

# SMF Serviceability

- [Peer Monitoring, on page 1](#)
- [Log Monitoring, on page 2](#)

## Peer Monitoring

### View Peer Status Through Grafana

Table 1: Feature History

Feature Name	Release Information	Description
SMF Metrics – View Peer Status Through Grafana	2025.01.0	<p>With this release, SMF provides the ability to view the connection status of Diameter (Gx and Gy), RADIUS, CGF, and N4 peers using Grafana queries on Grafana cloud.</p> <p>In a single pane view, you can see the peer status across various deployments, aiding in faster identification and resolution of connectivity issues.</p> <p>The Grafana query shows the current status of the peers and also shows the peer status if it is connected or not connected.</p> <p>For more information about SMF metrics, see <a href="#">SMF Metrics</a>.</p>

SMF uses the following metrics to view the peer status in Grafana:

Table 2: Metrics Used for Grafana Queries

Peer	Metric	Configuration Required
Diameter (Gx and Gy)	<b>rpc_host_status</b>	<pre>infra metrics verbose protocol metrics rpc_host_status level <b>debug</b> exit</pre> <p><b>OR</b></p> <pre>infra metrics verbose protocol level <b>debug</b> exit</pre> <p><b>Note</b> After adding this configuration, you must restart the diameter-ep pods.</p>
RADIUS	<b>Radius_Server_Status</b>	No configuration required
CGF (GTPP/Gz)	<b>nodemgr_gtp_stats</b>  Note that this metric is new in this release (2025.01.0).	<pre>infra metrics verbose application metrics nodemgr_gtp_stats level <b>debug</b> exit</pre> <p><b>OR</b></p> <pre>infra metrics verbose application level <b>debug</b> exit</pre>
N4	<b>nodemgr_upf_link_status</b>  Note that this metric is new in this release (2025.01.0).	<pre>infra metrics verbose application metrics nodemgr_upf_link_status level <b>debug</b> exit</pre> <p><b>OR</b></p> <pre>infra metrics verbose application level <b>debug</b> exit</pre>

# Log Monitoring

## Feature Summary and Revision History

### Summary Data

Table 3: Summary Data

Applicable Product(s) or Functional Area	SMF
Applicable Platform(s)	SMI

Feature Default Setting	Enabled – Always-on
Related Changes in this Release	Not Applicable
Related Documentation	Not Applicable

## Revision History

*Table 4: Revision History*

Revision Details	Release
First introduced.	2023.01.0

## Feature Description

The SMF logs and serviceability feature perform in the following modes:

- It helps and captures capabilities to enable limited debug logs in the production with a chain of troubleshooting tools.
- These further help in improving the time taken in finding a root cause of any issue found during the production.

This feature allows the operator to enable specific LogTag to debug call failures and procedure failures, to facilitate a better RCA in the production. It has the following characteristics:

- The SMF must provide a tool or utility to generate core dumps that help in downloading and investigating the problem further.
- The SMF must print the SUPI of the failed subscriber along with the error details in the logs.
- The required subscriber information MonSub helps in debugging a particular subscriber.

## Relationships

The following modules are associated with this feature:

- [Call Failure Logs, on page 8](#)
- [Procedure Failure Logs, on page 9](#)
- [Generic Procedure Failure Logs, on page 12](#)
- [Additional Call Flow Failure Logs, on page 13](#)
- [Event Trace Logs, on page 16](#)
- [Call Flow Statistics Logs, on page 19](#)
- [Core Dump Utility Logs, on page 21](#)
- [Monitor Subscriber \(MonSub\) Logs, on page 22](#)
- [N40 Additional Logs and Statistics, on page 26](#)

- [N7 Additional Logs and Statistics, on page 27](#)

## How it Works

This section describes how this feature works.

### Log Instances

The log instance generates messages, used for identifying issues, deployment status, and performance tuning. The application infrastructure provides a common way to enable log messages across applications. Each log instance has the following:

- Timestamp
- Log message
- Log level
- LogTag

### LogTag

The LogTag is used as a filter to enable or disable the specific type of log messages. Before or during the logging session, they are precreated, evaluated, and exempted. It consists of the following:

- Module name
- Component name
- Interface name

### Creating a LogTag

The following is a sample example of creating a LogTag:

```
common.LogTagN7RestEp = appCtx.RegisterLogTag("rest_ep", "app", "n7")
```

### Logging a Message

The following is a sample example of a LogTag message logging:

```
appCtx.Info(common.LogTagN7RestEp, "Starting rest-ep app")
```

### Log Levels

The application infrastructure provides upto six variants of log levels, which can be used as filter along with LogTag to enable or disable specific logs. Each level represents the level of importance of a log message, which can be used while troubleshooting. The following table lists log levels and their usage:

**Table 5: Log Levels**

Log Levels	Usage
Error	Used when there's incorrectness leading to serious issues.
Warning	Used to notify and warn, when there's an occurrence of any of the following scenarios: <ul style="list-style-type: none"> <li>• Something serious is about to happen.</li> <li>• If there's an activity which is erroneously running</li> <li>• Continuously giving error notes</li> <li>• Not attended scenarios</li> </ul>
Info	Used for normal expected behavior such as starting an application or stopping the same, and so on.
Debug	Used to provide more information required to debug problems.
Trace	Used to provide extensive information. Also, used in monitoring routines, where the same debug log keeps coming periodically.
Off	Used when there isn't any meaning in the logging information. Configured in the CLI to turn off or turn on the logging activity.

**Log Level Order**

Every time, the application infrastructure logs any log message, it matches the log level, and the LogTag with the configured log setting, before logging.

**Table 6: Log Levels**

Log Levels (Order)	Usage
Error (0)	Matches error logs.
Warn (1)	Matches warn and error logs.
Info (2)	Matches info, warn, and error logs.
Debug (3)	Matches debug, info, warn, and error logs.
Trace (4)	Matches trace, debug, info, warn, and error logs.
Off (5)	Matches no log to disable errors.

## SMF Logs

The SMF supports operators to enable specific LogTag. The following is a list of modules which support the implementation of this feature.

### 1. Call Failure LogTag:

- Enabled in the CLI mode
- The SMF must enable the following logs based on the disconnect reason:
  - Error
  - Warning
  - Debug
- It prints the following log parameters:
  - Transaction ID
  - Disconnect reason
  - Event Trace
  - Session Keys
  - Error Category (For major disconnect reason)

### 2. Procedure Failure LogTag:

- Enabled in the CLI mode
- The SMF must enable the following logs based on the disconnect reason:
  - Warning
- It prints the following log parameters:
  - Transaction ID
  - Procedure Name
  - Event Trace
  - Detailed Error: It includes the following:
    - Failure reason or cause
    - Disconnect reason (if applicable)
    - Failure metrics

### 3. Additional Call Flow Failure LogTag:

- Enabled for specific reasons or conditions
- It prints the following log parameters:
  - Transaction ID

- Event Trace
- Call flow-specific error messages
- The supported log levels:
  - Error
  - Warning
  - Info
  - Debug

#### 4. Additional Generic Procedure Failure LogTag:

- Enabled in the CLI mode
- The SMF must not enable the Event Trace based on the disconnect reason.
- If the operator needs failure logs for all procedures, then the operator can enable this LogTag.

**Note** The operator needs to activate this LogTag carefully, as it prints logs of all failed procedures. This action can cause an overflow of service logs.

- It prints the following log parameters:
  - Transaction ID
  - Procedure Name
  - Detailed Error: It includes the following:
    - Failure reason or cause
    - Disconnect reason (if applicable)
    - Failure metrics

#### 5. Call Flow Statistics LogTag:

- This process gets tabulated at the end of all procedures.

#### 6. Core Dump LogTag:

- This process initiates the debugging activities for a core dump utility.

#### 7. Subscriber Monitoring LogTag:

- This process initiates the debugging activities for any kind of failures. It also processes the subscriber monitoring based on the subscriber SUPI.

**Timesaver**

For more information, see *Troubleshooting Information* > [Logs](#).

## Call Failure Logs

The following are the synopsis of the Call Failure logs to trigger session management policies towards the SMF:

- For call failures and call releases, the disconnect-reason-based statistics are defined and attached.
- Disconnect Reasons—They are classified into three categories as the following:
  - Major
  - Minor
  - Normal
- On call failure or call release scenarios, messages are logged as the following:
  - Major (Catastrophic) Category Disconnect Reasons—The transaction log at Error level is to display the Error category, Disconnect reason, along with Event Trace, and Session keys.
  - Minor (Critical) Category Disconnect Reasons—The transaction log at Warning level to dump the Disconnect reason, along with Event Trace, and Session keys.
  - Normal Category Disconnect Reasons—The transaction log at Debug level to dump the Disconnect reason along with the Event Trace and Session keys.
  - Graceful Core Dump—This transaction log also gets performed with the same LogTag and levels.
- A new LogTag to log the Call Failures also gets defined.
- The Transaction ID gets printed in a Call Failure logs to align with the logs and call flow.
- Based on the disconnect reason statistics, the callfailure tag with the corresponding log level can be enabled to collect further information of the session. The following is a list of examples:
  - Event Trace
  - Session keys
  - Core Dump

### Sample Dump for Call Failure Logs

The following is a sample dump for Call Failure logs:

Example: For a procedure lapsed time of over two seconds, a Warning message gets logged with the event trace.

```
2022/08/23 11:10:31.222 [WARN] [smf-service.smf-app.callfailure-debug] 2sec Time Elapsed:
EVENT TRACE SessionKeys[[imsi-123456789012345:5 (pk)]]
CurIndex:[2], CurProcInst:[0], CreateTimeStamp:[2022-08-23 11:10:31.204 +0530 IST],
```

```
BaseTimeStamp:[2022-08-23 11:10:31.204 +0530 IST]
```

INDEX	EVENT NAME			EVENT TYPE		PROC NAME
		PROC INST	TXN ID	TIMESTAMP		
1	N11SmContextCreateReq			INCOMING_EVENT		PDU Session Establishment
		1	1	2022-08-23 11:10:31.215 +0530 IST		
2	N11SmContextCreateReq			ENDPROC_EVENT		PDU Session Establishment
		1	1	2022-08-23 11:10:31.221 +0530 IST		

## Configuring the Call Failure Logs

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.callfailure-debug level
application/transaction <debug level>
```

### NOTES:

- **Warning**—The logging level supported for call failure LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

### Configuration Example

The following is an example configuration.

```
config
  logging name smf-service.smf-app.callfailure-debug level transaction warn
  logging name smf-service.smf-app.callfailure-debug level application error
exit
```

### Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.callfailure-debug
logging name smf-service.smf-app.callfailure-debug level application error
logging name smf-service.smf-app.callfailure-debug level transaction warn
```

## Procedure Failure Logs

The following are the synopsis of the Procedure Failure logs to trigger session management policies towards the SMF:

- During the termination scenario, each Procedure Failure log turns on the EndProcedure.
- During the failure scenario, the Error Code returns to the SMF Infra indicating whether the procedure was a success or a failure.
- On failure, a Transaction log (common to all procedures) with level warning is used to dump the session details as the following:
  - Event Trace
  - Procedure Name
  - Error Details—It contains failure reason or cause, disconnect reason (if applicable) and failure metrics.

- The Procedure Failure LogTag is common to all procedures.
- Procedure-specific LogTags will be configured for each procedure and used to enable logging for specific procedure failures.
- The Transaction ID gets printed in a procedure failure logs to align with the logs and call flow.
- The detailed errors note gets printed in the procedure failure logs. It helps in understanding the problem, the actual error cause, disconnect reason (if applicable), and failure metrics.

### Logging a Message for Procedure Failure Logs

The following is a sample example of a LogTag for Procedure Failure logs:

```
2023/01/15 11:34:30.002 [WARN] [smf-service.smf-app.pdnsetup-procfailure]
[Txn :7]Procedure=[PDN Connect [LTE]], PduState=[IDLE], Rat-Type=[rat_type_unknown],
FailureReason=[udm_subscribe_notify_failure],
DisconnectReason=[disc_pdnsetup_udm_sub_notify_resp_failed]
2023/01/15 11:34:30.002 [WARN] [smf-service.smf-app.pdnsetup-procfailure] [Txn :7]EVENT
TRACE
CurIndex:[8], CurProcInst:[0], CreateTimeStamp:[2022-09-13 11:34:27.942 +0000 UTC],
BaseTimeStamp:[2022-09-13 11:34:27.942 +0000 UTC]

|INDEX|EVENT NAME |EVENT TYPE |PROC NAME |PROC INST |TXN ID |TIMESTAMP |
|1 |S5S8CreateSessReq |INCOMING_EVENT |PDN Connect [LTE] |1 |7 |2022-09-13 11:34:27.942
+0000 UTC |
|2 |N10RegistrationSuccess |INCOMING_EVENT |PDN Connect [LTE] |1 |7 |2022-09-13 11:34:27.943
+0000 UTC |
```

## Configuring the Procedure Failure Logs

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.pdusetup-procfailure level
transaction <debug level>
logging name smf-service.smf-app.pdnsetup-procfailure level
transaction <debug level>
logging name smf-service.smf-app.pdurelease-procfailure
level transaction <debug level>
logging name smf-service.smf-app.pdndisconnect-procfailure level
transaction <debug level>
logging name smf-service.smf-app.5gim-procfailure
level transaction <debug level>
logging name smf-service.smf-app.xnho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.n2ho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.nrtowifiho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.enbtowifiho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.wifitonrho-procfailure
level transaction <debug level>
```

```

logging name smf-service.smf-app.wifitoenbho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.4gdedbrr-procfailure
level transaction <debug level>
logging name smf-service.smf-app.pdnmodmbr-procfailure level
transaction <debug level>
logging name smf-service.smf-app.5gmodify-procfailure
level transaction <debug level>
logging name smf-service.smf-app.5g4gho-procfailure
level transaction <debug level>
logging name smf-service.smf-app.n26ho-procfailure
level transaction <debug level>

```

**NOTES:**

- **Warning**—The logging level supported for procedure failure LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

**Configuration Example**

The following is an example configuration.

```

config
logging name smf-service.smf-app.4gdedbrr-procfailure level transaction warn
logging name smf-service.smf-app.5g4gho-procfailure level transaction warn
logging name smf-service.smf-app.5gim-procfailure level transaction warn
logging name smf-service.smf-app.5gmodify-procfailure level transaction warn
logging name smf-service.smf-app.enbtowifiho-procfailure level transaction warn
logging name smf-service.smf-app.n26ho-procfailure level transaction warn
logging name smf-service.smf-app.n2ho-procfailure level transaction warn
logging name smf-service.smf-app.nrtowifiho-procfailure level transaction warn
logging name smf-service.smf-app.pdndisconnect-procfailure level transaction warn
logging name smf-service.smf-app.pdnmodmbr-procfailure level transaction warn
logging name smf-service.smf-app.pdnsetup-procfailure level transaction warn
logging name smf-service.smf-app.pdurelease-procfailure level transaction warn
logging name smf-service.smf-app.pdusetup-procfailure level transaction warn
logging name smf-service.smf-app.wifitoenbho-procfailure level transaction warn
logging name smf-service.smf-app.wifitonrho-procfailure level transaction warn
logging name smf-service.smf-app.xnho-procfailure level transaction warn
exit

```

**Configuration Verification**

To verify the configuration:

```

[smf] smf# show running-config logging name
logging name smf-service.smf-app.4gdedbrr-procfailure level transaction warn
logging name smf-service.smf-app.5g4gho-procfailure level transaction warn
logging name smf-service.smf-app.5gim-procfailure level transaction warn
logging name smf-service.smf-app.5gmodify-procfailure level transaction warn
logging name smf-service.smf-app.enbtowifiho-procfailure level transaction warn
logging name smf-service.smf-app.n26ho-procfailure level transaction warn
logging name smf-service.smf-app.n2ho-procfailure level transaction warn
logging name smf-service.smf-app.nrtowifiho-procfailure level transaction warn
logging name smf-service.smf-app.pdndisconnect-procfailure level transaction warn
logging name smf-service.smf-app.pdnmodmbr-procfailure level transaction warn
logging name smf-service.smf-app.pdnsetup-procfailure level transaction warn
logging name smf-service.smf-app.pdurelease-procfailure level transaction warn
logging name smf-service.smf-app.pdusetup-procfailure level transaction warn
logging name smf-service.smf-app.wifitoenbho-procfailure level transaction warn

```

```
logging name smf-service.smf-app.wifitonrho-procfailure level transaction warn
logging name smf-service.smf-app.xrho-procfailure level transaction warn
```

## Generic Procedure Failure Logs

The following are the synopsis of the Generic Procedure Failure logs to trigger session management policies towards the SMF:

- During the termination scenario, each Procedure Failure log turns on the EndProcedure.
- During the failure scenario, the Error Code returns to the SMF Infra indicating whether the procedure was a success or a failure.
- On failure, a Generic Transaction log (common to all procedures) with level warning is used to dump the session details as the following:
  - Transaction ID
  - Procedure Name
  - Detailed Error—It contains failure reason or cause, disconnect reason (if applicable) and failure metrics.
- The Generic Procedure Failure LogTag is common to all procedures.
- When a specific procedure failure LogTag is disabled and a Generic Procedure Failure LogTag is enabled, then the SMF doesn't print the Event Trace.
- The Event Trace is printed, only when a specific procedure failure LogTag gets enabled.
- The Transaction ID gets printed in a procedure failure logs to align with the logs and call flow.
- The Detailed errors note gets printed in the generic procedure failure logs. It helps in understanding the problem, the actual error cause, disconnect reason (if applicable), and failure metrics.

### Logging a Message for Generic Procedure Failure Logs

The following is a sample example of a LogTag for Generic Procedure Failure logs:

```
2023/01/15 10:58:01.171 [WARN] [smf-service.smf-app.procfailure] [Txn :1]Procedure=[PDN
Connect [LTE]],
PduState=[IDLE], Rat-Type=[rat_type_unknown], FailureReason=[udm_subscribe_notify_failure],
DisconnectReason=[disc_pdnsetup_udm_sub_notify_resp_failed]
```

## Configuring the Generic Procedure Failure Logs

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.procfailure level transaction <debug
level>
```

### NOTES:

- **Warning**—The logging level supported for generic procedure failure LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

## Configuration Example

The following is an example configuration.

```
config
 logging name smf-service.smf-app.procfailure level transaction warn
exit
```

## Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.procfailure
logging name smf-service.smf-app.procfailure level transaction warn
```

## Additional Call Flow Failure Logs

The following are the synopsis of the Additional Call Flow Failure logs to trigger session management policies towards the SMF:

- Extra LogTags are added for specific procedures.
- These LogTags can be enabled for specific conditions between the procedure flow.
- The Additional Call Flow Failure logs help in identifying a procedure lapsed event and reciprocate with a logged warning message in the event trace.

### Sample Dump for Additional Call Flow Failure Logs

The following is a sample dump for Additional Call Flow Failure logs:

Example: For a procedure lapsed time of over two seconds, a warning message gets logged with the event trace.

```
2022/08/23 11:10:31.222 [WARN] [smf-service.smf-app.5gmodify-failure] 2sec Time Elapsed:
EVENT TRACE SessionKeys[[imsi-123456789012345:5 (pk)]]
CurIndex:[2], CurProcInst:[0], CreateTimeStamp:[2022-08-23 11:10:31.204 +0530 IST],
BaseTimeStamp:[2022-08-23 11:10:31.204 +0530 IST]
|INDEX|EVENT NAME                                |EVENT TYPE                                |PROC NAME
|PROC INST |TXN ID      |TIMESTAMP                                |
```

### Logging a Message for Additional Call Flow Failure Logs

The following is a sample example of a LogTag for Additional Call Flow Failure logs:

```
2022/08/23 11:10:31.222 [WARN] [smf-service.smf-app.5gmodify-failure] 2sec Time Elapsed:
EVENT TRACE SessionKeys[[imsi-123456789012345:5 (pk)]]
CurIndex:[2], CurProcInst:[0], CreateTimeStamp:[2022-08-23 11:10:31.204 +0530 IST],
BaseTimeStamp:[2022-08-23 11:10:31.204 +0530 IST]
|INDEX|EVENT NAME                                |EVENT TYPE                                |PROC NAME
|PROC INST |TXN ID      |TIMESTAMP                                |
```

## Configuring the Additional Call Flow Failure Logs

To configure this feature, use the following configuration:

```

Logging name smf-service.smf-app.4gdedbrr-failure level transaction <debug
level>
logging      name      smf-service.smf-app.pdnmodmbr-failure      level
transaction  <debug level>
logging      name      smf-service.smf-app.5gmodify-failure      level
transaction  <debug level>
logging      name      smf-service.smf-app.5g4gho-failure        level
transaction  <debug level>
logging      name      smf-service.smf-app.n26ho-failure          level
transaction  <debug level>
logging      name      smf-service.smf-app.wifi-nr-ho
level        transaction <debug level>
logging      name      smf-service.smf-app.datacheck              level
transaction  <debug level>
logging      name      smf-service.smf-app.N16                    level
transaction  <debug level>
logging      name      smf-service.smf-app.erir                    level
transaction  <debug level>
logging      name      smf-service.smf-app.flagdb                  level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr                      level    transaction
<debug level>
logging      name      smf-service.smf-app.dcr-ue                  level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-dup              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-mme              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-pcf              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-ubr              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-absent           level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-amf              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-chf              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-gnb              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-smf              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-udm              level
transaction  <debug level>
logging      name      smf-service.smf-app.dcr-brr-ue              level
transaction  <debug level>

```

```
logging      name      smf-service.smf-app.epsfb      level
transaction  <debug level>
```

**NOTES:**

- **Warning**—The logging level supported for additional call flow failure LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

**Configuration Example**

The following is an example configuration.

```
config
logging name smf-service.smf-app.4gdedbrr-failure level transaction warn
logging name smf-service.smf-app.5g4gho-failure level transaction warn
logging name smf-service.smf-app.5gmodify-failure level transaction warn
logging name smf-service.smf-app.N16 level transaction warn
logging name smf-service.smf-app.datacheck level transaction warn
logging name smf-service.smf-app.dcr level transaction warn
logging name smf-service.smf-app.dcr-brr-absent level transaction warn
logging name smf-service.smf-app.dcr-brr-amf level transaction warn
logging name smf-service.smf-app.dcr-brr-chf level transaction warn
logging name smf-service.smf-app.dcr-brr-dup level transaction warn
logging name smf-service.smf-app.dcr-brr-gnb level transaction warn
logging name smf-service.smf-app.dcr-brr-mme level transaction warn
logging name smf-service.smf-app.dcr-brr-pcf level transaction warn
logging name smf-service.smf-app.dcr-brr-smf level transaction warn
logging name smf-service.smf-app.dcr-brr-ubr level transaction warn
logging name smf-service.smf-app.dcr-brr-udm level transaction warn
logging name smf-service.smf-app.dcr-brr-ue level transaction warn
logging name smf-service.smf-app.dcr-ue level transaction warn

```

## Event Trace Logs

The following are the synopsis of the Event Trace logs to trigger session management policies towards the SMF:

- Event Trace logs provide an execution sequence for a session. It represents the following:
  - Message Type
  - Event Type—Incoming or Outgoing or Internal submitted event type.
  - Procedure Type and Procedure Instance—Where the message is associated with.
  - Txn ID—Where the message is associated with.
  - Timestamp—For the same message associated with
- Event Trace logs also describe other events as the following:
  - Local2DB—When the session details are derived into a primitive structure.
  - DB2Local—When the session details aren't derived from DB to Session DS.
  - Procedure Events—When it conveys the END or SUSPEND or ABORT or CLEANUP events also.

### Sample Dump for Event Trace Logs

The following is a sample dump for Event Trace logs:

```

## Configuring the Event Trace Logs

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.event-trace level transaction debug-level
```

### NOTES:

- **Warning | Error**—The logging level supported for Event Trace LogTags.
- **Session Keys | Procedure Name | Event Trace**—The logging level parameters supported for Event Trace LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

### Configuration Example

The following is an example configuration.

```
logging name smf-service.smf-app.event-trace level transaction warn
```

### Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.event-trace
logging name smf-service.smf-app.event-trace level transaction warn
```

## Call Flow Statistics Logs

The following are the synopsis of the Call Flow Statistics Logs to trigger session management policies towards the SMF:

- Currently, each call flow has the following general labels and other specific labels:
  - Attempted
  - Success
  - Failure + Reason
- All the call flow statistics gets integrated with EndProcedure.

- Each DispositionEnd used to end the call flow in the procedure, concludes either as a success or a failure scenario. Each failure scenario has a reason for integration as well.
- Failure causes can be classified into different levels. They are further mapped and classified as the following:
  - Major or Error
    - Internal Error—All internal errors due to which the call flow is failing, are categorized as error.
    - Transaction Timeout Error—On interfaces, outbound response timeouts (transaction timeouts) are categorized as errors.
  - Minor or Warning
    - Server Error—On interfaces, outbound responses with the http status code 5xx (server errors) are categorized as a warning.
    - Client Error—On interfaces, inbound responses with the http status code 4xx (client errors) or timeouts are categorized as a warning.
  - Normal
    - Server Error—On interfaces, inbound responses with the http status code 5xx (server errors) are categorized as normal.
    - Client Error—On interfaces, outbound responses with http status code 4xx (client errors) are categorized as normal.
- Unknown—Those scenarios, where the call flow gets failed, but the reason doesn't get populated, fall under the unknown cause.
- Further, these scenarios can be enhanced to cases, other statistics labels of statistics, which get integrated to empty statuses.

Example: RAT type integrated as empty, DNN type not integrated, and so on.

## Configuring the Call Flow Statistics Logs

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.stats-debug level transaction debug-level
```

### NOTES:

- **Warning | Error**—The logging level supported for call flow statistics LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

### Configuration Example

The following is an example configuration.

```
logging name smf-service.smf-app.stats-debug level transaction warn
```

## Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.stats-debug
logging name smf-service.smf-app.stats-debug level transaction warn
```

## Core Dump Utility Logs

The following are the synopsis of the Core Dump Utility Logs to trigger session management policies towards the SMF:

- The Core Dump Utility logs provide functionality to conditionally generate a core dump for debugging purposes.
- The core file generation doesn't kill the process and it continues to execute as usual.
- The core dump functionality is disabled by default and it needs to be enabled by specifying the appropriate configurable parameters.

### Important

The core dump generation is a performance impacting activity. Hence, it's recommended to restrict the core dump to a minimum number, such as one or two core dumps for every 15 minutes. As a result, you need to fine-tune the core dump, if you see any performance impact.

### Logging a Message for Core Dump Utility Logs

The following is a sample example of a LogTag for Core Dump Utility Logs:

```
2022/10/14 09:14:38.809 [WARN] [smf-service.smf-app.pdusetup-procfailure] [Txn Id: 3] {PDU
Session Establishment} -> COREDUMP ->
Generating Core: current core count 1,
File:/opt/workspace/smf-service/src/smf-service/procedures/pdusetup/procedure.go:612
2022/10/14 09:15:38.817 [WARN] [smf-service.smf-app.pdusetup-procfailure] {PDU Session
Establishment} -> COREDUMP ->
Generating Core: current core count 2,
File:/opt/workspace/smf-service/src/smf-service/procedures/generic/CallFailureDebug.go:70
```

## Configuring the Core Dump Utility Logs

To configure this feature, use the following configuration:

**config**

```
    dump core [ count count_number | interval interval_details | expires
expires_details | pod-name pod_name | file-detail file_detail ]
end
```

**NOTES:**

- **count count\_number**—Specify the maximum number of times the core dump can be taken. Example: Two core dumps can be taken in a span of 15 minutes, where two is the count. Range: 0-50

- **interval** *interval\_details*—Specify the total duration of the interval (in minutes) to take the core dumps. Example: Two cores can be taken in a span of 15 minutes, where 15 minutes is the total interval time to take two core dumps. Range: 1-3600
- **expires** *expires\_details*—Specify the time after which a core agent stops generating a core dump. Format: CCYY-MM-DDTHH:MM:SS, with an example: 2020-03-24T23:15:00+05:30 or 2022-10-17T19:00:00+00:00
- **pod-name** *pod\_name*—List the name of the pod to enable core dump activities.
- **file-detail** *file\_detail*—List the file name, line number to a specific core dump. Example: Procedures or PDUIM or procedure.go:1902, the maximum size is 10.
- For more information, see *Troubleshooting Information* > [Logs](#).

## Configuration Example

The following is an example configuration.

```
dump core count 2 interval 15 expires pod-name [ smf-service-n0-0 smf-service-n0-1 ]
file-detail [ procedures/generic/CallFailureDebug.go:70 procedures/pdusetup/procedure.go:612
]
```

## Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config dump core
dump core
count 2 interval 15 expires 2023-01-18T18:00:00-00:00 pod-name [ smf-service-n0-0
smf-service-n0-1 ] file-detail [ procedures/generic/CallFailureDebug.go:70
procedures/pdusetup/procedure.go:612 ]
exit
```

# Monitor Subscriber (MonSub) Logs

The following are the synopsis of the Monitor Subscriber (MonSub) Logs to trigger session management policies towards the SMF:

- The logs help to control the logging level of transaction logs, when the monitor subscriber CLI gets enabled.
- The Monitor Subscriber CLI captures the transaction logs for a given SUPI or IMSI.
- The Monitor Subscriber Logger uses a specific logging level, used for the subscriber, for which the monitor subscriber CLI gets triggered.
- The SMF must support per-subscriber monitoring activities. If required, it must be used to monitor a particular subscriber based on the appropriate configurable parameters, such as SUPI or IMSI.
- As a default value, the monitor subscriber functionality is disabled. It gets enabled manually by specifying the appropriate configurable parameters.

## Logging a Message for MonSub Logs

The following is a sample example of a LogTag for MonSub Logs:

```

## Configuring the Monitor Subscriber Logs

To configure this feature, use the following configuration:

```
config
  monitor subscriber [ supi supi_id | imsi imsi_value | imei imei_id |
capture-duration capture_duration | dump dump_name | gr-instance gr_instance_id |
internal-messages internal_messages | list list_details | namespace namespace_details
| nf-service nf_service_details | transaction-logs transaction_logs ]
end
```

### NOTES:

- **supi** *supi\_id*—Specify the subscriber identifier. For example, imsi-123456789, imsi-123\*
- **imsi** *imsi\_value*—Specify the subscriber IMSI. For example: 123456789, \*
- **imei** *imei\_id*—Specify the subscriber IMEI. For example: 123456789012345, \*
- **capture-duration** *capture\_duration*—Specify the duration in seconds during which the monitor subscriber activity gets captured. The default is 300 seconds (five minutes). It's an optional parameter.
- **dump** *dump\_filename*—Specify the name of the dump filename. Example: monitor subscriber-dump [filename]
- **gr-instance** *gr\_instance\_id*—Specify the GR instance ID. It's an optional parameter. It's a monitor subscriber for the given gr-instance only. The instance ID 1 denotes the local instance ID.
- **internal-messages** *internal\_messages*—When set to yes, it enables internal messaging. By default, a disabled value It's an optional parameter.
- **list** *list\_details*—Specify the details of the list. It includes the monitor subscriber list files.
- **namespace** *namespace\_details*—Enable the specified namespace. By default, the namespace is set to none. It's an optional parameter.

---

**Note** A deprecated keyword in the release 2021.02.0 and replaced with nf-service as the keyword

---

- **nf-service** *nf\_service\_details*—Enable the specified NF service. By default, nf-service is set to none. It's a mandatory parameter. The possible values: sgw, smf, pgw

---

**Note** The nf-service keyword replaces the namespace keyword in the release 2021.02 and onwards.

---

- **transaction-logs** *transaction\_logs*—Enable transaction logs when set to yes. By default, a disabled value. It's an optional parameter.

**Note** To view the transaction history logs, use the dump transaction history command. The latest transaction logs get stored in a circular queue of size 1024 transaction logs.

- For more information, see *Troubleshooting Information* > [Logs](#).

**Important** The MonSub needs subscriber SUPI or IMSI in monitor subscriber command. The following are important actions:

- As a prerequisite, the SMF must print the subscriber SUPI or IMSI in the logs.
- Currently, SMF transaction logs are printing subscriber session keys which include subscriber SUPI or IMSI in the transaction logs.
- The operator can pick the subscriber SUPI or IMSI from these logs.

## Configuration Example

The following is an example configuration.

```
logging level monitor-subscriber info
logging name infra.message_log.core level monitor-subscriber debug
```

## Configuration Verification

To verify the configuration:

```
smf# show running-config logging
logging level monitor-subscriber info
logging name infra.message_log.core level monitor-subscriber debug
```

## N40 Additional Logs and Statistics

The following are the synopsis of the additional logs and statistics for N40 to trigger session management policies towards the SMF:

- Enhances the current message-level statistics for rest-ep consisting of extra LogTag or labels, as the following:
  - DNN type
  - RAT type
  - PDN type
  - Procedure type
  - Types of error cause, when there are errors.
  - Interface failure

- When the current message-level statistics get enhanced, the redundant statistics from the SMF-Service such as Message-level statistics can be removed, as the rest-ep already consists of the same message.
- The problems and their details can be updated for all the CHF-initiated messages as the following:
  - Notify
  - For Abort
  - Re-Auth
- The transaction logging levels and the LogTag for the additional logs and statistics for N40 must be in sync. In the event of a failure scenario, the applicable LogTag for N40 must be added. They are as the following:
  - Major (Error)
  - Minor (Warning)
  - Normal (Info)
- When the logging level gets enabled with the corresponding category, the following options are available:
  - Event Trace
  - Core Dump

## Configuring the N40 Additional Logs and Statistics

To configure this feature use the following configuration:

```
logging name smf-service.smf-app.chf level transaction debug-level
```

### NOTES:

- **Warning | Error**—The logging level supported for the N40 additional logs and statistics LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

### Configuration Example

The following is an example configuration.

```
logging name smf-service.smf-app.chf level transaction warn
```

### Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.chf
logging name smf-service.smf-app.chf level transaction warn
```

## N7 Additional Logs and Statistics

The following are the synopsis of the additional logs and statistics for N7 to trigger session management policies towards the SMF:

- It detects HTTP error codes for the PCF initiated update notification and terminate messages containing problem details.
- Enhances the current message-level statistics for rest-ep consisting of extra LogTag or labels, as the following:
  - DNN type
  - RAT type
  - PDN type
  - Procedure type
  - Types of error cause, when there are errors.
  - Interface failure
- The transaction logging levels and LogTag for the additional logs and statistics for N7 must be in sync. They are as the following:
  - Error
  - Warning
  - Info
- When the logging level gets enabled with the corresponding category, the following options are available:
  - Event Trace
  - Core Dump

## Configuring the N7 Additional Logs and Statistics

To configure this feature, use the following configuration:

```
logging name smf-service.smf-app.pcf level transaction debug-level
```

### NOTES:

- **Warning | Error**—The logging level supported for N7 additional logs and statistics LogTags.
- For more information, see *Troubleshooting Information* > [Logs](#).

### Configuration Example

The following is an example configuration.

```
logging name smf-service.smf-app.pcf level transaction warn
```

### Configuration Verification

To verify the configuration:

```
[smf] smf# show running-config logging name smf-service.smf-app.pcf
logging name smf-service.smf-app.pcf level transaction warn
```
