Introducción

Este documento explica y proporciona un ejemplo de cómo configurar el puenteo de respaldo con ISDN. Esta configuración usa el método de interfaz de respaldo para identificar que el link principal está desactivado. Para más información sobre el respaldo, vea [configurar y resolver problemas el backup DDR](#).

En los entornos WAN interligados, la única solución de backup del Dial-on-Demand Routing (DDR) disponible es el uso del ISDN, pues el interligar sobre el async no se soporta.

Sea consciente que el interligar en una conexión ISDN tiende a mantener la conexión activa por mismo los períodos prolongados, si no permanentemente. Si la compañía telefónica (compañía telefónica) carga para el ISDN basado en el tiempo de conexión y el link serial se sigue que está abajo por mismo un tiempo prolongado, éste puede dar lugar a una cuenta muy grande.

Note: Esta configuración es para un sitio y un canal B. Para más de un canal B, usted debe utilizar los Perfiles de marcado. (Refiera a los [Perfiles de marcado que configuran para interligar usando Configuración de isdn](#).)

Para la información sobre el configuración de Bridging en un entorno del NON-respaldo, vea el [Bridging Across ISDN](#).

prerrequisitos

Requisitos

Antes de utilizar esta configuración, asegúrese de que cumple con los siguientes requisitos:

- Poseer un conocimiento básico de ISDN.

Componentes Utilizados

La información que contiene este documento se basa en las siguientes versiones de software y hardware.

- Cisco 2500 Series Router con una interfaz serial PÁLIDA y una interfaz BRI cada uno.
- Software Release 12.2(7b) de Cisco IOS®.

Note: Esta configuración puede usarse con cualquier router que tenga un link de WAN (de serie) y un puerto BRI.

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

Productos Relacionados

Esta configuración puede utilizarse con cualquier par de routers que ejecuten el software del IOS de Cisco y cada uno debe tener al menos una interfaz serial WAN y una interfaz BRI.

Convenciones

Para obtener más información sobre las convenciones del documento, consulte [Convenciones de Consejos Técnicos de Cisco](#).

Configurar

En esta sección encontrará la información para configurar las funciones descritas en este documento.

Note: Para obtener información adicional sobre los comandos que se utilizan en este documento, use la Command Lookup Tool (solo para clientes [registrados](#)).

Diagrama de la red

En este documento, se utiliza esta configuración de red:

Configuraciones

En este documento, se utilizan estas configuraciones:

- [Router1](#)
- [Router2](#)

Router1

```

Defines the type of STP used for the interface in !---
bridge-group 1. Here the IEEE STP is used. !--- The IEEE
802.1D STP is the preferred way to run the bridge. !

```

Verificación

En esta sección encontrará información que puede utilizar para comprobar que su configuración funcione correctamente.

La herramienta [Output Interpreter](#) (sólo para clientes [registrados](#)) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

- **isdn status de la demostración** — visualiza el Layer 1 (L1), la capa 2 (L2), y acoda 3 el estatus (L3) de las interfaces de ISDN.
- **marcador de la demostración** — visualiza el estatus del marcador y el estado individual de los canales ISDN.
- **Bridge de la demostración** — clases de las visualizaciones de entradas en el Bridge Forwarding Database.
- **interfaz de la demostración** — visualiza el estatus de las diversas interfaces, tales como el serial y las interfaces BRI.
- **atravesar-árbol de la demostración** — visualiza la topología del árbol de expansión sabida al router.

Comandos show en ROUTER1 cuando Serial0 está activo.

[Troubleshooting](#)

En esta sección encontrará información que puede utilizar para solucionar problemas de configuración.

[Recursos de resolución de problemas](#)

Utilice estos recursos como sea necesario:

- [Soporte de tecnología ISDN](#)
- [Resolución de problemas de líneas en serie](#)
- [Conexión adosada HDLC](#)

[Comandos para resolución de problemas](#)

La herramienta [Output Interpreter](#) (sólo para clientes [registrados](#)) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

Note: [Antes de ejecutar un comando de depuración, consulte Información importante sobre comandos de depuración.](#)

- **debug dialer** — proporciona la información sobre los eventos de la interfaz del dialer.
- **debug isdn event** — las visualizaciones hacen el debug de los mensajes relacionados con la actividad ISDN que ocurre en el lado del usuario de la interfaz de ISDN.
- **debug ISDN q931** — proporciona la información sobre la configuración de la llamada y cierre de las conexiones de red ISDN (L3) entre el router local (lado del usuario) y la red.
- **el debug isdn q921** — las visualizaciones hace el debug de los mensajes relacionados con los procedimientos de acceso de la capa del link de datos (L2) que ocurren en el router en el

canal D (LAPD) de su interfaz de ISDN.

- **negociación ppp del debug** — las visualizaciones hacen el debug de los mensajes relacionados con la negociación de opciones PPP y los parámetros del protocolo network control (NCP).
- **autenticación PPP del debug** — Los mensajes del debug de las visualizaciones se relacionaron con el intercambio de los paquetes de la GRIETA y del protocolo password authentication (PAP).

depurar salida en ENRUTADOR1 cuando serial0 desciende e ISDN se levanta
