Configuración de respaldo ISDN con rutas estáticas flotantes

Contenido

Introducción

Este documento proporciona una configuración de muestra para implementar un backup ISDN con las Rutas estáticas flotantes, y proporciona la información básica sobre troubleshooting para los este tipos de configuración.

Para la información sobre la mayoría de las implementaciones frecuentes del backup ISDN, y las comparaciones entre éstos, refiera al documento siguiente: Evaluación de interfaces de respaldo, rutas estáticas flotantes y vigilancia de programas dialer para el respaldo de DDR.

prerrequisitos

Requisitos

No hay requisitos específicos para este documento.

Componentes Utilizados

La información que contiene este documento se basa en las versiones de software y hardware indicadas a continuación.

- Dos Cisco 2500 Router que funcionan con los Software Release 12.2(3) y 12.2(5) de Cisco IOS®

La información que se presenta en este documento se originó a partir de dispositivos dentro de un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener un comando antes de ejecutarlo.

Convenciones

Para obtener más información sobre las convenciones del documento, consulte Convenciones de Consejos Técnicos de Cisco.

Configurar

En esta sección encontrará la información para configurar las funciones descritas en este documento.

Note: Para encontrar la información adicional en los comandos usados en este documento, utilice la herramienta de búsqueda de comandos (clientes registrados solamente).

Diagrama de la red

Este documento utiliza la instalación de red que se muestra en el siguiente diagrama.

Verificación

En esta sección encontrará información que puede utilizar para confirmar que su configuración esté funcionando correctamente.

La herramienta del Output Interpreter soportan a los ciertos comandos show (clientes registrados solamente), que permite que usted vea una análisis de la salida del comando show.

- **ruta de IP de la demostración** - Entradas de tabla de IP Routing de las visualizaciones.
- show interfaces - Muestra las estadísticas para todas las interfaces configuradas en el router o en el servidor de acceso.

Troubleshooting

En esta sección encontrará información que puede utilizar para solucionar problemas de configuración.

Comandos para resolución de problemas

La herramienta del Output Interpreter soportan a los ciertos comandos show (clientes registrados solamente), que permite que usted vea una análisis de la salida del comando show.

Note: **Antes de ejecutar un comando debug, consulte Información Importante sobre Comandos Debug.**

- debug isdn q931 - Muestra información acerca de la configuración de llamadas y desconexión de conexiones de red ISDN (Capa 3) entre el router local (lado del usuario) y la red.
- debug isdn events: muestra los acontecimientos de ISDN que se producen en el lado del usuario (en el router) de la interfaz de ISDN. Los eventos ISDN que pueden visualizarse son eventos Q.931 (configuración de llamada y desactivación de conexiones de red ISDN).
- debug dialer – Muestra información de depuración acerca de los paquetes o eventos en una interfaz del marcador.
- debug ppp negotiation – hace que el comando debug ppp muestre los paquetes PPP transmitidos durante el inicio de PPP donde se negocian las opciones PPP
- debug ppp authentication – Hace que el comando debug ppp muestre los mensajes del protocolo de autenticación, entre ellos el intercambio de paquetes de protocolo de autenticación por desafío mutuo (CHAP) y los intercambios de protocolo de autenticación de contraseña (PAP).

Ejemplo de resultado de depuración

Aquí, podemos probar la funcionalidad de backup usando los **comandos shutdown and no shutdown** en la interfaz serial en el lado remoto. Esto lleva en consecuencia, a la desaparición de la ruta ip principal a la red de destino en cuestión.

Déjenos primera mirada en el estado inicial de la interfaz primaria y de la tabla de IP Routing:
