

APPENDIX **B**

Distribution Package Examples

Following are examples of valid .xml distribution package files from typical enterprise environments. The file listings are augmented with crossreferences to the features indicated in the high-level descriptions. The file, `sscAdminGuideExXml.zip`, also distributed in the `SSCAdminUtils` zip file, contains all of these examples as individual .xml files, for a convenient starting point and easy text editing.

**Note**

In all of the examples, the license string is functionally invalid. Replace with one appropriate to your application.

High-level Descriptions

- Example B-1—Illustrates only the base elements of a distribution package. No networks are defined in this example. (Use [Example B-1](#).)
- Example B-2—illustrates the addition of minimal, nonauthenticating, open (1) Wi-Fi and (2) wired networks. (Use [Example B-2](#).)
- Example B-3—Illustrates (1) a nonauthenticating, WPA personal Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) WPA-Personal association with TKIP encryption

Such a network would be applicable to any corporate-supplied home equipment (where you configure the key) that your end-user might have for connecting to your enterprise network remotely. (Use [Example B-3](#).)

**Note**

Any of the following authenticating Wi-Fi network definitions can be extracted and used in a wired authenticating network by removing the `associationMode` element. Extract the following:

```
<authenticationNetwork>  
  Retain otherwise: .....  
  Remove this: <associationMode>...</associationMode>  
</authenticationNetwork>
```

- Example B-4—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) machine/user connection context

- (3) user password credentials obtained from an initial, one-time prompt
- (4) machine password obtained automatically from the MS Active Directory setup
- (5) single, tunneled EAP method
- (6) server certificated validation based on release 4.0 functionality

(Use [Example B-4.](#))

- Example B-5—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) machine/user connection context
 - (3) user password credentials obtained from the operating system (single-signon)
 - (4) machine credential obtained automatically from the MS Active Directory setup
 - (5) multiple, tunneled EAP methods
 - (6) server certificate validation based on multiple authentication server rules and release 4.1 (7) CA certificate deployment support

(Use [Example B-5.](#))

- Example B-6—Illustrates (1) an authenticating, Wi-Fi network with the following properties:
 - Novell domain compatible network
 - (2) user connection context
 - (3) user password credentials obtained from the OS (single-signon)
 - (4) single, tunneled EAP method
 - (5) server certificate validation based on release 4.0 functionality

(Use [Example B-6.](#))

- Example B-7—Illustrates (1) an authenticating, Wi-Fi network with the following properties:
 - (2) machine connection context
 - (3) machine credentials obtained from release 4.1 static credential support
 - (4) single, tunneled EAP method
 - (5) server certificate validation based on release 4.0 functionality

(Use [Example B-7.](#))

- Example B-8—Illustrates (1) an authenticating, Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) user client certificate credentials obtained from a smartcard
 - (4) TLS EAP method
 - (5) server certificate validation based on release 4.0 functionality

(Use [Example B-8.](#))

- Example B-9a—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) user password credentials obtained from an initial, one-time prompt
 - (4) EAP-FAST-GTC method (autonomous, authenticated PAC provisioning)
 - (5) server certificate validation for PAC provisioning based on release 4.0 functionality

(Use [Example B-9a.](#))

- Example B-9b—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) user password credentials obtained from an initial, one-time prompt
 - (4) EAP-FAST-GTC method (autonomous, unauthenticated PAC provisioning)
 - (5) server AID validation for PAC provisioning based on release 4.0 functionality
 (Use [Example B-9b](#).)
- Example B-9c—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) user password credentials obtained from an initial, one-time prompt
 - (4) FAST EAP-MSCHAPv2 method with release 4.1 manual PAC provisioning support (Cisco ACS server configured for no autonomous PAC provisioning.)
 - (5) no server validation
 (Use [Example B-9c](#).)
- Example B-10—Illustrates (1) an authenticating Wi-Fi network with the following properties:
 - (2) user connection context
 - (3) user password credentials obtained from new release 4.1 static credential support
 - (4) single, tunneled EAP method
 - (5) server certificate validation based on release 4.0 functionality
 (Use [Example B-10](#).)
- Example B-11—Illustrates (1) a wired-only version with the following properties:
 - (2) preset end-user version
 - (3) authenticating network only
 - (4) machine and user connection context
 - (5) FAST EAP method only
 - (6) server certificate validation
 (Use [Example B-11](#).)
