## [Introduzione](#)

In questo documento vengono illustrati alcuni esempi di configurazione del router e del server per la richiamata PPP (Point-to-Point Protocol) con RADIUS.

## [Operazioni preliminari](#)

### [Convenzioni](#)

Per ulteriori informazioni sulle convenzioni usate, consultare il documento [Cisco sulle convenzioni nei suggerimenti tecnici](#).

### [Prerequisiti](#)

Per eseguire questa operazione:

- Eseguire il test iniziale con l'autenticazione e la richiamata locali, ovvero rimuovere il comando **aaa new-model**. Se il callback non funziona con l'autenticazione locale, non funzionerà con RADIUS. Vedere [questo esempio](#) di utilizzo dell'autenticazione locale.
- Eseguire ulteriori test di autenticazione PPP con RADIUS senza callback. Se gli utenti non riescono a eseguire l'autenticazione e/o l'autorizzazione senza richiamata, l'autenticazione e l'autorizzazione non funzioneranno con la richiamata.
- Una volta completata l'autenticazione locale per la richiamata e l'autenticazione PPP con RADIUS, aggiungere le informazioni dell'utente locale sul router (ad esempio la stringa di connessione di richiamata) al profilo dell'utente sul server.

**Nota:** il client in questi test era un server NT 4.0, DUN, configurato come di consueto per una connessione PPP, ma con l'opzione **Abilita estensioni PPP/LCP** selezionata in **Server** per consentire la richiamata Microsoft. Il callback Microsoft è supportato nel software Cisco IOS® versione 11.3.2.T e successive. Per informazioni specifiche su come configurare il PC con Microsoft Windows per la richiamata automatica, visitare il sito Web Microsoft.

## Componenti usati

Questa configurazione è stata sviluppata e testata utilizzando le versioni software seguenti.

- Software Cisco IOS release 11.3.2.T e successive
- CiscoSecure ACS UNIX 2.x o CiscoSecure ACS per Windows 2.x o versioni successive

## Configurazione

In questa sezione vengono presentate le informazioni necessarie per configurare le funzionalità descritte più avanti nel documento.

**Nota:** per ulteriori informazioni sui comandi menzionati in questo documento, usare lo [strumento di ricerca dei comandi](#) (solo utenti [registrati](#)).

## Esempio di rete

Questo documento utilizza le impostazioni di rete mostrate nel diagramma sottostante.

## Configurazione server - CiscoSecure NT

- L'utente ottiene la password e la password di conferma.

- In Impostazioni gruppo: attribute 006 Service-Type = Attributo con frame 007 Framed-Protocol = PPP
- Nell'ultima casella visualizzata, Cisco RADIUS Attributes, selezionare [009\001 - AV-Pair] e, sotto, immettere: `lcp:callback-dialstring=20367`

## [Configurazione server - Cisco Secure UNIX](#)

```
rtp-berry# ./ViewProfile -p 9900 -u callback
User Profile Information
user = callback{
profile_id = 34
profile_cycle = 1
radius=Cisco {
check_items= {
2="callback"
}
reply_attributes= {
6=2
7=1
9,1="lcp:callback-dialstring=20367"
}
}
}
```

## [Configurazione server - Livingston RADIUS \(con Cisco av-pair\)](#)

```
callback2 Password = "callback2"
User-Service-Type = Framed-User,
Framed-Protocol = PPP,
cisco-avpair = "lcp:callback-dialstring=20367"
```

## [Configurazioni](#)

## Verifica

Attualmente non è disponibile una procedura di verifica per questa configurazione.

## Risoluzione dei problemi

Le informazioni contenute in questa sezione permettono di risolvere i problemi relativi alla configurazione.

### Comandi per la risoluzione dei problemi

**Nota:** prima di usare i comandi di **debug**, consultare le [informazioni importanti sui comandi di debug](#).

- **debug aaa authentication** Visualizza informazioni sull'autenticazione AAA.
- **debug aaa authorization** - Visualizza le informazioni sull'autorizzazione AAA.
- **debug callback:** visualizza gli eventi di callback quando il router utilizza un modem e uno script di chat per richiamare una linea terminale.
- **debug chat:** visualizza i caratteri inviati tra il server di accesso alla rete (NAS) e il PC. Uno script di chat è un insieme di coppie di stringhe di invio previsto che definiscono la procedura di handshake tra dispositivi DTE (Data Terminal Equipment)-DTE o DCE (Data Communications Equipment).
- **debug modem** - Osservare l'attività della linea del modem su un server di accesso.
- **debug ppp negotiation:** visualizza i pacchetti PPP trasmessi durante l'avvio del protocollo PPP, in cui le opzioni PPP vengono negoziate.
- **debug ppp authentication:** visualizza i messaggi del protocollo di autenticazione, inclusi gli scambi di pacchetti Challenge Authentication Protocol (CHAP) e gli scambi PAP (Password

Authentication Protocol).

- **debug radius**: visualizza informazioni di debug dettagliate associate a RADIUS.

## Output di esempio del comando debug

```
General OS:
Modem control/process activation debugging is on
AAA Authentication debugging is on
AAA Authorization debugging is on
PPP:
PPP protocol negotiation debugging is on
Chat Scripts:
Chat scripts activity debugging is on
Callback:
Callback activity debugging is on
Radius protocol debugging is on

## [Callback PPP con numero specificato dall'utente](#)

Gli esempi precedenti erano relativi alla richiamata a un numero predefinito (specificato nel server). Il callback può essere eseguito anche con un numero specificato dall'utente; ovvero il numero di richiamata viene specificato come null nel server di autenticazione. In questo modo, il router chiederà all'utente un numero di richiamata. Anche in questo caso, il test iniziale deve essere eseguito con la richiamata locale specificata. Se il callback locale e una stringa di callback null non funzionano, ovvero rimuovono il comando **aaa new-model**, il callback RADIUS non funzionerà. Per specificare una stringa di callback null locale per il router:

```
username callback callback-dialstring "" password 0 callback
```

Sul PC, in Accesso remoto (server Windows NT), Preferenze utente, selezionare la casella **Richiamata - potrebbe essere necessario chiedere conferma della chiamata se il server offre**. Una volta autenticato l'utente, sul PC viene visualizzata una finestra che indica "Richiamata - È stato inserito "Impostato dal chiamante", seguito dal resto del messaggio e quindi "Immettere il numero di telefono del modem".

## [Configurazioni server](#)

### [Configurazione server - CiscoSecure NT](#)

- L'utente ottiene la password e la password di conferma.
- In Impostazioni gruppo: attribute 006 Service-Type = Attributo con frame 007 Framed-Protocol = PPP
- Nell'ultima casella visualizzata, Cisco RADIUS Attributes, selezionare [009\001 - AV-Pair] e, sotto, immettere: lcp:callback-dialstring=

## Configurazione server - Cisco Secure UNIX

```
rtp-berry# ./ViewProfile -p 9900 -u callback
User Profile Information
user = callback{
profile_id = 34
profile_cycle = 1
radius=Cisco {
check_items= {
2="callback"
}
reply_attributes= {
6=2
7=1
9,1="lcp:callback-dialstring="
}
}
}
```

## Configurazione server - Livingston RADIUS

```
callback2 Password = "callback2"
User-Service-Type = Framed-User,
Framed-Protocol = PPP,
cisco-avpair = "lcp:callback-dialstring="
```
