Inleiding

Dit document beschrijft de **ingestelde pad-selectie** verklaring in een routebeleid voor Border Gateway Protocol (BGP) binnen Cisco IOS®-XR.

Achtergrondinformatie

Veel ontwerpen zijn erop gericht om BGP meerdere paden te laten selecteren en bekendmaken voor één prefix.

Standaard wordt slechts één BGP-pad als het beste pad geselecteerd en wordt alleen dit beste pad geadverteerd. Het BGP-algoritme voor selectie van beste pad beslist hierover:

[BGP-algoritme voor selectie van het beste pad](#)

Naast het beste pad kan een tweede-best pad worden gekozen als back-uppad. Dit reservepad kan in ontwerpen met BGP PIC (Prefix Onafhankelijke Convergentie) worden gebruikt.

BGP kan meerdere paden installeren om taakverdeling te bereiken. Dit kan zijn: Edge Multipath-belasting (ECMP) of ongelijke kosten-multipath (UCMP). Deze multipath wordt geïnstalleerd in de routingtabel (RIB) en in de tabel Data plane of FIB (Forwarding Instance Base) om een taakverdeling te bereiken. De FIB-tabel is ook bekend als de CEF-tabel (Cisco Express Forwarding).

Dit artikel richt zich op twee doelen:

- Hoe zorgt u ervoor dat BGP meerdere paden kiest die moeten worden geïnstalleerd?
- Hoe krijgen we BGP om meerdere paden aan te geven?

Een andere functie die wordt gebruikt door BGP is Aanvullende paden (ADD-paden). Met deze functie kan BGP meerdere paden per BGP-sessie adverteren.

Samenvatting

- Het beste pad wordt altijd door BGP gekozen. Zo niet, dan is er iets mis. Dit artikel heeft geen betrekking op deze scenario's.
- Er kan een reservepad worden gekozen als de specifieke optie is ingesteld (bijvoorbeeld BGP PIC).
- Een route-beleid kan onder een specifieke adresfamilie voor BGP worden ingesteld om de te installeren en/of geadverteerde paden te selecteren.
- Vóór Cisco IOS®-XR 7.3.1 is er ondersteuning voor slechts één **set pad-selectie** verklaring in het route-beleid voor het selecteren van paden voor een specifiek voorvoegsel.
- Om met Cisco IOS®-XR 7.3.1 te beginnen, is er steun voor meerdere **set pad-selectie** verklaringen in het route-beleid voor het selecteren van paden voor een specifiek voorvoegsel.
- Om met Cisco IOS®-XR 7.3.1 te beginnen, werd een eigenschap toegevoegd waar een route-beleid kan worden gebruikt om specifieke paden voor een BGP prefix aan één BGP buurman te adverteren.

De selectie van multipath paden door BGP wordt uitgevoerd in volgorde van ontvangst van de paden. De opdrachten **bgp** van de **show** tonen echter de BGP-paden in lexicografische volgorde.

Een nieuwe opdracht - geïntroduceerd in Cisco IOS®-XR 7.3.1 - kan worden gebruikt om de BGP paden te zien in de volgorde waarin ze werden ontvangen:

```
show bgp <afi> rd <rd> <path_details>
```

Dit helpt de verificatie en probleemplossing van multipath. Hiermee wordt de belangrijkste vraag opgelost waarom een pad is gekozen als een multipath en niet als een ander.

Een pad dat meerdere pad beschermt is een reservepad dat geen multipath is maar alle andere multipath paden beschermt.

Om te beginnen met Cisco IOS®-XR 7.3.1, is er deze nieuwe sleutelwoord **multipath-protection-advertentie** voor de **ingestelde pad-selectie** verklaring. Het kan worden gebruikt om het multi-path-security pad **naast het back-uppad of langs de multipath paden** aan te geven. De volledige opdrachten die in het routebeleid moeten worden gebruikt zijn:

```
set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
set path-selection multipath advertise multipath-protect multipath-protect-advertise
```

Dit is een overzicht van de **set pad-selectie** opdracht met al zijn sleutelwoordcombinaties. Een gedetailleerdere uitleg en voorbeelden worden gevonden in de volgende sectie.

In alle onderstaande gevallen is het beste pad geïnstalleerd. Als dit niet het geval is, is er iets mis (de volgende hop is bijvoorbeeld ongeldig), maar dit heeft niets te maken met de opdracht **pad-selectie**.

Om het reservepad te kunnen selecteren moet een optie voor BGP worden ingeschakeld waarmee een BGP back-uppad kan worden geselecteerd: Bijvoorbeeld BGP PIC.

Multipath paden zijn in BGP ingeschakeld door **maximum-paden** van de adresfamilie:

```
maximum-paths {ebgp | eibgp | ibgp} <2-32> (unequal-cost)
```

Per definitie is het beste pad een multipath. Het beste pad is het enige pad dat in de routingtabel is geïnstalleerd indien multipath voor BGP niet is ingeschakeld. U kunt controleren hoeveel PHP paden in de routingtabel met de **maximum-paden {ebgp van het bevel geïnstalleerd zijn | eibgp | ibgp} <2-32> (ongelijke kosten)**.

Deze tabel geeft een overzicht van alle opties met de opdracht **pad-selectie**. Voor meer details en voorbeelden, zie de volgende paragraaf voor elk van de hier gepresenteerde gevallen.

Case	Opdracht	Installeren	ADVIEZEN
1	back-up voor maken van pad selecteren 1 installatie	1 back-uppad geïnstalleerd.	Alleen het beste pad geadverteerd.
2	reserve 1-advertenties instellen voor pad-selectie	Het reservepad is niet geïnstalleerd.	Het reservepad wordt geadverteerd.
3	reserve 1-advertenties instellen voor pad-selectie	Het reservepad is geïnstalleerd.	Het reservepad wordt geadverteerd.
4	pad selectie alle advertenties instellen	Het reservepad is niet geïnstalleerd. De multipath-paden zijn geïnstalleerd.	Alle paden worden geadverteerd (beste reservepad, multipath niet-multipath).
5	pad instellen	De multipath-paden zijn geïnstalleerd.	Alleen het beste pad geadverteerd.
6	pad-selectie multipath-advertenties instellen	De multipath-paden zijn geïnstalleerd.	De multipath-paden worden geadverteerd.

beschermen advertenties

De multipath-paden zijn
geïnstalleerd.
Een ander pad is
geïnstalleerd als back-
uppad (het 'reservepad
(bescherming multipath)'
als er nog paden naast de
multipath liggen.

Alleen het beste pad
geadverteerd.

Het beste pad en het
reservepad worden
geadverteerd.
Het backup-pad (sec
multipath) wordt niet
geadverteerd.

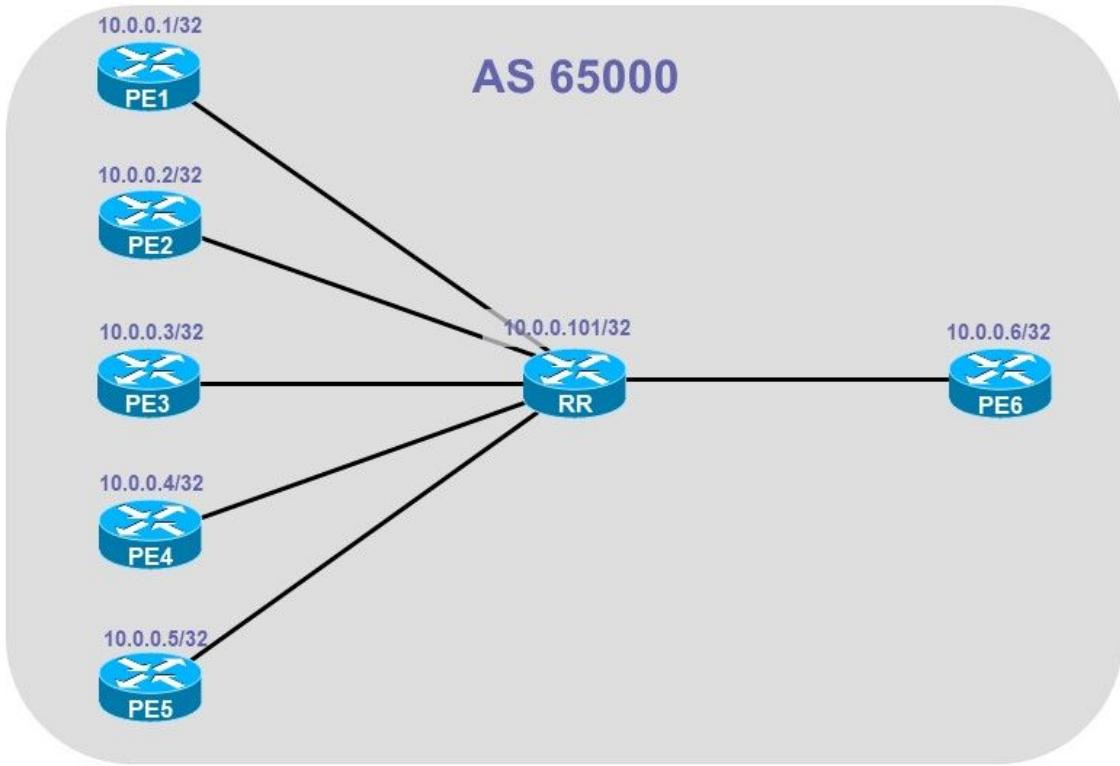

Alle group-best paden
worden geadverteerd

Het beste pad, het ba
pad en het backup-pa
(bescherm multipath)
worden geadverteerd

De multipath-paden
worden geadverteerd
Het backup-pad (sec
multipath) wordt niet
geadverteerd.

De multipath-paden
worden geadverteerd
Het backup-pad (sec
multipath) wordt
geadverteerd.

Dit is de topologie die door dit document wordt gebruikt.

In alle gevallen is ADD-PATH ingeschakeld tussen de RR (routereflector) en PE6.

PE1, PE2, PE3, PE4, PE5 en PE6 adverteren met hetzelfde voorvoegsel als vpng4-eenastroute naar de RR.

PE6 is de ingang van PE, die dit voorvoegsel van de RR ontvangt.

Tenzij anders vermeld is ADD-PATH ingeschakeld op elke BGP-sessie en IPgp 3-paden is ingesteld op de RR voor adresfamilie vpng4 unicast.

Opmerking: Er is maximaal één reservepad geïnstalleerd in de RIB- en CEF-tabellen. Meer dan één is niet mogelijk/ondersteund. Het pad wordt gemarkerd als een back-up in de BGP-tabel, de RIB-tabel en de CEF-tabel.

De back-uproute wordt altijd door BGP gekozen in dit artikel. Een back-uproute kan worden gekozen door een andere optie, maar hier is het altijd BGP.

Als multipath is ingesteld voor BGP, kunnen er multipath (ECMP of UCMP)-paden zijn geïnstalleerd in de BGP-tabel. Ze worden gemarkerd met **meerdere snijpad**. Het back-uppad is het op één na beste pad, dus indien er een is, zou het een van de multipath paden moeten zijn. Dit betekent dat er een reservekopie (bescherm multipath) kan zijn dat door BGP is gekozen als deze optie is geconfigureerd (**het multipath-beschermings sleutelwoord in de set path-selectie route-policy statement**). Als dit probleem zich voordoet, is dit **back-uppad (bescherming multipath)** het reservepad in de RIB- en CEF-tabel. Het **back-uppad** dat door BGP is gekozen en als zodanig door BGP is gemarkerd, is dan geen reservepad, maar een multipath.

Een back-uproute op een RR heeft niet veel zin als die RR alleen de rol van een RR heeft.

In dit artikel wordt aangenomen dat de RR ook een PE-router is. In dat geval, selecteert en

installeert u een backup route. De back-uproute kan worden gebruikt voor BGP PIC.

Een back-uproute wordt gemarkerd met **back-up** in het RIB als het specifieke prefix wordt gespecificeerd of met "!" als het prefix niet wordt gespecificeerd.

!
!
!
```

Het route-beleid met de set pad-selectie verklaringen wordt toegepast onder de adresfamilie vpng4 unicast.

Het route-beleid met de set pad-selectie verklaringen wordt ook toegepast op VRF. Dit is nodig als een reserveroute moet worden geïnstalleerd in de VRF RIB/CEF-tabel (of geadverteerd via de BGP-sessie via de PE-CE-link).

Op dit punt zijn beide routebeleidslijnen hetzelfde, maar er kunnen verschillende worden toegepast onder de adresfamilie versus de VRF.

Maximum-path ibgp 3 wordt gebruikt onder VRF één, waarbij gespecificeerd wordt dat er maximaal drie ECMP-paden in de RIB/CEF-tabel kunnen zijn.

Deze gevallen tonen alle mogelijkheden voor het route-beleid met **vastgestelde pad-selectie**.

1. back-up voor maken van pad selecteren 1 installatie

Conclusie: Alleen het beste pad en de meerdere paden worden geïnstalleerd. Alleen het beste pad wordt geadverteerd. Er is geen reservepad geselecteerd, geïnstalleerd of geadverteerd.

6. pad-selectie multipath-advertenties instellen

Adversiteit is een verplicht sleutelwoord.

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
end-policy
```

Om dit te laten werken moet er een multipath zijn dat is ingeschakeld voor BGP voor de specifieke adresfamilie.

Hier is het multipath voor ipv4 unicast in VRF één ingeschakeld.

```
router bgp 65000
vrf one
rd 1:1
address-family ipv4 unicast
  maximum-paths ibgp 3
  additional-paths selection route-policy BGP-Path-Selection
  redistribute connected
```

```
RP/0/RP0/CPU0:RR#show bgp vpng4 unicast rd 1:1 10.1.1.1/32
```

```

- Er zijn drie multipath-paden.
- Er is één pad voor back-up (bescherming multipath). Dit is het geïnstalleerde back-uppad in de RIB/CEF-tabel.
- Het vijfde pad is niet gemarkeerd.
- Het beste pad en het reservepad worden geadverteerd.

Er is mogelijk geen **back-up-pad (bescherming multipath)**. Als er bijvoorbeeld **maximaal BGP-paden 2** zijn geconfigureerd en er slechts 2 paden worden ontvangen, dan zijn twee paden multipath en is er geen **back-up (beschermen multipath)** pad.

Dit geadverteerde back-uppad is een van de multipath paden (duidelijke back-up in de BGP-tabel).

Dit is met **maximum paden ibgp 1**:

```

- Er is geen ECMP op RR.
- Het tweede beste pad is het back-uppad. Het wordt geïnstalleerd in de RIB/CEF-tabel.
- Het beste pad en backup pad worden geadverteerd.
- Er is geen **backup-pad (bescherm multipath)**.

Conclusie: Alle multipath paden zijn geïnstalleerd in het RIB. Een ander pad wordt als back-uppad geïnstalleerd. Het beste pad en het reservepad worden geadverteerd.

9. Pad-selectie groepsbeste advertenties instellen

- Groepsbestel kan alleen met **reclame** worden gebruikt.
- Group-best selectie is het beste pad per AS (Autonomo Systeem) en ook per volgende hop.
- Het prefix voortkomt uit verschillende autonome systemen.

Voor dit geval wordt een andere topologie gebruikt. De routers zijn hetzelfde als in afbeelding 1, maar PE4 is nu in AS 65004 en PE5 in AS 65005. Alle andere routers zijn nog steeds in AS 65000.

Afbeelding 2

Dit betekent dat er nu een eBGP-sessie is tussen de RR en PE4 en tussen de RR en PE5.

```

RR adverteert het groepsbeste pad uit de drie paden die van AS 65000 zijn ontvangen. Afgezien van dit pad, adverteert de RR ook het groepsbeste pad dat van AS 65004 is ontvangen en het pad van AS 65005.

Er zijn drie groepsbeste paden omdat de drie paden een ander buurland AS hebben. Al deze paden worden geadverteerd. De multipath-paden worden niet geadverteerd.

Conclusie: Alle group-best paden worden geadverteerd.

10. Stel een pad-selectie back-up in en installeer multi-path-beschermde advertenties met multipath-beveiliging

Deze optie is alleen beschikbaar vanaf Cisco IOS®-XR 7.3.1.

Om met Cisco IOS®-XR 7.3.1 te beginnen, is er een nieuwe sleutelwoord **multipath-protection-advertentie**.

Dit maakt het mogelijk om het **multi-path-security** pad **naast het back-uppad** te adverteren. Vóór Cisco IOS®-XR 7.3.1 is het **multi-path security** pad geïnstalleerd, maar niet geadverteerd. (Zie zaak 8.)

```

```

Conclusie:

- Alle 3 paden zijn gemarkeerd als multipath in BGP.
- 3 ECMP-paden worden geïnstalleerd in de RIB/CEF-tabel.
- Het tweede pad is het back-uppad. Als back-up gemarkeerd (bescherming tegen multipath) in BGP en als back-uppad geïnstalleerd in de RIB/CEF-tabel.
- Het beste pad, de meerdere paden en de ‘backup(bescherm multipath)’ paden worden geadverteerd.

Nieuw pad selectietraject vanaf Cisco IOS®-XR 7.3.1

Vanaf Cisco IOS®-XR 7.3.1 is dit veranderd:

- Per buurpad selectie is mogelijk. Voor Cisco IOS®-XR 7.3.1 was dit slechts per adresfamilie.
- De meerdere set pad-selectie verklaringen zijn toegestaan in één route-beleid.
- De BGP-paden kunnen worden weergegeven in de volgorde waarin ze worden ontvangen.

Per buurpad selectie mogelijk

Dit is de pad selectie beschikbaar in een route-beleid:

```
RP/0/RP0/CPU0:RR(config-rpl)#set path-selection ?
all          BGP all paths
backup       BGP backup path
best-path    BGP best path
group-best   BGP group best path
multipath    BGP multipath
```

Het **beste pad** is de standaard.

Dit wordt ondersteund op het niveau van de adresfamilie.

Configuratievoorbeeld:

```
router bgp 65000
address-family ipv4 unicast
!
address-family vpng4 unicast
additional-paths receive
additional-paths send
  additional-paths selection route-policy BGP-Path-Selection
!
neighbor 10.0.0.1
remote-as 65000
update-source Loopback0
address-family ipv4 unicast
  route-reflector-client
!
address-family vpng4 unicast
  route-reflector-client
!
!
vrf one
rd 1:1
address-family ipv4 unicast
maximum-paths ibgp 2
  additional-paths selection route-policy BGP-Path-Selection
  redistribute connected
!
```

Om met Cisco IOS®-XR 7.3.1 te beginnen, worden sommige opties van de padselectie in een route-beleid ook op het buurniveau ondersteund. Dit leidt tot een meer gedetailleerde controle op welke paden worden geadverteerd waaraan de BGP-buren zich houden. Als voorbeeld zou een spreker van BGP de beste weg en één reserveweg aan één BGP burcht kunnen adverteren, maar adverteert het multipath en beschermt het multipath aan een andere buur.

Op het niveau van de buurlanden:

```

RP/0/RP0/CPU0:RR(config-rpl)#if destination ?
in                               Member of a set
  is-all                         Check for additional paths selected by all path-selection
  is-backup-path                  Checks for backup path
  is-best-external                Checks for best external route
  is-best-path                    Checks for best path
  is-multi-path                  Checks for multiple paths
  is-multipath-protect          Checks for multipath-protect path
  longer-than                     Prefix-length greater than the route's prefix length
  or-longer                       Prefix-length equal to or greater than the route's prefix length

```

Waarschuwing: Het beste pad is multipath als de BGP-opdracht **maximum-path** is ingesteld.

Als echter de enige conditie die in het route-beleid is ingesteld **is multi-path**, worden alleen de multipath paden die niet het beste pad zijn, geadverteerd! Dit hangt af van het BGP-ontwerp, maar als de multipath-paden moeten worden geadverteerd, moet ook het beste pad worden geadverteerd.

De **is-all** en **is-multipath-protection** worden pas geïntroduceerd met Cisco IOS®-XR 7.3.1.

De meerdere set pad-selectie Statements zijn toegestaan in Eén routebeleid

Vanaf Cisco IOS®-XR 7.3.1 kunt u **meerdere pad-selectie** verklaringen hebben in één route-beleid gerelateerd aan één prefix. Vóór Cisco IOS®-XR 7.3.1 was dit niet toegestaan en zou dit leiden tot onvoorspelbaar BGP-padgedrag.

Per prefix wordt gekeken naar meer dan één pad selectie of niet.

Bijvoorbeeld, vóór Cisco IOS®-XR 7.3.1 wordt het volgende niet ondersteund:

```

route-policy add-path-to-ibgp
set weight 65000
  set path-selection backup 1 install
set metric-type type-1
set extcommunity rt RT BUSINESS additive
  set path-selection all advertise
set rib-metric 100
end-policy

```

U hebt twee **set pad-selectie** verklaringen in één route-beleid toegepast op dezelfde prefixes.

Echter, vóór Cisco IOS®-XR 7.3.1, wordt het volgende ondersteund. De reden is dat de verschillende pad selectie verklaringen zijn voor verschillende prefixes, omdat **als** statements met een selectie (bestemming, gemeenschap, ...) worden gebruikt.

Voorbeeld 1:

```

route-policy ADDPATH
if destination in TRAFFIC_1 then
  set path-selection backup 1 install
endif
if destination in TRAFFIC_2 then
  set path-selection multipath advertise
endif
end-policy

```

Dit is goed aangezien de **set-path selection** statements betrekking hebben tot verschillende prefixes (deze zijn in twee verschillende **if** statements).

Voorbeeld 2:

```
route-policy ADDPATH-2
  if community matches-any COMM_ADD-PATH then
    set path-selection backup 1 install multipath-protect advertise
  else
    set path-selection best-path
  endif
end-policy
```

Dit is goed omdat de geselecteerde pad selectie-statements betrekking hebben op verschillende prefixes (deze zijn in twee verschillende delen van de **if** statement).

Om te beginnen met Cisco IOS®-XR 7.3.1, wordt dit ondersteund.

Dit is een voorbeeld van een route-beleid met meer dan één **set pad-selectie** verklaring:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Het route-beleid per-buur specificeert welke paden aan die buur worden geadverteerd. Elk pad kan alleen worden gekozen uit de reeds gemarkerde paden op het niveau van de adresfamilie.

Op het niveau van de adresfamilie, hebt u de volgende opties:

```
RP/0/RP0/CPU0:RR(config-rpl)#set path-selection ?
all          BGP all paths
backup       BGP backup path
best-path    BGP best path
group-best   BGP group best path
multipath    BGP multipath
```

Op het niveau van de buurlanden:

```
RP/0/RP0/CPU0:RR(config-rpl)#if destination ?
in           Member of a set
is-all        Check for additional paths selected by all path-selection
is-backup-path Checks for backup path
is-best-external Checks for best external route
is-best-path   Checks for best path
is-multi-path   Checks for multiple paths
is-multipath-protect Checks for multipath-protect path
longer-than    Prefix-length greater than the route's prefix length
or-longer     Prefix-length equal to or greater than the route's prefix length
```

Waarschuwing: Het beste pad is multipath als de BGP-opdracht **maximum-path** is ingesteld.

Als echter de enige conditie die in het route-beleid is ingesteld **is multi-path**, worden alleen de multipath paden die niet het beste pad zijn, geadverteerd! Dit hangt af van het BGP-ontwerp, maar als de multipath-paden moeten worden geadverteerd, moet ook het beste pad worden geadverteerd.

De **is-all** en **is-multipath-protection** worden pas geïntroduceerd met Cisco IOS®-XR 7.3.1.

Met deze benadering kan het **markeren** van pad selectie een combinatie zijn van de opties voor padselectie die u hebt (bijvoorbeeld alle opties voor back-up, multipath, multipath-security enzovoort).

Het buurbeleid controleert de **advertentie** op basis van de selectieteken.

Voor het markering: U kunt bijvoorbeeld een back-up- en multipath hebben dat samen is geconfigureerd in het routebeleid op het niveau van de adresfamilie:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise    (1)
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
  (2)
end-policy
!
```

De twee hierboven gestelde pad-selectie verklaringen zijn wat nieuw ondersteund wordt om te beginnen met Cisco IOS®-XR 7.3.1. Met maximum-pad ibgp 3 nog in het voorbeeld ingesteld, hebt u deze:

- Hiermee kunnen het beste pad en alle multipath-paden worden geadverteerd.
- Hiermee kan het beste pad en de backup-pad worden geadverteerd (bescherming multipath).

Deze combinatie was niet mogelijk vóór Cisco IOS®-XR 7.3.1. Dit betekent dat of (1) of (2) van kracht zouden zijn.

Dit is het resultaat:

```

Het is nu mogelijk om aan één buurman de primaire (beste weg) en reservepaden te adverteren, gebaseerd op *is-best-path of is-back-up-path*.

Voor een andere buur, kan het multipath worden geadverteerd met **is-multi-path**.

Voorbeeld van buurroutebeleid (gebruikt met het routebeleid op het niveau van de adresfamilie):

```

route-policy BGP-neighbor-1
  if community matches-any COMM-LIST-1 then
    if destination is-best-path or destination is-backup-path then
      pass
    else
      drop
    endif
  elseif community matches-any COMM-LIST-2 then
    if destination is-multi-path or destination is-multipath-protect then
      pass
    else
      drop
    endif
  else
    drop
  endif
end-policy
!
```

Als de RR deze BGP-paden heeft:

```
RP/0/RP0/CPU0:RR#show bgp vpnv4 unicast rd 1:1 10.1.1.1/32
```

```

```

Deze paden zijn het multipath-pad (maar niet het beste pad!) en het back-up-pad (beschermen multipath).

De BGP-paden tonen in de volgorde waarin ze zijn ontvangen

De BGP-paden worden in lexicografische volgorde weergegeven.

Een nieuwe opdracht - geïntroduceerd in Cisco IOS®-XR 7.3.1 - kan worden gebruikt om de BGP paden te zien in de volgorde waarin ze werden ontvangen:

```
show bgp <afi> rd <rd> <path_details> <age-order>
```

Deze opdracht is handig om in te zien waarom paden zijn gemarkerd met meerdere paden. De eerder ontvangen paden zijn gemarkerd met multipath en zijn in RIB geïnstalleerd als maximum-path routes. De opdracht route **tonen** toont het **BGP multi path** sleutelwoord voor de als dusdanig geïnstalleerde routes.

Om te verifiëren welk pad gemarkerd is met multipath kan de nieuwe opdracht worden gebruikt om de volgorde te controleren waarin alle paden werden ontvangen. De nieuwere paden staan boven de uitvoer.

Bijvoorbeeld, met de volgende configuratie:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Er zijn geen veranderingen in het best-pad beslissingsproces en de paden hebben ook geen eigenschappen (zoals lokale voorkeur) die het best-pad beslissingsproces beïnvloeden.

RR heeft deze BGP-selectie:

```
RP/0/RP0/CPU0:RR#show bgp vpnv4 unicast rd 1:1 10.1.1.1/32
```

```
BGP routing table entry for 10.1.1.1/32, Route Distinguisher: 1:1

```

Waarom is het pad vanaf 10.0.0.1 het beste pad? Waarom is het pad vanaf 10.0.0.2 het back-uppad? Waarom is het pad van 10.0.0.3 multipath? Waarom is het pad van 10.0.0.4 de back-up (beschermt multipath)? Waarom is het pad vanaf 10.0.0.5 niet het beste pad, niet multipath en niet het back-up- (security multipath) pad?

Je kunt dit zien met dezelfde opdracht met **leeftijdvolgorde** aan het einde. De nieuwere paden staan boven de uitvoer.

```

```

Aangezien de meeste eigenschappen in de BGP-paden gelijk zijn tussen de paden, is de beslissing om het beste pad te kiezen gedaald naar de laagste router-ID van de BGP-luidspreker. Hier zie je de BGP-luidspreker 10.0.0.1. Het reservepad is het op een na beste pad en dus de op een na laagste router-ID van de BGP-luidspreker. Hier is dit 10.0.0.2.

De paden van 10.0.0.4 en 10.0.0.5 zijn geen multipath paden, omdat ze later dan de paden van 10.0.0.1, 10.0.0.2 en 10.0.0.3 zijn geïnstalleerd.

Back-up versus back-up (beschermend multipath)

```

route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Max. pad bgp 3 is ingesteld.

De back-up is de op één na beste route. Hier werden de meerdere pad paden ontvangen voor het reservepad. Er zijn dus drie multipath paden en een ander is een back-up pad.

- Het pad vanaf 10.0.0.5 is verdwenen.
- Het pad van 10.0.0.2 is nog steeds back-up, maar het is nu ook multipath.
- Omdat het reservepad ook een multipath is, hebt u nu een back-up (bescherming multipath) pad. Dit is het pad vanaf 10.0.0.4.

Sluit de buurman 10.0.0.5:

```

Er is niets veranderd in de 4 paden die al eerder waren geïnstalleerd. Alleen het pad vanaf 10.0.0.5 werd toegevoegd. Het staat aan de top omdat het nieuw is. Het is geen multipath of een backup pad.

Het pad van 10.0.0.5 is veranderd van multipath in non-multipath nadat de staat het pad heeft veranderd!

Conclusie:

- De volgorde waarin paden worden ontvangen, speelt een rol in het bepalen van welke paden meerdere paden zijn.
- De volgorde waarin paden worden ontvangen, speelt een rol als er al dan niet een reservekopie (beschermt multipath) is.
- De volgorde waarin paden worden ontvangen, speelt geen rol in welke pad wordt gekozen als het beste pad of back-uppad.

Bestellen via IGP-metriek

Er is een optie om meerdere paden te bestellen per de metriek van het Protocol van de Gateway van het Binnenlandse Zaken (IGP).

```

RP/0/RP0/CPU0:RR#conf t
RP/0/RP0/CPU0:RR(config)#router bgp 65000
RP/0/RP0/CPU0:RR(config-bgp)#vrf one

RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost ?
deterministic Deterministic Multipath selection primarily on IGP metric order
selective Allow multipaths only from marked neighbors
<cr>
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost deterministic ?
selective Allow multipaths only from marked neighbors
<cr>
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#maximum-paths ibgp 3 unequal-cost deterministic
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#commit

```

```
RP/0/RP0/CPU0:RR(config-bgp-vrf-af)#end
```

```
RP/0/RP0/CPU0:RR#
```

De ongelijke kosten zijn nodig zoals anders, dan eindig je met alleen het beste pad, een reservepad, maar geen multipath omdat multipath dezelfde IGP kosten nodig heeft om als multipath te worden beschouwd.

De IGP kosten van RR aan de PE routers worden in de topologie gewijzigd. De IGP-kosten zijn als volgt ingesteld:

- RR naar PE1: 5
- RR naar PE2: 4
- RR naar PE3: 3
- RR naar PE4: 2
- RR naar PE5: 1

Er zijn nog steeds deze:

```
route-policy BGP-Path-Selection
  set path-selection multipath advertise
  set path-selection backup 1 install multipath-protect advertise multipath-protect-advertise
end-policy
!
```

Voordat de IGP metriek (de kosten zijn hetzelfde voor alle links) verandert:

```

- Het beste pad is nu het pad van 10.0.0.5 vanwege de lagere IGP metrische (metrische 2).
- Het reservepad is nu het pad met de op één na beste IGP metrische, het pad van 10.0.0.4 (metrisch 3).
- Het beste pad en reservepad zijn ook multipath, dus er moet nog één multipath worden gekozen. Dit is het pad van 10.0.0.3 (metrisch 4).
- Het backup-pad (security multipath) is het pad vanaf 10.0.0.2 (metriek 5).
- Ten slotte is het pad van 10.0.0.1 (metriek 6) helemaal niet gemarkerd, omdat het de slechtste metriek heeft.
