Introduction

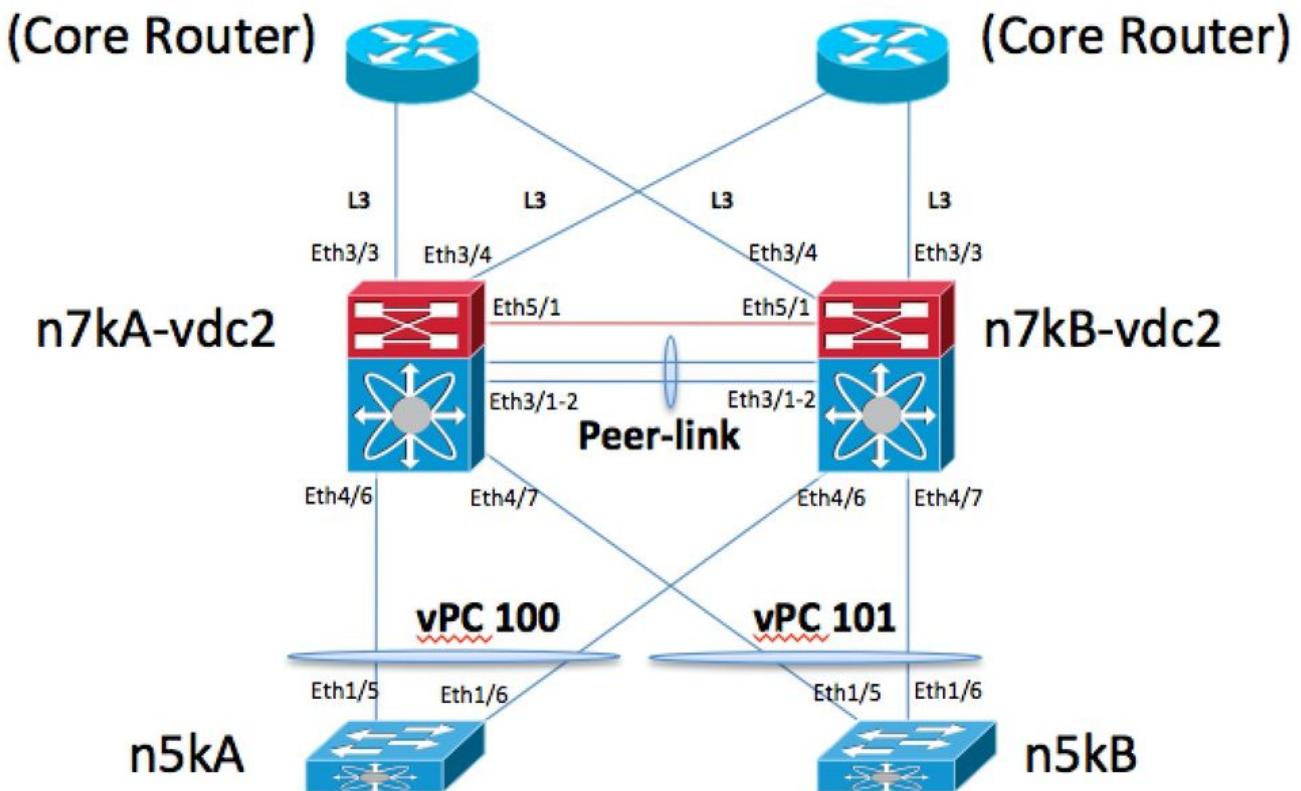

Ce document décrit le Suivi d'objets de vpc, pourquoi il est utilisé, et comment cela fonctionne.

Suivi d'objets de vpc

[Diagramme du réseau](#)

Voici le schéma de réseau utilisé pour cette démonstration :

vPC Object Tracking Topology

Le pair de vpc que le lien est l'Ethernet 5/1 du Port canalisé 1. est le lien de pair-keepalive de vpc. Il y a deux principaux Routeurs qui sont connectés par l'intermédiaire des liens e3/3 et e3/4 L3 /30 sur chaque case N7K. N5KA et N5KB simulent le vpc des Commutateurs L2 connecté sur le vpc 100 et le vpc 101. N7KA est le périphérique maître de vpc.

N7KB-vdc2#

le Suivi d'objets de vpc est utilisé dans un scénario de ce type. Vous avez un module M132 utilisé pour le lien de pair de vpc aussi bien que les liaisons ascendantes L3 au noyau. En cas où vous devez perdre le module M132 dû à une panne HW vous perdriez le vpc peer-link aussi bien que les liaisons ascendantes L3. Si c'étaient de se produire sur la case secondaire de vpc (N7KB) ce ne serait pas un problème car le pair primaire opérationnel succéderait interrompre les Ports canalisés de vpc et les interfaces de VLAN sur le secondaire opérationnel. Le problème est dans le cas d'une panne HW sur le périphérique maître opérationnel (N7KA). Si vous n'utilisiez pas le Suivi d'objets nous interromprions tous les Ports canalisés de vpc sur N7KB aussi bien que les interfaces de VLAN. Le lien de pair serait également en baisse. Vous n'auriez pas une manière de conduire le principal trafic dans nos VLAN de vpc dans ce scénario.

Le Suivi d'objets vient à bout ceci en réduisant le vpc sur le primaire opérationnel de sorte que nous n'entrions pas dans ce scénario où nous réduisons les interfaces de VLAN et les Ports canalisés de vpc sur la case qui a les liaisons ascendantes restantes au noyau.

Voici que vous voyez les messages de keepalive de pair de vpc utilisant l'ethanalyzer :

Maintenant vous êtes laissé dans le cet état. N7KA est le pair primaire de vpc, mais il cesse d'envoyer des messages de keepalive de pair de vpc à N7KB de sorte que N7KB ne disparaît pas interrompu. N7KB est le seul système qui a des liaisons ascendantes.

Note: e3/4 sur N7KB se connecte à un autre ports continu sur N7KA qui est pourquoi il est également descendu. Le point est que vous avez dépisté des interfaces sur N7KB et aucun sur N7KA ainsi il cesse de l'envoyer message à N7KB sur le lien de pair-keepalive.

Ethanalyzer a sorti de N7KA :

(Avis après que le Syslog TRACK_INTFS_DOWN nous n'envoient plus le pair-keepalives à N7KB, nous les recevons seulement de N7KB qui est 1.1.1.2)

Détails sur la panne de Pair-keepalive de vpc :

Réexécutez le test afin de voir ce qui se produit avec le lien de pair-keepalive.

Envoyez les keepalives bidirectionnel - actuellement tout est haut et opérationnel :

```

Maintenant vous voyez que seulement N7KB (1.1.1.2) envoie les messages de keepalive à N7KA (1.1.1.1) :

```

```

Voici que vous voyez que l'état sur N7KB affichant la keepalive de pair a manqué :
