

ADC for Dynamic Rules

Table 1: Feature History

Feature Name	Release Information	Description
ADC Dynamic Rules over Gx	2024.02.0	<p>UPF leverages the dynamic ADC rules for traffic matching and charging. This feature allows the service providers to manage IoT devices, such as connected cars, and charge their subscribers based on the traffic flows classified by SMF or UPF. With this traffic classification, the service providers enable service monetization.</p> <p>In summary, SMF first processes the dynamic ADC rules received from PCF with TDF-App-Identifier, Service ID, and Rating group. SMF then sends this information to UPF to classify ruledefs and perform charging.</p> <p>Default Setting: Enabled – Always-on</p>

- [Feature Description, on page 1](#)
- [How it Works, on page 1](#)
- [OAM Support, on page 2](#)

Feature Description

UPF processes N4 messages received from SMF and installs, removes, and modifies the message entities (PDR/URR/FAR/QER) of dynamic ADC rules.

UPF matches the configured ruledef with the TDF-App-Identifier AVP received in the dynamic ADC rule as part of PDR installation from SMF. If matched, UPF classifies the packets and charges the subscribers as per the Rating Group and Service ID of the Dynamic rule PDR.

How it Works

PCRF installs a dynamic ADC rule with charging rule definition on SMF. UPF receives the N4 messages from SMF containing the dynamic ADC rule-related PDRs, URRs, QERs, and FARs. The dynamic ADC rule PDR contains the Application ID corresponding to the TDF-App-Identifier received from the PCRF and the Mute notification. UPF does not enable any Application Start/Stop triggers as Mute is enabled.

Upon receiving the N4 message, UPF matches the ruledef pointed using the Application ID/TDF-App-Identifier. UPF then charges the packets matching to this ruledef against the URR received and applies bandwidth policing based on the QER received for the dynamic ADC rule PDR.

UPF supports the following three use cases to support dynamic ADC rules:

- **Installing a Dynamic ADC Rule per Subscription:** Upon receiving the dynamic ADC rule from PCRF, SMF installs the rule and sends an N4 Session Establishment Request to UPF to create PDR, QER, FAR, and URR. The Create PDR Request for this dynamic ADC rule contains the TDF-App-Identifier and Mute AVP enabled for all dynamic ADC rules.

UPF matches the configured ruledef with the TDF-App-Identifier and charges the packets according to the RG/SI received in the Dynamic ADC rule. UPF does not generate the N4 Session report for APP-START/STOP, as Mute notifications are enabled from PCRF on SMF during rule install.

- **Modifying a Dynamic ADC Rule from PCRF/SMF:** PCRF sends a Re-authorization request (RAR) to SMF along with a Dynamic ADC Rule Modification request. SMF then sends a Session Modification Request to UPF to update QER containing the updated gate status and MBR values.

UPF performs modifications of the AVPs and sends a N4 Session Modification Response to SMF.

- **Removing a Dynamic ADC Rule from PCRF/SMF:** UPF receives an N4 Modify Request with Remove PDRs and QERs corresponding to the dynamic ADC rule. UPF also receives Remove URRs occasionally, if it is the last rule for that Rating-Group/Service-ID.

Upon receiving the N4 Modify Request, UPF stops matching the rule for the ruledef pointed by the TDF-App-Identifier from the Session Modification Request.

For detailed information on dynamic ADC rules, see the *UCC 5G SMF Configuration and Administration Guide* applicable for the release.

OAM Support

This section describes operations, administration, and maintenance support for this feature.

Show Command Output

This section describes the show commands supported in this feature.

show subscribers user-plane-only full all

The output of the show command **show subscribers user-plane-only full all** has been enhanced to display the number of associated ADC PDRs.

```
[local]UPF1# show subscribers user-plane-only full all
