Descripción conmutada y ejemplo de configuración del Multicast de la escritura de la etiqueta ASR 9000 VPL (LS)

Contenido

Introducción

Este documento describe el Multicast conmutado escritura de la etiqueta virtual del servicio del LAN privado (VPL) (LS) para las 9000 Series del router de los servicios de la agregación (ASR) que funcionan con el software del ® XR del Cisco IOS.

Prerrequisitos

Requisitos

No hay requisitos específicos para este documento.

Componentes Utilizados

Este documento no tiene restricciones específicas en cuanto a versiones de software y de hardware.

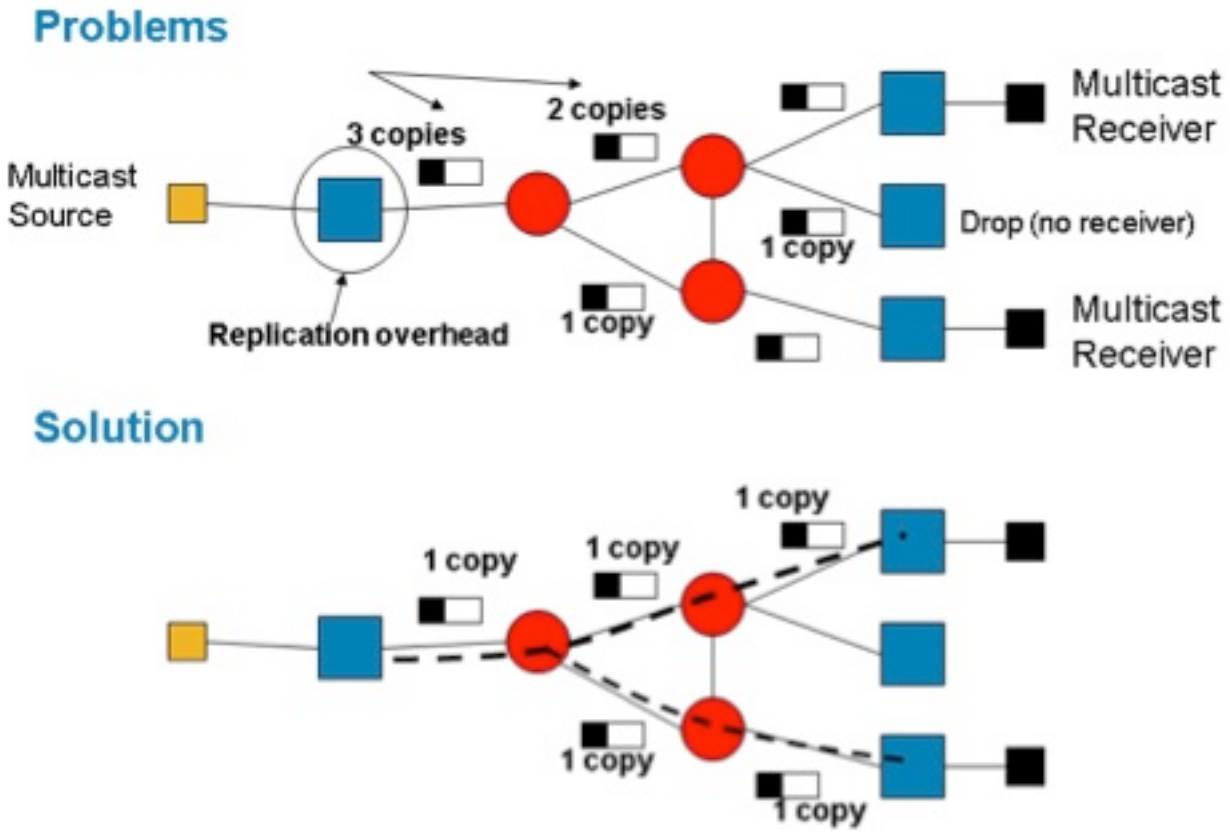
La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

Los VPL etiquetan la descripción conmutada del Multicast (LS)

Los VPL emulan a los servicios LAN a través de una base del Multiprotocol Label Switching (MPLS). Una interconexión total de los pseudowires de punto a punto (P2P) (PWs) se configura entre todo el Routers del borde del proveedor (PE) que participe en un dominio VPL para proporcionar la emulación VPL. El broadcast, el Multicast, y el tráfico de la unidifusión desconocida se inunda en un dominio VPL a todos los PE. La replicación del ingreso se utiliza para enviar ese tráfico saturado sobre cada P2P PWs a todo el Routers del telecontrol PE que sea parte del mismo dominio VPL.

Desventajas de la replicación del ingreso

- La replicación del ingreso es ancho de banda ineficaz porque el mismo paquete se pudo enviar las épocas múltiples sobre el mismo link para cada P2P picovatio.
- La replicación del ingreso puede dar lugar al ancho de banda de link perdido significativo cuando hay broadcast pesado y el Multicast VPL trafica.
- La replicación del ingreso es también uso intensivo de recurso porque el router del ingreso PE lleva la carga completa de la replicación.



Características VPL LS

Los VPL son una tecnología ancho-desplegada del proveedor de servicio L2VPN que también se utiliza para el transporte del Multicast. Aunque la tecnología L2 permita que el snooping sea utilizado para optimizar la replicación del tráfico Multicast en los pseudowires L2, la base sigue siendo agnóstica al tráfico Multicast. Como consecuencia, las copias múltiples del mismo flujo atraviesan las redes del núcleo. Para atenuar esta ineficacia, pares LS con los VPL para introducir los árboles de multidifusión LS sobre la base. En la versión 5.1.0 del Software Cisco IOS XR, las 9000 Series de Cisco ASR implementan VPL LS con los árboles inclusivos de la ingeniería de tráfico de la punta a de múltiples puntos (P2MP-TE). Los puntos extremos VPL se descubren automáticamente y los árboles P2MP-TE se configuran con el uso de la ingeniería de tráfico del Resource Reservation Protocol (RSVP-TE) sin la intervención operativa.

- Los VPL LS superan las desventajas de la replicación del ingreso.
- La solución VPL LS emplea P2MP LSP en la base MPLS para llevar el broadcast, el Multicast, y el tráfico de la unidifusión desconocida para un dominio VPL.
- El P2MP LSP permite la replicación en el nodo óptimo de la red MPLS a lo más y minimiza la cantidad de replicación del paquete en la red.
- La solución VPL LS envía solamente el tráfico inundado VPL sobre P2MP LSP.
- El tráfico del unicast VPL todavía se envía sobre P2P PWs. El tráfico enviado sobre el acceso PWs continúa siendo enviado con la replicación del ingreso.
- El P2MP PWs es unidireccional en comparación con P2P PWs, que son bidireccionales.

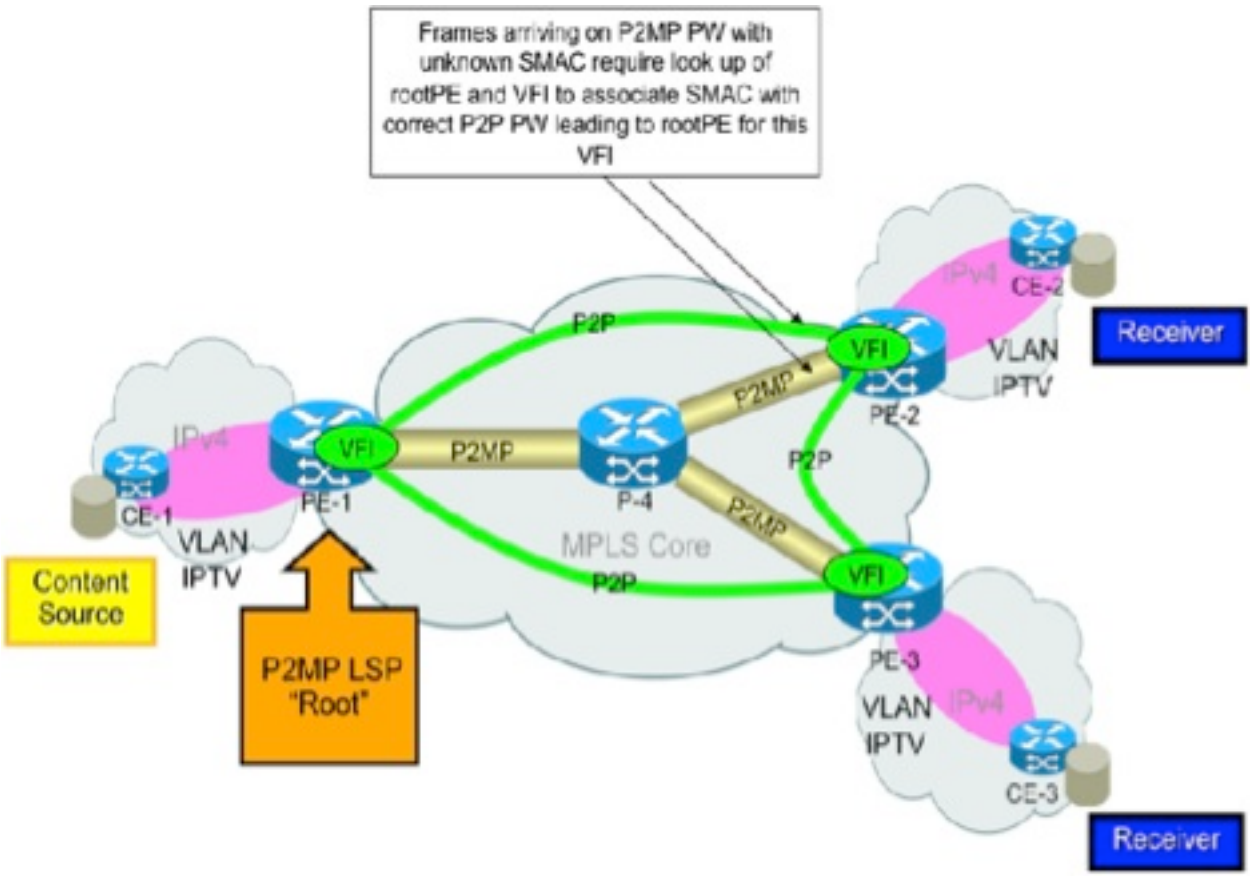
- La solución VPL LS implica la creación de un P2MP picovatio por el dominio VPL para emular a un servicio VPL P2MP para la base PWs en el dominio VPL.
- Los VPL LS se soportan en la versión 5.1.0 del Cisco IOS XR y posterior.

Restricciones VPL LS

- Las funciones de la versión 5.1.0 VPL LS del Cisco IOS XR soportan solamente los árboles de la Ingeniería de tráfico MPLS P2MP-TE configurados con RSVP-TE.
- UN P2MP picovatio se puede señalar con el protocolo BGP solamente en la versión 5.1.0 del Cisco IOS XR. En esta primera fase, el telecontrol PE que participa en el dominio VPL auto-se descubre con la detección automática BGP (BGP-AD).
- La señalización estática LDP no se soporta en la versión 5.1.0 del Cisco IOS XR.

Aprendizaje del Media Access Control (MAC)

El aprendizaje de MAC en la hoja PE para una trama que llegue en P2MP picovatio se hace como si la trama se reciba en el P2P picovatio que lleva a la raíz PE para ese P2MP picovatio. En esta imagen, el aprendizaje de MAC en PE-2 para las tramas que llegan en el P2MP picovatio LSP arraigado el PE-1 se hace como si la trama llegara en el P2P picovatio entre el PE-1 y PE-2. El avión del control L2VPN es responsable de programar la información de la disposición VPL con la información P2P picovatio para el aprendizaje de MAC en la disposición P2MP LSP.



Soporte de la indagación del Internet Group Management Protocol (IGMPSN)

El snooping del Internet Group Management Protocol (IGMP) (IGMPSN) se soporta en ambos la cabeza y cola del P-árbol P2MP en un dominio de Bridge que participe en VPL LS. Esto permite que el tráfico Multicast IGMPSN sobre un caso de reenvío virtual (VFI) PWs se beneficie de la optimización del recurso proporcionada por P2MP LSP. Si IGMPSN se habilita en un dominio de Bridge con uno o más VFI PWs que participa en VPL LS, todo el tráfico Multicast de la capa dos (L2) se envía sobre la pista del P-árbol P2MP asociada al dominio de Bridge. Las rutas de Multicast L2 se utilizan para remitir el tráfico a los receptores locales, los Ethernetes fluyen las puntas (EFPs), acceso PWs, y VFI PWs que no participen en VPL LS.

Cuando IGMPSN se habilita en un dominio de Bridge que sea una cola P2MP LSP, la disposición optimizada del tráfico Multicast L2 recibida en el P2MP LSP se hace para los receptores locales (es decir, los puertos de Bridge del circuito de la conexión (AC) (BP) y el acceso picovatio BP).

> Nota: El snooping del Label Distribution Protocol del Multicast (MLDP) no se soporta en la versión 5.1.0 del Cisco IOS XR.

Escala soportada

La versión 5.1.0 soporta un máximo de **1000** túneles P2MP o **1000** P2MP PWs del Cisco IOS XR por cabeza/router del Tail.

Configuración VPL LS

Configuración del túnel del auto P2MP

```
mpls traffic-eng
 interface GigabitEthernet0/1/1/0
 !
 interface GigabitEthernet0/1/1/1
 !
 auto-tunnel p2mp
 tunnel-id min 100 max 200
```

Configuración del Fast ReRoute del MPLS TE (FRR)

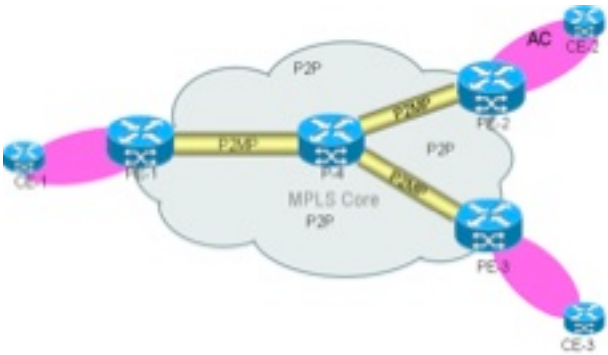
```
mpls traffic-eng
 interface GigabitEthernet0/1/1/0
 auto-tunnel backup
  nhop-only
 !
 !
 interface GigabitEthernet0/1/1/1
 auto-tunnel backup
  nhop-only
 !
```

```
 !
 auto-tunnel p2mp
 tunnel-id min 100 max 200
 !
 auto-tunnel backup
 tunnel-id min 1000 max 1500
 !
 attribute-set p2mp-te set1
 bandwidth 10000
 fast-reroute
 record-route
 !
```

Configuración L2VPN

```
l2vpn
 bridge group bg1
 bridge-domain bg1_bd1
  interface GigabitEthernet0/1/1/10.1
  !
  vfi bg1_bd1_vfi
   vpn-id 1
   autodiscovery bgp
    rd auto
    route-target 209.165.201.1:1
    signaling-protocol bgp
     ve-id 100
    !
   !
   multicast p2mp
    signaling-protocol bgp
    !
    transport rsvp-te
     attribute-set p2mp-te set1
    !
```

Topología de ejemplo y configuración



Los túneles P2MP son túneles auto-descubiertos. Los túneles estáticos P2MP no se soportan.

Las configuraciones del túnel estáticas no se utilizan. La configuración del túnel auto P2MP se debe habilitar en todo el Routers PE y también en un router P si actúa como nodo del brote. Un nodo del brote es un router del punto mediano y del tailend al mismo tiempo.

Una topología de ejemplo con la configuración se muestra aquí. En esta topología, el P2MP PWs se crea entre los tres PE y un router P que actúe como nodo del brote. El tres Routers PE actúa como la pista (para el Tráfico de ingreso) y Tail (para el tráfico de salida).

Verifique - Comandos show

Estos comandos show son útiles para hacer el debug de y verificar el estatus de los túneles del MPLS TE P2MP picovatio y P2MP.

- muestre el dominio de Bridge l2vpn
- muestre el detalle del dominio de Bridge l2vpn
- muestre a mpls los túneles tráfico-ingleses p2mp
- muestre los mpls que remiten el detalle del <label> de las escrituras de la etiqueta
- muestre a mpls los túneles tráfico-ingleses p2mp tabulares

A continuación, se incluyen algunos ejemplos:

Troubleshooting VPL LS

Problemas de la configuración común

La mayoría de las causas comunes para los problemas P2MP en el L2VPN se muestran aquí.

- La configuración BGP para el LS es exactamente lo mismo que ésa para BGP-AD. Aseegurese exportar/las rutas de la familia del direccionamiento de la importación l2vpn VPL-vpws configurando a la direccionamiento-**familia l2vpn VPL-vpws** para los vecinos BGP.

- Hay MPLS y Errores de configuración del Multicast.

  La Ingeniería de tráfico MPLS se debe habilitar en las interfaces adonde el P2MP PWs pasa.

  show l2vpn bridge-domain

RP/0/RSP0/CPU0:PE1#
```

- La configuración L2VPN para el LS en la versión 5.1.0 del Cisco IOS XR requiere que usted:

  Configure la configuración de ID VPN para el VFIConfigure el Multicast P2MP para el VFI. Confgure el Transport Protocol y Signaling Protocol, como en este ejemplo de configuración:

```
l2vpn
bridge group bg
 bridge-domain bd1
  vfi vf1
   vpn-id 1
   autodiscovery bgp
    rd auto
    route-target 209.165.201.7:1
    signaling-protocol bgp
      ve-id 1
  multicast p2mp
     signaling-protocol bgp
     transport rsvp-te
```

- La pista/el Tail LS se debe fijar correctamente. En la versión 5.1.0 del Cisco IOS XR, cada cola LS es también una pista LS y viceversa. Porque no hay **intercambio de capacidad** explícito **LS** entre el Routers, todo el Routers en un dominio de Bridge habilitado LS debe participar en el LS.

L2VPN y comandos show y Troubleshooting L2FIB

- El proceso de administrador L2VPN (l2vpn_mgr) comunica con el proceso de control de la Ingeniería de tráfico MPLS (TE) (te_control) y pide la creación de túnel. Asegúrese de que el te_control y los procesos l2vpn_mgr estén en el estado de ejecución con estos comandos: **muestre l2vpn_mgr de procesomuestre el te_control de proceso**

- Marque que el proceso l2vpn_mgr ha pedido la creación de túnel. Una entrada para el túnel debe estar en este comando show:

```
RP/0/RSP0/CPU0:PE1#show l2vpn atom-db preferred-path
Tunnel               BW Tot/Avail/Resv    Peer ID           VC ID
-------------------------------------------------------------------
tunnel-mte1 0/0/0                         209.165.200.226    1
                                                  209.165.200.227    1
                                                  209.165.200.228    1
```

- El L2VPN tiene que recibir la información del túnel del proceso del te_control. Verifique que este comando show tenga detalles no-cero tales como túnel-identificación, Ext.tunnel-id, túnel-ifh, y p2mp-id:

```
RP/0/RSP0/CPU0:PE1#show l2vpn atom-db preferred-path private
Tunnel tunnel-mte1 0/0/0:
 Peer ID: 209.165.200.226, VC-ID 1
 Peer ID: 209.165.200.227, VC-ID 1
 Peer ID: 209.165.200.228, VC-ID 1
 MTE details:
      tunnel-ifh: 0x08000e20
     local-label: 289994
         p2mp-id: 100
       tunnel-id: 100
   Ext.tunnel-id: 209.165.200.225
```

- El L2VPN debe hacer publicidad del caso del servicio de multidifusión del proveedor (PMSI) al resto del Routers PE. Marque que l2vpn_mgr ha enviado el PMSI para el VFI configurado. La pista del evento LS: envíe PMSI debe estar presente en el historial de eventos para el VFI.

```
RP/0/0/CPU0:one#show l2vpn bridge-domain p2mp private
[...]
