## Introduction

Ce document décrit comment configurer et vérifier l'environnement multisite Ethernet VPN/Virtual Extensible LAN (EVPN/VxLAN) sur les commutateurs Cisco Nexus 9000. Elle implique l'appairage de fabric virtuel dans les noeuds leaf vPC.

Pour la connectivité de site à site, le concept de serveur de routage est expliqué.

## Conditions préalables

## Exigences

Cisco vous recommande de prendre connaissance des rubriques suivantes :

- VPN de couche 3 MPLS (Multiprotocol Label Switching)
- Protocole MP-BGP (Multiprotocol-Border Gateway Protocol)
- EVPN

## Composants utilisés

Les informations contenues dans ce document sont basées sur les versions de matériel et de logiciel suivantes :

Toutes les feuilles de site	N9K-C9336C-FX2	NXOS : 10.2(3)
Comm1_Spine1	N9K-C9364C	NXOS : 10.2(4)
Comm1_Spine2	N9K-C9364C	NXOS 9.3(5)
S1_Border Gateway1, S2_Border Gateway2, S2_Border Gateway1	N9K-C932C	NXOS : 9.3(9)
Passerelle en limite S1_2	N9K-C932C	NXOS : 10.2(4)
Serveur de routage	N9K-C9396PX	NXOS : 9.2(2)
Hôte 1	N3K-C3264C-E	NXOS : 9.3(5)
Hôte 2 et Hôte 3	N3K-C3264C-E	NXOS : 9.2(2)

The information in this document was created from the devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. Si votre réseau est en ligne, assurez-vous de bien comprendre l'incidence possible des commandes.

## Informations générales

Le data center est un pool de ressources qui contient la puissance de calcul, le stockage et les applications nécessaires pour prendre en charge n'importe quel environnement d'entreprise. Une planification adéquate de la conception de l'infrastructure du data center est essentielle. Ce document traite des exigences critiques, telles que les réseaux d'hôpitaux, et de la manière de satisfaire ou de dépasser ces exigences. Les déploiements d'infrastructures informatiques et de data centers modernes nécessitent une haute disponibilité (HA), la possibilité d'évoluer à un rythme plus rapide et des performances élevées en permanence.

Quelques exigences essentielles explorées dans l'espace de conception/d'architecture DC incluent :

- La densité des ports est améliorée par l'extendeur de fabric (FEX).
- La capacité de calcul est améliorée par la virtualisation matérielle (UCS).
- La bande passante de liaison ascendante de la couche d'accès est améliorée par port-

channel.

- La redondance au niveau du châssis est améliorée par vPC.
- Le fabric SDN (Software-Defined Networking) est amélioré par l'infrastructure ACI (Application Centric Infrastructure), qui automatise la couche sous-jacente et la couche de superposition dans un fabric.
- Le déploiement et la prise en charge rapides de nouveaux services sont améliorés par Data Center Network Manager (DCNM).
- La bande passante requise pour les applications longue distance est améliorée par la fibre noire ou le service de longueur d'onde.
- Avant tout, la redondance et l'évolutivité géographiques sont des attributs clés pour dynamiser/faire évoluer l'environnement du data center. VxLAN/EVPN multisite nous aide à avoir de meilleures solutions d'interconnexion de data center (DCI).

## En quoi le multisite est-il utile ?

La connectivité externe inclut la connexion du data center au reste du réseau : à Internet, au WAN ou au campus. Toutes les options fournies pour la connectivité externe sont compatibles avec les services partagés et se concentrent sur le transport de couche 3 (L3) vers les domaines de réseau externes.

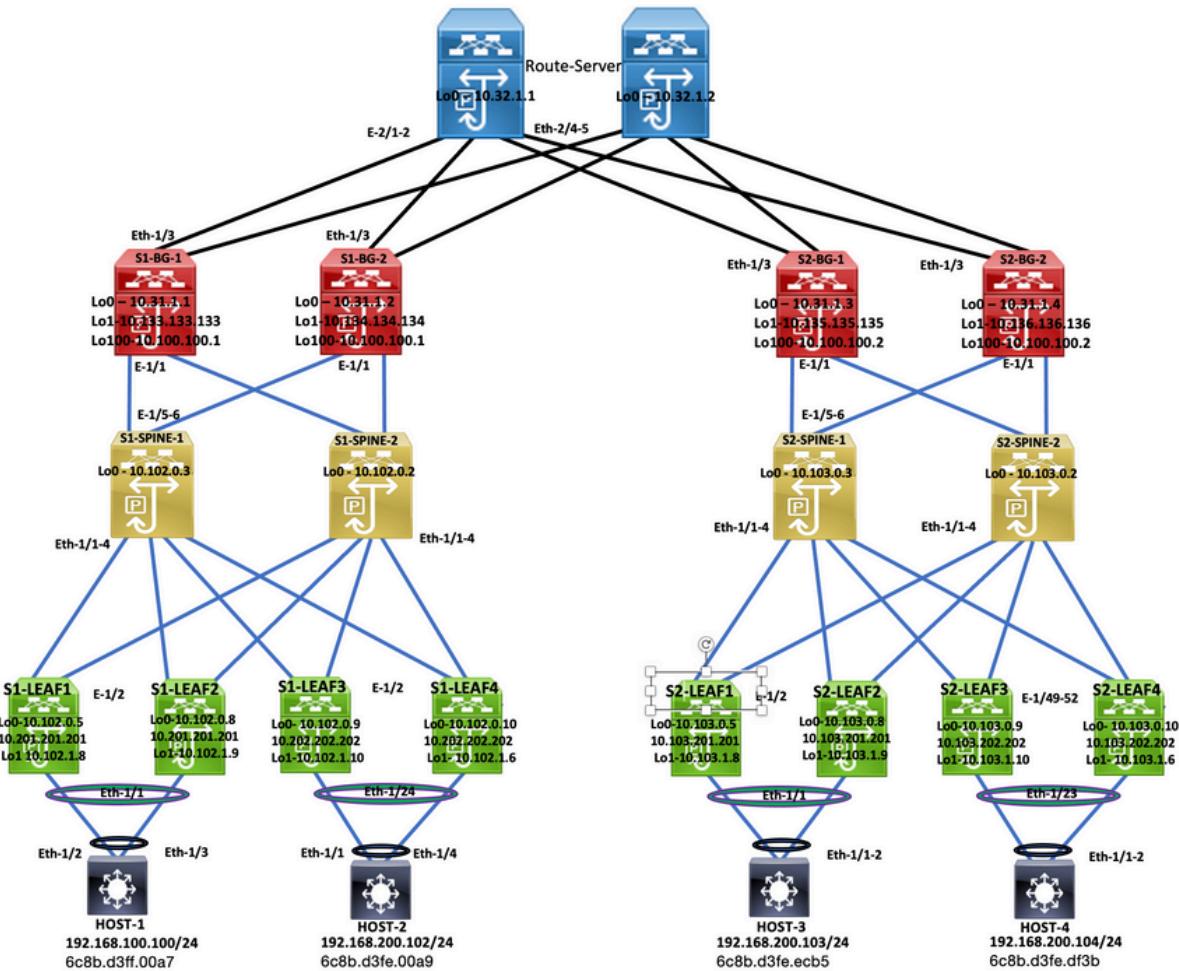

- EVPN est une solution VPN tout-en-un de nouvelle génération.
- Non seulement il fonctionne avec de nombreuses autres technologies VPN, mais il est également meilleur.
- Intégration avec les réseaux existants.
- Publicité/extension sélective :
  - Étendez la seule couche 2 (L2) : des VLAN/sous-réseaux spécifiques qui peuvent être étendus avec des routes de type 2.
  - Extension des seuls domaines L3 - des domaines L3 spécifiques peuvent être étendus avec des routes de type 5.
- Détection automatique du groupe de redondance avec les routes de type 4.
- Aliasage, retrait massif d'adresses, indication de multihébergement (MH) à horizon divisé (SH) avec routes de type 1.
- Détection automatique des points d'extrémité de tunnel de multidiffusion et du type de tunnel de multidiffusion (MCAST) avec des routes de type 3.

## Autres avantages

- Équilibrage de la charge de travail entre les data centers et les clouds.
- Réponse proactive aux perturbations - réduit les risques de catastrophes imminent, telles que les ouragans et les inondations.
- Maintenance et migrations du data center : événements planifiés sur une période donnée et intégration avec les réseaux existants.
- Sauvegarde et reprise après sinistre en tant que service (aaS).

## À propos de cette traduction

Cisco a traduit ce document en traduction automatisée vérifiée par une personne dans le cadre d'un service mondial permettant à nos utilisateurs d'obtenir le contenu d'assistance dans leur propre langue.

Il convient cependant de noter que même la meilleure traduction automatisée ne sera pas aussi précise que celle fournie par un traducteur professionnel.
