[Informazioni correlate](#)

[Introduzione](#)

In alcuni ambienti, potrebbe essere necessario raggruppare più collegamenti seriali in modo che funzionino come un unico collegamento con larghezza di banda aggregata. Questo documento descrive come configurare i router Cisco 4500 in modo che includano quattro interfacce seriali con un'interfaccia di modello virtuale.

Questa configurazione può essere utilizzata per i router connessi su linee affittate o per i router che dispongono dell'unità CSU/DSU (Channel Service Unit). A seconda delle esigenze, è possibile aggiungere ulteriori funzionalità alla configurazione.

[Prerequisiti](#)

[Requisiti](#)

Nessun requisito specifico previsto per questo documento.

[Componenti usati](#)

Le informazioni fornite in questo documento si basano sulle versioni software e hardware riportate di seguito.

- Router Cisco 4500 in un ambiente lab non configurato.

- Cisco IOS® versione 12.2(10b) era in esecuzione su entrambi i router.

Le informazioni discusse in questo documento fanno riferimento a dispositivi usati in uno specifico ambiente di emulazione. Su tutti i dispositivi menzionati nel documento la configurazione è stata ripristinata ai valori predefiniti. Se la rete è operativa, valutare attentamente eventuali conseguenze derivanti dall'uso dei comandi.

Prodotti correlati

Questa configurazione può essere utilizzata anche con le seguenti versioni hardware e software.

- Due router qualsiasi con quattro interfacce seriali ciascuna.
- È possibile utilizzare interfacce seriali WIC-1T e WIC-2T.

Convenzioni

Per ulteriori informazioni sulle convenzioni usate, consultare il documento [Cisco sulle convenzioni nei suggerimenti tecnici](#).

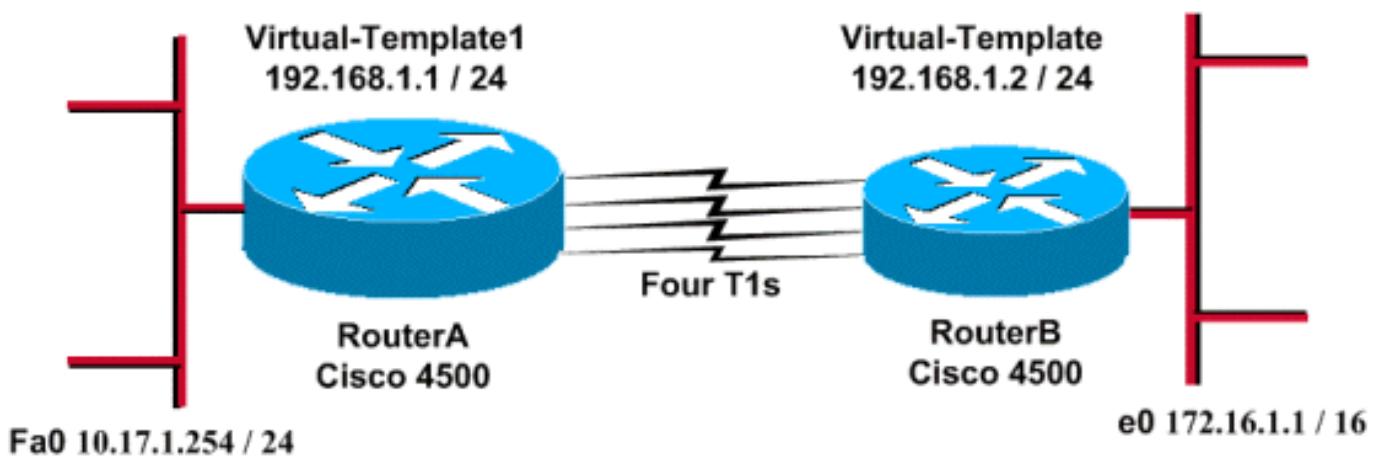

Configurazione

In questa sezione vengono presentate le informazioni necessarie per configurare le funzionalità descritte più avanti nel documento.

Nota: per ulteriori informazioni sui comandi menzionati in questo documento, usare lo [strumento di ricerca dei comandi](#) (solo utenti [registrati](#)).

Esempio di rete

Questo documento utilizza le impostazioni di rete mostrate nel diagramma sottostante.

Configurazioni

Questa configurazione è stata testata con il software Cisco IOS versione 12.2(10b) sui router serie 4500. Gli stessi concetti di configurazione si applicano a una topologia di router simile o ad altre

versioni di Cisco IOS.

Questo documento utilizza le configurazioni mostrate di seguito.

RouterA

```

Configurare quanto segue per implementare la configurazione precedente:

- multilink virtual-template
- interface modello-virtuale
- PPP multilink in ciascuna delle interfacce seriali in cui deve essere eseguito il bundling.
- RIP come protocollo di routing IP

Il loopback 0 dell'interfaccia è configurato in modo da non causare mai errori e il **loopback 0 senza**

numero ip migliora il bundling di più di cinque interfacce seriali con lo stesso indirizzo IP.

Quando tutte le interfacce seriali sono attive e il traffico utente deve essere inviato, Multilink PPP crea un'interfaccia di accesso virtuale e viene eseguita la negoziazione PPP. La configurazione per questa interfaccia di accesso virtuale viene duplicata dal modello virtuale. Il numero di interfacce seriali attive è incluso in questa interfaccia di accesso virtuale e viene creata una larghezza di banda aggregata.

Verifica

Le informazioni contenute in questa sezione permettono di verificare che la configurazione funzioni correttamente.

Alcuni comandi **show** sono supportati dallo [strumento Output Interpreter \(solo utenti registrati\)](#); lo strumento permette di visualizzare un'analisi dell'output del comando **show**.

- **show ip route**
- **show ip rip database**
- **mostra connessione multipla ppp**
- **show interface virtual-access 1**

```
RouterA#show ip route
```

    0 carrier transitions

```

Risoluzione dei problemi

Le informazioni contenute in questa sezione permettono di risolvere i problemi relativi alla configurazione.

Comandi per la risoluzione dei problemi

Alcuni comandi **show** sono supportati dallo [strumento Output Interpreter \(solo utenti registrati\)](#); lo strumento permette di visualizzare un'analisi dell'output del comando **show**.

Nota: prima di usare i comandi di **debug**, consultare le [informazioni importanti sui comandi di debug](#).

- **debug ppp negotiation**: per vedere se un client sta passando una negoziazione PPP; questo comando viene utilizzato per verificare la presenza di una negoziazione degli indirizzi.
- **debug ppp authentication**: consente di verificare se un client sta passando l'autenticazione. Se si usa una versione del software Cisco IOS precedente alla 11.2, usare il comando **debug ppp chap**.
- **debug ppp error**: consente di visualizzare gli errori di protocollo e le statistiche sugli errori associate alla negoziazione e al funzionamento della connessione PPP.
- **debug vtemplate**: per visualizzare la copia del modello virtuale per creare un'interfaccia di accesso virtuale.
- **debug degli eventi di connessione multipla ppp** - Per visualizzare il debug degli eventi di connessione multipla PPP. Visualizza informazioni sugli eventi che interessano i gruppi di connessione multipla.
- **show ppp multilink**: consente di visualizzare i membri del fascio di connessione multipla.

I router Cisco 4500 hanno ottenuto le seguenti uscite. Mostrano i router che stabiliscono una connessione PPP multilink.

```
RouterA#debug vtemplate
