[Introduction](#)

L'Algorithme de chiffrement optimisé pour le logiciel (SEAL) est un algorithme alternatif au Norme de chiffrement de données (DES), au triple DES (3DES), et au Norme AES (Advanced Encryption Standard). SCHELLEZ le cryptage utilise une clé de chiffrement 160-bit et a une incidence inférieure à la CPU une fois comparé à d'autres algorithmes articulés autour d'un logiciel. Ce document montre comment configurer un tunnel d'IPSec d'entre réseaux locaux (site à site) utilisant le JOINT.

[Conditions préalables](#)

[Conditions requises](#)

Aucune spécification déterminée n'est requise pour ce document.

[Composants utilisés](#)

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

- Routeurs de la gamme Cisco 7200 exécutant la version de logiciel 12.3(7)T de Cisco IOS®

Les informations contenues dans ce document ont été créées à partir des périphériques d'un environnement de laboratoire spécifique. Tous les périphériques utilisés dans ce document ont

démarré avec une configuration effacée (par défaut). Si votre réseau est opérationnel, assurez-vous que vous comprenez l'effet potentiel de toute commande.

Conventions

Pour plus d'informations sur les conventions utilisées dans ce document, reportez-vous aux [Conventions relatives aux conseils techniques Cisco](#).

Configurez

Cette section vous fournit des informations pour configurer les fonctionnalités décrites dans ce document.

Note: Utilisez l'outil [Command Lookup Tool](#) (clients [enregistrés](#) seulement) pour trouver plus d'informations sur les commandes utilisées dans ce document.

Diagramme du réseau

Ce document utilise la configuration réseau suivante :

Vérifiez

Cette section présente des informations que vous pouvez utiliser pour vous assurer que votre configuration fonctionne correctement.

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) ([clients enregistrés](#) uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

- **crypto map d'exposition** — Vérifie la configuration sur le routeur. Cette sortie est prise du routeur 1.

```
R1#show crypto map
Crypto Map "cisco" 10 ipsec-isakmp
Peer = 10.10.10.2
Extended IP access list 100
access-list 100 permit ip 172.18.124.0 0.0.0.255 20.20.20.0 0.0.0.255
Current peer: 10.10.10.2
Security association lifetime: 4608000 kilobytes/3600 seconds
PFS (Y/N): N
Transform sets={
cisco,
}
Interfaces using crypto map cisco:
Ethernet1/0
```

[Dépannez](#)

Cette section fournit des informations que vous pouvez utiliser pour dépanner votre configuration.

[Dépannage des commandes](#)

Certaines commandes **show** sont prises en charge par l'[Output Interpreter Tool](#) ([clients enregistrés](#) uniquement), qui vous permet de voir une analyse de la sortie de la commande show.

Note: Avant d'émettre des commandes de **débogage**, référez-vous aux [informations importantes sur des commandes de debug](#).

[ISAMP et debugs d'IPSec](#)

- **show debugging** — Affiche des informations au sujet des types d'élimination des imperfections qui sont activés pour votre routeur.

```
R1#show debugging
Cryptographic Subsystem:
Crypto ISAKMP debugging is on
Crypto IPSEC debugging is on
```

```

```

Commandes show

- **show crypto isakmp sa** - Affiche le protocole Internet Security Association Management Protocol (ISAKMP) Security Association (SA) établi entre les homologues.
R1#**show crypto isakmp sa**

```
dst src state conn-id slot
10.10.10.1 10.10.10.2 QM_IDLE 1 0
```

```
R2#show crypto isakmp sa
dst src state conn-id slot
10.10.10.1 10.10.10.2 QM_IDLE 1 0
```

- **show crypto ipsec sa** — Affiche IPsec SA construit entre les pairs.

```
R1#show crypto ipsec sa
interface: Ethernet1/0
Crypto map tag: cisco, local addr. 10.10.10.1
```

```

Limites avec le jeu de transformations d'ESP-joint

Il y a trois limites sur l'utilisation du jeu de transformations d'ESP-joint :

- Le jeu de transformations d'ESP-joint peut être utilisé seulement si aucun crypto accélérateur n'est présent. Cette limite est présente parce que le crypto accélérateur en cours n'implémente pas le jeu de transformations de cryptage de JOINT, et si un crypto accélérateur est présent, il manipulerait toutes les connexions d'IPSec qui sont établies en pourparlers avec l'IKE. Si un crypto accélérateur est présent, le logiciel de Cisco IOS permettra le jeu de transformations à être configuré, mais il avertira qu'il ne sera pas utilisé tant que le crypto accélérateur est activé.
- Le jeu de transformations d'ESP-joint peut être utilisé seulement en même temps qu'un jeu de

transformations d'authentification, à savoir un de ces derniers : **esp-md5-hmac**, **ESP-SHA-hmac**, **ah-md5-hmac**, ou **oh-SHA-hmac**. Cette limite est présente parce que le cryptage de JOINT est particulièrement faible quand il s'agit de protection contre des modifications du paquet chiffré. Par conséquent, pour empêcher une telle faiblesse, un jeu de transformations d'authentification est exigé (des jeux de transformations d'authentification sont conçus pour déjouer de telles attaques.). Si vous tentez de configurer un jeu de transformations d'IPSec utilisant le JOINT sans jeu de transformations d'authentification, une erreur est générée, et le jeu de transformations est rejeté.

- Le jeu de transformations d'ESP-joint ne peut pas être utilisé avec un crypto map manuellement introduit. Cette limite est présente parce qu'une telle configuration réutiliserait le même flot de clés pour chaque réinitialisation, qui compromettrait la Sécurité. En raison du problème de sécurité, une telle configuration est interdite. Si vous tentez de configurer un crypto map manuellement introduit avec un jeu de transformations basé sur joint, une erreur est générée, et le jeu de transformations est rejeté.
