

CVP "Verzend naar VRU" en "Run Ext Script"-fouten

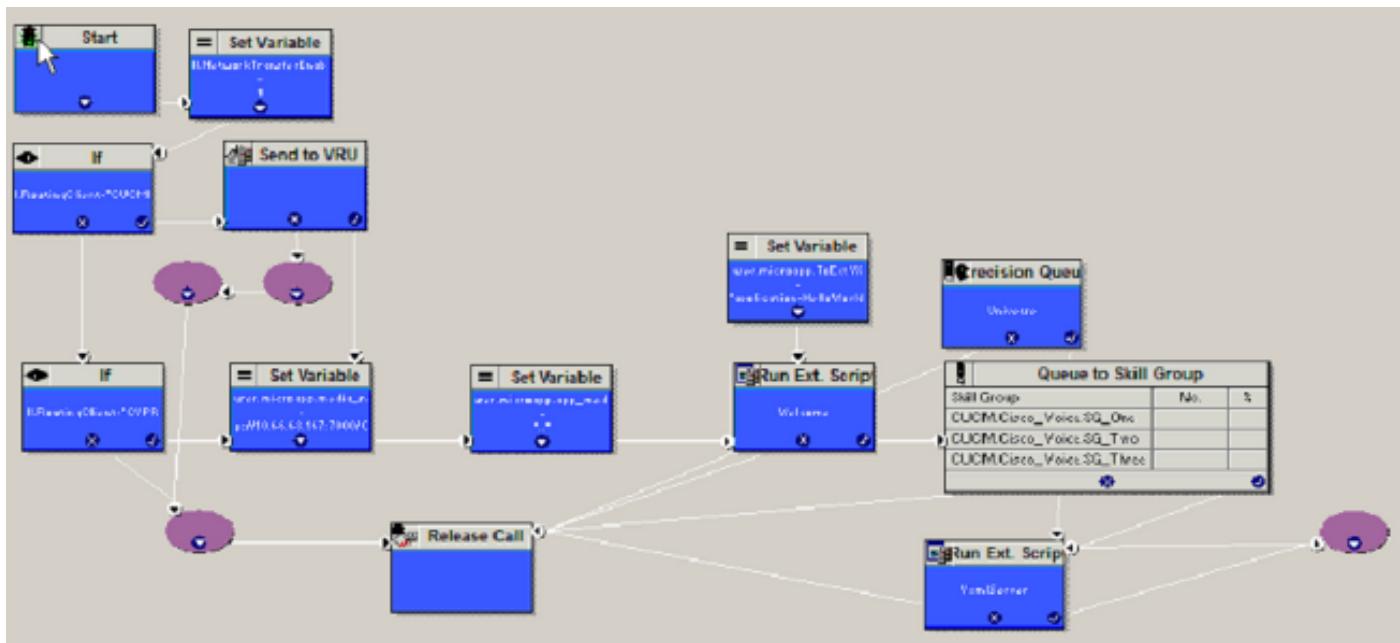

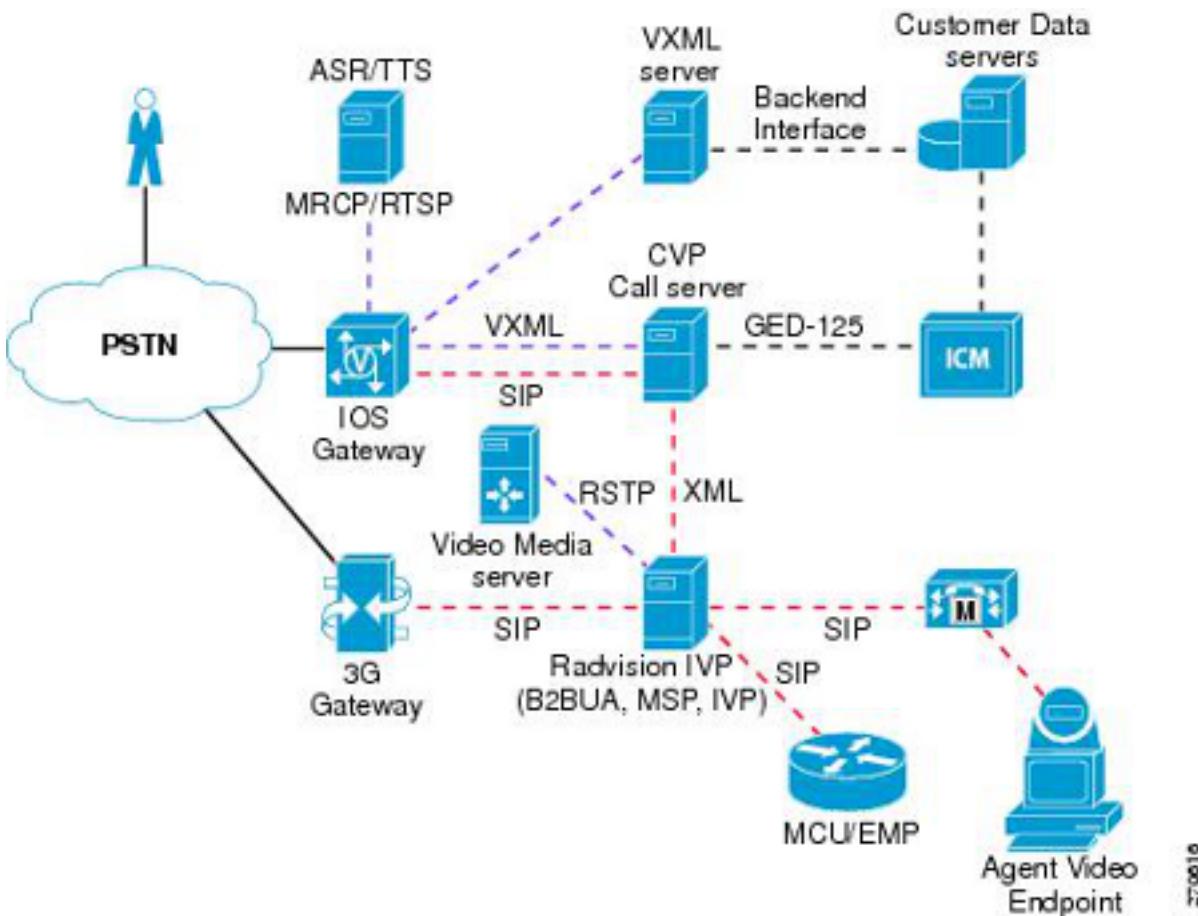

Inleiding

Dit document beschrijft de fouten "Verzend naar VRU" en "Uitgebreid script uitvoeren". De gevuldte benadering wordt predictieve probleemoplossing genoemd. Door problemen oplossen bij de voorspellingen zult u op de hoogte worden gebracht van het probleem dat is gebaseerd op de weblogs, het verwante gedrag en de manier waarop u het best het probleem kunt aanpakken.

In implementaties van Customer Voice Portal (CVP) komen zeer veel gevallen van gespreksfouten voor bij het knooppunt "Verzend naar VRU" of "Uitloopscript". Hoewel het slechts één knooppunt is in Intelligent Contact Management (ICM), zijn er veel signaleringsgebeurtenissen die moeten voorkomen op CVP, de Voice XML (VXML)-gateway en/of de VXML-server. De configuratie van een aantal plaatsen moet correct worden voltooid. De meeste mislukkingen gebeuren door verkeerde configuratie of een mislukking buiten de ICM. Zodra u bekend bent met de meest gebruikelijke configuratieproblemen en/of het falen in apparaten, is het gemakkelijker om echte problemen in productienetwerken in te lossen.

Netwerkdiagrammen

"Verzend naar VRU" en/of "run Ext Script" met CVP

Achtergrond van "Verzend naar VRU" of "Uitloopsscripts"

Wanneer een oproep op ICM via de CVP, de Cisco Unified Communications Manager (CUCM) of een andere PG (PG) binnenkomt, heeft ICM wellicht een behandeling van de Voice Response Unit (VRU) nodig om mededelingen af te spelen en gebruikersinput te verzamelen. Om dit te doen, moet ICM eerst de vraag naar het netwerk VRU verzenden. Alleen het netwerk VRU kan aankondigingen afspelen en gebruikersinput verzamelen. Dus als een oproep afkomstig is van een Public Switched Telephony Network (PSTN) naar ICM via de CVP of CUCM, moet ICM het "Send to VRU"-knooppunt gebruiken om de oproep naar een netwerk VRU te verzenden. Er zijn

bepaalde knooppunten die impliciet "Verzend naar VRU" hebben, zoals "Uitsluitend script uitvoeren" of "Wachtrij naar Skill Group". Zodra de oproep bij het netwerk VRU aankomt, voert ICM dan het "Extern script draaien" knooppunt uit.

Hoe ICM identificeert welke VRU moet gebruiken

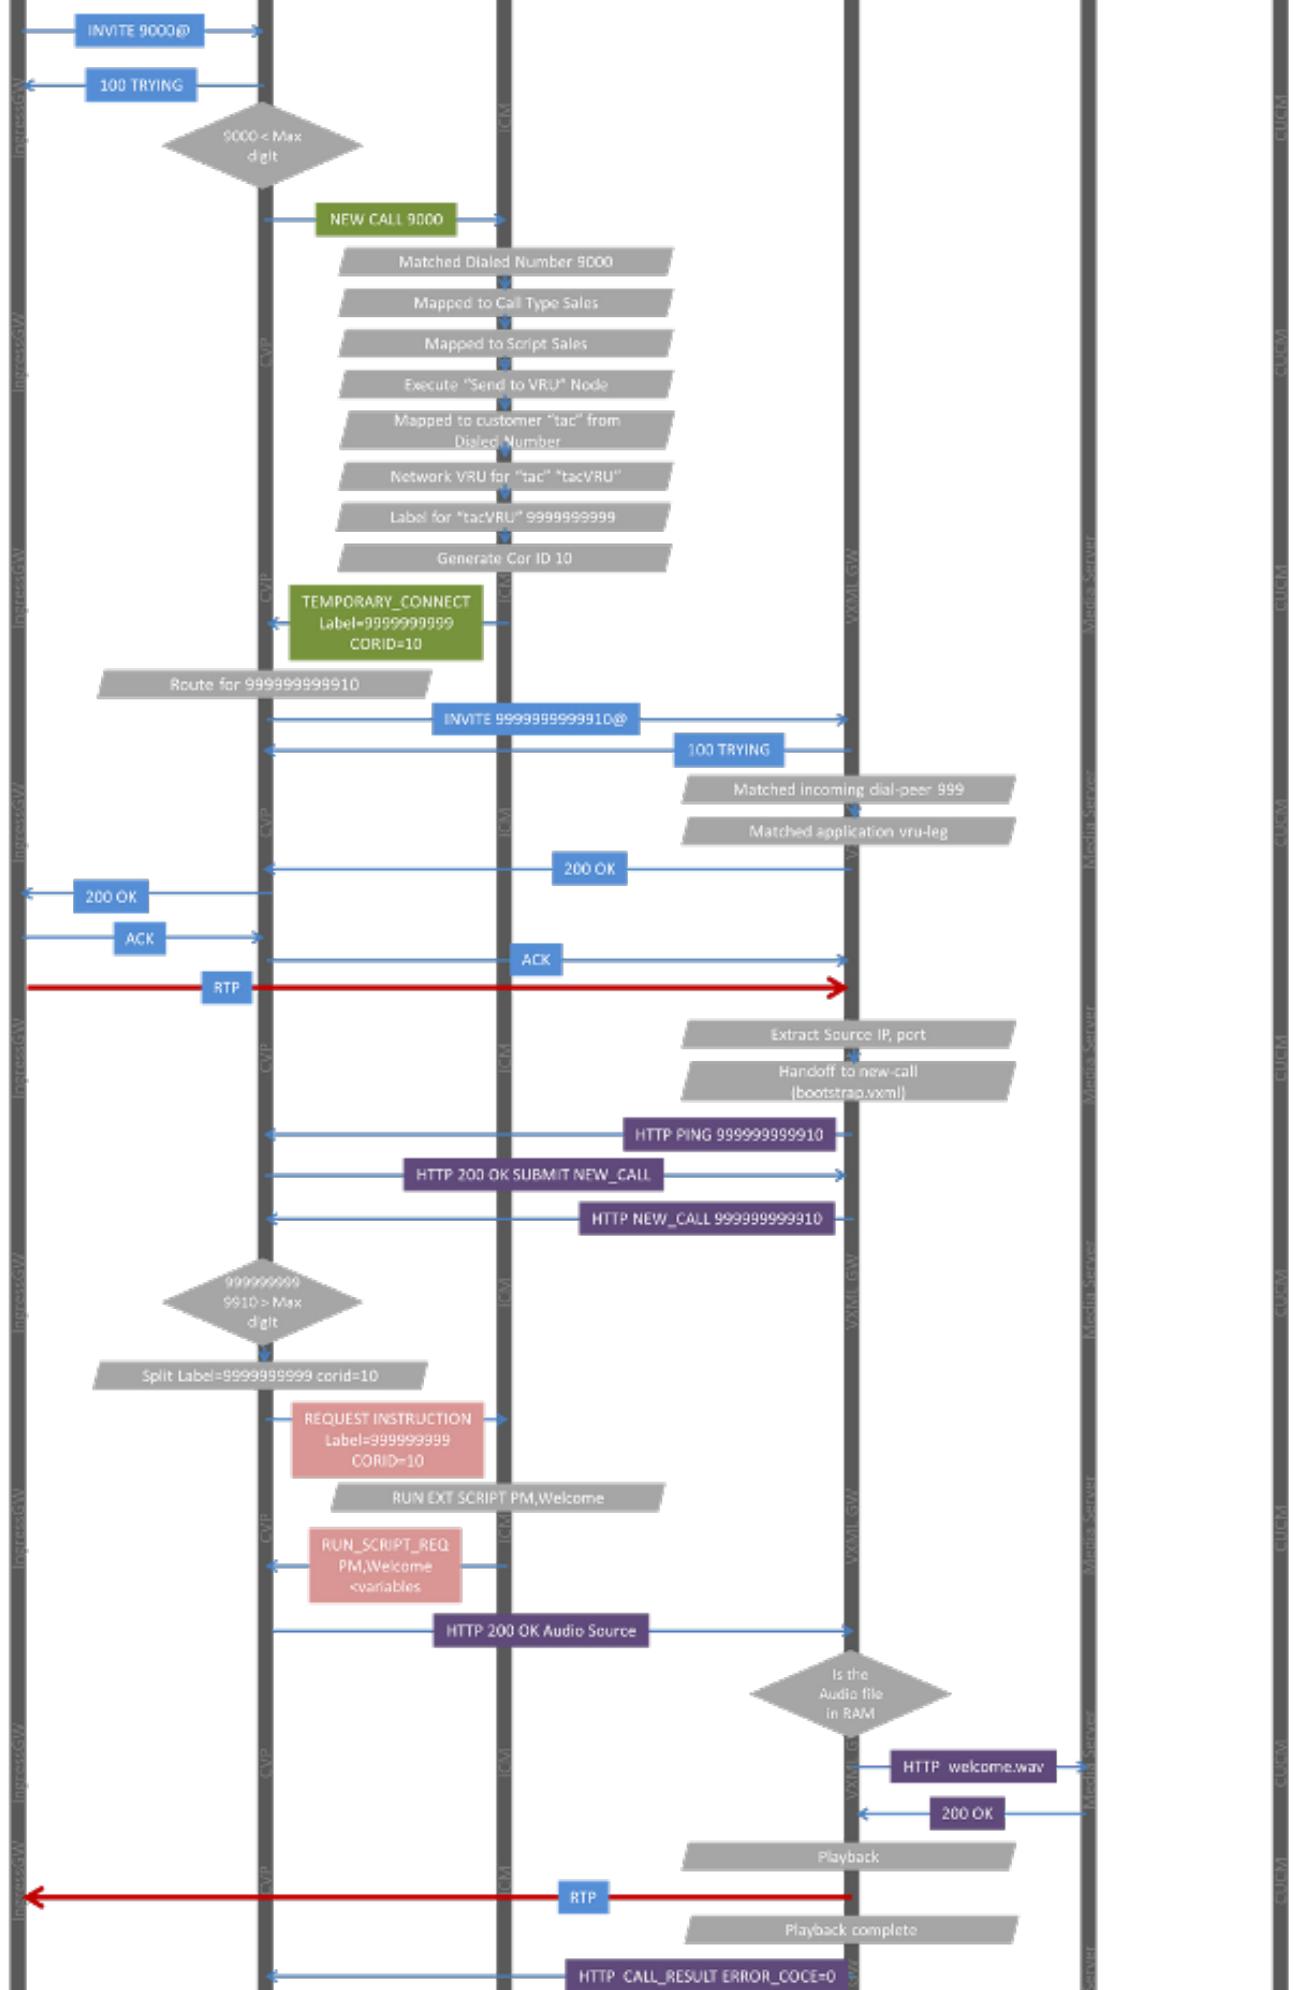

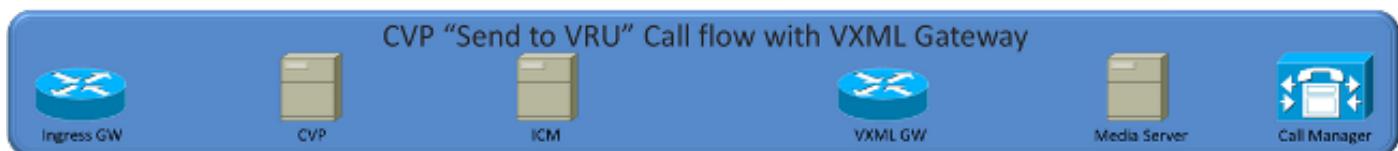

Wanneer ICM een vraag van de CVP routingclient ontvangt, en als de vraag naar het netwerk VRU moet worden verzonden, zoekt ICM de klanteninstantie die voor het gedialineerde nummer wordt gevormd. Zodra de klanteninstantie wordt geïdentificeerd gebruikt ICM het netwerk VRU dat voor die klanteninstantie is geconfigureerd. Dan vindt ICM het etiket voor de routingclient in dat netwerk VRU. Samen met Correlatie ID stuurt ICM het VRU-label naar CVP-routing client. Wanneer een klantinstantie niet is ingesteld, moet het standaardnetwerk VRU worden geconfigureerd. Maar als beste praktijk, zou de klanteninstantie altijd moeten worden gedefinieerd op het dialed number.

Ladderdiagram

De vraag stromen veranderingen hangen af van waar de vraag voortkomt en tot ICM bereikt. Het hangt ook af van het signaleringsprotocol dat voor de oproep wordt gebruikt. Op basis daarvan zijn hier de verschillende ladderdiagrammen:

1. Session Initiation Protocol (SIP) - PSTN Gateway stuurt de oproep naar de CVP en de CVP stuurt naar ICM
2. SIP - CUCM stuurt de oproep naar ICM en de overboekingen naar het CVP

SIP - PSTN-gateway stuurt de oproep naar de CVP en de CVP wordt naar de ICM verzonden

1. De Ingress-poort stuurt een INVITE naar het CVP.
2. De CVP keert terug met 100 TRYING.
3. De CVP bepaalt of het een nieuwe oproep of een VRU-oproep is. Hiermee wordt de DNIS-lengte (Digital Number Identification Service) gecontroleerd. Indien de DNIS lengte kleiner of gelijk is aan de "Max DIGIT" gedefinieerd in het ICM subsysteem, weet de CVP dat het een nieuwe oproep is.
4. De CVP stuurt een NEW_CALL-verzoek naar de ICM.
5. Zodra de ICM PG de NEW_CALL naar het Routeverzoek converteert en naar de ICM router stuurt:
 - De ICM router probeert de DNIS van het routeverzoek met het gedialineerde nummer aan te passen.
 - Zodra het gedraaide nummer is aangepast, brengt ICM het in kaart aan een vraagtype.
 - Zodra het aanroepen type is aangepast wordt het in kaart gebracht in een script. Als het script nu zal worden uitgevoerd, voert de ICM router het script uit.
 - Zodra het script het knooppunt "Verzend naar VRU" of "Run Ext Script" bereikt, moet ICM de oproep naar de VRU sturen. Het probeert het juiste netwerk VRU te vinden.
 - Gebaseerd op het dialed number vindt ICM welke klant dit gedialaliseerde nummer behoort.
 - Zodra de klant wordt gevonden vindt ICM welk netwerk VRU zal worden gebruikt.
 - De ICM router kiest het etiket dat voor CVP RC wordt gedefinieerd en genereert de correlatie-ID.
6. Het CVP krijgt het etiket 9999999999 en correlatie ID10. Het combineert het en zoekt een route. Aangezien proxy niet wordt gebruikt, is het een statische route die is gedefinieerd onder SIP.
7. Het CVP stuurt de oproep voor 999999999910 naar de VXML poort.
8. Op de VXML gateway komt 99999999910 overeen met een dial-peer die bootstrap.tcl als de te beroepen aanvraag heeft.
9. De VXML-gateway accepteert de oproep en stuurt 200 OK naar de CVP.
10. Het CVP retourneert de 200 OK naar de Ingress poort met Secure Devices Provisioning (SDP), gekopieerd van de VXML poort 200 OK.
11. De Ingress poort stuurt ACK naar de CVP. De transactie van het INBOUND-gedeelte van de oproep is nu voltooid.
12. De CVP stuurt ACK naar de VXML poort. Er is hier een afhankelijkheid. Indien de ACK van het INBOUND-been niet wordt ontvangen, stuurt de CVP de ACK niet naar de VXML-gateway.
13. In de tussentijd, op de VXML gateway haalt de bootstrap toepassing de SIP headers uit om te weten te komen waar deze oproep vandaan kwam. Zij gebruikt deze informatie om een HTTP-aanvraag naar het CVP te sturen.
14. De VXML gateway stuurt een HTTP PING-bericht naar dezelfde CVP waar de SIP-oproep kwam.
15. Het CVP Interactive Voice Response (IVR) subsysteem reageert met 200 OK.
16. De VXML gateway stuurt nu een NEW_CALL HTTP-verzoek naar de CVP met DNIS=99999999910.
17. Aangezien de DNIS groot is, wordt het "max cijfer" gedefinieerd in de CVP (dat 10 is). Het CVP weet dat het een terugkerende VRU is, zodat het de etikettering en correlatie-ID scheidt en een aanvraag voor INSTRUCTIE naar CVP stuurt met etiket = 9999999999, correlatie ID=10.
18. Op basis van de correlatie ID=10 weet ICM op welk script de oproep wachtte. Dus blijft het

- de volgende stap uitvoeren, die "Ext Script uitvoeren" is. Het stuurt "RUN_SCRIPT_REQ" naar PM, verwelkom dit samen met andere variabelen voor Error Correcting Code (ECC).
19. Met behulp van de ECC variabelen en de RUN_SCRIPT_REQ instructie bouwt het CVP IVR subsysteem het VXML document en stuurt het terug als 200 OK.
 20. De VXML poort ontvangt 200 OK en bepaalt welk golfbestand moet spelen en van waar.
 21. Het controleert zijn cache, het bestand is niet aanwezig, dus het stuurt een HTTP-aanvraag naar de webserver voor het bestand.
 22. De webserver stuurt 200 OK met het audiobestand.
 23. De VXML gateway stuurt het audiobestand als Routing Table Protocol (RTP) naar de ingangsgateway.
 24. Zodra de VXML gateway het bestand speelt, stuurt het een ander HTTP-verzoek naar CVP met CALL_RESULT, FOUT_CODE=0.
 25. CVP stuurt "RUN_SCRIPT_RESULT" naar ICM met error_CODE=0.
 26. ICM volgt door de succesvolle tak van het knooppunt "Ext Script" en gaat naar "Wachtrij om te doden".
 27. ICM moet het VRU-been loskoppelen. Dus ICM verstoort de verbinding op het VRU-been.
 28. Tegelijkertijd verstuur ICM het CONNECT label 2001 naar het switchbeen.
 29. CVP stuurt 200 OK naar HTTP-aanvraag van de VXML-gateway om de verbinding te ontkoppelen.
 30. Tegelijkertijd stuurt CVP BYE op het SIP-been naar de VXML-gateway.
 31. Zodra de BYE naar de VXML-gateway wordt verstuurd, stuurt CVP een SIP-INVITE naar 91919191 die naar de VXML-gateway wordt gestuurd volgens de configuratie van het kiesschema.
 32. Zodra CVP 200 OK ontvangt van de VXML-gateway voor de oproep van 91919191, stuurt het Re INVITE terug naar de INBOUND-poot/Ingress-gateway.
 33. De Ingress poort stuurt 200 OK naar de nieuwe uitnodiging.
 34. Het CVP stuurt ACK naar de Ingress poort en de VXML poort.
 35. Het RTP pad wordt ingesteld tussen de Ingress poort en de VXML poort en de klant kan de ringback horen.
 36. Nu stuurt CVP een SIP-INVITE naar CUCM voor het jaar 2001.
 37. CUCM stuurt een 100 TRYING- en 180 RINGING-evenement. CVP doet niets met het 180 RINGING-bericht.
 38. Zodra de beambte de oproep beantwoordt, stuurt CUCM 200 OK.
 39. Dit veroorzaakt meerdere voorvalen bij CVP.
 40. CVP stuurt BYE door naar 91919191 VXML-achterbeen. CVP stuurt een nieuwe uitnodiging terug naar de Ingress-gateway om het audiopad naar de telefoon te wijzigen.
 41. De Ingress poort stuurt 200 OK naar de nieuwe uitnodiging.
 42. CVP stuurt ACK naar Ingress Gateway en CUCM.
 43. De audio wordt nu gemaakt tussen de Ingress-gateway en de IP-telefoon.

Configuratie

Configuratie van PSTN-gateway

```
dial-peer voice 2000 voip
destination-pattern 20..
translate-outgoing called 1
session protocol sipv2
session target ipv4:10.66.68.169
session transport tcp
codec g711ulaw
no vad
```

CVP-configuratie

De "Maximale lengte van DNIS" moet overeenkomen met de lengte van het VRU-label.

9191>;10.66.75.241

ICM-configuratie

Het dialed nummer moet een aangesloten klant hebben. Het wordt aanbevolen om ook een klant te hebben geassocieerd voor het vraagtype.

De klant/instantie moet aan het netwerk VRU zijn gekoppeld.

De CVP PG/Routing-client moet een aan VRU gekoppeld netwerk hebben.

Network VRU: Type10			
Agent auto-configuration: <input type="checkbox"/> Internal IP/TA Only: <input type="checkbox"/>			
Agent targeting mode: * Device Target Preferred			

Het type 10 netwerk VRU moet worden geconfigureerd. Alle CVP-PG's moeten een etiket hebben toegevoegd. De lengte van het etiket moet overeenkomen met de configuratie "MAX length of DNIS" van de CVP.

Het netwerk VRU-script moet aan het netwerk VRU zijn gekoppeld.

Configuratie van VXML-gateway

Taal voor snijcommando (TCL) toepassingen moeten worden geconfigureerd. De juiste toepassingen moeten worden geassocieerd met wijzerplaat-peers. De "header-passeren" moet worden ingesteld. CvPhone moet in de bootstrap-toepassing worden geconfigureerd.

Probleemoplossing

Aangezien dit document uitlegt hoe het probleem "Send to VRU" en/of "Run Ext Script" moet worden opgelost, neem aan dat de oproep van PSTN reeds in ICM is en ICM het "Send to VRU" knooppunt raakt. De te volgen methode is om in elke stap van de aanroep-stroom te kijken die fout kan gaan en het resultaat te bestuderen en hoe het eruit zou moeten zien. Deze details worden gebruikt in het lab.

IP Addressing:

CVP - 10.66.68.169
VXML Gateway - 10.66.75.241
CUPS Proxy - 10.66.68.164
CUCM - 10.66.68.163

Label:

Dialed Number - 2002 and 2003
VRU label for CVP - 1234567890
VRU label for CUCM - 9876543210

Analyse

ICM kiest het netwerk VRU gebaseerd op de klanteninstantie van het gedialineerde nummer. Als het dialed nummer geen klanteninstantie heeft, heeft ICM geen netwerk VRU etiket voor de vraag gevonden. ICM stuurt "RELEASE" naar CVP.

Geen "Network VRU" gedefinieerd op klant

```

Analyse

Zodra ICM een geldige klanteninstantie van het gedialiseerde nummer vindt, zoekt het het netwerk VRU op die ICM instantie. Als geen netwerk VRU wordt gedefinieerd, faalt ICM het label van het netwerk VRU. ICM stuurt "RELEASE" naar CVP.

Geen VRU-label voor routingclient

```

```

Analyse

Zelfs als ICM een netwerk VRU vindt, moet het type 10 zijn en moet er een etiket worden gevormd voor de routingclient waar de vraag kwam. ICM stuurt "RELEASE" naar CVP.

PG heeft geen "Network VRU" ingesteld

Analyse

Voordat een oproep naar het netwerk VRU wordt verzonden, moet ICM weten of de Routing client al dan niet een netwerk VRU-mogelijkheid heeft. Hiervoor moet de routingclient-PG een netwerk VRU hebben geconfigureerd dat Type 10 moet zijn (of Type 5 voor de oudere stijl configuratie). ICM stuurt "Dialoog FOUT" naar de CVP.

Onderdeel 2: CVP heeft geen route voor VRU Label

```

Analyse

Als alle configuraties op ICM juist zijn, stuurt ICM een VRU-label en correlatie-ID naar de CVP. Nu moet de CVP een route hebben om de oproep naar de VXML-gateway te sturen. Ofwel de CVP moet een statische route hebben, ofwel de CVP kan een vervangende route gebruiken om de oproep te sturen. Maar in beide gevallen moet het CVP in staat zijn de verbinding naar de VXML-gateway te sturen.

Vraag 3: VXML-gateway mislukt VRU TCL-scripts

Correcte dial-peers

```

Analyse

Als de CVP de verbinding naar de VXML gateway kan leiden, moet de vraag de VRU wijzerplaat-peer als inkomend wijzerplaat-peer aanpassen. Als een ander kiestoon-peer is aangepast, heeft deze niet de juiste toepassing. In dit geval komt het overeen met de inkomende dial-peers 92001 en CCAPI handvatten voor toepassing "Standaard". Dit gebeurt wanneer CCAPI op de gateway geen toepassing op een dial-peer vindt. Het niet aanpassen van de inkomende dial-peers kan om meerdere redenen gebeuren:

- Geen dial-peers ingesteld voor het VRU-been.
- Het inkomende overeenkomende patroon komt niet overeen met de DNIS voor de VRU-oproep. Controleer het nummer SIP-bericht met het "inkomende oproepen-nummer" in de VRU-dial-peer.
- Bepaal of de CVP SigDigits voorbereidt die niet in de gateway-peer VXML zou kunnen worden gevormd.

Geen toepassing/service ingesteld op Dial-peer

Analyse

De VRU dial-peer in de gateway VXML moet voor de VRU toepassing worden gevormd die bootstrap.tcl is. Als de wijzerplaat-peer geen dienst/toepassing heeft gevormd, probeert de gateway VXML om de vraag te leiden en kijkt naar de uitgaande wijzerplaat-peer. Als geen uitgaande wijzerplaat-peer wordt aangepast, faalt de vraag in elk geval. In dit geval, ook al komt het aan de inkomende wijzerplaat-peer 999 die onze VRU wijzerplaat-peer is, het toont nog aan dat de vraag naar de "Standaard"toepassing van de Controle API (CCAPI) van de Bel (Call Control API) behandelt. Dit betekent dial-peers 999 heeft niet de VRU/bootstrap toepassing gevormd.

Vraag 4: VXML Gateway kan geen HTTP-aanvraag naar CVP verzenden

Kop-passeren is niet ingesteld

```

Analyse

Wanneer de VXML gateway de vraag VRU ontvangt, past het aan met de wijzerplaat-peer die de VRU toepassing heeft gevormd. Om te weten te komen van welke CVP de vraag van oorsprong is, moet de VRU/bootstrap toepassing de SIP koppen zien. Daarom moet het doorgeven van de kop worden ingesteld. In dit geval wordt de inkomende dial-peer 999 aangepast en wordt CCAPI naar de bootstrap-toepassing verzonden. Wanneer de toepassing probeert de SIP-header te parseren faalt het. Als de bootstrap-toepassing de SIP-header niet kan zien, probeert hij het

HTTP-verzoek naar het bronadres van de oproep te sturen. Dus, als de oproep via proxy komt, wordt het HTTP bericht naar de proxy verzonden. In dit voorbeeld is 10.66.68.164 CUPS-proxy. Aangezien het VRU-gedeelte van de oproep afkomstig is van proxy en er geen header passeren is ingesteld (er kan geen SIP-header worden geparseerd), probeert de toepassing de HTTP-aanvraag naar 10.66.68.164 te verzenden in poort 800. Nu, volmacht heeft geen haven 8000 geopend. Dus de TCP handshake faalt en er wordt geen HTTP-bericht verzonden. Voor een proxy-omgeving is een header-passeren ingesteld of wordt "param censuur" ingesteld om het HTTP-bericht te verzenden.

Vraag 5: CVP splitst VRU-label en correlatie-ID verkeerd

Analyse

Voor de VRU-oproep tot het werk moeten de "MAX lengte van DNIS" en de VRU-labellengte

overeenkomen. Wanneer het HTTP-verzoek terugkomt van de VXML-gateway met het VRU-label en correlatie-ID samen, splitst de CVP het VRU-label en correlatie-ID op basis van de "MAX-lengte van DNIS". Als het niet overeenkomt met welke ICM is geconfigureerd voor de VRU-lengte, splitst CVP de correlatie-ID verkeerd uit, die uiteindelijk door ICM wordt verworpen. In dit geval stuurt ICM het VRU-label 1234567890 en correlatie-ID 8922. Wanneer het CVP de Aanvraag Instructie stuurt, stuurt het Correlatie ID 922. Bijgevolg klaagt ICM dat 922 een onbekende Correlatie-ID is. Omdat ICM geen antwoord van een gesprek kreeg met Correlatie ID 8922, is het ook vaak terug. ICM heeft geen kennis van het feit dat de oproep met Correlatie ID 8922 en 922 deel uitmaakt van dezelfde oproepen. Dus voor 922 keert het terug onbekend en voor 8922 werd het vastgesteld.

Vraag 6: ICM/CVP stuurt verkeerde URL

MediaURL is onvolledig

Analyse

Om audioresties voor de juiste locaties te kunnen weergeven, moeten alle benodigde variabelen correct worden ingesteld. Er zijn weinig variabelen die bijdragen aan de URL van de audio-bestanden. U moet ervoor zorgen dat welke variabele ook wordt ingesteld, het gebruik van deze CVP's de URL voor het audiobestand creëert. Audio-bestanden moeten op die locatie beschikbaar zijn. Het is ook belangrijk om te bepalen welke mediaserver in gebruik is. Er is Tomcat voor de VXML server die op port 7000 luistert, Tomcat voor de Call server die op poort 8000 luistert en de Internet Information Server (IS) die op poort 80 luistert. In sommige gevallen kan de klant een andere webserver hebben die als mediaserver kan worden gebruikt. Het is belangrijk dat de juiste variabelen op de ICM worden ingesteld om een correcte URL voor de mediabestanden te creëren. De bestanden moeten ook op de juiste locatie op de mediaserver zijn geplaatst.

Media URL voor VXML Server is onjuist

Analyse

In ICM, moet de variabele UseXVXML op "N" worden ingesteld als de server VXML in de aanroep flow is. Als deze niet is ingesteld, voegt CVP Server.vxml aan het eind van de URL toe die niet bestaat. Als resultaat hiervan retourneert de VXML server een 400 foutmelding en de VXML gateway geeft foutcode 9 terug wat verkeerde URL betekent.

Vraag 7: SigDigit

CVP heeft geen route voor het VRU-label na hangende SigDigit

```

Analyse

Wanneer SigDigit wordt gebruikt, presteert CVP de SigDigit voor alle uitgaande gesprekken van de CVP voordat het op zoek is naar een route. Als een statische route wordt gebruikt, moet de CVP de statische route van het VRU-label hebben, dat vooraf is vastgesteld met SigDigit. Hetzelfde is waar voor het ringback aantal evenals de lijnen van het Agent uitbreidingsaantal. Als een proxy wordt gebruikt, moet de proxy de route hebben voor het VRU-label en het ringback-nummer, evenals de Agent-extensie met SigDigits, die vooraf is ingesteld.

Vraag 8: VXML Gateway-toepassing is niet ingesteld voor SigDigit

Analyse

Als SigDigit in gebruik is en de CVP een route daarvoor op de juiste manier heeft ingesteld, komt de oproep op de VXML gateway met DNIS aan als SigDigits + VRU etiket + Correlatie ID. Naast het "inkomende opriepen-nummer" van de dial-peers dat de bovenstaande combinatie moet aanpassen, dient de bootstrap ook met SigDigit te worden geconfigureerd. Indien niet ingesteld, wanneer de VXML gateway het New Call HTTP-verzoek naar de CVP verstuur, wordt de cijfers niet verwijderd, dus stuurt de CVP de verkeerde correlatie-ID op basis van de "Max length of DNIS" naar ICM. Daarom faalt de oproep uiteindelijk.

Vraag 9: CallManager krijgt het verkeerde VRU-label te overdragen

```

Analyse

Terwijl de CVP PG het netwerk VRU moet hebben geconfigureerd, moet de CUCM PG niet het netwerk VRU hebben. Als het wordt geconfigureerd veronderstelt ICM dat het correlatie-ID kan ondersteunen welke CUCM niet ondersteunt. Als resultaat hiervan ontvangt de JTAPI Gateway (JGW) het bericht alleen het VRU-label en niet de correlatie-ID die toegevoegd is. Het gesprek mislukt. Als echter geen netwerk VRU is geconfigureerd, krijgt de JGW de route als "VRU-label + correlatie-ID".

Vraag 10: CallManager presteert SigDigit niet aan het VRU-label

```

Analyse

Als de CVP voor SigDigit is ingesteld, wordt een aantal cijfers uit het opgeroepen nummer verwijderd. Wanneer CUCM de oproep stuurt met "VRU-label + correlatie-ID", dan stipt de CVP enkele cijfers vanaf het begin. Het resultaat is dat de verkeerde correlatie-ID naar ICM wordt gestuurd. In dit geval stuurt ICM VRU-label 9876543210 en correlatie-ID 9026. CUCM stuurt de oproep naar het CVP met ingang van 98765432109026. Het CVP is ingesteld voor SigDigit = 3. Het CVP neemt 987 op als SigDigit. Vervolgens wordt het VRU-label en correlatie-ID uitgesplitst op basis van de maximale lengte van DNIS, die 10 is. Van de 65432109026 wordt de correlatie-ID 6, wat CVP naar ICM stuurt. Zoals verwacht, geeft ICM onbekende correlatie ID 6 terug, en keren uit voor correlatie ID 9026. In dat geval moet het CUCM-routepatroon SigDigit (in dit geval 606) op de VRU-labelroute naar de CVP zetten.

Conclusie

Het lijkt soms moeilijk om problemen op te lossen met "Verzend naar VRU" of "Run Ext Script", maar het kan gemakkelijk zijn als de juiste benadering wordt gevuld. Wegens afhankelijkheid van meerdere toepassingen, zou het u kunnen vereisen om door loggen/sporen van meerdere apparaten te gaan. Hier volgen de logische stappen:

1. Start met de routerlogbestanden. Bepaal of de router een VRU-niveau en/of VRU-script heeft toegewezen om te worden uitgevoerd.
2. Controleer de CVP-stammen om te bepalen hoe ver in de berichtenstroom de oproep is.

Deze twee stappen geven een zeer goed begrip van de vraagstatus en leiden u naar de volgende stap, die is of u de Cisco IOS® VXML gateway, VXML server, enzovoort moet zuiveren.
