[Introduzione](#)

Questo documento spiega come supportare un client PPPoE (Point-to-Point Protocol over Ethernet) su router Cisco IOS® connessi tramite un'interfaccia Ethernet a un modem DSL o alle apparecchiature DSL della sede del cliente (CPE) di un altro fornitore.

Gli ISP spesso forniscono ai clienti un modem DSL dotato di un'interfaccia Ethernet per il collegamento al segmento Ethernet del cliente e di un'altra interfaccia per la connettività della linea DSL. In questo caso, il modem DSL funge da bridge solo se il CPE non è configurabile per alcuna connettività IP o funzionalità avanzate tramite DSL. Ciò limita la connettività a un solo PC client PPPoE. Con l'aggiunta di un router Cisco IOS connesso all'interfaccia Ethernet del modem DSL, è possibile eseguire la funzione PPPoE Client IOS sul router Cisco. In questo modo è possibile connettere più PC sul segmento Ethernet collegato al router Cisco IOS. Con l'uso del router Cisco IOS, è possibile migliorare le connettività DSL e tutte le funzionalità di IOS, ad esempio la sicurezza, NAT (Network Address Translation) e DHCP (Dynamic Host Configuration Protocol), per gli host interni.

La funzionalità PPPoE consente di avviare una sessione PPP su un client Ethernet di bridging semplice. La sessione viene trasportata sul collegamento ATM tramite frame Ethernet con bridge incapsulati. È possibile terminare la sessione presso un ufficio centrale del vettore di scambio locale o presso un punto di presenza dell'ISP.

[Prerequisiti](#)

[Requisiti](#)

Nessun requisito specifico previsto per questo documento.

Componenti usati

Le informazioni fornite in questo documento si basano sulle seguenti versioni software e hardware:

- Software Cisco 827-4V CPE IOS release 12.1(1)XB
- Router Cisco 2611 con software Cisco IOS versione 12.2(2)T1
- Cisco 6400 Universal Access Concentrator (UAC) con software Cisco IOS versione 12.1(5)DC1 image

Le informazioni discusse in questo documento fanno riferimento a dispositivi usati in uno specifico ambiente di emulazione. Su tutti i dispositivi menzionati nel documento la configurazione è stata ripristinata ai valori predefiniti. Se la rete è operativa, valutare attentamente eventuali conseguenze derivanti dall'uso dei comandi.

Convenzioni

Per ulteriori informazioni sulle convenzioni usate, consultare il documento [Cisco sulle convenzioni nei suggerimenti tecnici](#).

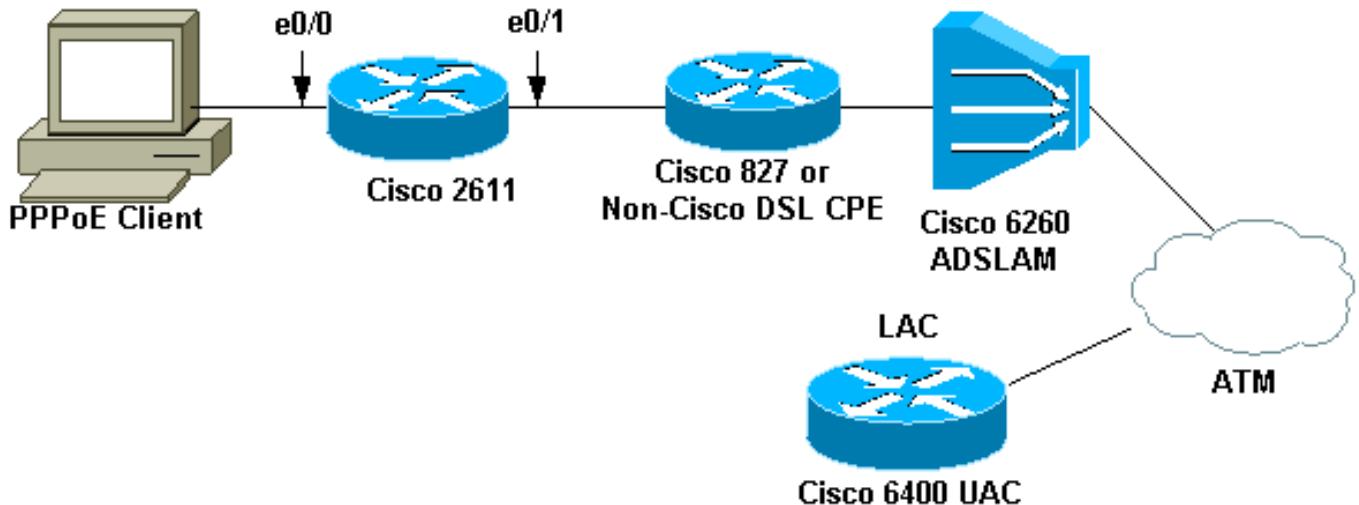

Configurazione

In questa sezione vengono presentate le informazioni necessarie per configurare le funzionalità descritte più avanti nel documento.

Nota: per ulteriori informazioni sui comandi menzionati in questo documento, usare lo [strumento di ricerca dei comandi](#) (solo utenti [registrati](#)).

Esempio di rete

Nel documento viene usata l'impostazione di rete mostrata nel diagramma.

Nota: in questo documento, la connessione del client PPPoE viene avviata dal router Cisco. Questo è il router Cisco 2611 in questa configurazione. Il router Cisco 827 nel diagramma

rappresenta il CPE DSL non Cisco.

Configurazioni

Nel documento vengono usate queste configurazioni.

Verifica

Le informazioni contenute in questa sezione permettono di verificare che la configurazione funzioni correttamente.

Alcuni comandi **show** sono supportati dallo [strumento Output Interpreter \(solo utenti registrati\)](#); lo [strumento permette di visualizzare un'analisi dell'output del comando show](#).

- **show vpdn session all**: visualizza le informazioni sulla sessione VPDN. Queste informazioni includono le statistiche relative a interfaccia, tunnel, nome utente, pacchetti, stato e finestra.
- **show interface ethernet 0/1**: visualizza le informazioni sull'interfaccia Ethernet sul router.
- **show interfaces dialer 1**: visualizza le informazioni sulla dialer sul router.
- **show ip local pool nrp1**: visualizza le informazioni sul pool locale ip.
- **show ip route**: visualizza le informazioni sul router IP.

Questo è l'output del comando **show vpdn session all** su Cisco 2611.

```

pooh#show vpdn session all
%No active L2TP tunnels
%No active L2F tunnels
%No active PPTP tunnels
PPPoE Session Information Total tunnels 1 sessions 1
session id: 1
!---- Local MAC address. local MAC address: 0030.9424.af21, remote MAC address: 0050.736f.4c37
virtual access interface: Vil, outgoing interface: Et0/1 599 packets sent, 599 received 9202
bytes sent, 8154 received !---- Verify that the outgoing interface for the PPPoE session !--- is
Ethernet0/1 and the local MAC address that displays is the !--- MAC address of Ethernet0/1. The
remote MAC address that displays !--- is the MAC address of the Aggregator device (6400). !---
You can see it on the 6400 as the local MAC address in the !--- show vpdn session on the 6400.

```

Questo è l'output del comando **show interface ethernet 0/1** su Cisco 2611.

```
pooh#show interface ethernet 0/1
Ethernet0/1 is up, line protocol is up
Hardware is AmdP2, address is 0030.9424.af21 (bia 0030.9424.af21)
MTU 1500 bytes, BW 10000 Kbit, DLY 1000 usec,
reliability 255/255, txload 1/255, rxload 1/255
Encapsulation ARPA, loopback not set
Keepalive set (10 sec)
ARP type: ARPA, ARP Timeout 04:00:00
Last input 00:00:40, output 00:00:01, output hang never
Last clearing of "show interface" counters never
Queueing strategy: fifo
