Configuration de la redirection BGP FlowSpec VRF vers VRF

Table des matières

Introduction

Ce document décrit comment configurer la redirection BGP Flowspec VRF vers VRF.

Exigences

- Implémentation IGP compatible MPLS opérationnelle
- Une implémentation VPNv4 opérationnelle

Composants utilisés

Il a été testé sur les routeurs à services d'agrégation de la gamme Cisco ASR 9000 exécutant Cisco IOS XR version 7.8.2

The information in this document was created from the devices in a specific lab environment. Tous les dispositifs utilisés dans ce document ont démarré par une configuration effacée (par défaut). Si votre réseau est en ligne, assurez-vous de bien comprendre l’incidence possible des commandes.

La fonctionnalité de spécification de flux BGP (Flowspec) vous permet de déployer et de propager rapidement des fonctionnalités de filtrage et de réglementation parmi de nombreux routeurs homologues BGP afin d'atténuer les effets d'une attaque par déni de service distribué (DDoS) sur votre réseau.

Configurer

Local  Outgoing    Prefix             Outgoing     Next Hop        Bytes
Label  Label       or ID              Interface                    Switched
------ ----------- ------------------ ------------ --------------- ------------
24005  Aggregate   64501_flowspec: Per-VRF Aggr[V]   \
                                      64501_flowspec                1500
```

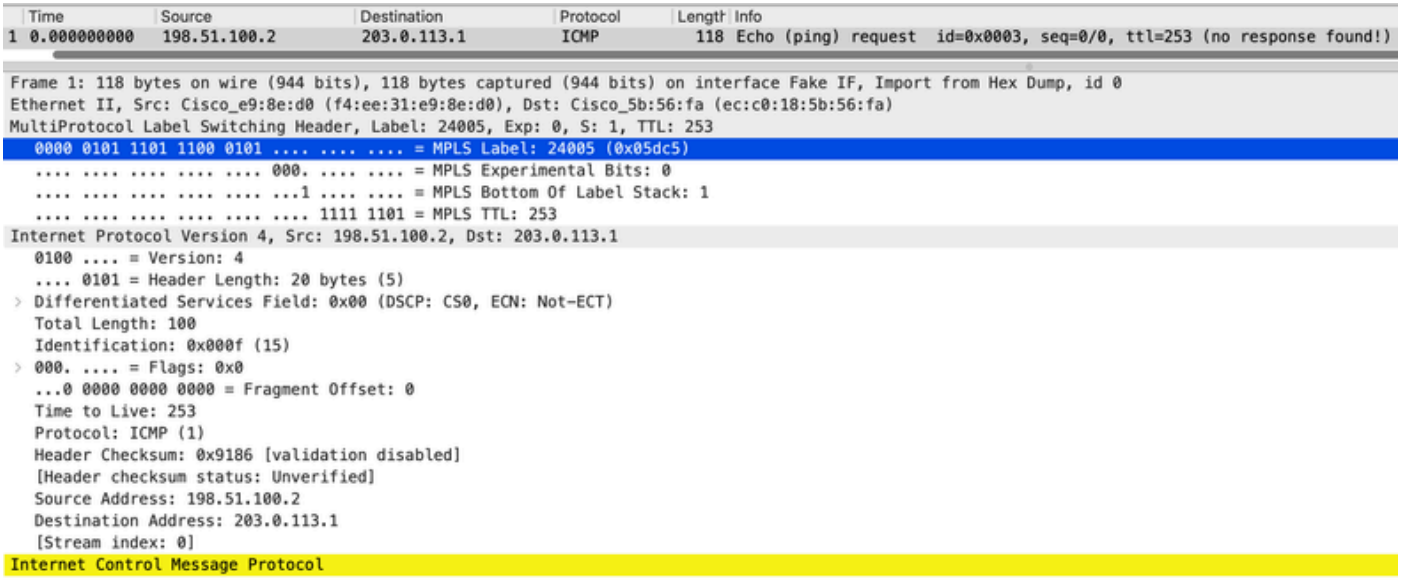

Figure 2 PCAP montrant des preuves de redirection du trafic, notez l'étiquette MPLS de service 24005.

Le trafic entrant VRF 64501_internet sur le client Flowspec qui correspond à la stratégie est redirigé vers le VRF 64501_flowspec.
