## Introduzione

Questo documento descrive e fornisce configurazioni di esempio per i metodi comuni di perdita di route VRF (Virtual Routing and Forwarding).

## Prerequisiti

### Requisiti

Cisco raccomanda la conoscenza dei seguenti argomenti:

- Border Gateway Protocol (BGP)
- Ridistribuzione del protocollo di routing
- VRF
- Software Cisco IOS® XE

Per ulteriori informazioni su questi argomenti, vedere:

[Ridistribisci protocolli di routing](#)

[Esempio di ridistribuzione reciproca tra configurazione EIGRP e BGP](#)

[Informazioni sulla ridistribuzione delle route OSPF in BGP](#)

## Componenti usati

Per questo documento, sono stati usati router con Cisco IOS® XE versioni 16.12.X e 17.X

Le informazioni discusse in questo documento fanno riferimento a dispositivi usati in uno specifico ambiente di emulazione. Su tutti i dispositivi menzionati nel documento la configurazione è stata ripristinata ai valori predefiniti. Se la rete è operativa, valutare attentamente eventuali conseguenze derivanti dall'uso dei comandi.

## Premesse

Il protocollo VRF consente a un router di gestire tabelle di routing separate per reti virtuali diverse. Quando sono necessarie eccezioni, la perdita di route VRF consente di instradare parte del traffico tra i VRF senza utilizzare route statiche.

## Scenario 1 - Perdita della route VRF tra BGP e IGP ( EIGRP )

Nello scenario 1 viene illustrato un esempio di perdita di route VRF tra BGP e EIGRP. Questo metodo può essere utilizzato per altri IGP.

### Esempio di rete

Il diagramma reticolare illustrato nell'immagine 1 mostra la topologia di livello 3 in cui è necessaria una perdita di percorso.

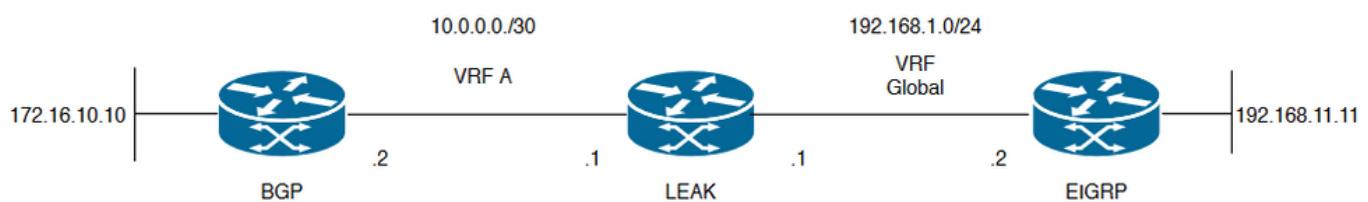

Immagine 1. Topologia route leaking per lo scenario 1

Il router "LEAK" ha un vicino BGP a un vicino nel VRF A e un vicino EIGRP nel VRF globale. La periferica 192.168.11.11 deve essere in grado di connettersi alla periferica 172.16.10.10 attraverso la rete.

La perdita del router non può effettuare il routing tra i due router perché i percorsi si trovano in VRF diversi. Queste tabelle di routing mostrano i percorsi correnti per VRF e indicano i percorsi che devono essere trafugati tra VRF globale e VRF A.

Tabelle di routing delle perdite:

## Tabella di routing EIGRP ( routing globale )

LEAK#**show ip route**

Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP  
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area

n - NAT, Ni - NAT inside, No - NAT outside, Nd - NAT DIA  
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2  
ia - IS-IS inter area, \* - candidate default, U - per-user static route  
H - NHRP, G - NHRP registered, g - NHRP registration summary  
o - ODR, P - periodic downloaded static route, l - LISP  
a - application route  
+ - replicated route, % - next hop override, p - overrides from PfR

Gateway of last resort is not set

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks

C 10.0.0.0/30 is directly connected, GigabitEthernet1

L 10.0.0.1/32 is directly connected, GigabitEthernet1

172.16.0.0/32 is subnetted, 1 subnets

**B 172.16.10.10 [200/0] via 10.0.0.2, 01:47:58** >> Route to be exchanged to the global routing table.

## Configurazione

Eseguire le procedure per creare la perdita tra le due tabelle di routing:

### Step 1.

Create route-maps to filter the routes to be injected in both routing tables.

LEAK(config)#**Route-map VRF\_TO\_EIGRP**

```
LEAK(config-route-map)#match ip address prefix-list VRF_TO_EIGRP
LEAK(config-route-map)#exit
!
Prefix-list created to match the host that is attached to the previous route-map configured.
!
ip prefix-list VRF_TO_EIGRP permit 172.16.10.10/32
```

or

```
LEAK(config)#Route-map VRF_TO_EIGRP
LEAK(config-route-map)# match ip address 10
LEAK(config-route-map)#exit
!
ACL created to match the host that is attached to the previous route-map.
!
LEAK#show ip access-lists 10
10 permit 172.16.10.10

LEAK(config)#Route-map EIGRP_TO_VRF
LEAK(config-route-map)#match ip address prefix-list EIGRP_TO_VRF
LEAK(config-route-map)#exit
LEAK(config)#
!
Prefix-list created to match the host that is attached to the previous route-map configured.
!
ip prefix-list EIGRP_TO_VRF permit 192.168.11.11/32
```

or

```
LEAK(config)#Route-map EIGRP_TO_VRF
LEAK(config-route-map)#match ip address 20
LEAK(config-route-map)#exit
LEAK(config)#
!
ACL created to match the host that is attached to the previous route-map.
!
LEAK#show ip access-list 20
10 permit 192.168.11.11
```

## Step 2.

Define the import/export maps and add the route-map names.

```
LEAK(config)#vrf definition A
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#import ipv4 unicast map EIGRP_TO_VRF >> Import the global routing table
routes at the VRF routing table.
LEAK(config-vrf-af)#export ipv4 unicast map VRF_TO_EIGRP >> Export the VRF routes to the Global
Routing Table.
LEAK(config-vrf-af)#end
```

## Step 3.

Proceed with the dual redistribution.

Redistribute EIGRP

```
LEAK(config)#router bgp 1
LEAK(config-router)#redistribute eigrp 1
LEAK(config-router)#end
```

Redistribution BGP

```
LEAK(config)#router eigrp 1
LEAK(config-router)#redistribute bgp 1 metric 100 1 255 1 1500
```

```
LEAK(config-router)#end
```

## Verifica

```
Routing table from VRF A
```

```
LEAK#show ip route vrf A
```

```
Routing Table: A
```

```
< Snip for resume >
```

```
10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, GigabitEthernet1
L 10.0.0.1/32 is directly connected, GigabitEthernet1
172.16.0.0/32 is subnetted, 1 subnets
B 172.16.10.10 [200/0] via 10.0.0.2, 00:58:53
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
B 192.168.1.0/24 is directly connected, 00:01:00, GigabitEthernet2
L 192.168.1.1/32 is directly connected, GigabitEthernet2
192.168.11.0/32 is subnetted, 1 subnets
B 192.168.11.11 [20/130816] via 192.168.1.2, 00:01:00, GigabitEthernet2 >> Route from global
routing table at VRF A routing table.
```

```
Global Routing Table (EIGRP)
```

```
LEAK#show ip route
```

```
< snip for resume >
```

```
Gateway of last resort is not set
```

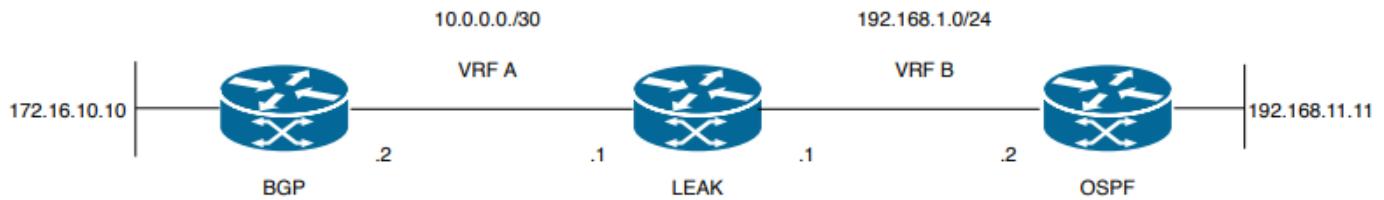

```
172.16.0.0/32 is subnetted, 1 subnets
B 172.16.10.10 [200/0] via 10.0.0.2 (A), 00:04:47 >> Route from VRF A at global routing table.
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C 192.168.1.0/24 is directly connected, GigabitEthernet2
L 192.168.1.1/32 is directly connected, GigabitEthernet2
192.168.11.0/32 is subnetted, 1 subnets
D 192.168.11.11 [90/130816] via 192.168.1.2, 01:03:35, GigabitEthernet2
LEAK#
```

## Scenario 2 - Perdita di VRF tra VRF A e VRF B

Nello scenario 2 viene descritta la perdita tra due VRF diversi.

### Esempio di rete

In questo documento viene utilizzata la seguente configurazione di rete:

**Immagine 2.** Topologia della perdita di percorso per lo scenario 2

Il router "LEAK" ha una connessione BGP con un router adiacente nel VRF A e un router adiacente OSPF nel VRF B. Il dispositivo 192.168.11.11 deve connettersi al dispositivo 172.16.10.10 attraverso la rete.

La perdita del router non può effettuare il routing tra i due router perché i percorsi si trovano in VRF diversi. Queste tabelle di routing mostrano i percorsi correnti per VRF e indicano i percorsi che devono essere trafugati tra VRF A e VRF B.

Tabella di routing delle perdite:

#### Tabella di routing VRF A

```
LEAK#show ip route vrf A

Routing Table: A
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, m - OMP
n - NAT, Ni - NAT inside, No - NAT outside, Nd - NAT DIA
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
H - NHRP, G - NHRP registered, g - NHRP registration summary
o - ODR, P - periodic downloaded static route, l - LISP
a - application route
+ - replicated route, % - next hop override, p - overrides from PfR

Gateway of last resort is not set

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, Ethernet0/0
L 10.0.0.2/32 is directly connected, Ethernet0/0
172.16.0.0/32 is subnetted, 1 subnets
B 172.16.10.10 [200/0] via 10.0.0.1, 00:03:08 >> Route to be exchange to routing table VRF B.
```

#### Tabella di routing VRF B

```
LEAK#show ip route vrf B

Routing Table: B
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2, m - OMP
n - NAT, Ni - NAT inside, No - NAT outside, Nd - NAT DIA
i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, * - candidate default, U - per-user static route
H - NHRP, G - NHRP registered, g - NHRP registration summary
```

```
o - ODR, P - periodic downloaded static route, l - LISP  
a - application route  
+ - replicated route, % - next hop override, p - overrides from PfR
```

Gateway of last resort is not set

```
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks  
C 192.168.1.0/24 is directly connected, Ethernet0/1  
L 192.168.1.2/32 is directly connected, Ethernet0/1  
192.168.11.0/32 is subnetted, 1 subnets  
o 192.168.11.11 [110/11] via 192.168.1.1, 00:58:45, Ethernet0/1 >> Route to be exchange to  
routing table VRF A.
```

## Configurazione

Per creare la perdita tra le due tabelle di routing, attenersi alla procedura descritta di seguito.

### Step 1.

Create route-maps to filter the routes to be injected in both routing tables.

```
LEAK(config)#Route-map VRFA_TO_VRFB  
LEAK(config-route-map)#match ip address prefix-list VRFA_TO_VRFB  
LEAK(config-route-map)#exit  
!  
Prefix-list created to match the host and IP segment that is attached to the previous route-map  
configured.  
!  
ip prefix-list VRFA_TO_VRFB permit 172.16.10.10/32  
ip prefix-list VRFA_TO_VRFB permit 10.0.0.0/30
```

or

```
LEAK(config)#Route-map VRFA_TO_VRFB  
LEAK(config-route-map)#match ip address 10  
LEAK(config-route-map)#exit  
!  
ACL created to match the host and IP segment that is attached to the previous route-map.  
!  
LEAK#show ip access-lists 10  
10 permit 172.16.10.10  
20 permit 10.0.0.0
```

```
LEAK(config)#Route-map VRFB_TO_VRFA  
LEAK(config-route-map)#match ip address prefix-list VRFB_TO_VRFA  
LEAK(config-route-map)#exit  
!  
Prefix-list created to match the host and IP segment that is attached to the previous route-map  
configured.  
!  
ip prefix-list VRFB_TO_VRFA permit 192.168.11.11/32  
ip prefix-list VRFB_TO_VRFA permit 192.168.1.0/24
```

or

```
LEAK(config)#Route-map VRFB_TO_VRFA  
LEAK(config-route-map)#match ip address 20  
LEAK(config-route-map)#exit  
!  
ACL created to match the host and IP segment that is attached to the previous route-map
```

configured.

```
!
LEAK#show ip access-lists 20
10 permit 192.168.11.11
20 permit 192.168.1.0
```

#### Step 2.

At the VRFs configure the import/export map, use the route-map names to leak the routes.

```
LEAK(config)#vrf definition A
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#export map VRFA_TO_VRFB
LEAK(config-vrf-af)#import map VRFB_TO_VRFA
```

```
LEAK(config)#vrf definition B
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#export map VRFB_TO_VRFA
LEAK(config-vrf-af)#import map VRFA_TO_VRFB
```

#### Step 3.

Add the route-target to import and export the route distinguisher from both VRFs.

```
! --- Current configuration for VRF A

vrf definition A
rd 1:2
!
address-family ipv4
route-target export 1:2
route-target import 1:1
exit-address-family

! --- Current configuration from VRF B

vrf definition B
rd 2:2
!
address-family ipv4
exit-address-family

! --- Import the routes from VRF B into VRF A

LEAK(config)#vrf definition A
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#route-target import 2:2

! --- Import routes from VRF A to VRF B and export routes from VRF B

LEAK(config-vrf-af)#vrf definition B
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#route-target import 1:2
LEAK(config-vrf-af)#route-target export 2:2
```

## Verifica

Check the Routing Tables

**VRF A Routing Table**

```
LEAK#show ip route vrf A
```

Routing Table: A

<Snip for resume >

```
10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, Ethernet0/0
L 10.0.0.2/32 is directly connected, Ethernet0/0
172.16.0.0/32 is subnetted, 1 subnets
B 172.16.10.10 [200/0] via 10.0.0.1, 00:07:20
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
B 192.168.1.0/24 is directly connected, 00:00:10, Ethernet0/1
L 192.168.1.2/32 is directly connected, Ethernet0/1
192.168.11.0/32 is subnetted, 1 subnets
B 192.168.11.11 [20/11] via 192.168.1.1 (B), 00:00:10, Ethernet0/1 >> Route from VRF B routing table at VRF A.
```

#### VRF B Routing Table

```
LEAK#show ip route vrf B
```

Routing Table: B

< Snip for resume >

```
10.0.0.0/30 is subnetted, 1 subnets
B 10.0.0.0 [200/0] via 10.0.0.1 (A), 00:00:15
172.16.0.0/32 is subnetted, 1 subnets
B 172.16.10.10 [200/0] via 10.0.0.1 (A), 00:00:15 >> Route from VRF A routing table at VRF B.
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
C 192.168.1.0/24 is directly connected, Ethernet0/1
L 192.168.1.2/32 is directly connected, Ethernet0/1
192.168.11.0/32 is subnetted, 1 subnets
O 192.168.11.11 [110/11] via 192.168.1.1, 01:05:12, Ethernet0/1
```

## Scenario 3 - Perdita di VRF tra OSPF ( VRF ) e EIGRP ( globale ) con BGP ( opzionale )

Nello scenario 3 viene descritta la perdita del percorso tra due IGP (VRF B e VRF globale).

### Esempio di rete

In questo documento viene utilizzata la seguente configurazione di rete:

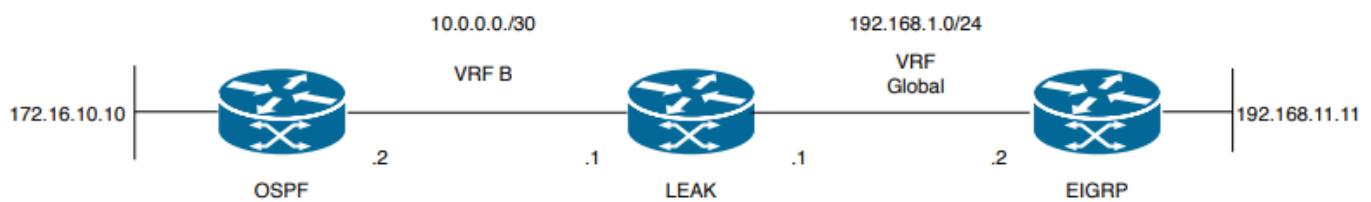

Immagine 3. Topologia della perdita di percorso per lo scenario 3

Il router "LEAK" ha un router adiacente OSPF a un router adiacente nel VRF B e un router

adiacente EIGRP nel VRF globale. La periferica 172.16.10.10 deve essere in grado di connettersi alla periferica 192.168.11.11 attraverso la rete.

Il router LEAK non è in grado di connettere questi due host. Queste tabelle di routing mostrano i percorsi correnti per VRF e indicano i percorsi che devono essere trafugati tra VRF B e VRF globale.

**Nota:** questa configurazione è presentata come un esempio per eseguire una perdita quando uno degli IGP si trova su un VRF, l'uso della ridistribuzione tra VRF e global VRF non consentito nei dispositivi.

Tabella di routing delle perdite:

### Tabella di routing EIGRP ( EIGRP )

```
LEAK#show ip route
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP

o - ODR, P - periodic downloaded static route, l - LISP
a - application route
+ - replicated route, % - next hop override, p - overrides from PfR

Gateway of last resort is not set
```

```

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, Ethernet0/0
L 10.0.0.2/32 is directly connected, Ethernet0/0
172.16.0.0/32 is subnetted, 1 subnets
O 172.16.10.10 [110/11] via 10.0.0.1, 01:43:45, Ethernet0/0 >> Route to be exchange from routing
table VRF B at global routing table.

```

## Configurazione

Per creare la perdita tra le due tabelle di routing, attenersi alla procedura descritta di seguito.

### Step 1.

Create route-maps for import and export to be injected in both routing tables.

```

LEAK(config)#Route-map OSPF_TO_EIGRP
LEAK(config-route-map)#match ip address prefix-list OSPF_TO_EIGRP
LEAK(config-route-map)#exit
!
Prefix-list created to match the host that is attached to the previous route-map configured.
!
ip prefix-list OSPF_TO_EIGRP permit 172.16.10.10/32
ip prefix-list OSPF_TO_EIGRP permit 10.0.0.0/30

or

LEAK(config)#Route-map OSPF_TO_EIGRP
LEAK(config-route-map)#match ip address 10
LEAK(config-route-map)#exit
!
ACL created to match the host that is attached to the previous route-map.
!
LEAK#show ip access-lists 10
10 permit 172.16.10.10
20 permit 10.0.0.0

LEAK(config)#Route-map EIGRP_TO OSPF
LEAK(config-route-map)#match ip address prefix-list EIGRP_TO OSPF
LEAK(config-route-map)#exit
!
Prefix-list created to match the host that is attached to the previous route-map configured.
!
ip prefix-list EIGRP_TO OSPF permit 192.168.11.11/32
ip prefix-list EIGRP_TO OSPF permit 192.168.1.0/24

or

LEAK(config)#Route-map EIGRP_TO OSPF
LEAK(config-route-map)#match ip address 20
LEAK(config-route-map)#exit
!
ACL created to match the host that is attached to the previous route-map.
!
LEAK#show ip access-lists 20
10 permit 192.168.11.11
20 permit 192.168.1.0/24

```

### Step 2.

Add the import/export maps in order to match the route-map names.

```

Current configuration
!
```

```

vrf definition B
rd 1:2
!
address-family ipv4
exit-address-family
!
!
LEAK(config-vrf)#vrf definition B
LEAK(config-vrf)#address-family ipv4
LEAK(config-vrf-af)#import ipv4 unicast map EIGRP_TO OSPF
LEAK(config-vrf-af)#export ipv4 unicast map OSPF_TO_EIGRP

```

#### **Step 3.**

To perform the leak is necessary to create a BGP process, in order to redistribute the IGPs protocols.

```

router bgp 1
bgp log-neighbor-changes
!
address-family ipv4 vrf B >> Include the address-family to inject VRF B routing table (OSPF)
!
exit-address-family

```

**Nota:** per evitare l'errore, verificare che per il VRF sia configurato un identificatore di route:  
 "%vrf B does not have "rd" configured, please configure "rd" before configuring import route-map"

#### **Step 4.**

Create a Dual Redistribution.

IGPs redistribution.

```

LEAK(config-router)#router bgp 1
LEAK(config-router)#redistribute eigrp 1
!
LEAK(config-router)#address-family ipv4 vrf B
LEAK(config-router-af)#redistribute ospf 1 match internal external 1 external 2
LEAK(config-router-af)#end

```

BGP Redistribution

```

LEAK(config)#router ospf 1 vrf B
LEAK(config-router)#redistribute bgp 1
!
LEAK(config-router)#router eigrp TAC
LEAK(config-router)#
LEAK(config-router)# address-family ipv4 unicast autonomous-system 1
LEAK(config-router-af)#
LEAK(config-router-af)# topology base
LEAK(config-router-af-topology)#redistribute bgp 1 metric 100 1 255 1 1500

```

## **Verifica**

Controllare le tabelle di routing

### **Tabella di routing globale**

```

LEAK#show ip route
<Snip for resume >
172.16.0.0/32 is subnetted, 1 subnets

```

```
B 172.16.10.10 [20/11] via 10.0.0.1, 00:14:48, Ethernet0/0 >> Route from VRF B routing table at
global routing table ( EIGRP ).  
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks  
C 192.168.1.0/24 is directly connected, Ethernet0/1  
L 192.168.1.1/32 is directly connected, Ethernet0/1  
192.168.11.0/32 is subnetted, 1 subnets  
D 192.168.11.11 [90/1024640] via 192.168.1.2, 02:16:51, Ethernet0/1
```

## Tabella di routing VRF B

```
LEAK#show ip route vrf B
Routing Table: B

<Snip for resume >

10.0.0.0/8 is variably subnetted, 2 subnets, 2 masks
C 10.0.0.0/30 is directly connected, Ethernet0/0
L 10.0.0.2/32 is directly connected, Ethernet0/0
172.16.0.0/32 is subnetted, 1 subnets
O 172.16.10.10 [110/11] via 10.0.0.1, 00:34:25, Ethernet0/0
192.168.1.0/24 is variably subnetted, 2 subnets, 2 masks
B 192.168.1.0/24 is directly connected, 00:08:51, Ethernet0/1
L 192.168.1.1/32 is directly connected, Ethernet0/1
192.168.11.0/32 is subnetted, 1 subnets
B 192.168.11.11 [20/1024640] via 192.168.1.2, 00:08:51, Ethernet0/1 >> Route from global routing
table ( EIGRP ) at VRF B routing table.
```
