Ejemplo de configuración del passthrough de la red del regulador 5760/3850 del Wireless LAN

Contenido

Introducción

Este documento describe cómo configurar la característica del passthrough de la red en un regulador del Wireless LAN (WLC).

Prerequisites

Requisitos

Este documento asume que las configuraciones iniciales están completadas ya en el WLC.

Componentes Utilizados

La información que contiene este documento se basa en las siguientes versiones de software y hardware.

- 5760 WLC que funciona con el código de la versión 3.3
- Lightweight Access Point de las 3600 Series del Cisco Aironet
- Supplicant de la Tecnología inalámbrica del natural de Microsoft Windows 7

La información que contiene este documento se creó a partir de los dispositivos en un ambiente de laboratorio específico. Todos los dispositivos que se utilizan en este documento se pusieron en

funcionamiento con una configuración verificada (predeterminada). Si la red está funcionando, asegúrese de haber comprendido el impacto que puede tener cualquier comando.

Passthrough de la red en los reguladores del Wireless LAN

El passthrough de la red es una solución que se utiliza típicamente para el acceso de invitado. El proceso del passthrough de la red es similar al de la autenticación Web, salvo que no se requiere ningunos credenciales de autenticación para el passthrough de la red.

En el passthrough de la red, reorientan a los usuarios de red inalámbrica a la página de la política de uso cuando intentan utilizar Internet por primera vez. Una vez que los usuarios validan la directiva, pueden hojear Internet. Este cambio de dirección a la página de la directiva es manejado por el WLC.

En este ejemplo, una interfaz VLAN se crea en una subred distinta en el WLC. Entonces, un identificador del conjunto separado del Wireless LAN (red inalámbrica (WLAN)) /Service (SSID) se crea y se configura con el passthrough de la red, y él se asocia a esta interfaz VLAN.

> **Note**: El passthrough de la red no proporciona ninguna encripción de datos.

Configurar

Aquí está el diagrama de la red:

Usted puede completar esta configuración con el CLI o el GUI.

Configuración con el CLI

Configure el snooping del DHCP para los VLA N que usted utiliza para los clientes. En este ejemplo, el **VLAN20** se utiliza para los clientes. El pool se configura en el mismo WLC.

TenGigabitEthernet1/0/1 del WLC 5760 conecta con el uplink el Switch. Si usted tiene el servidor DHCP configurado en el servidor más allá el WLC o en un servidor DHCP externo, después usted tiene que confiar en el snooping del DHCP y retransmitir la información.

```
ip device tracking
ip dhcp snooping vlan 12,20,30,40
ip dhcp snooping
!
ip dhcp pool vlan20
 network 20.20.20.0 255.255.255.0
 default-router 20.20.20.1

interface Vlan20
 ip address 20.20.20.1 255.255.255.0

interface TenGigabitEthernet1/0/1
 switchport trunk native vlan 12
```

```
 switchport mode trunk
 ip dhcp relay information trusted
 ip dhcp snooping trust

parameter-map type webauth global
 type consent
 virtual-ip ipv4 192.168.200.1
!
!
parameter-map type webauth web
 type consent

wlan Webauth 9 Webauth
 client vlan VLAN0020
 no security wpa
 no security wpa akm dot1x
 no security wpa wpa2
 no security wpa wpa2 ciphers aes
 security web-auth
 security web-auth parameter-map web
 session-timeout 1800
```

Configuración con el GUI

Complete estos pasos para configurar en el GUI.

1. Del WLC GUI, navegue al **> Security (Seguridad) de la configuración:**

2. En la inferior derecha de la **página Seguridad**, navegue al **mapa de Webauth > del parámetro de Webauth:**

3. Elija **global** para la correspondencia del parámetro predeterminado:

4. Navegue al **mapa del parámetro de Webauth > editan** para configurar a la dirección IP virtual. Es **192.169.200.1** en este ejemplo. Cambie el tipo **para consentir**, de modo que el Parámetro global se convierta en **consentimiento** (passthrough de la red).

   Note: No es obligatorio configurar la correspondencia del Parámetro global para consentir.

5. Cree la correspondencia del parámetro, y elija el **consentimiento** para el tipo. Este ejemplo utiliza la **red** como el nombre del Parámetro-mapa, que se utiliza bajo la red inalámbrica (WLAN) para que a los usuarios accedan la página del consentimiento.

Aquí está una captura de pantalla de las correspondencias del parámetro en el GUI:

6. Del WLC GUI, navegue a la **configuración > a la Tecnología inalámbrica > a la red inalámbrica (WLAN)** para crear una nueva red inalámbrica (WLAN). Este ejemplo tiene **Webauth** como la red inalámbrica (WLAN) asociada al **VLAN20**:

7. Navegue a la **red inalámbrica (WLAN) > editan el > Security (Seguridad) > Layer2**, y no seleccionan **ninguno** para la Seguridad de la capa 2:

8. Navegue a la **red inalámbrica (WLAN) > editan el > Security (Seguridad) > Layer3**, y eligen la configuración apropiada para el **mapa del parámetro de Webauth**. En este ejemplo, es **red**.

9. Salve la configuración, y está listo para probar.

10. Después de que usted conecte con la red inalámbrica (WLAN), el cliente recibe la dirección IP. Cuando usted intenta abrir al navegador con la dirección IP virtual, las visualizaciones de la **página de registro del consentimiento**, y usted deben hacer clic el botón de radio del **validar**.

   Note: Si usted tiene la configuración válida del Domain Name Server (DNS), después usted no necesita ingresar manualmente a la dirección IP virtual en el hojeador.

11. Una vez que usted el tecleo **valida**, los lanzamientos de la página de la autenticación satisfactoria, que le da la opción para navegar a la página pedida.

Ejemplo del cliente

Aquí está la captura de paquetes de la laptop del cliente cuando el cliente recibe el DHCP:

Después de que el cliente reciba la dirección IP, el cliente abre al navegador, y teclea a la dirección IP virtual.

> **Note**: Si el DNS se configura correctamente, después usted no necesita ingresar a la dirección IP virtual en el hojeador.

Porque esta configuración no utiliza ninguna certificaciones del webauth, hay errores CERT en esta captura de paquetes:

Después de la autenticación satisfactoria, el cliente está en el estado de **FUNCIONAMIENTO** en el WLC GUI.

Verificación

Actualmente, no hay un procedimiento de verificación disponible para esta configuración.

Troubleshooting

> **Note**: Porque los debugs son uso intensivos del procesador, usted debe ejecutar los debugs en una ventana de mantenimiento planificado.

Ingrese estos debugs para resolver problemas su configuración:

```
debug client mac-address 00:21:6A:89:51:CA
debug ip http all
debug access-session all

All Auth Manager debugging is on
SURBG-5760#debug ip admission all
All IP admission debugging is on
