Introduction

This document describes how to configure a redundant VPN failover if a remote site loses its VPN 3000 Concentrator or Internet connectivity. In this example, assume that the corporate network located behind the VPN 3030B uses Open Shortest Path First (OSPF) as its default routing protocol.

Note: When you redistribute between routing protocols, you can form a routing loop which can cause trouble on the network. OSPF is used in this example, but it is not the only routing protocol that can be used.

The goal of this example is to have the 192.168.1.0 network use the red tunnel (under normal operating circumstances), depicted in the Network Diagram section, to reach 192.168.3.x. If the tunnel, VPN Concentrator, or ISP drops, then the 192.168.3.0 network is learned over a dynamic routing protocol over the green tunnel. Also, connectivity is not lost to the 192.168.3.0 site. Once the issue is resolved, the traffic automatically reverts back to the red tunnel.

Note: RIP has a three minute aging timer before it allows a new route to be accepted over an invalid route. Also, assume that the tunnels are created and that traffic can pass among the peers.

Prerequisites

Requirements

There are no specific requirements for this document.

Components Used

The information in this document is based on these software and hardware versions:

- Cisco Routers 3620 and 3640
- Cisco VPN 3080 Concentrator – Version: Cisco Systems, Inc./VPN 3000 Concentrator Version 4.7
- Cisco VPN 3060 Concentrator – Version: Cisco Systems, Inc./VPN 3000 Concentrator Series Version 4.7
- Cisco VPN 3030 Concentrator – Version: Cisco Systems, Inc./VPN 3000 Concentrator Series Version 4.7

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If your network is live, make sure that you understand the potential impact of any command.

Conventions

For more information on document conventions, refer to the Cisco Technical Tips Conventions.

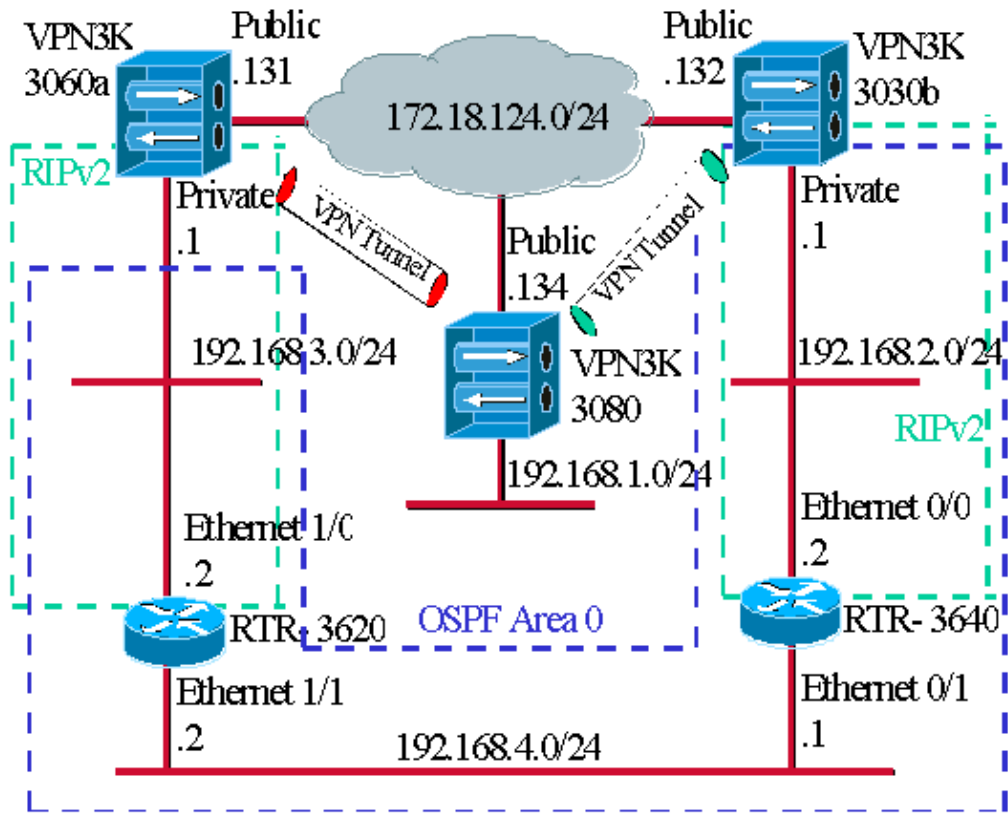

Configure

In this section, you are presented with the information to configure the features described in this document.

Note: To find additional information on the commands used in this document, use the Command Lookup Tool (registered customers only) .

Network Diagram

This document uses this network setup:

The blue dashes indicate that OSPF is enabled from VPN 3030b to RTR-3640 and RTR-3620.

The green dashes indicate that RIPv2 is enabled from private VPN 3060a to RTR-3620, RTR-3640, and private VPN 3030b.

RIPv2 is also enabled on the red and green VPN tunnels because network discovery is enabled. It is not necessary to enable RIP on the VPN 3080 private interface. There is also no RIP on the 192.168.4.x network because all routes are learned by OSPF over this link.

Note: PCs on the 192.168.2.x and 192.168.3.x networks need to have their default gateways pointing to the routers and not to the VPN Concentrators. Allow the routers to decide on where to route the packets.

Router Configurations

This document uses these router configurations:

- Router 3620
- Router 3640

Router 3620
<pre>rtr-3620#write terminal Building configuration... Current configuration : 873 bytes ! version 12.2 service timestamps debug uptime service timestamps log uptime no service password-encryption !</pre>

```

hostname rtr-3620
!
ip subnet-zero
!
interface Ethernet1/0
 ip address 192.168.3.2 255.255.255.0
 half-duplex
!
interface Ethernet1/1
 ip address 192.168.4.2 255.255.255.0
 half-duplex
!
router ospf 1
 log-adjacency-changes

!--- To pass the routes learned through RIP into the OSPF process,
!--- use the redistribute command.
!--- To prevent a routing loop, block the 192.168.1.0 network
!--- from entering the OSPF process. It should only be learned
!--- through the RIP process. No two different routing processes
!--- exchange information unless you implicitly use the
!--- redistribute command.
!--- The 192.168.1.x network is learned through OSPF from the
!--- 192.168.2.x side. However, since the admin distance is changed,
!--- it is not installed into the table
!--- because RIP has an administrative distance of 120,
!--- and all of the OSPF distances are 130.

redistribute rip subnets route-map block192.168.1.0

!--- To enable the OSPF process for the interfaces that are included
!--- in the 192.168.x.x networks:

network 192.168.0.0 0.0.255.255 area 0

!--- Since RIP's default admin distance is 120 and OSPF's is 110,
!--- make RIP a preferable metric for communications
!--- over the "backup" network.
!--- Change any learned OSPF routes from neighbor 192.168.4.1
!--- to an admin distance of 130.

distance 130 192.168.4.1 0.0.0.0
!

!--- To enable RIP on the Ethernet 1/0 interface and set it to
!--- use version 2:

router rip
 version 2
 network 192.168.3.0
!
ip classless
!
!
access-list 1 deny 192.168.1.0 0.0.0.255
access-list 1 permit any
route-map block192.168.1.0 permit 10
 match ip address 1
!
line con 0
 exec-timeout 0 0
line aux 0
line vty 0 4
!
end

```

Router 3640

```
rtr-3640#write terminal
Building configuration...

Current configuration : 1129 bytes
!
version 12.2
service timestamps debug uptime
service timestamps log uptime
no service password-encryption
!
hostname rtr-3640
!
ip subnet-zero
!
interface Ethernet0/0
 ip address 192.168.2.2 255.255.255.0
 half-duplex
!
interface Ethernet0/1
 ip address 192.168.4.1 255.255.255.0
 half-duplex
!
router ospf 1
 log-adjacency-changes

!--- Use this command to push RIP learned routes into OSPF.
!--- You need this when the VPN 3060a or the connection drops and
!--- the 192.168.3.0 route needs to be injected into the OSPF backbone.

 redistribute rip subnets

!--- Place all 192.168.x.x networks into area 0.

 network 192.168.0.0 0.0.255.255 area 0

!--- Since RIP's default admin distance is 120 and OSPF's is 110,
!--- make RIP a preferable metric for communications
!--- over the "backup" network.
!--- Change any learned OSPF routes from neighbor 192.168.4.2
!--- to an admin distance of 130.

 distance 130 192.168.4.2 0.0.0.0
!

!--- To enable RIP on the Ethernet 0/0 interface and set it to
!--- use version 2:

router rip
 version 2
 network 192.168.2.0
!
ip classless
!
line con 0
 exec-timeout 0 0
line aux 0
line vty 0 4
!
end
```

VPN 3080 Concentrator Configuration

LAN-to-LAN VPN 3080 to VPN 3030b

Select **Configuration > Tunneling and Security > IPSec > IPSec LAN-to-LAN**. Since Network Autodiscovery is used, there is no need to fill out the local and remote network lists.

Note: VPN Concentrators that run software version 3.1 and earlier have a check box for autodiscovery. Software version 3.5 (used on the VPN 3080) uses a drop-down menu, such as the one pictured here.

Configuration Tunneling and Security IPSec LAN-to-LAN Add	
Add a new IPSec LAN-to-LAN connection.	
Enable <input type="checkbox"/>	Check to enable this LAN-to-LAN connection.
Name <input type="text" value="3080-3030b"/>	Enter the name for this LAN-to-LAN connection.
Interface <input type="text" value="Ethernet 2 (Public) (172.18.124.134)"/>	Select the interface for this LAN-to-LAN connection.
Connection Type <input type="text" value="Bi-directional"/>	Choose the type of LAN-to-LAN connection. An <i>Originate-Only</i> may have multiple peers specified below.
Peers <input type="text" value="172.18.124.132"/>	Enter the remote peer IP addresses for this LAN-to-LAN connection. <i>Originate-Only</i> connection may specify up to ten peer IP addresses, one IP address per line.
Digital Certificate <input type="text" value="None (Use Preshared Keys)"/>	Select the digital certificate to use.
Certificate Transmission <input type="radio"/> Entire certificate chain <input type="radio"/> Identity certificate only	Choose how to send the digital certificate to the IKE peer.
Preshared Key <input type="text"/>	Enter the preshared key for this LAN-to-LAN connection.
Authentication <input type="text" value="ESP/MD5/HMAC-128"/>	Specify the packet authentication mechanism to use.
Encryption <input type="text" value="3DES-168"/>	Specify the encryption mechanism to use.
IKE Proposal <input type="text" value="IKE-3DES-MD5"/>	Select the IKE Proposal to use for this LAN-to-LAN connection.
Filter <input type="text" value="-None-"/>	Choose the filter to apply to the traffic that is tunneled through the LAN connection, under NAT Transparency.
Bandwidth Policy <input type="text" value="-None-"/>	Choose the bandwidth policy to apply to this LAN-to-LAN connection.
Routing <input type="text" value="Network Autodiscovery"/>	Choose the routing mechanism to use. Parameters below are ignored when Network Autodiscovery is chosen.
Local Network: If a LAN-to-LAN NAT rule is used, this is the Translated Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the local network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a wildcard mask, which is the reverse of a subnet mask. A wildcard mask has 1s in bit positions to ignore, 0s in bit positions to include. For example, 10.10.1.0/0.0.0.255 = all 10.10.1.nnn addresses.
Wildcard Mask <input type="text"/>	
Remote Network: If a LAN-to-LAN NAT rule is used, this is the Remote Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the remote network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a wildcard mask, which is the reverse of a subnet mask. A wildcard mask has 1s in bit positions to ignore, 0s in bit positions to include. For example, 10.10.1.0/0.0.0.255 = all 10.10.1.nnn addresses.
Wildcard Mask <input type="text"/>	
<input type="button" value="Add"/>	<input type="button" value="Cancel"/>

LAN-to-LAN VPN 3080 to VPN 3060a

Select **Configuration > Tunneling and Security > IPSec > IPSec LAN-to-LAN**. Since Network Autodiscovery is used, there is no need to fill out the local and remote network lists.

Note: VPN Concentrators that run software version 3.1 and earlier have a check box for autodiscovery. Software version 3.5 (used on the VPN 3080) uses a drop-down menu, such as the one pictured here.

Configuration Tunneling and Security IPSec LAN-to-LAN Add	
Add a new IPSec LAN-to-LAN connection.	
Enable <input type="checkbox"/>	Check to enable this LAN-to-LAN connection.
Name <input type="text" value="3080-3060a"/>	Enter the name for this LAN-to-LAN connection.
Interface <input type="text" value="Ethernet 2 (Public) (172.18.124.134)"/>	Select the interface for this LAN-to-LAN connection.
Connection Type <input type="text" value="Bi-directional"/>	Choose the type of LAN-to-LAN connection. An <i>Originate-Only</i> connection may have multiple peers specified below.
Peers <input type="text" value="172.18.124.131"/>	Enter the remote peer IP addresses for this LAN-to-LAN connection. <i>Originate-Only</i> connection may specify up to ten peer IP addresses, one IP address per line.
Digital Certificate <input type="text" value="None (Use Preshared Keys)"/>	Select the digital certificate to use.
Certificate Transmission <input type="radio"/> Entire certificate chain <input type="radio"/> Identity certificate only	Choose how to send the digital certificate to the IKE peer.
Preshared Key <input type="text"/>	Enter the preshared key for this LAN-to-LAN connection.
Authentication <input type="text" value="ESP/MD5/HMAC-128"/>	Specify the packet authentication mechanism to use.
Encryption <input type="text" value="3DES-168"/>	Specify the encryption mechanism to use.
IKE Proposal <input type="text" value="IKE-3DES-MD5"/>	Select the IKE Proposal to use for this LAN-to-LAN connection.
Filter <input type="text" value="-None-"/>	Choose the filter to apply to the traffic that is tunneled through this LAN connection.
IPSec NAT-T <input type="checkbox"/>	Check to let NAT-T compatible IPSec peers establish this LAN-to-LAN connection through a NAT device. You must also enable IPSec over under NAT Transparency.
Bandwidth Policy <input type="text" value="-None-"/>	Choose the bandwidth policy to apply to this LAN-to-LAN connection.
Routing <input type="text" value="Network Autodiscovery"/>	Choose the routing mechanism to use. Parameters below are ignored when Network Autodiscovery is chosen.
Local Network: If a LAN-to-LAN NAT rule is used, this is the Translated Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the local network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard</i> mask, which is the reverse of a subnet mask. wildcard mask has 1s in bit positions to ignore, 0s in bit positions to match. For example, 10.10.1.0/0.0.0.255 = all 10.10.1.nnn addresses.
Wildcard Mask <input type="text"/>	
Remote Network: If a LAN-to-LAN NAT rule is used, this is the Remote Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the remote network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard</i> mask, which is the reverse of a subnet mask. wildcard mask has 1s in bit positions to ignore, 0s in bit positions to match.
Wildcard Mask <input type="text"/>	

VPN 3060a Concentrator Configuration

LAN-to-LAN VPN 3060a to VPN 3080

Select **Configuration > Tunneling and Security > IPsec > IPsec LAN-to-LAN**.

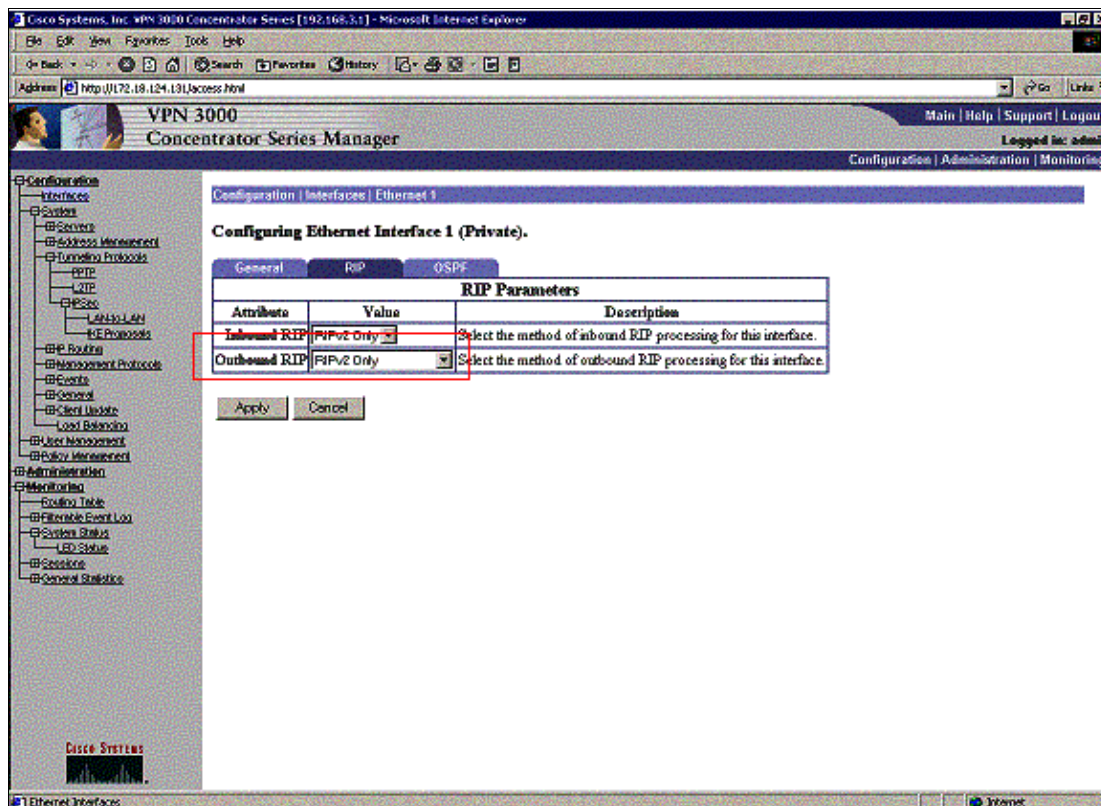

Note: There is a check box on the VPN 3060 for Network Autodiscovery instead of the drop-down menu as in software version 3.5 and later.

Configuration Tunneling and Security IPsec LAN-to-LAN Add	
Add a new IPsec LAN-to-LAN connection.	
Enable <input type="checkbox"/>	Check to enable this LAN-to-LAN connection.
Name <input type="text" value="3060a-3080"/>	Enter the name for this LAN-to-LAN connection.
Interface <input type="text" value="Ethernet 2 (Public) (172.18.124.131)"/>	Select the interface for this LAN-to-LAN connection.
Connection Type <input type="text" value="Bi-directional"/>	Choose the type of LAN-to-LAN connection. An <i>Originate-Only</i> connection may have multiple peers specified below.
Peers <input type="text" value="172.18.124.134"/>	Enter the remote peer IP addresses for this LAN-to-LAN connection. <i>Originate-Only</i> connection may specify up to ten peer IP addresses; one IP address per line.
Digital Certificate <input type="text" value="None (Use Preshared Keys)"/>	Select the digital certificate to use.
Certificate Transmission <input type="radio"/> Entire certificate chain <input type="radio"/> Identity certificate only	Choose how to send the digital certificate to the IKE peer.
Preshared Key <input type="text"/>	Enter the preshared key for this LAN-to-LAN connection.
Authentication <input type="text" value="ESP/MD5/HMAC-128"/>	Specify the packet authentication mechanism to use.
Encryption <input type="text" value="3DES-168"/>	Specify the encryption mechanism to use.
IKE Proposal <input type="text" value="IKE-3DES-MD5"/>	Select the IKE Proposal to use for this LAN-to-LAN connection.
Filter <input type="text" value="-None-"/>	Choose the filter to apply to the traffic that is tunneled through this LAN connection.
IPsec NAT-T <input type="checkbox"/>	Check to let NAT-T compatible IPsec peers establish this LAN-to-LAN connection through a NAT device. You must also enable IPsec over under NAT Transparency.
Bandwidth Policy <input type="text" value="-None-"/>	Choose the bandwidth policy to apply to this LAN-to-LAN connection.
Routing <input type="text" value="Network Autodiscovery"/>	Choose the routing mechanism to use. Parameters below are ignored. Network Autodiscovery is chosen.
Local Network: If a LAN-to-LAN NAT rule is used, this is the Translated Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the local network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard</i> mask, which is the reverse of a subnet mask. wildcard mask has 1s in bit positions to ignore, 0s in bit positions to match. For example, 10.10.1.0/0.0.0.255 = all 10.10.1.nnn addresses.
Wildcard Mask <input type="text"/>	
Remote Network: If a LAN-to-LAN NAT rule is used, this is the Remote Network address.	
Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the remote network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard</i> mask, which is the reverse of a subnet mask. wildcard mask has 1s in bit positions to ignore, 0s in bit positions to match.
Wildcard Mask <input type="text"/>	

Enable RIP to Pass the Tunnel-Learned Routes to the VPN 3620 Router

Select **Configuration > Interfaces > Private > RIP**. Change the drop-down menu to **RIPv2 Only** and click **Apply**. Then select **Configuration > System > Tunneling Protocols > IPsec > LAN-to-LAN**.

Note: The default is outbound RIP, and it is disabled for the private interface.

VPN 3030b Concentrator Configuration

LAN-to-LAN VPN 3030b to VPN 3080

Select **Configuration > Tunneling and Security > IPSec > LAN-to-LAN**.

Add a new IPsec LAN-to-LAN connection.

Enable <input type="checkbox"/>	Check to enable this LAN-to-LAN connection.
Name <input type="text" value="3030B-3080"/>	Enter the name for this LAN-to-LAN connection.
Interface <input type="text" value="Ethernet 2 (Public) (172.18.124.132)"/>	Select the interface for this LAN-to-LAN connection.
Connection Type <input type="text" value="Bi-directional"/>	Choose the type of LAN-to-LAN connection. An <i>Originate-Only</i> connection may have multiple peers specified below.
Peers <input type="text" value="172.18.124.134"/>	Enter the remote peer IP addresses for this LAN-to-LAN connection. <i>Originate-Only</i> connection may specify up to ten peer IP addresses one IP address per line.
Digital Certificate <input type="text" value="None (Use Preshared Keys)"/>	Select the digital certificate to use.
Certificate Transmission <input type="radio"/> Entire certificate chain <input type="radio"/> Identity certificate only	Choose how to send the digital certificate to the IKE peer.
Preshared Key <input type="text"/>	Enter the preshared key for this LAN-to-LAN connection.
Authentication <input type="text" value="ESP/MD5/HMAC-128"/>	Specify the packet authentication mechanism to use.
Encryption <input type="text" value="3DES-168"/>	Specify the encryption mechanism to use.
IKE Proposal <input type="text" value="IKE-3DES-MD5"/>	Select the IKE Proposal to use for this LAN-to-LAN connection.
Filter <input type="text" value="-None-"/>	Choose the filter to apply to the traffic that is tunneled through this LAN connection.
IPsec NAT-T <input type="checkbox"/>	Check to let NAT-T compatible IPsec peers establish this LAN-to-LAN connection through a NAT device. You must also enable IPsec over under NAT Transparency.
Bandwidth Policy <input type="text" value="-None-"/>	Choose the bandwidth policy to apply to this LAN-to-LAN connection.
Routing <input type="text" value="Network Autodiscovery"/>	Choose the routing mechanism to use. Parameters below are ignored. Network Autodiscovery is chosen.

Local Network: If a LAN-to-LAN NAT rule is used, this is the Translated Network address.

Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the local network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard mask</i> , which is the reverse of a subnet mask. A wildcard mask has 1s in bit positions to ignore, 0s in bit positions to use. For example, 10.10.1.0/0.0.0.255 = all 10.10.1.nnn addresses.
Wildcard Mask <input type="text"/>	

Remote Network: If a LAN-to-LAN NAT rule is used, this is the Remote Network address.

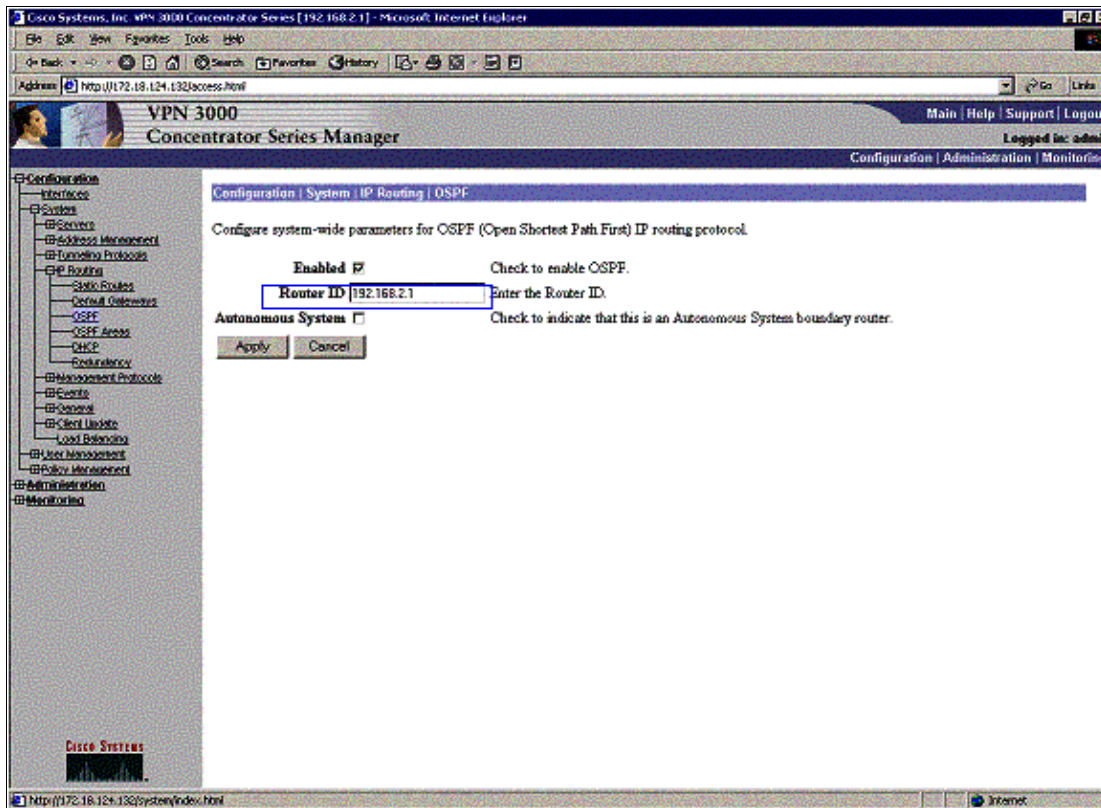

Network List <input type="text" value="Use IP Address/Wildcard-mask below"/>	Specify the remote network address list or the IP address and wildcard mask for this LAN-to-LAN connection.
IP Address <input type="text"/>	Note: Enter a <i>wildcard mask</i> , which is the reverse of a subnet mask. A wildcard mask has 1s in bit positions to ignore, 0s in bit positions to use.
Wildcard Mask <input type="text"/>	

Enable RIP to Pass the Tunnel-Learned Routes to the VPN 3640 Router

Follow the steps listed earlier in this document for VPN 3060a Concentrator.

Enable OSPF to Pass the Backbone-Learned Routes to the VPN 3030b Concentrator

Select **Configuration > System > IP Routing > OSPF** and enter the router ID.

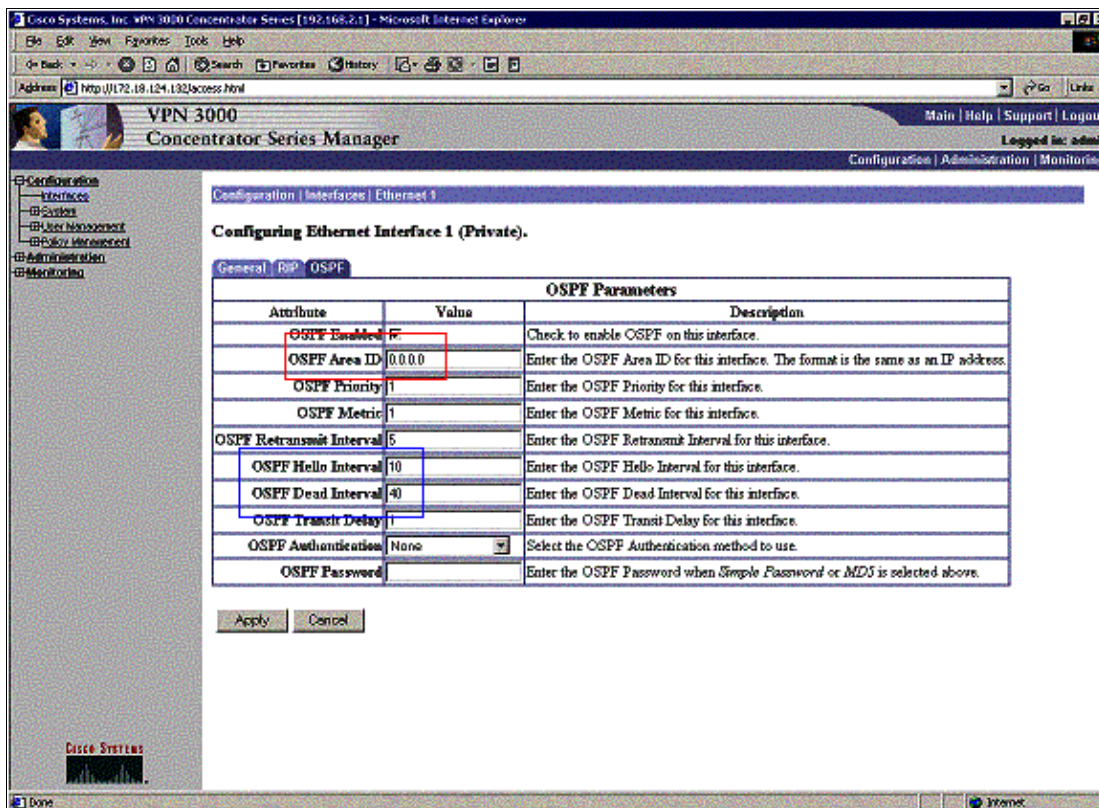

```
rtr-3640#show ip ospf neighbor
```

Neighbor ID	Pri	State	Dead Time	Address	Interface
192.168.4.2	1	FULL/DR	00:00:39	192.168.4.2	Ethernet0/1

*!--- For troubleshooting purposes, it helps to make the router ID the
!--- IP address of the private interface.*

192.168.2.1	1	FULL/BDR	00:00:36	192.168.2.1	Ethernet0/0
-------------	---	----------	----------	-------------	-------------

The area ID needs to match the ID on the wire. Since the area in this example is 0, it is represented by 0.0.0.0. Also, check the **Enable OSPF** box and click **Apply**.

Make sure that your OSPF timers match that of the router. To verify the routers timers, use the **show ip ospf interface <interface name>** command.

```
rtr-3640#show ip ospf interface ethernet 0/0
Ethernet0/0 is up, line protocol is up
 Internet Address 192.168.2.2/24, Area 0
 Process ID 1, Router ID 192.168.4.1, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State DR, Priority 1
 Designated Router (ID) 192.168.4.1, Interface address 192.168.2.2
 Backup Designated router (ID) 192.168.2.1, Interface address 192.168.2.1
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:05
 Index 1/1, flood queue length 0
 Next 0x0(0)/0x0(0)
 Last flood scan length is 1, maximum is 2
 Last flood scan time is 0 msec, maximum is 0 msec
 Neighbor Count is 1, Adjacent neighbor count is 1
   Adjacent with neighbor 192.168.2.1 (Backup Designated Router)
 Suppress hello for 0 neighbor(s)
```

For more information on OSPF, refer to RFC 1247 [\[1\]](#).

Verify

This section provides information you can use to confirm your configuration is working properly.

Certain **show** commands are supported by the Output Interpreter Tool (registered customers only), which allows you to view an analysis of **show** command output.

This command output shows accurate routing tables.

```
rtr-3620#show ip route
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
```

D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

Gateway of last resort is not set

```
172.18.0.0/24 is subnetted, 1 subnets
R    172.18.124.0 [120/1] via 192.168.3.1, 00:00:11, Ethernet1/0
C    192.168.4.0/24 is directly connected, Ethernet1/1
```

*!--- The 192.168.1.x network is learned from the
!--- VPN 3060a Concentrator.*

```
R    192.168.1.0/24 [120/2] via 192.168.3.1, 00:00:11, Ethernet1/0
```

*!--- The 192.168.3.x network traverses the 192.168.4.x network
!--- to get to the 192.168.2.x network.*

```
O    192.168.2.0/24 [130/20] via 192.168.4.1, 00:01:07, Ethernet1/1
C    192.168.3.0/24 is directly connected, Ethernet1/0
```

rtr-3640#show ip route

Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

Gateway of last resort is not set

```
172.18.0.0/24 is subnetted, 1 subnets
R    172.18.124.0 [120/1] via 192.168.2.1, 00:00:23, Ethernet0/0
C    192.168.4.0/24 is directly connected, Ethernet0/1
```

*!--- The 192.168.1.x network is learned from the
!--- VPN 3030b Concentrator.*

```
R    192.168.1.0/24 [120/2] via 192.168.2.1, 00:00:23, Ethernet0/0
C    192.168.2.0/24 is directly connected, Ethernet0/0
```

*!--- The 192.168.2.x network traverses the 192.168.4.x network
!--- to get to the 192.168.3.x network.
!--- This is an example of perfect symmetrical routing.*

```
O    192.168.3.0/24 [130/20] via 192.168.4.2, 00:00:58, Ethernet0/1
```

This is the VPN 3080 Concentrator routing table under normal circumstances.

VPN 3000 Concentrator Series Manager

Monitoring | Routing Table

Clear Routes

Valid Routes: 6

Address	Mask	Next Hop	Interface	Protocol	Age	Metric
0.0.0.0	0.0.0.0	172.18.124.1	2	Default	0	1

192.168.2.0	255.255.255.0	172.18.124.132	2	RIP	19	2
192.168.3.0	255.255.255.0	172.18.124.131	2	RIP	28	2
192.168.4.0	255.255.255.0	172.18.124.132	2	RIP	19	9

Networks 192.168.2.x and 192.168.3.x are both learned through the VPN tunnels 172.18.124.132 and 172.18.124.131, respectively. The 192.168.4.x network is learned through the 172.18.124.132 tunnel because the router's OSPF advertisements are placed into the VPN 3030b Concentrator's routing table. Then the routing table advertises the network out to the remote VPN peers.

This is the VPN 3030b Concentrator routing table under normal circumstances.

VPN 3000 Concentrator Series Manager

Monitoring | Routing Table

Clear Routes

Valid Routes: 6

Address	Mask	Next Hop	Interface	Protocol	Age	Metric
0.0.0.0	0.0.0.0	172.18.124.1	2	Default	0	1
172.18.124.0	255.255.255.0	0.0.0.0	2	Local	0	1
192.168.1.0	255.255.255.0	172.18.124.134	2	RIP	24	2
192.168.2.0	255.255.255.0	0.0.0.0	1	Local	0	1
192.168.3.0	255.255.255.0	192.168.2.2	1	OSPF	0	21
192.168.4.0	255.255.255.0	192.168.2.2	1	OSPF	0	11

The red box highlights that the 192.168.1.x network is learned from the VPN tunnel. The blue box highlights that networks 192.168.3.x and 192.168.4.x are learned through the core OSPF process.

This is the VPN 3060a Concentrator routing table under normal circumstances.

The screenshot shows the Cisco VPN 3000 Concentrator Series Manager web interface. The page title is "VPN 3000 Concentrator Series Manager" and the user is logged in as "admin". The navigation menu includes Configuration, Administration, and Monitoring. The "Monitoring" section is expanded, showing "Routing Table". The routing table is titled "Valid Routes: 4" and contains the following data:

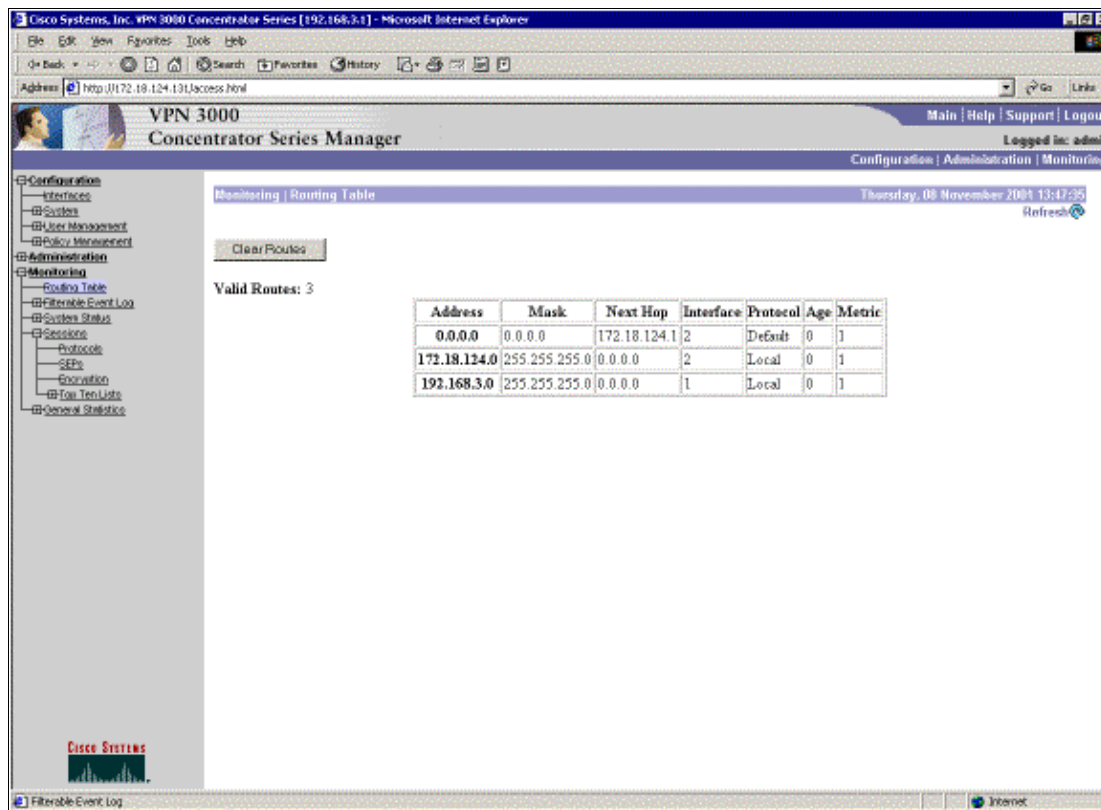

Address	Mask	Next Hop	Interface	Protocol	Age	Metric
0.0.0.0	0.0.0.0	172.18.124.1	2	Default	0	1
172.18.124.0	255.255.255.0	0.0.0.0	2	Local	0	1
192.168.1.0	255.255.255.0	172.18.124.134	2	RIP	12	2
192.168.3.0	255.255.255.0	0.0.0.0	1	Local	0	1

Network 192.168.1.x is the only network here, and it can be reached through the VPN tunnel. There is no 192.168.2.0 network since no process (such as RIP) passes along that route. There is nothing lost as long as the PCs on the 192.168.3.x network do not point their default gateway to the VPN Concentrator. You can always add a static route if you choose. However, for this example, the VPN Concentrator itself does not need to reach the 192.168.2.0 network.

Troubleshoot

Simulated Fault

This is a simulated fault in the configuration. If you remove the filter to the public interface, then the VPN tunnel drops. This causes the route for the 192.168.1.0 learned through the tunnel to drop as well. It takes approximately three minutes for the RIP process to purge out the route. Therefore, you can potentially have a three-minute outage until the route times itself out.

Once the RIP route expires, the new routing table on the routers appears similar to this:

```
rtr-3620#show ip route
```

```
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route
```

```
Gateway of last resort is not set
```

```
       172.18.0.0/24 is subnetted, 1 subnets
R       172.18.124.0 [120/1] via 192.168.3.1, 00:00:05, Ethernet1/0
C       192.168.4.0/24 is directly connected, Ethernet1/1
```

```
!--- Now the 192.168.1.0 route is learned properly
!--- through the OSPF backbone.
```

```
O E2 192.168.1.0/24 [130/20] via 192.168.4.1, 00:00:05, Ethernet1/1
O     192.168.2.0/24 [130/20] via 192.168.4.1, 19:55:48, Ethernet1/1
C     192.168.3.0/24 is directly connected, Ethernet1/0
```

What Can Go Wrong?

If you forget to add in the admin distance change to 130, then you can possibly see this output. Note that both VPN tunnels are up.

VPN 3080 Concentrator

Note: This is the non-graphical user interface (GUI) version of the routing table.

Monitor -> 1

Routing Table

Number of Routes: 6

IP Address	Mask	Next Hop	Intf	Protocol	Age	Metric
0.0.0.0	0.0.0.0	172.18.124.1	2	Default	0	1
172.18.124.0	255.255.255.0	0.0.0.0	2	Local	0	1
192.168.1.0	255.255.255.0	0.0.0.0	1	Local	0	1
192.168.2.0	255.255.255.0	172.18.124.132	2	RIP	10	2
192.168.3.0	255.255.255.0	172.18.124.131	2	RIP	2	2
192.168.4.0	255.255.255.0	172.18.124.132	2	RIP	10	9

To get to the 192.168.3.0 network, the route needs to go through 172.18.124.131. However, the routing table on RTR-3620 shows:

```
rtr-3620#show ip route
```

```
Codes: C - connected, S - static, I - IGRP, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, E - EGP
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default, U - per-user static route, o - ODR
       P - periodic downloaded static route
```

Gateway of last resort is not set

```
172.18.0.0/24 is subnetted, 1 subnets
O E2 172.18.124.0 [110/20] via 192.168.4.1, 00:03:16, Ethernet1/1
C 192.168.4.0/24 is directly connected, Ethernet1/1
```

!--- This is an example of asymmetric routing.

```
O E2 192.168.1.0/24 [110/20] via 192.168.4.1, 00:03:16, Ethernet1/1
O 192.168.2.0/24 [110/20] via 192.168.4.1, 00:03:16, Ethernet1/1
C 192.168.3.0/24 is directly connected, Ethernet1/0
```

To get back to the 192.168.1.0 network, the route needs to go through the backbone 192.168.4.x network.

The traffic still works since the autodiscovery generates the proper security association (SA) information on the VPN 3030b Concentrator. For example:

Routing -> 1

Routing Table

Number of Routes: 6

IP Address	Mask	Next Hop	Intf	Protocol	Age	Metric
0.0.0.0	0.0.0.0	172.18.124.1	2	Default	0	1
172.18.124.0	255.255.255.0	0.0.0.0	2	Local	0	1
192.168.1.0	255.255.255.0	0.0.0.0	1	Local	0	1
192.168.2.0	255.255.255.0	172.18.124.132	2	RIP	28	2
192.168.3.0	255.255.255.0	172.18.124.131	2	RIP	20	2
192.168.4.0	255.255.255.0	172.18.124.132	2	RIP	28	9

IKE Sessions: 1
IPSec Sessions: 2

IKE Session			
Session ID	1	Encryption Algorithm	3DES-168
Hashing Algorithm	MD5	Diffie-Hellman Group	Group 2 (1024-bit)
Authentication Mode	Pre-Shared Keys	IKE Negotiation Mode	Main
Rekey Time Interval	86400 seconds		

IPSec Session			
Session ID	2	Remote Address	172.18.124.132
Local Address	172.18.124.134	Encryption Algorithm	3DES-168
Hashing Algorithm	MD5	Encapsulation Mode	Tunnel
Rekey Time Interval	28800 seconds		
Bytes Received	222048	Bytes Transmitted	129584

IPSec Session			
Session ID	3	Remote Address	192.168.3.0/0.0.0.255
Local Address	192.168.1.0/0.0.0.255	Encryption Algorithm	3DES-168
Hashing Algorithm	MD5	Encapsulation Mode	Tunnel
Rekey Time Interval	28800 seconds		
Bytes Received	280	Bytes Transmitted	280

Even though the routing table says the peer should be 172.18.124.131, the actual SA (traffic flow) is through the VPN 3030b Concentrator at 172.18.124.132. The SA table takes precedence over the route table. Only close examination of the route table and the SA table on the VPN 3060a Concentrator shows that traffic does not flow in the right direction.
