Uso de Puente medio PPP para conectar redes enrutadas y con conexión en puente.

Contenido

Introducción

Este documento proporciona una configuración de muestra para usar el mitad-bridging PPP para conectar ruteado y los Bridged Network.

prerrequisitos

Requisitos

No hay requisitos específicos para este documento.

Componentes Utilizados

La información que contiene este documento se basa en las siguientes versiones de software y hardware.

- Software Release 12.2(7b) de Cisco IOS®.

- Dos Cisco 2500 Series Router. Cada uno tiene por lo menos una interfaz del ISDN BRI.

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

Productos Relacionados

Esta configuración también se puede utilizar con las siguientes versiones de hardware y software:

- Cualquier interfaz serial, tal como serial, Basic Rate Interface (BRI), interfaz de la velocidad primaria (PRI), y así sucesivamente.
- Cisco IOS Software Release 11.2.
- Cualquier Cisco IOS Software corriente del router como se mencionó anteriormente, y por lo menos un puerto ISDN-BRI. Sin embargo, la función half-bridge se puede utilizar en un router con una interfaz serial.

Convenciones

Para obtener más información sobre las convenciones del documento, consulte Convenciones de Consejos Técnicos de Cisco.

Antecedentes

El puente envía paquetes de puente al medio puente PPP que los convierte en paquetes enrutados y los reenvía a otros procesos del router. Asimismo, el semipuente PPP convierte los paquetes ruteados a los paquetes de puente de Ethernet, y los envía al Bridge en la misma subred Ethernet.

Note: Esta configuración no cubre un Bridge completo en los ambos lados. Para tal configuración refiera al documento del Bridging Across ISDN.

Sea consciente que el interligar en una conexión ISDN tiende a mantener la conexión activa por mismo los períodos prolongados, si no permanentemente. Si la compañía telefónica carga para el ISDN basado el tiempo de conexión, ésta puede dar lugar a una cuenta muy grande. Por lo tanto, este escenario se recomienda para los que tengan líneas ISDN de uso ilimitado.

Note: Una interfaz no puede funcionar como un semipuente y un Bridge. El Cisco IOS Software soporta no más que un semipuente PPP por la subred Ethernet.

Configurar

En esta sección encontrará la información para configurar las funciones descritas en este documento.

Note: Para obtener información adicional sobre los comandos que se utilizan en este documento, use la Command Lookup Tool (solo para clientes registrados).

Diagrama de la red

En este documento, se utiliza esta configuración de red:

Configuraciones

En este documento, se utilizan estas configuraciones:

- **Venus**Configuran a este router como Bridge completo con el Routing IP inhabilitado. Los diales del dispositivo cuando llega cualquier tráfico Bridged.
- **Saturn**Han configurado a este router como Half-Bridge. Observe que no configuran a los **comandos dialer string, dialer group, y dialer list** en este lado. Este router nunca marcará tan, pero validará las llamadas entrantes. Esto evita que el router marque al router remoto. Hemos girado el Routing IP aquí. El Bridging Software lleno no se configura en este router. El Half-Bridge PPP se está ejecutando en la interfaz BRI, así que los comandos como la **demostración interligan** y el atravesar-**árbol de la demostración** no rinde ninguna salida en este router.

```

Verificación

En esta sección encontrará información que puede utilizar para confirmar que su configuración esté funcionando correctamente.

La herramienta Output Interpreter (sólo para clientes registrados) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

- **isdn status de la demostración** — visualiza el estatus L1, L2, y L3 de las interfaces de ISDN.
- **marcador de la demostración** — visualiza el estatus del marcador, y el estado individual de los canales ISDN.
- **Bridge de la demostración** — clases de las visualizaciones de entradas en el Bridge Forwarding Database, en el modo EXEC privilegiado.
- **interfaz de la demostración** — visualiza el estatus de las diversas interfaces, incluyendo el serial y las interfaces BRI.
- **la demostración arp** — marca la asignación ARP. El ARP es un protocolo usado para asociar el direccionamiento de la capa 2 (dirección MAC) a un direccionamiento de la capa 3 (dirección IP).

- **atravesar-árbol de la demostración** — visualiza la topología del árbol de expansión sabida al router.

Comandos show en Venus luego realizar la llamada a Saturno

Troubleshooting

En esta sección encontrará información que puede utilizar para solucionar problemas de configuración.

Recursos de resolución de problemas

Los procedimientos deTroubleshooting para las llamadas ISDN entrantes y salientes se explican en la tecnología de marcación manual: Documento de las técnicas de Troubleshooting. La información adicional en cómo resolver problemas los problemas de la capa ISDN 1, de la capa 2 y de la capa 3 se da al usar el comando show isdn status para el Troubleshooting de BRI y resolviendo problemas el ISDN BRI acode 3 usando el comando debug isdn q931.

Comandos para resolución de problemas

La herramienta Output Interpreter (sólo para clientes registrados) permite utilizar algunos comandos “show” y ver un análisis del resultado de estos comandos.

Note: Antes de ejecutar un comando de depuración, consulte Información importante sobre comandos de depuración.

- **debug dialer** — indica cuando se ha detectado el tráfico interesante, y cuando se inicia la marca.
- **debug isdn event** — indica la actividad ISDN que ocurre en el lado del usuario de la interfaz de ISDN, y es similar **hacer el debug de ISDN q931**.
- **debug ISDN q931** — proporciona la información sobre la configuración de la llamada y cierre de las conexiones de red ISDN (capa 3), entre el router local (lado del usuario) y la red.
- **el debug isdn q921** — visualiza la capa del link de datos (los procedimientos de acceso de la capa 2) que están ocurriendo en el router en el canal D (LAPD) de su interfaz de ISDN.
- **negociación ppp del debug** — realiza la negociación de opciones PPP y los parámetros del protocolo network control (NCP).
- **autenticación PPP del debug** — permite el intercambio de los paquetes del protocolo challenge authentication (GRIETA) y del protocolo password authentication (PAP).

Comandos Debug en el Venus cuando llega el tráfico interesante
