## [Introducción](#)

Este documento demuestra el uso de los comandos mejorados de inscripción automática de certificados. Esta feature es una mejora diseñada para facilitar la administración de los certificados en los routers. La función de inscripción auto de certificados introduce cinco nuevos submandatos del comando `crypto ca trustpoint`. Estos comandos son `ip-address (ca-trustpoint)`, `password (ca-trustpoint)`, `serial-number`, `subject-name` y `usage`. Estos comandos proporcionan nuevas opciones para solicitudes de certificado y permiten a los usuarios especificar los campos en la configuración en vez de tener que hacerlo mediante indicaciones. Sin embargo, el uso de indicaciones sigue siendo la opción predeterminada si no se habilita esta función. Los usuarios pueden cargar previamente toda la información necesaria en la configuración. Esto permite a cada router obtener su certificado automáticamente cuando se inicie.

Las autoridades de certificación del trustpoint (CA) combinan y substituyen la funcionalidad de la identidad y la Raíz confiable CA. Así, el **comando `crypto ca trustpoint`** desaprueba los **comandos `crypto ca identity` y `crypto ca trusted-root`**. Discuten los **comandos `auto-enroll regenerate` y `rsakey label`** también en este documento.

Refiérase a [cómo obtener un certificado digital de Microsoft Windows CA usando el ASDM en un ASA](#) para aprender un escenario más casi igual con el PIX/ASA 7.x.

Refiera a [configurar el Cisco VPN 3000 Concentrator 4.7.x para conseguir un certificado digital y un certificado SSL](#) para aprender un escenario más casi igual con el concentrador del Cisco VPN de la serie 3000.

## [prerrequisitos](#)

### [Requisitos](#)

No hay requisitos específicos para este documento.

### [Componentes Utilizados](#)

La información en este documento se aplica a estas versiones de software y hardware.

- Cisco 7204, 2611, y 1720 Router
- Servidores de certificados de la independiente de Microsoft
- Software Release 12.2(12.10)T y 12.2.11T de Cisco IOS®

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

### [Convenciones](#)

Consulte [Convenciones de Consejos Técnicos de Cisco](#) para obtener más información sobre las convenciones sobre documentos.

## [Antecedentes](#)

Además de los comandos de la inscripción del certificado, se discuten estos diversos comandos de la mejora de la inscripción del certificado:

- **trustpoint crypto Ca** — Declara CA que el router debe utilizar.
- **tema-nombre [x.500-name]** — Especifica el asunto en el pedido de certificado. Si el submandato del tema-nombre no se utiliza, por abandono, se utiliza el nombre de dominio completo (FQDN) del router. Esto se utiliza en el modo de configuración del Ca-trustpoint. Por ejemplo, el formato del nombre x.500 es el tema-nombre OU=ROME, O=ITALY.
- **IP address (IP address | interfaz)** — especifica una dirección IP punteada o una interfaz que se incluya en el pedido de certificado. Esto se utiliza en el modo de configuración del Ca-trustpoint.
- **cadena de contraseña** — Especifica la contraseña de revocación para el certificado. Esto se utiliza en el modo de configuración del Ca-trustpoint. Puesto que el Listas de revocación de certificados (CRL) no se utiliza en este documento, todas las contraseñas se fijan a "ningunos."
- **[none] del número de serie** — Especifica si un número de serie se debe incluir en el pedido

de certificado. Esto se utiliza en el modo de configuración del Ca-trustpoint.

- **uso method1 [method2, [method3]]** — Especifica el uso previsto para el certificado. Las opciones disponibles son Internet Key Exchange (IKE), Cliente SSL, y servidor del SSL. El uso en este documento es IKE. Esto se utiliza en el modo de configuración del Ca-trustpoint.
- **auto-aliste el [regenerate]** — Pida automáticamente un certificado del router de CA que utilice los parámetros en la configuración. Este comando genera una nueva clave del Rivest-Shamir-Adelman (RSA) solamente si una nueva clave no existe con la escritura de la etiqueta pedida. Utilizado en el modo de configuración del Ca-trustpoint, este comando marca para saber si hay certificados del router expirados. Un trustpoint para que se configura auto-alista las tentativas al reenroll cuando expira el certificado del router. Una de las ventajas de este comando es que algunos CA requieren una nueva clave para que el reenrollment trabaje. Por lo tanto, el submandato se utiliza para generar una nueva clave. El enlistamiento automático se realiza en el lanzamiento para cualquier trustpoint CA que se configura y no tiene un certificado válido. Cuando expira el certificado que es publicado por un trustpoint CA (configurado para el Autoregistro), se pide un nuevo certificado. Aunque esta característica no proporcione la renovación perfecta de certificación, proporciona recuperación autónoma de la expiración.
- **[key-size [encryption-key-size] de la clave-escritura de la etiqueta del rsakeypair]** — Especifica qué par clave a asociarse a un certificado. Este comando se utiliza en el modo de configuración del Ca-trustpoint. En muchos casos un router puede ser requerido alistar con los servidores del certificado múltiple. Sin embargo, cada servidor de CA puede tener un diverso requisito de política (por ejemplo, longitud de clave). Este submandato permite los pares claves del socio RSA de diversos tamaños a los certificados de identidad de diversos servidores de CA. Si el submandato no se utiliza, utilizan al router FQDN por abandono. La clave-escritura de la etiqueta se genera durante la inscripción si no existe ya o si publican el comando auto-enroll regenerate. Especifique el tamaño de clave para generar la clave y especifique el cifrado-clave-tamaño para pedir el cifrado, las claves de la firma, y los Certificados separados. Por ejemplo:

```
2611-VPN(config)#crypto ca trustpoint caserver2
2611-VPN(ca-trustpoint)#rsakeypair tacvpn 512 512
```

**Note:** Por abandono, la característica del enlistamiento automático pide un nuevo certificado cuando expira el certificado viejo. La Conectividad puede ser perdida mientras que se mantiene la petición porque se borran el certificado y los pares claves actuales inmediatamente después que se genera la nueva clave. La nueva clave no tiene un certificado para hacerla juego hasta que el proceso sea completo, y las conexiones IKE entrantes no pueden ser establecidas hasta que se publique el nuevo certificado. La renovación de clave para la característica del renewal del certificado introducida en el Cisco IOS Software Release 12.3(7)T permite que el pedido de renovación del certificado sea hecho antes de que el certificado expire y conserve la clave y el certificado viejos hasta que el nuevo certificado esté disponible. Para más información sobre esta característica, refiera a la [renovación de clave para el renewal del certificado](#).

## Configurar

En esta sección se presenta información para configurar las características que este documento describe.

**Note:** Use la herramienta [Command Lookup Tool](#) ([clientes registrados solamente](#)) para encontrar más información sobre los comandos usados en este documento.

## [Diagrama de la red](#)

Este diagrama de la red muestra al Router usado en el laboratorio, los servidores de CA, y el asunto de los certificados de identidad obtenidos por el router de los dos servidores de CA.

## [Configuraciones](#)

Este documento usa estas configuraciones. El 2611-VPN Router es el router de eje de conexión que se alista en el server1 de CA y el server2 de CA. Alistan al 2611-1 Router con el server1 de CA y alistan al 7204-1 Router con el server2 de CA.

- [Configuración y Certificados del router de eje de conexión 2611-VPN a partir de dos diversos servidores de CA](#)
- [Configuración y Certificados del 1720-1 Router del server1 de CA](#)
- [Configuración y Certificados del 7204-1 Router del server2 de CA](#)

## Verificación

Estas secciones proporcionan la confirmación de independientemente de si la configuración trabaja cuando usted publica estos **comandos show**. Estos comandos verify CA y si los certificados de identidad (certificados del router) fueron publicados por el servidor de CA.

[La herramienta Output Interpreter Tool \(clientes registrados solamente\)](#) (OIT) soporta ciertos comandos show. Utilice la OIT para ver un análisis del resultado del comando show.

- **muestre el certificado Ca crypto** — Muestra la información sobre los Certificados, el certificado de la autoridad de certificación, y cualquier Certificados de la autoridad de registro. Utilice el **comando show crypto ca certificates** en el modo EXEC.
- **el Ca crypto autentica** — Autentique las autoridades de certificación (extraiga el certificado de CA). Utilice el **comando crypto ca authenticate** en el modo de configuración global.
- **mypubkey rsa del show crypto key** — Muestra las claves públicas RSA del router. Utilice el **comando show crypto key mypubkey rsa** en el modo EXEC.
- **muestre isakmp crypto sa** — Muestra todas las asociaciones actuales de la seguridad de intercambio dominante de Internet (SA) en un par. Utilice el **comando show crypto isakmp sa** en el modo EXEC.
- **muestre IPsec crypto sa** — Muestra las configuraciones usadas por el IPsec actual SA. Utilice el **comando show crypto ipsec sa** en el modo EXEC.
- **reloj de la demostración** — Muestra el tiempo de sistema actual en el router.
- **hh determinado del calendario: milímetro: día mes año ss** — Fija el tiempo de sistema de calendario. Para más información sobre los diversos relojes y fuentes de hora externa de la configuración en el router, refiera a [realizar la administración del sistema básico](#).

Para los comandos adicionales relacionados con la Interoperabilidad de CA, el IPsec, y el IKE, refieren al [SENIOR: Parte 4: Comandos de la seguridad IP y de la Interoperabilidad del cifrado](#) y de las [autoridades de certificación](#).

Esta salida es del **comando show crypto ca certificate**.

## Regeneración de un par de claves RSA

Estos comandos en el 7204-1 Router ilustran cómo utilizan al comando **auto-enroll regenerate y rsakey label**. La figura muestra la Secuencia de eventos después de que CA fuera declarado en el router y después de publicar el comando **crypto ca authenticate ca server**. El comando **auto-enroll** trabaja solamente después que usted ha autenticado CA. Una vez que se autentica CA, el router alista automáticamente con el servidor de CA. Usted no necesita publicar el comando **crypto ca enroll ca server**. Una vez que expira el certificado de identidad, el router alista automáticamente con el servidor de CA. Con la introducción de este comando no hay necesidad de alistar

manualmente con el servidor de CA una vez que expira el certificado de la identidad (router).

Usted no necesita utilizar una fuente de hora externa (servidor NTP) en el router si usted fija el sistema de calendario en el router con el **comando calendar set** para fijar la hora correcta. Recargar al router sincronizes el reloj del sistema con el sistema de calendario.

**Note:** El **comando calendar set** no está disponible en los 1700 y 2600 Router. Utilice una fuente de hora externa en este Routers.

CA se configura en el router. Esta salida detalla el enlistamiento automático de los certificados de identidad y de la regeneración del par clave RSA en el 7204-1 Router. Esta salida es intrépida en ciertas áreas acentuar la información importante.

```

## Cuando el par clave RSA no existe

Si el par clave RSA no existe durante el enlistamiento automático, un par de claves de los fines generales y del uso se genera automáticamente durante la inscripción, pues esta salida muestra. Este ejemplo comienza sin una configuración del certificado en el 7204-1 Router y un par clave RSA no se genera.

## Cuando se vence el certificado de identidad

El 2611-VPN no tiene una fuente de hora externa configurada y el reloj del sistema se utiliza para seguir el tiempo. El server2 de CA se declara en el router, se autentica el servidor de CA, y el 2611-VPN Router alista automáticamente con el servidor de CA para sus certificados de identidad. El servidor de CA se configura para publicar los certificados de identidad que son solamente válidos por un día. Una vez que expira el certificado, el router alista automáticamente con el servidor de CA y la Secuencia de eventos se muestra en esta salida.

```

## [Troubleshooting](#)

En esta sección encontrará información que puede utilizar para solucionar problemas de configuración.

## [Comandos para resolución de problemas](#)

La herramienta [Output Interpreter](#) (sólo para clientes [registrados](#)) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

**Note:** [Antes de ejecutar un comando de depuración, consulte Información importante sobre comandos de depuración.](#)

- [debug crypto pki transaction](#)
- [debug crypto pki messages](#)
- [debug crypto ipsec](#)
- [debug crypto isakmp](#)

## [Depuración en los routers](#)

El IKE y los debugs del IPsec del tres Routers se muestran en esta salida. Durante las negociaciones IKE con un peer IPsec, el 2600 Router tiene que decidir qué servidor de CA a utilizar. En el escenario de prueba, el 1720-1 y los 7204 inició el túnel IPsec al 2600-VPN Router.

Esta salida muestra los debugs del IPsec IKE/en el 2611-VPN Router con los **comandos show crypto**.

```
2611-VPN#show debug
```

```
Cryptographic Subsystem:
```

```
  Crypto ISAKMP debugging is on
```

```
  Crypto IPSEC debugging is on
```

```
