present and creates a new session. The new CLI command **gtpc message-handling create-session-request ho-ind new-call-reject** added under access profile disables the old behavior and rejects the call with "Context Not Found".

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Handover Procedures chapter.

| Revision Details                                                                                                | Release       |
|-----------------------------------------------------------------------------------------------------------------|---------------|
| FB Call Continuity Cause Code Expansion                                                                         | 2021.02.2     |
| Added support for:                                                                                              | 2021.02.0     |
| Configuring APN-AMBR action in Create Session Response                                                          |               |
| • Container field—0005H (Selected Bearer Control Mode) for the PCO, ePCO, or aPCO IE in Create Session Response |               |
| • GTP-C path failure detection and debugging improvements                                                       |               |
| • GTP-C peer restart detection improvements                                                                     |               |
| • Handling the dedicated bearer procedure failures observed at the expiry of procedure SLA timer                |               |
| Introduced procedure to support dynamic configuration of the Access Profile configuration.                      | 2020.03.0     |
| New CLI command in the DNN profile configuration to reject calls from 4G-only UE devices.                       | 2020.02.1     |
| First introduced.                                                                                               | Pre-2020.02.0 |

# **Feature Description**

The SMF interacts with the peer NFs while processing the dedicated bearer procedure.

When the dedicated bearer procedure does not end within a configurable SLA procedure timeout value, the graceful clean-up is performed at SMF and peer nodes. This clean-up action is based on the stage at which the dedicated bearer procedure is executing.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

# **Handover Support in Home Routed Roaming**

|--------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| FB Call Continuity Cause Code Expansion                                                                                                                      | 2021.02.2     |
| Added support for:                                                                                                                                           | 2021.02.0     |
| Configuring calls with handover indication.                                                                                                                  |               |
| • UE Local IP Address and UE UDP Port IEs in GTPC messages.                                                                                                  |               |
| TFT Handling for Wi-Fi Handovers is supported.                                                                                                               | 2021.01.0     |
| The Wi-Fi to 5GS Handover with EPS Fallback feature is fully qualified in this release.                                                                      | 2020.02.2     |
| The Wi-Fi to 5GS Handover with EPS Fallback feature is not fully qualified in this release. For more information, contact your Cisco Account representative. | 2020.02.1     |
| First introduced.                                                                                                                                            | Pre-2020.02.0 |

# **Feature Description**

The SMF includes the following new IEs in the n3gaLocation attribute of GTPC messages.

- UE Local IP Address
- UE UDP Port

The supported GTPC messages are Create Session Request, Create Bearer Response, Modify Bearer Request, and Delete Bearer Response.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Handover Procedures chapter.

#### **Table 62: Revision History**

| Revision Details                                               | Release       |
|----------------------------------------------------------------|---------------|
| Added support for the following features:                      | 2021.02.0     |
| • New calls with static IP address.                            |               |
| • Quarantine queue size.                                       |               |
| • IP address validation with CDL Configuration and statistics. |               |
| IP Address Validation with CDL Configuration introduced.       | 2021.02.0     |
| Updated quarantine time range to 3600 seconds.                 | 2021.02.0     |
| VRF Support introduced.                                        | 2020.02.5     |
| First introduced.                                              | Pre-2020.02.0 |

### **Behavior Change**

**Previous Behaviour**: No Additional CDL Check was performed during IP Allocation. **New Behaviour**: On Enabling CLI, CDL Check is performed during IP Allocation. IP validation ignore mismatch responses is meant for avoiding duplicate IPs. If this feature is enabled, SMF Nodemgr checks if the current IP is already used by any other records in CDL. If no records are found, then IP address is assigned to the UE. If CDL record is found, then a new IP is assigned to the UE. New stats display Nodemgr to CDL IP-Validation and IPAM Quarantine IP Batch-related statistics.

Customer Impact: Enabling validation ignore mismatch responses may have certain performance impact.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IP Address Management Chapter.

|---------------------------------------------------------------------------|---------------|
| Introduced support for the following:                                     | 2021.01.0     |
| Co-located UPF Selection                                                  |               |
| • Enhanced Limits for Maximum Groups in<br>Bandwidth Policy Configuration |               |
| Handling Session Report Rejection Procedure                               |               |
| • New Format of Outer Header information element (IE)                     |               |
| Introduced support for the following:                                     | 2020.03.0     |
| • UPF node selection based on DNN and PDU Session type                    |               |
| Modification of authorized default QoS                                    |               |
| • Additional session report and UPF node report request                   |               |
| First introduced.                                                         | Pre-2020.02.0 |

# **Feature Description**

The existing threshold configuration for IP pool allows you to define percentage of IP addresses to be considered as threshold hit for a given UPF. IPAM informs SMF when threshold is hit for a particular pool (for each DNN and UPF), SMF gives lower priority to such UPF until UPF hits the threshold condition.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

# IPv6 Interface ID Generation—CSCvw93433

# **Behavior Change Summary and Revision History**

#### Table 66: Revision History

| Revision Details                                                                                           | Release       |
|------------------------------------------------------------------------------------------------------------|---------------|
| Added support for IPv6 interface ID generation based<br>on SBI VIP address and CommonId of the subscriber. | 2021.01.1     |
| SMF supports the maximum limit of 2048 for the following configurations:                                   | 2021.01.0     |
| • Precedence                                                                                               |               |
| Operator policy                                                                                            |               |
| • DNN policy                                                                                               |               |
| • DNN profile                                                                                              |               |
| SMF supports case insensitive DNN configuration.                                                           | 2020.02.5.t1  |
| First introduced.                                                                                          | Pre-2020.02.0 |

### **Behavior Change**

The SMF generates the IPv6 interface ID without International Mobile Subscriber Identity (IMSI) or Extended Unique Identifier (EUI).

**Previous Behavior**: The SMF generated the IPv6 interface ID in EUI-64 format based on configured or default virtual-mac under DNN. The interface ID is common for all subscribers under DNN. This operation resulted in apps like Google Duo to reject connections due to security policy.

**New Behavior**: The SMF generates unique 64-bit interface ID which is non-EUI-64 format by using SBI VIP address and CommonId of the subscriber.

That is, IPv6 interface ID = VIP-IP (4 bytes) + CommonId (4 bytes)

By default, virtual-mac CLI command is now disabled under DNN configuration.

Table 67: Interface ID for Different Messages

| Call Model | PDU Session Establishment Accept | Create Session Response                                             |
|------------|----------------------------------|---------------------------------------------------------------------|
| 5G         | N11-SBI-VIP+CommonID             | Not Applicable                                                      |
| 4G         | Not Applicable                   | GTP-VIP+CommonID                                                    |

|-------------------|-----------|
| First introduced. | 2021.02.0 |

### **Feature Description**

To distinguish between local site instance and remote site instance, the instance-awareness support has been introduced in this release.

To support instance awareness, the following configuration changes have been implemented:

- Configuration of two new GR instances through **instances instance** command at the root level for both local and remote sites
- Enable configuration of instance system-id, cluster-id, and slice-name for CDL within each GR instance Sample configuration:

```
config
instances instance gr_instance_id
system-id system_id
cluster-id cluster_id
slice-name cdl_slice_name
end
```

• Local instance configuration using local-instance command at the root level

Sample configuration:

```
config
    local-instance instance instance_id
    end
```

• Instance configuration with unique identifier using the instance instance-id command at the root level

Sample configuration:

```
config
    instance instance-id instance_id
    end
```

• Root-level endpoint configuration commands are allowed only under instance configuration.

Sample configuration:

```
config
    instance instance-id instance_id
    endpoint gtp
    end
```

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > DSCP Marking chapter.

• Profile SMF configuration allows configuration of Fully Qualified Domain Name (FQDN) corresponding to the configured instances. For example, **instances 1 fqdn cisco.com.apn.epc.mnc456.mcc123**.

Sample configuration:

```
config
  profile smf smf_profile_name
    instances instance_id fqdn fqdn_name
    end
```

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

• IPAM pools must be associated with a GR instance.

**Note** If you are planning to upgrade the SMF from release 2021.01 to release 2021.02, make sure to remove the existing IPAM configuration and then proceed with the upgrade.

Sample configuration:

```
config
    ipam
    instance instance_id
        address-pool pool_name
        end
```

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > IP Address Management chapter.

• CDL configuration includes instance-specific data slice information. That is, **slice-name** keyword has been added to the **cdl datastore session** command.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Cisco Common Data Layer chapter.

- Enhancements to the following commands to include gr-instance as input.
  - show endpoint
  - show peers
  - show subscriber
  - clear subscriber
  - show ipam pool
  - show ipam dp
  - show nrf registration-info
  - show nrf subscription-info
  - show nrf discovery-info
  - monitor subscriber
  - monitor protocol

Note If the gr-instance is not provided, the local instance is used.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Troubleshooting Information chapter.

- Enhancements to the following CDL commands to include slice-name as input:
  - cdl show sessions count summary
  - cdl show indexes
  - cdl clear sessions

|-------------------------------------------------------------------------------------------------------------|----------------|
| Added support for interworking with ISE.                                                                    | 2021.02.2.t1.0 |
| Introduced new CLI option in charging profile to generate the RADIUS accounting trigger on TFT change.      | 2021.02.0      |
| To support instance awareness on RADIUS, the SMF allows:                                                    | 2021.02.0      |
| Instance-level configuration under RADIUS     profile                                                       |                |
| • NAS-IP-Address and NAS-Identifier attribute configuration per instance-id in RADIUS profile configuration |                |
| • RADIUS Disconnect-Request VIP configuration<br>per instance-id in RADIUS endpoint<br>configuration        |                |

| Revision Details                                                    | Release       |
|---------------------------------------------------------------------|---------------|
| Added support for the following:                                    | 2020.02.5.t1  |
| • PAP, CHAP, and MSCHAP-based RADIUS authentication                 |               |
| Multiple RADIUS NAS-IP source addresses                             |               |
| <ul> <li>Handling RADIUS Disconnect and CoA<br/>Requests</li> </ul> |               |
| RADIUS Accounting on SMF                                            |               |
| New attributes in the RADIUS Access Response message                |               |
| First introduced.                                                   | Pre-2020.02.0 |

# **Feature Description**

To support instance awareness on RADIUS, the following changes have been implemented:

- · Allow instance-level configuration under RADIUS profile
- Define NAS-IP-Address and NAS-Identifier attribute configurations per instance-id in RADIUS profile configuration
- Define RADIUS Disconnect-Request VIP configuration per instance-id in RADIUS endpoint configuration
- Consider NAS-IP-Address and NAS-Identifier attributes under instance configuration as high priority over non-instance based attribute configuration
- Support new label "grInstId" in the following RADIUS metrics:
  - Radius\_Requests\_Statistics
  - Radius\_Requests\_Current
  - Radius\_CoaDM\_Requests\_Statistics
  - Radius\_CoaDM\_Requests\_Current

Note

e The existing non-instance based NAS-IP-Address and NAS-Identifier attribute configurations are used as default NAS-IP and default NAS-Identifier for local-instance of the site. The precedence of NAS-IP and NAS-ID remain the same as before.

The following is an example configuration for NAS-IP-Address and NAS-Identifier attributes.

```
config
profile radius
attribute
instance 1
nas-ip 209.165.200.225
```

```
nas-identifier smf1
  exit
  instance 2
   nas-ip 209.165.201.2
   nas-identifier smf2
  exit
 exit
 accounting
  attribute
   instance 1
    nas-ip 209.165.200.225
    nas-identifier smf1
   exit
   instance 2
    nas-ip 209.165.201.2
    nas-identifier smf2
   exit
  exit
 exit
exit
server-group gl
 attribute
  instance 1
  nas-ip 209.165.200.225
   nas-identifier smf1
  exit
  instance 2
   nas-ip 209.165.201.2
   nas-identifier smf2
  exit
 exit
exit
accounting
 attribute
  instance 1
  nas-ip 209.165.200.225
   nas-identifier smf1
  exit
  instance 2
   nas-ip 209.165.201.2
   nas-identifier smf2
  exit
 exit
exit
exit
```

The following is an example configuration for RADIUS Disconnect-Request VIP.

```
config
 instance instance-id 1
 endpoint radius
  replicas 1
  interface coa-nas
   vip-ip 10.0.0.0 vip-port 3799
   exit
  exit
 exit
 instance instance-id 2
 endpoint radius
  replicas 1
   interface coa-nas
   vip-ip 10.1.0.0 vip-port 3799
   exit
  exit
```

```
exit
exit
```

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > RADIUS Authentication and Accounting chapter.

| First introduced.                                                                                                                                                                                                                                                                                   | Pre-2020.02.0 |

# **Feature Description**

The SMF selects the UPF node for EPS and 5GS sessions based on certain predefined query parameters such as DNN, pdn-type-subscription, pdn-type-session, priority, load, and Dual Connectivity with New Radio (DCNR). The DCNR is applicable only to the EPS calls.

The following two query parameters are new in this release:

Subscriber location

#### • Network slice

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

## **Feature Description**

Generating the Modify Bearer Response message at gtpc-ep pod is called MBR short circuit. SMF now generates Modify Bearer Response messages at gtpc-ep pod to limit the impact of processing Modify Bearer Request, sending Modify Bearer Response message (Modify Bearer Response) with success cause at the smf-service pods, the Modify Bearer Response message are generated at gtpc-ep pod.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > MBR Short Circuit Optimization chapter.

| Revision Details  | Release   |
|-------------------|-----------|
| First introduced. | 2021.02.1 |

# **Feature Description**

Mesh connectivity enables UPF to connect to all SMFs in particular region. However, subscriber is hosted on only one UPF.

All UPFs in the region must be connected to all the SMFs in the region. Ideally, SMF can be connected to a maximum of 1024 UPFs. UPF can support up to a maximum of four peers (SMF, SGW-C, and cnSGW).

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Mesh Connectivity to All UPFs chapter.

## **Feature Description**

SMF allows IPv4 addresses to be configured in MTU. If UE requests, configuration links MTU in PCO IE. When CSR comes with PCO requesting IPv4 link MTU, SMF sends create session response with PCO containing link MTU configured under network-capability policy. When N1 Pdu session Establishment Request comes with PCO requesting IPv4 link MTU, SMF sends N1 Pdu Session Establishment response with PCO containing link MTU configured under network-capability policy.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > MTU Support in PCO chapter.

|----------------------------------------------------------------------------------------------|---------------|
| Introduced support for non-standard QCI for dynamic PCC and session rules                    | 2021.02.2     |
| Introduced support for the following features:                                               | 2021.02.0     |
| • Bit rate mapping                                                                           |               |
| • UPF Selection based on Slice and Location                                                  |               |
| • UP Optimization                                                                            |               |
| Introduced support for the following:                                                        | 2021.01.0     |
| Co-located UPF Selection                                                                     |               |
| <ul> <li>Enhanced Limits for Maximum Groups in<br/>Bandwidth Policy Configuration</li> </ul> |               |
| Handling Session Report Rejection Procedure                                                  |               |
| • New Format of Outer Header information element (IE)                                        |               |
| Introduced support for the following:                                                        | 2020.03.0     |
| • UPF node selection based on DNN and PDU Session type                                       |               |
| • Modification of authorized default QoS                                                     |               |
| • Additional session report and UPF node report request                                      |               |
| First introduced.                                                                            | Pre-2020.02.0 |

# **Feature Description**

SMF supports QoS enforcement only at PCC rule and session levels. This feature captures the requirements to support QoS enforcement at QoS flow level.

New configuration is added for this feature under the QoS profile (associated with DNN Profile) to enable flow level Qos-enforcement.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

|----------------------------------------------------------------------------------|---------------|
| Added support for:                                                               | 2021.02.0     |
| • Cause IE on N11 interface.                                                     |               |
| <ul> <li>NAS messages compliance with invalid protocol data handling.</li> </ul> |               |
| • ProblemDetails JSON object on N11 interface.                                   |               |
| • Error handling with HTTP error codes.                                          |               |
| • HTTP/2 TLS support for SBA interface.                                          |               |
| First introduced.                                                                | Pre-2020.02.0 |

# **Feature Description**

The SMF is NAS messages compliant with invalid protocol data handling as defined in 3GPP TS 24.501 with this release.

SMF complies to the following sections of 3GPP TS 24.501 for this feature:

- 7.2 Message too short or too long
  - 7.2.1 Message too short
  - 7.2.2 Message too long

- 7.6 Unknown and unforeseen IEs in the non-imperative message part
  - 7.6.1 IEIs unknown in the message
  - 7.6.2 Out of sequence IEs
  - 7.6.3 Repeated IEs
- 7.7 Non-imperative message part errors
  - 7.7.1 Syntactically incorrect optional IEs
  - 7.7.2 Conditional IE errors

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

# **New Container Identifier Support**

### **Revision History**

**Table 87: Revision History** 

| Revision Details                        | Release   |
|-----------------------------------------|-----------|
| FB Call Continuity Cause Code Expansion | 2021.02.2 |

| Revision Details                                                                                                | Release       |
|-----------------------------------------------------------------------------------------------------------------|---------------|
| Added support for:                                                                                              | 2021.02.0     |
| Configuring APN-AMBR action in Create Session Response                                                          |               |
| • Container field—0005H (Selected Bearer Control Mode) for the PCO, ePCO, or aPCO IE in Create Session Response |               |
| • GTP-C path failure detection and debugging improvements                                                       |               |
| • GTP-C peer restart detection improvements                                                                     |               |
| • Handling the dedicated bearer procedure failures observed at the expiry of procedure SLA timer                |               |
| Introduced procedure to support dynamic configuration of the Access Profile configuration.                      | 2020.03.0     |
| New CLI command in the DNN profile configuration to reject calls from 4G-only UE devices.                       | 2020.02.1     |
| First introduced.                                                                                               | Pre-2020.02.0 |

The SMF populates the container identifier 0005H (Selected Bearer Control Mode) in PCO, ePCO, and aPCO IE in Create Session Response. The container identifier contents field with value 2 indicates that the MS/NW mode is selected.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > EPS Interworking chapter.

# **Feature Description**

With this release, SMF supports 5G aggregation along with New Radio Dual Connectivity (NR-DC) to achieve higher 5G data rates.

This feature has the following key points:

- Use NR-DC only for data traffic.
- Use only default flow for data traffic.
- One tunnel is sufficient.
- SMF requires no configuration.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > New Radio Dual Connectivity chapter.

|--------------------------------------------------------------------------------------------------------|----------------|
| Added support for interworking with ISE.                                                               | 2021.02.2.t1.0 |
| Introduced new CLI option in charging profile to generate the RADIUS accounting trigger on TFT change. | 2021.02.0      |

| Revision Details                                                                                            | Release       |
|-------------------------------------------------------------------------------------------------------------|---------------|
| To support instance awareness on RADIUS, the SMF allows:                                                    | 2021.02.0     |
| Instance-level configuration under RADIUS     profile                                                       |               |
| • NAS-IP-Address and NAS-Identifier attribute configuration per instance-id in RADIUS profile configuration |               |
| • RADIUS Disconnect-Request VIP configuration<br>per instance-id in RADIUS endpoint<br>configuration        |               |
| Added support for the following:                                                                            | 2020.02.5.t1  |
| • PAP, CHAP, and MSCHAP-based RADIUS authentication                                                         |               |
| Multiple RADIUS NAS-IP source addresses                                                                     |               |
| Handling RADIUS Disconnect and CoA<br>Requests                                                              |               |
| RADIUS Accounting on SMF                                                                                    |               |
| New attributes in the RADIUS Access Response message                                                        |               |
| First introduced.                                                                                           | Pre-2020.02.0 |

The SMF generates RADIUS ACCOUNTING-INTERIM-UPDATE trigger whenever a change in Traffic Flow Template (TFT) is detected during the 4G or 5G call.

The SMF controls the trigger generation using the new CLI keyword **tft-change**. The **accounting triggers** CLI command in Charging Profile configuration includes the new keyword option.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > RADIUS Authentication and Accounting chapter.

| Revision Details                                                                                                                                                                                                                                                                                    | Release   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| Introduced support for non-standard QCI for dynamic PCC and session rules                                                                                                                                                                                                                           | 2021.02.2 |
| Introduced support for the following features:<br>• Bit rate mapping<br>• UPF Selection based on Slice and Location<br>• UP Optimization                                                                                                                                                            | 2021.02.0 |
| <ul> <li>Introduced support for the following:</li> <li>Co-located UPF Selection</li> <li>Enhanced Limits for Maximum Groups in<br/>Bandwidth Policy Configuration</li> <li>Handling Session Report Rejection Procedure</li> <li>New Format of Outer Header information<br/>element (IE)</li> </ul> | 2021.01.0 |

| Revision Details                                        | Release       |
|---------------------------------------------------------|---------------|
| Introduced support for the following:                   | 2020.03.0     |
| • UPF node selection based on DNN and PDU Session type  |               |
| • Modification of authorized default QoS                |               |
| • Additional session report and UPF node report request |               |
| First introduced.                                       | Pre-2020.02.0 |

The SMF supports non-standard QCI values in dynamic PCC and session rules along with the standard QCI values. Non-standard QCIs are the values from 1 through 255 and that are not part of standard QCI values as defined in section 6.1.7.2 of 3GPP 23.203 specification.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

#### Table 99: Revision History

| Revision Details                                                       | Release   |
|------------------------------------------------------------------------|-----------|
| In this release, added support for the following functionality:        | 2021.02.0 |
| • Configurable retry actions for specific error codes.                 |           |
| • Flexible options for the retry action associated with an error code. |           |
| • Httpv2 status code range in the failure handling templates of NFs.   |           |

| Revision Details                                                                     | Release       |
|--------------------------------------------------------------------------------------|---------------|
| Introduced support for individual NF Profile member changes through NRF notification | 2020.03.0     |
| Included the following new parameters as part of the NRF discovery query:            |               |
| • limit                                                                              |               |
| • max-payload-size                                                                   |               |
| • requester-snssais                                                                  |               |
| First introduced.                                                                    | Pre-2020.02.0 |

Currently, the system performs error-handling by segregating error codes into recoverable and non-recoverable error codes. It attempts to recover the endpoints with continuous retries when an NF service consumer receives recoverable error from the NRF server for messages like NFRegistration, NFUpdate, NF Heart-Beat, and so on. The NRF Failure Profile Support feature provides a flexible way for handling errors during the NRF interactions with other NF service consumers.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > NF Discovery and Management chapter.

| First introduced.                                                                                                                                                                                                                                                                                   | Pre-2020.02.0 |

## **Feature Description**

The converged core gateway with the cnSGWc and SMF supports selection of a converged UP node to truly realize convergence. With this functionality, it is possible to create an optimized data path for the UE.

The SMF uses the existing UPF selection logic and sends information on the selected UPF to cnSGWc so that it selects the same UPF. This feature involves implementing some configuration changes to select the same UPF during initial EPS attach and 5G to 4G handover procedures.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Policy and User Plane Management chapter.

| Revision Details                                               | Release       |
|----------------------------------------------------------------|---------------|
| Added support for:                                             | 2021.02.0     |
| Cause IE on N11 interface.                                     |               |
| • NAS messages compliance with invalid protocol data handling. |               |
| ProblemDetails JSON object on N11 interface.                   |               |
| • Error handling with HTTP error codes.                        |               |
| • HTTP/2 TLS support for SBA interface.                        |               |
| First introduced.                                              | Pre-2020.02.0 |

# **Feature Description**

SMF supports sending and receiving the ProblemDetails JSON object on the N11 interface.

An application error can prevent the SMF service, acting as an HTTP server, from completing the HTTP request. In this case, the SMF service maps the application error to the similar 4xx or 5xx HTTP status.

An HTTP status code determines the cause of the error. However, sometimes these status codes don't have adequate information about an error. In this case, the SMF service acting as the HTTP server provides more application-related error information to the SMF service acting as an HTTP client. This SMF service provides

the additional information by including the representation of "ProblemDetails" data structure in the response body.

3GPP specification defines JSON as one of the document formats. HTTP APIs reuse this format to identify various problem types based on the requirement.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Interfaces Support chapter.

# Query Interface IE Support—CSCvx69260

# **Behavior Change Summary and Revision History**

### **Summary Data**

#### Table 104: Summary Data

| Applicable Products or Functional Area | SMF                               |

#### Table 105: Revision History

| Revision Details                                                                  | Release       |
|-----------------------------------------------------------------------------------|---------------|
| Added support for Query Interface IE.                                             | 2021.02.0     |
| Introduced support for reconciliation of billing records when CHF is unreachable. | 2021.02.0     |
| Added session-level limitations on the N4 interface.                              | 2021.01.1     |
| Introduced support for the following:                                             | 2021.01.0     |
| Zero Usage Report Suppression                                                     |               |
| Dynamic ACS Configuration Change                                                  |               |
| First introduced.                                                                 | Pre-2020.02.0 |

## **Behavior Change**

**Previous Behavior**: If the Charging Characteristics (CC) trigger happened at SMF, then the SMF sent QUERY URR to the CHF for the created URR.

**New Behavior**: If the CC trigger happens at SMF and the trigger is armed at session level, the SMF queries the online and offline URRs at UPF, and the RADIUS URR if accounting is enabled. This feature enables SMF to discover the URR present at UPF.

A new custom IE, QUERY\_INTERFACE is introduced to support this functionality. The QUERY\_INTERFACE IE is set along with the QUARR flag while sending the N4 Modification Request. The new CLI command **query-all-urr** in the Charging Profile configuration can be configured to query all URRs. By default, this command is enabled.

If the QUARR flag is not set, the UPF does not report all URRs even if the QUERY\_INTERFACE IE is set. If QUARR flag is set with the QUERY\_INTERFACE IE, the Query URR will not be relayed to the UPF.

Customer Impact: The SMF sends the CDR message to CHF if the CC trigger happens at SMF.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Subscriber Charging chapter.

# **Reconciliation of Billing Records**

# **Feature Summary and Revision History**

### **Summary Data**

#### Table 106: Summary Data

| Applicable Products or Functional Area | SMF                               |
|----------------------------------------|-----------------------------------|

| Related Documentation                  | Not Applicable                    |

### **Revision History**

#### Table 107: Revision History

| Revision Details                                                                  | Release   |
|-----------------------------------------------------------------------------------|-----------|
| Added support for Query Interface IE.                                             | 2021.02.0 |
| Introduced support for reconciliation of billing records when CHF is unreachable. | 2021.02.0 |

| Revision Details                                     | Release       |
|------------------------------------------------------|---------------|
| Added session-level limitations on the N4 interface. | 2021.01.1     |
| Introduced support for the following:                | 2021.01.0     |
| Zero Usage Report Suppression                        |               |
| Dynamic ACS Configuration Change                     |               |
| First introduced.                                    | Pre-2020.02.0 |

The SMF falls back to the offline CHF when all the converged CHF servers are unreachable. Then, the SMF sends the usage to the offline CHF.

The reporting to offline CHF does not include any differentiator in Used Unit Container (UUC) for the offline service and the converted offline service.

SMF supports a new enumerated value "CONVERTED\_OFFLINE" in the Quota Management Indicator (QMI) added to the UUC. The SMF uses this enumerated value to mark the converted offline usage records sent to the offline CHF.

Important

t The Reconciliation of Billing Records is a customer-specific enhancement that requires IE level compliance across both the SMF and the CHF.

With this enhancement, the offline CHF can easily differentiate between normal offline usage and converted usage records.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Subscriber Charging chapter.

# Reporting of Deferred Usage with Quota Request—CSCvy31552

## **Behavior Change Summary and Revision History**

#### **Summary Data**

#### Table 108: Summary Data

| Applicable Product(s) or Functional Area | SMF                 |

## **Behavior Change**

Previous Behavior: Earlier deployment CLI caused Grafana dashboard queries to fail.

The earlier deployment used the following CLI commands:

- K8s name laucs504-cnat
- K8s namespace smf-data
- K8s nf-name smf

**New Behavior**: In this release, the old deployment CLI is restored to maintain the same behaviour as existed in the SMF Release 2020.02.0. With this deployment CLI, you can configure the app-name, cluster-name, and dc-name that is required for the Grafana dashboard queries.

The new deployment uses the following CLI commands:

- app-name LASMF106
- cluster-name LAUCS504-SMF-DATA
- dc-name LAUCS504

# **Session-level URR Limitation**

## **Feature Summary and Revision History**

#### Table 113: Revision History

| Revision Details                                                                  | Release       |
|-----------------------------------------------------------------------------------|---------------|
| Added support for Query Interface IE.                                             | 2021.02.0     |
| Introduced support for reconciliation of billing records when CHF is unreachable. | 2021.02.0     |
| Added session-level limitations on the N4 interface.                              | 2021.01.1     |
| Introduced support for the following:                                             | 2021.01.0     |
| Zero Usage Report Suppression                                                     |               |
| Dynamic ACS Configuration Change                                                  |               |
| First introduced.                                                                 | Pre-2020.02.0 |

## **Feature Description**

The SMF Charging feature includes the following limitations on the N4 interface:

- If the session-level URR (CDR-i) is created once, it will remain through the session. It will not get deleted in the subsequent session (CDR-u).
- If the session-level URR is not created, then it will not be created in the subsequent CDR-u even if session limits are available.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Subscriber Charging chapter.

# **Session Setup Timer Support**

# **Feature Summary and Revision History**

### **Summary Data**

Table 115: Revision History

| Revision Details                                          | Release   |
|-----------------------------------------------------------|-----------|
| Added support for session setup timer and back-off timer. | 2021.02.0 |
| First introduced.                                         | 2020.02.0 |

## **Feature Description**

The SMF supports the custom-driven session setup timer. The session setup timer is triggered when new calls are established. If the call is not established within the defined timeout value, the SMF aborts the call. This timer is applicable to 4G, 5G, and Wi-Fi sessions.

The new timeout setup CLI command added under profile DNN configures the session setup timeout value.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Session Timers chapter.

# Show Subscriber Output Change for ARP—CSCvy54440

## **Behavior Change Summary and Revision History**

#### **Summary Data**

#### Table 116: Summary Data

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |

## **Behavior Change**

**Previous Behavior:** The values for "preemptCap" and "preemptVuln" attributes of Allocation and Retention Priority (ARP) were displayed as numbers in the output of **show subscriber** CLI command.

The following is an example output of the **show subscriber** command.

```
"arp": {
"preemptCap": 1,
"preemptVul": 1,
"priorityLevel": 8,
```

New Behavior: Now, these ARP flags are displayed as strings instead of numbers.

The following is an example output of the **show subscriber** command.

```
"arp": {
  "preemptCap": MAY_PREEMPT,
  "preemptVul": PREEMPTBLE,
  "priorityLevel": 8,
```

# show subscriber supi Command Support

|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| Added support for the following enhancements:                                                                                                                                                                                                                            | 2021.02.2     |
| • The <b>show subscriber nf-service smf</b> <i>smf_url</i> command to show subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                         |               |
| • The <b>clear subscriber nf-service smf</b> <i>smf_url</i> command to clear subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                       |               |
| • The <b>clear subscriber nf-service smf</b> <i>smf_url</i> command to clear subscriber details based on the IP address value of the vSMF or hSMF.                                                                                                                       |               |
| • The <b>show subscriber supi</b> <i>supi_idpsid psid_value</i> <b>full</b> command to show detailed subscriber information for roaming-specific use case as hSMF and vSMF.                                                                                              |               |
| • The <b>show subscriber supi</b> <i>supi_id</i> <b>psid</b> <i>psid_value</i> <b>summary</b> command to show detailed information about subscriber sessions for roaming-specific use case as hSMF and vSMF.                                                             |               |
| Added support for the following enhancements:                                                                                                                                                                                                                            | 2021.02.0     |
| • The <b>show subscriber supi</b> <i>supi_value</i> <b>psid</b> <i>psid_value</i> <b>summary</b> command to provide detailed information about subscriber sessions.                                                                                                      |               |
| • The clear subscriber nf-service smf and show subscriber nf-service smf commands with supported keywords and filters.                                                                                                                                                   |               |
| • The <b>clear subscriber</b> and <b>clear subscriber nf-service smf</b> commands to support the <b>reactivation</b> keyword to clear sessions when release cause as reactivation-required is configured. This enhancement also supports disconnect and release reasons. |               |
| • The imei keyword for monitor subscriber, clear subscriber, and show subscriber CLI commands.                                                                                                                                                                           |               |
| First introduced.                                                                                                                                                                                                                                                        | Pre-2020.02.0 |

# **Feature Description**

The **show subscriber supi** *supi\_value* **psid** *psid\_value* **summary** is a new CLI command added in this release to display detailed information about subscriber sessions. This command improves usability and can be used for debugging purposes.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Troubleshooting Information chapter.

| New attributes in the RADIUS Access Response message                |               |
| First introduced.                                                   | Pre-2020.02.0 |

# **Feature Description**

SMF supports communication with ISE for Cisco private 5G. Based on the policies that SMF receives from ISE, Cisco private 5G supports various behaviors on the enterprise side. ISE provides a mechanism for the enterprise customers to perform tasks, such as identifying the subscriber, defining groups for the subscribers, and assigning policy.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > RADIUS Authentication and Accounting chapter.

# SMF Service Node and Replica Configuration—CSCvx45374

# **Behavior Change Summary and Revision History**

### **Summary Data**

|----------------------|-----------|
| First introduced.    | 2021.02.0 |
| CDETS ID: CSCvx45374 |           |

## **Behavior Change**

**Previous Behavior**: The **endpoint service** and **endpoint sgw-service** configurations allowed a non-zero value to be configured for **nodes**.

**New Behavior**: This release allows you to configure a zero value for **nodes** and non-zero value for **replicas** in the **endpoint service** and **endpoint sgw-service** configurations.

The SMF service pod template is updated to allow zero count for nodes so that all replicas are part of a single replica set. If node count is configured as zero, the pod affinity rules are not applied and the pod topology constraints are applied (Kubernetes 1.19 and above) instead.

For example:

```
endpoint service
replicas 10
nodes 0
exit
```

**Customer Impact**: This change provides flexibility to spin service pods on any node matching the node labels with sufficient resources.

# smf-service Restart—CSCvy02596

## **Behavior Change Summary and Revision History**

### **Summary Data**

#### Table 124: Summary Data

| Applicable Product(s) or Functional Area | SMF                 |

## **Behavior Change**

**Previous Behavior**: When the call model events (mix of both the 4G and the 5G events) ran and if the smf-service or the in-service upgrade stopped, the smf-service crash occurred.

**New Behavior**: When the call model events (mix of both the 4G and the 5G events) run, the smf-service pod restart occurs in the following cases:

- smf-service pod recovery operation
- smf-service in-service upgrade

# **Subscriber IMEI Support**

## **Feature Summary and Revision History**

### **Summary Data**

#### Table 126: Summary Data

| Applicable Product(s) or Functional Area | SMF                 |

| Revision Details                                                                                       | Release   |
|--------------------------------------------------------------------------------------------------------|-----------|
| The <b>monitor subscriber</b> CLI command includes the <b>imei</b> keyword to support subscriber IMEI. | 2021.02.0 |

| Revision Details                                          | Release       |
|-----------------------------------------------------------|---------------|
| Added show commands for the RPC feature in App-Infra SMF. | 2020.03.0     |
| First introduced.                                         | Pre-2020.02.0 |

The subscriber IMEI support is added for monitoring and troubleshooting purposes. The following CLI commands are enhanced in this release:

- monitor subscriber—The imei keyword added to this command specifies the subscriber IMEI as a 15 or 16 digit integer. For example: 123456789012345, \*
- clear subscriber—The imei keyword added to this command clears subscriber details with the specified IMEI ID.
- **show subscriber**—The **imei** keyword added to this command displays subscriber details with the specified IMEI ID.
- show peers all—The interfaceName keyword added to this command specifies the interface name.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Troubleshooting Information chapter.

|-------------------|-----------|
| First introduced. | 2021.02.0 |

## **Feature Description**

The SMF does not support rolling software upgrade from release 2021.01 to release 2021.02. In order to upgrade from release 2021.01 to release 2021.02, you must perform a fresh SMF deployment from the Ops Center. For details, see the *Deploying and Configuring SMF through Ops Center* chapter in the *Ultra Cloud Core 5G Session Management Function, Release 2021.02 - Configuration and Administration Guide.* 

After the fresh deployment is complete, make sure that all the instance-aware configuration changes are available. For the complete list of configuration changes, see the Instance-aware Configuration Changes, on page 48 section in this document.

Also, make sure to clean up the etcd entries if the **etcd persistence** is enabled through **k8s volume-claims true** command. For the clean-up operation, use the **kubectl exec -it etcd-***(namespace)***-etcd-cluster-0 -n cn-cn1 -- etcdctl del --prefix ''''** command.

# UPF Interaction while Deleting WPS Dynamic Rule—CSCvx68018

## **Feature Summary and Revision History**

#### **Summary Data**

#### Table 130: Summary Data

| Applicable Product(s) or Functional Area | SMF                               |
|------------------------------------------|-----------------------------------|
| Applicable Platform(s)                   | SMI                               |
| Feature Default Setting                  | Disabled – Configuration Required |
| Related Changes in this Release          | Not Applicable                    |
| Related Documentation                    | Not Applicable                    |

Table 131: Revision History

| Revision Details                                                                                                      | Release   |
|-----------------------------------------------------------------------------------------------------------------------|-----------|
| UPF Interaction while Deleting WPS Dynamic Rule                                                                       | 2021.01.0 |
| SBI Message Priority Mechanism and Message-Prioritization based on Procedures are introduced.                         | 2021.01.0 |
| The Wireless Priority Services feature is fully qualified in this release.                                            | 2020.03.0 |
| First introduced.                                                                                                     | 2020.02.0 |
| This feature is not fully qualified in this release. For more information, contact your Cisco Account representative. |           |

## **Behavior Change**

Previous Behavior: SMF sets MP flag in N4 message while deleting dynamic rule.

**New Behavior**: With this release, SMF will not set MP flag in N4 message while deleting dynamic rule if no other existing rules ARP isn't matching wps-profile.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Wireless Priority Services chapter.

### **Summary Data**

#### Table 132: Summary Data

| Applicable Product(s) or Functional Area | SMF                 |
|------------------------------------------|---------------------|
| Applicable Platform(s)                   | SMI                 |
| Feature Default Setting                  | Enabled - Always-on |
| Related Changes in this Release          | Not Applicable      |
| Related Documentation                    | Not Applicable      |

#### Table 133: Revision History

| Revision Details                                               | Release       |
|----------------------------------------------------------------|---------------|
| Provided support for User Location Information (ULI) reporting | 2021.02.0     |
| First introduced.                                              | Pre-2020.02.0 |

# **Feature Description**

The SMF generates the usage report whenever a change in the subscriber location is detected in the following messages:

- Delete Bearer Command
- Delete Bearer Response
- Modify Bearer Request

This feature is compliant with the 3GPP TS 32.291, version 15.4.0.

For more information, refer to the UCC 5G SMF Configuration and Administration Guide > Handover Procedures chapter.
