[Introduction](#)

Ce document montre comment configurer un routeur de Cisco et un pare-feu Cisco Secure PIX pour implémenter un entre réseaux locaux IPSec utilisant des Certificats numériques. Pour réaliser cette configuration, vous devez effectuer les tâches suivantes :

1. Configurez le routeur et le PIX.
2. Obtenez les Certificats numériques sur le routeur et le PIX.
3. Configurez l'IKE et les stratégies IPSecs sur le routeur et le PIX, et définissez quel trafic (le

trafic intéressant) sera chiffré utilisant IPSec par une liste d'accès.

Avant de commencer

Conventions

Pour plus d'informations sur les conventions des documents, référez-vous aux [Conventions utilisées pour les conseils techniques de Cisco](#).

Conditions préalables

Aucune condition préalable spécifique n'est requise pour ce document.

Composants utilisés

Les informations dans ce document sont basées sur les versions de logiciel et de matériel ci-dessous.

- Routeur de Cisco 1700
- Version de logiciel de Cisco IOS® 12.2(6)
- Pare-feu 520 de Cisco PIX
- Version 6.0.1 de Pare-feu PIX.

Les informations présentées dans ce document ont été créées à partir de périphériques dans un environnement de laboratoire spécifique. Tous les périphériques utilisés dans ce document ont démarré avec une configuration effacée (par défaut). Si vous travaillez dans un réseau opérationnel, assurez-vous de bien comprendre l'impact potentiel de toute commande avant de l'utiliser.

Théorie générale

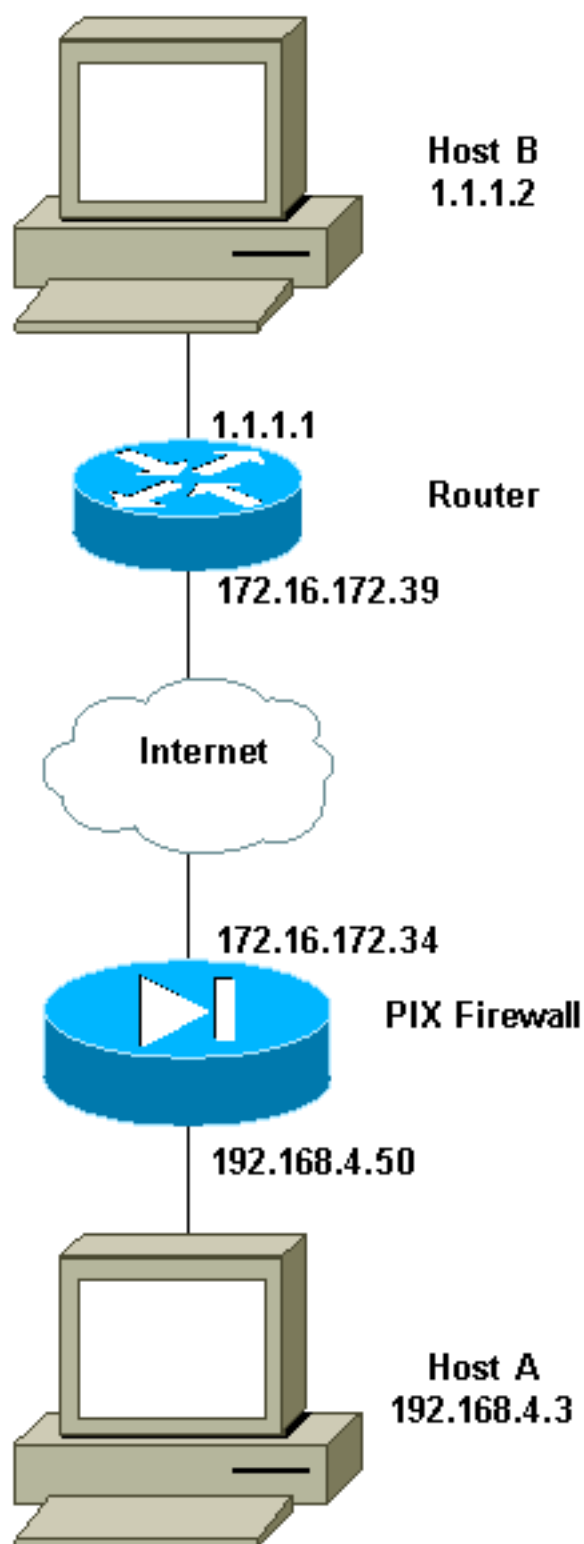

Dans notre exemple, nous avons défini l'adresse réseau de l'hôte A (adresse source) et l'adresse réseau de l'hôte B (adresse de destination) comme trafic que l'IPSec chiffrera sur le PIX. La liste d'accès sur le routeur est l'image retournée de la liste d'accès sur le PIX.

Nous avons configuré le PIX et le routeur de sorte que les hôtes résidant sur le RÉSEAU LOCAL intérieur des deux périphériques utilisent leurs adresses privées tout en allant par le tunnel d'IPSec. Sur le PIX, la **liste d'accès** et les commandes **0 nat** fonctionnent ensemble. Quand l'hôte A sur le réseau de 192.168.4.0 va à 1.1.1.0 le réseau, la liste d'accès permet le trafic réseau de 192.168.4.0 à chiffrer sans Traduction d'adresses de réseau (NAT). Cependant, quand ces mêmes utilisateurs vont n'importe où ailleurs, ils sont traduits à l'adresse de 172.16.172.57 par la translation d'adresses d'adresse du port (PAT). Sur le routeur, le **route-map** et les **commandes access-list** permettent le trafic réseau de 1.1.1.0 à chiffrer sans NAT. Cependant, quand le même hôte B va n'importe où ailleurs, ils sont traduits à l'adresse de 172.16.172.39 par PAT.

Pour tester la configuration, nous avons cinglé de l'hôte A derrière le Pare-feu PIX à l'hôte B derrière le routeur. Quand le paquet IP est arrivé au Pare-feu PIX, il a apparié la liste d'accès et a ainsi initié la négociation IPSec. Ainsi le PIX est le demandeur et le routeur est le responder pendant la négociation IPSec. Pour dépannage des buts, vous devez examiner le PIX et le routeur cryptos met au point.

[Diagramme du réseau](#)

Ce document utilise la configuration réseau indiquée dans le diagramme suivant :

pix520-1# **Remarque:** Le nom d'hôte et le nom de domaine sont exigés parce que le routeur assigne un nom de domaine complet (FQDN) aux clés et aux Certificats utilisés par IPSec, basé sur le nom d'hôte et l'ip domain name que vous assignez au routeur. Par

exemple, un certificat est nommé « router.cisco.com » basé sur un nom de hôte du routeur de « routeur » et un ip domain name de routeur de « cisco.com. »

2. Générez la paire de clés RSA pour le routeur, qui est utilisé pour signer et chiffrer des messages de gestion des clés d'IKE. Vous devez générer la paire de clés afin d'obtenir un **certificat pour le routeur.**

```
1720-1(config)#crypto key generate rsa
The name for the keys will be: 1720-1.cisco.com
Choose the size of the key modulus in the range of 360 to 2048 for your
General Purpose Keys. Choosing a key modulus greater than 512 may take a few minutes.
```

```
How many bits in the modulus [512]:
Generating RSA keys ...
[OK]
```

- Utilisez la commande de **show crypto key mypubkey rsa** de voir la paire de clés RSA du routeur.

```
1720-1#sh cr key mypubkey rsa
% Key pair was generated at: 19:26:22 PST Jan 10 2002
Key name: 1720-1.cisco.com
Usage: General Purpose Key
Key Data:

 8C1667AE 93993049 DA362602 4E4D9EF8 2F8C4777 30F9F958 7F020301 0001
```

```
1720-1#
```

3. Déclarez le serveur de l'autorité de certification (CA) afin de configurer les paramètres de transmission entre le routeur et le CA. Si nous utilisons une autorité d'enregistrement, alors nous spécifions également le mode d'autorité d'enregistrement (RA). Utilisez la commande **crl optional** si vous voulez que des autres les Certificats pairs soient reçus par le routeur même si le Liste des révocations de certificat (CRL) approprié n'est pas accessible au

```
1720-1(config)# crypto ca identity vpn
1720-1(ca-identity)#enrollment url http://171.69.89.16:80
1720-1(ca-identity)# query url ldap://171.69.89.16
1720-1(ca-identity)# enrollment retry count 20
1720-1(ca-identity)# enrollment retry period 5
1720-1(ca-identity)# enrollment mode ra
1720-1(ca-identity)#exit
```

4. Le routeur doit authentifier le CA en obtenant le certificat auto-signé du Ca qui contient la clé publique du Ca. Puisque le CA signe son propre certificat, la clé publique du Ca devrait être manuellement authentifiée en contactant l'administrateur CA pour comparer l'empreinte digital de certificat CA. Dans cet exemple, nous authentifions manuellement la clé publique en comparant les deux empreintes digital après que nous recevions le certificat de Ca, plutôt que l'entrant dans à un appel de procédure.

```
1720-1(config)#cr ca authenticate vpn
Certificate has the following attributes:
Fingerprint: 1FCDF2C8 2DEDA6AC 4819D4C4 B4CFF2F5
% Do you accept this certificate? [yes/no]: y
```

```
1720-1(config)#Utilisez la crypto commande SH de CERT Ca de visualiser les Certificats CA et de RA et de les vérifier que l'authentification était réussie.
1720-1#sh cr ca cert
RA Signature Certificate
```

Status: Available

5. Obtenez un certificat signé du CA pour chacune des paires de clés RSA du routeur. Si vous génériez les clés RSA d'usage universel, le routeur a une paire de clés RSA et a besoin de seulement un certificat. Si vous génériez les clés RSA spéciales d'utilisation, alors le routeur a deux paires de clés RSA et a besoin de deux Certificats. Vous devez contacter l'administrateur CA pour accorder manuellement les Certificats de routeur s'il est configuré sur le serveur CA. En outre, si le serveur CA est configuré de sorte que vous deviez fournir le mot de passe au moment de l'inscription, puis administrateur du contact CA pour ce mot de passe. Dans cet exemple, le serveur CA a été installé de sorte que nous n'ayons pas eu besoin de fournir un mot de passe pendant l'inscription.

```
1720-1(config)#cr ca enroll vpn
%
% Start certificate enrollment ..
% Create a challenge password. You will need to verbally provide this
password to the CA Administrator in order to revoke your certificate.
For security reasons your password will not be saved in the configuration.
Please make a note of it.
```

Password:

Re-enter password:

```
% The subject name in the certificate will be: 1720-1.cisco.com
% Include the router serial number in the subject name? [yes/no]: n
% Include an IP address in the subject name? [yes/no]: n
Request certificate from CA? [yes/no]: y
% Certificate request sent to Certificate Authority
% The certificate request fingerprint will be displayed.
% The 'show crypto ca certificate' command will also show the fingerprint.
```

```
1720-1(config)#      Fingerprint:  A1D6C28B 6575AD08 F0B656D4 7161F76F
```

3d09h: CRYPTO_PKI: status = 102: *certificate request pending* Après que nous exécutons les commandes pour l'inscription, le routeur communique avec le serveur et les tentatives CA d'obtenir son certificat. Pendant ce temps, si le serveur CA est configuré pour avoir besoin d'une authentification manuelle des Certificats, puis votre besoin de volonté de contacter l'administrateur CA. Utilisez la **crypto** commande **SH de CERT Ca** de visualiser le certificat de routeur et de le vérifier que l'inscription a été réussie. Dans l'exemple suivant, les Certificats n'ont pas été approuvés.

```
1720-1#sh crypto ca cert
```

Obtenez les Certificats sur le PIX

Pour obtenir les Certificats sur un Pare-feu PIX, vous suivrez les mêmes étapes que sur le routeur. Cependant, la syntaxe de commande PIX est différente.

- Placez le nom d'hôte et l'ip domain name.

```
hostname pix520-1
```

```
domain-name vpn.com
```

- Générez la paire de clés RSA.`pix520-1(config)# ca generate rsa key 512`

Utilisez l'ordre de la **RSA de mypubkey de l'exposition Ca** d'afficher la paire de clés

```
RSA.pix520-1(config)# sh ca mypubkey rsa
```

```
% Key pair was generated at: 04:54:34 Jan 11 2002
```

```
Key name: pix520-1.vpn.com
```

```
Usage: General Purpose Key
```

```
Key Data:
```

```
305c300d 06092a86 4886f70d 01010105 00034b00 30480241 009d95d5 e1147546
```

```
1f9ef873 81a36256 4b81388b 188fbc66 40fc4c56 c1801311 ff450cca e8d715c3
```

```

```

```
pix520-1(config)#
```

- Déclarez le serveur CA.`pix520-1(config)# ca identity cisco 171.69.89.16 171.69.89.16`

```
pix520-1(config)# ca configure cisco ra 20 5
```

- Authentifiez le CA.`pix520-1(config)# ca authenticate cisco`

Certificate has the following attributes:

Fingerprint: 1fcdf2c8 2deda6ac 4819d4c4 b4cff2f5

Utilisez la commande de CERT de l'exposition Ca de visualiser le certificat de CA sur le PIX.

```
pix520-1(config)# sh ca cert
```

CA Certificate

```
Status: Available !--- The authentication was successful. Certificate Serial Number: 3b2fd307 Key Usage: General Purpose OU = sjvpn O = cisco C = us CRL Distribution Point: CN = CRL1, OU = sjvpn, O = cisco, C = us Validity Date: start date: 22:02:40 Jun 19 2001 end date: 22:32:40 Jun 19 2021 RA Signature Certificate Status: Available !--- The authentication was successful. Certificate Serial Number: 3b2fd319 Key Usage: Signature CN = First Officer OU = sjvpn O = cisco C = us CRL Distribution Point: CN = CRL1, OU = sjvpn, O = cisco, C = us Validity Date: start date: 22:03:31 Jun 19 2001 end date: 22:33:31 Jun 19 2004 RA KeyEncipher Certificate Status: Available !--- The authentication was successful. ```

5. Demandez le CA pour le CRL.

```
pix520-1(config)# ca enroll cisco 171.69.89.16
```

```
%
```

```
% Start certificate enrollment ..
```

```
% The subject name in the certificate will be: pix520-1.vpn.com
```

```
% Certificate request sent to Certificate Authority
```

```
% The certificate request fingerprint will be displayed.
```

```
pix520-1(config)# Fingerprint: 6961df68 d3b5e667 8903a66b 969eee64
```

```
CRYPTO_PKI: status = 102: certificate request pending
```

```
CRYPTO_PKI: status = 102: certificate request pending
```

```
!pix520-1(config)#
```

```
pix520-1(config)# show ca cert
```

Certificate

```
Status: Available !--- The enrollment was successful. Certificate Serial Number: 3b2fd653 Key Usage: General Purpose Subject Name Name: pix520-1.vpn.com CRL Distribution Point: CN = CRL1, OU = sjvpn, O = cisco, C = us Validity Date: start date: 04:13:45 Jan 11 2002 end date: 04:43:45 Jan 11 2003 RA Signature Certificate Status: Available !--- The enrollment was successful. ```

6. Utilisez la commande SH de crl Ca de visualiser le CRL.

```
pix520-1(config)# sh ca crl
```

CRL:

```
CRL Issuer Name:
```

```
OU = sjvpn, O = cisco, C = us
```

```
LastUpdate: 00:17:34 Jan 11 2002
```

```
NextUpdate: 01:17:34 Jan 12 2002
```

```
pix520-1(config)#
```

7. Pour sauvegarder les Certificats sur le PIX, utilisez la commande suivante :

```
pix520-1(config)# ca save all
```

```
pix520-1(config)#
```

Vérifiez

Cette section présente des informations que vous pouvez utiliser pour vous assurer que votre configuration fonctionne correctement.

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) ([clients enregistrés](#) uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Des commandes **show** peuvent être exécutées sur le PIX et le routeur.

- **show crypto isakmp sa** - Visualisez toutes les associations de sécurité en cours d'IKE (SAS) à un pair.
- **show crypto ipsec sa** - Affiche les configurations utilisées par les associations de sécurité en cours d'IPSec.
- **active de connexions de show crypto engine** - (routeur seulement) connexions en cours et informations d'expositions concernant les paquets chiffrés et déchiffrés.
- **show crypto ca crl** - (routeur seulement) affiche le courant CRL sur le routeur.
- **show crypto ca certificat** - (routeur seulement) affiche le routeur, le serveur CA, et les Certificats de RA sur le routeur. Il affiche également le point de distribution de certificat (CDP).
- **affichez les Certificats Ca** - (PIX seulement) affiche les Certificats PIX, CA, et de RA. À la différence du routeur, il n'affiche pas le CDP.
- **affichez le crl Ca** - (PIX seulement) affiche le CRL sur le PIX.
- **show clock** - Affiche le temps en cours sur le router/PIX (du mode enable).

[Dépannez](#)

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

Dépannage des commandes

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) ([clients enregistrés](#) uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Remarque: Avant d'exécuter les commandes **debug**, référez-vous à la section **Informations importantes sur les commandes Debug**.

Ce qui suit met au point doit s'exécuter sur les deux pairs d'IPSec :

- **debug crypto isakmp** - (routeur et PIX) erreurs d'affichages pendant le Phase 1.
- **debug crypto ipsec** - (routeur et PIX) erreurs d'affichages pendant le Phase 2.
- **debug crypto engine** - (routeur seulement) affiche des informations du moteur de chiffrement.
- **debug crypto pki transactions** - (routeur seulement) les informations d'expositions concernant les transactions d'Infrastructure à clés publiques (PKI) de routeur.
- **debug crypto pki messages** - (routeur seulement) les informations d'expositions concernant le PKI entré/messages.
- **debug crypto Ca** - (PIX seulement) affiche des informations concernant des transactions de PKI et des messages d'entrée/sortie.

L'autorisation des associations de sécurité doit être faite sur les deux pairs. Les commandes PIX sont exécutées dans le mode enable ; les commandes de routeur sont exécutées dans le mode non activé.

- **clear crypto isakmp SA** - (PIX) autorise les associations de sécurité de Phase 1.
- **clear crypto ipsec sa** - (PIX) autorise les associations de sécurité de Phase 2.
- **clear crypto isakmp** - (routeur) autorise les associations de sécurité de Phase 1.
- **clear crypto sa** - (routeur) autorise les associations de sécurité de Phase 2.

Debug de certificat témoin du routeur

Ceci sectionne des expositions met au point du routeur quand nous exécutons les commandes de débogage suivantes de PKI tandis qu'obtenir délivre un certificat d'un serveur CA. Ceux-ci met au point ont été obtenus pendant une session réussie.

```
1720-1#debug cr pki transactions
Crypto PKI Trans debugging is on
1720-1#debug cr pki messages
Crypto PKI Msg debugging is on
```

```

Problèmes potentiels

Cette section discute les symptômes, les causes, et les résolutions des erreurs communes qui sont faites tandis qu'obtenir délivre un certificat sur le routeur et PIX.

Non-concordance d'identité d'ISAKMP

Le routeur et les PIX assignent un FQDN aux clés et aux Certificats utilisés par IPsec. Pendant la négociation d'IKE ou de phase 1 le router/IOS vérifie le FQDN dans le certificat. Par conséquent nous devons utiliser l'identité d'ISAKMP comme adresse Internet, au lieu de l'adresse sur le PIX et le routeur. Dans l'exemple suivant, le router/IOS vérifie le FQDN dans le certificat.

flags= 0x4

```
return status is IKMP_NO_ERROR
```

```
pix520-1(config)#
```

La sortie de commande show suivante explique également l'intervalle de temps.

```
1720-1#sh crypto ca crls
```

```
CRL Issuer Name:
```

```
OU = sjvpn, O = cisco, C = us
```

```
LastUpdate: 16:17:34 PST Jan 10 2002
```

```
NextUpdate: 17:17:34 PST Jan 11 2002
```

```
Retrieved from CRL Distribution Point:
```

```
LDAP: CN = CRL1, OU = sjvpn, O = cisco, C = us
```

Si la date et l'heure de l'horloge sur le routeur ou le PIX ne tombe pas entre le début et les dates de fin sur les Certificats et le prochain/dernière modification du CRL, alors vous obtiendrez l'erreur suivante pendant la négociation de la phase 1 :

Le routeur mettent au point :

```
1720-1#sh crypto ca crls
```

```
CRL Issuer Name:
```

```
OU = sjvpn, O = cisco, C = us
```

```
LastUpdate: 16:17:34 PST Jan 10 2002
```

```
NextUpdate: 17:17:34 PST Jan 11 2002
```

```
Retrieved from CRL Distribution Point:
```

```
LDAP: CN = CRL1, OU = sjvpn, O = cisco, C = us
```

Dans cet exemple, le temps de routeur a été placé 16:07:02 au 28 février 1993, qui ne tombe pas entre les temps valides requis par le CA. Pour résoudre le problème, placez l'heure appropriée sur le routeur.

```
1720-1#clock set 01:05:01 january 11 2002
```

```
1720-1#sh clock
```

```
01:05:04.903 PST Fri Jan 11 2002
```

```
1720-1#
```

[Port 80 HTTP/TCP bloqué](#)

Le routeur et les PIX utilisent le port TCP 80 pendant l'authentification et l'inscription avec le serveur CA. Si vous avez des problèmes d'inscription ou d'authentification, vérifiez que le port 80 HTTP/TCP n'est pas bloqué entre le router/PIX et le serveur CA.

[PIX/Router n'a pas le CRL](#)

Puisque nous n'avons pas spécifié la commande **crl optional** sur le PIX/router, chacun des deux périphériques vérifieront le CRL pendant la négociation de la phase une. Si le CRL n'est pas présent, vous verrez les erreurs suivantes.

PIX mettent au point :

```
1720-1#clock set 01:05:01 january 11 2002
```

```
1720-1#sh clock
```

```
01:05:04.903 PST Fri Jan 11 2002
```

```
1720-1#
```

Pour résoudre ce problème, obtenez les Certificats du serveur CA en émettant une commande de *surnom de la demande Ca de crl Ca* ; nous avons utilisé la **demande Cisco de crl du Cr Ca**.

[Deletes certificats et paires de clés RSA](#)

Vous pouvez devoir supprimer des Certificats numériques ou des paires de clés RSA du routeur ou du PIX.

Certificats et paires de clés RSA de routeur d'effacement

Commandes :

- **aucun surnom du crypto ca identity Ca** - Supprimez les Certificats de routeur.
- **crypto key zeroize rsa** - Supprimez la paire de clés RSA.

Pour supprimer les Certificats, suivez l'exemple ci-dessous :

```
1720-1#conf t
Enter configuration commands, one per line. End with CNTL/Z.
1720-1(config)#no crypto ca identity vpn
% Removing an identity will destroy all certificates received from
the related Certificate Authority.

Are you sure you want to do this? [yes/no]: y
% Be sure to ask the CA administrator to revoke your certificates.

No enrollment sessions are currently active.
```

```
1720-1(config)#
1720-1#sh cr ca cert
1720-1#
!--- The certificates are no longer available.
```

Pour supprimer la paire de clés RSA sur le routeur, suivez l'exemple ci-dessous :

```
1720-1(config)#crypto key zeroize rsa
% Keys to be removed are named 1720-1.cisco.com.
Do you really want to remove these keys? [yes/no]: y
1720-1(config)#.

1720-1#sh crypto key mypubkey rsa
1720-1#
!-- The RSA key pairs are no longer available.
```

Certificats et paires de clés RSA de l'effacement PIX

Commandes :

- **aucun surnom de l'identité Ca Ca** - Supprimez les Certificats du PIX.
- **mise à zéro RSA Ca** - Supprimez le keypair RSA du PIX.

Pour supprimer les Certificats sur le PIX, suivez l'exemple ci-dessous :

```
pix520-1(config)# no ca identity cisco
% Removing the identity will destroy all certificates.
% Be sure to ask the CA administrator to revoke your certificates.

pix520-1(config)# sh cr ca cert
pix520-1(config)#
!--- The certificates are no longer available.
```

Pour supprimer la paire de clés RSA sur le PIX, suivez l'exemple ci-dessous :

```
pix520-1(config)# ca zeroize rsa

pix520-1(config)# sh ca mypubkey rsa
```

!--- The RSA key pairs are no longer available.
